GENERAL INFORMATION

Administration

FAULT-TRACING

CAMSHAFT DIAGNOSTICS (CVVT)

In addition to electrical checks of the camshaft reset valve, the engine control module (ECM) checks that the position of the camshaft is correct and that the control (deployment and return of the camshaft) is working satisfactorily. The control module uses the signals from the camshaft position sensor and engine speed (RPM) sensor (crankshaft position) for the diagnostics.

Checking the camshaft position

The control module checks that the 0 position of the camshaft (mechanical rest position) is correct. During certain driving conditions, camshaft control is not active. If this is the case, the control module checks the deviation between the camshaft position (angle position) and the crankshaft position (angle position).

The difference is stored in the engine control module (ECM) as an adaption value. A diagnostic trouble code (DTC) is stored in the engine control module (ECM) if the adaptation value becomes too high or low. The deviation of the camshafts from the reference position can be read off.

Checking the camshaft control

When camshaft control is active, the control module checks that the camshaft moves to the intended position. If the position is not reached, the time the system takes to deploy to the correct camshaft position (the transition time from the actual to the desired camshaft angle) is measured. A diagnostic trouble code (DTC) is stored in the engine control module (ECM) if the camshaft angle does not reach the desired value within a certain time frame.

CATALYTIC CONVERTER DIAGNOSTIC

- For 5 cylinder engines, see **CATALYTIC CONVERTER DIAGNOSTICS 5 CYLINDER**
- For 6 cylinder engines, see **CATALYTIC CONVERTER DIAGNOSTICS 6 CYLINDER**.

CATALYTIC CONVERTER DIAGNOSTICS 5 CYLINDER

Fig. 1: Identifying Three-Way Catalytic Converter And Heated Oxygen Sensors
Courtesy of VOLVO CARS CORPORATION

The three-way catalytic converter (TWC) stores oxygen from the exhaust gases and uses it to make toxic gases more environmentally friendly. The catalytic converter is a 3 way catalytic converter in which HC (hydrocarbons) and CO (carbon monoxide) are oxidized and NO_x (nitrous oxide) is reduced. As the three-way catalytic converter (TWC) ages its ability to store oxygen drops. This reduces the conversion capacity of the three-way catalytic converter (TWC). To avoid dangerous emissions the engine control module (ECM) checks three-way catalytic converter (TWC) efficiency. In brief, this check is carried out as follows.

Two heated oxygen sensors (HO2S) are used to check the three-way catalytic converter (TWC), one upstream of the converter and one in the center of the converter (the rear heated oxygen sensor (HO2S)). The main function of the heated oxygen sensors (HO2S) is to measure the oxygen content in the exhaust gases so that the engine control module (ECM) can maintain the fuel / air mixture at around lambda=1. This mixture allows for optimum catalytic conversion. To determine catalytic converter efficiency the amplitude of the heated oxygen sensor (HO2S) signals is compared (amplitude is a measure of signal oscillation).

When efficiency of the catalytic converter is good and the fuel / air mixture is normal, the front probe signal switches between rich and lean while the rear probe signal is steady. If the three-way catalytic converter (TWC) efficiency is poor but the fuel / air mixture is normal, the rear probe signal will also switch between rich and lean. This is because the exhaust gases flow straight through the three-way catalytic converter (TWC) without being acted on. If the amplitude of the rear sensor becomes too great in relation to the amplitude of the front sensor for a number of checks, a diagnostic trouble code (DTC) will be stored for catalytic converter efficiency.

CATALYTIC CONVERTER DIAGNOSTICS 6 CYLINDER

Fig. 2: Identifying Three-Way Catalytic Converter
Courtesy of VOLVO CARS CORPORATION

The three-way catalytic converter (TWC) stores oxygen from the exhaust gases and uses it to make toxic gases more environmentally friendly. The catalytic converter is a 3 way catalytic converter in which HC (hydrocarbons) and CO (carbon monoxide) are oxidized and NO_x (nitrous oxide) is reduced. As the three-way catalytic converter (TWC) ages its ability to store oxygen drops. This reduces the conversion capacity of the three-way catalytic converter (TWC). To avoid dangerous emissions the engine control module (ECM) checks three-way catalytic converter (TWC) efficiency. In brief, this check is carried out as follows.

Three heated oxygen sensors (HO2S) check the common catalytic converter. One heated oxygen sensor (HO2S) is in front of the three-way catalytic converter (TWC) for each bank of cylinders and a common rear heated oxygen sensor (HO2S) in the center of the three-way catalytic converter (TWC). The main function of the heated oxygen sensors (HO2S) is to measure the oxygen content in the exhaust gases so that the engine control module (ECM) can maintain the fuel / air mixture at around lambda=1. This mixture allows for optimum catalytic conversion. To determine catalytic converter efficiency the amplitude of the heated oxygen sensor (HO2S) signals is compared (amplitude is a measure of signal oscillation).

When efficiency of the catalytic converter is good and the fuel / air mixture is normal, the front probe signals for banks 1 and 2 switch between rich and lean while the rear probe signal is steady. If the three-way catalytic converter (TWC) efficiency is poor but the fuel / air mixture is normal, the rear probe signal will also switch between rich and lean. This is because the exhaust gases flow straight through the three-way catalytic converter

(TWC) without being acted on. If the amplitude of the rear sensor becomes too great in relation to the amplitude of the front sensor for a number of checks, a diagnostic trouble code (DTC) will be stored for catalytic converter efficiency.

DESCRIPTION OF ACTIVATIONS

BUTTONS ON THE LEFT-HAND KEYPAD

Activate the buttons on the left-hand keypad.

- CD button
- Back button
- AM/FM button
- Forward button
- 1 button
- 4 button
- 7 button
- * button
- 2 button
- 5 button
- 8 button
- 0 button
- 3 button
- 6 button
- 9 button
- # button
- * button

BUTTONS ON THE RIGHT-HAND KEYPAD

Activate the buttons on the right-hand keypad.

- buttons for sound control
- button for carphone on/off
- button for selecting the function
- buttons for the carphone and menu control
- button to open the CD tray
- CD eject button
- Up button
- Down button
- knob to select the source

- SIM card holder (only for cars with carphones)

DISPLAY TEST

Activate the display test positions.

- Normal
- All pixels on
- All pixels off
- Predetermined pattern 1
- Predetermined pattern 2
- Predetermined pattern 3
- Predetermined pattern 4.

STANDARD DISPLAY SYMBOLS

Activate the symbols in the standard display.

- TP symbol
- Symbol)))
- DDPLII symbol
- PHONE symbol
- REG symbol
- 3CH symbol
- PHONE ONLINE symbol
- MESSAGE symbol
- VOICE MESSAGE symbol.

DESCRIPTION OF EXTENDED DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

CONTENTS

Select type of description.

- see **DESCRIPTION OF FROZEN VALUES**
- see **COUNTERS, DESCRIPTION**
- see **STATUS IDENTIFIER, DESCRIPTION**

DESCRIPTION OF FROZEN VALUES

EXPLANATION

Not all the parameters described need to be implemented in the control module. This varies from system to

system.

Frozen values are parameter values that are stored when a diagnostic trouble code (DTC) is stored.

HINT: Frozen values are stored the first time a diagnostic trouble code (DTC) is generated. Because of this, intermittent open-circuits on the MOST network may be hard to diagnose.

BATTERY VOLTAGE, VALUE

Measurement range: 0-30 V.

Normal value when the generator (GEN) is charging: 13.0-14.5 V.

The value indicates the voltage at the central electronic module (CEM).

DISTANCE, VALUE

Measurement range: 0-1048575 km.

The value indicates the total mileage of the car at the time the diagnostic trouble code (DTC) was stored.

PASSENGER COMPARTMENT TEMPERATURE, VALUE

Measurement range: -60-195 °C.

The combined instrument panel obtains the value via the control area network (CAN).

OUTSIDE TEMPERATURE, VALUE

Measurement range: -128-127.75 °C.

The combined instrument panel obtains the value via the control area network (CAN).

ENGINE RUNNING, STATUS

The status displays whether the engine was running when the diagnostic trouble code (DTC) was stored.

No = the engine was not running

Yes = the engine was running

TIME, VALUE

The value displays the time that has passed since the diagnostic trouble code (DTC) was stored.

CAN COMMUNICATION, STATUS

The status indicates the control modules in the Control area network (CAN) which were communicating when

the diagnostic trouble code (DTC) was stored.

30 SUPPLY, VALUE

Measurement range: 0-50 V

The value indicates the power supply to the infotainment control module (ICM) when the diagnostic trouble code (DTC) was stored.

5 V SUPPLY, VALUE

Measurement range: 0-10 V

Normal range: 4.5-5.5 V

The value indicates the internal power supply in the infotainment control module (ICM) when the diagnostic trouble code (DTC) was stored.

3.3 V SUPPLY, VALUE

Measurement range: 0-5 V

Normal range: 2.9-3.5 V

The value indicates the internal power supply in the infotainment control module (ICM) when the diagnostic trouble code (DTC) was stored.

DISPLAY VOLTAGE, VALUE

Measurement range: 0-600 V

Normal range: 40-80 V

The value indicates the power supply to the display in the infotainment control module (ICM) when the diagnostic trouble code (DTC) was stored.

RING BREAK DIAGNOSTIC, STATUS

The status indicates the status of the MOST network when the diagnostic trouble code (DTC) was stored.

Status is stored the first time a diagnostic trouble code (DTC) is generated. If the fault is intermittent, the diagnostic trouble code may be generated several times, but the frozen value is only stored the first time. Because of this, intermittent open-circuits on the MOST network may be hard to diagnose.

OK = MOST network OK.

Open-circuit location = Indicates the location of the open-circuit in the MOST network.

MOST LOCKED, STATUS

The status indicates whether the MOST network was closed when the diagnostic trouble code (DTC) was stored.

No = The MOST network was not closed and communication was not possible.

Yes = The MOST network was closed and communication was possible.

BUTTONS LEFT KEYPAD, STATUS

The status indicates which button on the left-hand keypad was activated when the diagnostic trouble code (DTC) was stored.

Activated = The button was activated

Not activated = The button was not activated.

BUTTONS RIGHT KEYPAD, STATUS

The status indicates which button on the right-hand keypad was activated when the diagnostic trouble code (DTC) was stored.

Activated = The button was activated

Not activated = The button was not activated.

INPUT SIGNAL FROM THE BUTTON CIRCUIT, VALUE

Measurement range: 0-1023 V

The value indicates the voltage in the button circuit when the diagnostic trouble code (DTC) was stored.

- Left button circuit 1 (AM/FM, CD, |<<, >>|)
- Left button circuit 2 (*, 7, 4, 1)
- Left button circuit 3 (0, 8; 5, 2)
- Left button circuit 4 (#, 9, 6, 3)
- Right button circuit 1 (>>, AM/FM, |<<, CD)
- Right button circuit 2 (Up, Down, CD eject)
- Right button circuit 5 (sound)
- Button circuit for power button

VOLUME AND SELECTOR SWITCHES, STATUS

The status indicates the position of the switches in the Volume and Selector controls

Open

Closed

VOLUME AND SELECTOR KNOB MOVEMENT, VALUE

Measurement range: 0-FF (step)

The value indicates whether the Volume or Selector controls have been activated and how many steps they had been moved when the diagnostic trouble code (DTC) was stored.

DESCRIPTION OF FROZEN VALUES, CENTRAL ELECTRONIC MODULE (CEM)

EXPLANATION

Not all the parameters described need to be implemented in the control module. This varies from system to system.

Frozen values are parameter values that are stored when a diagnostic trouble code (DTC) is stored.

BATTERY VOLTAGE, VALUE

Measurement range: 0-12 V.

Normal value when the generator (GEN) is charging: 13.0-14.5 V.

DISTANCE, VALUE

Measurement range: 0-1048575 km.

The value indicates the total mileage of the car at the time the diagnostic trouble code (DTC) was stored.

PASSENGER COMPARTMENT TEMPERATURE, VALUE

Measurement range: -60-195 °C.

The combined instrument panel obtains the value via the control area network (CAN).

OUTSIDE TEMPERATURE, VALUE

Measurement range: -128-127.75 °C.

The combined instrument panel obtains the value via the control area network (CAN).

ENGINE RUNNING, STATUS

The status displays whether the engine was running when the diagnostic trouble code (DTC) was stored.

No = the engine was not running

Yes = the engine was running

TIME, VALUE

The value displays the time that has passed since the diagnostic trouble code (DTC) was stored.

DESCRIPTION OF FROZEN VALUES, PHONE MODULE (PHM)

EXPLANATION

Not all the parameters described need to be implemented in the control module. This varies from system to system.

Frozen values are parameter values that are stored when a diagnostic trouble code (DTC) is stored.

BATTERY VOLTAGE, VALUE

Measurement range: 0-28.4 V.

Normal value when the generator (GEN) is charging: 13.0-14.5 V.

The value indicates the voltage at the steering wheel module.

DISTANCE, VALUE

Measurement range: 0-1048575 km.

The value indicates the total mileage of the car at the time the diagnostic trouble code (DTC) was stored.

PASSENGER COMPARTMENT TEMPERATURE, VALUE

Measurement range: -60-195 °C.

The phone module (PHM) obtains the value via the control area network (CAN).

OUTSIDE TEMPERATURE, VALUE

Measurement range: -128-127.75 °C.

The phone module (PHM) obtains the value via the control area network (CAN).

ENGINE RUNNING, STATUS

The status displays whether the engine was running when the diagnostic trouble code (DTC) was stored.

No = the engine was not running

Yes = the engine was running

TIME, VALUE

The value displays the time that has passed since the diagnostic trouble code (DTC) was stored.

FUNCTIONS, STATUS

The status indicates which type of function was available when the diagnostic trouble code (DTC) was stored.

Carphone = normal carphone services available.

SOS = calls can only be made to the emergency services.

Infocom = data communication.

Unit switched off = the phone module (PHM) is switched off.

CALL STATUS

The status indicates the type of call when the diagnostic trouble code (DTC) was stored.

No activity = the phone module (PHM) is in standby mode. No ongoing calls or calls be made to/from the car.

Call from car = a number has been dialed from the car, but no answer.

Call to car = an incoming call to the car, but no answer.

Call = an ongoing call.

Call + outgoing = a call is on hold while a number is being dialed from the car. No answer.

Call + incoming = a call is on hold and there is an incoming call to the car.

Call on hold = approximately call is on hold.

Call + hold = a call is on hold and another call is ongoing.

Conference = a call with multiple participants connected

KEY POSITION, STATUS

The status indicates the position of the ignition key when the diagnostic trouble code (DTC) was stored.

No key = no key in the ignition switch.

Position 0 = ignition key in position 0.

Position 1 = ignition key in position 1.

Position 2 = ignition key in position 2.

Position 3 = ignition key in position 3.

CONTROL MODULE COMMUNICATION, CAN/MOST, STATUS

The status indicates which control modules on the MOST and LS-CAN networks the central electronic module (CEM) was able to communicate with when the diagnostic trouble code (DTC) was stored.

CEM OK = communication with the central electronic module (CEM), LS-CAN.

CEM nok = no communication with the central electronic module (CEM), LS-CAN.

AUD OK = communication with the audio module (AUD), MOST.

AUD nok = no communication with the audio module (AUD), MOST.

DIM OK = communication with the Driver Information Module (DIM), LS-CAN.

DIM nok = no communication with the Driver Information Module (DIM), LS-CAN.

DDM OK = communication with the Driver Door Module (DDM), LS-CAN.

DDM nok = no communication with the Driver Door Module (DDM), LS-CAN.

MMM OK = communication with the multimedia module (MMM), MOST.

MMM nok = no communication with the multimedia module (MMM), MOST.

PDM OK = communication with the Passenger Door Module (PDM), LS-CAN.

PDM nok = no communication with the Passenger Door Module (PDM), LS-CAN.

PSM OK = communication with the Power Seat Module (PSM), LS-CAN.

PSM nok = no communication with the Power Seat Module (PSM), LS-CAN.

SRS OK = communication with the Supplemental Restraint System Module (SRS), LS-CAN.

SRS nok = no communication with the Supplemental Restraint System Module (SRS), LS-CAN.

REM OK = communication with the rear electronic module (REM), LS-CAN.

REM nok = no communication with the rear electronic module (REM), LS-CAN.

SWM OK = communication with the steering wheel module (SWM), LS-CAN.

SWM nok = no communication with the steering wheel module (SWM), LS-CAN.

CCM OK = communication with the Climate Control Module (CCM), LS-CAN.

CCM nok = no communication with the Climate Control Module (CCM), LS-CAN.

UEM OK = communication with the upper electronic module (UEM), LS-CAN.

UEM nok = no communication with the upper electronic module (UEM), LS-CAN.

DESCRIPTION OF PARAMETERS, CD MODULE

CD PLAYER STATUS

The CD player can have the following status:

- Play
- Stop
- Pause
- Load
- Unload
- Search forwards
- Search backwards
- Fast forward
- Fast backward
- Retract
- Empty

TRACK

The value indicates which disc track is playing at the moment.

PLAYED TIME

The value indicates the time the current track has been playing.

ACTIVE DISC, ONLY FOR CARS WITH A CD CHANGER

Measurement range: 1-6.

The value indicates which of the discs in the CD changer is active.

DESCRIPTION OF PARAMETERS, MD MODULE

MD PLAYER STATUS

The MD player can have the following status:

- Play
- Stop
- Pause
- Load
- Unload
- Search forwards
- Search backwards
- Fast forward
- Fast backward
- Retract
- Empty

TRACK

The value indicates which disc track is playing at the moment.

PLAYED TIME

The value indicates the time the current track has been playing.

DESCRIPTION OF PARAMETERS, PHONE MODULE (PHM)

POWER SUPPLY, VALUE

Measurement range 0-65.535 V.

Normal value is approximately 12 V. The phone module (PHM) is supplied with +30.

The value indicates the power supply to the phone module (PHM).

PHONE MODULE (PHM) TEMPERATURE, VALUE

Measurement range -127- 127°C.

The normal temperature is approximately 70 °C but may vary depending on whether the air conditioning (A/C) or heater is in use.

The value indicates the internal temperature in the phone module (PHM).

SIGNAL STRENGTH GSM, VALUE

Measurement range 0-100%.

The value indicates the signal strength for GSM reception and may vary depending on the position of the operator and of the car.

DESCRIPTION OF PARAMETERS, ANTENNA MODULE (ATM)

FREQUENCY BAND AM/FM

Indicates the current wave band or whether the control module is switched off.

MAIN ANTENNA

The value indicates whether the main aerial is on or off.

SUB-ANTENNA

The value indicates whether the sub aerial is on or off.

REGION

Indicates which region the antenna module (ATM) is configured for, EU / US / AUS / JP.

EQUIPPED WITH TMC

Indicates whether the antenna module (ATM) is equipped with TMC.

EQUIPPED WITH GPS

Indicates whether the antenna module (ATM) is equipped with GPS.

FREQUENCY

Indicates the frequency which is set.

TMC FREQUENCY

Indicates the frequency the TMC receiver is set to.

SIGNAL STRENGTH TMC

Indicates the strength of the TMC signal.

GPS RECEIVED POSITION, LONGITUDE

Indicates the received longitudinal position.

GPS RECEIVED POSITION, LATITUDE

Indicates the received latitudinal position.

GPS SATELLITES ACCESSIBLE

Indicates how many satellites the system is in contact with.

- **Not available** - no contact with the satellite
- **No fix** - contact with a satellite but unable to fix a position
- **2D fix** - contact with a satellite, two-dimensional position fixing
- **3D fix** - contact with a satellite, three-dimensional position fixing.

DESCRIPTION OF PARAMETERS, INFOTAINMENT CONTROL MODULE (ICM)

30 SUPPLY, VALUE

Measurement range: 0 - 50 V

Normal range: 12 - 14 V

The value indicates the power supply to the infotainment control module (ICM).

5 V SUPPLY, VALUE

Measurement range: 0 - 10 V

Normal range: 4.5 - 5.5 V

The value indicates the internal power supply in the infotainment control module (ICM).

3.3 V SUPPLY, VALUE

Measurement range: 0 - 5 V

Normal range: 2.9 - 3.5 V

The value indicates the internal power supply in the infotainment control module (ICM).

DISPLAY VOLTAGE, VALUE

Measurement range: 0 - 600 V

Normal range: 40 - 80 V

The value indicates the voltage to the display in the infotainment control module (ICM).

POWER CONSUMPTION INFOTAINMENT, VALUE

Measurement range: 0 - 50 A

The value gives the power consumption of the infotainment system.

POWER CONSUMPTION INFOTAINMENT CONTROL MODULE (ICM), VALUE

Measurement range: 0 - 50 A

The value gives the power consumption of the Infotainment Control Module (ICM).

INPUT SIGNAL FROM THE BUTTON CIRCUIT, VALUE

Measurement range: 0 - 1023 V

Normal range: ~4.1 V (when no buttons in the relevant circuit are affected.)

The value indicates the voltage in the button circuit.

- Normal range: ~(3.6V, 3.1V, 2.4V, 1.4V)
- Left button circuit 1 (>>|, AM/FM, |<<, CD)
- Left button circuit 2 (*, 7, 4, 1)
- Left button circuit 3 (0, 8; 5, 2)
- Left button circuit 4 (#, 9, 6, 3)
- Right button circuit 1 (>>, AM/FM, |<<, CD)
- Normal range: ~(3.1V, 2.4V, 1.4V)
- Right button circuit 2 (Up, Down, CD eject)
- Normal range: ~(1.4V)
- Right button circuit 5 (sound)
- Button circuit for power button

NUMBER OF CONTROL MODULES IN THE MOST NETWORK, VALUE

The value indicates the number of control modules in the present MOST network. The number can be between 4-8.

BUTTONS IN THE KEYPAD, STATUS

The status displays if the selected button is activated or not

DISPLAY TEST, STATUS

Status displays the position for display test.

- Normal
- All pixels on

- All pixels off
- Predetermined pattern 1
- Predetermined pattern 2
- Predetermined pattern 3
- Predetermined pattern 4
- Undefined.

DISPLAY TYPE, STATUS

Status indicates what display type for the present unit.

- Standard
- Graphic
- Undefined.

MOST-LOCKED, STATUS

The status indicates whether the MOST network is closed and communication possible.

No

Yes

RING BREAK DIAGNOSTIC, STATUS

NOTE: This parameter is only changed after a ring break diagnostic has been run.

After the ring break diagnosis has been carried out the status indicates if there is an open-circuit and if so the location of the open-circuit.

OK

Pos1 - Pos8

HINT: The number of possible positions varies depending on the number of control modules in the car.

NETWORK ACTIVITY, STATUS

Status indicates if there is communication in the MOST network.

No

Yes

3 DB SWITCH, STATUS

Status displays if the 3 dB switch is on or off.

FUEL PRESSURE REGULATION, DIAGNOSTICS

FUEL PRESSURE REGULATION, DIAGNOSTICS

General

The fuel pump control module has no functions for diagnostics. Fuel pressure control components and functions are diagnosed by the engine control module (ECM).

The following components and functions are diagnosed by the engine control module (ECM). Diagnostic trouble codes (DTCs) can be stored for each component and function:

- **Fuel pump control module** , a diagnostic checks the power supply. A diagnostic trouble code (DTC) will be stored and the fuel pump will not work if there is no power supply to the fuel pump control module
- **Fuel pressure sensor** with temperature sensor, a diagnostic checks the pressure and temperature signals to, see if they are outside the normal operating range of the sensor. If a fault in the fuel pressure sensor is detected, the fuel pump (FP) will run at a predefined power and the pressure is governed by the by-pass valve in the fuel tank
- **Fuel pressure** , the engine control module (ECM) compares the requested pressure with the measured pressure(signal from the fuel pressure sensor). If the measured pressure deviates excessively from the requested pressure, or if the pressure pulses, a diagnostic trouble code (DTC) will be stored for incorrect fuel pressure. The diagnostic is not active if a diagnostic trouble code (DTC) for the fuel pressure sensor is stored. A diagnostic trouble code (DTC) for fuel pressure will be stored if there is a fault in the *fuel pump* .
- **Communication cable.** The engine cannot be started if there is a fault in the communication cable between the engine control module (ECM) and the fuel pump control module. A diagnostic trouble code (DTC) will be stored for the fault.

Components and functions which cannot be diagnosed:

If there is a fault in the *by-pass valve* in the tank unit, the starting process of the engine will take longer if the valve is leaking fuel when the fuel pump is off. If the valve does not open when there are pressure peaks in the fuel system, engine operation will be affected negatively, especially after engine braking. The fault can also cause rough idling.

HEATED OXYGEN SENSOR (HO2S) DIAGNOSTIC, 5-CYLINDER ENGINE

The front heated oxygen sensor (HO2S) is a lineal type and functions with current control. Therefore it is not possible to measure the signals from the heated oxygen sensor (HO2S) using a multimeter. The rear heated oxygen sensor (HO2S) is a binary type as with earlier heated oxygen sensors (HO2S).

The Engine Control Module (ECM) checks the heated oxygen sensors (HO2S) when the conditions for diagnostics have been fulfilled.

The following faults can be registered by the control module:

- **Electrical fault** in the circuits for the heated oxygen sensors (HO2S) and for the heated oxygen sensor (HO2S) preheating
- **Adaptation.** The control module checks that the long-term fuel trim is not higher or lower than the pre-defined values
- **Large difference between the front and rear heated oxygen sensor (HO2S) adaptation.** The control module checks that the difference between the rear and front heated oxygen sensor (HO2S) adaptation is not too great. The fault may be in the front or rear heated oxygen sensor (HO2S) or the wiring
- **Heated oxygen sensor (HO2S) dynamics.** The control module checks that the changeover period between rich and lean mixtures is not too long
- **Unlikely signals between the front and rear heated oxygen sensors (HO2S).** When the control module registers a rich mixture in the front probe at the same time that a lean mixture is registered in the rear probe or vice versa.

HEATED OXYGEN SENSOR (HO2S) DIAGNOSTIC, 6-CYLINDER ENGINE

HEATED OXYGEN SENSOR (HO2S) DIAGNOSTIC

The front heated oxygen sensor (HO2S) is a linear type and functions with current control. Therefore, it is not possible to measure the signals from the heated oxygen sensor (HO2S) using a multimeter. The rear heated oxygen sensor (HO2S) is a binary type as with earlier heated oxygen sensors (HO2S). The Engine Control Module (ECM) checks the heated oxygen sensors (HO2S) when the conditions for diagnostics have been fulfilled.

There are two sets of front and rear heated oxygen sensors, one for bank 1 and one for bank 2.

Bank 1; cylinder 1, 2, and 3.

Bank 2; cylinder 4, 5, and 6.

The following faults can be registered by the control module:

- **Electrical faults in the circuits** for the heated oxygen sensors (HO2S) and for oxygen sensor preheating.
- **Adaption** The control module checks that the long-term fuel trim is not higher or lower than the pre-defined values.
- **Heated oxygen sensor (HO2S) dynamics.** The control module checks that the changeover period between rich and lean mixtures is not too long.

HEATED OXYGEN SENSOR (HO2S) DIAGNOSTIC, 8-CYLINDER ENGINE

The front heated oxygen sensor (HO2S) is a linear type and functions with current control. Therefore, it is not possible to measure the signals from the heated oxygen sensor (HO2S) using a multimeter. The rear heated oxygen sensor (HO2S) is a binary type as with earlier heated oxygen sensors (HO2S). The Engine Control Module (ECM) checks the heated oxygen sensors (HO2S) when the conditions for diagnostics have been fulfilled.

There are two sets of front and rear heated oxygen sensors, one for bank 1 and one for bank 2.

Bank 1 (front cylinder row); cylinders 1, 3, 5 and 7.

Bank 2 (rear cylinder row, closest to the passenger compartment); cylinders 2, 4, 6 and 8.

The following faults can be registered by the control module:

- **Electrical faults in the circuits** for the heated oxygen sensors (HO2S) and for oxygen sensor preheating.
- **Adaption** The control module checks that the long-term fuel trim is not higher or lower than the pre-defined values.
- **Heated oxygen sensor (HO2S) dynamics.** The control module checks that the changeover period between rich and lean mixtures is not too long.

LEAK DIAGNOSTICS (CERTAIN MARKETS ONLY)

To minimize false detection of leakage, new software has been released for the Engine control module (ECM). The software has been released afterwards, in order of priority, started at the end of 2006.

To check the current software version, use VIDA (Volvo scan tool).

The improved software version makes diagnostics more robust and durable against aging and wear of the leak diagnostic unit. It affects strategies, behavior and to a degree also read off parameters.

- Original version for model year -2004, see: **LEAK DIAGNOSTICS, ORIGINAL VERSION (-2004)**
- Original version for model year 2005-, see: **LEAK DIAGNOSTICS, ORIGINAL VERSION (2005-)**
- Improved version for all model years, see: **LEAK DIAGNOSTICS, IMPROVED VERSION (2002-)**

LEAK DIAGNOSTICS, IMPROVED VERSION (2002-)

Fig. 3: Fuel Tank System Leak Overview
Courtesy of VOLVO CARS CORPORATION

All gases that evaporate from fuel in the fuel tank must be led to and stored in the evaporative emission system (EVAP) canister so that they can be directed into the engine for combustion. In order to detect leakages which cause evaporation of gases into the air, the fuel tank system is diagnosed for leakage. The fuel tank system consists of:

- fuel tank
- the EVAP canister purge valve (1)
- EVAP canister (2)
- leak diagnostic unit (3)
- air cleaner (ACL) (4)
- Roll-over valve (5)
- Float Limit Vent Valve (6)
- fuel filler pipe (7)
- all lines between the above components.

The fuel tank system has a leak diagnostic unit to diagnose any leakage. The leak diagnostic unit pressurizes the fuel tank system when the conditions for leak diagnostics are met.

The control module can detect faults in the function of the leak diagnostic unit and leakage that is 0.5 mm or

greater. Minor leak; leakage greater than 0.5 mm but less than 1.0 mm. Major leak; leakage greater than 1.0 mm.

The leak diagnostic unit consists of a pump and a valve that controls the air flow in the unit. The Engine control module (ECM) checks for leakage in the fuel tank system by measuring the relationship between reached pressure and flow from the leak diagnostic pump during pressurization.

If a certain pressure is not reached with a predetermined supplied flow (with known mass), the Engine control module (ECM) interprets this as a leak from the fuel tank system.

Leak diagnostics starts in normal operation when specific conditions are met, see below. The diagnostics can also be started on command using VIDA (Volvo scan tool) when some of these conditions are ignored.

Conditions for diagnosis

The diagnosis begins when all the following conditions are met.

Note: When diagnostics are started on command using VIDA (Volvo scan tool), certain different conditions apply.

- No diagnostic trouble codes (DTCs) for EVAP valve or atmospheric pressure sensor may be stored.
- The engine is switched off until the engine coolant temperature (ECT) has fallen to a few degrees above the outside temperature, then engine running for at least 10 minutes
- Ignition off
- Vehicle speed 0 km/h.
- Engine coolant temperature (ECT) 4-35°C.
- Maximum altitude of 2500 meters above sea level
- Outside temperature 4-35 °C.
- Fuel volume in the tank between 0-85 %. The engine control module (ECM) ignores these parameters if a diagnostic trouble code (DTC) is stored for the fuel level sensor and the fuel volume cannot be determined.
- Battery voltage between 11-15 V. The voltage must be stable.
- EVAP canister purge valve closed
- Low volume in the canister.
- Fuel tank filler cap locked. Tip. Locking occurs when the vehicle speed exceeds approximately 20 km/h.

Diagnostic phases

The diagnostic is divided into the following phases and is carried out in sequence when all conditions for the diagnostic have been met.

- reference phase
- function test
- checking the fuel tank system

Reference phase

Before the leak diagnostic begins, the control module runs a reference phase for leakage. During the reference phases for leakage that is 0.5 mm, the pump in the leak diagnostic unit pumps ambient air through a 0.5 mm hole and back out to the ambient air. At the same time, the pump in the leak diagnostic unit is monitored and the reference values stored for later use to determine whether the tank system is leaking or not.

If a reference value for the pump is outside its unexpectedly high or low, or deviates too much, diagnostics is cancelled and a DTC is stored.

Function test

After the reference phase, the valve in the leak diagnostic unit is activated and controls the air flow to the fuel tank to pressurize the fuel tank system. This change of air flow will cause the load the pump to fall briefly before the pressure builds up in the fuel tank system. If the load does not change within permitted parameters within a permitted time, diagnostics is cancelled and a DTC is stored.

Checking the tank system, major leak (leak greater than 1.0 mm)

Diagnostics are carried out every time conditions for diagnostics are met.

The leak diagnostic unit pressurizes the fuel tank system and checks for leaks by monitoring the pressure the fuel tank system. The pressure is a calculated pressure, calculated using the measured pump power consumption. If the pressure stabilizes and/or does not exceed 1500 Pa within 450 seconds, this is interpreted as a leak from the fuel tank system. Diagnostics are cancelled and a DTC for major leak is stored.

Checking the fuel tank system, minor leak (leakage greater than 0.5 mm but less than 1.0 mm)

The diagnostic for minor leaks is run every other time that the conditions for the diagnostic are met. Otherwise diagnostics stop after checking for major leaks.

The leak diagnostic unit continues to pressurize the fuel tank system. The Engine control module (ECM) checks for leakage in the fuel tank system by measuring the relationship between reached pressure and flow from the leak diagnostic pump during pressurization. In a sealed system the relationship between these must be linear. Any deviations from the linear relationship are calculated and used to determine how well sealed the tank system is.

A diagnostic trouble code (DTC) is stored if a minor leak is detected within 15 minutes.

LEAK DIAGNOSTICS, ORIGINAL VERSION (-2004)

Fig. 4: Fuel Tank System Overview
Courtesy of VOLVO CARS CORPORATION

All gases that evaporate from fuel in the fuel tank must be led to and stored in the evaporative emission system (EVAP) canister so that they can be directed into the engine for combustion. In order to detect leakages that cause gas to evaporate into the air, the fuel tank system is diagnosed for leakage. The fuel tank system consists of fuel tank, fuel filler pipe (7), EVAP canister (2), EVAP valve (1), air cleaner (4), leak diagnostic unit (3) and all cables between these components. The fuel tank system has a leak diagnostic unit that makes it possible to diagnose any leaks. The unit pressurizes the fuel tank system when the ignition is switched off if the conditions for leak diagnostics are met. The control module can detect faults in the function of the diagnostic unit and leakage that is 0.5 mm (minor leak) or greater (major leak, fuel filler cap missing).

The leak diagnostic unit consists of a pump and a valve that controls the air flow in the unit. The fuel tank system tests for leaks by measuring the power consumption of the pump. The power consumption of the pump corresponds to a certain pressure in the fuel tank system. During diagnosis, the rate at which the pressure can build up is checked, taking into account the quantity of fuel in the tank. The quicker the pressurization the better the fuel tank system is sealed.

Conditions for diagnosis

The diagnosis begins when all the following conditions are met:

- There must be no diagnostic trouble code (DTC) stored for the following components or functions:
  - the power stage for the pump in the leak diagnostic unit

    - the power stage for the valve in the leak diagnostic unit
    - the power stage for the EVAP canister purge valve
    - the EVAP canister purge valve.
- Engine off for at least 5 hours (context), engine running for at least 20 minutes (context)
- Ignition off
- Vehicle speed 0 km/h
- Engine coolant temperature (ECT) +4 °C or higher
- Maximum altitude of 2500 meters above sea level
- Outside temperature between +4 and +35 °C
- Stable signal from the fuel level sensor
- Fuel volume in the tank between 15-85 %
- Battery voltage between 11.0-14.5 V. The voltage must be stable
- EVAP canister purge valve closed
- Low volume in the canister.

Diagnostic phases

The diagnostic is divided into the following phases and is carried out in sequence when all conditions for the diagnostic have been met.

- Reference phase 1
- Function test
- Leak diagnostic.

Reference phase and function test

Fig. 5: Fault Free Fuel Tank System Diagram
Courtesy of VOLVO CARS CORPORATION

(the illustration is a diagram of a fault free fuel tank system) Before the actual leak diagnostic begins, the control module enters a reference phase for leakage and checks the components in the system.

Reference phase 1 and reference phase 2

During the reference phases (1-2) for leakage that is 0.5 mm, the pump in the leak diagnostic unit pumps ambient air through a 0.5 mm hole and back out to the ambient air. At the same time, the power consumption of the pump is measured and stored in the control module (A). The stored value for the power consumption of the pump corresponds to a leakage of 0.5 mm.

Function test

If the value for the power consumption of the pump is too high or low during reference phase1 (1-2), or if the value varies too much during reference phase 1 (1-2), the diagnostic is cancelled and starts again the next time the conditions for the diagnostic are met. Diagnostic trouble code (DTC) ECM-431D, faulty signal, is stored if the diagnostic is cancelled 10 times due to excessive variation in the power consumption of the pump.

After the reference phase, the valve (2) in the leak diagnostic unit is activated and controls the air flow to the fuel tank to pressurize the fuel tank system. This change of air flow will cause the power consumption of the pump to fall briefly before the pressure builds up in the fuel tank system (3). Diagnostic trouble code (DTC) ECM-431D, signal missing, is stored if the value for the power consumption of the pump drops too quickly, too

slowly or not at all.

Leak diagnostic

Fig. 6: Fault Free Fuel Tank System Diagram (Major Leak)
Courtesy of VOLVO CARS CORPORATION

(the illustration is a diagram of a fault free fuel tank system). As long as diagnostic trouble code (DTC) ECM-431D is not stored, the leak diagnostic will be carried out after the reference phase and the function test.

Major leak

(leaks >1.0 mm) The diagnostic for "major leaks" is carried out every other time when the diagnostic conditions are met. The leak diagnostic unit pressurizes the fuel tank system, measures the power consumption of the pump (4) and compares this with a calculated desired value (B). If the measured value does not reach the calculated desired value within a certain amount of time (this time is determined by the fuel level in the tank), the function of the leak diagnostic unit is rechecked by running reference phase 2 again to check that low power consumption has not led to changes in the components. Diagnostic trouble code ECM-400C, major leak, is generated if the power consumption of the pump is OK during reference phase 2.

Diagnostic trouble code (DTC) ECM-4338 (fuel tank filler cap missing) will also be stored and the driver will receive a text message in the Driver Information Module (DIM) when a major leak is detected by the Engine Control Module (ECM).

Minor leak

Fig. 7: Fault Free Fuel Tank System Diagram (Minor Leak)
Courtesy of VOLVO CARS CORPORATION

(leaks >0.5 mm <1.0 mm). The diagnostic for "minor leaks" is carried out every 14th time when the diagnostic conditions are met. The diagnostic for major leaks is always run before the diagnostic for minor leaks. The leak diagnostic unit continues to pressurize the fuel tank system (5). If the measured value (6) is the same or less than the value stored in the reference phase (A) after a certain amount of time (determined by the fuel level in the tank), reference phase 2 (7) is run to ensure that the lower power consumption (6) is not the result of changes in components. If the measured power consumption during the second reference phase (7) is lower than that measured during pressurization (6), the control module interprets this as meaning that the fuel tank system is sealed. Diagnostic trouble code ECM-400C, minor leak, is generated if the measured power consumption from the second reference phase (7) is the same or higher than that measured during pressurization (6).

LEAK DIAGNOSTICS, ORIGINAL VERSION (2005-)

Fig. 8: Fuel Tank System Leak Overview
Courtesy of VOLVO CARS CORPORATION

All gases that evaporate from fuel in the fuel tank must be led to and stored in the evaporative emission system (EVAP) canister so that they can be directed into the engine for combustion. In order to detect leakages which cause evaporation of gases into the air, the fuel tank system is diagnosed for leakage. The fuel tank system consists of:

- fuel tank
- the EVAP canister purge valve (1)
- EVAP canister (2)
- leak diagnostic unit (3)
- air cleaner (ACL) (4)
- Roll-over valve (5)
- Float Limit Vent Valve (6)
- fuel filler pipe (7)
- all lines between the above components.

The fuel tank system has a leak diagnostic unit to diagnose any leakage. The leak diagnostic unit pressurizes the fuel tank system when the ignition is off, if the conditions for diagnosis have been met. The control module can detect faults in the function of the leak diagnostic unit and leakage that is 0.5 mm or greater. Minor leak; leakage greater than 0.5 mm but less than 1.0 mm. Major leak; leakage greater than 1.0 mm.

The leak diagnostic unit consists of a pump and a valve that controls the air flow in the unit. The fuel tank system tests for leaks by measuring the power consumption of the pump. The power consumption of the pump corresponds to a certain pressure in the fuel tank system. During diagnosis, the rate at which the pressure can build up is checked, taking into account the quantity of fuel in the tank. The quicker the pressurization the better the fuel tank system is sealed.

Conditions for diagnosis

The diagnosis begins when all the following conditions are met:

- There must be no diagnostic trouble code (DTC) stored for the following components or functions:
  - the power stage for the pump in the leak diagnostic unit
  - the power stage for the valve in the leak diagnostic unit
  - the power stage for the EVAP canister purge valve
  - the evaporative emission system (EVAP) valve
  - the engine coolant temperature (ECT) sensor
  - speed signal.
- The engine is switched off until the engine coolant temperature (ECT) has fallen to a few degrees above the outside temperature, then engine running for at least 10 minutes
- Ignition off
- Vehicle speed 0 km/h
- Engine coolant temperature (ECT) -5 °C or higher
- Maximum altitude of 2500 meters above sea level.
- Outside temperature between -5 and +35 °C
- Fuel volume in the tank less than 85 %. The engine control module (ECM) ignores these parameters if a diagnostic trouble code (DTC) is stored for the fuel level sensor and the fuel volume cannot be determined
- Battery voltage between 11.0-14.5 V. The voltage must be stable
- EVAP canister purge valve closed
- Low volume in the canister.

Fuel tank filler cap check

The exception from the above conditions is when the car has been refuelled. The engine control module (ECM) starts a check of the fuel tank filler cap after refuelling. This check is a simplified version of the leak diagnostic unit for major leaks. The fuel tank filler cap control is run whilst the vehicle is being driven. This allows the control module to check that the cap has been reinstalled. A diagnostic trouble code (DTC) is stored in the engine control module (ECM) and a text message is displayed in the driver information module (DIM) if the cap is missing.

Diagnostic phases

The diagnostic is divided into the following phases and is carried out in sequence when all conditions for the

diagnostic have been met.

- Reference phase
- Function test
- Leak diagnostics

Reference phase (1-2)

Fig. 9: Fault Free Fuel Tank System Diagram
Courtesy of VOLVO CARS CORPORATION

The illustration is a diagram of a fault free fuel tank system.

Before the leak diagnostic begins, the control module runs a reference phase for leakage. During the reference phase (1-2) for leakage that is 0.5 mm, the pump in the leak diagnostic unit pumps ambient air through a 0.5 mm hole and back out to the ambient air. At the same time, the power consumption (A) of the pump is measured and stored in the control module. The stored value (A) for the power consumption of the pump corresponds to a leakage of 0.5 mm. This value is then used by the engine control module (ECM) to determine the leak status of the fuel tank system.

Function test (1-3)

If the value for the power consumption of the pump is too high or low during the reference phase (1-2), or if the

value varies too much during the reference phase (1-2), the diagnostic is cancelled and starts again the next time the conditions for the diagnostic are met. A diagnostic trouble code (DTC) is stored if the diagnostic is cancelled several time in a row because the power consumption of the pump is varying excessively.

After the reference phase, the valve (2) in the leak diagnostic unit is activated and controls the air flow to the fuel tank to pressurize the fuel tank system. This change of air flow will cause the power consumption of the pump to fall briefly before the pressure builds up in the fuel tank system (3). A diagnostic trouble code is stored if the value for the power consumption of the pump drops too quickly, slowly or not at all.

Leak diagnostic, major leak (leakage greater than 1.0 mm)

Fig. 10: Fault Free Fuel Tank System Diagram (Major Leak)
Courtesy of VOLVO CARS CORPORATION

The diagnostic for "major leaks" is carried out each time when the conditions for the diagnostic are met. The leak diagnostic unit pressurizes the fuel tank system, measures the power consumption of the pump (4) and compares this with a calculated desired value (B). A diagnostic trouble code (DTC) for a major leak is stored if the measured value does not reach the calculated desired value within a certain time (the time is determined by atmospheric pressure and the fuel level in the tank).

Leak diagnostic, minor leak (leakage greater than 0.5 mm but less than 1.0 mm)

The diagnostic for minor leaks is run every other time that the conditions for the diagnostic are met. The diagnostic for major leaks is always run before the diagnostic for minor leaks. The leak diagnostic unit

continues to pressurize the fuel tank system (5-6). After a certain amount of time (the time varies depending on the fuel level in the tank), the engine control module (ECM) checks that the fuel tank system for leaks. This is determined based on:

- time
- the measured reference current consumption of the pump (A)
- the measured power consumption of the pump when the assessment is made
- the shape and character of the current curve during pressurization.

A diagnostic trouble code (DTC) is stored if a minor leak is detected.

MISFIRE DIAGNOSTIC (B8444S)

MISFIRING

If the fuel / air mix does not completely ignite in the combustion chamber, the engine misfires. The engine control module (ECM) detects the misfire by registering deviations in the rotation of the flywheel.

Deviation in flywheel rotation is due to:

- driveline oscillations
  - incorrect fuel / air mixture
  - poor ignition sparking
  - insufficient compression.
- normal variations caused by uneven combustion
  - incorrect fuel / air mixture
  - poor ignition sparking
  - insufficient compression.
- flywheel mechanical tolerances
  - incorrect fuel / air mixture
  - poor ignition sparking
  - insufficient compression.
- misfiring, which is caused by:
  - incorrect fuel / air mixture
  - poor ignition sparking
  - insufficient compression.

DIAGNOSTICS

The mechanical tolerances and oscillations in the drive line disrupt the signal. This makes it difficult to determine if a misfire has occurred or if the detection is incorrect.

The signal from the flywheel is adapted to filter out the irregular rotation. This eliminates the mechanical

variations in the flywheel.

Misfires can be detected by registering the time difference between the intervals and comparing this with the filtered time difference in the flywheel. If the flywheel signal has not been adapted, the diagnostic is active. However this cannot identify misfires as accurately as an adapted flywheel signal. The adaptation is carried out at different loads and engine speed ranges. For the values to be set in the different ranges, the deviation in speed must be within certain fixed limits.

The misfire diagnostic is shut off when certain component faults have been detected by the engine control module (ECM).

"Rough Road" detection (drivetrain oscillations, caused by extremely uneven road surfaces, for example) is not activated on this engine.

DIAGNOSTIC TROUBLE CODE (DTC) MANAGEMENT

Diagnostic trouble codes (DTC) for misfiring will light the malfunction indicator lamp (MIL).

The engine control module (ECM) determines how much the engine is misfiring by counting the number of misfires during a certain number of engine revolutions.

MISFIRE AFFECTING EMISSION LEVELS

If the Engine control module (ECM) detects a number of misfires below 1, 000 engine RPM this is interpreted as misfires affecting emissions. Trouble code is stored and MIL-light is activated. Immediately in connection with engine start, that is, during the engine's first 1, 000 revs after start, the misfire diagnosis is four times as sensitive as later in the driving cycle.

CATALYTIC CONVERTER DAMAGING MISFIRE

If the engine control module (ECM) detects a certain number of misfires during 200 engine revolutions, this is interpreted as misfiring which damages the three-way catalytic converter (TWC). The number of misfires that the engine control module (ECM) allows before interpreting it as misfiring depends on the load and engine speed range. the malfunction indicator lamp (MIL) flashes when the misfire occurs, and shines constantly once the diagnostic trouble code (DTC) is stored.

The engine control module (ECM) does not store specific diagnostic trouble codes (DTCs) for emission or catalytic converter damaging related misfires.

The engine control module (ECM) registers and stores the engine speed and load range and whether the engine is warm or cold when misfiring is detected.

If the misfire stops, the requirements for the engine speed, load parameters and engine temperature must be met without misfiring before the engine control module (ECM) will begin counting down to extinguish the malfunction indicator lamp (MIL) and erase the stored diagnostic trouble codes (DTCs) for misfiring

The number of misfires can be read off.

MISFIRE DIAGNOSTIC (B6324S)

MISFIRE DIAGNOSTIC

Misfiring

If the fuel / air mix does not completely ignite in the combustion chamber, the engine misfires. The engine control module (ECM) detects the misfire by registering deviations in the rotation of the flywheel.

Deviation in flywheel rotation is due to:

- driveline oscillations
  - incorrect fuel / air mixture
  - poor ignition sparking
  - insufficient compression.
- normal variations caused by uneven combustion
  - incorrect fuel / air mixture
  - poor ignition sparking
  - insufficient compression.
- flywheel mechanical tolerances
  - incorrect fuel / air mixture
  - poor ignition sparking
  - insufficient compression.
- misfiring, which is caused by:
  - incorrect fuel / air mixture
  - poor ignition sparking
  - insufficient compression.

Diagnostics

The mechanical tolerances and oscillations in the drive line disrupt the signal. This makes it difficult to determine if a misfire has occurred or if the detection is incorrect.

The signal from the flywheel is adapted to filter out the irregular rotation. This eliminates the mechanical variations in the flywheel.

Misfires can be detected by registering the time difference between the intervals and comparing this with the filtered time difference in the flywheel. If the flywheel signal has not been adapted, the diagnostic is active. However this cannot identify misfires as accurately as an adapted flywheel signal. The adaptation is carried out at different loads and engine speed ranges. For the values to be set in the different ranges, the deviation in speed must be within certain fixed limits.

The misfire diagnostic is shut off when certain component faults have been detected by the engine control module (ECM).

"Rough Road" detection (drivetrain oscillations caused by, for example, extremely uneven roads) is not activated on this engine.

Diagnostic trouble code (DTC) management

Diagnostic trouble codes (DTC) for misfiring will light the malfunction indicator lamp (MIL).

The engine control module (ECM) determines how much the engine is misfiring by counting the number of misfires during a certain number of engine revolutions.

Misfire affecting emission levels

If Engine control module (ECM) detects a certain number of misfires during 1, 000 engine revolutions this is interpreted as misfiring that affects emissions. Fault code is stored and the MIL-light is turned on. Directly in connection with engine start, that is, during the engine's first 1, 000 revs after start, the misfiring diagnosis is four times as sensitive as later in the driving cycle.

Catalytic converter damaging misfire

If the engine control module (ECM) detects a certain number of misfires during 200 engine revolutions, this is interpreted as misfiring which damages the three-way catalytic converter (TWC). The number of misfires that the engine control module (ECM) allows before interpreting it as misfiring depends on the load and engine speed range. the malfunction indicator lamp (MIL) flashes when the misfire occurs, and shines constantly once the diagnostic trouble code (DTC) is stored.

The engine control module (ECM) does not store specific diagnostic trouble codes (DTCs) for emission or catalytic converter damaging related misfires.

The engine control module (ECM) registers and stores the engine speed and load range and whether the engine is warm or cold when misfiring is detected.

If the misfire stops, the requirements for the engine speed, load parameters and engine temperature must be met without misfiring before the engine control module (ECM) will begin counting down to extinguish the malfunction indicator lamp (MIL) and erase the stored diagnostic trouble codes (DTCs) for misfiring

The number of misfires can be read off.

MISFIRE DIAGNOSTIC (B5254T2; B6294T)

If the fuel / air mixture does not ignite completely in the ignition stroke the engine is misfiring. The engine control module (ECM) detects the misfire by registering deviations in the rotation of the flywheel.

Deviation in flywheel rotation is due to:

- Driveline oscillations
    - Incorrect fuel / air mixture
    - Poor ignition spark

    - Insufficient compression.
- Normal variations caused by uneven combustion
    - Incorrect fuel / air mixture
    - Poor ignition spark
    - Insufficient compression.
- Flywheel mechanical tolerances
    - Incorrect fuel / air mixture
    - Poor ignition spark
    - Insufficient compression.
- Misfire, caused by
    - Incorrect fuel / air mixture
    - Poor ignition spark
    - Insufficient compression.

Diagnostics

The mechanical tolerances and oscillations in the drive line disrupt the signal. This makes it difficult to determine if a misfire has occurred or if the detection is incorrect.

The signal from the flywheel is adapted to filter out the irregular rotation. This eliminates the mechanical variations in the flywheel.

Two camshaft revolutions are divided into five intervals for 5 cylinder engines and six intervals for 6 cylinder engines.

Misfires can be detected by registering the time difference between the intervals and comparing this with the filtered time difference in the flywheel. If the flywheel signal has not been adapted, the diagnostic is active. However this cannot identify misfires as accurately as an adapted flywheel signal. The adaptation is carried out at different loads and engine speed ranges. For the values to be set in the different ranges, the deviation in rotation must be within certain fixed limits.

Drive line oscillation, caused by uneven road surfaces for example, may lead to uneven engine operation. Drive line oscillations are registered by the accelerator in the brake control module (BCM) which sends this information to the engine control module (ECM).

The misfire diagnostic is shut off when:

- The brake control module (BCM) transmits information to the engine control module (ECM) about driveline oscillations
- A fault has been detected by the engine control module (ECM) in the engine speed (RPM) sensor, mass air flow (MAF) sensor or engine coolant temperature (ECT) sensor
- When one of the DSTC (Dynamic stability and traction control), traction control or Anti-lock Brake Systems (ABS) are active.

The following applies from model year 2005-

The injector for that cylinder will be disabled if the engine control module (ECM) detects misfiring in a cylinder. This will cut the fuel supply to the cylinder.

Diagnostic trouble code (DTC) management

The engine control module (ECM) determines how much the engine is misfiring by counting the number of misfires during a certain number of engine revolutions. If the engine control module (ECM) detects a particular number of misfires below 1000 RPM it is interpreted as emission related misfires. If the misfires exceed a certain value during 200 engine revolutions, this is interpreted as misfiring which damages the three-way catalytic converter (TWC).

Diagnostic trouble codes (DTC) for misfiring will light the malfunction indicator lamp (MIL). If there is risk of damage to the three way catalytic converter, the malfunction indicator lamp (MIL) will flash during misfiring and then switch to a constant light.

The engine control module (ECM) registers and stores the RPM and load ranges within which the misfire occurred. For the diagnostic trouble code (DTC) to be stored, the misfire must occur a further two times within the same RPM and load ranges.

In the event of emissions related misfiring, the malfunction indicator lamp (MIL) lights during the second operating cycle and a diagnostic trouble code (DTC) is stored.

If the misfire stops, the requirements for the RPM and load ranges must be met without misfiring before the engine control module (ECM) will begin counting down to extinguish the warning lamp and erase the stored diagnostic trouble codes (DTCs) for misfiring.

OIL LEVEL SENSOR, DIAGNOSTICS

General

The engine control module (ECM) can diagnose the oil level sensor. A diagnostic trouble code (DTC) will be stored if an internal fault is detected in the oil level sensor or if there is an open-circuit or a short-circuit to ground or voltage in its wiring connectors. A diagnostic trouble code (DTC) will also be stored if the oil level is too low or high or if the oil level drops rapidly over a certain time (leakage).

The pulse ratio of all the oil level sensor pulses in a pulse train must be within the normal operating range of 17-83 %. If this is exceeded, a diagnostic trouble code (DTC) will be stored in the engine control module (ECM).

HINT: Extremely diluted engine oil can result in a diagnostic trouble code (DTC) for the oil level being stored in the engine control module (ECM).

OVERVIEW

GENERAL INFORMATION

The engine control module (ECM) diagnoses both internal signals and functions as well as signals and functions

from connected components.

CONDITIONS FOR DIAGNOSIS

For the diagnosis of a component or function to start, certain specific conditions must be met. The conditions for diagnostics vary depending on the component or function being diagnosed.

Conditions must be met during the diagnostic in order for the diagnostic to be completed. The time and conditions for the diagnostic vary depending on the component or function being diagnosed. Certain diagnostics only require the ignition to be switched on and off for a diagnostic to be run. Other diagnostics require that several different conditions are met. For example:

- vehicle speed
- engine coolant temperature (ECT)
- time since start
- different load and engine speed relationships in the same trip
- a certain event (for example the evaporative emission system (EVAP) valve is operating).

When the engine control module (ECM) has run all the implemented diagnostics, the control module has completed a "trip". An extensive driving schedule in various conditions is required to complete a trip. The engine may also need to be shut off for a certain amount of time and then switched on again to complete a trip.

EMISSION-RELATED DIAGNOSTIC FUNCTIONS

The engine control module (ECM) checks that the emission-related systems are working. These systems are checked by running a diagnostic function. The diagnostic function checks the components and that the system is functioning.

DIAGNOSTIC TROUBLE CODE MEMORY

When the engine control module (ECM) detects a fault, the diagnostic trouble code (DTC) and status are stored in the diagnostic trouble code (DTC) memory and are now visible at normal diagnostic trouble code (DTC) read out. If the diagnostic trouble code (DTC) lights the malfunction indicator lamp (MIL) this occurs at the same time. If an existing fault disappears and does not recur, the engine control module, after a certain number of fault-free operating cycles and depending on the DTC, changes the status of the diagnostic trouble code (DTC). This means that it can no longer be read off at normal DTC read out. In this status, the diagnostic trouble code (DTC) remains until the engine control module (ECM) erases diagnostic trouble code (DTC) or is disconnected from power.

SUBSTITUTE VALUE

For certain types of diagnostic trouble codes (DTCs), the missing signal is replaced with a substitute value so that the system can continue functioning.

THREE-WAY CATALYTIC CONVERTER (TWC) DIAGNOSTICS (B8444S)

The three-way catalytic converter (TWC) stores oxygen from the exhaust gases and uses it to make toxic gases

more environmentally friendly. The catalytic converter is a 3 way catalytic converter in which HC (hydrocarbons) and CO (carbon monoxide) are oxidized and NO_x (nitrous oxide) is reduced. As the three-way catalytic converter (TWC) ages, its ability to store oxygen is reduced. The conversion capacity of the three-way catalytic converter (TWC) is reduced and unburned residue which is harmful to environment is released. To reduce the environmentally damaging emissions, the engine control module (ECM) checks the efficiency of the three-way catalytic converter (TWC). In brief, this check is carried out as follows.

To be able to check the catalytic converter, two heated oxygen sensors are used; one heated oxygen sensor in front of the catalytic converter in the engine compartment (front heated oxygen sensor) and a heated oxygen sensor after the catalytic converter in the engine compartment (rear heated oxygen sensor). After the rear heated oxygen sensor there is another catalytic converter, located at the front end of the propeller shaft tunnel under the vehicle's floor. However, this catalytic converter is not monitored.

The main function of the heated oxygen sensors is to measure the oxygen content in the exhaust gases so that the engine control module (ECM) can maintain the fuel/air mixture at around lambda=1. This mixture allows for optimum catalytic conversion.

NOTE: **On this version there are two banks on the engine's exhaust side, each one with catalytic converters and heated oxygen sensors according to the above description.**

To evaluate the efficiency of the three-way catalytic converter (TWC) one uses a deviation added to the lambda signal.

This means that 8 to 15 minutes after the engine is started (depending on the market) catalytic converter diagnostics start.

The process is as follows:

A deviation is added to the lambda signal and the engine control module (ECM) is allowed to correct this.

The deviation switches between positive and negative values so that the fuel/air mixture switches between rich and lean.

A counter registers the number of switches occurring while the diagnostic is taking place.

If the rear heated oxygen sensor registers a large number of switches exceeding a parameter, a diagnostic trouble code (DTC) for three-way catalytic converter (TWC) efficiency will be stored.

If the parameter is not exceeded the three-way catalytic converter (TWC) is deemed to be operating well.

NOTE: **In a poorly operating way catalytic converter the switches caused by the deviation will quickly exceed the parameter. This is because the exhaust gases in principle pass straight through the catalytic converter without being cleaned. If the catalytic converter is operating well the switches will be slower as it takes a longer time for the variations to make themselves felt.**

There are two catalytic converters, one for bank 1 and one for bank 2.

Bank 1 (front cylinder row); cylinders 1, 3, 5 and 7.

Bank 2 (rear cylinder row, closest to the passenger compartment); cylinders 2, 4, 6 and 8.

THREE-WAY CATALYTIC CONVERTER (TWC) DIAGNOSTICS (B6324S)

THREE-WAY CATALYTIC CONVERTER (TWC) DIAGNOSTICS

The three-way catalytic converter (TWC) stores oxygen from the exhaust gases and uses it to make toxic gases more environmentally friendly. The catalytic converter is a 3 way catalytic converter in which HC (hydrocarbons) and CO (carbon monoxide) are oxidized and NO_x (nitrous oxide) is reduced. As the three-way catalytic converter (TWC) ages, its ability to store oxygen is reduced. The conversion capacity of the three-way catalytic converter (TWC) is reduced and unburned residue which is harmful to environment is released. To reduce the environmentally damaging emissions, the engine control module (ECM) checks the efficiency of the three-way catalytic converter (TWC). In brief, this check is carried out as follows.

Two heated oxygen sensors are used to control the catalytic converter; one heated oxygen sensor in front of the catalytic converter in the engine compartment (front heated oxygen sensor) and one heated oxygen sensor after the catalytic converter in the engine compartment (rear heated oxygen sensor). After the rear heated oxygen sensor there is another catalytic converter, located at the front of the propeller shaft tunnel under the vehicle's floor. However, this catalytic converter is not monitored.

The main function of the heated oxygen sensors is to measure the oxygen content in the exhaust gases so that the engine control module (ECM) can maintain the fuel/air mixture at around lambda=1. This mixture allows for optimum catalytic conversion.

NOTE: On this version there are two banks on the engine's exhaust side, each with a set of catalytic converters and heated oxygen sensors as described above.

To evaluate the efficiency of the three-way catalytic converter (TWC) one uses a deviation added to the lambda signal.

This means that 8 to 15 minutes after the engine is started (depending on the market) catalytic converter diagnostics start.

The process is as follows:

A deviation is added to the lambda signal and the engine control module (ECM) is allowed to correct this.

The deviation switches between positive and negative values so that the fuel/air mixture switches between rich and lean.

A counter registers the number of switches occurring while the diagnostic is taking place.

If the rear heated oxygen sensor registers a large number of switches exceeding a parameter, a diagnostic

trouble code (DTC) for three-way catalytic converter (TWC) efficiency will be stored.

If the parameter is not exceeded the three-way catalytic converter (TWC) is deemed to be operating well.

NOTE: **In a poorly operating three-way catalytic converter (TWC) the switches caused by the deviation will quickly exceed the parameter. This is because the exhaust gases in principle pass straight through the three-way catalytic converter (TWC) without being cleaned. If the three-way catalytic converter (TWC) is operating well the switches will be slower as it takes a longer time for the variations to make themselves felt.**

There are four catalytic converters, two for bank 1 and two for 2.

Bank 1; cylinder 1, 2, and 3.

Bank 2; cylinder 4, 5, and 6.

ENGINE PERFORMANCE

General - Overhaul instructions

THREADS (2003-2012)

THREADS

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

THREAD INSERTS, GENERAL

Fig. 1: Identifying Helicoil Thread Inserts
Courtesy of VOLVO CARS CORPORATION

Damaged threads can in most cases be reconditioned using HELICOIL thread inserts.

Thread inserts are available in a variety of sizes, pitches and lengths. A correctly reconditioned thread will generally increase the strength of a joint.

DESIGNATION OF THREAD INSERT

Fig. 2: Measuring Old Threads And Thread Length In Hole
Courtesy of VOLVO CARS CORPORATION

Measure the old threads and thread length in the hole.

A: Thread.

B: Thread length.

DRILLING AND TAPPING NEW THREAD IN THE HOLE

Fig. 3: Drilling And Tapping New Thread In Hole
Courtesy of VOLVO CARS CORPORATION

Drill out the old threads using the correct diameter drill bit. Blow the hole clean.

Tap the new thread using the correct tap.

NOTE: The thread taps referred to in the text are specially made for use with the HELI-COIL system.

Use methylated spirit or similar to lubricate the threading operation in aluminum. Thread longer threads in stages, backing out the tap and blowing the tap and the hole clean in between.

Thread the hole to the proper depth (or through if it is to be threaded throughout).

C: drill depth.

D: cutting phase.

TOOLS REQUIRED FOR INSTALLATION

Fig. 4: Identifying Installation Tool
Courtesy of VOLVO CARS CORPORATION

The installation tool (illustrated) is used for threads **M6 - M14** . During some operations the tool must be disassembled by removing the locking ring, for example with countersunk threads.

For threads **M16** and larger the specific tool for each thread size must be used The guide and mandrel are included.

INSTALLING THE THREAD INSERT IN THE INSTALLATION TOOL

Fig. 5: Identifying Tang, Guide, And Mandrel
Courtesy of VOLVO CARS CORPORATION

Locate the thread insert with the tang facing down in the tool.

Turn the spindle until the tang engages in the recess.

Screw the thread insert into the guide, do not apply pressure, until the first turn of the thread insert is flush with the guide opening.

A: Tang.

B: Guide.

C: Mandrel.

INSTALLATION OF THREAD INSERT

Fig. 6: Installation Of Thread Insert
Courtesy of VOLVO CARS CORPORATION

Hold the installation tool straight above and centered over the hole. Screw in the insert without applying pressure on the spindle handle. Screw in until the end of the insert reaches at least half a thread revolution into the thread.

The insert must not touch the bottom of the hole or stick out of the other side if it is a through hole.

Break off the tang with the proper tang breaker. For **M14** threads and coarser, use a pair of flat-nosed pliers or similar and break downwards.

EXTRACTION OF DAMAGED THREAD INSERT

Fig. 7: Filing Notch In Thread Insert
Courtesy of VOLVO CARS CORPORATION

Alternative 1

File a notch in the thread insert, about a quarter turn in from the end. Do not file through the insert.

NOTE: Do not damage the thread in the material.

Use a triangular scraper or similar to extract the insert by rotating it.

Alternative 2

Carefully expose the end of the thread insert. Use flat-nose pliers to pull the thread insert out.

Clean out the threads in the hole using the thread tap and blow clean.

Install a new thread insert.

RECONDITIONING SPARKPLUG THREADS

NOTE: Reconditioning of spark plug threads must be carried out with removed cylinder head.

TAPPING THREAD IN SPARKPLUG HOLE

Fig. 8: Identifying Tap, Reamer, And Steering
Courtesy of VOLVO CARS CORPORATION

Use combination tap 998 5823-5 and thread repair inserts for spark plug thread **M14x1, 25** .

NOTE: Do not drill out spark plug threads.

Combined tap

A: Tap.

B: Reamer.

C: Steering.

INSTALLATION OF THREAD INSERT

Fig. 9: Installing Thread Insert
Courtesy of VOLVO CARS CORPORATION

There are times when the cap nut cannot be used because of space restrictions. On these occasions the guide should be taped into place.

NOTE: **As the thread insert for the spark plug thread is thinner (finer) than usual it is extra important to not pressure on the pin when inserting the thread insert (both in the nozzle and the material).**

Twist the thread insert down and check that the upper thread is at least a half thread down into the thread and that none of the insert protrudes into the combustion chamber.

If the insert has been screwed in too far it must be turned until it is all the way through. If it is not deformed it can be inserted again.

Break off the tang with a pair of flat nose pliers. Check the thread. Install a sparkplug.

THREAD TABLE

Values in mm		
Thread dimension	**Drill - diameter**	**Examples of areas of**

		use
M6x1	6.3	Oil pump
M7x1	7.3	Sump to cylinder block, Intermediate section to cylinder block, Water pump to cylinder block
M8x1.25	8.4	Studs at the exhaust ports
M10x1.5	10.5	Intermediate section to cylinder block, Gearbox to engine
M12x1.5	12.5	
M14x1.25		Spark plugs
M14x1.5	14.2	Oil pressure switch. Oil pressure outlet engine / turbocharger unit.
M18x1.5	18.5	Oil drain plug in the sump.

THREADS WHICH MUST NOT BE RECONDITIONED

Coolant outlet for the drain nipple, heat exchanger / oil cooler.

Plug hole for crankshaft setting.

Screw holes for cylinder head screws.

FLANGED JOINT

Power transmission

FLANGED JOINT

FLANGED JOINT, ASSEMBLING

CHECK

CONDITIONS

All mating surfaces must be thoroughly cleaned.

Always replace gaskets, nuts and screws with **new** ones.

Always use those components shown in the replacement parts range for the relevant area.

CHECK

Always ensure:

- that there are not cracks or other damage at the mating surfaces which could result in leakage
- that all threads are working correctly
- that the gasket faces are flat.

Always remedy if necessary

PROCEDURE

Always use the listed tightening torques.

Always use copper paste **1161 408** where indicated in the method.

Always follow the listed procedure for tightening torques and, where applicable, angle-tightening.

GENINFO

Power transmission

GENINFO

SCREWED JOINT, TORQUE/ANGLE TIGHTENING

Special tools:

see **9512050**

SCREWED JOINT

There are a great number of torque spanner systems available on the market where the spanner grip can be replaced with other types. These wench grips are normally ideally suited to torque tightening screwed joints in poorly accessible places.

There may be occasions when torque tightening of a screwed joint must be followed by angle tightening and space does not allow the use of protractor (part number see **9512050**). In these cases, use either a nut, a screw head or a tool. These are usually hexagonal and each corner is **60°** . If there are twelve edges, each corner is **30°** .

Fig. 1: Identifying Marked Nut

Courtesy of VOLVO CARS CORPORATION

To angle tighten, mark the material and nut for example as shown in the illustration and then tighten so that the markings are opposite each other.

GENERAL INFORMATION

Power transmission

TRANSMISSION

TRANSAXLE OIL (TF-80SC AND TF-80SC AWD)

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

WARNING: **Avoid skin contact with the transmission oil.**

CAUTION: **Use only transmission oil, Volvo part no. 116 1540-8 (1litre container), 116 1640-6 (4 liter container).**

CONDITIONS

CHANGING THE OIL

The capacity of the transmission is **7.65± 0.15** liters. (MAX, MIN).

NOTE: **This volume applies to a completely new transmission that has never been filled before.**

The oil should be replaced only in the two following instances:

Where diagnostic trouble codes (DTCs) TCM 0042 and TCM 0046 are stored, in which case the diagnostic function activates the warning lamp in the following circumstances.

The transmission control module (TCM) receives data about the operating temperature of the transmission fluid while the vehicle is being driven. TCM 0042 is stored after an accumulated amount of time.

Diagnostic trouble code (DTC) TCM 0046 is stored if the transmission fluid temperature has exceeded 150 °C for more than 2 minutes.

On vehicles used in continuous taxi service and / or used to tow a trailer or caravan for most of its mileage, the oil should be changed according to the service program.

WARNING: **The oil may be very hot if the vehicle has just been driven. Avoid skin contact.**

DRAINING OIL

Fig. 1: Draining Off Oil
Courtesy of VOLVO CARS CORPORATION

Remove:

- the splash guard under the engine
- the oil plug. Drain the oil into a container.

Tighten the plug. See: **TIGHTENING TORQUE** .

The splashguard under the engine is installed later when the work is complete.

CONNECTING HOSES

Fig. 2: Identifying Oil Line, Hose And Transparent Plastic Hose
Courtesy of VOLVO CARS CORPORATION

Remove the oil line (1) between the transmission cover and the oil cooler.

HINT: The quick-release connectors for the oil line are detached by pressing the clutch housing towards the cover/oil cooler. Hold the connection housing in this position. Pull back the lugs on the connection housing. Pull the connector off the cover/oil cooler.

Connect a hose (2) to the return pipe sleeve connector on the cover. This hose is used to fill with oil.

Install a transparent plastic hose (3) on the oil cooler connecting sleeve, which runs down into a container.

FILLING WITH TRANSMISSION FLUID

Apply the parking brake. Move the gear selector lever to position P.

Fill approximately 2 liters of oil through the hose connected to the transmission cover.

Start the engine. Allow the engine to idle so that the oil pump for the transmission pumps out the oil. Turn the engine off when air bubbles start to become visible in the hose.

Fill approximately 2 liters of oil again as described above. Start the engine again. Allow the engine to idle so that the oil pump for the transmission pumps out the oil. Turn the engine off when air bubbles start to become

visible in the hose.

FURTHER FILLING OF TRANSMISSION OIL

Fig. 3: Identifying Oil Line, Hose And Transparent Plastic Hose
Courtesy of VOLVO CARS CORPORATION

Fill approximately 2 liters of oil through the hose connected to the transmission cover.

Remove the hoses from the oil cooler and the transmission cover.

Connect the oil line between the oil cooler and the transmission cover.

CHECKING THE OIL LEVEL

Check the oil level. See: **TRANSMISSION OIL LEVEL - CHECKING** .

NOTE: After changing the transmission oil, the transmission oil change counter must be reset. See RESETTING TRANSMISSION FLUID CHANGE COUNTER .

TRANSPORTATION EQUIPMENT (2003-06)

REMOVING THE BATTERY ISOLATOR

NOTE: **The graphics in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the graphics is always correct.**

GENERAL INFORMATION ABOUT HANDLING BATTERY ISOLATORS

NOTE: **The following applies only to cars with alarms: if the car needs to be locked when the battery isolator is installed, wait for 30 seconds before mechanically locking the car. The remote control cannot be used. If the car is locked too quickly, the siren is activated when the battery isolator disconnects the battery.**

The battery isolator must be returned and reused several times.

CAUTION: The battery isolator is fragile. Handle carefully

REMOVING THE BATTERY ISOLATOR

Fig. 1: Battery Isolator Cables
Courtesy of VOLVO CARS CORPORATION

Remove:

- the panel in front of the rear electronic module (REM)
- the yellow cable (1) for the battery isolator from the rear electronic module (REM)
- the red cable (2) for the battery isolator from the battery positive terminal.

Fig. 2: Battery Isolator And Negative Lead
Courtesy of VOLVO CARS CORPORATION

Remove:

- the battery negative lead (1) from the battery isolator
- the battery isolator (2) from the battery negative terminal
- the cables from the battery isolator and discard them.

Fig. 3: Battery Brackets
Courtesy of VOLVO CARS CORPORATION

Applies to the XC90:

Connect the battery negative lead to the battery negative terminal. Tighten to **6 ± 1.5 Nm** .

Place the protective cover over the battery. Position the bracket over the cover. Secure the bracket using the two screws and the nut. Tighten to **25 Nm** .

Fig. 4: Rear Storage Compartment
Courtesy of VOLVO CARS CORPORATION

Applies to the XC90:

Reinstall the panel in front of the rear electronic module (REM) and the block at the foot of the panel.

Position the winder handle for the jack.

Install the storage compartment and floor hatch.

RETURNING THE BATTERY ISOLATOR

Return the battery isolator to the following address:

USA

Volvo Cars of North America, Inc.

Technical Material Analysis Dept.

6 Volvo Drive Bldg. C

Rockleigh, NJ 07647

Canada:

Volvo Cars of Canada Ltd.

Technical Material Analysis Dept.

175 Gordon Baker Rd.

North York, Ontario, M2H 2N7

Other:

	Loudspeaker right rear. Signal too high

ACCESSORY USB UNIT (AUU) DTCS

ACCESSORY USB UNIT (AUU) - DTC INDEX

DTC	Description
AUU-0001	Battery Voltage. Algorithm Based Failures
AUU-0002	Control Module. System Programming Failures

BRAKE CONTROL MODULE (BCM) DTCS

BRAKE CONTROL MODULE (BCM) - DTC INDEX

DTC	Description
BCM-C002001	ABS pump motor control. General malfunction information. General electrical malfunction (B6324S)
BCM-C002001	ABS pump motor control. General malfunction information. General electrical malfunction (B8444S)
BCM-C00201C	ABS pump motor control. General electrical malfunction. Incorrect voltage (B6324S)
BCM-C00201C	ABS pump motor control. General electrical malfunction. Incorrect voltage (B8444S)
BCM-C002071	ABS pump motor control. Mechanical malfunction. Jammed (B6324S)
BCM-C002071	ABS pump motor control. Mechanical malfunction. Jammed (B8444S)
BCM-C002201	Brake servo solenoid. General malfunction information. General electrical malfunction (B6324S)
BCM-C002201	Brake servo solenoid. General malfunction information. General electrical malfunction (B8444S)
BCM-C003007	Toothed wheel left front. General malfunction information. Mechanical malfunction (B6324S)
BCM-C003007	Toothed wheel left front. General malfunction information. Mechanical malfunction (B8444S)
BCM-C003101	Wheel speed sensor left front. General malfunction information. General electrical malfunction (B6324S)
BCM-C003101	Wheel speed sensor left front. General malfunction information. General electrical malfunction (B8444S)
BCM-C003107	Wheel speed sensor left front. General malfunction information. Mechanical malfunction (B6324S)
BCM-C003107	Wheel speed sensor left front. General malfunction information. Mechanical malfunction (B8444S)
BCM-C003701	Wheel speed sensor left rear. General malfunction information. General electrical malfunction (B6324S)

BCM-C003701	Wheel speed sensor left rear. General malfunction information. General electrical malfunction (B8444S)
BCM-C004064	Brake pedal switch "A". Algorithm error. Signal outside permitted range (B6324S)
BCM-C004064	Brake pedal switch "A". Algorithm error. Signal outside permitted range (B8444S)
BCM-C004401	Brake pressure sensor "A". General malfunction information. General electrical malfunction (B6324S)
BCM-C004401	Brake pressure sensor "A". General malfunction information. General electrical malfunction (B8444S)
BCM-C004664	Brake pressure sensor "A"/"B". Algorithm error. Signal outside permitted range (B6324S)
BCM-C004664	Brake pressure sensor "A"/"B". Algorithm error. Signal outside permitted range (B8444S)
BCM-C004801	Pedal position sensor. General malfunction information. General electrical malfunction (B6324S)
BCM-C004801	Pedal position sensor. General malfunction information. General electrical malfunction (B8444S)
BCM-C004864	Pedal position sensor. Algorithm error. Signal outside permitted range (B6324S)
BCM-C004864	Pedal position sensor. Algorithm error. Signal outside permitted range (B8444S)
BCM-C006101	Acceleration sensor lateral. General malfunction information. General electrical malfunction (B6324S)
BCM-C006101	Acceleration sensor lateral. General malfunction information. General electrical malfunction (B8444S)
BCM-C006128	Acceleration sensor lateral. General signal error. Signal displacement error/zero adjustment error (B6324S)
BCM-C006128	Acceleration sensor lateral. General signal error. Signal displacement error/zero adjustment error (B8444S)
BCM-C006164	Acceleration sensor lateral. Algorithm error. Signal outside permitted range (B6324S)
BCM-C006164	Acceleration sensor lateral. Algorithm error. Signal outside permitted range (B8444S)
BCM-C006A01	Multi-axial acceleration sensor. General malfunction information. General electrical malfunction (B6324S)
BCM-C006A01	Multi-axial acceleration sensor. General malfunction information. General electrical malfunction (B8444S)
BCM-C006A04	Multi-axial acceleration sensor. General malfunction information. Internal error (B6324S)
BCM-C006A04	Multi-axial acceleration sensor. General malfunction information. Internal error (B8444S)
BCM-C006A16	Multi-axial acceleration sensor. General electrical malfunction. Voltage too low (B6324S)

BCM-C006A16	Multi-axial acceleration sensor. General electrical malfunction. Voltage too low (B8444S)
BCM-C006A17	Multi-axial acceleration sensor. General electrical malfunction. Voltage too high (B6324S)
BCM-C006A17	Multi-axial acceleration sensor. General electrical malfunction. Voltage too high (B8444S)
BCM-C006B00	Stability system active too long. General malfunction information. No information on malfunction type (B6324S)
BCM-C006B00	Stability system active too long. General malfunction information. No information on malfunction type (B8444S)
BCM-C007200	Brake temperature too high. General malfunction information. No information on malfunction type (B6324S)
BCM-C007200	Brake temperature too high. General malfunction information. No information on malfunction type (B8444S)
BCM-C008204	Brake system malfunction indicator. General malfunction information. Internal error (B6324S)
BCM-C008204	Brake system malfunction indicator. General malfunction information. Internal error (B8444S)
BCM-C008216	Brake system malfunction indicator. General electrical malfunction. Voltage too low (B6324S)
BCM-C008216	Brake system malfunction indicator. General electrical malfunction. Voltage too low (B8444S)
BCM-C008217	Brake system malfunction indicator. General electrical malfunction. Voltage too high (B6324S)
BCM-C008217	Brake system malfunction indicator. General electrical malfunction. Voltage too high (B8444S)
BCM-C008249	Brake system malfunction indicator. Internal error. Electrical malfunction (B6324S)
BCM-C008249	Brake system malfunction indicator. Internal error. Electrical malfunction (B8444S)
BCM-C110668	Communication between control modules. Algorithm error. Event-controlled information (B6324S)
BCM-C110668	Communication between control modules. Algorithm error. Event-controlled information (B8444S)
BCM-C110687	Communication between control modules. Bus/message error. Message missing (B6324S)
BCM-C110687	Communication between control modules. Bus/message error. Message missing (B8444S)
BCM-C110768	Communication between control modules. Algorithm error. Event-controlled information (B6324S)
BCM-C110768	Communication between control modules. Algorithm error. Event-controlled information (B8444S)
BCM-C110787	Communication between control modules. Bus/message error. Message missing (B6324S)

BCM-C110787	Communication between control modules. Bus/message error. Message missing (B8444S)
BCM-C110801	Voltage feed sensor. General malfunction information. General electrical malfunction (B6324S)
BCM-C110801	Voltage feed sensor. General malfunction information. General electrical malfunction (B8444S)
BCM-C111154	AYC sensor. Programming error. Calibration missing (B6324S)
BCM-C111154	AYC sensor. Programming error. Calibration missing (B8444S)
BCM-C111301	Hydraulic valves. General malfunction information. General electrical malfunction (B6324S)
BCM-C111301	Hydraulic valves. General malfunction information. General electrical malfunction (B8444S)
BCM-C111495	Inclination sensor. Component malfunction. Incorrect assembly (B6324S)
BCM-C111495	Inclination sensor. Component malfunction. Incorrect assembly (B8444S)
BCM-C111542	Control module. Internal malfunction. General memory error (B6324S)
BCM-C111542	Control module. Internal malfunction. General memory error (B8444S)
BCM-C11164A	Factory test DSTC. Internal malfunction. Incorrect component (B6324S)
BCM-C11164A	Factory test DSTC. Internal malfunction. Incorrect component (B8444S)
BCM-C111768	Stability function. Algorithm error. Event-controlled information (B6324S)
BCM-C111768	Stability function. Algorithm error. Event-controlled information (B8444S)
BCM-C111802	Brake servo disengage switch. General malfunction information. General signal error (B6324S)
BCM-C111802	Brake servo disengage switch. General malfunction information. General signal error (B8444S)
BCM-U000100	HS-CAN communication bus. General malfunction information. No information on malfunction type (B6324S)
BCM-U000100	HS-CAN communication bus. General malfunction information. No information on malfunction type (B8444S)
BCM-U010000	Failed communication with the Engine Control Module (ECM). General malfunction information. No information on malfunction type (B6324S)
BCM-U010000	Failed communication with the Engine Control Module (ECM). General malfunction information. No information on malfunction type (B8444S)
BCM-U011400	Failed communication with differential electronic module (DEM). General malfunction information. No information on malfunction

	type
BCM-U011400	Failed communication with differential electronic module (DEM). General malfunction information. No information on malfunction type (B6324S)
BCM-U011400	Failed communication with differential electronic module (DEM). General malfunction information. No information on malfunction type (B8444S)
BCM-U012587	Failed communication with multi-axial acceleration sensor module. Bus/message error. Message missing (B6324S)
BCM-U012587	Failed communication with multi-axial acceleration sensor module. Bus/message error. Message missing (B8444S)
BCM-U012588	Failed communication with multi-axial acceleration sensor module. Bus/message error. Open circuit (B6324S)
BCM-U012588	Failed communication with multi-axial acceleration sensor module. Bus/message error. Open circuit (B8444S)
BCM-U012600	Failed communication with steering angle sensor module (SAS). General malfunction information. No information on malfunction type (B6324S)
BCM-U012600	Failed communication with steering angle sensor module (SAS). General malfunction information. No information on malfunction type (B8444S)
BCM-U030000	Internal software incompatible with the control module. General malfunction information. No information on malfunction type (B6324S)
BCM-U030000	Internal software incompatible with the control module. General malfunction information. No information on malfunction type (B8444S)
BCM-U030046	Control module incompatible internal software. Internal error. Defective calibration / parameter memory (B6324S)
BCM-U030046	Control module incompatible internal software. Internal error. Defective calibration / parameter memory (B8444S)
BCM-U030087	Control module incompatible internal software. Bus/message error. Message missing (B6324S)
BCM-U030087	Control module incompatible internal software. Bus/message error. Message missing (B8444S)
BCM-U040164	Invalid data received from engine control module (ECM). Algorithm error. Signal outside permitted range (B6324S)
BCM-U040164	Invalid data received from engine control module (ECM). Algorithm error. Signal outside permitted range (B8444S)
BCM-U040482	Invalid data received from transmission control module (TCM). Bus/message error. Sequence counter not correct or not updated (B6324S)
BCM-U040482	Invalid data received from transmission control module (TCM). Bus/message error. Sequence counter not correct or not updated (B8444S)

BCM-U041464	Invalid data received from connection differential electronic module (DEM). Algorithm error. Signal outside permitted range (B6324S)
BCM-U041464	Invalid data received from connection differential electronic module (DEM). Algorithm error. Signal outside permitted range (B8444S)
BCM-U042829	Invalid data received from steering angle sensor module (SAS). General signal error. Signal invalid (B6324S)
BCM-U042829	Invalid data received from steering angle sensor module (SAS). General signal error. Signal invalid (B8444S)
BCM-U042862	Invalid data received from steering angle sensor module (SAS). Algorithm error. Comparison error (B6324S)
BCM-U042862	Invalid data received from steering angle sensor module (SAS). Algorithm error. Comparison error (B8444S)
BCM-U042864	Invalid data received from steering angle sensor module (SAS). Algorithm error. Signal outside permitted range (B6324S)
BCM-U042864	Invalid data received from steering angle sensor module (SAS). Algorithm error. Signal outside permitted range (B8444S)
BCM-XXXXXX	Unknown diagnostic trouble code for this control module version (B6324S)
BCM-XXXXXX	Unknown diagnostic trouble code for this control module version (B8444S)

CLIMATE CONTROL MODULE (CCM) DTCS

CLIMATE CONTROL MODULE (CCM) - DTC INDEX

DTC	Description
CCM-0001	Configuration fault. Non-approved value
CCM-0002	Evaporator temperature sensor. Signal too high/Signal missing
CCM-0003	Evaporator temperature sensor. Signal too low
CCM-0004	Passenger compartment temperature sensor. Signal too high/Signal missing
CCM-0005	Passenger compartment temperature sensor. Signal too high/Signal missing
CCM-0006	Blower fan motor passenger compartment temperature sensor. Signal too high/Signal missing
CCM-0011	Control module. Internal fault
CCM-0020	Function button. Activated too long
CCM-0030	Left heater pad. Faulty signal
CCM-0031	Sensor left-hand seat heater. Faulty signal
CCM-0032	Left-hand seat heater. Internal fault
CCM-0033	Left-hand seat heater. Internal fault
CCM-0034	Right heater pad. Faulty signal
CCM-0035	Sensor right-hand seat heater. Faulty signal
CCM-0036	Right-hand seat heater. Internal fault

CCM-0037	Right-hand seat heater. Internal fault
CCM-0040	Air quality sensor. Internal fault
CCM-0050	Blower fan knob. Faulty signal
CCM-0051	Temperature control left. Faulty signal
CCM-0052	Temperature control right. Faulty signal
CCM-0053	Air distribution control. Faulty signal
CCM-0060	Damper motor defroster. Internal fault
CCM-0061	Recirculation damper motor. Internal fault
CCM-0062	Left temperature damper motor. Internal fault
CCM-0063	Right temperature damper motor. Internal fault
CCM-0064	Air distribution damper motor. Internal fault
CCM-0070	Configuration fault. Faulty identification
CCM-0071	Damper motor. Faulty position
CCM-0072	Damper motor. Initiation fault
CCM-0073	Configuration fault. Calibration not done
CCM-0074	Damper motor, defroster Internal fault
CCM-0074	Damper motor, defroster Internal fault (L.H.D)
CCM-0075	Damper motor Internal fault
CCM-0076	Damper motor, temperature left Internal fault
CCM-0077	Damper motor, temperature right Internal fault
CCM-0078	Damper motor distribution Internal fault
CCM-0090	Lower switch. Faulty ID
CCM-0091	Lower switch. ID missing
CCM-00A0	Blower fan motor. Signal too low
CCM-00A1	Blower fan motor. Signal too high
CCM-DD00	LIN bus1. Incorrect data
CCM-DD01	LIN bus1. Signal too high/Signal too low
CCM-DD02	LIN bus1. Faulty check sum
CCM-DD10	Air quality sensor (AQS). No communication
CCM-DD12	Left-hand seat heater. No communication
CCM-DD14	Recirculation damper motor. No communication
CCM-DD15	Left temperature damper motor. No communication
CCM-DD16	Damper motor air distribution. No communication
CCM-DD20	LIN bus 2. Incorrect data
CCM-DD21	LIN bus 2. Signal too high/Signal too low
CCM-DD22	LIN bus 2. Incorrect check sum
CCM-DD30	Right-hand seat heater. No communication
CCM-DD31	Recirculation damper motor. No communication
CCM-DD32	Right temperature damper motor. No communication
CCM-DD33	Damper motor defroster. No communication
CCM-DD34	Air quality sensor (AQS). No communication
CCM-E001	

	Control module communication
CCM-E003	Configuration fault
CCM-E010	Power supply
CCM-XXXX	Unknown diagnostic trouble code (DTC) for the current control module version

CENTRAL ELECTRONIC MODULE (CEM) DTCS

CENTRAL ELECTRONIC MODULE (CEM) - DTC INDEX

DTC	Description
CEM-1A03	S-Power supply. Signal too low
CEM-1A04	X-Power supply. Signal too low
CEM-1A05	X-Power supply. Signal too high
CEM-1A06	15-Power supply. Signal too low
CEM-1A07	15-Power supply. Signal too high
CEM-1A08	50-Power supply. Signal missing
CEM-1A09	50-Power supply. Signal too high
CEM-1A51	Communication with the supplemental restraint system module (SRS). Signal missing
CEM-1A52	Communication with the driver door module (DDM). Signal missing
CEM-1A53	Communication with the passenger door module (PDM). Signal missing
CEM-1A54	Communication with the power seat module (PSM). Signal missing
CEM-1A55	Communication with the climate control module (CCM). Signal missing
CEM-1A56	Communication with the driver information module (DIM). Signal missing
CEM-1A58	Communication with the phone module (PHM). Signal missing
CEM-1A59	Communication with the audio module (AUM). Signal missing
CEM-1A5A	Communication with the rear electronic module (REM). Signal missing
CEM-1A5C	Communication with the upper electronic module (UEM). Signal missing
CEM-1A5E	Communication with the steering wheel angle sensor module (SAS). Signal missing
CEM-1A5E	Communication with the steering wheel angle sensor module (SAS). Signal missing (B6324S)
CEM-1A5E	Communication with the steering wheel angle sensor module (SAS). Signal missing (B8444S)
CEM-1A5F	Communication with the brake control module (BCM). Signal missing
CEM-1A5F	Communication with the brake control module (BCM). Signal missing (B8444S)
CEM-1A61	Communication with the transmission control module (TCM). Signal missing (TF-80SC AWD)
CEM-1A62	Communication with the engine control module (ECM). Signal missing
CEM-1A62	Communication with the engine control module (ECM). Signal missing

	(B8444S)
CEM-1A63	Communication with the accessory electronic module (AEM). Signal missing
CEM-1A64	Communication with the differential electronic module (DEM). Signal missing
CEM-1A64	Communication with the differential electronic module (DEM). Signal missing (B6324S)
CEM-1A64	Communication with the differential electronic module (DEM). Signal missing (B8444S)
CEM-1A66	Communication with the infotainment control module (ICM). Signal missing
CEM-1A67	Communication with HCM control module Signal missing
CEM-1A67	Communication with HCM control module Signal missing (B6324S)
CEM-1A67	Communication with HCM control module Signal missing (B8444S)
CEM-1C05	30-Power supply. Signal too low
CEM-1D01	Control module. Internal fault
CEM-1D02	Control module. Internal fault
CEM-1D03	Control module not fully programmed. Internal fault
CEM-1D06	Control module. Configuration fault
CEM-1D07	Control module. Internal fault
CEM-1D08	Control module. Internal fault
CEM-1D09	Control module. Internal fault
CEM-1D0A	Control module. Internal fault
CEM-1D0B	Control module. Internal fault
CEM-1F00	ECM, software. Faulty signal
CEM-1F01	TCM, software. Faulty signal
CEM-2F01	Seat position sensor, driver. Signal too high
CEM-2F02	Seat position sensor, driver. Signal too low
CEM-2F03	Seat position sensor, driver. Faulty signal
CEM-2F04	Seat position sensor, passenger. Signal too high
CEM-2F05	Seat position sensor, passenger. Signal too low
CEM-2F06	Seat position sensor, passenger. Faulty signal
CEM-3F02	Shift lock signal. Signal too high
CEM-3F03	Shift lock signal. Signal too low
CEM-3F81	Immobilizer signal. Signal too high
CEM-3F82	Immobilizer signal. Signal too low
CEM-3F83	Immobilizer signal. Signal too low
CEM-3F84	Immobilizer signal. Faulty signal
CEM-3F90	Fuel pump relay. Open-circuit or short-circuit to ground
CEM-3F91	Fuel pump relay. Short-circuit to supply voltage
CEM-4A31	Ejector sensor. Faulty signal
CEM-4A33	Fuel level sensor. Short-circuit to supply voltage or open-circuit

CEM-4A34	Fuel level sensor. Short-circuit to ground
CEM-4A35	Fuel level sensor. Faulty signal
CEM-4A37	Fuel level sensor. Short-circuit to supply voltage or open-circuit
CEM-4A38	Fuel level sensor. Short-circuit to ground
CEM-4F00	Reset button. Activated too long
CEM-4F01	Read button. Activated too long
CEM-4F41	Light emitting diode, left camera module. Signal too low
CEM-4F42	Light emitting diode, right camera module. Signal too low
CEM-4F43	Light emitting diode, left camera module. Signal too high
CEM-4F44	Light emitting diode, right camera module. Signal too high
CEM-4F45	Light emitting diode, left camera module. No signal
CEM-4F46	Light emitting diode, right camera module. No signal
CEM-4F47	Left camera module. Internal fault
CEM-4F48	Right camera module (RCM). Internal fault
CEM-4F90	Seat belt reminder. Signal too high
CEM-4F91	Seat belt reminder. Signal too low
CEM-4F92	Seat belt reminder. Signal missing
CEM-4F93	Seat belt reminder. Faulty signal
CEM-5A00	Sun sensor. Signal too high
CEM-5A01	Sun sensor. Signal too low
CEM-5F31	Coolant temperature sensor Open circuit or short circuit to supply
CEM-5F32	Coolant temperature sensor Short circuit to ground
CEM-5F36	Flame sensor Short circuit to ground
CEM-5F37	Factory set diagnostic trouble code (DTC). Faulty code
CEM-5F39	Flame sensor Flame interuption
CEM-5F3A	Water pump. Signal too high
CEM-5F3B	Water pump. Signal too low
CEM-5F3C	Combustion fan. Signal too high
CEM-5F3D	Combustion fan. Signal too low
CEM-5F3E	Combustion fan. Faulty signal
CEM-5F3F	Fuel pump (FP). Signal too high
CEM-5F40	Fuel pump (FP). Signal too low
CEM-5F41	Overheat protection thermostat. Signal too low
CEM-5F42	Power supply. Faulty
CEM-5F43	Power supply. Missing
CEM-5F46	Glow plugs. Faulty signal
CEM-5F47	Control module power supply. Signal too high
CEM-5F4C	Power supply. Signal too low
CEM-5F4D	On-board diagnostic (OBD) system. Too long time
CEM-5F4F	Start attempt. Too many unsuccessful attempts
CEM-5F50	Overheat protection thermostat. Signal too high
CEM-6C41	

	Antenna/light ring-clock signal cable. Signal too high
CEM-6C42	Antenna/light ring - clock signal cable. Signal too low
CEM-6C43	Antenna/light ring - data communication cable. Signal too high
CEM-6C44	Antenna/light ring - data communication cable. Signal too low
CEM-6C45	Antenna/light ring. Communication problems
CEM-6C46	Antenna/light ring. Internal fault
CEM-6C48	Transponder type. Faulty signal
CEM-6C49	Transponder communication. Faulty signal
CEM-6E01	Switch, fuel tank filler cover. Faulty signal
CEM-6F01	Cruise control ON/OFF button. Activated too long
CEM-6F02	Cruise control Set+ button. Activated too long
CEM-6F03	Cruise control Set- button. Activated too long
CEM-6F04	Cruise control, Resume button. Activated too long
CEM-6F05	Cruise control, Cancel button. Activated too long
CEM-6F06	Cruise control. Faulty signal
CEM-6F07	Cruise control. Faulty signal
CEM-7A01	Scan- button. Activated too long
CEM-7A02	Scan+ button. Activated too long
CEM-7A03	Scan- button. Activated too long
CEM-7A04	Volume+ button. Activated too long
CEM-7A05	Phone YES button. Activated too long
CEM-7A06	Phone NO button. Activated too long
CEM-7A07	RTI Right button. Activated too long
CEM-7A08	RTI Left button. Activated too long
CEM-7A09	RTI Down button. Activated too long
CEM-7A0A	RTI Up button. Activated too long
CEM-7A0B	RTI Back button. Activated too long
CEM-7A0C	RTI Enter button. Activated too long
CEM-8A01	Invalid switch position for the light switch. Faulty position
CEM-8A20	Low beam left. Signal too low
CEM-8A21	Low beam right. Signal too low
CEM-8A30	Daytime running lamps, left. Faulty signal
CEM-8A31	Daytime running lamps, right. Faulty signal
CEM-8A32	High beam flash. Activated too long
CEM-8B01	Parking lamps. Signal too low
CEM-8C11	Switch, front fog lamps. Activated too long
CEM-8C12	Rear fog switch Activated too long
CEM-8D01	Stop lamps. Signal too low
CEM-8D03	Brake light switch internal fault
CEM-8D04	Internal fault in control module
CEM-8E01	Back-up (reversing) lamp switch. Faulty signal
CEM-8E02	

	Left-hand turn signal lamp. Signal too low
CEM-8F03	Right-hand turn signal lamp. Signal too low
CEM-8F04	Turn signal lamp. Faulty signal
CEM-8F05	Switch, hazard warning signal flashers. Activated too long
CEM-8F06	Switch, hazard warning signal flashers. Signal missing
CEM-8F07	Switch, hazard warning signal flashers. Signal too low
CEM-8F08	Engine control module (ECM). Signal too low
CEM-8F09	Engine control module (ECM). Signal too high
CEM-8F11	CEM Headlamp beam height control. Signal too high
CEM-8F12	CEM Headlamp beam height control. Signal too low
CEM-8F13	LSM Headlamp beam height control. Signal too high
CEM-8F14	LSM Headlamp beam height control. Signal too low
CEM-8F15	Xenon lamp left. Faulty signal
CEM-8F16	Xenon lamp left. Signal too low
CEM-8F17	Xenon lamp left. Faulty signal
CEM-8F18	Xenon lamp left. Signal too high/Signal missing
CEM-8F19	Xenon lamp right. Faulty signal
CEM-8F1A	Xenon lamp right. Signal too low
CEM-8F1B	Xenon lamp right Faulty signal
CEM-8F1C	Xenon lamp right. Signal too high / Signal missing
CEM-8F1D	X-supply relay circuit. Short-circuit to supply voltage
CEM-8F21	Windshield wiper. Faulty signal
CEM-8F22	Windshield wiper. Signal too low
CEM-8F23	Relay, windshield wiper. Signal too high
CEM-8F25	Relay, windshield wiper. Signal too low
CEM-8F26	Windshield wipers. Signal too high
CEM-8F2C	Windshield wiper. Signal too high
CEM-8F2D	Windshield wiper. Signal too low
CEM-8F2E	Windshield wiper. Signal too low
CEM-8F30	Windshield wiper lever. Signal missing
CEM-8F31	Windshield wiper lever. Faulty signal
CEM-8F32	Windshield wiper lever. Faulty signal
CEM-8F41	Tailgate washer motor relay. Signal too high
CEM-8F43	Tailgate washer motor relay. Signal too low
CEM-8F44	Windshield wiper lever. Faulty signal
CEM-8F45	Windshield wiper lever. Faulty signal
CEM-8F51	Relay, headlamp wash/wipe. Signal too low
CEM-8F52	Relay, headlamp wash/wipe. Signal too low or signal missing
CEM-8FD0	Relay, auxiliary lamp. Signal too high
CEM-8FF0	Rain sensor button. Activated too long
CEM-8FF1	Light emitting diode, Rain sensor button. Signal too low
CEM-9C01	

	Glove compartment lighting. Signal too low
CEM-9C02	Antenna/light ring. Short-circuit to ground
CEM-9C03	Antenna/light ring. Signal missing
CEM-9E01	Interior lighting. Signal too low
CEM-9F20	Twilight sensor. Short-circuit to supply voltage
CEM-9F21	Twilight sensor. Short-circuit to ground
CEM-9F24	Rheostat. Signal too high
CEM-9F25	Rheostat. Signal too low
CEM-9F26	Interior lighting. Signal too low
CEM-DD00	Communication with LSM control module and CPM control modoule. Communication fault
CEM-DD01	Communication with LSM control module and CPM control module. Short-circuit to supply or ground
CEM-DD02	Communication with LSM control module and CPM control module. Communication fault
CEM-DD10	Communication with the light switch module (LSM). Signal missing
CEM-DD11	Communication with the combustion preheater module (CPM). Signal missing
CEM-DD20	LIN-bus 2. Communication fault
CEM-DD21	LIN-bus 2. No signal
CEM-DD30	Communication with the alternator control module (ACM). Signal missing
CEM-DD31	Communication with left camera module (LCM). No signal
CEM-DD32	Communication with right camera module (LCM). No signal
CEM-DD40	Communication with the steering wheel module (SWM). Communication fault
CEM-DD41	Communication with the steering wheel module (SWM). Signal missing
CEM-DD50	Communication with the steering wheel module (SWM). Signal missing
CEM-DD51	Communication with the steering wheel module (SWM). Signal missing
CEM-DD52	Communication with the steering wheel module (SWM). Signal missing
CEM-DF01	CAN-H, low speed network. Signal missing
CEM-DF03	CAN-H, low speed network. Signal too high
CEM-DF04	CAN-L, low speed network. Signal too low
CEM-DF05	CAN-H, low speed network. Signal too low
CEM-DF06	CAN-L, low speed network. Signal too high
CEM-DF07	CAN-H, low speed network. Faulty signal
CEM-DF11	CAN-H, high speed network. Signal missing
CEM-DF13	CAN-H, high speed network. Signal too high
CEM-DF14	CAN-L, high speed network. Signal too low
CEM-DF15	CAN-H, high speed network. Signal too low
CEM-DF16	CAN-L, high speed network. Signal too high
CEM-DF17	CAN-H, high speed network. Faulty signal

CEM-E000	Control module communication
CEM-E000	Control module communication (B8444S)
CEM-E001	Control module communication
CEM-XXXX	Unknown diagnostic trouble code (DTC) for the current control module version

DRIVER DOOR MODULE (DDM) DTCS

DRIVER DOOR MODULE (DDM) - DTC INDEX

DTC	Description
DDM-0019	Lock, driver's door. Signal too low
DDM-001A	Driver's door lock. Signal too low
DDM-001D	Central locking button. Internal fault
DDM-0034	Control, driver's window. Faulty signal
DDM-0035	Control, passenger window. Faulty signal
DDM-0036	Control, left rear side window. Faulty signal
DDM-0037	Control, right rear side window. Faulty signal
DDM-0038	Control, door mirror. Faulty signal
DDM-0039	Child-proof lock. Stuck in the active position
DDM-003B	Control, driver's window. Faulty signal
DDM-003C	Control, passenger window. Faulty signal
DDM-003D	Control, left rear side window. Faulty signal
DDM-003E	Control, right rear side window. Faulty signal
DDM-003F	Control, door mirror. Signal too high
DDM-0040	Control, door mirror selector. Signal too high
DDM-0045	Door mirror lamp. Signal too low
DDM-0049	Control module. Internal fault
DDM-004A	Outside temperature sensor. Signal too high
DDM-004B	Outside temperature sensor. Signal missing
DDM-004C	Control module. Internal fault
DDM-004D	Control module. Internal fault
DDM-E001	Control module communication. Faulty communication
DDM-E003	Configuration fault. Faulty configuration
DDM-XXXX	Unknown diagnostic trouble code (DTC) for the current control module version

DIFFERENTIAL ELECTRONIC MODULE (DEM) DTCS

DIFFERENTIAL ELECTRONIC MODULE (DEM) - DTC INDEX

DTC	Description
DEM-P056017	System voltage. General electrical fault. Too high voltage (B6324S, TF-80SC AWD)

DEM-P056017	System voltage. General electrical fault. Too high voltage (B8444S, TF-80SC AWD)
DEM-P060749	Control module performance. Internal fault. Electrical fault (B8444S, TF-80SC AWD)
DEM-P060749	Control module performance. Internal fault. Electrical fault (B6324S, TF-80SC AWD)
DEM-P093211	Hydraulic pressure sensor circuit. General electrical fault. Short circuit to ground. (B6324S, TF-80SC AWD; B8444S, TF-80SC AWD)
DEM-P093215	Hydraulic pressure sensor circuit. General electrical fault. Short circuit to a voltage source or open circuit. (B6324S, TF-80SC AWD; B8444S, TF-80SC AWD)
DEM-P093711	Oil temperature sensor circuit. General electrical fault. Short circuit to ground (B6324S, TF-80SC AWD; B8444S, TF-80SC AWD)
DEM-P093715	Oil temperature sensor circuit. General electrical fault. Short circuit to a voltage source or open circuit. (B6324S, TF-80SC AWD; B8444S, TF-80SC AWD)
DEM-P093827	Oil temperature sensor circuit within/outside the limits. General signal fault. Rate of signal change exceeds the limit. (B6324S, TF-80SC AWD; B8444S, TF-80SC AWD)
DEM-P096162	Pressure regulation solenoid A control circuit within/outside the limits. Algorithm fault. Comparison fault (B6324S, TF-80SC AWD; B8444S, TF-80SC AWD)
DEM-P118854	Calibration memory. Programming fault. No calibration stored. (B6324S, TF-80SC AWD)
DEM-P118854	Calibration memory. Programming fault. No calibration stored. (B8444S, TF-80SC AWD)
DEM-P163568	Tire/Axle Out of Acceptable Range. Algorithm Based Failures. Event information (B6324S, TF-80SC AWD)
DEM-P163568	Tire/Axle Out of Acceptable Range. Algorithm Based Failures. Event information (B8444S, TF-80SC AWD)
DEM-P168912	Solenoid circuit oil pressure regulation. General electrical fault. Short circuit to a voltage source (B6324S, TF-80SC AWD)
DEM-P168912	Solenoid circuit oil pressure regulation. General electrical fault. Short circuit to a voltage source (B8444S, TF-80SC AWD)
DEM-P168914	Solenoid circuit oil pressure regulation. General electrical fault. Short circuit to ground or open circuit (B6324S, TF-80SC AWD)
DEM-P168914	Solenoid circuit oil pressure regulation. General electrical fault. Short circuit to ground or open circuit (B8444S, TF-80SC AWD)
DEM-P188912	Oil pressure pump performance. General electrical fault. Short circuit to a voltage source (B6324S, TF-80SC AWD)
DEM-P188912	Oil pressure pump performance. General electrical fault. Short circuit to a voltage source (B8444S, TF-80SC AWD)
DEM-P188914	Oil pressure pump performance. General electrical fault. Short circuit to ground or open circuit (B6324S, TF-80SC AWD)

DEM-P188914	Oil pressure pump performance. General electrical fault. Short circuit to ground or open circuit (B8444S, TF-80SC AWD)
DEM-P188974	Oil Pressure Pump Performance. Mechanical Failures. Actuator slipping (B6324S, TF-80SC AWD; B8444S, TF-80SC AWD)
DEM-P188A68	Differential Oil Temperature Too High/Too Low. Algorithm Based Failures. Event information (B6324S, TF-80SC AWD; B8444S, TF-80SC AWD)
DEM-U000100	HS-CAN communication bus. General fault information. No information about the type of fault (B6324S, TF-80SC AWD)
DEM-U000100	HS-CAN communication bus. General fault information. No information about the type of fault (B8444S, TF-80SC AWD)
DEM-U010000	Failed communication with the Engine Control Module (ECM). General fault information. Type of fault not specified. (B6324S, TF-80SC AWD)
DEM-U010000	Failed communication with the Engine Control Module (ECM). General fault information. Type of fault not specified. (B8444S, TF-80SC AWD)
DEM-U012900	Failed communication with the Brake Control Module (BCM). General fault information. Type of fault not specified. (B6324S, TF-80SC AWD)
DEM-U012900	Failed communication with the Brake Control Module (BCM). General fault information. Type of fault not specified. (B8444S, TF-80SC AWD)
DEM-U014000	Failed communication with the Central Electronic Module (CEM). General fault information. No information about the type of fault (B6324S, TF-80SC AWD)
DEM-U014000	Failed communication with the Central Electronic Module (CEM). General fault information. No information about the type of fault (B8444S, TF-80SC AWD)
DEM-U030000	Internal software incompatible with the control module. General information. No information about the type of fault. (B6324S, TF-80SC AWD)
DEM-U030000	Internal software incompatible with the control module. General information. No information about the type of fault. (B8444S, TF-80SC AWD)
DEM-U03004A	Internal software is incompatible with the control module. Internal fault. Wrong component (B6324S, TF-80SC AWD)
DEM-U03004A	Internal software is incompatible with the control module. Internal fault. Wrong component (B8444S, TF-80SC AWD)
DEM-U300362	Battery voltage. Algorithm fault. Comparison fault (B6324S, TF-80SC AWD)
DEM-U300362	Battery voltage. Algorithm fault. Comparison fault (B8444S, TF-80SC AWD)
DEM-XXXXXX	Unspecified diagnostic trouble code (DTC) for current control module version (B6324S, TF-80SC AWD)

DEM-XXXXXX	Unspecified diagnostic trouble code (DTC) for current control module version (B8444S, TF-80SC AWD)

DRIVER INFORMATION MODULE (DIM) DTCS

DRIVER INFORMATION MODULE (DIM) - DTC INDEX

DTC	Description
DIM-0001	Driving distance. Incorrect value
DIM-0002	ABS-lamp. Faulty circuit
DIM-0003	SRS-lamp. Faulty circuit
DIM-0005	Red warning lamp Faulty circuit
DIM-0006	Orange warning lamp Faulty circuit
DIM-0007	Global parameter. Internal fault
DIM-000C	Control module. Internal fault
DIM-E001	Control module communication. Faulty communication
DIM-E003	Configuration fault. Faulty configuration
DIM-XXXX	Unknown diagnostic trouble code (DTC) for the current control module version

ENGINE CONTROL MODULE (ECM) DTCS - B6324S

ENGINE CONTROL MODULE (ECM) - DTC INDEX

OBD-II Code	DTC	Description
B1024	ECM-B102400	Start control unit. General Failure Information. No sub type information
B1024	ECM-B102482	Start control unit. Bus Signal / Message Failures. Alive / sequence counter incorrect / not updated
B1024	ECM-B102486	Start control unit. Bus Signal / Message Failures. Signal invalid
B10A2	ECM-B10A268	Crash Input. Algorithm Based Failures. Event information
B10FF	ECM-B10FF68	Ignition control. Algorithm Based Failures. Event information
C0040	ECM-C004082	Brake Pedal Switch "A". Bus Signal / Message Failures. Alive / sequence counter incorrect / not updated
P0011	ECM-P001100	Intake Camshaft Position Timing - Over-Advanced (Bank 1). General Failure Information. No sub type information
P0012	ECM-P001200	Intake Camshaft Position Timing - Over-Retarded (Bank 1). General Failure Information. No sub type information

P0012	**ECM-P001268**	Intake Camshaft Position Timing - Over-Retarded (Bank 1). Algorithm Based Failures. Event information
P0016	**ECM-P001600**	Crankshaft Position - Camshaft Position Correlation - Bank 1 Sensor A. General Failure Information. No sub type information
P0018	**ECM-P001800**	Crankshaft Position - Camshaft Position Correlation - Bank 2 Sensor A. General Failure Information. No sub type information
P001A	**ECM-P001A00**	Intake (A) Cam Profile Control Circuit / Open (Bank 1). General Failure Information. No sub type information
P001B	**ECM-P001B00**	Intake (A) Cam Profile Control Circuit Low (Bank 1). General Failure Information. No sub type information
P001C	**ECM-P001C00**	Intake (A) Cam Profile Control Circuit High (Bank 1). General Failure Information. No sub type information
P0031	**ECM-P003100**	HO2S Heater Control Circuit Low (Bank 1, Sensor 1). General Failure Information. No sub type information
P0032	**ECM-P003200**	HO2S Heater Control Circuit High (Bank 1, Sensor 1). General Failure Information. No sub type information
P0037	**ECM-P003700**	HO2S Heater Control Circuit Low (Bank 1, Sensor 2). General Failure Information. No sub type information
P0038	**ECM-P003800**	HO2S Heater Control Circuit High (Bank 1, Sensor 2). General Failure Information. No sub type information
P003C	**ECM-P003C00**	Intake (A) Camshaft Profile Control Performance or Stuck Off (Bank 1). General Failure Information. No sub type information
P003D	**ECM-P003D00**	Intake (A) Camshaft Profile Control Stuck On (Bank 1). General Failure Information. No sub type information
P0051	**ECM-P005100**	HO2S Heater Control Circuit Low (Bank 2, Sensor 1). General Failure Information. No sub type information
P0052	**ECM-P005200**	HO2S Heater Control Circuit High (Bank 2, Sensor 1). General Failure Information. No sub type information
P0057	**ECM-P005700**	HO2S Heater Control Circuit Low (Bank 2, Sensor 2). General Failure Information. No sub type information

P0058	**ECM-P005800**	HO2S Heater Control Circuit High (Bank 2, Sensor 2). General Failure Information. No sub type information
P0070	**ECM-P007000**	Ambient Air Temperature Sensor Circuit. General Failure Information. No sub type information
P0071	**ECM-P007100**	Ambient Air Temperature Sensor Range/Performance. General Failure Information. No sub type information
P0072	**ECM-P007200**	Ambient Air Temperature Sensor Circuit Low Input. General Failure Information. No sub type information
P0073	**ECM-P007300**	Ambient Air Temperature Sensor Circuit High Input. General Failure Information. No sub type information
P0075	**ECM-P007500**	Intake Valve Control Circuit (Bank 1). General Failure Information. No sub type information
P0076	**ECM-P007600**	Intake Valve Control Circuit Low (Bank 1). General Failure Information. No sub type information
P0077	**ECM-P007700**	Intake Valve Control Circuit High (Bank 1). General Failure Information. No sub type information
P0087	**ECM-P008700**	Fuel Rail/System Pressure - Too Low. General Failure Information. No sub type information
P0088	**ECM-P008800**	Fuel Rail/System Pressure - Too High. General Failure Information. No sub type information
P0089	**ECM-P008968**	Fuel Pressure Regulator Performance. Algorithm Based Failures. Event information
P0100	**ECM-P010000**	Mass or Volume Air Flow Circuit. General Failure Information. No sub type information
P0101	**ECM-P010100**	Mass or Volume Air Flow Circuit Range/Performance. General Failure Information. No sub type information
P0102	**ECM-P010200**	Mass or Volume Air Flow Circuit Low Input. General Failure Information. No sub type information
P0103	**ECM-P010300**	Mass or Volume Air Flow Circuit High Input. General Failure Information. No sub type information
P0105	**ECM-P010500**	Manifold Absolute Pressure/BARO Circuit. General Failure Information. No sub type information
P0106	**ECM-P010600**	Manifold Absolute Pressure/BARO Sensor Range/Performance. General Failure

		Information. No sub type information
P0107	**ECM-P010700**	Manifold Absolute Pressure/BARO Sensor Low Input. General Failure Information. No sub type information
P0108	**ECM-P010800**	Manifold Absolute Pressure/BARO Sensor High Input. General Failure Information. No sub type information
P0111	**ECM-P011000**	Intake Air Temperature Sensor 1 Circuit. General Failure Information. No sub type information
P0111	**ECM-P011100**	Intake Air Temperature Sensor 1 Circuit Range/Performance. General Failure Information. No sub type information
P0112	**ECM-P011200**	Intake Air Temperature Sensor 1 Circuit Low Input. General Failure Information. No sub type information
P0113	**ECM-P011300**	Intake Air Temperature Sensor 1 Circuit High Input. General Failure Information. No sub type information
P0114	**ECM-P011400**	Intake Air Temperature Sensor 1 Intermittent/Erratic. General Failure Information. No sub type information
P0115	**ECM-P011500**	Engine Coolant Temperature Circuit. General Failure Information. No sub type information
P0116	**ECM-P011600**	Engine Coolant Temperature Circuit Range/Performance. General Failure Information. No sub type information
P0117	**ECM-P011700**	Engine Coolant Temperature Circuit Low Input. General Failure Information. No sub type information
P0118	**ECM-P011800**	Engine Coolant Temperature Circuit High Input. General Failure Information. No sub type information
P0120	**ECM-P012023**	Throttle/Pedal Position Sensor A Circuit. General Signal Failures. Signal stuck low
P0120	**ECM-P012024**	Throttle/Pedal Position Sensor A Circuit. General Signal Failures. Signal stuck high
P0120	**ECM-P012038**	Throttle/Pedal Position Sensor A Circuit. FM (Frequency Modulated) / PWM (Pulse Width Modulated) Failures. Signal frequency incorrect
P0128	**ECM-P012800**	Coolant Thermostat (Coolant Temp Below Thermostat Regulating Temperature). General Failure Information. No sub type information
P0131	**ECM-P013100**	O2 Circuit Low Voltage (Bank 1, Sensor 1). General Failure Information. No sub type

		information
P0132	**ECM-P013200**	O2 Circuit High Voltage (Bank 1, Sensor 1). General Failure Information. No sub type information
P0133	**ECM-P013300**	O2 Circuit Slow Response (Bank 1, Sensor 1). General Failure Information. No sub type information
P0134	**ECM-P013400**	O2 Circuit No Activity Detected (Bank 1, Sensor 1). General Failure Information. No sub type information
P0137	**ECM-P013700**	O2 Circuit Low Voltage (Bank 1, Sensor 2). General Failure Information. No sub type information
P0138	**ECM-P013800**	O2 Circuit High Voltage (Bank 1, Sensor 2). General Failure Information. No sub type information
P0151	**ECM-P015100**	O2 Circuit Low Voltage (Bank 2, Sensor 1). General Failure Information. No sub type information
P0152	**ECM-P015200**	O2 Circuit High Voltage (Bank 2, Sensor 1). General Failure Information. No sub type information
P0153	**ECM-P015300**	O2 Circuit Slow Response (Bank 2, Sensor 1). General Failure Information. No sub type information
P0154	**ECM-P015400**	O2 Circuit No Activity Detected (Bank 2, Sensor 1). General Failure Information. No sub type information
P0157	**ECM-P015700**	O2 Circuit Low Voltage (Bank 2, Sensor 2). General Failure Information. No sub type information
P0158	**ECM-P015800**	O2 Circuit High Voltage (Bank 2, Sensor 2). General Failure Information. No sub type information
P0170	**ECM-P017068**	Fuel Trim (Bank 1). Algorithm Based Failures. Event information
P0171	**ECM-P017100**	System Too Lean (Bank 1). General Failure Information. No sub type information
P0172	**ECM-P017200**	System Too Rich (Bank 1). General Failure Information. No sub type information
P0174	**ECM-P017400**	System Too Lean (Bank 2). General Failure Information. No sub type information
P0175	**ECM-P017500**	System Too Rich (Bank 2). General Failure Information. No sub type information
P0180	**ECM-P018000**	Fuel Temperature Sensor A Circuit. General

		Failure Information. No sub type information
P0181	**ECM-P018100**	Fuel Temperature Sensor A Circuit Range/Performance. General Failure Information. No sub type information
P0182	**ECM-P018200**	Fuel Temperature Sensor A Circuit Low Input. General Failure Information. No sub type information
P0183	**ECM-P018300**	Fuel Temperature Sensor A Circuit High Input. General Failure Information. No sub type information
P0190	**ECM-P019000**	Fuel Rail Pressure Sensor. General Failure Information. No sub type information
P0191	**ECM-P019100**	Fuel Rail Pressure Sensor Range/Performance. General Failure Information. No sub type information
P0192	**ECM-P019200**	Fuel Rail Pressure Sensor Low Input. General Failure Information. No sub type information
P0193	**ECM-P019300**	Fuel Rail Pressure Sensor High Input. General Failure Information. No sub type information
P0201	**ECM-P020100**	Cylinder 1 Injector Circuit / Open. General Failure Information. No sub type information
P0202	**ECM-P020200**	Cylinder 2 Injector Circuit / Open. General Failure Information. No sub type information
P0203	**ECM-P020300**	Cylinder 3 Injector Circuit / Open. General Failure Information. No sub type information
P0204	**ECM-P020400**	Cylinder 4 Injector Circuit / Open. General Failure Information. No sub type information
P0205	**ECM-P020500**	Cylinder 5 Injector Circuit / Open. General Failure Information. No sub type information
P0206	**ECM-P020600**	Cylinder 6 Injector Circuit / Open. General Failure Information. No sub type information
P0220	**ECM-P022023**	Throttle/Pedal Position Switch B Circuit. General Signal Failures. Signal stuck low
P0220	**ECM-P022024**	Throttle/Pedal Position Switch B Circuit. General Signal Failures. Signal stuck high
P0220	**ECM-P022082**	Throttle/Pedal Position Switch B Circuit. Bus Signal / Message Failures. Alive / sequence counter incorrect / not updated
P029C	**ECM-P029C68**	Cylinder 1 Balance - Injector Restricted. Algorithm Based Failures. Event information
P02A0	**ECM-P02A068**	Cylinder 2 Balance - Injector Restricted. Algorithm Based Failures. Event information
P02A4	**ECM-P02A468**	Cylinder 3 Balance - Injector Restricted. Algorithm Based Failures. Event information
P02A8	**ECM-P02A868**	Cylinder 4 Balance - Injector Restricted.

		Algorithm Based Failures. Event information
P0300	**ECM-P030000**	Random Misfire Detected. General Failure Information. No sub type information
P0301	**ECM-P030100**	Cylinder 1 Misfire Detected. General Failure Information. No sub type information
P0326	**ECM-P032600**	Knock Sensor 1 Circuit Range/Performance (Bank 1). General Failure Information. No sub type information
P0327	**ECM-P032700**	Knock Sensor 1 Circuit Low Input (Bank1). General Failure Information. No sub type information
P0328	**ECM-P032800**	Knock Sensor 1 Circuit High Input (Bank 1). General Failure Information. No sub type information
P0331	**ECM-P033100**	Knock Sensor 2 Circuit Range/Performance (Bank 2). General Failure Information. No sub type information
P0332	**ECM-P033200**	Knock Sensor 2 Circuit Low Input (Bank 2). General Failure Information. No sub type information
P0333	**ECM-P033300**	Knock Sensor 2 Circuit High Input (Bank 2). General Failure Information. No sub type information
P0335	**ECM-P033500**	Crankshaft Position Sensor A Circuit. General Failure Information. No sub type information
P0336	**ECM-P033600**	Crankshaft Position Sensor A Circuit Range/Performance. General Failure Information. No sub type information
P0339	**ECM-P033900**	Crankshaft Position Sensor A Circuit Intermittent. General Failure Information. No sub type information
P0340	**ECM-P034000**	Camshaft Position Sensor A Circuit (Bank 1 or single sensor). General Failure Information. No sub type information
P0341	**ECM-P034100**	Camshaft Position Sensor A Circuit Range/Performance (Bank 1 or single sensor). General Failure Information. No sub type information
P0344	**ECM-P034400**	Camshaft Position Sensor A Circuit Intermittent (Bank 1 or single sensor). General Failure Information. No sub type information
P0345	**ECM-P034500**	Camshaft Position Sensor A Circuit (Bank 2). General Failure Information. No sub type information
P0346	**ECM-P034600**	Camshaft Position Sensor A Circuit

		Range/Performance (Bank 2). General Failure Information. No sub type information
P0349	**ECM-P034900**	Camshaft Position Sensor A Circuit Intermittent (Bank 2). General Failure Information. No sub type information
P0351	**ECM-P035100**	Ignition Coil A Primary/Secondary Circuit. General Failure Information. No sub type information
P0352	**ECM-P035200**	Ignition Coil B Primary/Secondary Circuit. General Failure Information. No sub type information
P0353	**ECM-P035300**	Ignition Coil C Primary/Secondary Circuit. General Failure Information. No sub type information
P0354	**ECM-P035400**	Ignition Coil D Primary/Secondary Circuit. General Failure Information. No sub type information
P0355	**ECM-P035500**	Ignition Coil E Primary/Secondary Circuit. General Failure Information. No sub type information
P0356	**ECM-P035600**	Ignition Coil F Primary/Secondary Circuit. General Failure Information. No sub type information
P0365	**ECM-P036500**	Camshaft Position Sensor B Circuit (Bank 1). General Failure Information. No sub type information
P0366	**ECM-P036600**	Camshaft Position Sensor B Circuit Range/Performance (Bank 1). General Failure Information. No sub type information
P0369	**ECM-P036900**	Camshaft Position Sensor B Circuit Intermittent (Bank 1). General Failure Information. No sub type information
P0420	**ECM-P042000**	Catalyst System Efficiency Below Threshold (Bank 1). General Failure Information. No sub type information
P0430	**ECM-P043000**	Catalyst System Efficiency Below Threshold (Bank 2). General Failure Information. No sub type information
P043E	**ECM-P043E00**	Evaporative Emission System Leak Detection Reference Orifice Low Flow. General Failure Information. No sub type information
P0441	**ECM-P044100**	Evaporative Emission System Incorrect Purge Flow. General Failure Information. No sub type information
P0442	**ECM-P044200**	Evaporative Emission System Leak Detected

		(small leak). General Failure Information. No sub type information
P0444	**ECM-P044400**	Evaporative Emission System Purge Control Valve Circuit Open. General Failure Information. No sub type information
P0455	**ECM-P045500**	Evaporative Emission System Leak Detected (gross leak/no flow). General Failure Information. No sub type information
P0458	**ECM-P045800**	Evaporative Emission System Purge Control Valve Circuit Low. General Failure Information. No sub type information
P0459	**ECM-P045900**	Evaporative Emission System Purge Control Valve Circuit High. General Failure Information. No sub type information
P0460	**ECM-P046000**	Fuel Level Sensor A Circuit. General Failure Information. No sub type information
P0461	**ECM-P046100**	Fuel Level Sensor A Circuit Range/Performance. General Failure Information. No sub type information
P0464	**ECM-P046400**	Fuel Level Sensor A Circuit Intermittent. General Failure Information. No sub type information
P0480	**ECM-P048000**	Fan 1 Control Circuit. General Failure Information. No sub type information
P0481	**ECM-P048100**	Fan 2 Control Circuit. General Failure Information. No sub type information
P0483	**ECM-P048368**	Fan Performance. Algorithm Based Failures. Event information
P0500	**ECM-P050082**	Vehicle Speed Sensor A. Bus Signal / Message Failures. Alive / sequence counter incorrect / not updated
P0500	**ECM-P050087**	Vehicle Speed Sensor A. Bus Signal / Message Failures. Missing message
P0504	**ECM-P050429**	Brake Switch A / B Correlation. General Signal Failures. Signal signal invalid
P0504	**ECM-P050462**	Brake Switch A / B Correlation. Algorithm Based Failures. Signal compare failure
P0504	**ECM-P050465**	Brake Switch A / B Correlation. Algorithm Based Failures. Signal has too few transitions / events
P0505	**ECM-P050568**	Idle Air Control System. Algorithm Based Failures. Event information
P0506	**ECM-P050600**	Idle control rpm lower than expected. General malfunction information. No information on malfunction type

P0507	**ECM-P050700**	Idle control rpm higher than expected. General malfunction information. No information on malfunction type
P050B	**ECM-P050B00**	Cold Start Ignition Timing Performance. General Failure Information. No sub type information
P0525	**ECM-P052548**	Cruise Control Servo Control Circuit Range/Performance. System Internal Failures. Supervision software failure
P052A	**ECM-P052A00**	Cold Start Camshaft Position Timing Over-Advanced (Bank 1). General Failure Information. No sub type information
P052B	**ECM-P052B00**	Cold Start Intake (A) Camshaft Position Timing Over-Retarded (Bank 1). General Failure Information. No sub type information
P052D	**ECM-P052D00**	Cold Start Camshaft Position Timing Over-Retarded (Bank 2). General Failure Information. No sub type information
P0531	**ECM-P053100**	A/C Refrigerant Pressure Sensor A Circuit Range/Performance. General Failure Information. No sub type information
P0532	**ECM-P053200**	A/C Refrigerant Pressure Sensor A Circuit Low Input. General Failure Information. No sub type information
P0533	**ECM-P053300**	A/C Refrigerant Pressure Sensor A Circuit High Input. General Failure Information. No sub type information
P0534	**ECM-P053400**	A/C Refrigerant Charge Loss. General Failure Information. No sub type information
P0562	**ECM-P056200**	System Voltage Low. General Failure Information. No sub type information
P0563	**ECM-P056300**	System Voltage High. General Failure Information. No sub type information
P0575	**ECM-P057500**	Cruise Control Input Circuit. General Failure Information. No sub type information
P0603	**ECM-P060300**	Internal Control Module Keep Alive Memory (KAM) Error. General Failure Information. No sub type information
P0607	**ECM-P060704**	Control Module Performance. General Failure Information. System Internal Failures
P0615	**ECM-P061511**	Starter Relay Circuit. General Electrical Failures. Circuit short to ground
P0615	**ECM-P061512**	Starter Relay Circuit. General Electrical Failures. Circuit short to battery
P0615	**ECM-P061513**	Starter Relay Circuit. General Electrical

		Failures. Circuit open
P061A	ECM-P061A00	Internal Control Module Torque Performance. General Failure Information. No sub type information
P061A	ECM-P061A68	Internal Control Module Torque Performance. Algorithm Based Failures. Event information
P061B	ECM-P061B64	Internal Control Module Torque Calculation Performance. Algorithm Based Failures. Signal plausibility failure
P061B	ECM-P061B68	Internal Control Module Torque Calculation Performance. Algorithm Based Failures. Event information
P0620	ECM-P062001	Generator Control Circuit. General Failure Information. General electrical failure
P0620	ECM-P06204B	Generator Control Circuit. System Internal Failures. Over temperature
P0620	ECM-P062074	Generator Control Circuit. Mechanical Failures. Actuator slipping
P0628	ECM-P062800	Fuel Pump A Control Circuit Low. General Failure Information. No sub type information
P0629	ECM-P062900	Fuel Pump A Control Circuit High. General Failure Information. No sub type information
P0634	ECM-P063400	PCM / ECM / TCM Internal Temperature Too High. General Failure Information. No sub type information
P0634	ECM-P06344B	PCM / ECM / TCM Internal Temperature Too High. System Internal Failures. Over temperature
P0634	ECM-P063498	PCM / ECM / TCM Internal Temperature Too High. Component Failures. Component or system over temperature
P0642	ECM-P064200	Sensor Reference Voltage A Circuit Low. General Failure Information. No sub type information
P0645	ECM-P064500	A/C Clutch Relay Control Circuit. General Failure Information. No sub type information
P0646	ECM-P064600	A/C Clutch Relay Control Circuit Low. General Failure Information. No sub type information
P0647	ECM-P064700	A/C connection relay control circuit high. General malfunction information. No information on malfunction type
P064D	ECM-P064D68	Internal Control Module O2 Sensor Processor Performance - Bank 1. Algorithm Based Failures. Event information
P064E	ECM-P064E68	Internal Control Module O2 Sensor Processor

		Performance - Bank 2. Algorithm Based Failures. Event information
P0661	**ECM-P066100**	Intake Manifold Tuning Valve Control Circuit Low - Bank 1. General Failure Information. No sub type information
P0662	**ECM-P066200**	Intake Manifold Tuning Valve Control Circuit High - Bank 1. General Failure Information. No sub type information
P0668	**ECM-P066800**	PCM / ECM / TCM Internal Temperature Sensor Circuit Low. General Failure Information. No sub type information
P0669	**ECM-P066900**	PCM / ECM / TCM Internal Temperature Sensor Circuit High. General Failure Information. No sub type information
P068B	**ECM-P068B00**	Control module internal power +5V. General Failure Information. No sub type information
P0691	**ECM-P069100**	Fan 1 Control Circuit Low. General Failure Information. No sub type information
P0692	**ECM-P069200**	Fan 1 Control Circuit High. General Failure Information. No sub type information
P06A0	**ECM-P06A000**	Variable A/C Compressor Control Circuit. General Failure Information. No sub type information
P06A1	**ECM-P06A100**	Variable A/C Compressor Control Circuit Low. General Failure Information. No sub type information
P06A2	**ECM-P06A200**	Variable A/C Compressor Control Circuit High. General Failure Information. No sub type information
P0700	**ECM-P070000**	Transmission Control System (MIL Request). General Failure Information. No sub type information
P0737	**ECM-P073768**	TCM Engine Speed Output Circuit. Algorithm Based Failures. Event information
P0850	**ECM-P085023**	Park / Neutral Switch Input Circuit. General Signal Failures. Signal stuck low
P0850	**ECM-P085024**	Park / Neutral Switch Input Circuit. General Signal Failures. Signal stuck high
P0850	**ECM-P085086**	Park / Neutral Switch Input Circuit. Bus Signal / Message Failures. Signal invalid
P0A0F	**ECM-P0A0F68**	Engine Failed to Start. Algorithm Based Failures. Event information
P1126	**ECM-P112662**	Throttle Position (Narrow Range) Sensor Circuit. Algorithm Based Failures. Signal compare failure

P1137	ECM-P113700	Lack Of HO2S12 Switches - Sensor Indicates Lean. General Failure Information. No sub type information
P1138	ECM-P113800	Lack Of HO2S12 Switches - Sensor Indicates Rich. General Failure Information. No sub type information
P1157	ECM-P115700	Lack Of HO2S22 Switches - Sensor Indicates Lean. General Failure Information. No sub type information
P1158	ECM-P115800	Lack Of HO2S22 Switches - Sensor Indicates Rich. General Failure Information. No sub type information
P1170	ECM-P117068	Engine Shut Off Solenoid. Algorithm Based Failures. Event information
P1173	ECM-P117368	Rotor Calibration. Algorithm Based Failures. Event information
P1224	ECM-P122477	Throttle Position Sensor B Out Of Self Test Range. Mechanical Failures. Commanded position not reachable
P1250	ECM-P125000	Throttle Valve Spring. General Failure Information. No sub type information
P1260	ECM-P126000	Theft Detected, Vehicle Immobilized. General Failure Information. No sub type information
P1346	ECM-P134600	Fuel Level Sensor B Circuit. General Failure Information. No sub type information
P145C	ECM-P145C68	Fan System Component Error A. Algorithm Based Failures. Event information
P145D	ECM-P145D68	Fan System Component Error B. Algorithm Based Failures. Event information
P151B	ECM-P151B68	Idle Speed Control - RPM Lower Than Expected. Algorithm Based Failures. Event information
P151C	ECM-P151C68	Idle Speed Control - RPM Higher Than Expected. Algorithm Based Failures. Event information
P1572	ECM-P157281	Brake Pedal Switch Circuit. Bus Signal / Message Failures. Invalid serial data received
P1572	ECM-P157282	Brake Pedal Switch Circuit. Bus Signal / Message Failures. Alive / sequence counter incorrect / not updated
P1572	ECM-P157287	Brake Pedal Switch Circuit. Bus Signal / Message Failures. Missing message
P1573	ECM-P157300	Throttle Position Not Available. General Failure Information. No sub type information
P1574	ECM-P157462	Throttle Position Sensor Outputs Disagree.

		Algorithm Based Failures. Signal compare failure
P1589	**ECM-P158900**	Throttle Control Unable To Control To Desired Throttle Angle. General Failure Information. No sub type information
P1771	**ECM-P177100**	Throttle Position Sensor Circuit High Input. General Failure Information. No sub type information
P1772	**ECM-P177200**	Throttle Position Sensor Circuit Low Input. General Failure Information. No sub type information
P1934	**ECM-P193400**	Vehicle Speed Signal. General Failure Information. No sub type information
P2004	**ECM-P200400**	Intake Manifold Runner Control Stuck Open (Bank 1). General Failure Information. No sub type information
P2005	**ECM-P200500**	Intake Manifold Runner Control Stuck Open (Bank 2). General Failure Information. No sub type information
P2006	**ECM-P200600**	Intake Manifold Runner Control Stuck Closed (Bank 1). General Failure Information. No sub type information
P2007	**ECM-P200700**	Intake Manifold Runner Control Stuck Closed (Bank 2). General Failure Information. No sub type information
P2106	**ECM-P210600**	Throttle Actuator Control System - Forced Limited Power. General Failure Information. No sub type information
P2111	**ECM-P211100**	Throttle Actuator Control System - Stuck Open. General Failure Information. No sub type information
P2118	**ECM-P211800**	Throttle Actuator Control Motor Current Range/Performance. General Failure Information. No sub type information
P2135	**ECM-P213562**	Throttle/Pedal Position Sensor/Switch A / B Voltage Correlation. Algorithm Based Failures. Signal compare failure
P2162	**ECM-P216262**	Vehicle Speed Sensor A / B Correlation. Algorithm Based Failures. Signal compare failure
P2226	**ECM-P222600**	Barometric Pressure Circuit. General Failure Information. No sub type information
P2227	**ECM-P222700**	Barometric Pressure Circuit Range/Performance. General Failure Information. No sub type information

P2228	**ECM-P222800**	Barometric Pressure Circuit Low Input. General Failure Information. No sub type information
P2229	**ECM-P222900**	Barometric Pressure Circuit High Input. General Failure Information. No sub type information
P2270	**ECM-P227000**	O2 Sensor Signal Stuck Lean - Bank 1, Sensor 2. General Failure Information. No sub type information
P2271	**ECM-P227100**	O2 Sensor Signal Stuck Rich - Bank 1, Sensor 2. General Failure Information. No sub type information
P2272	**ECM-P227200**	O2 Sensor Signal Stuck Lean - Bank 2, Sensor 2. General Failure Information. No sub type information
P2273	**ECM-P227300**	O2 Sensor Signal Stuck Rich - Bank 2, Sensor 2. General Failure Information. No sub type information
P2401	**ECM-P240100**	Evaporative Emission System Leak Detection Pump Control Circuit Low. General Failure Information. No sub type information
P2402	**ECM-P240200**	Evaporative Emission System Leak Detection Pump Control Circuit High. General Failure Information. No sub type information
P2407	**ECM-P240700**	Evaporative Emission System Leak Detection Pump Sense Circuit Intermittent/Erratic. General Failure Information. No sub type information
P2408	**ECM-P240800**	Fuel Cap Sensor/Switch Circuit. General Failure Information. No sub type information
P240B	**ECM-P240B00**	Evaporative Emission System Leak Detection Pump Heater Circuit Low. General Failure Information. No sub type information
P240C	**ECM-P240C00**	Evaporative Emission System Leak Detection Pump Heater Circuit High. General Failure Information. No sub type information
P2419	**ECM-P241900**	Evaporative Emission Control System Switching Valve Control Circuit Low. General Failure Information. No sub type information
P2420	**ECM-P242000**	Evaporative Emission Control System Switching Valve Control Circuit High. General Failure Information. No sub type information
P2421	**ECM-P242100**	Evaporative Emission Control System Vent Valve Stuck Open. General Failure Information. No sub type information

P2422	**ECM-P242200**	Evaporative Emission Control System Vent Valve Stuck Closed. General Failure Information. No sub type information
P252C	**ECM-P252C00**	Engine Oil Quality Sensor Circuit Low. General Failure Information. No sub type information
P252D	**ECM-P252D00**	Engine Oil Quality Sensor Circuit High. General Failure Information. No sub type information
P2583	**ECM-P258382**	Cruise Control Front Distance Range Sensor. Bus Signal / Message Failures. Alive / sequence counter incorrect / not updated
P2610	**ECM-P261085**	ECM/PCM Internal Engine Off Timer Performance. Bus Signal / Message Failures. Signal above allowable range
U0001	**ECM-U000100**	High Speed CAN Communication Bus. General Failure Information. No sub type information
U0101	**ECM-U010100**	Lost Communication with Transmission control module. General Failure Information. No sub type information
U0104	**ECM-U010482**	Lost Communication With Cruise Control Module. Bus Signal / Message Failures. Signal compare failure
U0120	**ECM-U012086**	Lost Communication with Starter/ Generator Control Module. Bus Signal / Message Failures. Signal invalid
U0120	**ECM-U012087**	Lost Communication with Starter/ Generator Control Module. Bus Signal / Message Failures. Missing message
U0121	**ECM-U012100**	Lost Communication With Brake Control Module. General Failure Information. No sub type information
U0129	**ECM-U012900**	Lost Communication With Brake System Control Module. General Failure Information. No sub type information
U0141	**ECM-U014100**	Lost Communication With Central electronic module "A". General Failure Information. No sub type information
U0167	**ECM-U016700**	Lost Communication With Vehicle Immobilizer Control Module. General Failure Information. No sub type information
U0300	**ECM-U030000**	Internal Control Module Software Incompatibility. General Failure Information. No sub type information
U0322	**ECM-U032200**	Software Incompatibility with Body Control

		Module. General Failure Information. No sub type information
U0405	ECM-U040583	Invalid Data Received From Cruise Control Module. Bus Signal / Message Failures. Value of signal protection calculation incorrect
U0405	ECM-U04058F	Invalid Data Received From Cruise Control Module. Bus Signal / Message Failures. Erratic
U0418	ECM-U041800	Invalid Data Received From Brake Control Module. General Failure Information. No sub type information
U0418	ECM-U041886	Invalid Data Received From Brake Control Module. Bus Signal / Message Failures. Signal invalid
U0422	ECM-U042200	Invalid Data Received From Central electronic module. General Failure Information. No sub type information
U0426	ECM-U042600	Invalid data received from vehicle immobilizer control module. General malfunction information. No information on malfunction type
U2107	ECM-U210765	Collision Mitigation By Braking. Algorithm Based Failures. Signal has too few transitions / events
U2107	ECM-U210782	Collision Mitigation By Braking. Bus Signal / Message Failures. Alive / sequence counter incorrect / not updated
U2108	ECM-U210800	Adaptive Cruise Control. General Failure Information. No sub type information
U2108	ECM-U210882	Adaptive Cruise Control. Bus Signal / Message Failures. Alive / sequence counter incorrect / not updated

ENGINE CONTROL MODULE (ECM) DTCS - B8444S

ENGINE CONTROL MODULE (ECM) - DTC INDEX

OBD-II Code	DTC	Description
P0011	ECM-P001100	Intake camshaft position control - extended too far - (bank 1). General fault information. Type of fault not specified.
P0012	ECM-P001200	Intake camshaft position control - returned too far - (bank 1). General fault information. Type of fault not specified.
P0014	ECM-P001400	Controlling camshaft position exhaust- too much control - (bank 1). General fault information. No information about fault type

P0015	**ECM-P001500**	Exhaust camshaft position control - returned too far - (bank 1). General fault information. Type of fault not specified.
P0016	**ECM-P001600**	Crankshaft Position - Camshaft Position Correlation - Bank 1 Sensor A. General Failure Information. No sub type information
P0017	**ECM-P001700**	Crankshaft Position - Camshaft Position Correlation - Bank 1 Sensor B. General Failure Information. No sub type information
P0018	**ECM-P001800**	Crankshaft Position - Camshaft Position Correlation - Bank 2 Sensor A. General Failure Information. No sub type information
P0019	**ECM-P001900**	Crankshaft Position - Camshaft Position Correlation - Bank 2 Sensor B. General Failure Information. No sub type information
P0021	**ECM-P002100**	Intake camshaft position control - extended too far - (bank 2). General fault information. Type of fault not specified.
P0022	**ECM-P002200**	Intake camshaft position control - returned too far - (bank 2). General fault information. Type of fault not specified.
P0024	**ECM-P002400**	Controlling camshaft position exhaust - too much control- (bank 2). General fault information. No information about fault type
P0025	**ECM-P002500**	Exhaust camshaft position control - returned too far - (bank 2). General fault information. Type of fault not specified.
P0031	**ECM-P003100**	Heated oxygen sensor (HO2S) control circuit low (bank 1, sensor 1). General fault information. No information about fault type
P0032	**ECM-P003200**	Heated oxygen sensor (HO2S) control circuit high (bank 1, sensor 1). General fault information. No information about fault type
P0037	**ECM-P003700**	Heated oxygen sensor (HO2S) control circuit low (bank 1, sensor 2). General fault information. No information about fault type
P0038	**ECM-P003800**	Heated oxygen sensor (HO2S) control circuit high (bank 1, sensor 2). General fault information. No information about fault type
P0051	**ECM-P005100**	Heated oxygen sensor (HO2S) control circuit low (bank 2, sensor 1). General fault information. No information about fault type
P0052	**ECM-P005200**	Heated oxygen sensor (HO2S) control circuit high (bank 2, sensor 1). General fault information. No information about fault type

P0057	**ECM-P005700**	Heated oxygen sensor (HO2S) control circuit low (bank 2, sensor 2). General fault information. No information about fault type
P0058	**ECM-P005800**	Heated oxygen sensor (HO2S) control circuit high (bank 2, sensor 2). General fault information. No information about fault type
P0071	**ECM-P007100**	Ambient Air Temperature Sensor Range/Performance. General Failure Information. No sub type information
P0072	**ECM-P007200**	Ambient air temperature sensor circuit low input signal. General fault information. Type of fault not specified.
P0073	**ECM-P007300**	Ambient air temperature sensor circuit high input signal. General fault information. Type of fault not specified.
P0075	**ECM-P007500**	Intake valve control circuit (bank 1). General fault information. Type of fault not specified.
P0076	**ECM-P007600**	Intake valve control circuit low (bank 1). General fault information. Type of fault not specified.
P0077	**ECM-P007700**	Intake valve control circuit high (bank 1). General fault information. Type of fault not specified.
P0078	**ECM-P007800**	Exhaust valve control circuit (bank 1). General fault information. Type of fault not specified.
P0079	**ECM-P007900**	Exhaust valve control circuit low (bank 1). General fault information. Type of fault not specified.
P0080	**ECM-P008000**	Exhaust valve control circuit high (bank 1). General fault information. Type of fault not specified.
P0089	**ECM-P008900**	Fuel pressure regulator performance. General fault information. No information about fault type
P0091	**ECM-P009100**	Fuel pressure regulator control circuit low. General fault information. Type of fault not specified.
P0092	**ECM-P009200**	Fuel pressure regulator control circuit high. General fault information. Type of fault not specified.
P0101	**ECM-P010100**	Air mass or volume air flow circuit within/exceeding limit values. General fault information. Type of fault not specified.
P0102	**ECM-P010200**	Air mass or volume, airflow circuit low input signal. General fault information. Type of fault

		not specified.
P0103	**ECM-P010300**	Air mass or volume, airflow circuit high input signal. General fault information. Type of fault not specified.
P0106	**ECM-P010600**	Manifold Absolute Pressure/BARO Sensor Range/Performance. General Failure Information. No sub type information
P0107	**ECM-P010700**	Manifold absolute pressure/BARO sensor low input. General fault information. Type of fault not specified.
P0108	**ECM-P010800**	Manifold absolute pressure/BARO sensor high input. General fault information. Type of fault not specified.
P0111	**ECM-P011100**	Intake air temperature sensor 1 circuit within/exceeding limit values. General fault information. Type of fault not specified.
P0112	**ECM-P011200**	Intake air temperature sensor 1 circuit low input signal. General fault information. Type of fault not specified.
P0113	**ECM-P011300**	Intake air temperature sensor 1 circuit high input signal. General fault information. Type of fault not specified.
P0114	**ECM-P011400**	Intake air temperature sensor 1 intermittent/irregular. General fault information. Type of fault not specified.
P0116	**ECM-P011600**	Coolant temperature circuit within/outside the range. General fault information. No information about fault type
P0117	**ECM-P011700**	Coolant temperature circuit low input signal. General fault information. No information about fault type
P0118	**ECM-P011800**	Coolant temperature circuit high input signal. General fault information. No information about fault type
P0122	**ECM-P012200**	Throttle/pedal position sensor A circuit low input signal. General fault information. No information about fault type.
P0123	**ECM-P012300**	Throttle/pedal position sensor A circuit high input signal. General fault information. No information about fault type.
P0128	**ECM-P012800**	Coolant thermostat (coolant temperature lower than thermostat-control temperature. General malfunction information. No information on malfunction type
P0131	**ECM-P013100**	O2 Circuit Low Voltage (Bank 1, Sensor 1).

		General Failure Information. No sub type information
P0132	**ECM-P013200**	O2 Circuit High Voltage (Bank 1, Sensor 1). General Failure Information. No sub type information
P0133	**ECM-P013300**	Heated oxygen sensor (HO2S) slow response (bank 1, sensor 1). General fault information. No information about fault type
P0134	**ECM-P013400**	Heated oxygen sensor (HO2S) circuit no activity registered (bank 1, sensor 1). General fault information. No information about fault type
P0136	**ECM-P013600**	Heated oxygen sensor (HO2S) circuit (bank 1, sensor 2). General fault information. No information about fault type
P0137	**ECM-P013700**	Heated oxygen sensor (HO2S) circuit low voltage (bank 1, sensor 2). General fault information. No information about fault type
P0138	**ECM-P013800**	Heated oxygen sensor (HO2S) circuit high voltage (bank 1, sensor 2). General fault information. No information about fault type
P0151	**ECM-P015100**	O2 Circuit Low Voltage (Bank 2, Sensor 1). General Failure Information. No sub type information
P0152	**ECM-P015200**	O2 Circuit High Voltage (Bank 2, Sensor 1). General Failure Information. No sub type information
P0153	**ECM-P015300**	Heated oxygen sensor (HO2S) slow response (bank 2, sensor 1). General fault information. No information about fault type
P0154	**ECM-P015400**	Heated oxygen sensor (HO2S) circuit no activity registered (bank 2, sensor 1). General fault information. No information about fault type
P0156	**ECM-P015600**	Heated oxygen sensor (HO2S) circuit (bank 2, sensor 2). General fault information. No information about fault type
P0157	**ECM-P015700**	Heated oxygen sensor (HO2S) circuit low voltage (bank 2, sensor 2). General fault information. No information about fault type
P0158	**ECM-P015800**	Heated oxygen sensor circuit high voltage (bank 2, sensor 2). General malfunction information. No information on malfunction type
P0171	**ECM-P017100**	System too lean (bank 1). General malfunction information. No information on malfunction

		type
P0172	**ECM-P017200**	System too rich (bank 1). General malfunction information. No information on malfunction type
P0174	**ECM-P017400**	System too lean (bank 2). General malfunction information. No information on malfunction type
P0175	**ECM-P017500**	System too rich (bank 2). General malfunction information. No information on malfunction type
P0181	**ECM-P018100**	Fuel pressure temperature sensor A circuit within/outside range. General fault information. No information about fault type
P0182	**ECM-P018200**	Fuel temperature sensor A circuit low input signal. General fault information. No information about fault type
P0183	**ECM-P018300**	Fuel temperature sensor A circuit high input signal. General fault information. No information about fault type

P0574	**ECM-P057400**	Cruise Control System - Vehicle Speed Too High. General Failure Information. No sub type information
P0603	**ECM-P060300**	Internal malfunction in control module (KAM). General malfunction information. No information on malfunction type
P0607	**ECM-P060700**	Control module performance. General fault information. No information about fault type
P0615	**ECM-P061500**	Starter relay circuit. General fault information. Type of fault not specified.
P0616	**ECM-P061600**	Starter relay circuit low. General fault information. Type of fault not specified.
P0617	**ECM-P061700**	Starter relay circuit high. General fault information. Type of fault not specified.
P061A	**ECM-P061A62**	Internal Control Module Torque Performance. Algorithm Based Failures. Signal compare failure
P0620	**ECM-P062001**	Generator Control Circuit. General Failure Information. General electrical failure
P0620	**ECM-P06204B**	Generator Control Circuit. System Internal Failures. Over temperature
P0620	**ECM-P062074**	Generator Control Circuit. Mechanical Failures. Actuator slipping
P0628	**ECM-P062800**	Fuel pump A control circuit low. General fault information. No information about fault type
P0629	**ECM-P062900**	Fuel pump A control circuit high. General fault information. No information about fault type
P0634	**ECM-P063400**	PCM/ECM/TCM Internal temperature too high. General malfunction information. No information on malfunction type
P0641	**ECM-P064100**	Sensor reference voltage A open circuit. General malfunction information. No

		information on malfunction type
P0645	**ECM-P064500**	A/C connection relay control circuit. General malfunction information. No information on malfunction type
P0646	**ECM-P064600**	A/C connection relay control circuit low. General malfunction information. No information on malfunction type
P0647	**ECM-P064700**	A/C connection relay control circuit high. General malfunction information. No information on malfunction type
P0661	**ECM-P066100**	Intake manifold control valve control circuit low - bank 1. General fault information. No information about fault type
P0662	**ECM-P066200**	Intake manifold control valve control circuit high - bank 1. General fault information. No information about fault type
P0668	**ECM-P066800**	PCM/ECM/TCM internal temperature sensor circuit low. General malfunction information. No information on malfunction type
P0685	**ECM-P068500**	ECM/PCM power relay control circuit/open circuit. General malfunction information. No information on malfunction type
P0691	**ECM-P069100**	Fan 1 control circuit low. General fault information. Type of fault not specified.
P0692	**ECM-P069200**	Fan 1 control circuit high. General fault information. Type of fault not specified.
P0737	**ECM-P073700**	TCM engine rpm output circuit. General malfunction information. No information on malfunction type
P1126	**ECM-P112600**	Throttle Position (Narrow Range) Sensor Circuit. General Failure Information. No sub type information
P1224	**ECM-P122400**	Throttle Position Sensor B Out Of Self Test Range. General Failure Information. No sub type information
P1250	**ECM-P125000**	Throttle Valve Spring. General Failure Information. No sub type information
P1260	**ECM-P126000**	Theft registered, vehicle immobilized. General malfunction information. No information on malfunction type
P1270	**ECM-P127000**	Engine rpm or speed limitation reached. General malfunction information. No information on malfunction type
P1572	**ECM-P157200**	Bake pedal switch circuit. General fault information. Type of fault not specified.

P1574	ECM-P157400	Throttle position sensor output signals are not correct. General malfunction information. No information on malfunction type
P1589	ECM-P158900	Throttle Control Unable To Control To Desired Throttle Angle. General Failure Information. No sub type information
P1602	ECM-P160200	Immobilizer/ECM communication error. General malfunction information. No information on malfunction type
P1638	ECM-P163800	CAN-link ECM/INSTM circuit/network. General malfunction information. No information on malfunction type
P1709	ECM-P170900	Parking/neutral position switch outside self-test range. General malfunction information. No information on malfunction type
P1771	ECM-P177100	Throttle Position Sensor Circuit High Input. General Failure Information. No sub type information
P1772	ECM-P177200	Electronic throttle unit low input signal. General malfunction information. No information on malfunction type
P1934	ECM-P193400	Speed signal vehicle. General malfunction information. No information on malfunction type
P2004	ECM-P200400	Intake Manifold Runner Control Stuck Open (Bank 1). General Failure Information. No sub type information
P2006	ECM-P200600	Variable intake stuck in closed position (bank 1). General fault information. No information about fault type
P2067	ECM-P206700	Fuel level sensor B circuit low. General malfunction information. No information on malfunction type
P2096	ECM-P209600	Post Catalyst Fuel Trim System Too Lean Bank 1. General Failure Information. No sub type information
P2106	ECM-P210600	Throttle Actuator Control System - Forced Limited Power. General Failure Information. No sub type information
P2111	ECM-P211100	Electronic throttle unit control system - jammed in open position. General malfunction information. No information on malfunction type
P2118	ECM-P211800	Throttle Actuator Control Motor Current Range/Performance. General Failure Information. No sub type information

P2135	**ECM-P213500**	Throttle/pedal position sensor/contact A/B voltage correlation. General fault information. Type of fault not specified.
P2158	**ECM-P215886**	Vehicle Speed Sensor B. Bus Signal / Message Failures. Signal invalid
P2162	**ECM-P216200**	Speed sensor A/B correlation. General malfunction information. No information on malfunction type
P2175	**ECM-P217500**	Electronic throttle unit control system - low air flow registered. General malfunction information. No information on malfunction type
P2227	**ECM-P222700**	Barometric Pressure Circuit High Input. General Failure Information. No sub type information
P2228	**ECM-P222800**	Atmospheric pressure circuit low input signal. General fault information. Type of fault not specified.
P2270	**ECM-P227000**	O2 Sensor Signal Stuck Lean - Bank 1, Sensor 2. General Failure Information. No sub type information
P2271	**ECM-P227100**	O2 Sensor Signal Stuck Rich - Bank 1, Sensor 2. General Failure Information. No sub type information
P2272	**ECM-P227200**	O2 Sensor Signal Stuck Lean - Bank 2, Sensor 2. General Failure Information. No sub type information
P2273	**ECM-P227300**	O2 Sensor Signal Stuck Rich - Bank 2, Sensor 2. General Failure Information. No sub type information
p2401	**ECM-P240100**	EVAP emission system, leakage diagnosis pump control circuit low. General fault information. Type of fault not specified.
P2402	**ECM-P240200**	EVAP emission system, leakage diagnosis pump control circuit high. General fault information. Type of fault not specified.
P2408	**ECM-P240800**	Tank cap sensor/contact circuit. General fault information. Type of fault not specified.
P240B	**ECM-P240B00**	EVAP emission system, leakage diagnosis pump heating circuit low. General fault information. Type of fault not specified.
P240C	**ECM-P240C00**	EVAP emission system, leakage diagnosis pump heating circuit high. General fault information. Type of fault not specified.
P2419	**ECM-P241900**	Tank ventilation system changeover valve

		control circuit low. General fault information. Type of fault not specified.
P2420	**ECM-P242000**	Tank ventilation system changeover valve control circuit low. General fault information. Type of fault not specified.
P2421	**ECM-P242100**	Evaporative Emission Control System Vent Valve Stuck Open. General Failure Information. No sub type information
P2422	**ECM-P242200**	Evaporative Emission Control System Vent Valve Stuck Closed. General Failure Information. No sub type information
P250C	**ECM-P250C00**	Oil level sensor circuit low. General fault information. Type of fault not specified.
P250D	**ECM-P250D00**	Oil level sensor circuit high. General fault information. Type of fault not specified.
P250E	**ECM-P250E00**	Oil level sensor circuit intermittent/irregular. General fault information. Type of fault not specified.
P252B	**ECM-P252B00**	Oil quality sensor circuit within/exceeding limit values. General fault information. Type of fault not specified.
P252C	**ECM-P252C00**	Oil quality sensor circuit low. General fault information. Type of fault not specified.
P252D	**ECM-P252D00**	Oil quality sensor circuit high. General fault information. Type of fault not specified.
P2610	**ECM-P261000**	ECM/PCM internal engine shut-down timer performance. General malfunction information. No information on malfunction type
U0001	**ECM-U000100**	HS-CAN communication bus. General malfunction information. No information on malfunction type

GLOBAL POSITIONING SYSTEM (GPS) DTCS

GLOBAL POSITIONING SYSTEM (GPS) - DTC INDEX

DTC	Description
GPS-0001	Antenna GPS. Signal missing
GPS-0002	Antenna GPS. Signal too high
GPS-0003	Control module. Internal fault

HEADLAMP CONTROL MODULE (HCM) DTCS

HEADLAMP CONTROL MODULE (HCM) - DTC INDEX

DTC	Description
HCM-B104076	Lamp Unit. Mechanical Failures. Wrong mounting position (B8444S)
HCM-B104076	Lamp Unit. Mechanical Failures. Wrong mounting position (B6324S)
HCM-B1D6401	Left Headlamp Swivelling Motor Circuit. General Failure Information. General electrical failure (B6324S)
HCM-B1D6401	Left Headlamp Swivelling Motor Circuit. General Failure Information. General electrical failure (B8444S)
HCM-B1D6477	Left Headlamp Swivelling Motor Circuit. Mechanical Failures. Commanded position not reachable (B6324S)
HCM-B1D6477	Left Headlamp Swivelling Motor Circuit. Mechanical Failures. Commanded position not reachable (B8444S)
HCM-B1D6501	Right Headlamp Swivelling Motor Circuit. General Failure Information. General electrical failure (B6324S)
HCM-B1D6501	Right Headlamp Swivelling Motor Circuit. General Failure Information. General electrical failure (B8444S)
HCM-B1D6577	Right Headlamp Swivelling Motor Circuit. Mechanical Failures. Commanded position not reachable (B6324S)
HCM-B1D6577	Right Headlamp Swivelling Motor Circuit. Mechanical Failures. Commanded position not reachable (B8444S)
HCM-B1D6616	Left Headlamp Power Module. General Electrical Failures. Circuit voltage below threshold (B6324S)
HCM-B1D6616	Left Headlamp Power Module. General Electrical Failures. Circuit voltage below threshold (B8444S)
HCM-B1D6716	Right Headlamp Power Module. General Electrical Failures. Circuit voltage below threshold (B6324S)
HCM-B1D6716	Right Headlamp Power Module. General Electrical Failures. Circuit voltage below threshold (B8444S)
HCM-P060141	Internal Control Module Memory Check Sum Error. System Internal Failures. General checksum failure (B6324S)
HCM-P060141	Internal Control Module Memory Check Sum Error. System Internal Failures. General checksum failure (B8444S)
HCM-U000100	High Speed CAN Communication Bus. General Failure Information. No sub type information (B6324S)
HCM-U000100	High Speed CAN Communication Bus. General Failure Information. No sub type information (B8444S)
HCM-U012687	Lost Communication With Steering Angle Sensor Module. Bus Signal/Message Failures. Missing message (B6324S)
HCM-U012687	Lost Communication With Steering Angle Sensor Module. Bus Signal/Message Failures. Missing message (B8444S)
HCM-U012987	Lost Communication With Brake Control Module. Bus Signal/Message Failures. Missing message (B6324S)
HCM-U012987	Lost Communication With Brake Control Module. Bus

	Signal/Message Failures. Missing message (B8444S)
HCM-U030000	Internal Control Module Software Incompatibility. General Failure Information. No sub type information (B6324S)
HCM-U030000	Internal Control Module Software Incompatibility. General Failure Information. No sub type information (B8444S)
HCM-U042281	Invalid Data Received From Central electronic module. Bus Signal/Message Failures. Invalid serial data received (B6324S)
HCM-U042281	Invalid Data Received From Central electronic module. Bus Signal/Message Failures. Invalid serial data received (B8444S)
HCM-U054283	Invalid Data Received From Headlamp Control Module "A". Bus Signal/Message Failures. Value of signal protection calculation incorrect (B6324S)
HCM-U054283	Invalid Data Received From Headlamp Control Module "A". Bus Signal/Message Failures. Value of signal protection calculation incorrect (B8444S)
HCM-U054286	Invalid Data Received From Headlamp Control Module "A". Bus Signal/Message Failures. Signal invalid (B6324S)
HCM-U054286	Invalid Data Received From Headlamp Control Module "A". Bus Signal/Message Failures. Signal invalid (B8444S)
HCM-U054288	Invalid Data Received From Headlamp Control Module "A". Bus Signal/Message Failures. Bus off (B6324S)
HCM-U054288	Invalid Data Received From Headlamp Control Module "A". Bus Signal/Message Failures. Bus off (B8444S)
HCM-U054383	Invalid Data Received From Headlamp Control Module "B". Bus Signal/Message Failures. Value of signal protection calculation incorrect (B6324S)
HCM-U054383	Invalid Data Received From Headlamp Control Module "B". Bus Signal/Message Failures. Value of signal protection calculation incorrect (B8444S)
HCM-U054386	Invalid Data Received From Headlamp Control Module "B". Bus Signal/Message Failures. Signal invalid (B6324S)
HCM-U054386	Invalid Data Received From Headlamp Control Module "B". Bus Signal/Message Failures. Signal invalid (B8444S)
HCM-U054388	Invalid Data Received From Headlamp Control Module "B". Bus Signal/Message Failures. Bus off (B6324S)
HCM-U054388	Invalid Data Received From Headlamp Control Module "B". Bus Signal/Message Failures. Bus off (B8444S)
HCM-U1A3887	Lost Communication With Left Headlamp Module. Bus Signal/Message Failures. Missing message (B6324S)
HCM-U1A3887	Lost Communication With Left Headlamp Module. Bus Signal/Message Failures. Missing message (B8444S)
HCM-U1A3987	Lost Communication With Right Headlamp Module. Bus Signal/Message Failures. Missing message (B6324S)
HCM-U1A3987	Lost Communication With Right Headlamp Module. Bus Signal/Message Failures. Missing message (B8444S)

HCM-U300316	Battery Voltage. General Electrical Failures. Circuit voltage below threshold (B6324S)
HCM-U300316	Battery Voltage. General Electrical Failures. Circuit voltage below threshold (B8444S)
HCM-U300317	Battery Voltage. General Electrical Failures. Circuit voltage above threshold (B6324S)
HCM-U300317	Battery Voltage. General Electrical Failures. Circuit voltage above threshold (B8444S)

INTEGRATED AUDIO MODULE (IAM) DTCS

INTEGRATED AUDIO MODULE (IAM) - DTC INDEX

DTC	Description
IAM-1001	AM/FM antenna. No signal
IAM-1002	AM/FM antenna. Faulty signal
IAM-2001	Control module. Internal fault
IAM-2002	Control module. Internal fault
IAM-2003	Control module. Internal fault
IAM-2004	Control module. Internal fault
IAM-2005	Control module. Internal fault
IAM-3001	Front left speaker. Signal too low
IAM-3002	Front left speaker. Signal too high
IAM-3003	Front left speaker. Faulty signal
IAM-3004	Front left speaker. No signal
IAM-3005	Front left speaker. Faulty signal
IAM-3011	Front right speaker. Signal too low

IAM-3013	Front right speaker. Faulty signal
IAM-3014	Front right speaker. No signal
IAM-3015	Front right speaker. Faulty signal
IAM-3021	Rear left speaker. Signal too low
IAM-3022	Rear left speaker. Signal too high
IAM-3023	Rear left speaker. Faulty signal
IAM-3024	Rear left speaker. No signal
IAM-3025	Rear left speaker. Faulty signal
IAM-3031	Rear right speaker. Signal too low
IAM-3032	Rear right speaker. Signal too high
IAM-3033	Rear right speaker. Faulty signal
IAM-3034	Rear right speaker. No signal
IAM-3035	Rear right speaker. Faulty signal
IAM-9001	Control module. Configuration fault
IAM-9002	Control module. Overheated

IAM-XXXX	Unspecified Diagnostic Trouble Code (DTC) for current control module version

INFOTAINMENT CONTROL MODULE (ICM) DTCS

INFOTAINMENT CONTROL MODULE (ICM) - DTC INDEX

DTC	Description
ICM-1A02	Control module. Faulty voltage
ICM-1A51	Communication with the audio module (AUD). Signal missing
ICM-1A53	Communication with the multimedia module (MMM). Signal missing
ICM-1A54	Communication with the Subwoofer module (SUB). Signal missing
ICM-1A57	Communication with the phone module (PHM). Signal missing
ICM-1A58	Communication with the Global positioning system module (GPS). Signal missing
ICM-1A5A	Communication with integrated audio module (IAM). Signal missing
ICM-1A5B	Communication with Remote Digital Audio Receiver (RDAR) Signal missing
ICM-1A5D	Communication With Accessory USB Unit (AUU) Signal missing
ICM-1D01	Control module. Internal fault
ICM-1D03	Control module, not fully programmed. Internal fault
ICM-1D07	Control module. Internal fault
ICM-1D08	Control module. Internal fault
ICM-1F20	Left keypad. Activated too long
ICM-1F21	Left-hand keypad circuit 1. Signal too high/too low
ICM-1F22	Left-hand keypad circuit 2. Signal too high/too low
ICM-1F23	Left-hand keypad circuit 3. Signal too high/too low
ICM-1F24	Left-hand keypad circuit 4. Signal too high/too low
ICM-1F25	Right-hand keypad circuit 5. Signal too high/too low
ICM-1F26	Right keypad. Activated too long
ICM-1F27	Right-hand keypad circuit 1. Signal too high/too low
ICM-1F28	Right-hand keypad circuit 2. Signal too high/too low
ICM-1F29	POWER button. Signal too high/low
ICM-1F30	POWER button. Activated too long
ICM-1F31	SOUND button. Activated too long
ICM-1F32	VOLUME knob. Signal missing
ICM-1F33	SELECTOR knob. Signal missing
ICM-1F34	VOLUME knob. Faulty signal
ICM-1F35	SELECTOR knob. Faulty signal
ICM-1F36	Display heater. Faulty voltage
ICM-1F38	Display Temperature Sensor Faulty Voltage
ICM-6C71	Audio module (AUD) not approved. Faulty signal
ICM-6C72	Multimedia module (MMM) not approved. Faulty signal

ICM-6C73	Subwoofer module (SUB) not approved. Faulty signal
ICM-6C76	Phone module (PHM) not approved. Faulty signal
ICM-6C77	Global Positioning Module (GPS) not valid. Faulty signal
ICM-6C79	Infotainment control module (ICM) not valid. Faulty signal
ICM-6C7A	Integrated audio module (IAM) not valid. Faulty signal
ICM-6C7B	Remote Digital Audio Receiver (RDAR) not valid Faulty signal
ICM-6C7D	Accessory USB Unit (AUU) not valid Faulty signal
ICM-DC00	Control module communication. Internal fault
ICM-DC01	Control module communication. Faulty signal
ICM-DC02	Control module communication. Signal missing
ICM-E001	Control module communication. Internal fault
ICM-E003	Configuration fault. Software fault
ICM-E010	Power supply. Signal too low
ICM-XXXX	Unknown diagnostic trouble code (DTC) for the current control module version

MULTIMEDIA MODULE (MMM) DTCS

MULTIMEDIA MODULE (MMM) - DTC INDEX

DTC	Description
MMM-1000	Control module. Internal fault
MMM-1010	Control module. Internal fault
MMM-1020	Control module. Internal fault
MMM-2000	Control module. Internal fault
MMM-2010	Control module. Internal fault
MMM-2100	Control module. Internal fault
MMM-2110	Control module. Internal fault
MMM-3100	GPS-antenna. Open circuit
MMM-3110	GPS-antenna. Ground (GND) short
MMM-4000	Control module. Internal fault
MMM-5000	Control module. Internal fault
MMM-5010	Control module. Internal fault
MMM-5020	Control module. Internal fault
MMM-6000	Control module Faulty configuration
MMM-XXXX	Unknown diagnostic trouble code (DTC) for the current control module version

PASSENGER DOOR MODULE (PDM) DTCS

PASSENGER DOOR MODULE (PDM) - DTC INDEX

DTC	Description
PDM-001D	Central locking button. Faulty signal

PDM-0034	Control, passenger window. Faulty signal
PDM-0035	Control, passenger window. Faulty signal
PDM-003A	Door mirror lamp. Signal too low
PDM-003E	Control module. Signal too high
PDM-0040	Outside temperature sensor. Signal too high
PDM-0041	Outside temperature sensor. Signal missing
PDM-0042	Control module. Internal fault
PDM-0043	Control module. Internal fault
PDM-E001	Control module communication. Faulty communication
PDM-E003	Configuration fault. Faulty configuration
PDM-XXXX	Unknown diagnostic trouble code (DTC) for the current control module version

PHONE MODULE (PHM) DTCS

PHONE MODULE (PHM) - DTC INDEX

DTC	Description
PHM-0008	Reserve microphone. Signal too high/Signal missing
PHM-000A	Reserve microphone. Signal too low
PHM-000B	Handset cradle. Signal too high/Signal missing
PHM-000D	Handset microphone. Signal too low
PHM-000F	Handset loudspeaker. Signal too high/Signal missing
PHM-0010	Handset loudspeaker. Signal too low
PHM-0012	Handset supply. Signal too low
PHM-0013	Control module. Internal fault
PHM-0014	Carphone antenna. Signal too high/Signal missing
PHM-0015	Control module. Internal fault
PHM-0020	Handset microphone. Signal too high/Signal missing
PHM-0022	Handset supply. Signal too high
PHM-0030	Reserve battery. Voltage too low
PHM-003A	Internal antenna. Signal missing
PHM-0040	SIM card. Internal fault
PHM-0063	Lighting switch. Signal too high/Signal missing
PHM-0064	Lighting switch. Signal too low
PHM-0065	Volvo On Call switch. Signal too low or signal missing
PHM-0066	Volvo On Call switch. Signal too high
PHM-0067	Reserv battery. Not connected
PHM-0068	SIM card holder. Signal missing
PHM-006B	Control module memory fault. Internal fault
PHM-006C	Handset cradle. Signal too low
PHM-0070	Control module. Incorrect software

PHM-0080	Volvo On Call switch. Incorrect keypad installed
PHM-0082	Volvo On Call switch. Activated too long
PHM-0090	Control module. Incorrect software
PHM-E001	Control module communication. Faulty communication
PHM-E003	Configuration fault. Faulty configuration
PHM-E010	Power supply. Faulty signal
PHM-XXXX	Unknown diagnostic trouble code (DTC) for the current control module version

POWER SEAT MODULE (PSM) DTCS

POWER SEAT MODULE (PSM) - DTC INDEX

DTC	Description
PSM-0001	Hall sensor 1. Faulty signal. Intermittent fault
PSM-0001	Hall sensor 1. Faulty signal. Permanent fault
PSM-0002	Hall sensor 2. Faulty signal. Intermittent fault
PSM-0002	Hall sensor 2. Faulty signal. Permanent fault
PSM-0003	Hall sensor 3. Faulty signal. Intermittent fault
PSM-0003	Hall sensor 3. Faulty signal. Permanent fault
PSM-0004	Hall sensor 4. Faulty signal. Intermittent fault
PSM-0004	Hall sensor 4. Faulty signal. Permanent fault
PSM-0019	Memory function 1. Internal fault. Intermittent fault

PSM-0029	Operating button, memory 2. Too slow. Permanent fault
PSM-002A	Operating button, memory 3. Too slow. Intermittent fault
PSM-002A	Operating button, memory 3. Too slow. Permanent fault
PSM-002B	Memory button. Too slow. Permanent fault
PSM-002B	Memory button. Too slow. Intermittent fault
PSM-002C	Button combination not permissible, M1+ and M1-. Faulty signal. Intermittent fault
PSM-002C	Button combination not permissible, M1+ and M1-. Faulty signal. Permanent fault
PSM-002D	Button combination not permissible, M2+ and M2-. Faulty signal. Intermittent fault
PSM-002D	Button combination not permissible, M2+ and M2-. Faulty signal. Permanent fault
PSM-002E	Button combination not permissible, M3+ and M3-. Faulty signal. Intermittent fault
PSM-002E	Button combination not permissible, M3+ and M3-. Faulty signal. Permanent fault
PSM-002F	Button combination not permissible, M4+ and M4-. Faulty signal. Intermittent fault
PSM-002F	Button combination not permissible, M4+ and M4-. Faulty signal. Permanent fault
PSM-0030	Front-rear adjustment, Motor 1 (M1+). Signal missing. Intermittent fault
PSM-0030	Front-rear adjustment, Motor 1 (M1+). Signal missing. Permanent fault
PSM-0031	Front-rear adjustment, Motor 1 (M1-). Signal missing. Intermittent fault
PSM-0031	Front-rear adjustment, Motor 1 (M1-). Signal missing. Permanent fault
PSM-0032	Backrest, Motor 2 (M2+). Signal missing. Intermittent fault
PSM-0032	Backrest, Motor 2 (M2+). Signal missing. Permanent fault
PSM-0033	Backrest, Motor 2 (M2-). Signal missing. Intermittent fault
PSM-0033	Backrest, Motor 2 (M2-). Signal missing. Permanent fault
PSM-0034	Seat rear edge, Motor 3 (M3+). Signal missing. Intermittent fault
PSM-0034	Seat rear edge, Motor 3 (M3+). Signal missing. Permanent fault

PSM-0035	Seat rear edge, Motor 3 (M3-). Signal missing. Intermittent fault
PSM-0035	Seat rear edge, Motor 3 (M3-). Signal missing. Permanent fault
PSM-0036	Seat front edge, Motor 4 (M4+). Signal missing. Permanent fault
PSM-0036	Seat front edge, Motor 4 (M4+). Signal missing. Intermittent fault
PSM-0037	Seat front edge, Motor 4 (M4-). Signal missing. Intermittent fault
PSM-0037	Seat front edge, Motor 4 (M4-). Signal missing. Permanent fault
PSM-0038	Wrong software
PSM-003A	Hall sensor 1. Faulty signal. Intermittent fault
PSM-003A	Hall sensor 1. Faulty signal. Permanent fault
PSM-003B	Hall sensor 2. Faulty signal. Intermittent fault
PSM-003B	Hall sensor 2. Faulty signal. Permanent fault
PSM-003C	Hall sensor 3. Faulty signal. Intermittent fault
PSM-003C	Hall sensor 3. Faulty signal. Permanent fault
PSM-003D	Hall sensor 4. Faulty signal. Intermittent fault
PSM-003D	Hall sensor 4. Faulty signal. Permanent fault
PSM-E001	Control module communication. Faulty communication
PSM-E003	Configuration fault. Faulty configuration
PSM-XXXX	Unknown diagnostic trouble code (DTC) for the current control module version

REAR ELECTRONIC MODULE (REM) DTCS

REAR ELECTRONIC MODULE (REM) - DTC INDEX

DTC	Description
REM-1D01	Control module. Internal fault
REM-1D02	Control module. Internal fault
REM-1D03	Control module, not fully programmed Internal fault
REM-1D07	Control module. Internal fault
REM-1D08	Control module. Internal fault
REM-1D0A	Control module. Internal fault
REM-1F8C	Trailer foglight driver, signal or temperature too high
REM-4A40	Gas temperature sensor. Signal too high
REM-4A41	Gas temperature sensor. Signal too low
REM-4A42	Gas pressure sensor. Signal too high
REM-4A43	Gas pressure sensor. Signal too low
REM-4A44	Fuel level, gas. Faulty signal
REM-4A45	Fuel level, gas. Signal too high
REM-4A46	Fuel level, gas. Signal too low
REM-4A47	Fuel level, gas. Signal too low
REM-4A48	Fuel level, gas. Signal too high
REM-4F42	Parking sensor 1. Faulty signal

REM-4F43	Parking sensor 2. Faulty signal
REM-4F44	Parking sensor 3. Faulty signal
REM-4F45	Parking sensor 4. Faulty signal
REM-4F46	Parking sensor 5. Faulty signal
REM-4F47	Parking sensor 6. Faulty signal
REM-4F48	Parking sensor 7. Faulty signal
REM-4F49	Parking sensor 8. Faulty signal
REM-4F4A	Parking assistance module (PAM). Faulty signal
REM-6A01	Switch, central locking motor. Signal too high
REM-6A02	Switch central locking motor. Signal too high
REM-6A03	Switch central locking motor. Signal too low
REM-6A04	Switch central locking motor. Signal too low
REM-6A05	Switch locking motor child-proof lock. Faulty signal
REM-6A06	Switch locking motor child-proof lock. Faulty signal
REM-6A07	Power child lock motor switch. Faulty signal
REM-6A08	Power child lock motor switch. Faulty signal
REM-6A09	Power child lock motor switch. Faulty signal
REM-6A0A	Power child lock motor switch. Faulty signal
REM-6A10	Door switch. Signal too high
REM-6A11	Door switch. Signal too high
REM-6A12	Door switch. Signal too high
REM-6A13	Door switch. Signal too high
REM-6A14	Hood switch. Signal too high
REM-6A15	Switch, tailgate. Signal too high
REM-6C11	Tilt sensor. Signal too high
REM-6C12	Tilt sensor. Signal too low
REM-6C15	Tilt sensor. Communication fault
REM-6C16	Tilt sensor. Internal fault
REM-6C17	Glass break wire. Signal missing
REM-6C18	Glass break wire. Signal too high
REM-6F51	Tailgate handle. Signal too low
REM-7A20	Subwoofer X-feed, signal or temperature too high
REM-8B01	Parking lamps right. Signal too low
REM-8B11	Parking lamps left. Signal too low
REM-8B21	License plate lighting. Signal too low
REM-8C21	Rear fog lamp. Signal too low
REM-8D11	High level stop lamp. Signal too low
REM-8D12	High level stop lamp. Signal too high
REM-8F10	Position sensor xenon lamp. Signal too high
REM-8F11	Xenon lamp position sensor. Signal too low
REM-8F12	Xenon lamp position sensor. Not calibrated
REM-8F13	

	Position sensor xenon lamp. Calibration fault
REM-9F21	Cargo compartment lighting. Signal too low
REM-DD00	LIN communication. Communication fault
REM-DD01	LIN communication. Communication fault
REM-DD02	LIN communication. Communication fault
REM-DD10	LIN communication. Communication fault
REM-DD20	Level sensor alarm. Communication fault
REM-DD21	Level sensor alarm. Faulty signal
REM-E001	Control module communication. Defective communication
REM-E003	Configuration fault. Faulty configuration
REM-E010	Power supply control module. Signal too low
REM-XXXX	Unknown diagnostic trouble code (DTC) for the current control module version

STEERING ANGLE SENSOR (SAS) DTCS

STEERING ANGLE SENSOR (SAS) - DTC INDEX

DTC	Description
SAS-C008B64	Excessive steering angle. Algorithm fault. Inappropriate signal (B6324S)
SAS-C008B64	Excessive steering angle. Algorithm fault. Inappropriate signal (B8444S)
SAS-C008C64	Excessive rate of change of steering angle. Algorithm fault. Inappropriate signal (B6324S)
SAS-C008C64	Excessive rate of change of steering angle. Algorithm fault. Inappropriate signal (B8444S)
SAS-C008D05	Steering Angle Sensor (SAS) - ECU internal fault. General information. Programming fault (B6324S)
SAS-C008D05	Steering Angle Sensor (SAS) - ECU internal fault. General information. Programming fault (B8444S)
SAS-C008E44	Steering Angle Sensor (SAS) - ECU stack overrun. Internal fault. Data memory fault (B6324S)
SAS-C008E44	Steering Angle Sensor (SAS) - ECU stack overrun. Internal fault. Data memory fault (B8444S)
SAS-C008F44	Steering Angle Sensor (SAS) - double check fault. Internal fault. Data memory fault (B6324S)
SAS-C008F44	Steering Angle Sensor (SAS) - double check fault. Internal fault. Data memory fault (B8444S)
SAS-C009005	Steering Angle Sensor (SAS) - RAM check-sum fault. General information. Programming fault (B6324S)
SAS-C009005	Steering Angle Sensor (SAS) - RAM check-sum fault. General information. Programming fault (B8444S)
SAS-C009102	Steering Angle Sensor (SAS) - analogue-digital converter LED fault.

	General fault information. General signal fault (B6324S)
SAS-C009102	Steering Angle Sensor (SAS) - analogue-digital converter LED fault. General fault information. General signal fault (B8444S)
SAS-C009205	Steering Angle Sensor (SAS) - task overstepping CAN MCU (main ECU). General information. Programming fault (B6324S)
SAS-C009205	Steering Angle Sensor (SAS) - task overstepping CAN MCU (main ECU). General information. Programming fault (B8444S)
SAS-C009305	Steering Angle Sensor (SAS) - task overstepping double control CAN MCU (main ECU). General information. Programming fault (B6324S)
SAS-C009305	Steering Angle Sensor (SAS) - task overstepping double control CAN MCU (main ECU). General information. Programming fault (B8444S)
SAS-C009404	Steering Angle Sensor (SAS) analogue-digital converter. General fault information. Internal fault (B6324S)
SAS-C009404	Steering Angle Sensor (SAS) analogue-digital converter. General fault information. Internal fault (B8444S)
SAS-C009513	Steering Angle Sensor (SAS) - no internal ground or 12 V connection. General electrical fault. Open circuit (B6324S)
SAS-C009513	Steering Angle Sensor (SAS) - no internal ground or 12 V connection. General electrical fault. Open circuit (B8444S)
SAS-C009687	The Steering Angle Sensor (SAS) lacks vehicle configuration data. Bus or message fault. Missing message (B6324S)
SAS-C009687	The Steering Angle Sensor (SAS) lacks vehicle configuration data. Bus or message fault. Missing message (B8444S)
SAS-C009781	Steering Angle Sensor (SAS) invalid total parameter value. Bus or message fault. Faulty data received (B6324S)
SAS-C009781	Steering Angle Sensor (SAS) invalid total parameter value. Bus or message fault. Faulty data received (B8444S)
SAS-C009887	The Steering Angle Sensor (SAS) lacks an ignition switch signal. Bus or message fault. Missing message (B6324S)
SAS-C009887	The Steering Angle Sensor (SAS) lacks an ignition switch signal. Bus or message fault. Missing message (B8444S)
SAS-C009904	Steering Angle Sensor (SAS). General fault information. Internal fault (B6324S)
SAS-C009904	Steering Angle Sensor (SAS). General fault information. Internal fault (B8444S)
SAS-C009D01	Steering Angle Sensor (SAS) analogue-digital converter fault. General fault information. General electrical fault (B6324S)
SAS-C009D01	Steering Angle Sensor (SAS) analogue-digital converter fault. General fault information. General electrical fault (B8444S)
SAS-C009E64	CPU to CPU communication fault. Algorithm fault. Inappropriate signal (B6324S)
SAS-C009E64	CPU to CPU communication fault. Algorithm fault. Inappropriate

	signal (B8444S)
SAS-C009F64	Invalid Grey code. Algorithm fault. Inappropriate signal (B6324S)
SAS-C009F64	Invalid Grey code. Algorithm fault. Inappropriate signal (B8444S)
SAS-C010029	Analogue sensor 1 outside limit. General signal fault. Signal invalid (B6324S)
SAS-C010029	Analogue sensor 1 outside limit. General signal fault. Signal invalid (B8444S)
SAS-C010129	Analogue sensor 2 outside limit. General signal fault. Signal invalid (B6324S)
SAS-C010129	Analogue sensor 2 outside limit. General signal fault. Signal invalid (B8444S)
SAS-C010229	Analogue sensor sum outside limit. General signal fault. Signal invalid (B6324S)
SAS-C010229	Analogue sensor sum outside limit. General signal fault. Signal invalid (B8444S)
SAS-C010349	The Steering Angle Sensor (SAS) lacks internal voltage (5 V). Internal fault. Electrical fault (B6324S)
SAS-C010349	The Steering Angle Sensor (SAS) lacks internal voltage (5 V). Internal fault. Electrical fault (B8444S)
SAS-U001000	Medium speed CAN communication bus. General fault information. No information about the type of fault. (B6324S)
SAS-U001000	Medium speed CAN communication bus. General fault information. No information about the type of fault. (B8444S)
SAS-U030000	The internal software of the control module is incompatible. General fault information. No information about the type of fault. (B6324S)
SAS-U030000	The internal software of the control module is incompatible. General fault information. No information about the type of fault. (B8444S)
SAS-U300362	Battery voltage. Algorithm fault. Comparison fault (B6324S)
SAS-U300362	Battery voltage. Algorithm fault. Comparison fault (B8444S)
SAS-XXXXXX	Unspecified diagnostic trouble code (DTC) for current control module version. General electrical fault. Short circuit to ground (B6324S)
SAS-XXXXXX	Unspecified diagnostic trouble code (DTC) for current control module version. General electrical fault. Short circuit to ground (B8444S)

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) DTCS

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) - DTC INDEX

DTC	Description
SRS-0010	Driver's airbag stage 1. Signal too high. Intermittent fault
SRS-0010	Driver's airbag stage 1. Signal too high. Permanent fault
SRS-0011	Driver's airbag stage 1. Signal too low. Intermittent fault
SRS-0011	Driver's airbag stage 1. Signal too low. Permanent fault
SRS-0012	Driver airbag, stage 1. Capacitance too high. Intermittent fault

SRS-0012	Driver airbag, stage 1. Capacitance too high. Permanent fault
SRS-0013	Driver airbag, stage 1. Capacitance too low. Intermittent fault
SRS-0013	Driver airbag, stage 1. Capacitance too low. Permanent fault
SRS-0014	Driver airbag, stage 1. Resistance too high. Intermittent fault
SRS-0014	Driver airbag, stage 1. Resistance too high. Permanent fault
SRS-0015	Driver airbag, stage 1. Resistance too low. Intermittent fault
SRS-0015	Driver airbag, stage 1. Resistance too low. Permanent fault
SRS-0016	Driver's airbag, stage 1. Configuration fault. Intermittent fault
SRS-0018	Driver airbag, stage 2. Signal too high. Intermittent fault
SRS-0018	Driver airbag, stage 2. Signal too high. Permanent fault
SRS-0019	Driver airbag, stage 2. Signal too low. Intermittent fault
SRS-0019	Driver airbag, stage 2. Signal too low. Permanent fault
SRS-001A	Driver's airbag, stage 2. Capacitance too high. Intermittent fault
SRS-001A	Driver's airbag, stage 2. Capacitance too high. Permanent fault
SRS-001B	Driver's airbag, stage 2. Capacitance too low. Intermittent fault
SRS-001B	Driver's airbag, stage 2. Capacitance too low. Permanent fault
SRS-001C	Driver's airbag, stage 2. Resistance too high. Intermittent fault
SRS-001C	Driver's airbag, stage 2. Resistance too high. Permanent fault
SRS-001D	Driver's airbag, stage 2. Resistance too low. Intermittent fault
SRS-001D	Driver's airbag, stage 2. Resistance too low. Permanent fault
SRS-001E	Driver.s airbag stage 2. Configuration fault. Permanent fault
SRS-0020	Passenger airbag, stage 1. Signal too high. Intermittent fault
SRS-0020	Passenger airbag, stage 1. Signal too high. Permanent fault
SRS-0021	Passenger airbag, stage 1. Signal too low. Intermittent fault
SRS-0021	Passenger airbag, stage 1. Signal too low. Permanent fault
SRS-0022	Passenger airbag, stage 1. Capacitance too high. Intermittent fault
SRS-0022	Passenger airbag, stage 1. Capacitance too high. Permanent fault
SRS-0023	Passenger airbag, stage 1. Capacitance too low. Intermittent fault
SRS-0023	Passenger airbag, stage 1. Capacitance too low. Permanent fault
SRS-0024	Passenger airbag, stage 1. Resistance too high. Intermittent fault
SRS-0024	Passenger airbag, stage 1. Resistance too high. Permanent fault
SRS-0025	Passenger airbag, stage 1. Resistance too low. Intermittent fault
SRS-0025	Passenger airbag, stage 1. Resistance too low. Permanent fault
SRS-0026	Passenger airbag, stage 1. Configuration fault. Intermittent fault
SRS-0028	Passenger airbag stage 2. Signal too high. Intermittent fault
SRS-0028	Passenger airbag stage 2. Signal too high. Permanent fault
SRS-0029	Passenger airbag stage 2. Signal too low. Intermittent fault
SRS-0029	Passenger airbag stage 2. Signal too low. Permanent fault
SRS-002A	Passenger airbag, stage 2. Capacitance too high. Intermittent fault
SRS-002A	Passenger airbag, stage 2. Capacitance too high. Permanent fault
SRS-002B	Passenger airbag, stage 2. Capacitance too low. Intermittent fault
SRS-002B	

	Passenger airbag, stage 2. Capacitance too low. Permanent fault
SRS-002C	Passenger airbag, stage 2. Resistance too high. Intermittent fault
SRS-002C	Passenger airbag, stage 2. Resistance too high. Permanent fault
SRS-002D	Passenger airbag, stage 2. Resistance too low. Intermittent fault
SRS-002D	Passenger airbag, stage 2. Resistance too low. Permanent fault
SRS-0030	Front left side impact protection (SIPS) bag. Signal too high. Intermittent fault
SRS-0030	Front left side impact protection (SIPS) bag. Signal too high. Permanent fault
SRS-0031	Front left side impact protection (SIPS) bag. Signal too low. Intermittent fault
SRS-0031	Front left side impact protection (SIPS) bag. Signal too low. Permanent fault
SRS-0032	Front left side impact protection (SIPS) bag. Capacitance too high. Intermittent fault
SRS-0032	Front left side impact protection (SIPS) bag. Capacitance too high. Permanent fault
SRS-0033	Front left side impact protection (SIPS) bag. Capacitance too low. Intermittent fault
SRS-0033	Front left side impact protection (SIPS) bag. Capacitance too low. Permanent fault
SRS-0034	Front left side impact protection (SIPS) bag. Resistance too high. Intermittent fault
SRS-0034	Front left side impact protection (SIPS) bag. Resistance too high. Permanent fault
SRS-0035	Front left side impact protection (SIPS) bag. Resistance too low. Intermittent fault
SRS-0035	Front left side impact protection (SIPS) bag. Resistance too low. Permanent fault
SRS-0036	Left front side impact protection (SIPS) bag. Configuration fault. Permanent fault
SRS-0038	Left inflatable curtain. Signal too high. Intermittent fault
SRS-0038	Left inflatable curtain. Signal too high. Permanent fault
SRS-0039	Left inflatable curtain. Signal too low. Intermittent fault
SRS-0039	Left inflatable curtain. Signal too low. Permanent fault
SRS-003A	Left inflatable curtain. Capacitance too high. Intermittent fault
SRS-003A	Left inflatable curtain. Capacitance too high. Permanent fault
SRS-003B	Left inflatable curtain. Capacitance too low. Intermittent fault
SRS-003B	Left inflatable curtain. Capacitance too low. Permanent fault
SRS-003C	Left inflatable curtain. Resistance too high. Intermittent fault
SRS-003C	Left inflatable curtain. Resistance too high. Permanent fault
SRS-003D	Left inflatable curtain. Resistance too low. Intermittent fault
SRS-003D	Left inflatable curtain. Resistance too low. Permanent fault

SRS-0040	Right front side impact protection (SIPS) bag. Signal too high. Intermittent fault
SRS-0040	Right front side impact protection (SIPS) bag. Signal too high. Permanent fault
SRS-0041	Right front side impact protection (SIPS) bag. Signal too low. Intermittent fault
SRS-0041	Right front side impact protection (SIPS) bag. Signal too low. Permanent fault
SRS-0042	Right front side impact protection (SIPS) bag. Capacitance too high. Intermittent fault
SRS-0042	Right front side impact protection (SIPS) bag. Capacitance too high. Permanent fault
SRS-0043	Right front side impact protection (SIPS) bag. Capacitance too low. Intermittent fault
SRS-0043	Right front side impact protection (SIPS) bag. Capacitance too low. Permanent fault
SRS-0044	Right front side impact protection (SIPS) bag. Resistance too high. Intermittent fault
SRS-0044	Right front side impact protection (SIPS) bag. Resistance too high. Permanent fault
SRS-0045	Right front side impact protection (SIPS) bag. Resistance too low. Intermittent fault
SRS-0045	Right front side impact protection (SIPS) bag. Resistance too low. Permanent fault
SRS-0048	Right inflatable curtain. Signal too high. Intermittent fault
SRS-0048	Right inflatable curtain. Signal too high. Permanent fault
SRS-0049	Right inflatable curtain. Signal too low. Intermittent fault
SRS-0049	Right inflatable curtain. Signal too low. Permanent fault
SRS-004A	Right inflatable curtain. Capacitance too high. Intermittent fault
SRS-004A	Right inflatable curtain. Capacitance too high. Permanent fault
SRS-004B	Right inflatable curtain. Capacitance too low. Intermittent fault
SRS-004B	Right inflatable curtain. Capacitance too low. Permanent fault
SRS-004C	Right inflatable curtain. Resistance too high. Intermittent fault
SRS-004C	Right inflatable curtain. Resistance too high. Permanent fault
SRS-004D	Right inflatable curtain. Resistance too low. Intermittent fault
SRS-004D	Right inflatable curtain. Resistance too low. Permanent fault
SRS-0050	Passenger airbag stage 3. Signal too high
SRS-0051	Passenger airbag, stage 3. Signal too low
SRS-0052	Passenger airbag, stage 3. Capacitance too high
SRS-0053	Passenger airbag, stage 3. Capacitance too low
SRS-0054	Passenger airbag, stage 3. Resistance too high
SRS-0055	Passenger airbag, stage 3. Resistance too low
SRS-0056	Passenger airbag, stage 3. Configuration fault

SRS-0058	Driver airbag, stage 3. Signal too high
SRS-0059	Driver airbag, stage 3. Signal too low
SRS-005A	Driver's airbag, stage 3. Capacitance too high
SRS-005B	Driver's airbag, stage 3. Capacitance too low
SRS-005C	Driver's airbag, stage 3. Resistance too high
SRS-005D	Driver's airbag, stage 3. Resistance too low
SRS-005E	Driver's airbag stage 3. Configuration fault
SRS-0060	Front left seat belt tensioner. Signal too high. Intermittent fault
SRS-0060	Front left seat belt tensioner. Signal too high. Permanent fault
SRS-0061	Front left seat belt tensioner. Signal too low. Intermittent fault
SRS-0061	Front left seat belt tensioner. Signal too low. Permanent fault
SRS-0062	Front left seat belt tensioner. Capacitance too high. Intermittent fault
SRS-0062	Front left seat belt tensioner. Capacitance too high. Permanent fault
SRS-0063	Front left seat belt tensioner. Capacitance too low. Intermittent fault
SRS-0063	Front left seat belt tensioner. Capacitance too low. Permanent fault
SRS-0064	Front left seat belt tensioner. Resistance too high. Intermittent fault
SRS-0064	Front left seat belt tensioner. Resistance too high. Permanent fault
SRS-0065	Front left seat belt tensioner. Resistance too low. Intermittent fault
SRS-0065	Front left seat belt tensioner. Resistance too low. Permanent fault
SRS-0066	Front left seat belt tensioner. Configuration fault. Intermittent fault
SRS-0068	Front right seat belt tensioner. Signal too high. Intermittent fault
SRS-0068	Front right seat belt tensioner. Signal too high. Permanent fault
SRS-0069	Front right seat belt tensioner. Signal too low. Intermittent fault
SRS-0069	Front right seat belt tensioner. Signal too low. Permanent fault
SRS-006A	Front right seat belt tensioner. Capacitance too high. Intermittent fault
SRS-006A	Front right seat belt tensioner. Capacitance too high. Permanent fault
SRS-006B	Front right seat belt tensioner. Capacitance too low. Intermittent fault
SRS-006B	Front right seat belt tensioner. Capacitance too low. Permanent fault
SRS-006C	Front right seat belt tensioner. Resistance too high. Intermittent fault
SRS-006C	Front right seat belt tensioner. Resistance too high. Permanent fault
SRS-006D	Front right seat belt tensioner. Resistance too low. Intermittent fault
SRS-006D	Front right seat belt tensioner. Resistance too low. Permanent fault
SRS-0070	Rear left seat belt tensioner. Signal too high. Intermittent fault
SRS-0070	Rear left seat belt tensioner. Signal too high. Permanent fault
SRS-0071	Rear left seat belt tensioner. Signal too low. Intermittent fault
SRS-0071	Rear left seat belt tensioner. Signal too low. Permanent fault
SRS-0072	Rear left seat belt tensioner. Capacitance too high. Intermittent fault
SRS-0072	Rear left seat belt tensioner. Capacitance too high. Permanent fault
SRS-0073	Rear left seat belt tensioner. Capacitance too low. Intermittent fault
SRS-0073	Rear left seat belt tensioner. Capacitance too low. Permanent fault
SRS-0074	Rear left seat belt tensioner. Resistance too high. Intermittent fault
SRS-0074	

	Rear left seat belt tensioner. Resistance too high. Permanent fault
SRS-0075	Rear left seat belt tensioner. Resistance too low. Intermittent fault
SRS-0075	Rear left seat belt tensioner. Resistance too low. Permanent fault
SRS-0076	Rear left seat belt tensioner. Configuration fault. Intermittent fault
SRS-0078	Rear center seat belt tensioner. Signal too high. Intermittent fault
SRS-0078	Rear center seat belt tensioner. Signal too high. Permanent fault
SRS-0079	Rear center seat belt tensioner. Signal too low. Intermittent fault
SRS-0079	Rear center seat belt tensioner. Signal too low. Permanent fault
SRS-007A	Rear center seat belt tensioner. Capacitance too high. Intermittent fault
SRS-007A	Rear center seat belt tensioner. Capacitance too high. Permanent fault
SRS-007B	Rear center seat belt tensioner. Capacitance too low. Intermittent fault
SRS-007B	Rear center seat belt tensioner. Capacitance too low. Permanent fault
SRS-007C	Rear center seat belt tensioner. Resistance too high. Intermittent fault
SRS-007C	Rear center seat belt tensioner. Resistance too high. Permanent fault
SRS-007D	Rear center seat belt tensioner. Resistance too low. Intermittent fault
SRS-007D	Rear center seat belt tensioner. Resistance too low. Permanent fault
SRS-007E	Rear center seat belt tensioner. Configuration fault. Intermittent fault
SRS-0080	Rear right seat belt tensioner. Signal too high. Intermittent fault
SRS-0080	Rear right seat belt tensioner. Signal too high. Permanent fault
SRS-0081	Rear right seat belt tensioner. Signal too low. Intermittent fault
SRS-0081	Rear right seat belt tensioner. Signal too low. Permanent fault
SRS-0082	Rear right seat belt tensioner. Capacitance too high. Intermittent fault
SRS-0082	Rear right seat belt tensioner. Capacitance too high. Permanent fault
SRS-0083	Rear right seat belt tensioner. Capacitance too low. Intermittent fault
SRS-0083	Rear right seat belt tensioner. Capacitance too low. Permanent fault
SRS-0084	Rear right seat belt tensioner. Resistance too high. Intermittent fault
SRS-0084	Rear right seat belt tensioner. Resistance too high. Permanent fault
SRS-0085	Rear right seat belt tensioner. Resistance too low. Intermittent fault
SRS-0085	Rear right seat belt tensioner. Resistance too low. Permanent fault
SRS-0090	Seat belt tensioner 3rd row left. Signal too high
SRS-0091	Seat belt tensioner 3rd row left. Signal too low
SRS-0092	Seat belt tensioner 3rd row left. Capacitance too high
SRS-0093	Seat belt tensioner 3rd row left. Capacitance too low
SRS-0094	Seat belt tensioner 3rd row left. Resistance too high
SRS-0095	Seat belt tensioner 3rd row left. Resistance too low
SRS-0096	Seat belt tensioner 3rd row left. Configuration fault
SRS-0098	Seat belt tensioner 3rd row right. Signal too high
SRS-0099	Seat belt tensioner 3rd row right. Signal too low
SRS-009A	Seat belt tensioner 3rd row right. Capacitance too high
SRS-009B	Seat belt tensioner 3rd row right. Capacitance too low
SRS-009C	Seat belt tensioner 3rd row right. Resistance too high
SRS-009D	

	Seat belt tensioner 3rd row right. Resistance too low
SRS-009E	Seat belt tensioner 3rd row right. Configuration fault
SRS-00A0	Inflatable curtain rear left. Signal too high
SRS-00A1	Inflatable curtain rear left. Signal too low
SRS-00A2	Inflatable curtain rear left. Capacitance too high
SRS-00A3	Inflatable curtain rear left. Capacitance too low
SRS-00A4	Inflatable curtain rear left. Resistance too high
SRS-00A5	Inflatable curtain rear left. Resistance too low
SRS-00A6	Inflatable curtain rear left. Configuration fault
SRS-00A8	Inflatable curtain rear right. Signal too high
SRS-00A9	Inflatable curtain rear right. Signal too low
SRS-00AA	Inflatable curtain rear right. Capacitance too high
SRS-00AB	Inflatable curtain rear right. Capacitance too low
SRS-00AC	Inflatable curtain rear right. Resistance too high
SRS-00AD	Inflatable curtain rear right. Resistance too low
SRS-00AE	Inflatable curtain rear right. Configuration fault
SRS-00B0	Front left side impact sensor. Faulty signal. Intermittent fault
SRS-00B0	Front left side impact sensor. Faulty signal. Permanent fault
SRS-00B1	Front left side impact sensor. Communication fault. Intermittent fault
SRS-00B1	Front left side impact sensor. Communication fault. Permanent fault
SRS-00B2	Front left side impact sensor. Faulty identity. Intermittent fault
SRS-00B2	Front left side impact sensor. Faulty identity. Permanent fault
SRS-00B3	Front left side impact sensor. Internal fault. Intermittent fault
SRS-00B4	Front left side impact sensor. Configuration fault. Intermittent fault
SRS-00B5	Front right side impact sensor. Faulty signal. Intermittent fault
SRS-00B5	Front right side impact sensor. Faulty signal. Permanent fault
SRS-00B6	Front right side impact sensor. Communication fault. Intermittent fault
SRS-00B6	Front right side impact sensor. Communication fault. Permanent fault
SRS-00B7	Front right side impact sensor. Faulty identity. Intermittent fault
SRS-00B7	Front right side impact sensor. Faulty identity. Permanent fault
SRS-00B8	Front right side impact sensor. Internal fault. Intermittent fault
SRS-00B9	Front right side impact sensor. Configuration fault. Intermittent fault
SRS-00BA	Rear left side impact sensor. Faulty signal. Intermittent fault
SRS-00BA	Rear left side impact sensor. Faulty signal. Permanent fault
SRS-00BB	Rear left side impact sensor. Communication fault. Intermittent fault
SRS-00BB	Rear left side impact sensor. Communication fault. Permanent fault
SRS-00BC	Rear left side impact sensor. Faulty identity. Intermittent fault
SRS-00BC	Rear left side impact sensor. Faulty identity. Permanent fault
SRS-00BD	Rear left side impact sensor. Internal fault. Intermittent fault
SRS-00BE	Rear left side impact sensor. Configuration fault. Intermittent fault
SRS-00BF	Rear right side impact sensor. Faulty signal. Intermittent fault
SRS-00BF	

	Rear right side impact sensor. Faulty signal. Permanent fault
SRS-00C0	Rear right side impact sensor. Communication fault. Intermittent fault
SRS-00C0	Rear right side impact sensor. Communication fault. Permanent fault
SRS-00C1	Rear right side impact sensor. Faulty identity. Intermittent fault
SRS-00C1	Rear right side impact sensor. Faulty identity. Permanent fault
SRS-00C2	Rear right side impact sensor. Internal fault. Intermittent fault
SRS-00C3	Rear right side impact sensor. Configuration fault. Intermittent fault
SRS-00C4	Front left side impact sensor. Cross-connected
SRS-00C5	Front right side impact sensor. Cross-connected
SRS-00C6	Rear left side impact sensor. Cross-connected
SRS-00C7	Rear right side impact sensor. Cross-connected
SRS-00D3	Collision signal. Signal too high. Intermittent fault
SRS-00D3	Collision signal. Signal too high. Permanent fault
SRS-00D4	SRS indicator lamp. Faulty function. Intermittent fault
SRS-00D4	SRS indicator lamp. Faulty function. Permanent fault
SRS-00D5	SRS indicator lamp. Signal missing. Intermittent fault
SRS-00D5	SRS indicator lamp. Signal missing. Permanent fault
SRS-00D7	Collision signal. Collision signal received. Intermittent fault
SRS-00D7	Collision signal. Collision signal received. Permanent fault
SRS-00D8	Control. Faulty signal. Intermittent fault
SRS-00D8	Control. Faulty signal. Permanent fault
SRS-00D9	Occupant weight sensor. Configuration fault
SRS-00DA	Model. Faulty signal. Intermittent fault
SRS-00DA	Model. Faulty signal. Permanent fault
SRS-00DB	Passenger airbag. Faulty signal. Intermittent fault
SRS-00DB	Passenger airbag. Faulty signal. Permanent fault
SRS-00DC	Number of seats. Faulty signal
SRS-00DD	CAN signal. Signal missing
SRS-00E2	CAN signal. Signal missing. Intermittent fault
SRS-00E2	CAN signal. Signal missing. Permanent fault
SRS-00E3	CAN signal. Signal missing. Intermittent fault
SRS-00E3	CAN signal. Signal missing. Permanent fault
SRS-00E4	CAN signal. Signal missing. Intermittent fault
SRS-00E4	CAN signal. Signal missing. Permanent fault
SRS-00E5	CAN signal. Faulty function
SRS-00E6	CAN signal. Signal missing
SRS-00E7	CAN signal. Signal missing
SRS-00E8	Adaptive steering column. Signal too high
SRS-00E9	Adaptive steering column. Signal too low
SRS-00EA	Adaptive steering column. Capacitance too high
SRS-00EB	Adaptive steering column. Capacitance too low
SRS-00EC	

	Adaptive steering column. Resistance too high
SRS-00ED	Adaptive steering column. Resistance too low
SRS-00EE	Adaptive steering column. Configuration fault
SRS-00F0	Front left seat belt buckle. Signal too high
SRS-00F1	Front left seat belt buckle. Signal too low or signal missing
SRS-00F2	Front left seat belt buckle. Faulty signal
SRS-00F3	Front right seat belt buckle. Signal too high
SRS-00F4	Front right seat belt buckle. Signal too low or signal missing
SRS-00F5	Front right seat belt buckle. Faulty signal
SRS-00F6	Front seat belt buckle. Signal too high
SRS-00F7	Front seat belt buckle. Signal too low
SRS-0101	Driver airbag stage 1. Circuit fault
SRS-0102	Driver airbag stage 2. Circuit fault
SRS-0103	Passenger airbag stage 1. Circuit fault
SRS-0104	Passenger airbag stage 2. Circuit fault
SRS-0105	Side impact protection (SIPS) bag left front. Circuit fault
SRS-0106	Inflatable curtain (IC) left. Circuit fault
SRS-0107	Side impact protection (SIPS) bag right front. Circuit fault
SRS-0108	Inflatable curtain (IC) right. Circuit fault
SRS-0109	Passenger airbag stage 3. Circuit fault
SRS-010A	Driver airbag stage 3. Circuit fault
SRS-010B	Seat belt tensioner left front. Circuit fault
SRS-010C	Seat belt tensioner right front. Circuit fault
SRS-010D	Seat belt tensioner left rear. Circuit fault
SRS-010E	Seat belt tensioner middle rear. Circuit fault
SRS-010F	Seat belt tensioner right rear. Circuit fault
SRS-0110	Control module. Internal fault. Intermittent fault
SRS-0111	Control module. Internal fault. Intermittent fault
SRS-0112	Control module. Internal fault. Intermittent fault
SRS-0113	Control module. Internal fault. Intermittent fault
SRS-0114	Control module. Internal fault. Intermittent fault
SRS-0115	Control module. Internal fault. Intermittent fault
SRS-011A	Control module. Internal fault. Intermittent fault
SRS-011B	Control module. Internal fault. Intermittent fault
SRS-011C	Control module. Internal fault
SRS-011D	Control module. Internal fault. Intermittent fault
SRS-011E	Control module. Internal fault. Intermittent fault
SRS-011F	Control module. Internal fault. Intermittent fault
SRS-0120	Control module. Internal fault. Intermittent fault
SRS-0121	Control module. Internal fault. Intermittent fault
SRS-0122	Control module. Internal fault. Intermittent fault
SRS-0123	

	Control module. Internal fault. Intermittent fault
SRS-0124	Control module. Internal fault. Intermittent fault
SRS-0125	Control module. Internal fault. Intermittent fault
SRS-0126	Control module. Internal fault. Intermittent fault
SRS-0127	Control module. Internal fault. Intermittent fault
SRS-0128	Control module. Internal fault. Intermittent fault
SRS-0129	Control module. Internal fault. Intermittent fault
SRS-012B	Control module. Internal fault. Intermittent fault
SRS-012C	Control module. Internal fault. Intermittent fault
SRS-0130	Control module. Internal fault. Intermittent Fault
SRS-0135	Belt tensioner 3rd row left. Circuit fault
SRS-0136	Belt tensioner 3rd row right. Circuit fault
SRS-0137	Inflatable curtain rear left. Circuit fault
SRS-0138	Inflatable curtain rear right. Circuit fault
SRS-0139	Adaptive steering column. Circuit fault
SRS-013A	Control module. Internal fault
SRS-013B	Control module. Internal fault
SRS-0210	Front right front impact sensor. Faulty signal
SRS-0211	Front right front impact sensor. Communication fault
SRS-0212	Front right front impact sensor. Faulty identification
SRS-0213	Front right front impact sensor. Internal fault
SRS-0214	Front right front impact sensor. Configuration fault
SRS-0215	Front right front impact sensor. Cross-connected
SRS-0218	Front left front impact sensor. Faulty signal
SRS-0219	Front left front impact sensor Communication fault
SRS-021A	Front left front impact sensor. Faulty identification
SRS-021B	Front left front impact sensor. Internal fault
SRS-021C	Front left front impact sensor. Configuration fault
SRS-021D	Front left front impact sensor. Cross-connected
SRS-0220	CAN signal. Signal missing
SRS-0221	CAN signal. Diagnostic trouble code (DTC) in the central electronic module (CEM)
SRS-0222	CAN signal. Diagnostic trouble code (DTC) in the central electronic module (CEM)
SRS-0223	CAN signal. Signal missing
SRS-0224	CAN signal. Configuration fault
SRS-0225	CAN signal. Configuration fault
SRS-0228	Control module. Programming error
SRS-0230	Switch for the passenger airbag. Signal too low or signal missing
SRS-0231	Switch for the passenger airbag. Signal too low or signal missing
SRS-0232	Switch for the passenger airbag. Incorrect measurement range

SRS-0233	Switch for the passenger airbag. Incorrect measurement range
SRS-0234	Switch for the passenger airbag. Signal too high
SRS-0235	Switch for the passenger airbag. Signal too high
SRS-0236	Switch for the passenger airbag. Faulty function
SRS-0237	Switch for the passenger airbag. Faulty signal
SRS-0238	Switch for the passenger airbag. Faulty signal
SRS-0239	Switch for the passenger airbag. Configuration fault
SRS-023A	Switch for the passenger airbag. Configuration fault
SRS-0240	Passenger airbag. Activation
SRS-0241	Passenger airbag. Deactivation
SRS-0250	Occupant weight sensor (OWS). Calibration fault
SRS-0251	Occupant weight sensor (OWS). Configuration fault
SRS-0252	Occupant weight sensor (OWS). Internal fault
SRS-0253	Occupant weight sensor (OWS). Communication fault
SRS-0254	Occupant weight sensor (OWS). Communication fault
SRS-0256	Occupant weight sensor (OWS). Internal fault
SRS-0258	Occupant weight sensor (OWS). Calibration fault
SRS-0259	Occupant weight sensor. Signal missing
SRS-025A	Occupant weight sensor (OWS). Internal fault
SRS-025B	Occupant weight sensor (OWS). Signal too low
SRS-025C	Occupant weight sensor (OWS). Signal too high
SRS-025D	Occupant weight sensor (OWS). Signal missing
SRS-025E	Occupant weight sensor (OWS). Internal fault
SRS-025F	Occupant weight sensor (OWS). Signal too low
SRS-0260	Occupant weight sensor (OWS). Signal too high
SRS-0261	Occupant weight sensor. Signal missing
SRS-0262	Occupant weight sensor (OWS). Incorrect data
SRS-DD00	Control module communication. Faulty communication
SRS-DD01	Communication control module. Signal too high / signal too low
SRS-DD02	Communication control module. Faulty communication
SRS-DD10	Communication control module. Faulty communication
SRS-E001	Control module communication. Faulty communication
SRS-E003	Configuration fault. Faulty configuration
SRS-XXXX	Unknown diagnostic trouble code (DTC) for the current control module version

TRANSMISSION CONTROL MODULE (TCM) DTCS

TRANSMISSION CONTROL MODULE (TCM) - DTC INDEX

DTC	Description
TCM-P021868	Transmission Fluid Overtemperature Condition. Algorithm Based

	Failures. Event information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P050000	Vehicle Speed Sensor A. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P050000	Speed sensor A. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P056008	System voltage. General fault information. Bus/message fault (B8444S, TF-80SC AWD)
TCM-P056100	System Voltage Unstable. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P056100	System voltage unstable. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P056200	System Voltage Low. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P056200	System voltage low. General information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P056300	System voltage high. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P060000	Serial communication link. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P060100	Internal Control Module Memory Check Sum Error. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P060100	Internal fault in control module memory checksum. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P060300	Internal Control Module Keep Alive Memory (KAM) Error. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P060300	Internal memory fault in control module (KAM). General for information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P060400	Internal Control Module Random Access Memory (RAM) Error. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P060400	Internal memory fault in control module (RAM). General for information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P060500	Internal Control Module Read Only Memory (ROM) Error. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P060500	Internal memory fault in control module (ROM). General for information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P061000	Configuration fault in the control module. General fault information.

	No information about the fault type (B8444S, TF-80SC AWD)
TCM-P061400	ECM/TCM Incompatible. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P061400	ECM/TCM not compatible. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P062F00	Internal Control Module EEPROM Error. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P062F00	Internal EEPROM memory fault in control module. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P070500	Transmission Range Sensor A Circuit (PRNDL Input). General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P070500	Gearbox position sensor A circuit (PRNDL input). General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P070600	Transmission Range Sensor A Circuit Range/Performance. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P070600	Gearbox position sensor A circuit inside/outside tolerance. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P070900	Gearbox position sensor A circuit intermittent. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P070900	Transmission Range Sensor A Circuit Intermittent. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P071100	Transmission Fluid Temperature Sensor A Circuit Range/Performance. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P071100	Gearbox oil temperature sensor A circuit inside/outside tolerance. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P071200	Transmission Fluid Temperature Sensor A Circuit Low Input. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P071200	Gearbox oil temperature sensor A circuit inside/outside tolerance. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P071300	Transmission Fluid Temperature Sensor A Circuit High Input. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P071300	Gearbox oil temperature sensor A circuit inside/outside tolerance.

	General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P071500	Turbine/Input Shaft Speed Sensor A Circuit. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P071500	Turbine/input shaft speed sensor A circuit. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P071600	Turbine/Input Shaft Speed Sensor A Circuit Range/Performance. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P071600	Turbine/input shaft speed sensor A circuit inside/outside tolerance. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P071700	Turbine/input shaft speed sensor A circuit no signal. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P071800	Turbine/Input Shaft Speed Sensor A Circuit Intermittent. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P071800	Turbine/input shaft speed sensor A circuit intermittent. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P072000	Output Shaft Speed Sensor Circuit. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P072000	Output shaft speed sensor circuit. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P072100	Output Shaft Speed Sensor Circuit Range/Performance. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P072100	Output shaft speed sensor circuit inside/outside tolerance. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P072200	Output Shaft Speed Sensor Circuit No Signal. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P072200	Output shaft speed sensor circuit no signal. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P072300	Output Shaft Speed Sensor Circuit Intermittent. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P072300	Output shaft speed sensor circuit intermittent. General fault information. No information on fault type (B8444S, TF-80SC AWD)

TCM-P072500	Engine Speed Input Circuit. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P072500	Engine speed input circuit. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P072900	Gear 6 Incorrect Ratio. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P072900	Gear 6 incorrect ratio. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P073000	Incorrect Gear Ratio. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P073000	Incorrect gear ratio. General malfunction information. No information on malfunction type (B8444S, TF-80SC AWD)
TCM-P073095	Incorrect Gear Ratio. Component Failures. Incorrect assembly (B6324S, TF-80SC AWD)
TCM-P073100	Gear 1 Incorrect Ratio. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P073200	Gear 2 Incorrect Ratio. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P073300	Gear 3 Incorrect Ratio. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P073400	Gear 4 Incorrect Ratio. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P073500	Gear 5 Incorrect Ratio. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P073600	Reverse Incorrect Ratio. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P073600	Reverse incorrect ratio. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P073F00	Unable to Engage Gear 1. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P073F00	Unable to select gear 1. General malfunction information. No information on malfunction type (B8444S, TF-80SC AWD)
TCM-P074100	Torque Converter Clutch Solenoid Circuit Performance Or Stuck Off. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P074100	Torque converter clutch solenoid circuit performance or stuck in off position. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P074200	Torque Converter Clutch Solenoid Circuit Stuck On. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P074200	Torque converter clutch solenoid circuit stuck in on position. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P074400	Torque Converter Clutch Solenoid Circuit Intermittent. General

	Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P074400	Torque converter clutch solenoid circuit intermittent. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P074468	Torque Converter Clutch Solenoid Circuit Intermittent. Algorithm Based Failures. Event information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P074A00	Unable to Engage Gear 2. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P074B00	Unable to Engage Gear 3. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P074C00	Unable to Engage Gear 4. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P074D00	Unable to Engage Gear 5. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P074E00	Unable to Engage Gear 6. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P077700	Pressure Control Solenoid B Stuck On. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P081711	Starter Disable Circuit. General Electrical Failures. Circuit short to ground (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P081711	Starter inhibitor circuit. General electric fault. Short-circuit to ground (B8444S, TF-80SC AWD)
TCM-P081712	Starter Disable Circuit. General Electrical Failures. Circuit short to battery (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P081712	Starter inhibitor circuit. General electrical fault. Short-circuit to voltage (B8444S, TF-80SC AWD)
TCM-P082601	Up and Down Switch Input Circuit. General Failure Information. General electrical failure (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P082601	Up and down switch input circuit. General fault information. General electrical fault (B8444S, TF-80SC AWD)
TCM-P086011	Transmission control module A communication circuit. General electrical fault. Short-circuit to ground (B8444S, TF-80SC AWD)
TCM-P086011	Gear Shift Module A Communication Circuit. General Electrical Failures. Circuit short to ground (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P086012	Gear Shift Module A Communication Circuit. General Electrical Failures. Circuit short to battery (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P086012	Transmission control module A communication circuit. General electrical fault. Short circuit to voltage (B8444S, TF-80SC AWD)
TCM-P086013	Gear Shift Module A Communication Circuit. General Electrical

	Failures. Circuit open (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P086013	Shifting control module A communication circuit. General electrical malfunction. Open circuit (B8444S, TF-80SC AWD)
TCM-P086087	Gear Shift Module A Communication Circuit. Bus Signal/Message Failures. Missing message (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P086087	Transmission control module A communication circuit. Bus/message error. Message missing (B8444S, TF-80SC AWD)
TCM-P089500	Shift Time Too Short. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P089500	Gear change time too short. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P089600	Shift Time Too Long. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P089600	Gear change times too long. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P089709	Transmission Fluid Deteriorated. General Failure Information. Component Failures (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P089709	Transmission fluid expended. General fault information. Component defect (B8444S, TF-80SC AWD)
TCM-P092813	Gear Shift Lock Solenoid Circuit/Open. General Electrical Failures. Circuit open (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P092813	Gear Shift Lock Solenoid Circuit/Open. General Electrical Failures. Circuit open (B8444S, TF-80SC AWD)
TCM-P093011	Gear Shift Lock Solenoid Circuit Low. General Electrical Failures. Circuit short to ground (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P093011	Gear Shift Lock Solenoid Circuit Low. General Electrical Failures. Circuit short to ground (B8444S, TF-80SC AWD)
TCM-P093112	Gear Shift Lock Solenoid Circuit High. General Electrical Failures. Circuit short to battery (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P093112	Gear Shift Lock Solenoid Circuit High. General Electrical Failures. Circuit short to battery (B8444S, TF-80SC AWD)
TCM-P096000	Pressure Control Solenoid A Control Circuit/Open. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P096000	Pressure regulator solenoid A control circuit/broken circuit. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P096100	Pressure Control Solenoid A Control Circuit Range/Performance. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P096100	Pressure regulator solenoid A control circuit inside/outside

	tolerance. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P096300	Pressure Control Solenoid A Control Circuit High. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P096300	Pressure regulator solenoid A control circuit high. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P096400	Pressure Control Solenoid B Control Circuit/Open. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P096400	Pressure regulator solenoid B control circuit/broken circuit. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P096500	Pressure Control Solenoid B Control Circuit Range/Performance. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P096500	Pressure regulator solenoid B control circuit inside/outside tolerance. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P096700	Pressure Control Solenoid B Control Circuit High. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P096700	Pressure regulator solenoid B control circuit high. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P096900	Pressure Control Solenoid C Control Circuit Range/Performance. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P096900	Pressure regulator solenoid B control circuit inside/outside tolerance. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P097000	Pressure Control Solenoid C Control Circuit Low. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P097000	Pressure regulator solenoid C control circuit low. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P097100	Pressure Control Solenoid C Control Circuit High. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P097100	Pressure regulator solenoid C control circuit high. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P097300	Shift Solenoid A Control Circuit Low. General Failure Information.

	No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P097300	Shift solenoid A control circuit low. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P097400	Shift Solenoid A Control Circuit High. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P097400	Shift solenoid A control circuit high. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P097600	Shift Solenoid B Control Circuit Low. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P097600	Shift solenoid B control circuit low. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P097700	Shift Solenoid B Control Circuit High. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P097700	Shift solenoid B control circuit high. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P170100	Reverse Engagement Error. General Failure Information. No sub type information (B8444S, TF-80SC AWD)
TCM-P170164	Reverse Engagement Error. Algorithm Based Failures. Signal plausibility failure (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P171900	Engine Torque Signal. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P171900	Engine torque signal. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P178368	Transmission Overtemperature Condition. Algorithm Based Failures. Event information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P179900	CAN TCM/ABS Circuit Malfunction. Bus Signal/Message Failures. Missing message (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P179900	CAN TCM/ABS circuit malfunction. Bus/message error. Message missing (B8444S, TF-80SC AWD)
TCM-P215800	Vehicle Speed Sensor B. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P215800	Speed sensor B. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P271900	Pressure Control Solenoid D Control Circuit Range/Performance. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P271900	Pressure regulator solenoid D control circuit inside/outside tolerance. General fault information. No information on fault type (B8444S, TF-80SC AWD)
TCM-P272000	Pressure Control Solenoid D Control Circuit Low. General Failure

	Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P272000	Pressure regulating solenoid D control circuit low. General fault information. No information about fault type (B8444S, TF-80SC AWD)
TCM-P272100	Pressure Control Solenoid D Control Circuit High. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P272100	Pressure regulating solenoid D control circuit high. General fault information. No information about fault type (B8444S, TF-80SC AWD)
TCM-P272800	Pressure Control Solenoid E Control Circuit Range/Performance. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P272800	Pressure regulating solenoid E control circuit inside/outside parameter values. General fault information. No information about fault type (B8444S, TF-80SC AWD)
TCM-P272900	Pressure Control Solenoid E Control Circuit Low. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P272900	Pressure regulating solenoid E control circuit low. General fault information. No information about fault type (B8444S, TF-80SC AWD)
TCM-P273000	Pressure Control Solenoid E Control Circuit High. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P273000	Pressure regulating solenoid E control circuit high. General fault information. No information about fault type (B8444S, TF-80SC AWD)
TCM-P273300	Pressure Control Solenoid F Stuck On. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P273700	Pressure Control Solenoid F Control Circuit Range/Performance. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P273700	Pressure regulating solenoid F control circuit inside/outside parameter values. General fault information. No information about fault type (B8444S, TF-80SC AWD)
TCM-P273800	Pressure Control Solenoid F Control Circuit Low. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P273800	Pressure regulating solenoid F control circuit low. General fault information. No information about fault type (B8444S, TF-80SC AWD)
TCM-P273900	Pressure Control Solenoid F Control Circuit High. General Failure

	Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P273900	Pressure regulating solenoid F control circuit high. General fault information. No information about fault type (B8444S, TF-80SC AWD)
TCM-P278368	Torque Converter Temperature Too High. Algorithm Based Failures. Event information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P278768	Clutch Temperature Too High. Algorithm Based Failures. Event information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P280000	Transmission Range Sensor B Circuit (PRNDL Input). General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P280000	Transmission area sensor B circuit (PRNDL input). General fault information. No information about fault type (B8444S, TF-80SC AWD)
TCM-P280500	Transmission Range Sensor A/B Correlation. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-P280500	Transmission area sensor A/B co-operation. General fault information. No information about fault type (B8444S, TF-80SC AWD)
TCM-U000100	High Speed CAN Communication Bus. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-U210000	Control Module Not Configured. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-U210100	Control Module Configuration Incompatible. General Failure Information. No sub type information (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-U300362	Battery Voltage. Algorithm Based Failures. Signal compare failure (B6324S, TF-80SC; B6324S, TF-80SC AWD)
TCM-XXXXXX	Unknown diagnostic trouble code (DTC) for the current control module version (B8444S, TF-80SC AWD)

UPPER ELECTRONICS MODULE (UEM) DTCS

UPPER ELECTRONICS MODULE (UEM) - DTC INDEX

DTC	Description
UEM-0004	Siren. Communication fault
UEM-0005	Sun roof. Communication fault
UEM-0007	Reading lamp. Signal too low
UEM-0008	Reading lamp. Signal too low
UEM-0009	Reading lamp. Signal too low

UEM-000A	Movement sensor. Communication fault
UEM-000B	Movement sensor. Signal too low
UEM-000C	Mass movement sensor. Signal too high
UEM-0011	Mass movement sensor. Signal too low
UEM-0013	Movement sensor. Internal fault
UEM-0014	Movement sensor. Internal fault
UEM-001C	General courtesy lighting. Signal faulty
UEM-001D	Reading lamp. Signal too high
UEM-001E	Reading lamp. Signal too high
UEM-0020	Rear view mirror. Signal missing
UEM-0030	Rear left reading lamp. Signal too low
UEM-0031	Rear left reading lamp. Signal missing
UEM-0032	Rear right reading lamp. Signal too low
UEM-0033	Rear right reading lamp. Signal missing
UEM-0034	Front left reading lamp. Signal too low
UEM-0035	Front left reading lamp. Signal missing
UEM-0036	Front right reading lamp. Signal too low
UEM-0037	Front right reading lamp. Signal missing
UEM-0038	General lighting. Signal too low
UEM-0039	General lighting. Signal missing
UEM-003A	Extended X supply (EXT_X). Signal too low
UEM-003C	Cargo compartment lighting/3rd row reading lamps. Signal too low
UEM-003D	Cargo compartment lighting/3rd row reading lamps. Faulty signal
UEM-0041	Control unit. Internal fault
UEM-0051	Sunroof. Signal faulty
UEM-0052	Sunroof motor. Signal too high
UEM-0053	Sunroof motor. Signal too low
UEM-0054	Sunroof motor. Signal too low
UEM-0056	Sunroof motor. Signal too high
UEM-0057	Sunroof motor. Signal too high
UEM-0058	Sunroof motor. Signal too high
UEM-0059	Sunroof motor. Signal too high
UEM-0060	Sunroof motor. Signal too high
UEM-0061	Sunroof motor. Signal too high
UEM-0062	Sunroof motor. Signal too high
UEM-0063	Sunroof motor. Signal too high
UEM-0064	Sunroof. Signal too high
UEM-0065	Sunroof. Signal faulty
UEM-0066	Sunroof. Signal faulty
UEM-0067	Sunroof. Signal faulty
UEM-0068	Sunroof. Signal faulty
UEM-0070	

	Sunroof. Signal faulty
UEM-0071	Control unit. Internal fault
UEM-0072	Control unit. Internal fault
UEM-0078	Siren. Configuration fault
UEM-0080	Rain sensor. Signal missing
UEM-0081	Rain sensor. Signal too low
UEM-0082	Rain sensor. Signal too high
UEM-0083	Rain sensor. Internal fault
UEM-0084	Rain sensor. Faulty signal
UEM-0090	PAD lamp. Signal too low
UEM-0091	PAD lamp. Signal too high
UEM-0093	Seat belt reminder. Faulty signal
UEM-0094	Seat belt reminder. Signal too high
UEM-00A0	Tire pressure sensor. Signal missing
UEM-00A1	Tire pressure sensor. Signal missing
UEM-00A2	Tire pressure sensor. Signal missing
UEM-00A3	Tire pressure sensor. Signal missing
UEM-00A4	Tire pressure sensor. Low battery voltage
UEM-00A5	Tire pressure sensor. Low battery voltage
UEM-00A6	Tire pressure sensor. Low battery voltage
UEM-00A7	Tire pressure sensor. Low battery voltage
UEM-00A8	Tire pressure warning. Sensor missing
UEM-00A9	Control module. Configuration fault
UEM-E001	Control module communication. Faulty communication
UEM-E003	Configuration fault. Faulty configuration
UEM-XXXX	Unknown diagnostic trouble code (DTC) for the current control module version

2008 VOLVO

V70, XC70 & XC90

BUZZERS, RELAYS & TIMERS

BUZZERS, RELAYS & TIMERS LOCATION

Component	Location
Audio Disconnection Relay (2/238)	Behind center of dash. See **Fig. 17**.
Auxiliary Light Relay (2/64)	Behind left headlight. See **Fig. 16**.
Climate Control System Relay (2/22)	In engine compartment relay/fuse box. See **Fig. 16**.
Deadlock Relay (Left Rear Door) (V70) (2/138)	In left rear door. See **Fig. 16**.
Deadlock Relay (Left Rear Door) (XC90) (2/138)	In left rear door. See **Fig. 17**.
Deadlock Relay (Right Rear Door) (2/139)	In right rear door. See **Fig. 17**.
Electric Engine Heater Relay (2/192)	Left front of engine compartment. See **Fig. 17**.
Engine Management System Main Relay (3/32)	In engine compartment relay/fuse box. See **Fig. 16**.
High Pressure Headlight Washer Motor Relay (2/182)	In engine compartment relay/fuse box. See **Fig. 17**.
Intermittent Wiping Relay (2/91)	In engine compartment relay/fuse box. See **Fig. 16**.
Radio Signal Remote Parking Heater Start Relay (2/191)	In right rear of cargo area. See **Fig. 17**.
Starter Motor Relay (2/35)	In engine compartment relay/fuse box. See **Fig. 16**.
Windshield Wiper Low/High Speed Relay (2/90)	In engine compartment relay/fuse box. See **Fig. 16**.

CIRCUIT PROTECTION DEVICES

CIRCUIT PROTECTION DEVICES LOCATION

Component	Location
Cargo Compartment Auxiliary Fuse Holder (11L)	At rear of cargo compartment. See **Fig. 84**.
Engine Compartment Distribution Box (15/31)	Left side of engine compartment. See **Fig. 85**.
Engine Compartment Fuse Box (11A)	At left side of engine compartment, forward of strut tower. See **Fig. 84**.
Main Fuses (11E)	Next to battery, in cargo compartment. See **Fig. 84**.
Passenger Compartment Fuse Box (11C)	At left end of dash. See **Fig. 84**.

CONTROL UNITS

CONTROL UNITS LOCATION

Component	Location
Accessory Electronic Module (AEM) (4/78)	At right rear corner of cargo compartment. See **Fig. 29**.
Accessory USB Unit (AUU) (4/124)	In center console.
Activation Unit DSTC (8/46)	On brake master cylinder. See **Fig. 54**.

Alternator Control Module (6/26)	On alternator. See **Fig. 32**.
Audio Module (AUD) (16/105)	Under right front seat. See **Fig. 66**.
Brake Control Module (BCM) (4/16)	At left rear corner of engine compartment. See **Fig. 26**.
Call Start Parking Heater Control Module (4/107)	Right rear of cargo compartment. See **Fig. 30**.
Cellular Phone Hands Free Control Module (V70) (16/93)	Under driver's seat. See **Fig. 65**.
Cellular Phone Hands Free Control Module (XC90) (16/93)	Behind right side of dash. See **Fig. 65**.
Central Electronic Module (CEM) (4/56)	Behind left side of dash. See **Fig. 28**.
Cooling Fan Module (4/71)	At front center of engine compartment. See **Fig. 28**.
Differential Electronic Module (DEM) (4/82)	At rear differential. See **Fig. 29**.
Driver/Passenger Door Module (DDM)/(PDM) (V70) (3/126)	In driver's door. See **Fig. 23**.
Driver/Passenger Door Module (DDM)/(PDM) (XC90) (3/126)	In driver's door. See **Fig. 24**.
Electronic Power Steering Control Module (4/99)	Left center of dash. See **Fig. 30**.
Electronic Throttle Module (4/50)	Front of engine compartment. See **Fig. 27**.
Engine Control Module (ECM) (4/46)	In engine compartment. See **Fig. 27**.
Fan Control Module (4/31)	Behind right side of dash, near blower fan. See **Fig. 27**.
Fuel Pump Control Module (4/83)	On fuel tank. See **Fig. 29**.
Global Positioning System Module (GPS) (16/139)	Under driver's seat. See **Fig. 67**.
Headlight Control Module (HCM) (4/118)	Under driver's seat. See **Fig. 30**.
Multimedia Module (MMM) (16/108)	Under driver seat. See **Fig. 66**.
Parking Assistance Camera Module (PAC) (4/120)	Left side of luggage compartment. See **Fig. 30**.
Parking Assistance Module (PAM) (V70) (4/86)	At left rear corner of cargo compartment. See **Fig. 29**.
Parking Assistance Module (PAM) (XC90) (4/86)	At left side of cargo area. See **Fig. 30**.
Passenger/Driver Door Module (PDM)/(DDM) (3/127)	In front passenger's door. See **Fig. 24**.
Phone Module (PHM) (16/60)	Behind center of dash. See **Fig. 63**.
Power Seat Module (PSM) (4/52)	Under driver's seat. See **Fig. 28**.
Rear Audio Separation Module (RAS) (16/122)	In center console. See **Fig. 66**.
Rear Electronic Module (REM) (4/58)	At left rear corner of cargo compartment. See **Fig. 28**.
Remote Parking Heater Start Control Module (4/106)	Right rear of cargo compartment. See **Fig. 30**.
Road Traffic Information Module (RTI) (16/45)	Left rear side of luggage compartment. See **Fig. 62**.
Seat Heating Module (SHM) (Left/Right) (9/12, 9/13)	Under respective front seats. See **Fig. 60**.
Steering Wheel Module (SWM) (3/254)	In steering wheel. See **Fig. 25**.
Sun Roof Module (SRM) (4/33)	Forward of sun roof opening. See **Fig. 27**.

Suspension Module (SUM) (4/84)	Under center console. See **Fig. 29**.
Traffic Information Module (Turn By Turn) (16/45)	Left rear of luggage compartment. See **Fig. 62**.
Trailer Module (4/110)	Left rear of cargo compartment. See **Fig. 30**.
Transmission Control Module (TCM) (TF-80SC) (4/28)	On transmission. See **Fig. 26**.
Transmission Control Module (TCM) (V70) (4/28)	Right front of engine compartment. See **Fig. 26**.
Transmission Control Module (TCM) (XC90) (4/28)	Right front of engine compartment. See **Fig. 27**.
Upper Electronic Module (UEM) (V70) (4/70)	Integral to rearview mirror. See **Fig. 28**.
Upper Electronic Module (UEM) (XC90) (4/70)	Rearward of roof console. See **Fig. 28**.

MOTORS

MOTORS LOCATION

Component	Location
Backrest Angle Motor (Driver's Seat) (6/16)	Under driver's seat. See **Fig. 31**.
Backrest Angle Motor (Passenger's Seat) (6/64)	Under front passenger's seat. See **Fig. 35**.
Climate Control System (Rear) (6/76)	Left rear of cargo compartment. See **Fig. 35**.
Coolant Pump (8-Cyl.) (6/113)	Left front of engine compartment. See **Fig. 37**.
Defroster Damper Motor Module (DMM) (6/102)	Near center of HVAC housing. See **Fig. 36**.
Door Lock Unit (Left Front) (3/74)	Rear left front door. See **Fig. 20**.
Door Lock Unit (Right Front) (3/75)	Rear of right front door. See **Fig. 20**.
Door Lock Unit (Right Rear) (3/77)	Rear of right rear door. See **Fig. 21**.
Door Lock Unit (V70) (Left Rear) (3/76)	Rear of left rear door. See **Fig. 20**.
Door Lock Unit (XC90) (Left Rear) (3/76)	Rear of left rear door. See **Fig. 21**.
Electric Cooling Fan Motor (6/29)	Front of engine compartment. See **Fig. 32**.
Engine Compartment Electrics Box Cooling Fan (V70) (6/44)	Right side of engine compartment. See **Fig. 33**.
Engine Compartment Electrics Box Cooling Fan (XC90) (6/44)	Right side of engine compartment. See **Fig. 34**.
Floor/Ventilation Damper Motor Module (DMM) (6/103)	Near center of HVAC housing. See **Fig. 36**.
Fore/Aft Motor (Driver's Seat) (6/19)	Under driver's seat. See **Fig. 32**.
Fore/Aft Motor (Passenger's Seat) (6/20)	Under front passenger's seat. See **Fig. 32**.
Front Power Window Motor (Left/Right) (6/58, 6/60)	In respective front door. See **Fig. 34**.
Fuel Filler Flap Lock Motor (6/37)	Right side of cargo compartment, behind carpet. See **Fig. 33**.
Fuel Leakage Control Pump (6/67)	Under rear of vehicle, near fuel tank. See **Fig. 35**.
Fuel Pump (6/33)	In fuel tank. See **Fig. 33**.
Headlight Adjustment Motor (Left/Right) (6/38, 6/39)	Behind respective headlight assembly. See **Fig. 33**.

Headlight High Pressure Washer Motor (6/104)	At right front corner of engine compartment. See **Fig. 36**.
Headlight Wiper Motor (Left/Right) (6/3, 6/4)	Below respective headlight assembly. See **Fig. 31**.
Intake Manifold Actuating Motor (Upper/Lower) (6/139, 6/140)	On intake manifold. See **Fig. 38**.
Lock Unit (Tailgate) (3/78)	Center of tailgate. See **Fig. 21**.
Passenger Compartment Fan Motor (6/28)	On lower right side of HVAC housing. See **Fig. 32**.
Power Exterior Rearview Mirror (Left/Right) (6/62, 6/63)	In respective rearview mirror. See **Fig. 34**.
Rear Power Window Motor (Left/Right) (6/92, 6/93)	In respective rear door. See **Fig. 36**.
Rear Window Wiper Motor (V70) (6/32)	At center of tailgate. See **Fig. 32**.
Rear Window Wiper Motor (XC90) (6/32)	At center of tailgate. See **Fig. 33**.
Recirculation Damper Motor Module (DMM) (6/48)	On lower right side of HVAC housing. See **Fig. 34**.
Starter Motor (6/25)	Left side of engine. See **Fig. 32**.
Sunroof Motor (6/15)	Forward of sun roof opening. See **Fig. 31**.
Swirl Throttle Regulator Motor (6/118)	Top left side of engine. See **Fig. 37**.
Temperature Damper Motor Module (DMM) (Left) (6/95)	On left end of HVAC housing. See **Fig. 36**.
Temperature Damper Motor Module (DMM) (Right) (6/96)	Near center of HVAC housing. See **Fig. 36**.
Throttle Body Motor (6/120)	On throttle body. See **Fig. 37**.
Turbo Regulator Motor (6/143)	Rear of engine, on turbo. See **Fig. 38**.
Up/Down Front Edge Motor (Driver's Seat) (6/17)	Under driver's seat. See **Fig. 31**.
Up/Down Front Edge Motor (Passenger's Seat) (6/65)	Under front passenger's seat. See **Fig. 35**.
Up/Down Rear Edge Motor (Driver's Seat) (6/18)	Under driver's seat. See **Fig. 31**.
Up/Down Rear Edge Motor (Passenger's Seat) (6/66)	Under front passenger's seat. See **Fig. 35**.
Vacuum Pump (6/114)	At left front of engine compartment. See **Fig. 37**.
Ventilation/Floor/Defroster Damper Motor Module (DMM) (6/69)	Near center of HVAC housing. See **Fig. 35**.
Washer Motor (V70) (6/127)	Bottom of reservoir tank. See **Fig. 37**.
Washer Motor (XC90) (6/127)	Bottom of reservoir tank. See **Fig. 38**.
Windshield Wiper Motor (6/1)	On left side of plenum. See **Fig. 31**.

SENDING UNITS & SENSORS

SENDING UNITS & SENSORS LOCATION

Component	Location
ABS Sensor (Front Left/Right) (7/31, 7/32)	Behind respective wheel, on spindle/hub assembly. See **Fig. 41**.
	Behind respective wheel, on spindle/hub assembly.

ABS Sensor (Rear Left/Right) (7/56, 7/57)	See **Fig. 42**.
Acceleration Sensor (Four-C Front Left/Right) (7/87, 7/88)	Behind respective side of front bumper. See **Fig. 43**.
Acceleration Sensor (Four-C Rear Left) (7/89)	Left rear of vehicle. See **Fig. 44**.
Accelerator Pedal Sensor (7/51)	Near accelerator pedal. See **Fig. 42**.
Air Quality Sensor (AQS) (7/159)	At right side of plenum. See **Fig. 49**.
Angle Sensor (Four-C/Bi-Xenon Rear Left) (7/120)	In left rear wheelwell. See **Fig. 46**.
Angle Sensor (Four-C Rear Right) (7/121)	In right rear wheelwell. See **Fig. 46**.
Automatic Transmission Fluid Temperature Sensor (AW51) (7/74)	On transmission. See **Fig. 43**.
Automatic Transmission Fluid Temperature Sensor (TF-80SC) (7/74)	On transaxle, under cover. See **Fig. 43**.
Body Sensor Cluster Stability Sensor (BSC) (7/164)	Under front passenger's seat. See **Fig. 49**.
Brake Fluid Level Sensor (7/4)	On brake master cylinder reservoir. See **Fig. 38**.
Brake Pedal Sensor (7/124)	Left rear corner of engine compartment. See **Fig. 47**.
Brake Pressure Sensor 1 (7/139)	On brake master cylinder. See **Fig. 48**.
Brake Pressure Sensor 2 (7/129)	On brake master cylinder. See **Fig. 47**.
Camshaft Position Sensor (Exhaust Side) (7/173)	On top left rear of engine. See **Fig. 49**.
Camshaft Position Sensor (Intake Side) (7/172)	On top rear of engine. See **Fig. 49**.
Camshaft Position Sensor (8-Cyl., Bank 1) (Exhaust) (7/189)	Right front of engine. See **Fig. 50**.
Camshaft Position Sensor (8-Cyl., Bank 1) (Intake) (7/188)	Left rear of engine. See **Fig. 50**.
Camshaft Position Sensor (8-Cyl., Bank 2) (Exhaust) (7/173)	Top right rear of engine. See **Fig. 50**.
Camshaft Position Sensor (8-Cyl., Bank 2) (Intake) (7/172)	On right rear of engine. See **Fig. 49**.
Climate Control System Pressure Sensor (V70) (7/8)	At right front of engine compartment. See **Fig. 38**.
Climate Control System Pressure Sensor (XC90) (7/8)	At right front of engine compartment. See **Fig. 39**.
Clutch Pedal Sensor (V70) (7/123)	Behind left side of dash. See **Fig. 46**.
Clutch Pedal Sensor (XC90) (7/123)	Behind left side of dash. See **Fig. 47**.
Coolant Level Sensor (7/73)	On engine coolant reservoir. See **Fig. 42**.
Coolant Temperature Sensor (Except 8-Cyl.) (7/16)	Left front of engine. See **Fig. 40**.
Coolant Temperature Sensor (8-Cyl.) (7/16)	Rear of engine. See **Fig. 40**.
Evaporator Temperature Sensor (7/41)	Near center of HVAC housing. See **Fig. 41**.
Front Impact Sensor (Left/Right) (7/178, 7/179)	Behind respective side of front bumper. See **Fig. 50**.
Fuel Level Sensor (Ejector Side) (7/130)	In fuel tank. See **Fig. 47**.
Fuel Level Sensor (Pump Side) (7/143)	In fuel tank. See **Fig. 48**.
Glass Breakage Sensor (Left/Right) (7/135, 7/136)	In respective rear window. See **Fig. 47**.
Glass Breakage Sensor (Tailgate) (7/137)	In tailgate window. See **Fig. 48**.

Heated Oxygen Sensor (Bank 1) (8-Cyl.) (7/82)	Upstream of left catalytic converter. See **Fig. 43**.
Heated Oxygen Sensor (Bank 2) (8-Cyl.) (7/15)	Upstream of right catalytic converter. See **Fig. 39**.
Heated Oxygen Sensor (Diagnostic 1) (7/82)	Downstream of right catalytic converter. See **Fig. 43**.
Heated Oxygen Sensor (Rear- Bank 2) (8-Cyl.) (7/103)	Downstream of right catalytic converter. See **Fig. 44**.
Heated Oxygen Sensor (Rear) (7/104)	Downstream of catalytic converter. See **Fig. 44**.
Heated Oxygen Sensor 3 (7/103)	Upstream of left catalytic converter. See **Fig. 44**.
Heated Oxygen Sensor (5-Cyl.) (7/15)	Upstream of catalytic converter. See **Fig. 39**.
Heated Oxygen Sensor (6-Cyl.) (2) (7/15)	Upstream of catalytic converters. See **Fig. 39**.
Impulse Sensor (7/25)	At rear of engine. See **Fig. 41**.
Inclination Sensor Module (ISM) (7/100)	Left rear of vehicle. See **Fig. 44**.
Input Speed Sensor (AW51) (7/61)	On transaxle. See **Fig. 42**.
Input Speed Sensor (TF-80SC) (7/61)	On transaxle, under cover. See **Fig. 42**.
Intake Manifold Pressure Sensor (Except 8-Cyl.) (7/81)	Left side of engine. See **Fig. 43**.
Intake Manifold Pressure Sensor (8-Cyl.) (7/81)	On intake manifold. See **Fig. 43**.
Intake Manifold Pressure & Temperature Sensor (7/165)	Left front of engine compartment. See **Fig. 49**.
Interior Temperature Sensor (7/10)	Integral to climate control module. See **Fig. 39**.
Knock Sensor (Front) (Except 8-Cyl.) (7/24)	On left front side of engine. See **Fig. 40**.
Knock Sensor (Front) (8-Cyl.) (7/24)	On left front of engine. See **Fig. 41**.
Knock Sensor (Rear) (7/23)	On left rear side of engine. See **Fig. 40**.
Mass Airflow Sensor (7/17)	In intake air duct. See **Fig. 40**.
Mass Movement Sensor (MMS) (Front) (7/122)	Center front of roof. See **Fig. 46**.
Mass Movement Sensor (MMS) (Rear) (7/158)	Center rear of roof. See **Fig. 49**.
Occupant Weight Sensor (OWS) (7/93)	Under front passenger's seat. See **Fig. 44**.
Oil Level Sensor (7/35)	Lower left front of engine. See **Fig. 41**.
Oil Pressure Monitor (7/6)	On left side of engine. See **Fig. 38**.
Output Speed Sensor (AW51) (7/62)	On top of transaxle. See **Fig. 42**.
Output Speed Sensor (TF080SC) (7/62)	On transaxle, under cover. See **Fig. 42**.
Outside Temperature Sensor (Engine Control Module) (7/105)	In left outside rearview mirror. See **Fig. 45**.
Outside Temperature Sensor (7/11)	In right hand outside mirror. See **Fig. 39**.
Parking Assistance Sensor (Front 5, 6, 7 & 8) (7/204-7/207)	In front bumper. See **Fig. 51**.
Parking Assistance Sensor (Rear 1, 2, 3 & 4) (7/131-7/134)	In rear bumper. See **Fig. 47**.
Pressure And Temperature Sensor (Bi-Fuel) (7/156)	Left rear of vehicle, on tank. See **Fig. 48**.
Pressure And Temperature Sensor (Fuel) (7/156)	Rear of engine. See **Fig. 48**.
Rain Sensor Module (RSM) (7/149)	Top center of windshield. See **Fig. 48**.
Seat Position Sensor (Driver/Passenger) (3/255,	Under respective front seat. See **Fig. 26**.

3/256)	
Seat Temperature Sensor (Left/Right) (7/110, 7/111)	In respective front seat cushion. See **Fig. 45**.
Shock Absorber Acceleration Sensor (Four-C Front Left/Right) (7/118, 7/119)	In respective front shock tower. See **Fig. 46**.
Side Impact Sensor (Left Front) (7/115)	In left "B" pillar. See **Fig. 45**.
Side Impact Sensor (Left/Right Rear) (7/108, 7/109)	Near respective rear door. See **Fig. 45**.
Side Impact Sensor (Right Front) (7/116)	In right "B" pillar. See **Fig. 46**.
Solar Sensor, Twilight Sensor & Indication Alarm (7/12)	At top center of dash. See **Fig. 39**.
Steering Angle Sensor (7/91)	At top of steering column. See **Fig. 44**.
Steering Wheel Angle Sensor (4/68)	Top of steering column. See **Fig. 28**.
Washer Fluid Level Sensor (7/5)	In windshield washer reservoir. See **Fig. 38**.
Weight Sensor (Passenger Seat Belt Reminder) (7/175)	Under passenger seat. See **Fig. 50**.

SOLENOIDS & SOLENOID VALVES

SOLENOIDS & SOLENOID VALVES LOCATION

Component	Location
Bi-Fuel, Fuel Tank Solenoid (Left Front) (8/89)	Under left center of vehicle. See **Fig. 57**.
Bi-Fuel, Fuel Tank Solenoid (Rear) (8/88)	At fuel tank. See **Fig. 57**.
Bi-Fuel, Fuel Tank Solenoid (Right Front) (8/90)	Under right center of vehicle. See **Fig. 57**.
Electromagnetic Clutch (Climate Control System) (8/3)	Left front of engine. See **Fig. 51**.
EVAP Valve (8/18)	Left side of engine compartment. See **Fig. 51**.
Fuel Cut-Off DFCO Valve (8/75)	Left side of engine compartment. See **Fig. 56**.
Fuel Pressure Bypass Valve (8/113)	Near rear of engine. See **Fig. 58**.
Injection Valves (8-Cyl.) (8/146 - 8/153)	On top of engine. See **Fig. 60**.
Injectors (8/6 - 8/11)	Top of engine. See **Fig. 51**.
Linear Pressure Solenoid (SLB1 & SLC 1 - 3) (8/142 - 8/145)	In transmission. See **Fig. 59**.
Lock-Up Solenoid (8/40)	Under transmission cover. See **Fig. 54**.
Pressure Solenoid (8/41)	Under transmission cover. See **Fig. 54**.
Rear Shock Absorber (Four-C) (Left/Right) (8/22, 8/23)	In respective rear wheelwell. See **Fig. 52**.
Reverse Interlock Solenoid (Manual) (8/134)	At base of shifter assembly. See **Fig. 59**.
Shift Lock Solenoid (8/36)	In floor console, at base of gear selector lever. See **Fig. 53**.
Shift Solenoid 1 (8/38)	In transmission. See **Fig. 54**.
Shift Solenoid 2 (8/39)	In transmission. See **Fig. 54**.
Shift Solenoid 3, 4 & 5 (8/72, 8/73 & 8/74)	Under transmission cover. See **Fig. 56**.

Shock Absorber (Four-C) (Left/Right Front) (8/20, 8/21)	In respective front wheelwell. See **Fig. 52**.
Speed-Dependent Power Steering Valve (6/71)	Left rear of engine compartment.
Throttle Solenoid (8/71)	Under transmission cover. See **Fig. 56**.
Turbocharger Control Valve (8/28)	On top rear of engine. See **Fig. 52**.
Variable Intake Valve (8-Cyl.) (8/107)	On intake manifold. See **Fig. 58**.
Variable Valve Timing Solenoid (Bank 1, Exhaust) (8/118)	Front left side of engine. See **Fig. 58**.
Variable Valve Timing Solenoid (Bank 1, Intake) (8/117)	Left front of engine. See **Fig. 58**.
Variable Valve Timing Solenoid (Intake) (5-Cyl.) (8/19)	On top rear of engine. See **Fig. 51**.
Variable Valve Timing Solenoid (Intake) (6-Cyl.) (8/19)	Top front of engine. See **Fig. 52**.
Variable Valve Timing Solenoid (Outlet) (8/81)	On top of engine. See **Fig. 57**.
Variable Valve Timing Solenoid (8-Cyl., Bank 2) (Exhaust) (8/81)	Top right front of engine. See **Fig. 57**.
Variable Valve Timing Solenoid (8-Cyl., Bank 2) (Intake) (8/19)	Top left front of engine. See **Fig. 52**.

SWITCHES

SWITCHES LOCATION

Component	Location
Fuel Filter Heating & Thermostatic Switch (8/85)	At front of right rear wheelwell. See **Fig. 57**.
Gear Selector Contacts (3/71)	On transaxle. See **Fig. 20**.
Hood Alarm Contact (V70) (3/62)	At left front of engine compartment. See **Fig. 20**.
Hood Alarm Contact (2) (XC90) (3/62)	At front of engine compartment. See **Fig. 20**.
Horn Contact (3/37)	In steering wheel, under horn pad. See **Fig. 19**.
Parking Brake Contact (V70) (3/47)	At base of parking brake lever. See **Fig. 19**.
Parking Brake Contact (XC90) (3/47)	At top of parking brake pedal assembly. See **Fig. 19**.
Reversing Light Contact (3/10)	On transaxle, near gear position contacts. See **Fig. 18**.
Seat Belt Buckle Contact (Left) (3/93)	On left seat belt buckle. See **Fig. 22**.
Seat Belt Buckle Contact (Right) (V70) (3/94)	On right seat belt buckle. See **Fig. 22**.
Seat Belt Buckle Contact (Right) (XC90) (3/94)	On right seat belt buckle. See **Fig. 23**.
Vacuum Pump Switch (8/84)	At front of engine compartment. See **Fig. 57**.

MISCELLANEOUS

MISCELLANEOUS LOCATION

Component	Location

Airbag Igniter (Driver Side) (8/30)	In steering wheel. See **Fig. 52**.
Airbag Igniter (Passenger Side) (V70) (8/31)	Behind right side of dash. See **Fig. 52**.
Airbag Igniter (Passenger Side) (XC90) (8/31)	Behind right side of dash. See **Fig. 53**.
Airbag Igniter Stage 2 (Driver Side) (8/61)	In steering wheel. See **Fig. 55**.
Airbag Igniter Stage 2 (Passenger Side) (8/32)	Behind right side of dash. See **Fig. 53**.
Airbag Igniter Stage 3 (Driver Side) (8/123)	In steering wheel. See **Fig. 59**.
Airbag Igniter Stage 3 (Passenger Side) (8/124)	Behind right side of dash. See **Fig. 59**.
Antenna Amplifier (Bumper) (16/67)	Right rear of vehicle. See **Fig. 64**.
Antenna (Bumper) (16/68)	Right side of rear bumper. See **Fig. 64**.
Antenna, Ring/Ignition Switch Lighting (16/65)	On steering column. See **Fig. 64**.
Antenna (Satellite Receiver) (16/153)	Rear of roof. See **Fig. 67**.
Battery (1/1)	In rear of cargo compartment, under carpet. See **Fig. 16**.
Belt Tensioner Igniter (Center Rear) (8/62)	In center rear seat belt tensioner assembly. See **Fig. 55**.
Belt Tensioner Igniter (Left/Right Front) (8/33, 8/34)	At respective "B" pillar. See **Fig. 53**.
Belt Tensioner Igniter (Left/Right Rear) (8/55, 8/56)	At respective "C" pillar. See **Fig. 55**.
Belt Tensioner Igniter (Left 3rd Row Seats) (8/94)	At left "D" pillar. See **Fig. 57**.
Belt Tensioner Igniter (Right 3rd Row Seats) (8/95)	At right "D" pillar. See **Fig. 58**.
Camera Module (LCM/RCM) (Left/Right) (27/3, 27/4)	In left or right mirror. See **Fig. 69**.
Capacitor (20/16)	In engine compartment relay/fuse box. See **Fig. 69**.
Cellular Phone Antenna (16/64)	Center front of roof. See **Fig. 63**.
Contact Reel (18/4)	Top of steering column. See **Fig. 69**.
Data Link Connector (17/13)	Under left side of dash. See **Fig. 67**.
Fuel Distributor (Gas) (6/105)	On engine. See **Fig. 37**.
Gear Selector Module (GSM) (3/156)	Integral to transmission shift lever. See **Fig. 24**.
GPS Antenna (Cellular Phone) (16/63)	Center front of roof. See **Fig. 63**.
GPS Antenna RTI (16/47)	At top left side of dash. See **Fig. 62**.
Horn 1 (16/10)	Front of engine compartment. See **Fig. 61**.
Horn 2 (16/11)	Front of engine compartment. See **Fig. 61**.
Inflatable Curtain Igniter (Left/Right 3rd Row Seats) (8/96, 8/97)	At respective "D" pillar. See **Fig. 58**.
Inflatable Curtain Igniter (Left/Right) (8/66, 8/67)	In roof, above respective rear window. See **Fig. 56**.
Jump Start Connection (17/17)	Left rear of engine compartment. See **Fig. 67**.
Microphone (Cellular Phone Hands Free) (V70) (16/127)	In left side of dash. See **Fig. 66**.
Microphone (Cellular Phone Hands Free) (XC90) (16/127)	In left side of dash. See **Fig. 67**.
MP3 Player (16/149)	Left rear of vehicle. See **Fig. 67**.
Program Selector (A/T) (3/155)	Part of selector lever assembly. See **Fig. 24**.

Satellite Radio Receiver (V70) (16/145)	Left rear of vehicle. See **Fig. 67**.
Satellite Radio Receiver (XC90) (16/145)	Right rear of vehicle. See **Fig. 67**.
Side Airbag Igniter (Front Left) (V70) (8/51)	On left side of driver's seat back. See **Fig. 54**.
Side Airbag Igniter (Front Left) (XC90) (8/51)	On left side of driver's seat back. See **Fig. 55**.
Side Airbag Igniter (Front Right) (8/52)	On right front seat back. See **Fig. 55**.
Siren (16/35)	Right front wheelwell. See **Fig. 62**.
Spark Plug & Ignition Coil (6-Cyl.) (20/3 - 20/8)	Top of engine. See **Fig. 69**.
Spark Plug W/Ignition Coil (8-Cyl.) (20/46 - 20/53)	Top of engine. See **Fig. 69**.
Steering Column Igniter (8/99)	In steering column. See **Fig. 58**.
Tow Hitch Cable Converter Harness (26/4)	Left rear corner of cargo compartment. See **Fig. 69**.
Tow Hitch Cable Harness Outlet (4-Pin) (17/37)	Under rear bumper. See **Fig. 68**.
Tow Hitch Cable Harness Outlet (7-Pin) (17/38)	Under rear bumper. See **Fig. 68**.
Tow Hitch Cable Harness Outlet (13-Pin) (17/39)	Under rear bumper. See **Fig. 68**.
T/V Receiver (16/36)	Left rear corner of cargo compartment. See **Fig. 62**.
Variable Valve Lifter (Front Plane) (8/125)	Top right rear of engine. See **Fig. 59**.
Variable Valve Lifter (Rear Plane) (8/126)	Top right front of engine. See **Fig. 59**.
Window Antenna Amplifier 1 (Left) (16/16)	Above left rear window. See **Fig. 61**.
Window Antenna Amplifier 1 (Right) (16/71)	Above right rear window. See **Fig. 64**.
Window Antenna Amplifier 2 (Left) (16/73)	Above left rear window. See **Fig. 64**.
Window Antenna Amplifier 2 (Right) (16/74)	Above right rear window. See **Fig. 64**.

CONNECTORS

CONNECTORS LOCATION

Component	Location
C54/1B (Gray, 14 Pin)	At left side of engine compartment. See **Fig. 75**.
C54/1C (Gray, 2 Pin)	Left front of engine compartment. See **Fig. 76**.
C54/3.1 (Gray, 36 Pin)	At left rear corner of engine compartment. See **Fig. 76**.
C54/3.2 (Gray, 6 Pin)	Behind left kick panel. See **Fig. 76**.
C54/4 (Gray, 8 Pin)	At left front of engine compartment. See **Fig. 76**.
C54/7 (Gray, 3 Pin)	At front of engine compartment. See **Fig. 76**.
C54/8 (Gray, 2 Pin)	Behind left headlight. See **Fig. 76**.
C54/9 (V70) (Gray, 6 Pin)	Behind left headlight. See **Fig. 76**.
C54/9 (XC90) (Gray, 6 Pin)	Behind left headlight. See **Fig. 77**.
C54/10 (Black, 12 Pin)	Behind left kick panel. See **Fig. 77**.
C54/11 (Black, 12 Pin)	Behind right kick panel. See **Fig. 77**.
C54/12 (Orange, 4 Pin)	Behind right side of dash. See **Fig. 77**.
C54/13 (Black, 22 Pin)	At left "A" pillar. See **Fig. 77**.
C54/14 (Gray, 12 Pin)	Behind left side of dash. See **Fig. 77**.
C54/16 (Green, 5 Pin)	At right front of roof. See **Fig. 78**.

C54/20 (Black, 12 Pin)	At left "B" pillar. See **Fig. 78**.
C54/21 (Black, 12 Pin)	At right "B" pillar. See **Fig. 78**.
C54/22 (V70) (Black, 12 Pin)	Behind left headlight. See **Fig. 78**.
C54/22 (XC90) (Black, 10 Pin)	Behind left headlight. See **Fig. 78**.
C54/23 (V70) (Black, 12 Pin)	Behind right headlight. See **Fig. 78**.
C54/23 (XC90) (Black, 10 Pin)	Behind right headlight. See **Fig. 78**.
C54/24 (Black, 20 Pin)	Under left front seat. See **Fig. 78**.
C54/25 (Black, 20 Pin)	Under right front seat. See **Fig. 78**.
C54/32 (Gray, 3 Pin)	Near bottom of left "C" pillar. See **Fig. 78**.
C54/34 (Gray, 4 Pin)	Near bottom of right "C" pillar. See **Fig. 79**.
C54/35 (Gray, 4 Pin)	Near bottom of right "C" pillar. See **Fig. 79**.
C54/36 (Gray, 6 Pin)	Near bottom of right "C" pillar. See **Fig. 79**.
C54/39 (Orange, 4 Pin)	Near bottom of right "C" pillar. See **Fig. 79**.
C54/40B (Gray, 8 Pin)	Near bottom of left "C" pillar. See **Fig. 79**.
C54/40C (Black, 2 Pin)	Near bottom of left "C" pillar. See **Fig. 79**.
C54/40D (Black, 2 Pin)	Near bottom of left "C" pillar. See **Fig. 79**.
C54/43B (Gray, 8 Pin)	Near bottom of right "C" pillar. See **Fig. 79**.
C54/43 (Gray, 14 Pin)	Near bottom of right "C" pillar. See **Fig. 79**.
C54/50 (Gray, 2 Pin)	Left rear corner of cargo compartment. See **Fig. 80**.
C54/53 (Gray, 4 Pin)	At front of engine compartment. See **Fig. 80**.
C54/54 (Gray, 8 Pin)	At right rear of cargo compartment. See **Fig. 80**.
C54/66.1 (Gray, 2 Pin)	At left rear of cargo compartment. See **Fig. 81**.
C54/66.2 (Black, 2 Pin)	At left rear of cargo compartment. See **Fig. 81**.
C54/74B (Orange, 2 Pin)	At bottom of left "C" pillar. See **Fig. 81**.
C54/74 (Yellow, 4 Pin)	At bottom of left "C" pillar. See **Fig. 81**.
C54/98 (Gray, 5 Pin)	At right rear corner of cargo compartment. See **Fig. 81**.
C54/100 (Black, 2 Pin)	Left side of engine. See **Fig. 81**.
C54/106 (Gray, 4 Pin)	At bottom of right "C" pillar. See **Fig. 81**.
C54/107 (Gray, 10 Pin)	At bottom of left "C" pillar. See **Fig. 81**.
C54/112 (Gray, 4 Pin)	Behind center of dash. See **Fig. 81**.
C54/113 (Black, 2 Pin)	At left front corner of engine compartment. See **Fig. 81**.
C54/117 (Orange, 2 Pin)	Near bottom of right "C" pillar. See **Fig. 81**.
C54/122 (Black, 2 Pin)	At right front corner of engine compartment.
C54/132 (Gray, 6 Pin)	Behind left side of dash. See **Fig. 82**.
C54/134 (XC90) (Gray, 12 Pin)	Under center console. See **Fig. 82**.
C54/134.2 (Except XC90) (Gray, 4 Pin)	Under center console. See **Fig. 82**.
C54/137A (Gray, 3 Pin)	Center of roof. See **Fig. 82**.
C54/139 (Gray, 12 Pin)	Under driver's seat. See **Fig. 82**.
C54/140 (Gray, 12 Pin)	Under center console. See **Fig. 82**.

C54/274 (Gray, 12 Pin)	Left center of roof. See **Fig. 82**.
C54/275 (Gray, 12 Pin)	Right center of roof. See **Fig. 82**.
C54/276 (Gray, 12 Pin)	In driver's seat back. See **Fig. 82**.
C54/277 (Gray, 12 Pin)	In front passenger's seat back. See **Fig. 83**.
C54/1300 (Gray, 6 Pin)	Behind right headlight. See **Fig. 83**.
C54/1400 (Gray, 6 Pin)	Under right side of dash. See **Fig. 83**.
C54/1401 (V70) (Gray, 10 Pin)	Center of roof. See **Fig. 83**.
C54/1401 (XC90) (Gray, 12 Pin)	Center of roof. See **Fig. 83**.
C54/1402 (Green, 22 Pin)	Center of roof. See **Fig. 83**.

GROUNDS

GROUNDS LOCATION

Component	Location
G31/1	Right side of engine compartment, on strut tower. See **Fig. 70**.
G31/2	In engine compartment, on left strut tower. See **Fig. 70**.
G31/4	At rear left side of engine. See **Fig. 70**.
G31/6	At left kick panel. See **Fig. 70**.
G31/10	At right kick panel. See **Fig. 70**.
G31/44	At lower left front of engine compartment. See **Fig. 71**.
G31/46	On left rear seat riser. See **Fig. 71**.
G31/47	On left rear seat riser. See **Fig. 71**.
G31/48	On right rear seat riser. See **Fig. 71**.
G31/53	Left side of engine compartment. See **Fig. 71**.
G31/66	On left front seat riser. See **Fig. 72**.
G31/67	On right front seat riser. See **Fig. 72**.
G31/70	Lower left front corner of engine compartment. See **Fig. 72**.
G31/72	At left rear of cargo compartment. See **Fig. 72**.
G31/73	At right rear of passenger's compartment, near floor. See **Fig. 72**.
G31/83	At left kick panel. See **Fig. 73**.
G31/84	At right kick panel. See **Fig. 73**.
G31/88	At top of engine. See **Fig. 73**.
G31/89	At top rear of engine. See **Fig. 73**.
G31/90	Left side of engine. See **Fig. 74**.
G31/91	At left side of engine. See **Fig. 74**.
G31/93	Left side of engine compartment, on strut tower. See **Fig. 74**.

G31/94	Right side of engine compartment, on strut tower. See **Fig. 74**.
G31/95	Left side of engine compartment, on strut tower. See **Fig. 74**.
G31/96	Right side of engine compartment, on strut tower. See **Fig. 74**.
G31/98	At front center of headliner. See **Fig. 75**.
G31/99	Above left rear window. See **Fig. 75**.
G31/100	Top left side of engine. See **Fig. 74**.
G31/102	Behind left corner of front bumper. See **Fig. 75**.
G31/120 (V70)	Left rear of cargo compartment. See **Fig. 75**.
G31/120 (XC90)	Right rear of cargo compartment. See **Fig. 75**.
G31/121 (8-Cyl.)	Top right side of engine.

SPLICES

SPLICES LOCATION

Component	Location
S53/301 (V70)	In engine compartment harness, at left front of engine compartment. See **Fig. 3**.
S53/301 (XC90)	In engine compartment harness, at left front of engine compartment. See **Fig. 4**.
S53/302 (V70)	In engine compartment harness, at right side of engine compartment. See **Fig. 3**.
S53/302 (XC90)	In engine compartment harness, at right front corner of engine compartment. See **Fig. 4**.
S53/303 (V70)	In engine compartment harness, at right side of engine compartment. See **Fig. 3**.
S53/303 (XC90)	In engine compartment harness, at right side of engine compartment. See **Fig. 4**.
S53/304 (6-Cyl.)	In engine harness, at rear of engine. See **Fig. 1**.
S53/304 (8-Cyl.)	In engine harness, at rear of engine. See **Fig. 2**.
S53/305	In engine compartment harness, at left side of engine compartment. See **Fig. 3**.
S53/309 (6-Cyl.)	In engine harness, at rear of engine. See **Fig. 1**.
S53/309 (8-Cyl.)	In engine harness, at top rear of engine. See **Fig. 2**.
S53/314	In engine harness, at left front of engine. See **Fig. 1**.
S53/315 (6-Cyl.)	In engine harness, at rear of engine. See **Fig. 1**.
S53/315 (8-Cyl.)	In engine harness, at top rear of engine. See **Fig. 2**.
S53/319	In engine harness, at left front of engine. See **Fig. 1**.
S53/324 (V70)	In engine compartment harness, at right side of engine compartment. See **Fig. 3**.
	In engine compartment harness, at right side of

S53/324 (XC90)	engine compartment. See **Fig. 4**.
S53/326	In engine harness, at left front of engine. See **Fig. 1**.
S53/328 (6-Cyl.)	In engine harness, at rear of engine. See **Fig. 1**.
S53/328 (8-Cyl.)	In engine harness, at right front of engine. See **Fig. 2**.
S53/329 (V70)	In engine compartment harness, at left side of engine compartment. See **Fig. 3**.
S53/329 (XC90)	In engine compartment harness, at left side of engine compartment. See **Fig. 4**.
S53/331 (V70)	In engine compartment harness, at left front of engine compartment. See **Fig. 3**.
S53/331 (XC90)	In engine compartment harness, at left side of engine compartment. See **Fig. 4**.
S53/332 (6-Cyl.)	In engine harness, at left front of engine. See **Fig. 1**.
S53/332 (8-Cyl.)	In engine harness, at left rear of engine. See **Fig. 2**.
S53/352 (V70)	In engine compartment harness, at left front of engine compartment. See **Fig. 3**.
S53/352 (XC90)	In engine compartment harness, at left front corner of engine compartment. See **Fig. 4**.
S53/353 (V70)	In engine compartment harness, at left side of engine compartment. See **Fig. 3**.
S53/353 (XC90)	In engine compartment harness, at left front corner of engine compartment. See **Fig. 4**.
S53/354 (V70)	In engine compartment harness, rear of engine compartment. See **Fig. 3**.
S53/355 (V70)	In engine compartment harness, rear of engine compartment. See **Fig. 3**.
S53/360 (6-Cyl.)	In engine harness, at rear of engine. See **Fig. 1**.
S53/360 (8-Cyl.)	In engine harness, at right side of engine. See **Fig. 2**.
S53/375	In engine harness, at left front of engine. See **Fig. 1**.
S53/376	In engine harness, at left front of engine. See **Fig. 1**.
S53/384 (V70)	In engine compartment harness, at left side of engine compartment. See **Fig. 3**.
S53/384 (XC90)	In engine compartment harness, at left side of engine compartment. See **Fig. 4**.
S53/394 (V70)	In engine compartment harness, at left side of engine compartment. See **Fig. 3**.
S53/394 (XC90)	In engine compartment harness, at left side of engine compartment. See **Fig. 4**.
S53/395 (V70)	In engine compartment harness, at left front of engine compartment. See **Fig. 3**.
S53/395 (XC90)	In engine compartment harness, at left front corner of engine compartment. See **Fig. 4**.
	In engine compartment harness, at side of engine

S53/396 (XC90)	compartment. See **Fig. 4**.
S53/397 (V70)	In engine compartment harness, at left side of engine compartment. See **Fig. 3**.
S53/397 (XC90)	In engine compartment harness, at left side of engine compartment. See **Fig. 4**.
S53/398 (V70)	In engine compartment harness, at rear of engine compartment. See **Fig. 3**.
S53/398 (XC90)	In engine compartment harness, at rear of engine compartment. See **Fig. 4**.
S53/400 (V70)	In front passenger compartment harness, behind left side of dash. See **Fig. 5**.
S53/400 (XC90)	In front passenger compartment harness, behind left side of dash. See **Fig. 6**.
S53/403 (V70)	In front passenger compartment harness, behind left side of dash. See **Fig. 5**.
S53/403 (XC90)	In front passenger compartment harness, behind left side of dash. See **Fig. 6**.
S53/405 (V70)	In front passenger compartment harness, behind left side of dash. See **Fig. 5**.
S53/405 (XC90)	In front passenger compartment harness, behind left side of dash. See **Fig. 6**.
S53/406 (V70)	In front passenger compartment harness, behind center of dash. See **Fig. 5**.
S53/408 (V70)	In front passenger compartment harness, behind left side of dash. See **Fig. 5**.
S53/408 (XC90)	In front passenger compartment harness, behind center of dash. See **Fig. 6**.
S53/415 (V70)	In front passenger compartment harness, behind left side of dash. See **Fig. 5**.
S53/415 (XC90)	In front passenger compartment harness, behind left side of dash. See **Fig. 6**.
S53/425 (V70)	In front passenger compartment harness, behind left side of dash. See **Fig. 5**.
S53/425 (XC90)	In front passenger compartment harness, behind left side of dash. See **Fig. 6**.
S53/433 (V70)	In front passenger compartment harness, behind center of dash. See **Fig. 5**.
S53/433 (XC90)	In front passenger compartment harness, behind left side of dash. See **Fig. 6**.
S53/434 (V70)	In front passenger compartment harness, behind center of dash. See **Fig. 5**.
S53/434 (XC90)	In front passenger compartment harness, behind left side of dash. See **Fig. 6**.
S53/437 (V70)	In front passenger compartment harness, behind left

	side of dash. See **Fig. 5**.
S53/437 (XC90)	In front passenger compartment harness, behind left side of dash. See **Fig. 6**.
S53/438 (V70)	In front passenger compartment harness, behind left side of dash. See **Fig. 5**.
S53/438 (XC90)	In front passenger compartment harness, behind left side of dash. See **Fig. 6**.
S53/443 (V70)	In front passenger compartment harness, behind left side of dash. See **Fig. 5**.
S53/443 (XC90)	In front passenger compartment harness, behind left side of dash. See **Fig. 6**.
S53/448 (V70)	In front passenger compartment harness, behind right side of dash. See **Fig. 5**.
S53/448 (XC90)	In front passenger compartment harness, behind center of dash. See **Fig. 6**.
S53/449	In front passenger compartment harness, at left rear wheelwell. See **Fig. 5**.
S53/450	In front passenger compartment harness, at left rear wheelwell. See **Fig. 5**.
S53/452	In front passenger compartment harness, behind center side of dash. See **Fig. 6**.
S53/454	In front passenger compartment harness, behind left side of dash. See **Fig. 6**.
S53/462	In engine harness, at rear of engine. See **Fig. 2**.
S53/500 (V70)	In front passenger compartment harness, under driver's door sill. See **Fig. 5**.
S53/500 (XC90)	In front passenger compartment harness, under left rear door sill. See **Fig. 6**.
S53/501 (V70)	In front passenger compartment harness, under front passenger's door sill. See **Fig. 5**.
S53/501 (XC90)	In front passenger compartment harness, under front passenger's door sill. See **Fig. 6**.
S53/503 (XC90)	In roof harness, at left front of roof. See **Fig. 10**.
S53/505 (V70)	In roof & inflatable curtain harness, at top of left "A" pillar. See **Fig. 9**.
S53/505 (XC90)	In roof harness, at left front of roof. See **Fig. 10**.
S53/508	In roof harness, forward of sun roof. See **Fig. 10**.
S53/509	In roof harness, forward of sun roof. See **Fig. 10**.
S53/514 (V70)	In left front door harness. See **Fig. 12**.
S53/514 (XC90)	In left front door harness. See **Fig. 14**.
S53/515 (V70)	In right front door harness. See **Fig. 13**.
S53/515 (XC90)	In right front door harness. See **Fig. 14**.
S53/523 (V70)	In front passenger compartment harness, at left kick panel. See **Fig. 5**.

S53/523 (XC90)	In front passenger compartment harness, at left kick panel. See **Fig. 6**.
S53/524 (V70)	In front passenger compartment harness, at left kick panel. See **Fig. 5**.
S53/524 (XC90)	In front passenger compartment harness, at left kick panel. See **Fig. 6**.
S53/525 (V70)	In front passenger compartment harness, behind right side of dash. See **Fig. 5**.
S53/525 (XC90)	In front passenger compartment harness, behind right side of dash. See **Fig. 6**.
S53/526 (V70)	In front passenger compartment harness, behind right side of dash. See **Fig. 5**.
S53/526 (XC90)	In front passenger compartment harness, behind right side of dash. See **Fig. 6**.
S53/567 (V70)	In front passenger compartment harness, under center floor console. See **Fig. 5**.
S53/568 (V70)	In front passenger compartment harness, under center floor console. See **Fig. 5**.
S53/569 (V70)	In front passenger compartment harness, at left kick panel. See **Fig. 5**.
S53/570 (V70)	In front passenger compartment harness, at left kick panel. See **Fig. 5**.
S53/575	In roof harness, at top of left "C" pillar. See **Fig. 10**.
S53/576	In roof harness, at top of left "C" pillar. See **Fig. 10**.
S53/577	In roof harness, at top of left "C" pillar. See **Fig. 10**.
S53/579 (V70)	In cargo compartment harness, at right front side of vehicle. See **Fig. 7**.
S53/579 (XC90)	In cargo compartment harness, at right front side of vehicle. See **Fig. 8**.
S53/583 (V70)	In roof & inflatable curtain harness, at left front of roof. See **Fig. 9**.
S53/583 (XC90)	In roof harness, forward of sun roof. See **Fig. 10**.
S53/584 (V70)	In front passenger compartment harness, under driver's door sill. See **Fig. 5**.
S53/584 (XC90)	In front passenger compartment harness, under driver's door sill. See **Fig. 6**.
S53/585 (V70)	In front passenger compartment harness, under driver's door sill. See **Fig. 5**.
S53/585 (XC90)	In front passenger compartment harness, under driver's door sill. See **Fig. 6**.
S53/601 (V70)	In cargo compartment harness, at left rear corner of cargo compartment. See **Fig. 7**.
S53/601 (XC90)	In cargo compartment harness, at left rear corner of cargo compartment. See **Fig. 8**.

S53/602 (V70)	In cargo compartment harness, at left rear corner of cargo compartment. See **Fig. 7**.
S53/602 (XC90)	In cargo compartment harness, at left rear corner of cargo compartment. See **Fig. 8**.
S53/604 (V70)	In cargo compartment harness, at right rear corner of cargo compartment. See **Fig. 7**.
S53/604 (XC90)	In cargo compartment harness, at right rear corner of cargo compartment. See **Fig. 8**.
S53/605 (V70)	In cargo compartment harness, at right rear of cargo area. See **Fig. 7**.
S53/606	In tailgate harness, at top left of tailgate. See **Fig. 11**.
S53/652	In cargo compartment harness, at right side of cargo compartment. See **Fig. 7**.
S53/653	In cargo compartment harness, at right side of cargo compartment. See **Fig. 7**.
S53/654	In cargo compartment harness, at right rear corner of cargo compartment. See **Fig. 7**.
S53/655	In cargo compartment harness, at right rear corner of cargo compartment. See **Fig. 7**.
S53/1400	In rear seat entertainment harness, at center of roof. See **Fig. 15**.
S53/1403	In rear seat entertainment harness, at center of roof. See **Fig. 15**.
S53/1404	In rear seat entertainment harness, at center of roof. See **Fig. 15**.
S53/1405	In rear seat entertainment harness, at left rear of cargo area. See **Fig. 15**.
S53/3002	In engine harness, at left front of engine. See **Fig. 2**.
S53/3006	In engine harness, at rear of engine. See **Fig. 2**.
S53/3006	In engine harness, at right side of engine. See **Fig. 2**.
S53/3009	In engine harness, at rear of engine. See **Fig. 2**.

Doors And Lids - Diagnostic Trouble Codes and Associated Procedures

DDM/PDM-0031 DOOR MIRROR POTENTIOMETER. SIGNAL TOO LOW (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) DDM/PDM-0031 is stored if the control module registers that the signal across the potentiometer for door mirror X axis control (left and right) is too low.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the signal cable.
- Open-circuit in the power cable.
- Short-circuit to ground in the power cable.

Fault symptom[s]

- The door mirror memory function is not working.

SIGNAL TOO LOW

CHECKING CONNECTORS AND COMPONENTS

Fig. 1: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 2: Checking Connector
Courtesy of VOLVO CARS CORPORATION

- Check the connector for the control module and door mirror. Check for contact resistance and oxidation.

  Remedy as necessary

- Reinstall the connectors, components etc.
- Ignition on.

  Test the door mirror function by changing its position and reading off the end values registered by the door mirror potentiometer.

  HINT: The end values for the door mirror potentiometer should be between approximately 1 V and 4 V.

Other information:

- see **REAR VIEW MIRROR, REPLACING**
- see **CHECKING WIRING AND TERMINALS**

Fig. 3: Connector, Green (16- Pin)

Fig. 4: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

Courtesy of VOLVO CARS CORPORATION

Does the door mirror potentiometer operate correctly?

- **YES**

  see: **VERIFICATION**

- **NO**

  see: **CHECKING FAULTY SIGNALS**

CHECKING FAULTY SIGNALS

Check the cable between the control module #25A and the door mirror potentiometer terminal #1. Check for an open-circuit. Check for a short-circuit to ground.

DDM/PDM-0031 Door mirror potentiometer, signal too low

Check the cable between control module #9A and door mirror potentiometer #9. Check for a short-circuit to ground.

DDM/PDM-0033 Door mirror potentiometer, signal too low

Check the cable between control module #10A and door mirror potentiometer #10. Check for a short-circuit to ground.

Other information:

- see **SIGNAL SPECIFICATION**
- see **CONNECTING THE BREAKOUT BOX**

Is the response within its permitted range?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  see: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

DDM/PDM-0031 DOOR MIRROR POTENTIOMETER. SIGNAL TOO LOW. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION**

SIGNAL TOO LOW. INTERMITTENT FAULT

CHECKING THE CONNECTORS AND COMPONENTS

Fig. 9: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 10: Checking Connector
Courtesy of VOLVO CARS CORPORATION

- Check the connector for the door node and door mirror. Check for contact resistance and oxidation.

  Remedy as necessary

- Reinstall the connectors, components etc.
- Ignition on.

  Test the door mirror function by changing its position and reading off the end values registered by the door mirror potentiometer.

  HINT: The end values for the door mirror potentiometer should be between approximately 1 V and 4 V.

Other information:

- To access the door mirror, see **REAR VIEW MIRROR, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 11: Connector, Green (16- Pin)

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

DDM/PDM-0032 DOOR MIRROR POTENTIOMETER. FAULTY SIGNAL (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) DDM/PDM-0032 is stored if the control module registers that the signal across the potentiometer for door mirror Y axis control (up and down) is too high.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the signal cable.
- Open-circuit in the signal cable.
- Short-circuit to ground in the power cable.
- Open-circuit in the ground lead.
- Short-circuit to supply voltage in the ground lead.

Fault symptom[s]

- The door mirror memory function is not working.

see **FAULTY SIGNAL. PERMANENT FAULT**

DDM/PDM-0033 DOOR MIRROR POTENTIOMETER. SIGNAL TOO LOW (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) DDM/PDM-0033 is stored if the control module registers that the signal across the potentiometer for door mirror Y axis control (up and down) is too low.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the signal cable.
- Open-circuit in the power cable.
- Short-circuit to ground in the power cable.

Fault symptom[s]

- The door mirror memory function is not working.

SIGNAL TOO LOW. PERMANENT FAULT

see **SIGNAL TOO LOW. PERMANENT FAULT**

DDM/PDM-E010 CONTROL MODULE. INTERNAL FAULT (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION DDM/PDM-E010

Condition

The diagnostic trouble code (DTC) is generated if the voltage to the driver door/passenger door module (DDM/PDM) differs from the voltage to the central electronic module (CEM) by more than 2 V.

The driver door/passenger door module (DDM/PDM) receives information on voltage to the central electronic module (CEM) via the CAN network.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is on.

Substitute Value

- None.

Possible Source

- Cable short-circuited to ground.
- Open-circuit on cable.
- Contact resistance.
- Half-blown fuse to driver door/passenger door module (DDM/PDM).

Fault symptom[s]

- Driver door/passenger door switch panel not working.

INTERNAL FAULT

CHECKING THE POWER SUPPLY

- Ignition off
- Unplug connector B to the driver door/passenger door module (DDM/PDM).
- Ignition on.

  Check the power supply to the driver door/passenger door module (DDM/PDM) by:

- Measuring the voltage between #B12 (#26) and #B5 (#19) on control module connector B.
- Measuring battery voltage.

If the difference between the control module supply voltage and battery voltage is greater than 2 V, the fault is in the supply cable or is due to contact resistance.

Also check the fuse of the driver door/passenger door module (DDM/PDM). A half-blown fuse can cause intermittent faults.

If the difference is less than 2 V, there could be an internal fault in the door control module.

Remedy as necessary.

Other information:

- see **CONNECTING THE BREAKOUT BOX**
- see **SIGNAL SPECIFICATION**
- Replacing the driver's side door module. See **DRIVER DOOR MODULE (DDM), REPLACING**
- Replacing the passenger side door module. See **PASSENGER DOOR MODULE (PDM), REPLACING** .
- see **CHECKING WIRING AND TERMINALS**

- **Continue**

  see: **VERIFICATION MIXED**

VERIFICATION MIXED

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 24: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 25: Checking Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Check that the power window mechanism, door mirrors and central locking operate.

Do all the functions operate normally?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  see: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CONNECTING THE BREAKOUT BOX

Special tools:

see **9511428**

see **9511499**

see **9511507**

see **9813194**

CONNECTING THE BREAKOUT BOX

- Ignition off.
- Remove the door panel
- Disconnect the module connectors.

NOTE: Unplug the 12-pin connector before the 30-pin connector.

Connect the adapter to the control module's connector. Connect breakout box see **9511428** and cable harness see **9511499** to the adapter.

Adapter cable harness see **9511507** is for the 12-pin connector, and adapter cable harness see **9813194** is for the 30-pin connector.

Disconnection of breakout box in reverse order.

Other information

- To remove the door panel, see **PANEL FRONT SIDE DOOR, REPLACING**
- For further information about signals and other values, see **SIGNAL SPECIFICATION** .

DDM-0019: LOCK, DRIVER'S DOOR. SIGNAL TOO LOW (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) DDM-0019 is stored if the driver's door module registers a low signal in the lock signal cable for unlocking for more than 10 seconds.

Substitute Value

- None.

Possible Source

- The lock has jammed in the unlocked position.
- Defective locking switch. (Short-circuit in the locking switch.)
- Short-circuit to ground in the lock signal cable for unlocking.

Fault symptom[s]

- Cannot be operated with a key from the driver's door.

SIGNAL TOO LOW

CHECKING FOR PERMANENT OR INTERMITTENT FAULTS

Check that the driver's door lock can be operated with the key.

Is the function OK?

- **YES**

  see: **CHECKING THE CABLE**

- **NO**

  see: **CHECKING THE CABLE**

CHECKING THE CABLE

Check the cable between the door control module and the lock unit on the driver's door. Check for a short-circuit to ground.

DDM-0019 Central locking input (Unlocking)

Door control module terminal #A12 and driver's door terminal #1.

DDM-001A Central locking input (Locking)

Door control module terminal #A13 and driver's door terminal #5.

DDM-001B Central locking, lock cylinder

Door control module terminal #A13 and driver's door terminal #5, and door control module terminal #A12 and driver's door terminal #1.

Remedy as necessary.

Other information:

- With the ignition off, the voltage between terminal #12B and ground must be battery voltage
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For further information about signals and other values, see **SIGNAL SPECIFICATION**
- Replacing the driver's side door module. See **DRIVER DOOR MODULE (DDM), REPLACING**
- Replacing the passenger side door module. See **PASSENGER DOOR MODULE (PDM), REPLACING** .
- See **LOCK MECHANISM FRONT SIDE DOOR, REPLACING** .
- see **CHECKING WIRING AND TERMINALS** .

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

INFORMATION

FAULT-TRACING INFORMATION

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.

It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

DDM-001A: DRIVER'S DOOR LOCK. SIGNAL TOO LOW (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) DDM-001A is stored if the driver's door module registers a low signal in the lock signal cable (locking) for more than 10 seconds.

Substitute Value

- None.

Possible Source

- The lock has jammed in the locked position.
- Defective locking switch. (Short-circuit in the locking switch.)
- Short-circuit to ground in the lock signal cable (LK).

Fault symptom[s]

- Cannot be operated with a key from the driver's door.

SIGNAL TOO LOW

see **SIGNAL TOO LOW**

DDM-001B: DRIVER'S DOOR LOCK. SIGNAL TOO LOW (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) DDM-001B is stored if the driver's door module registers a low signal in the two lock signal cables (locking and unlocking) for more than 2 seconds.

Substitute Value

- None.

Possible Source

- Defective locking switch. (Short-circuit in the locking switch.)
- Short-circuit to ground in the two lock signal cables (ULK+LK).

Fault symptom[s]

- Cannot be operated with a key from the driver's door.

SIGNAL TOO LOW

see **SIGNAL TOO LOW**

DDM-001D: CENTRAL LOCKING BUTTON. INTERNAL FAULT (2003-2012)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If driver door module (DDM) registers that the central locking button is depressed for more than 60 seconds, error code DDM-001D is set.

Substitute Value

- Nothing.

Possible Source

- Button depressed for more than 60 seconds.
- Defective central locking button.

Fault symptom[s]

- Cannot be operated from central-locking switch.

SIGNAL FAULTY

FAULT-TRACING INFORMATION

INFORMATION

There is no fault-tracing for this diagnostic fault code (DTC).

DDM-0034: CONTROL, DRIVER'S WINDOW. FAULTY SIGNAL (2005-2012)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If control unit registers that UP and DOWN signals to electric window lift on driver door are activated at the same time, diagnostic trouble code DDM-0034 is displayed.

Substitute Value

- Nothing.

Possible Source

- Electric window lift button on driver door is locked in two positions.

Fault symptom[s]

- Electric window lift on driver side does not work.

FAULTY SIGNAL

CHECKING FOR PERMANENT OR INTERMITTENT FAULTS

Fig. 32: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- The control module has previously registered an internal fault.

  This may be because the child-proof button has been depressed for more than 10 seconds.

Fault-trace and erase the diagnostic trouble codes (DTCs). Switch the ignition on and off and read off diagnostic trouble codes (DTCs) again.

If the diagnostic trouble code (DTC) is not still stored, the fault is due to the above.

- **Continue**

  see: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.

It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

DDM-003B: CONTROL, DRIVER'S WINDOW. FAULTY SIGNAL (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If control unit registers that electric window-lift switch on driver door is activated for more than 60 seconds, diagnostic trouble code DDM-003B is displayed.

Substitute Value

- Nothing.

Possible Source

- Electric window lift switch on driver door has stuck in an activated position.

Fault symptom[s]

- Electric window lift on driver side does not work.

FAULTY SIGNAL

CHECKING FOR PERMANENT OR INTERMITTENT FAULTS

Operate the window to its limit positions.

DDM-003B: Driver's window

DDM-003C: Passenger window

DDM-003D: Left rear side window

DDM-003E: Right rear side window

Is the power window control operating correctly?

- **YES**

  see: **FAULT-TRACING INFORMATION**

- **NO**

  see: **CHECKING THE OPERATION OF THE WINDOW**

CHECKING THE OPERATION OF THE WINDOW

Check that the button for operating the window is in the correct position. Check that the button has not jammed in an incorrect position. Press the button a few times and try to run the window up and down.

Is the power window control operating correctly?

- **YES**

  see: **FAULT-TRACING INFORMATION**

- **NO**

  see: **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

Fig. 44: Identifying Ignition OFF

- Ignition off.

The driver door module (DDM) has registered an internal fault.

NOTE: **A new control module is delivered without software. The control module must be programmed when it has been replaced.**

Other information:

- Replacing the driver's side door module. See **DRIVER DOOR MODULE (DDM), REPLACING**
- Replacing the passenger side door module. See **PASSENGER DOOR MODULE (PDM), REPLACING** .

After replacing the control module the window position must be initialized.

Ignition on.

Move the window to its upper limit position using manual control.

Initialize the window.

From model year 2003 inclusive, the window will lower approximately 10 centimeters and then close again during initialization.

  see: **VERIFICATION**

INTERMITTENT FAULT

Check control unit and wire connector (54/3R, 54/10 or 54/11 and 3/126 or 3/127) for contact resistance and oxidation. See **CONTACT RESISTANCE AND OXIDATION** , and for a loose contact. See **LOOSE CONNECTIONS (TERMINALS)** .

Check that main fuse (11A/2) in engine compartment relay/fuse box is correctly installed.

If control unit is on the left side, check that interior fuse (11C/35) in interior fuse box is correctly installed.

If control unit is on the right side, check that interior fuse (11C/36) in interior fuse box is correctly installed.

Check the wire between control unit 12B and the ignition lock for an intermittent short circuit to ground. See **SHORT-CIRCUIT TO GROUND, INTERMITTENT FAULTS** , and for an intermittent open circuit. See **OPEN-CIRCUIT, INTERMITTENT FAULTS** .

Check the wire between control unit 9B and ground: Check front left or right seat support for an intermittent

short circuit to ground. See **SHORT-CIRCUIT TO GROUND, INTERMITTENT FAULTS** , and for an intermittent open circuit. See **OPEN-CIRCUIT, INTERMITTENT FAULTS** .

Additional information:

- With ignition off, voltage between control unit 12B and ground should be battery voltage.
- To connect the test box, see **CONNECTING THE BREAKOUT BOX** .
- For information on signals and additional values, see **SIGNAL SPECIFICATION** .
- Replacing the driver's side door module. See **DRIVER DOOR MODULE (DDM), REPLACING**
- Replacing the passenger side door module. See **PASSENGER DOOR MODULE (PDM), REPLACING** .

INFORMATION

FAULT-TRACING INFORMATION

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.

It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

VERIFICATION

VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 93: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 94: Checking Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect the connectors, install the components, etc.

  Check that the voltage between control unit 12B and ground is the same as battery voltage.

Is the voltage correct?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

see: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

DDM-0049: CONTROL MODULE. INTERNAL FAULT (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION DDM-0049

Condition

Diagnostic trouble code (DTC) DDM-0049 is stored if the control module registers that a signal has not been updated within the set period.

Substitute Value

- The control module "Limp Home" program has been initiated.

Possible Source

- Internal fault.

Fault symptom[s]

- The power window mechanism does not operate
- Door mirror control does not function.

INTERNAL FAULT

REPLACING THE COMPONENT

Fig. 95: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

The driver door module (DDM) has registered an internal fault.

NOTE: **A new control module is delivered without software. The control module must be programmed in order to function after replacement.**

After replacing the control module the window position must be initialized.

- Ignition on.

Move the window to its upper limit position using manual control.

Initialize the window.

During initialization, the window will automatically go down to its lowest position and then go back up again.

Other information:

- Replacing the driver's side door module. See **DRIVER DOOR MODULE (DDM), REPLACING**
- Replacing the passenger side door module. See **PASSENGER DOOR MODULE (PDM), REPLACING** .

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION DDM-0049

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION DDM-0049**

INTERNAL FAULT

REPLACING THE COMPONENT

Fig. 97: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  The driver door module (DDM) has registered an internal fault.

  NOTE: A new control module is delivered without software. The control module must be programmed when it has been replaced.

  Other information:

  - Replacing the driver's side door module. See **DRIVER DOOR MODULE (DDM), REPLACING**
  - Replacing the passenger side door module. See **PASSENGER DOOR MODULE (PDM), REPLACING** .

After replacing the control module the window position must be initialized.

Ignition on.

Move the window to its upper limit position using manual control.

Initialize the window.

From model year 2003 inclusive, the window will lower approximately 10 centimeters and then close again during initialization.

Fig. 98: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

DDM-004A: OUTSIDE TEMPERATURE SENSOR. SIGNAL TOO HIGH (2005-2012)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If control unit registers that signal from temperature sensor is too high, diagnostic trouble code DDM-004A is displayed.

Substitute Value

- Nothing.

Possible Source

- Signal wire short circuited to voltage supply
- Open circuit in signal wire.

Fault symptom[s]

- Outside temperature sensor does not work.

SIGNAL TOO HIGH

CHECKING FOR PERMANENT OR INTERMITTENT FAULTS

Fig. 99: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check the outside temperature.

  NOTE: The outside temperature sensor is always located in the right door mirror.

Fig. 100: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the temperature within its permitted range?

- **YES**

  see: **INTERMITTENT FAULT**

- **NO**

  see: **CHECKING FOR A SHORT-CIRCUIT**

CHECKING FOR A SHORT-CIRCUIT

If the car is equipped with a 16-pin connector

Check the cable between driver door module (DDM) terminal #18A and power door mirror connector terminal #3. Check for an open-circuit.

Check the cable between driver door module (DDM) terminal #14A and power door mirror connector terminal #2. Check for a short-circuit to supply voltage. Check for an open-circuit.

Replace the cable if a fault is found.

Try a new outside temperature sensor if no fault was found.

Other information:

DDM-E001: CONTROL MODULE COMMUNICATION. FAULTY COMMUNICATION (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION DDM-E001

Condition

The control modules transmit and receive information via a standardized serial communication method - CAN (Controller Area Network). The diagnostic trouble code (DTC) is stored if the control module registers serious interference (CAN communication blocked).

NOTE: In the event of system communication problems, it is not possible to communicate with the control module. Therefore it will only be possible to read off the fault if it is intermittent.

Substitute Value

- The control module shuts itself off ("bus-off").

  HINT: The control module will remain shut off until the power supply is broken (15, 30, X). When the power supply is connected the control module will make a new attempt to communicate.

Possible Source

- Short-circuit between the control area network (CAN) wiring
- Open-circuit in the control area network (CAN) wiring
- Internal fault in the control module
- Internal fault in another control module in the same part of the control area network (CAN).

Fault symptom[s]

- The switch panel for the driver's door does not work
- Automatic window closure does not function
- Cannot be controlled with the remote control.

SIGNAL MISSING

see **SIGNAL MISSING**

DDM-E001: CONTROL MODULE COMMUNICATION. FAULTY COMMUNICATION (2003-2004)

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION DDM-E001**

FAULTY COMMUNICATION

see **FAULTY COMMUNICATION**

DDM-E003: CONFIGURATION FAULT. FAULTY CONFIGURATION (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION DDM-E003

Condition

Fig. 153: Driver Door Module And Passenger Door Module Control Modules
Courtesy of VOLVO CARS CORPORATION

The control module compares its configuration ID with the signal configuration transmitted on the control area network (CAN) by the central electronic module (CEM). If the configuration IDs do not correspond the fault code is stored. The diagnostic trouble code (DTC) is also stored if the communication between the control module and the central electronic module (CEM) is interrupted.

NOTE: **In the event of open-circuit in both the control area network (CAN) cables, it is not possible to communicate with the control module. Therefore it will only be possible to read off the diagnostic trouble code (DTC) if this type of fault is intermittent. When the diagnostic trouble code (DTC) is stored, the control module responds to the diagnostic command, however normal control area network (CAN) communication does not work. ("Expulsion mode")**

Substitute Value

- None.

Possible Source

- Faulty control area network (CAN) configuration ID. (The node is not intended for this car, for example a used control module with different software/hardware.)
- Open-circuit in the control area network (CAN) wiring between the control module and the central electrical module (CEM).

Fault symptom[s]

- The switch panel for the driver's door does not work
- Automatic window closure does not function
- Cannot be controlled with the remote control.

Courtesy of VOLVO CARS CORPORATION

PDM-001D: CENTRAL LOCKING BUTTON. FAULTY SIGNAL (2003-2012)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If the passenger door module (PDM) registers that the central locking button is depressed for more than 60 seconds, error code PDM-001D is set.

Substitute Value

- Nothing.

Possible Source

- Button depressed for more than 60 seconds.
- Defective central locking button.

Fault symptom[s]

- Cannot be operated from central-locking switch.

SIGNAL FAULTY

see **SIGNAL FAULTY**

PDM-0034: CONTROL, PASSENGER WINDOW. FAULTY SIGNAL (2005-2012)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If control unit registers that UP and DOWN signals to electric window lift on passenger door are active at the same time, diagnostic trouble code PDM-0034 is displayed.

Substitute Value

- Nothing.

Possible Source

- Electric window lift switch on passenger door is stuck in two positions.

Fault symptom[s]

- Electric window lift on passenger side does not work.

FAULTY SIGNAL

see **FAULTY SIGNAL**

PDM-0034: PASSENGER WINDOW CONTROL. SIGNAL FAULTY (2003-2004)

PDM-003A: DOOR MIRROR LAMP. SIGNAL TOO LOW (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) PDM-003A is stored if the control module registers that there is a short-circuit to ground in the signal supply to the mirror lamp, connected to the passenger door module, at the same time as the control module has requested the door mirror lamp to light.

Substitute Value

- None.

Possible Source

- Signal cable to the door mirror lamp, connected to passenger door module, short circuited to ground.

Fault symptom[s]

- Local lighting is not operating.

SIGNAL TOO LOW (2005, 2006)

CHECKING FAULTS

Fig. 156: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check if the lamp in the power door mirror lights up and goes out.

Fig. 157: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the lamp in the power door mirror working?

- **YES**

  see: **INTERMITTENT FAULT**

- **NO**

  see: **CHECKING FOR A SHORT-CIRCUIT**

CHECKING FOR A SHORT-CIRCUIT

Check the cable between control module terminal #8B and power door mirror terminal #13. Check for a short-circuit to ground.

Check the ground lead between the control module terminal #10B and the power door mirror terminal #6.

Replace the cable if a fault is found.

Other information:

- see **CONNECTING THE BREAKOUT BOX**
- Replacing the driver's side door module. See **DRIVER DOOR MODULE (DDM), REPLACING**
- Replacing the passenger side door module. See **PASSENGER DOOR MODULE (PDM), REPLACING** .
- see **SIGNAL SPECIFICATION**
- see **CHECKING WIRING AND TERMINALS**

Fig. 158: Connector, Green (16- Pin)
Courtesy of VOLVO CARS CORPORATION

Were any faults found in the cable?

- **YES**

  see: **VERIFICATION**

- **NO**

  see: **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

Check the bulb holder. Check for a short-circuit.

Remedy as necessary.

If no malfunction is found:Replace the bulb.

Other information

- see **BULB, GROUND LIGHTING, DOOR MIRROR, REPLACING**

- **Continue**

  see: **VERIFICATION**

INTERMITTENT FAULT

Check the control module and power door mirror connectors. Check for contact resistance and oxidation. Check for loose connections.

Check the cable between control module terminal #8B and power door mirror terminal #13. Check for an intermittent short-circuit to ground.

Check the ground lead between the control module terminal #10B and the power door mirror terminal #6.

Check the bulb holder and bulb if no fault was found.

Other information:

- see **CONNECTING THE BREAKOUT BOX**
- see **SIGNAL SPECIFICATION**
- see **BULB, GROUND LIGHTING, DOOR MIRROR, REPLACING**
- see **CHECKING WIRING AND TERMINALS**

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.

It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

PDM-003C: POWER SUPPLY. SIGNAL TOO LOW (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If control unit registers that power supply is too low compared with supply to CEM, diagnostic trouble code PDM-003C is displayed.

Substitute Value

- Nothing.

Possible Source

- Supply voltage too low.

Fault symptom[s]

- Electric window lift on passenger side does not work
- Automatic window closer does not work
- Central locking does not work.

SIGNAL TOO LOW

see **SIGNAL TOO LOW**

PDM-003E: CONTROL MODULE. SIGNAL TOO HIGH (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If control unit registers that a signal has not been updated within the specified time, diagnostic trouble code PDM-003E is displayed.

Substitute Value

- Nothing.

Possible Source

- Internal fault in software.

Fault symptom[s]

- Electric window lift does not work
- External rear-view mirror operation does not work
- Mist on windows and/or external rear-view mirrors.

SIGNAL TOO HIGH

REPLACING THE COMPONENT

Fig. 182: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

The passenger door module (PDM) has registered an internal fault.

NOTE: A new control module is delivered without software. The control module must be programmed when it has been replaced.

Other information:

- Replacing the driver's side door module. See **DRIVER DOOR MODULE (DDM), REPLACING**
- Replacing the passenger side door module. See **PASSENGER DOOR MODULE (PDM), REPLACING** .

After replacing the control module the window position must be initialized.

Ignition on.

Move the window to its upper limit position using manual control.

Initialize the window.

From model year 2003 inclusive, the window will lower approximately 10 centimeters and then close again during initialization.

INFORMATION

FAULT-TRACING INFORMATION

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.

It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

PDM-E001: CONTROL MODULE COMMUNICATION. FAULTY

COMMUNICATION (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PDM-E001

Condition

The control modules transmit and receive information via a standardized serial communication method - CAN (Controller Area Network). The diagnostic trouble code (DTC) is stored if the control module registers serious interference (CAN communication blocked).

NOTE: In the event of system communication problems, it is not possible to communicate with the control module. Therefore it will only be possible to read off the fault if it is intermittent.

Substitute Value

- The control module shuts itself off ("bus-off").

  HINT: The control module will remain shut off until the power supply is broken (15, 30, X). When the power supply is connected the control module will make a new attempt to communicate.

Possible Source

- Short-circuit between the control area network (CAN) wiring
- Open-circuit in the control area network (CAN) wiring
- Internal fault in the control module
- Internal fault in another control module in the same part of the control area network (CAN).

Fault symptom[s]

- The switch panel for the driver's door does not work
- Automatic window closure does not function
- Cannot be controlled with the remote control.

FAULTY COMMUNICATION

SIGNAL MISSING

see **SIGNAL MISSING**

PDM-E003: CONFIGURATION FAULT. FAULTY CONFIGURATION (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PDM-E003

Condition

Fig. 195: Driver Door Module And Passenger Door Module Control Modules
Courtesy of VOLVO CARS CORPORATION

The control module compares its configuration ID with the signal configuration transmitted on the control area network (CAN) by the central electronic module (CEM). If the configuration IDs do not correspond the fault code is stored. The diagnostic trouble code (DTC) is also stored if the communication between the control module and the central electronic module (CEM) is interrupted.

NOTE: **In the event of open-circuit in both the control area network (CAN) cables, it is not possible to communicate with the control module. Therefore it will only be possible to read off the diagnostic trouble code (DTC) if this type of fault is intermittent. When the diagnostic trouble code (DTC) is stored, the control module responds to the diagnostic command, however normal control area network (CAN) communication does not work. ("Expulsion mode")**

Substitute Value

- None.

Possible Source

- Faulty control area network (CAN) configuration ID. (The node is not intended for this car, for example a used control module with different software/hardware.)

- Open-circuit in the control area network (CAN) wiring between the control module and the central electrical module (CEM).

Fault symptom[s]

- The switch panel for the passenger door does not work
- Automatic window closure does not function
- Cannot be controlled with the remote control.

ACCESSORIES AND EQUIPMENT

Doors And Lids - Diagnostic Trouble Codes And Associated Procedures

DDM/PDM-0001 POWER WINDOW LIFT MOTOR M+ OR M-. SIGNAL TOO HIGH (2003-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

If the control module registers that the signal cable M+ or signal cable M- is too high, DTC DDM/PDM-0001 is stored.

Diagnostic Trouble Code (DTC) DDM/PDM-0001 can be diagnosed at terminal 15.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the M+ or M- signal cables.

Fault symptom[s]

- The power window mechanism does not operate.

SIGNAL TOO HIGH

CHECKING COMPONENTS AND WIRING

Check signal cable M+ between door control module connector terminal #B4 and central locking motor connector terminal #3. Check for a short-circuit to supply voltage.

Check signal cable M- between door control module connector terminal #B3 and central locking motor connector terminal #6. Check for a short-circuit to supply voltage.

Remedy as necessary.

Other information:

- To fault-trace wiring and terminals, see **CONTENTS**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access and replace the door control module, see **PASSENGER DOOR MODULE (PDM), REPLACING**

- For information about signals, see **SIGNAL SPECIFICATION**
- For information about power window mechanisms, see **WINDOW LIFT MECHANISM FRONT SIDE DOOR, REPLACING** .

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 1: Identifying Ignition ON

Fig. 2: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect the connectors, install the components, etc.
- Ignition on.

  Check that window operates by raising/lowering window to its end stops.

Does window operate?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

DDM/PDM-0005 POWER WINDOW LIFT MOTOR M+ OR M-. SIGNAL TOO LOW OR SIGNAL MISSING (2003-04)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code DDM/PDM-0005 is stored if the control module registers a low signal or open-circuit in the M+ signal cable or M- signal cable (the power supply wiring to the power window motor) when the window is operated upwards or downwards.

Diagnostic Trouble Code (DTC) DDM/PDM-0005 can be diagnosed when the power window motor is activated.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the M+ or M- signal cables
- Open-circuit in the M+ signal cable or M- signal cable
- Blown fuse.

Fault symptom[s]

- The power window mechanism does not operate.

SIGNAL TOO LOW OR SIGNAL MISSING

CHECKING FOR PERMANENT OR INTERMITTENT FAULTS

Fig. 3: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Press the switch for the power window to check the function of the power window mechanism.

Is the power window control operating correctly?

- **YES**

  Refer to **INTERMITTENT FAULT**

- **NO**

  Refer to **CHECKING THE CONNECTORS**

CHECKING THE CONNECTORS

Fig. 4: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check that the fuses are intact.

  Check the control module and power window lift motor connectors. Check for contact resistance and oxidation.

  Other information:

  - To access the driver/passenger door module (DDM/PDM), see **PASSENGER DOOR MODULE (PDM), REPLACING**

- To access and replace the power window mechanism, see **WINDOW LIFT MECHANISM FRONT SIDE DOOR, REPLACING**
- see **CHECKING THE POWER SUPPLY AND GROUND TERMINALS**
- see **CHECKING WIRING AND TERMINALS** .

- **Continue**

  Refer to **CHECKING THE CABLE**

CHECKING THE CABLE

Check the cable between door control module connector terminal #B4 and power window lift motor connector terminal #3. Check for an open-circuit. Check for a short-circuit to ground.

Check the cable between door control module connector terminal #B3 and power window lift motor connector terminal #6. Check for an open-circuit. Check for a short-circuit to ground.

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For further information about signals and other values, see **SIGNAL SPECIFICATION**
- To access the control module, see **PASSENGER DOOR MODULE (PDM), REPLACING**
- see **CHECKING THE POWER SUPPLY AND GROUND TERMINALS**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 5: Identifying Connector
Courtesy of VOLVO CARS CORPORATION

Was the cable OK?

- **YES**

  Refer to **REPLACING THE COMPONENT**

- **NO**

  Refer to **VERIFICATION**

REPLACING THE COMPONENT

Fig. 6: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Replace the window lift mechanism. See **WINDOW LIFT MECHANISM FRONT SIDE DOOR, REPLACING** .

Ignition on.

Move the window to its upper limit position using manual control.

Initialize the window.

From model year 2003 inclusive, the window will lower approximately 10 centimeters and then close again during initialization.

- **Continue**

  Refer to **VERIFICATION**

INTERMITTENT FAULT

Check the connectors for the control module and power window lift motor. Check for contact resistance and oxidation. Check for loose connections.

Check the cable between control module connector terminal #B4 and power window lift motor connector terminal #3. Check for an intermittent open-circuit.

Check the cable between the control module connector terminal #3B and the power window lift motor connector terminal #6. Check for an intermittent open-circuit.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For further information about signals and other values, see **SIGNAL SPECIFICATION**
- To access the control module, see **PASSENGER DOOR MODULE (PDM), REPLACING**
- To access and replace the power window mechanism, see **WINDOW LIFT MECHANISM FRONT SIDE DOOR, REPLACING**
- see **CHECKING THE POWER SUPPLY AND GROUND TERMINALS**
- see **CHECKING WIRING AND TERMINALS** .

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

DDM/PDM-0010 CENTRAL LOCKING MOTOR M1. SIGNAL TOO LOW (2003-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) DDM/PDM-0010 is stored if the control module registers a short-circuit to ground in signal cable M1.

Diagnostic trouble code (DTC) DDM/PDM-0010 can be diagnosed when the central locking locks or unlocks.

Substitute Value

- None.

Possible Source

- Signal cable M1 is short-circuited to ground.

Fault symptom[s]

- The central locking system does not function at all.

SIGNAL TOO LOW

CHECKING COMPONENTS AND WIRING

Check signal cable M1 between door control module connector terminal #B2 and central locking motor connector terminal #8. Check for a short-circuit to ground.

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access and replace the door control module, see **PASSENGER DOOR MODULE (PDM), REPLACING**
- For information about signals, see **SIGNAL SPECIFICATION**
- see **CONTENTS** .

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Check that the central locking system functions.

Does the central locking system function?

- **YES**

VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

DDM/PDM-0013 CENTRAL LOCKING MOTOR M3. SIGNAL TOO LOW (2003-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) DDM/PDM-0013 is stored if the control module registers a too low signal in signal cable M3.

Diagnostic trouble code (DTC) DDM/PDM-0013 can be diagnosed when the central locking is activated.

Substitute Value

- None.

Possible Source

- Signal cable M3 short-circuited to ground.

Fault symptom[s]

- The central locking system does not function at all.

SIGNAL TOO LOW

CHECKING COMPONENTS AND WIRING

Check signal cable M3 between door control module connector terminal #B1 and central locking motor connector terminal #6. Check for a short-circuit to ground.

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access and replace the door control module, see **PASSENGER DOOR MODULE (PDM), REPLACING**
- For information about signals, see **SIGNAL SPECIFICATION**
- see **CONTENTS** .

- **Continue**

- Reinstall the connectors, components etc.
- Ignition on.

  Check that the central locking system functions.

Does the central locking system function?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

DDM/PDM-0016 CENTRAL LOCKING MOTOR M2. SIGNAL TOO LOW (2003-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) DDM/PDM-0016 is stored if the control module registers a too low signal in signal cable M2.

Diagnostic trouble code (DTC) DDM/PDM-0016 can be diagnosed when the deadlock activates or deactivates.

Substitute Value

- None.

Possible Source

- Signal cable M2 short-circuited to ground.

Fault symptom[s]

- Does not deadlock.

SIGNAL TOO LOW

CHECKING COMPONENTS AND WIRING

Check signal cable M2 between door control module connector terminal #B6 and central locking motor connector terminal #7. Check for a short-circuit to ground.

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access and replace the door control module, see **PASSENGER DOOR MODULE (PDM), REPLACING**
- For information about signals, see **SIGNAL SPECIFICATION**
- see **CONTENTS** .

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

DDM/PDM-0020 POWER WINDOW MECHANISM HALL SENSOR 1. FAULTY SIGNAL (2005-12)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If control unit does not register a signal from Hall sensor H1 but registers a signal from Hall sensor H2 when window-lifting motor is activated, diagnostic trouble code DDM/PDM-0020 is displayed.

Substitute Value

- Nothing.

Possible Source

- Hall sensor H1 does not work
- Signal wire for Hall sensor H1 short circuited
- Open circuit on Hall sensor H1 signal wire.

Fault symptom[s]

- Automatic window closer does not work.

FAULTY SIGNAL

CHECKING FAULTS

Fig. 25: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Press the power window switch 2 steps up to check the function of the automatic power window mechanism.

Is the automatic power window mechanism functioning?

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

INFORMATION

FAULT-TRACING INFORMATION

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.

It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

DDM/PDM-0021 WINDOW LIFT HALL SENSOR 2. SIGNAL FAULTY (2003-04)

DIAGNOSTIC TROUBLE CODE INFORMATION

see **DIAGNOSTIC TROUBLE CODE INFORMATION**

FAULTY SIGNAL

CHECKING FOR PERMANENT OR INTERMITTENT FAULTS

Fig. 58: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Press the power window switch 2 steps up to check the function of the automatic power window mechanism.

Is the automatic power window mechanism functioning?

- **YES**

  Refer to **INTERMITTENT FAULT**

- **NO**

Refer to **CHECKING THE CONNECTORS**

CHECKING THE CONNECTORS

Fig. 59: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 60: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the power window lift motor connector. Check for contact resistance and oxidation and remedy. In particular, check for any damage
- Reinstall the components, reconnect the connectors etc.
- Ignition on.

  Press the power window switch 2 steps up and down.

  Other information:

  - To access the window lift mechanism, see **WINDOW LIFT MECHANISM FRONT SIDE DOOR, REPLACING**

- see **CHECKING WIRING AND TERMINALS** .

Fig. 61: Identifying Connector
Courtesy of VOLVO CARS CORPORATION

Fig. 62: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Is the automatic power window mechanism functioning?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING FOR OPEN-CIRCUITS AND SHORT-CIRCUITS**

CHECKING FOR OPEN-CIRCUITS AND SHORT-CIRCUITS

Check the cable between door control module terminal #24A and power window motor terminal connector #2.

Check for a short-circuit to ground. Check for a short-circuit to supply voltage. Check for an open-circuit.

Remedy as necessary.

Other information:

- When raising or lowering the window, the voltage between power window lift motor terminal #2 and ground must be 2.4 V
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For further information about signals and other values, see **SIGNAL SPECIFICATION**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 63: Identifying Connector
Courtesy of VOLVO CARS CORPORATION

Fig. 64: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

Fig. 65: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Replace the power window mechanism according to **WINDOW LIFT MECHANISM FRONT SIDE DOOR, REPLACING** .

Ignition on.

Move the window to its upper limit position using manual control.

Initialize the window.

From model year 2003 inclusive, the window will lower approximately 10 centimeters and then close again during initialization.

Fig. 66: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

INTERMITTENT FAULT

Check the connectors for the control module and power window lift motor. Check for contact resistance and oxidation. Check for loose connections.

Check the cable between control module terminal #24A and power window motor terminal #2. Check for an intermittent short-circuit to ground. Check for an intermittent short-circuit to supply voltage. Check for an intermittent open-circuit.

Other information:

- When raising or lowering the window, the voltage between power window lift motor terminal #2 and ground must be 2.4 V
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For further information about signals and other values, see **SIGNAL SPECIFICATION**
- To access the window lift mechanism, see **WINDOW LIFT MECHANISM FRONT SIDE DOOR,**

REPLACING

- see **CHECKING WIRING AND TERMINALS** .

Fig. 67: Identifying Connector
Courtesy of VOLVO CARS CORPORATION

Fig. 68: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **INFORMATION**

VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 69: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 70: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect connectors, install components, etc.
- Ignition on.

  Check that the automatic window operation works by pressing in the button 2 stages one way or the other.

Does the automatic window operation work?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

DDM/PDM-0022 POWER WINDOW MECHANISM HALL SENSOR 1 AND 2. FAULTY SIGNAL (2005-12)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If control unit does not register a signal from Hall sensors H1 and H2 when window-lifting motor is activated, diagnostic trouble code DDM/PDM-0022 is displayed.

Substitute Value

- Nothing.

Possible Source

- Hall sensors H1 and H2 do not work
- Signal wire for Hall sensors H1 and H2 short circuited
- Open circuit on signal wire for Hall sensors H1 and H2
- Open circuit or short circuit to ground on Hall sensor supply wire or ground.

Fault symptom[s]

- Automatic window closer does not work.

FAULTY SIGNAL

CHECKING FAULTS

Fig. 71: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Press the power window switch 2 steps up to check the function of the automatic power window mechanism.

Is the automatic power window mechanism functioning?

- **YES**

  Refer to **INTERMITTENT FAULT**

- **NO**

Refer to **CHECKING THE CONNECTORS**

CHECKING THE CONNECTORS

Fig. 72: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 73: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the power window lift motor connector. Check for contact resistance and oxidation. Check for damage carefully
- Reinstall the components, reconnect the connectors etc.
- Ignition on.

  Press the power window switch 2 steps up and down.

  Other information:

  - see **WINDOW LIFT MECHANISM FRONT SIDE DOOR, REPLACING**
  - see **CHECKING WIRING AND TERMINALS**

Fig. 74: Identifying Connector

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

DDM/PDM-0023 MIRROR MOTOR MX+. SIGNAL TOO HIGH (2003-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) DDM/PDM-0023 is stored if door mirror down is activated at the same time as the control module registers that there is voltage in the cable.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in signal cable MX+.

Fault symptom[s]

- Power door mirror control does not function.

SIGNAL TOO HIGH

CHECKING FOR PERMANENT OR INTERMITTENT FAULTS

Fig. 94: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Press the switch for the power door mirrors to check the function of the power door mirrors.

Can the power door mirrors be maneuvered?

- **YES**

  Refer to **INTERMITTENT FAULT**

- **NO**

  Refer to **CHECKING FOR A SHORT-CIRCUIT**

CHECKING FOR A SHORT-CIRCUIT

Check the cable between the driver/passenger door control module (DDM/PDM) and the power door mirror (as follows). Check for a short-circuit to supply voltage.

Remedy as necessary.

Try a new power door mirror if the cable is OK.

If the car is equipped with a 10-pin connector

DDM-0023 Door mirror motor MX+

Control module terminal #26A and power door mirror terminal #9.

DDM-0026 Door mirror motor MY+

Control module terminal #28A and power door mirror terminal #10.

DDM-0028 Door mirror motor MF+

Control module terminal #29A and power door mirror terminal #8.

If the car is equipped with a 16-pin connector

DDM-0023 Door mirror motor MX+

Control module terminal #26A and power door mirror terminal #15.

DDM-0026 Door mirror motor MY+

Control module terminal #28A and power door mirror terminal #16.

DDM-0028 Door mirror motor MF+

Control module terminal #29A and power door mirror terminal #14.

Other information:

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

DDM/PDM-0025 DOOR MIRROR MOTOR. DISCONNECTED (2003-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) DDM/PDM-0025 is stored if the control module registers that the signal cable for one of the power door mirror motors or defroster is interrupted at the same time that the relevant function is activated.

Substitute Value

- None.

Possible Source

- Open-circuit in the signal cable to the door mirror heating or motors (including the motor for electric folding door mirrors)
- Blown fuse 11C/35 or 11C/36.
- Damaged defroster in external mirror.

Fault symptom[s]

- Power door mirror control does not function
- Misting on the windows and/or door mirrors.

SIGNAL MISSING

CHECKING FOR PERMANENT OR INTERMITTENT FAULTS

Fig. 112: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Press the switch for the power door mirrors to check the function of the power door mirrors in all directions.

  Also check that folding in of the rearview mirrors works on vehicles equipped with this function.

Can the power door mirrors be maneuvered?

- **YES**

  Refer to **INTERMITTENT FAULT**

- **NO**

  Refer to **CHECKING THE CONNECTORS**

CHECKING THE CONNECTORS

Fig. 113: Identifying Ignition ON

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 120: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 121: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reconnect the components, connectors etc.

  Operate the door mirror to each limit position using the control. The mirror must move in the corresponding directions.

Is the mirror working?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

DDM/PDM-0026 MIRROR MOTOR MY+. SIGNAL TOO HIGH (2003-12)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If control unit registers that signal wire for lateral adjustment is short circuited to voltage supply when none of the external rear-view mirror motors are activated, diagnostic trouble code DDM/PDM-0026 is displayed.

Substitute Value

- Nothing.

Possible Source

- Signal wire MY+ short circuited to voltage supply.

Fault symptom[s]

- External rear-view mirror operation does not work.

SIGNAL TOO HIGH

see **SIGNAL TOO HIGH**

DDM/PDM-0027 MIRROR MOTOR MY+. SIGNAL TOO LOW (2003-12)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If control unit registers that signal wire for lateral adjustment is short circuited to ground when only one of the external rear-view mirror motors is activated, diagnostic trouble code DDM/PDM-0027 is displayed.

Substitute Value

- Nothing.

Possible Source

- Signal wire MY+ short circuited to ground.

Fault symptom[s]

- External rear-view mirror operation does not work.

SIGNAL TOO LOW

see **SIGNAL TOO LOW**

DDM/PDM-0028 MIRROR MOTOR MF+. SIGNAL TOO HIGH (2003-12)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If control unit registers that signal wire for lowering of external rear-view mirror is short circuited to voltage supply when none of the external rear-view mirror motors are active, diagnostic trouble code DDM/PDM-0028 is displayed.

Substitute Value

- Nothing.

Possible Source

- Signal wire MF+ short circuited to voltage supply.

Fault symptom[s]

- External rear-view mirror operation does not work.

SIGNAL TOO HIGH

see **SIGNAL TOO HIGH**

DDM/PDM-0029 MIRROR MOTOR MF+. SIGNAL TOO LOW (2003-12)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If control unit registers that signal wire for lowering of external rear-view mirror is short circuited to ground when only one of the external rear-view mirror motors is activated, diagnostic trouble code DDM/PDM-0029 is displayed.

Substitute Value

- Nothing.

Possible Source

- Signal wire MF+ short circuited to ground.

Fault symptom[s]

- External rear-view mirror operation does not work.

SIGNAL TOO LOW

see **SIGNAL TOO LOW**

DDM/PDM-002A MIRROR MOTOR MC. SIGNAL TOO HIGH (2003-12)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If control unit registers that a signal wire for a movement is short circuited to voltage supply when none of the external rear-view mirror motors are active, diagnostic trouble code DDM/PDM-002A is displayed.

Substitute Value

- Nothing.

Possible Source

- Signal wire MC+ short circuited to voltage supply.

Fault symptom[s]

- External rear-view mirror operation does not work.

SIGNAL TOO HIGH

CHECKING FOR PERMANENT OR INTERMITTENT FAULTS

Fig. 122: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Press the switch for the power door mirrors. Move the door mirrors to their limit position.

Can the power door mirrors be maneuvered?

- **YES**

  Refer to **INTERMITTENT FAULT**

- **NO**

  Refer to **CHECKING FOR A SHORT-CIRCUIT**

CHECKING FOR A SHORT-CIRCUIT

Check the cable between door control module terminal #27A and power door mirror terminal #7 (both 10 and 16-pin connectors). Check for a short-circuit to supply voltage.

Remedy as necessary.

Try a new power door mirror if the cable is OK.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For further information about signals and other values, see **SIGNAL SPECIFICATION**
- To access the connector for the power door mirror/replace the power door mirror, see **REAR VIEW MIRROR, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Courtesy of VOLVO CARS CORPORATION

Fig. 130: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect connectors, install components, etc.
- Ignition on.

  Test the rear-view mirror for a few seconds; the mirror should move in opposite directions.

Does the mirror work?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

DDM/PDM-002B MIRROR MOTOR MC. SIGNAL TOO LOW (2003-12)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If control unit registers that a signal wire for a movement is short circuited to ground when only one of the external rear-view mirror motors is activated, diagnostic trouble code DDM/PDM-002B is displayed.

Substitute Value

- Nothing.

Possible Source

- Signal wire MC+ short circuited to ground.

Fault symptom[s]

- External rear-view mirror operation does not work.

SIGNAL TOO LOW

CHECKING FOR PERMANENT OR INTERMITTENT FAULTS

Fig. 131: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Press the switch for the power door mirrors. Move the door mirrors to their limit position.

Can the power door mirrors be maneuvered?

- **YES**

  Refer to **INTERMITTENT FAULT**

- **NO**

  Refer to **CHECKING FOR A SHORT-CIRCUIT**

CHECKING FOR A SHORT-CIRCUIT

Check the cable between door control module terminal #27A and power door mirror terminal #7 (both 10 and 16-pin connectors). Check for a short-circuit to ground.

Remedy as necessary.

Replace the cable if a fault is found.

Try a new power door mirror if the cable is OK.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For further information about signals and other values, see **SIGNAL SPECIFICATION**
- To access the connector for the power door mirror/replace the power door mirror, see **REAR VIEW MIRROR, REPLACING**

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

DDM/PDM-002C DOOR MIRROR HEATER. SIGNAL TOO HIGH (2005-12)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If control unit registers that signal wire for external rear-view mirror defroster is short circuited to voltage supply when the function is inactive, diagnostic trouble code DDM/PDM-002C is displayed.

Substitute Value

- Nothing.

Possible Source

- Signal wire to external rear-view mirror defroster short circuited to voltage supply.

Fault symptom[s]

- Engine does not start
- Starter motor does not work
- Mist on windows and/or external rear-view mirrors.

SIGNAL TOO HIGH

CHECKING FAULTS

Fig. 140: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Ensure that the button for the rear defroster is depressed.

  Check that the defroster for the door mirrors is activated.

Fig. 141: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

Fig. 192: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect the connectors, install the components, etc.
- Ignition on.

  Make sure that rear window defroster button is depressed.

  Check to, see if external rear-view mirror defroster is activated.

Fig. 193: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is external rear-view mirror defroster activated?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

DDM/PDM-002F WINDOW MOTOR. SIGNAL TOO HIGH (2003-12)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If control unit registers that voltage is too high in one or more of the signal wires OUT1-OUT5, or that mirror heater overheats when a mirror motor or defroster is activated, diagnostic trouble code DDM/PDM-002F is displayed.

Substitute Value

- Nothing.

Possible Source

- Voltage too high in one or more of signal wires OUT1-OUT5
- External rear-view mirror heater overheats.

Fault symptom[s]

- External rear-view mirror operation does not work.

SIGNAL TOO HIGH

CHECKING FOR PERMANENT OR INTERMITTENT FAULTS

Fig. 194: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Press the switch for the power door mirrors to check the function of the power door mirrors.

Can the power door mirrors be maneuvered?

- **YES**

  Refer to **INTERMITTENT FAULT**

- **NO**

  Refer to **CHECKING FOR A SHORT-CIRCUIT**

CHECKING FOR A SHORT-CIRCUIT

Check the cable between the door control module and the power door mirror (as follows). Check for a short-circuit to supply voltage.

Remedy as necessary.

Try a new power door mirror if the cable is OK.

If the car is equipped with a 10-pin connector

Control module terminal #26A and power door mirror terminal #9.

Control module terminal #28A and power door mirror terminal #10.

Control module terminal #29A and power door mirror terminal #8.

Control module terminal #27A and power door mirror terminal #7.

Control module terminal #11B and power door mirror terminal #5.

If the car is equipped with a 16-pin connector

Control module terminal #26A and power door mirror terminal #15.

Control module terminal #28A and power door mirror terminal #16.

Control module terminal #29A and power door mirror terminal #14.

Control module terminal #27A and power door mirror terminal #7.

Control module terminal #11B and power door mirror terminal #8.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For further information about signals and other values, see **SIGNAL SPECIFICATION**
- To access the door control module, see **PASSENGER DOOR MODULE (PDM), REPLACING**
- To access and replace the power door mirror, see **REAR VIEW MIRROR, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

  Refer to **VERIFICATION**

INTERMITTENT FAULT

Check the door control module and power door mirror connectors. Check for contact resistance. Check for oxidation.

Check the cable between the door control module and the power door mirror (as follows). Check for an intermittent short-circuit to supply voltage. Check for an intermittent open-circuit.

If the car is equipped with a 10-pin connector

Control module terminal #26A and power door mirror terminal #9.

Control module terminal #28A and power door mirror terminal #10.

Control module terminal #29A and power door mirror terminal #8.

Control module terminal #27A and power door mirror terminal #7.

Control module terminal #11B and power door mirror terminal #5.

If the car is equipped with a 16-pin connector

Control module terminal #26A and power door mirror terminal #15.

Control module terminal #28A and power door mirror terminal #16.

Control module terminal #29A and power door mirror terminal #14.

Control module terminal #27A and power door mirror terminal #7.

Control module terminal #11B and power door mirror terminal #8.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For further information about signals and other values, see **SIGNAL SPECIFICATION**
- To access the door control module, see **PASSENGER DOOR MODULE (PDM), REPLACING**
- To access the power door mirror, see **REAR VIEW MIRROR, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

  Refer to **INFORMATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 201: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 202: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reconnect the components, connectors etc.

  Operate the door mirror to each limit position using the control. The mirror must move in the corresponding directions.

Is the mirror working?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

DDM/PDM-0030 DOOR MIRROR POTENTIOMETER. FAULTY SIGNAL (2005-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) PDM/DDM-0030 is stored if the control module registers that the signal across the potentiometer for door mirror X axis control (left and right) is too high.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the signal cable.
- Open-circuit in the signal cable.
- Short-circuit to ground in the power cable.
- Open-circuit in the ground lead.
- Short-circuit to supply voltage in the ground lead.

Fault symptom[s]

- The door mirror memory function is not working.

FAULTY SIGNAL

CHECKING CONNECTORS AND COMPONENTS

Fig. 203: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 204: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Check the connector for the control module and door mirror. Check for contact resistance and oxidation.

  Remedy as necessary

- Reinstall the connectors, components etc.
- Ignition on.

  Test the door mirror function by changing its position and reading off the end values registered by the door mirror potentiometer.

  HINT: The end values for the door mirror potentiometer should be between 1 and 4 V.

  Other information:

- see **REAR VIEW MIRROR, REPLACING**
- see **CHECKING WIRING AND TERMINALS**

Fig. 205: Connector, Green (16-Pin)
Courtesy of VOLVO CARS CORPORATION

Fig. 206: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Does the door mirror potentiometer operate correctly?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING FAULTY SIGNALS**

CHECKING FAULTY SIGNALS

Check the cable between control module terminal #25A and door mirror terminal #1. Check for a short-circuit to ground.

Check the cable between control module terminal #8A and door mirror terminal #11. Check for a short-circuit to supply voltage. Check for an open-circuit.

DDM/PDM-0030 Door mirror potentiometer, faulty signal

Check the cable between control module terminal #9A and door mirror terminal #9. Check for a short-circuit to supply voltage. Check for an open-circuit.

DDM/PDM-0032 Door mirror potentiometer, faulty signal

Check the cable between control module terminal #10A and door mirror terminal #10. Check for a short-circuit to supply voltage. Check for an open-circuit.

Other information:

- see **SIGNAL SPECIFICATION**
- see **CONNECTING THE BREAKOUT BOX**
- see **CHECKING WIRING AND TERMINALS**

Fig. 207: Connector, Green (16-Pin)
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 208: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 209: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reconnect the components, connectors etc.
- Ignition on.

Check that the limit values for the door mirrors are between 1 and 4 V.

Fig. 210: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the response within its permitted range?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

DDM/PDM-0030 DOOR MIRROR POTENTIOMETER. FAULTY SIGNAL. INTERMITTENT FAULT (2003-04)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION**

FAULTY SIGNAL. INTERMITTENT FAULT

CHECKING THE CONNECTORS AND COMPONENTS

Fig. 211: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 212: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Check the connector for the door node and door mirror. Check for contact resistance and oxidation.

  Remedy as necessary

- Reinstall the connectors, components etc.
- Ignition on.

  Test the door mirror function by changing its position and reading off the end values registered by the door mirror potentiometer.

  HINT: The end values for the door mirror potentiometer should be between approximately 1 V and 4 V.

Other information:

- To access the door mirror, see **REAR VIEW MIRROR, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 213: Connector, Green (16-Pin)
Courtesy of VOLVO CARS CORPORATION

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ACCESSORIES AND EQUIPMENT

Doors And Lids - General Diagnostics And Tests

CHECKING THE VOLTAGE/GROUND TERMINAL, DRIVER DOOR MODULE (DDM)/PASSENGER DOOR MODULE (PDM)

CHECKING THE POWER SUPPLY AND GROUND TERMINALS

Power supply

Voltage input terminal #B12 (#26) is powered from the battery (30-supply) via a fuse and is separate for the Driver door module (DDM) and Passenger door module (PDM). It will not be possible to activate the control module if there is an open-circuit.

Checking the power supply

Check the power supply cable from the battery to the driver door module (DDM)/passenger door module (PDM) terminal #B12 (B26). Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. Check the fuse. The voltage should be approximately battery voltage.

Ground terminal

The Passenger Door Module (PDM)/Driver Door Module (DDM) has two power inputs. The ground inputs from the control module are connected via separate ground leads to a common ground terminal in the car body. See the relevant wiring diagram for further information about the ground terminal.

1. Ground input terminal #B5 (#19) is connected via a ground cable to the ground terminal in the car body. If there is an open-circuit, the control module will function, but it will not be possible to operate the window on that side
2. Ground input terminal #B9 (#23) is connected via a ground cable to the ground terminal in the car body. The control module will not work if there is an open-circuit.

Checking ground terminal

Check the ground lead between driver door module (DDM)/passenger door module (PDM) terminal #B5 (#19) and the ground terminal in the car body. Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. With the ignition on, the drop in voltage between the ground connection for the driver door module (DDM)/passenger door module (PDM) ground connection terminal #B5 (#19) and the ground terminal must not be greater than 0.5 V.

Check the ground lead between driver door module (DDM)/passenger door module (PDM) terminal #B9 (#23) and the ground terminal in the car body. Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. With the ignition on, the drop in voltage between the ground connection for the driver door module (DDM)/passenger door module (PDM) ground connection terminal #B9 (#23) and the ground terminal must not be greater than 0.5 V.

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For information about signals, see **SIGNAL SPECIFICATION**
- see **CONTENTS** .

Fig. 1: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

CONNECTING THE BREAKOUT BOX, DRIVER DOOR MODULE (DDM)/PASSENGER DOOR MODULE (PDM)

CONNECTING THE BREAKOUT BOX

Special tools:

see **9511428**

see **9511499**

see **9511507**

see **9813194**

- Ignition off.
- Remove the door panel
- Disconnect the module connectors.

NOTE: Unplug the 12-pin connector before the 30-pin connector.

Connect the adapter to the control module's connector. Connect breakout box see **9511428** and cable harness see **9511499** to the adapter.

Adapter cable harness see **9511507** is for the 12-pin connector, and adapter cable harness see **9813194** is for the 30-pin connector.

Disconnection of breakout box in reverse order.

Other information

- To remove the door panel, see **PANEL FRONT SIDE DOOR, REPLACING**
- For further information about signals and other values, see **SIGNAL SPECIFICATION** .

ACCESSORIES AND BODY, CAB

Doors And Lids - Removal, Replacement And Installation

FUEL TANK FILLER COVER (2003-2011)

LOCK UNIT FUEL TANK FILLER COVER, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVING THE LOCK UNIT FOR THE FUEL TANK FILLER COVER

Fig. 1: Fuel Tank Filler Cover And Screws
Courtesy of VOLVO CARS CORPORATION

Fold up the cargo floor hatch.

Remove:

- the outer load floor
- the hatch (the rear section of the side panel in the cargo compartment).

Fold the insulation out of the way.

- the two screws holding the bracket in the body
- the connector
- two screws holding the lock unit on the bracket.

INSTALLING THE LOCK UNIT FOR THE FUEL TANK FILLER COVER

Install:

- the two screws holding the lock unit on the bracket
- the two screws holding the bracket in the body
- the connector.

Reinstall the insulation.

Install:

- the hatch (the rear section of the side panel in the cargo compartment)
- the outer load floor.

Fold down the cargo floor hatch.

HATCH, COVER (2003-2011)

COVER ANTENNA MODULE, REPLACING

REMOVE

Special tools:

see **9512337**

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATIONS

Fig. 2: Identifying Ignition Key Off
Courtesy of VOLVO CARS CORPORATION

Ignition off.

Remove the key from the ignition switch.

NOTE: After the key has been removed: Wait one minute before starting work.

REMOVING THE COVER FROM THE ANTENNA MODULE

Fig. 3: Identifying Wire Puller Into Right Hand Corner
Courtesy of VOLVO CARS CORPORATION

Remove:

- the headlining. See **HEADLINING, REPLACING**
- the antenna module.

NOTE: **The antenna module is PUR bonded in the roof and must be cut out. This is extremely difficult using a knife, there is a risk of damage to the paintwork around the sun roof. Use a wire instead for removal.**

WARNING: **Use protective goggles and protective gloves.**

Cut off four meters of piano wire.

Press the wire puller, special tool see **9512337** , into the rear right-hand corner.

Pull in both ends of the wire approximately 45 cm.

Fig. 4: Identifying Locating Pin
Courtesy of VOLVO CARS CORPORATION

Form the wire into a loop around the window and pull in the excess wire from one end.

Check which wire end moves so that they can be told apart.

Because there are locating pins at (1), the wire must be pulled in the direction arrowed.

Fig. 5: Secure Wire Using Welding Pliers
Courtesy of VOLVO CARS CORPORATION

Secure the wire going to the left using welding pliers.

Fig. 6: View Of Wire End To Be Winched To A Puller Bar
Courtesy of VOLVO CARS CORPORATION

Secure the wire end to be winched to a puller bar (see the illustration). Attach a short extension and a torx wrench or similar to the puller bar.

Tension the wire by winding it onto the puller handle.

Break the puller handle so that the wire is pulled into the car. Use the holes around the panel as holding points.

Wind in the wire up to the right-hand locating pin. There will be an obvious obstacle when the correct point has been reached.

Fig. 7: View Of Feeding The Wire
Courtesy of VOLVO CARS CORPORATION

Release the wire from the ratchet handle. Feed the wire in on the inside of the locating pin.

Secure the wire again and continue winding in until the hatch releases.

INSTALLING THE COVER PANEL FOR THE ANTENNA MODULE

The method for installing the cover panel is the same as for replacing windows. See **INSTALLING THE REAR WINDSHIELD**.

Clean the area on the panel to which PUR adhesive is to be applied using cleaner-H (black cap).

Apply PUR rim activator (blue cork) to the section of the panel where the adhesive will be applied.

NOTE: **PUR rim activator does not need to be applied if the old panel is reused within eight hours and there is still adhesive on it.**

Apply PUR adhesive to the cover panel or to the body flange.

Press the panel into place by hand.

Secure the panel using tape.

INSTALLING THE REAR WINDSHIELD

When working with PUR on the body flange, see **PUR ON BODY FLANGE** .

Clean the area on the window to which PUR adhesive is to be applied with cleaner-H (black cap).

Apply glass activator (yellow cap) to the area on the window to which PUR adhesive will be applied.

Apply glass primer (green cap) to the area on the window to which PUR adhesive will be applied.

Apply generously (although not so much that it runs).

Let the primer dry until the surface is matt.

Apply the PUR/RIM activator (blue cap) on the remaining PUR bead on the body flange.

Fig. 8: Identifying PUR Bead, Window Knife, Guide Hole, And Spacers
Courtesy of VOLVO CARS CORPORATION

Load the gun with both cartridges and the mixing pipe.

Apply adhesive to either the window or to the body flange.

Press the window into place by hand.

Reinstall the connector for the heated rear windshield.

Secure with tape.

Load the gun with both cartridges and the mixing pipe.

Apply adhesive to either the window or to the body flange.

Press the window into place by hand.

Secure with tape.

LOCK, HANDLE (2003)

CABLE, INTERNAL HANDLE, FRONT SIDE DOOR, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVING THE CABLE FOR THE INNER HANDLE IN THE FRONT SIDE DOORS

Fig. 9: Identifying Lock Mechanism & Cable
Courtesy of VOLVO CARS CORPORATION

Remove:

- the door panel. See **PANEL FRONT SIDE DOOR, REPLACING**
- the run-off profile.

Unhook the cable from the lock mechanism.

INSTALLING THE CABLE FOR THE INNER HANDLE IN THE FRONT SIDE DOORS

Hook the cable into the lock mechanism.

Install

- the run-off profile
- the door panel. See **PANEL FRONT SIDE DOOR, REPLACING** .

CABLE, INTERNAL HANDLE, REAR SIDE DOOR, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information**

is always correct.

REMOVING THE CABLE FOR THE INNER HANDLE IN THE REAR SIDE DOORS

Fig. 10: Identifying Lock Mechanism Cable
Courtesy of VOLVO CARS CORPORATION

Remove:

- the door panel. See **PANEL REAR SIDE DOOR, REPLACING**
- the run-off profile.

Unhook the cable from the lock mechanism.

INSTALLING THE CABLE FOR THE INNER HANDLE IN THE REAR SIDE DOORS

Hook the cable into the lock mechanism.

Install:

- the run-off profile
- the door panel. See **PANEL REAR SIDE DOOR, REPLACING** .

HANDLE INNER FRONT SIDE DOOR, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVING THE INNER HANDLE FROM THE FRONT SIDE DOORS

Fig. 11: Identifying Inner Handle Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the door panel. See **PANEL FRONT SIDE DOOR, REPLACING**
- the 3 screws.

Press the surround out of the bracket.

INSTALLING THE INNER HANDLE IN THE FRONT SIDE DOORS

Install the 3 screws. Tighten.

Press the surround into the bracket.

Install the door panel. See **PANEL FRONT SIDE DOOR, REPLACING** .

HANDLE INNER REAR SIDE DOOR, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVING THE INNER HANDLE FROM THE REAR SIDE DOORS

Fig. 12: Identifying Inner Handle Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the door panel. See **PANEL REAR SIDE DOOR, REPLACING**
- 3 screw.

Press the surround out of the bracket.

INSTALLING THE INNER HANDLE IN THE REAR SIDE DOORS

Press the surround into the bracket.

Install:

- 3 screw. Tighten
- the door panel. See **PANEL REAR SIDE DOOR, REPLACING** .

HANDLE INNER TAILGATE LOWER, REPLACING

NOTE: As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE INNER HANDLE FROM THE LOWER TAILGATE

Fig. 13: Identifying Tailgate Handle Screws
Courtesy of VOLVO CARS CORPORATION

Remove the lock mechanism. See **LOCK MECHANISM TAILGATE LOWER, REPLACING**.

Unhook the cable from the lock.

Remove the cable from the clip in the tailgate.

Remove the 3 screws.

Pull the opening handle and cables from the tailgate.

Remove:

- the cover on the opening handle
- the 2 screws.

Unhook the cables from the opening handle.

Release the catches.

Remove the cable from the bracket.

INSTALLING THE INNER HANDLE IN THE LOWER TAILGATE

NOTE: For tightening torques, see TIGHTENING TORQUE .

Install:

- the cable from the bracket
- the opening handle
- the 2 M5 screws. Tighten
- the cover
- the opening handle and the cables in the tailgate
- the 3 M8 screws. Tighten.

Press the cable into place in the clip.

Hook the cables in the lock.

Install the lock mechanism. See **LOCK MECHANISM TAILGATE LOWER, REPLACING**.

HANDLE OUTER FRONT SIDE DOOR, REPLACING

NOTE: As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Included in this method are methods for:

- outer front door handle **without** deadlocking. See **HANDLE OUTER FRONT SIDE DOOR (WITHOUT DEADLOCKING), REPLACING**
- outer front door handle **with** deadlocking. See **HANDLE, OUTER, FRONT, SIDE DOOR (WITH DEADLOCKING), REPLACING**.

HANDLE OUTER FRONT SIDE DOOR (WITHOUT DEADLOCKING), REPLACING

REMOVING THE HANDLE FROM THE OUTER FRONT SIDE DOOR (WITHOUT DEADLOCKING)

Close the side window.

Fig. 14: Identifying Outer Front Side Door Handle
Courtesy of VOLVO CARS CORPORATION

Remove:

- the door panel. See **PANEL FRONT SIDE DOOR, REPLACING**
- the run-off profile
- the two links between the handle and the lock.

Pull out the handle. Work out the front end of the handle from the side of the door.

Fig. 15: View Of Outside Door Bracket
Courtesy of VOLVO CARS CORPORATION

Remove the bracket on the outside of the door.

NOTE: **This bracket must be replaced with a new one.**

Fig. 16: Identifying Bracket Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the 4 screws
- the bracket for the handle by pressing it forwards from the inside.

INSTALLING THE HANDLE ON THE OUTER FRONT SIDE DOOR (WITHOUT DEADLOCKING)

NOTE: For tightening torques, see TIGHTENING TORQUE .

Install:

- the bracket for the handle
- the 4 M5 screws. Tighten
- the bracket on the outside of the door
- the handle Press back the upper front link mounting so that the handle is secured
- the links between the outer handle and the lock
- the run-off profile
- the door panel. See **PANEL FRONT SIDE DOOR, REPLACING** .

HANDLE, OUTER, FRONT, SIDE DOOR (WITH DEADLOCKING), REPLACING

REMOVING THE EXTERIOR HANDLE FROM THE FRONT SIDE DOORS

Fig. 17: View Of Door Strip Weatherstrip
Courtesy of VOLVO CARS CORPORATION

Remove:

- the door panel. See **PANEL FRONT SIDE DOOR, REPLACING**
- the run-off profile
- the window. See **WINDOW FRONT SIDE DOOR, REPLACE** .

Detach the weatherstrip up to the door arch.

Drill out the rivets. See **REMOVING RIVET** .

Remove the glass guide.

Fig. 18: Identifying Glass Guide Screw
Courtesy of VOLVO CARS CORPORATION

Remove 1 screw.

NOTE: Note how the cover is positioned at the member.

Work the cover out.

NOTE: There is no cover on the passenger side.

Fig. 19: Identifying Outer Front Side Door Handle
Courtesy of VOLVO CARS CORPORATION

Remove the links between the outer handle and the lock.

Press the upper front mounting for the link forward.

Pull out the handle. Work out the front end of the handle from the side of the door.

Fig. 20: View Of Outside Door Bracket
Courtesy of VOLVO CARS CORPORATION

Remove the bracket on the outside of the door.

NOTE: **This bracket must be replaced with a new one.**

Fig. 21: Identifying Bracket Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the 4 screws
- the bracket for the handle by pressing it forwards from the inside.

INSTALLING THE HANDLE ON THE OUTER FRONT SIDE DOOR (WITH DEADLOCKING)

NOTE: For tightening torques, see TIGHTENING TORQUE .

Install:

- the bracket for the handle
- the 4 M5 screws. Tighten
- the bracket on the outside of the door
- the handle.

Press back the upper link mounting so that the handle is secured.

Install:

- the links between the outer handle and the lock
- the cover
- 1 M5 screw. Tighten
- the glass guide
- the 2 blind rivets
- weatherstrip.

HINT: Work in the weatherstrip using a little soap.

Install:

- the side window. See **WINDOW FRONT SIDE DOOR, REPLACE**
- the run-off profile
- the door panel. See **PANEL FRONT SIDE DOOR, REPLACING** .

HANDLE OUTER REAR SIDE DOOR, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVING THE EXTERIOR HANDLE FROM THE REAR SIDE DOORS

The side window must be closed.

Fig. 22: Identifying Outer Front Side Door Handle
Courtesy of VOLVO CARS CORPORATION

Remove:

- the door panel. See **PANEL REAR SIDE DOOR, REPLACING**
- the run-off profile.

Detach the link for the exterior handle at the lock.

Press the upper mounting for the link forward.

Pull out the handle and work out the front edge of the handle from the side of the door.

Fig. 23: View Of Outside Door Bracket
Courtesy of VOLVO CARS CORPORATION

Remove the bracket on the outside of the door.

NOTE: Replace the bracket with a new one.

Fig. 24: Identifying Outer Rear Side Door Handle Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the 3 screws
- the bracket for the handle. Press the bracket forwards from the inside.

INSTALLING THE EXTERIOR HANDLE IN THE REAR SIDE DOORS

NOTE: For tightening torques, see TIGHTENING TORQUE .

Install:

- the bracket for the handle
- the 3 M5 screws. Tighten
- the bracket on the outside of the door
- the handle.

Press back the upper link mounting so that the handle is secured.

Install:

- the link between the exterior handle and the lock
- the soundproofing
- the door panel. See **PANEL REAR SIDE DOOR, REPLACING** .

HANDLE OUTER TAILGATE UPPER, REPLACING

NOTE: The illustrations in this service information are used for different model years and / or models. Some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE EXTERIOR HANDLE FROM THE UPPER TAILGATE

Fig. 25: Identifying Upper Tailgate Handle Mechanical Cable
Courtesy of VOLVO CARS CORPORATION

Remove:

- the wiper arm. See **TAILGATE WIPER ARM / BLADE, REPLACING**
- the panel. See **PANEL TAILGATE UPPER, REPLACING**
- the 3 screws for the wiper motor
- the wiper motor
- the mechanical cable for the outer opening handle

- the 4 nuts
- the connector.

Remove the outer handle.

INSTALLING THE EXTERIOR HANDLE ON THE UPPER TAILGATE

NOTE: **For tightening torques, see TIGHTENING TORQUE .**

Install:

- the opening handle
- 4 M6 nuts. Tighten
- the mechanical cable for the outer opening handle
- the wiper motor
- the connector for the wiper motor
- the 3 M6 screws. Tighten
- the panel. See **PANEL TAILGATE UPPER, REPLACING**
- the wiper arm. See **TAILGATE WIPER ARM / BLADE, REPLACING**

LOCK CYLINDER GLOVE COMPARTMENT, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVING THE LOCK CYLINDER

Fig. 26: Identifying Glove Compartment Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the 3 screws.

Fig. 27: View Of Lock Cylinder Screws
Courtesy of VOLVO CARS CORPORATION

- the panel
- the 2 screws
- the lock cylinder.

INSTALLING THE LOCK CYLINDER

Install:

- the lock cylinder
- the 2 screws. Tighten
- the panel
- the 3 screws. Tighten.

LOCK CYLINDER SIDE DOOR, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVING THE LOCK CYLINDER FROM THE SIDE DOOR

Fig. 28: Identifying Door Handle Clip
Courtesy of VOLVO CARS CORPORATION

Remove:

- the door panel. See **PANEL FRONT SIDE DOOR, REPLACING**
- the run-off profile
- the handle **with** deadlock. See **HANDLE, OUTER, FRONT, SIDE DOOR (WITH DEADLOCKING), REPLACING**
- the handle **without** deadlock. See **HANDLE OUTER FRONT SIDE DOOR (WITHOUT DEADLOCKING), REPLACING**
- the 1 clip
- the lock cylinder.

INSTALLING THE LOCK CYLINDER IN THE SIDE DOOR

Install:

- the lock cylinder
- the 1 clip

- the handle **with** deadlock. See **HANDLE, OUTER, FRONT, SIDE DOOR (WITH DEADLOCKING), REPLACING**
- the handle **without** deadlock. See **HANDLE OUTER FRONT SIDE DOOR (WITHOUT DEADLOCKING), REPLACING**
- the run-off profile
- the door panel. See **PANEL FRONT SIDE DOOR, REPLACING** .

LOCK MECHANISM FRONT SIDE DOOR, REPLACING

NOTE: **The illustrations in this service information are used for different model years and / or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

Included in this method are methods for:

- lock mechanism front side door **without** deadlocking. See **LOCK MECHANISM FRONT SIDE DOOR (WITHOUT DEADLOCKING), REPLACING**
- lock mechanism front side door **with** deadlocking. See **LOCK MECHANISM FRONT SIDE DOOR (WITH DEADLOCKING), REPLACING**.

LOCK MECHANISM FRONT SIDE DOOR (WITHOUT DEADLOCKING), REPLACING

REMOVING THE LOCK MECHANISM FROM THE OUTER FRONT SIDE DOOR (WITHOUT DEADLOCKING)

The window must be in the uppermost position.

Fig. 29: Identifying Lock Screws
Courtesy of VOLVO CARS CORPORATION

Remove the door panel. See **PANEL FRONT SIDE DOOR, REPLACING** .

Move the run-off profile to one side.

Remove:

- the link for the lock button
- the guide molding
- the 2 rivets. See **REMOVING RIVET**
- the guide rail.

Detach the links for the external handle.

Remove the 3 screws.

Lift the lock out of the door.

Remove the connector.

Unhook the cable.

INSTALLING THE LOCK MECHANISM FOR THE OUTER FRONT SIDE DOOR (WITHOUT DEADLOCKING)

NOTE: For tightening torques, see TIGHTENING TORQUE .

When installing a new lock (replacement part), the clip which determines the position on the link for the lock cylinder must be removed after the lock mechanism and link for the lock cylinder have been installed.

Turn the clip 90 degrees and pull it out.

HINT: Keep the clip. The clip can be used the next time the lock is removed, in order to establish the position of the link for the lock cylinder.

Hook the cable into place.

Connect the connector.

Lift the lock into the door.

Install the 3 M6 screws. Tighten.

CAUTION: Ensure that the lower link mounting (for the lock cylinder link) on the lock mechanism has been placed in the center position, so that the holes (for the transit safety catch) in the casing for the lock mechanism and the hole in the link mounting arm correspond.

Install:

- the links for the external handle
- the guide rail
- the 2 rivets for the guide rail
- the guide molding
- the link for the inner lock button
- the run-off profile
- the door panel. See **PANEL REAR SIDE DOOR, REPLACING** .

LOCK MECHANISM FRONT SIDE DOOR (WITH DEADLOCKING), REPLACING

REMOVING THE LOCK MECHANISM FROM THE OUTER FRONT SIDE DOOR (WITH DEADLOCKING)

Fig. 30: View Of Door Strip Weatherstrip
Courtesy of VOLVO CARS CORPORATION

Remove:

- the door panel. See **PANEL FRONT SIDE DOOR, REPLACING**
- the run-off profile
- the window. See **WINDOW FRONT SIDE DOOR, REPLACE** .

Detach the weatherstrip up to the door arch.

Drill out the rivets. See **REMOVING RIVET**.

Remove:

- the glass guide.

Fig. 31: Identifying Glass Guide Screw
Courtesy of VOLVO CARS CORPORATION

- 1 screw.

CAUTION: Note the position of the cover at the member.

Work the cover out.

NOTE: There is no cover on the passenger side.

Fig. 32: Identifying Lock Screws
Courtesy of VOLVO CARS CORPORATION

Detach the links for the external handle.

Remove the 3 screws.

Lift the lock out of the door.

Remove the connector.

Unhook the cable.

INSTALLING THE LOCK MECHANISM FOR THE OUTER FRONT SIDE DOOR (WITH DEADLOCKING)

NOTE: For tightening torques, see TIGHTENING TORQUE .

When installing a new lock (replacement part), the clip which determines the position on the link for the lock cylinder must be removed after the lock mechanism and link for the lock cylinder have been installed.

Turn the clip 90 degrees and pull it out.

HINT: Keep the clip. The clip can be used the next time the lock is removed, in order to establish the

position of the link for the lock cylinder.

Hook the cable into place.

Connect the connector.

Lift the lock into the door.

Install the 3 M6 screws. Tighten.

CAUTION: Ensure that the lower link mounting (for the lock cylinder link) on the lock mechanism has been placed in the center position, so that the holes (for the transit safety catch) in the casing for the lock mechanism and the hole in the link mounting arm correspond.

Install:

- the links between the outer handle and the lock
- the cover
- 1 M5 screw. Tighten
- the glass guide
- the 2 blind rivets
- weatherstrip.

HINT: Work in the weatherstrip using a little soap.

Install:

- the side window. See **WINDOW FRONT SIDE DOOR, REPLACE**
- the run-off profile
- the door panel. See **PANEL FRONT SIDE DOOR, REPLACING** .

REMOVING RIVET

Special tools	
	T9814075 SPRAY GUN **Tool number:** T9814075 **Tool description:** SPRAY GUN **Tool boards:**

Materials:	
Designation	**Part number**
Thin rustproofing agent	1161682

NOTE: If the pop rivet spins, drill at a 45° angle against the pop rivet.

Pay attention to heat generation when drilling in pop rivet mounted in plastic part.

Remove drill burrs and any remains of the rivet.

If possible, put tape on the back to catch pop rivet.

Fig. 33: Applying Thin Rustproofing Agent

To avoid rattling if it is not possible to remove remains of rivet.

Use: Thin rustproofing agent, 1161682

9814075

CAUTION: Make sure that rustproofing agent does not run out, discoloring the upholstery or other.

LOCK MECHANISM REAR SIDE DOOR, REPLACING

NOTE: The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE LOCK MECHANISM FOR THE REAR SIDE DOOR

The window must be closed before beginning removal.

Fig. 34: Identifying Back Door Lock Mechanism And Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the door panel. See **PANEL REAR SIDE DOOR, REPLACING**
- the run-off profile
- the link for the inner lock button
- the link for the external handle
- the 3 screws.

Lift the lock out of the door.

Remove the connector.

Unhook the cable.

Remove the cover from the top of the lock.

INSTALLING THE LOCK MECHANISM FOR THE REAR SIDE DOOR

NOTE: For tightening torques, see GENERAL TIGHTENING TORQUE .

Press down the cover (1) on the top of the lock.

Press in the locking plug (2).

Hook the cable into place.

Connect the connector.

Lift the lock into the door.

Install:

- the 3 M6 screws. Tighten
- the link for the external handle
- the link for the inner lock button
- the run-off profile
- the door panel. See **PANEL REAR SIDE DOOR, REPLACING** .

LOCK MECHANISM, TAILGATE, REPLACING

NOTE: As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Included in this method are methods for:

- the lock mechanism in the upper tailgate. See **LOCK MECHANISM TAILGATE UPPER, REPLACING**
- the lock mechanism in the lower tailgate. See **LOCK MECHANISM TAILGATE LOWER, REPLACING**.

LOCK MECHANISM TAILGATE UPPER, REPLACING

REMOVING THE LOCK MECHANISM FOR THE UPPER TAILGATE

Fig. 35: View Of Upper Tailgate Mechanical Cable
Courtesy of VOLVO CARS CORPORATION

Remove the panel. See **PANEL TAILGATE UPPER, REPLACING** .

Remove:

- the connector
- the mechanical cable for the inner opening handle
- the mechanical cable for the external opening handle.

Remove the 3 screws.

Angle out the lock mechanism.

INSTALLING THE LOCK MECHANISM FOR THE UPPER TAILGATE

NOTE: For tightening torques, see TIGHTENING TORQUE .

Install:

- the lock mechanism
- the 3 M8 screws. Tighten

- the mechanical cable for the outer opening handle
- the mechanical cable for the inner opening handle
- the connector
- the panel. See **PANEL TAILGATE UPPER, REPLACING** .

LOCK MECHANISM TAILGATE LOWER, REPLACING

REMOVING THE LOCK MECHANISM FOR THE LOWER TAILGATE

Fig. 36: View Of Lower Tailgate Lock Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the panel. See **PANEL TAILGATE LOWER, REPLACING**
- the 6 screws (3 screws per lock)
- the lock
- the cable.

INSTALLING THE LOCK MECHANISM FOR THE LOWER TAILGATE

NOTE: For tightening torques, see TIGHTENING TORQUE .

Install:

- the cable
- the lock
- the 6 M8 screws. Tighten
- the panel. See **PANEL TAILGATE LOWER, REPLACING** .

LOCK, HANDLE (2004-2011)

CABLE, INTERNAL HANDLE, FRONT SIDE DOOR, REPLACING

KEY REMOTE CONTROL, REPLACING

XC90: See **IGNITION KEY/REMOTE CONTROL, ADDING/REPLACING/ERASING**.

IGNITION KEY/REMOTE CONTROL, ADDING/REPLACING/ERASING

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

IGNITION KEY/REMOTE CONTROL, ADDING/REPLACING/ERASING

CAUTION: **When replacing an ignition key or remote control, the new unit must be programmed.**

Both software and the code on the packaging are required to add a new remote control.

Only the software is required to erase a remote control.

Only software is required to add an ignition key.

IGNITION KEY PROGRAMMING/ERASING

Order the software. See 9438428

REMOTE CONTROL PROGRAMMING/ERASING

Order the software. See 9438429

FINISHING

Check the function after programming an ignition key or remote control.

MODEL YEAR 2004

NOTE: **2004 sees the introduction of an ignition key integrated with the remote control.**

REMOVING KEYS FROM THE REMOTE CONTROL

Fig. 37: Identifying Key Battery Cover Removal
Courtesy of VOLVO CARS CORPORATION

Fold out the key and remove the battery cover.

Fig. 38: Identifying Key, Remote Control Unit, And Screw
Courtesy of VOLVO CARS CORPORATION

Remove the screw and separate the unit.

INSTALLING KEYS IN THE REMOTE CONTROL

Install

- the key.

NOTE: Always use a new key when installing.

- the screw
- the cover.

IGNITION KEY/REMOTE CONTROL, ADDING/REPLACING/ERASING

NOTE: The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

IGNITION KEY/REMOTE CONTROL, ADDING/REPLACING/ERASING

CAUTION: When replacing an ignition key or remote control, the new unit must be programmed.

Both software and the code on the packaging are required to add a new remote control.

Only the software is required to erase a remote control.

Only software is required to add an ignition key.

IGNITION KEY PROGRAMMING/ERASING

Order the software. See 9438428

REMOTE CONTROL PROGRAMMING/ERASING

Order the software. See 9438429

FINISHING

Check the function after programming an ignition key or remote control.

MODEL YEAR 2004

NOTE: 2004 sees the introduction of an ignition key integrated with the remote control.

REMOVING KEYS FROM THE REMOTE CONTROL

Fig. 39: Identifying Key Battery Cover Removal
Courtesy of VOLVO CARS CORPORATION

Fold out the key and remove the battery cover.

Fig. 40: Identifying Key, Remote Control Unit, And Screw
Courtesy of VOLVO CARS CORPORATION

Remove the screw and separate the unit.

INSTALLING KEYS IN THE REMOTE CONTROL

Install

- the key.

NOTE: Always use a new key when installing.

- the screw
- the cover.

LOCK CYLINDER GLOVE COMPARTMENT, REPLACING

see **LOCK CYLINDER GLOVE COMPARTMENT, REPLACING**

LOCK CYLINDER SIDE DOOR, REPLACING

POWER WINDOW MECHANISM (2003-2011)

WINDOW LIFT MECHANISM FRONT SIDE DOOR, REPLACING

NOTE: The illustrations in this service information are used for different model years and / or models. Some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE LIFT MECHANISM FROM THE FRONT SIDE DOOR

The window must be in the half open position.

Fig. 41: View Of Secure The Window Using Tape
Courtesy of VOLVO CARS CORPORATION

Remove:

- the panel. See **PANEL FRONT SIDE DOOR, REPLACING**
- the soundproofing
- the window. See **WINDOW FRONT SIDE DOOR, REPLACE** .

HINT: Instead of removing the window, press it up into its highest position.

Secure the window using tape.

NOTE: The mechanism is correctly positioned for removal when the holes in the mechanism and in the arm are opposite each other.

Fig. 42: View Of Life Mechanism Rivets
Courtesy of VOLVO CARS CORPORATION

Remove the 4 rivets. See **REMOVING RIVET** .

Work out the lift mechanism.

Remove the connectors for the lift mechanism motor.

INSTALLING THE LIFT MECHANISM FOR THE FRONT SIDE DOOR

Install:

- the connector for the lift mechanism motor
- the lift mechanism.

Fig. 43: Identifying Rivets Installation Order
Courtesy of VOLVO CARS CORPORATION

NOTE: Install 4 new rivets in the numerical order illustrated.

Install:

- the window. See **WINDOW FRONT SIDE DOOR, REPLACE**
- the soundproofing
- the panel. See **PANEL FRONT SIDE DOOR, REPLACING** .

INITIALIZING THE WINDOW POSITION

After replacing the lift mechanism, the window position must be initialized.

Ignition on.

Initialize the window position. See the information in VIDA vehicle communication function group 83.

WINDOW LIFT MECHANISM REAR SIDE DOOR, REPLACING

NOTE: As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE LIFT MECHANISM FOR THE REAR SIDE DOOR

The window must be in the half open position.

Fig. 44: View Of Window Rivets
Courtesy of VOLVO CARS CORPORATION

Remove:

- the panel. See **PANEL REAR SIDE DOOR, REPLACING**
- the run-off profile
- the loudspeaker. See **LOUDSPEAKER, REAR SIDE DOOR, REPLACING** .

Drill out the 2 rivets for the window. See **REMOVING RIVET** .

Fig. 45: Identifying Secured Window Using Tape
Courtesy of VOLVO CARS CORPORATION

Close the window.

Secure the window using tape.

Fig. 46: Identifying Lift Mechanism Rivets
Courtesy of VOLVO CARS CORPORATION

Disconnect the connector for the lift mechanism motor.

Remove:

- the 3 rivets. See **REMOVING RIVET**
- the 1 nut at the top of the lift mechanism.

Work out the lift mechanism.

INSTALLING THE LIFT MECHANISM FOR THE REAR SIDE DOOR

NOTE: For tightening torques, see TIGHTENING TORQUE .

Install:

- the lift mechanism
- 1 M6 nut. Tighten
- the 3 rivets for the lift mechanism
- the connector for the lift mechanism motor.

Lower the window.

Install:

- the 2 rivets securing the window to the lift mechanism
- the loudspeakers. See **LOUDSPEAKER, REAR SIDE DOOR, REPLACING**
- the run-off profile
- the panel. See **PANEL REAR SIDE DOOR, REPLACING** .

INITIALIZING THE WINDOW POSITION

After replacing the lift mechanism, the window position must be initialized.

Ignition on.

Initialize the window position. VIDA (Volvo scan tool) is necessary.

SIDE DOOR WITH CONTROLS (2003-2011)

DOOR STOP FRONT SIDE DOOR, REPLACING

NOTE: As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE DOOR STOP FOR THE FRONT SIDE DOOR

The window must be closed.

Fig. 47: Disconnecting And Moving Front Plastic Cover To Side
Courtesy of VOLVO CARS CORPORATION

Remove the door panel. See **PANEL FRONT SIDE DOOR, REPLACING** .

Disconnect and move the front plastic cover (1) to one side.

Fig. 48: Identifying Door Stop, Screw And Nuts
Courtesy of VOLVO CARS CORPORATION

Remove:

- one screw (2)
- the two nuts (3).

Fig. 49: Identifying Door Stop Removal Through Opening
Courtesy of VOLVO CARS CORPORATION

Twist the door stop carefully to remove it through the opening.

NOTE: **It is tight past at front guide for the front window. It is easy to dent the panels if great care is not taken.**

INSTALLING THE DOOR STOP FOR THE FRONT SIDE DOOR

NOTE: **For tightening torques, see GENERAL TIGHTENING TORQUE .**

Install:

- the door stop
- 2 M6 nuts. Tighten
- 1 M8 screw. Tighten
- the cover
- the door panel. See **PANEL FRONT SIDE DOOR, REPLACING** .

DOOR STOP REAR SIDE DOOR, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information is always correct.**

REMOVING THE DOOR STOP FOR THE REAR SIDE DOOR

The window must be closed.

Fig. 50: Identifying Soundproofing And Door Stop
Courtesy of VOLVO CARS CORPORATION

Remove:

- the door panel. See **PANEL REAR SIDE DOOR, REPLACING**
- soundproofing.

Fig. 51: Identifying Door Stop, Screw And Nuts
Courtesy of VOLVO CARS CORPORATION

- one screw (2)
- the two nuts (3).

Fig. 52: Identifying Soundproofing And Door Stop
Courtesy of VOLVO CARS CORPORATION

Twist the door stop (4) carefully to remove it through the opening.

INSTALLING THE DOOR STOP FOR THE REAR SIDE DOOR

NOTE: For tightening torques, see GENERAL TIGHTENING TORQUE .

Install:

- the door stop
- 2 M6 nuts. Tighten
- 1 M8 screw. Tighten
- the soundproofing
- the door panel. See **PANEL REAR SIDE DOOR, REPLACING** .

HINGES SIDE DOOR, REPLACING

Special tools:

see **9501080**

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVING HINGES FROM THE SIDE DOOR

Remove the necessary components. See **SIDE SECTION, EXPOSING** .

Grind off the bead weld around the hinge so that the hinge releases.

Grind clean.

Apply welding primer.

INSTALLING HINGES FOR THE SIDE DOOR

Fig. 53: Identifying Adjuster Shims
Courtesy of VOLVO CARS CORPORATION

Fig. 54: Identifying Cowl Side Holes
Courtesy of VOLVO CARS CORPORATION

Use special tool see **9501080** .

Install the hinges on the door using two adjuster shims (3) between each hinge and the door. This will make any late adjustment easier.

Align the door and hinges so that the edge of the hinges are positioned in the punched out holes in the cowl side (1).

Tack weld the hinges into place.

Check the alignments and clearance.

Fig. 55: Identifying Cowl Side Holes
Courtesy of VOLVO CARS CORPORATION

Remove:

- the door
- the door support.

Weld the hinges into place. Ensure that the weld is in the groove in the cowl side.

Fig. 56: Identifying Rear Edge Seal
Courtesy of VOLVO CARS CORPORATION

Seal at the rear edge (2). See **BODY SEAL** .

OUTER DOOR SKIN, REPLACING

NOTE: **Since the illustrations in this service information are used for different model years and/or models there may be some variation. However, the essential information in the illustrations is always correct.**

Included in this method are methods for:

- the front side outer door skin. See **FRONT SIDE OUTER DOOR SKIN, REPLACING**
- the rear side outer door skin. See **REPLACING THE REAR SIDE OUTER DOOR SKIN**.

FRONT SIDE OUTER DOOR SKIN, REPLACING

PREPARATIONS

Fig. 57: View Of Door Hinge Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the cover from the door mirror
- the interior handle. See **HANDLE INNER FRONT SIDE DOOR, REPLACING**
- the outer door skin. See **PANEL FRONT SIDE DOOR, REPLACING**
- the side window. See **WINDOW FRONT SIDE DOOR, REPLACE**
- the exterior handle. See **HANDLE OUTER FRONT SIDE DOOR, REPLACING**
- the door mirror. See **REAR VIEW MIRROR, REPLACING**
- the rubber and trim strips.

Disconnect the cable harness from its connector in the door.

Remove the screws (1) holding the 2 door hinges and lift down the door.

REMOVING THE DOOR PANEL FOR THE FRONT SIDE DOOR

Fig. 58: Identifying Collision Member
Courtesy of VOLVO CARS CORPORATION

Grind the panel edges.

Cut the outer door skin as illustrated.

The outer door skin is bonded in the frame and in the collision member.

Pry off the outer door skin.

NOTE: Check that the door frame is undamaged.

Clean the door frame.

INSTALLING THE FRONT SIDE OUTER DOOR SKIN

NOTE: For tightening torques, see TIGHTENING TORQUE .

Fig. 59: Identifying Outer Door Skin
Courtesy of VOLVO CARS CORPORATION

Align the frame in the outer door skin.

Cut the panel at the door arches.

Remove the frame from the outer door skin.

Apply:

- enamel primer to the points that will be PUR bonded
- PUR adhesive to the collision member
- bodywork adhesive (P/N 116 1524) on the outer door skin.

Secure the replacement part using two tack welds in the door arches.

Beat the edge over using a counterhold pressed hard against the outer door skin.

Check the alignment by hanging the door on the car. This must be done before the adhesive has cured.

Complete the welding.

Seal the outer door skin to the frame. See **BODY SEAL** .

FINISHING

Fig. 60: Identifying Door Skin Welding
Courtesy of VOLVO CARS CORPORATION

Install:

- the door to the hinges using 2 M8 screws. Tighten
- the exterior handle. See **HANDLE OUTER FRONT SIDE DOOR, REPLACING**
- the side window. See **WINDOW FRONT SIDE DOOR, REPLACE**
- the rubber and trim strips
- the cable harness in its connector in the door post
- the door mirror. See **REAR VIEW MIRROR, REPLACING**
- the outer door skin. See **PANEL FRONT SIDE DOOR, REPLACING**
- the interior handle. See **HANDLE INNER FRONT SIDE DOOR, REPLACING**
- the cover from the door mirror

REPLACING THE REAR SIDE OUTER DOOR SKIN

PREPARATIONS

Fig. 61: Identifying Rear Side Outer Door Skin
Courtesy of VOLVO CARS CORPORATION

Remove:

- the interior handle. See **HANDLE INNER REAR SIDE DOOR, REPLACING**
- the outer door skin. See **PANEL REAR SIDE DOOR, REPLACING**
- the side window. See **WINDOW REAR SIDE DOOR, REPLACING**
- the exterior handle. See **HANDLE OUTER REAR SIDE DOOR, REPLACING**
- the rubber and trim strips.

Disconnect the cable harness from its connector in the door.

Remove the screws (1) holding the 2 door hinges and lift down the door.

REMOVING THE OUTER DOOR SKIN FOR THE REAR SIDE DOOR

Fig. 62: Identifying Rear Side Door Frame
Courtesy of VOLVO CARS CORPORATION

Grind the panel edges.

Cut the outer door skin as illustrated.

The outer door skin is bonded in the frame and in the collision member.

Pry off the outer door skin.

NOTE: Check that the door frame is undamaged.

Clean the door frame.

INSTALLING THE OUTER DOOR SKIN FOR THE REAR SIDE DOOR

Fig. 63: Align The Frame In The Outer Door Skin
Courtesy of VOLVO CARS CORPORATION

Align the frame in the outer door skin.

Cut the door skin at the door arches.

Remove the frame from the outer door skin.

Apply:

- enamel primer to the points that will be PUR bonded
- PUR adhesive to the collision member
- bodywork adhesive (P/N 116 1524) on the outer door skin.

Secure the replacement part using two tack welds in the door arches.

Beat the edge over using a counterhold pressed hard against the outer door skin.

Check the alignment by hanging the door on the car. This must be done before the adhesive has cured.

Complete the welding.

Seal the outer door skin to the frame. See **BODY SEAL** .

FINISHING

Fig. 64: Install Outer Door Skin Weld Points
Courtesy of VOLVO CARS CORPORATION

Install:

- the door to the hinges using 2 M8 screws. Tighten
- the exterior handle. See **HANDLE OUTER REAR SIDE DOOR, REPLACING**
- the side window. See **WINDOW REAR SIDE DOOR, REPLACING**
- the rubber and trim strips
- the cable harness in its connector in the door post
- the outer door skin. See **PANEL REAR SIDE DOOR, REPLACING**
- the interior handle. See **HANDLE INNER REAR SIDE DOOR, REPLACING**

SIDE DOOR FRONT, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVING THE FRONT SIDE DOOR

Fig. 65: View Of Front Side Door Hinge
Courtesy of VOLVO CARS CORPORATION

Remove:

- the cover from the door mirror
- the interior handle. See **HANDLE INNER FRONT SIDE DOOR, REPLACING**
- the door panel. See **PANEL FRONT SIDE DOOR, REPLACING**
- the side window. See **WINDOW FRONT SIDE DOOR, REPLACE**
- the window lift mechanism. See **WINDOW LIFT MECHANISM FRONT SIDE DOOR, REPLACING**
- the loudspeakers. See **LOUDSPEAKER, FRONT SIDE DOOR, REPLACING**
- the lock mechanism. See **LOCK MECHANISM FRONT SIDE DOOR, REPLACING**
- the exterior handle. See **HANDLE OUTER FRONT SIDE DOOR, REPLACING**
- the door mirror. See **REAR VIEW MIRROR, REPLACING**
- the cable harness in the door
- the rubber and trim strips
- the door stop. See **DOOR STOP FRONT SIDE DOOR, REPLACING**.

HINT: Check whether there are any spacers (1) between the door and the hinge. Make a note of how many there are.

Remove the 4 screws (2) holding the door at the front edge. Then remove the upper screw and lower the door.

INSTALLING THE FRONT SIDE DOOR

Fig. 66: Identifying Front Door Spacers
Courtesy of VOLVO CARS CORPORATION

Install the door using only the upper screw but without tightening it.

Then install the other screws.

If spacers were installed, install them in the same place they were removed from.

Install the screws following the old color marking so that the door is roughly aligned.

Install:

- the cable harness in the door
- the lock mechanism. See **LOCK MECHANISM FRONT SIDE DOOR, REPLACING**
- the loudspeakers. See **LOUDSPEAKER, FRONT SIDE DOOR, REPLACING**

- the window lift mechanism. See **WINDOW LIFT MECHANISM FRONT SIDE DOOR, REPLACING**
- the side window. See **WINDOW FRONT SIDE DOOR, REPLACE**
- the interior handle. See **HANDLE INNER FRONT SIDE DOOR, REPLACING**.

Place seal lips over the holes in the door.

Install:

- the door stop. See **DOOR STOP FRONT SIDE DOOR, REPLACING**
- the door mirror. See **REAR VIEW MIRROR, REPLACING**
- the exterior handle. See **HANDLE OUTER FRONT SIDE DOOR, REPLACING**
- the door panel. See **PANEL FRONT SIDE DOOR, REPLACING**
- the cover from the door mirror
- the rubber and trim strips.

Adjust the door.

Tighten the 4 M8 screws at the front edge of the door.

SIDE DOOR REAR, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVING THE FRONT SIDE DOOR

Fig. 67: Identifying Front Door Hinge Components
Courtesy of VOLVO CARS CORPORATION

Remove:

- the interior handle. See **HANDLE INNER REAR SIDE DOOR, REPLACING**
- the door panel. See **PANEL REAR SIDE DOOR, REPLACING**
- the side window. See **WINDOW REAR SIDE DOOR, REPLACING**
- the window lift mechanism. See **WINDOW LIFT MECHANISM REAR SIDE DOOR, REPLACING**
- the loudspeakers. See **LOUDSPEAKER, REAR SIDE DOOR, REPLACING**
- the lock mechanism. See **LOCK MECHANISM REAR SIDE DOOR, REPLACING**
- the exterior handle. See **HANDLE OUTER REAR SIDE DOOR, REPLACING**
- the cable harness in the door
- the rubber and trim strips
- the door stop. See **DOOR STOP REAR SIDE DOOR, REPLACING**
- the SIPS block.

HINT: Check whether there are any spacers (1) between the door and the hinge. Make a note of how many there are.

Remove the 4 screws (2) holding the door at the front edge. Then remove the upper screw and lower the door.

INSTALLING THE FRONT SIDE DOOR

Fig. 68: Identifying Front Side Door Spacers
Courtesy of VOLVO CARS CORPORATION

Install the door using only the upper screw but without tightening it.

Then install the other screws.

If spacers were installed, install them in the same place they were removed from.

Install the screws following the old color marking so that the door is roughly aligned.

Install:

- SIPS block
- the cable harness in the door
- the lock mechanism. See **LOCK MECHANISM REAR SIDE DOOR, REPLACING**
- the loudspeakers. See **LOUDSPEAKER, REAR SIDE DOOR, REPLACING**
- the window lift mechanism. See **WINDOW LIFT MECHANISM REAR SIDE DOOR, REPLACING**
- the side window. See **WINDOW REAR SIDE DOOR, REPLACING**
- the interior handle. See **HANDLE INNER REAR SIDE DOOR, REPLACING**.

Place seal lips over the holes in the door.

Install:

- the door stop. See **DOOR STOP REAR SIDE DOOR, REPLACING**
- the exterior handle. See **HANDLE OUTER REAR SIDE DOOR, REPLACING**
- the door panel. See **PANEL REAR SIDE DOOR, REPLACING**
- the rubber and trim strips.

Adjust the door.

Tighten the 4 M8 screws at the front edge of the door

SUN ROOF (2003-2011)

APRON MOLDING SUN ROOF, REPLACEMENT

NOTE: **The illustrations in this service information are used for different model years and / or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVING THE APRON MOLDING FOR THE SUN ROOF

Fig. 69: Identifying Apron Molding Pulled Into Car
Courtesy of VOLVO CARS CORPORATION

The sun roof must be in the half open position.

Pull the apron molding inwards into the car.

Detach the upper edge of the apron molding.

Unhook the lower edge of the apron molding.

Remove the apron molding.

INSTALLING APRON MOLDING FOR THE SUN ROOF

Hook the apron molding into place at the top and bottom edges.

CONTROL MODULE, SUN ROOF, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATIONS

Fig. 70: Identifying Ignition In Off Position
Courtesy of VOLVO CARS CORPORATION

Close the sun roof.

Ignition off.

Fig. 71: Identifying Ignition Key Off
Courtesy of VOLVO CARS CORPORATION

Remove the key.

NOTE: After removing the key, wait one minute before starting work.

REMOVING THE SUN ROOF CONTROL MODULE

Fig. 72: Identifying Upper Electronic Module, Connector And Screw
Courtesy of VOLVO CARS CORPORATION

Remove:

- the upper electronic module (UEM). See **UPPER ELECTRONIC MODULE (UEM)/REARVIEW MIRROR, REPLACING**
- the first connector
- 1 screw.

Detach the control module and lift it down.

Remove:

- the second connector
- the control module for the sun roof.

INSTALLING THE SUN ROOF CONTROL MODULE

NOTE: For tightening torques, see TIGHTENING TORQUE .

Install:

- the small connector
- the control module
- 1 M6 screw. Tighten
- the large connector
- the upper electronic module (UEM). See **UPPER ELECTRONIC MODULE (UEM)/REARVIEW MIRROR, REPLACING** .

Calibrate the control module for the sun roof. See **SUN ROOF MODULE (SRM), CALIBRATING** .

ELECTRIC MOTOR, SUN ROOF, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATIONS

Fig. 73: Identifying Ignition Key Off
Courtesy of VOLVO CARS CORPORATION

Close the sun roof.

Ignition off.

Remove the key from the ignition switch.

NOTE: After removing the key, wait one minute before starting work.

REMOVING THE ELECTRIC MOTOR FOR THE SUN ROOF

Remove:

- the roof module. See **UPPER ELECTRONIC MODULE (UEM)/REARVIEW MIRROR,**

REPLACING

- the panel / plastic molding around the headlining / sun roof unit.

Fig. 74: Connector At Sun Roof
Courtesy of VOLVO CARS CORPORATION

- the 2 screws for the motor.

Carefully lower the headlining. Position several spacers between the sun roof unit and the headlining to avoid long term kinks.

Remove:

- 1 screw
- the connector
- the motor.

HINT: Use a 1/4 ratchet handle with a Torx 25 socket for the last screw.

INSTALLING THE ELECTRIC MOTOR FOR THE SUN ROOF

NOTE: For tightening torques, see TIGHTENING TORQUE .

Connect the connector.

Screw the electric motor into place using the 3 M5 screws. Tighten.

Install:

- the roof module. See **UPPER ELECTRONIC MODULE (UEM)/REARVIEW MIRROR, REPLACING**
- the panel / plastic molding around the headlining / sun roof. Start by pressing one corner into place, continue along a long side and then the shorter sides and the corners. Finish with a long side.

Check that the sun roof is operating correctly. If this is not the case, see **SUN ROOF MODULE (SRM), CALIBRATING** .

GLASS SUN ROOF, REPLACEMENT

NOTE: **The illustrations in this service information are used for different model years and / or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATIONS

Remove the apron molding. See **APRON MOLDING SUN ROOF, REPLACEMENT**.

REMOVING THE SUN ROOF GLASS

Fig. 75: Identifying Glass Sun Roof And Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the screws, 2 on each side
- the glass sun roof.

INSTALL

INSTALLING THE GLASS SUN ROOF

CAUTION: Check that the mechanism has not moved during the replacement.

Install:

- the glass sun roof
- the screws, 2 on each side.

Adjust. See **SUN ROOF, ADJUSTING** .

GUTTER SUN ROOF, REPLACEMENT

NOTE: **The illustrations in this service information are used for different model years and / or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVING THE GUTTER

Fig. 76: Identifying Glass Cover And Screws
Courtesy of VOLVO CARS CORPORATION

The sun roof must be in the half open position.

Remove:

- the glass cover. See **GLASS SUN ROOF, REPLACEMENT**
- the 2 screws (mounting to the mechanism, screwed from outside).

Pull the gutter forwards slightly.

Remove:

- 4 screws with washers,
- the drainage channel.

INSTALLING THE GUTTER

Install:

- the gutter
- 4 screws with washers. Tighten.

Slide the gutter backwards so that the hole on xxx corresponds to the hole in the mechanism.

Install:

- the 2 screws, (screwed from the outside). Tighten
- the glass cover. See **GLASS SUN ROOF, REPLACEMENT**.

Check for leakage. See **SUN ROOF, LEAK TEST** .

MECHANISM / MECHANICAL CABLE SUN ROOF, REPLACEMENT

NOTE: The illustrations in this service information are used for different model years and / or models. Some variation may occur. However, the essential information in the illustrations is always correct.

CAUTION: When replacing the mechanism / mechanical cable, both sides must be replaced.

PREPARATION

PREPARATORY WORK

Remove:

- the sun roof. See **SUN ROOF, REPLACING**
- the motor. See **ELECTRIC MOTOR, SUN ROOF, REPLACING**
- the glass cover. See **GLASS SUN ROOF, REPLACEMENT**
- the drainage channel. See **GUTTER SUN ROOF, REPLACEMENT**.

REMOVING THE MECHANISM / MECHANICAL CABLE

Fig. 77: Angling Mechanism Up
Courtesy of VOLVO CARS CORPORATION

Angle the mechanism up.

Remove the screw.

Fig. 78: Identifying Carriage And Slides
Courtesy of VOLVO CARS CORPORATION

Pull the carriage as far back as possible.

Remove the carriage from the slides.

Fig. 79: Identifying Screw And Bracket
Courtesy of VOLVO CARS CORPORATION

Remove:

- the screw
- the bracket.

NOTE: **Note the position of the locating pin for the drive plate against the bracket.**

Fig. 80: Identifying Drive Plate
Courtesy of VOLVO CARS CORPORATION

NOTE: Note the position of the locating pin for the drive plate against the mechanism.

Pull the drive plate as far back as possible.

Fig. 81: Identifying Screws
Courtesy of VOLVO CARS CORPORATION

Remove the 2 screws.

Fig. 82: Identifying Carriage And Mounting / Mechanical Cable
Courtesy of VOLVO CARS CORPORATION

Pull the carriage out.

Angle up and pull out the mounting / mechanical cable.

Fig. 83: Identifying Mechanism
Courtesy of VOLVO CARS CORPORATION

Withdraw the mechanism.

INSTALL

INSTALLING THE MECHANISM / MECHANICAL CABLE

NOTE: For tightening torques, see TIGHTENING TORQUE .

Fig. 84: Identifying Bracket And Mechanism
Courtesy of VOLVO CARS CORPORATION

Remove the bracket from the mechanism (applies to service kit).

Fig. 85: Identifying Mechanism In Front Position
Courtesy of VOLVO CARS CORPORATION

Slide in the mechanism to the front position.

Fig. 86: Identifying Mounting / Mechanical Cable And Drive Plate
Courtesy of VOLVO CARS CORPORATION

Remove the mounting / mechanical cable from the new drive plate (applies to service kit).

Fig. 87: Identifying Mounting / Mechanical Cable And Drive Plate
Courtesy of VOLVO CARS CORPORATION

Slide the drive plate into the groove.

Slide in the mounting / mechanical cable.

Fig. 88: Identifying Mounting / Mechanical Cable, Drive Plate And Screws
Courtesy of VOLVO CARS CORPORATION

Install the mounting / mechanical cable on the drive plate using the 2 M4 screws. Tighten.

Fig. 89: Identifying Drive Plate And Mounting/Mechanical Cable
Courtesy of VOLVO CARS CORPORATION

Slide in the drive plate with the mounting / mechanical cable. Guide it in against the mechanism.

Fig. 90: Identifying Bracket And Mechanism
Courtesy of VOLVO CARS CORPORATION

Install the bracket for the mechanism.

NOTE: **Position the guide pin for the drive plate against the bracket. Use the 1 M4 screw. Tighten.**

Fig. 91: Angling In And Pressing Mounting For Gutter Into Place
Courtesy of VOLVO CARS CORPORATION

Angle in and press the mounting for the gutter into place.

Fig. 92: Identifying Mounting For Gutter And Link Rod For Mechanism
Courtesy of VOLVO CARS CORPORATION

Slide in the mounting for the gutter.

Install the link rod for the mechanism. Tighten the screw.

FINISHING

Install:

- the motor. See **ELECTRIC MOTOR, SUN ROOF, REPLACING**
- the drainage channel. See **GUTTER SUN ROOF, REPLACEMENT**
- the sun roof. See **SUN ROOF, REPLACING**
- the glass cover. See **GLASS SUN ROOF, REPLACEMENT**.

Adjust. See **SUN ROOF, ADJUSTING** .

Check for leakage. See **SUN ROOF, LEAK TEST** .

SUN ROOF, REPLACING

NOTE: The illustrations in this service information are used for different model years

and / or models. Some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATIONS

Fig. 93: Identifying Ignition In Off Position
Courtesy of VOLVO CARS CORPORATION

Ignition off.

Fig. 94: Identifying Ignition Key Off
Courtesy of VOLVO CARS CORPORATION

Remove the key from the ignition switch.

NOTE: **The key must be removed to ensure that the ignition is not switched on by mistake.**

NOTE: **After removing the key, wait one minute before starting work.**

REMOVING THE SUN ROOF

Fig. 95: Identifying Sun Roof Bolts & Nuts
Courtesy of VOLVO CARS CORPORATION

Remove:

- the headlining. See **HEADLINING, REPLACING**
- the connector for the sun roof unit
- the front and rear drain hoses.

Fig. 96: Identifying 8 Screws, And 8 Spacers, For The Gutter Frame
Courtesy of VOLVO CARS CORPORATION

- the 8 screws, and 8 spacers, for the gutter frame.

NOTE: Note the position of spacers and screws and the various thicknesses and lengths.

Lift the sun roof down and out.

INSTALLING SUN ROOF

NOTE: For tightening torques, see TIGHTENING TORQUE .

Fig. 97: Identifying 8 Screws, And 8 Spacers, For The Gutter Frame
Courtesy of VOLVO CARS CORPORATION

HINT: Install the screws, the spacers and the nylon washer for the gutter frame before installation.

Install:

- the 2 M6*35 screws (position 1)
- the 2 M6*25 screws (position 2)
- the 2 M6*20 screws (position 3)
- the 2 M6*16 screws (position 4)
- the 2 spacers, 20*6, 5*19.3 mm (positions 1 and 2)
- the 2 spacers, 20*6, 5*9.6 mm (positions 2 and 2)
- the 4 spacers, 20*6, 5*4.4 mm (positions 3 and 4).

Lift the sun roof. Place the sun roof in position.

Tighten.

Install:

- the drainage

- the connector.

Adjust. See **SUN ROOF, ADJUSTING** .

Install the headlining. See **HEADLINING, REPLACING** .

Check for leakage. See **SUN ROOF, LEAK TEST** .

SUN VISOR / INNER COVER SUN ROOF, REPLACEMENT

REMOVE

REMOVING THE SUN VISOR / INNER COVER

Remove:

- the glass cover. See **GLASS SUN ROOF, REPLACEMENT**
- the drainage channel. See **GUTTER SUN ROOF, REPLACEMENT**.

Pull inner cover forwards.

Compress the spring.

Angle the hatch out through the roof opening.

Replace the sunroof.

INSTALLING THE SUN VISOR / INNER COVER

Angle the inner cover in through the roof opening.

Compress the spring.

Slide in the inner cover.

Install:

- the drainage channel. See **GUTTER SUN ROOF, REPLACEMENT**
- the glass cover. See **GLASS SUN ROOF, REPLACEMENT**.

REMOVE

REMOVING THE SLIDE SPRING FOR THE SUN VISOR / INNER COVER

Fig. 98: Identifying Removal Of Inner Hatch And Screw/Spring
Courtesy of VOLVO CARS CORPORATION

Remove:

- the inner hatch. See **REMOVING THE SUN VISOR / INNER COVER**
- the screw / spring.

Replace the spring.

INSTALLING THE SPRING SLIDE SUN VISOR / INNER COVER

Install:

- the screw / spring
- the inner hatch. See **INSTALLING THE SUN VISOR / INNER COVER**.

SWITCH SUN ROOF, REPLACING

NOTE: **The illustrations in this service information are used for different model years and / or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATIONS

Ignition off.

REMOVING THE SWITCH FOR THE SUN ROOF

Fig. 99: Identifying Catches And Switch Removal
Courtesy of VOLVO CARS CORPORATION

Remove the interior lighting. See **INTERIOR LIGHTING, REPLACING** .

Press out the catches. Pull the switch outwards and upwards.

Remove the catch and the conductive strap.

INSTALL

INSTALLING THE SWITCH FOR THE SUN ROOF

Press in the conductive strap. Press in the catch.

Correctly position the rear of the switch and press the switch into place.

Install the interior lighting. See **INTERIOR LIGHTING, REPLACING** .

TAILGATE / TRUNK LID WITH HINGES AND SUPPORT (2003-2011)

TAILGATE, REPLACING

TAILGATE UPPER, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVING THE UPPER TAILGATE

Fig. 100: View Of Tailgate Hinges
Courtesy of VOLVO CARS CORPORATION

Remove:

- the stop lamp
- the panel. See **PANEL TAILGATE UPPER, REPLACING**
- the wiper motor. See **MOTOR WINDSHIELD WIPER, REPLACING**
- the lock mechanism. See **LOCK MECHANISM TAILGATE UPPER, REPLACING**
- the cable harness
- the window. See **TAILGATE WINDSHIELD, REPLACING**
- the gas struts (3).

Remove the cover at the screws (4).

Transfer:

- the rubber strip
- the mounting clips
- the stops.

INSTALLING THE UPPER TAILGATE

NOTE: For tightening torques, see TIGHTENING TORQUE .

Install:

- the tailgate. Adjust approximately by screwing the tailgate into the hinges in the same places as prior to removal
- the cable harness
- the lock mechanism. See **LOCK MECHANISM TAILGATE UPPER, REPLACING**.

Check that the tailgate can be opened and closed.

Install the window. See **TAILGATE WINDSHIELD, REPLACING** .

Adjust the tailgate.

Tighten the 4 M6 screws (4).

Install:

- the gas struts
- the wiper motor. See **MOTOR WINDSHIELD WIPER, REPLACING**
- the panel. See **PANEL TAILGATE UPPER, REPLACING**
- the stop lamp.

TAILGATE LOWER, REPLACING

REMOVING THE LOWER TAILGATE

Fig. 101: View Of Soft Cover As Protection On The Bumper
Courtesy of VOLVO CARS CORPORATION

Place a soft cover as protection on the bumper.

Fig. 102: View Of Soft Cover Over Lower Tailgate
Courtesy of VOLVO CARS CORPORATION

Remove:

- the panel. See **PANEL TAILGATE LOWER, REPLACING**
- the lock mechanism. See **LOCK MECHANISM TAILGATE LOWER, REPLACING**
- the control arms (1) from the tailgate
- the screws (2) in the front edge. Lower the tailgate.

INSTALLING THE LOWER TAILGATE

NOTE: For tightening torques, see TIGHTENING TORQUE .

Install:

- the tailgate. Adjust approximately by screwing the tailgate into the hinges in the same places as prior to removal
- the lock mechanism. See **LOCK MECHANISM TAILGATE LOWER, REPLACING**.

Adjust the tailgate.

Tighten the 4 M8 screws.

Install:

- the control arms
- the panel. See **PANEL TAILGATE LOWER, REPLACING** .

ACCESSORIES AND EQUIPMENT

Doors And Lids - Specifications, Electrical/Electronic

SIGNAL SPECIFICATION, DRIVER DOOR MODULE (DDM)/PASSENGER DOOR MODULE (PDM)

SIGNAL SPECIFICATION

DRIVER DOOR MODULE/PASSENGER DOOR MODULE CONNECTOR A

Fig. 1: Driver Door Module/Passenger Door Module Connector A
Courtesy of VOLVO CARS CORPORATION

Connector A, terminals #A1 #A30

The following values are measured between the relevant terminal in column 1 and terminal #A6 (ground) unless otherwise stated.

The values are measured with the control module in "Active mode".

NOTE: **Check the ground connections as above before starting to measure using the breakout box.**

U = DC in volts (V).

Ubat = battery voltage in volts (V).

Ulow=Voltage close to 0 V.

Terminal,	Terminal,	Signal type	Ignition off	Ignition on	Miscellaneous

breakout box	control module		Active/not active	Active/not active	
#1	#A1	-	-	-	-
#2	#A2	Control module communication cable (CANH)	2.5-3.5 V	2.5-3.5 V	-
#3	#A3	Control modules communication cable (CANL)	1.5-2.5 V	1.5-2.5 V	-
#4	#A4	-	-	-	-
#5	#A5	-	-	-	-
#6	#A6	Ground, door lock (31)	0 V	0 V	-
#7	#A7	Door open warning lamp (D lamp)	Ubat/0 V	Ubat/0 V	Not used on all cars
#8	#A8	Ground, door mirror potentiometer (31S)	0 V/0 V	0 V/0 V	Not used on all cars
#9	#A9	Door mirror potentiometer signal (right/left)	0 V/0 V	Between 1-4 V	Not used on all cars
#10	#A10	Door mirror potentiometer signal (up/down)	0 V/0 V	Between 1-4 V	Not used on all cars
#11	#A11	Door lock (DL)	0 V at locked position, 12 V at unlocked position	0 V at locked position, 12 V at unlocked position	-
#12	#A12	Unlocking (ULK)	0 V, during unlocking	0 V, during unlocking	Unlock by key
#13	#A13	Lock (LK)	0 V, during locking	0 V, during locking	Lock by key

DRIVER DOOR MODULE/PASSENGER DOOR MODULE CONNECTOR B

Fig. 2: Audio Control Module (AUM)/External Amplifier To Loudspeakers, Gray Connector
Courtesy of VOLVO CARS CORPORATION

Connector B, terminals #B1 - #B12

The following values are measured between the relevant connection in column 1 and ground (B9 or #B5) unless otherwise stated.

NOTE: Check the ground connections as above before starting to measure using the breakout box.

U = DC in volts (V).

Ubat = battery voltage in volts (V).

Ulow=Voltage close to 0 V.

Terminal, breakout box	Terminal, control module	Signal type	Ignition off Active/not active	Ignition on Active/not active	Miscellaneous
#15	#B1	Lock motor 2 (M3)	Ubat/0 V	Ubat/0 V	Active during dead locking
#16	#B2	Lock motor 1 (M1)	Ubat/0 V	Ubat/0 V	Active when locking
#17	#B3	Power window lift motor (M-)	0 V	Ubat/0 V	Active when lowering the window
#18	#B4	Power window lift motor (M+)	0 V	Ubat/0 V	Active when raising the window
#19	#B5	Ground, power (31P)	0 V	0 V	-
#20	#B6	Locking motor, common (M2)	Ubat/0 V	Ubat/0 V	Active when unlocking
#21	#B7	Power supply, signal (30S)	Ubat	Ubat	Not used for model years from and including 2003
#22	#B8	Lamp, door mirror	Ubat/0 V	Ubat/0 V	-
#23	#B9	Ground, signal (31S)	0 V	0 V	Not used for model years from and including 2003
#24	#B10	Door mirror heating (Mi-)	0 V	0 V	-
#25	#B11	Door mirror heating (Mi+)	Ubat/0 V	Ubat/0 V	Active when the button is pressed
#26	#B12	Power supply, power (30P)	Ubat	Ubat	-

ACCESSORIES AND EQUIPMENT

Doors And Lids - Specifications, Other

VEHICLE COMMUNICATION INFORMATION, DRIVER DOOR MODULE (DDM) (2005-12)

DESCRIPTION OF ACTIVATIONS

ACTIVATING COMPONENTS AND FUNCTIONS

Use this option to activate components/functions in the driver door module (DDM).

The following components/parameters can be activated in alternative ways:

- The up/down control for the front left window
- The up/down control for the front right window
- The up/down control for the rear windows
- The selection of the left or right door mirror control
- Upwards/downwards/left/right door mirror control
- Power window motor, up/down
- Lock cable M1
- Lock cable M2
- Door mirror motor
- Defroster
- Door mirror lamp
- Door open warning lamp (does not apply to all vehicle).

DESCRIPTION OF PARAMETERS

THE FOLLOWING PARAMETERS CAN BE READ OFF:

- The status of the front left window up-control
- The status of the front left window down-control
- The status of the front left window auto-control
- The status of the front right window up-control
- The status of the front right window down-control
- The status of the front right window auto-control
- The status of the rear left window up-control
- The status of the rear left window down-control
- The status of the rear right window up-control
- The status of the rear right window down-control

- The status of the child safety button

NOTE: A diagnostic trouble code (DTC) is stored if the child safety button is activated for 10 seconds.

- The status for the selection of the control for the left door mirror
- The status for the selection of the control for the right door mirror
- The status of the upward control for the door mirror
- The status of the downward control for the door mirror
- The status of the control for the left door mirror
- The status of the control for the right door mirror
- The status of the up-motor for the power window
- The status of the down-motor for the power window
- Lock cable M1, status
- Lock cable M2, status
- Lock cable M3, status
- Door open warning lamp, status (does not apply to all vehicles)
- Defroster, status
- Door mirror lamp, status
- Outside temperature, value

NOTE: The outside temperature can only be read off from the control module on the right-hand side of the car.

- Power supply, value
- Signal supply, value
- Door mirror position X axis, value (does not apply to all vehicles)
- Door mirror position Y axis, value (does not apply to all vehicles).

READING OFF EXTENDED DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION, DRIVER'S DOOR MODULE

- see **COUNTERS, DESCRIPTION**

DESCRIPTION OF FROZEN VALUES DRIVER'S DOOR MODULE

EXPLANATION

Not all the parameters described need to be implemented in the control module. This varies from system to system.

Frozen values are parameter values that are stored when a diagnostic trouble code (DTC) is stored.

BATTERY VOLTAGE, VALUE

Measurement range: 0-25.5 V.

Normal value when the generator (GEN) is charging: 13.0-14.5 V.

DISTANCE, VALUE

Measurement range: 0-1048575 km.

The value indicates the total mileage of the car at the time the diagnostic trouble code (DTC) was stored.

PASSENGER COMPARTMENT TEMPERATURE, VALUE

Measurement range: -60-195°C.

OUTSIDE TEMPERATURE, VALUE

Measurement range: -128-127.75°C.

ENGINE RUNNING, STATUS

The status displays whether the engine was running when the diagnostic trouble code (DTC) was stored.

No = the engine was not running

Yes = the engine was running

TIME, VALUE

The value displays the time that has passed since the diagnostic trouble code (DTC) was stored.

STATUS IDENTIFIER, DESCRIPTION

Status identifier
There are different status identifiers that can be read off for each diagnostic trouble code (DTC). The control module tests each terminal almost continuously. By reading off the diagnostic trouble code (DTC) and the associated status identifier (which detects the fault and stores the DTC), information about the test is obtained. Not all status identifiers need to be implemented in one control module. This varies from system to system. All status identifiers are reset and start counting again each time the control module is powered up and when erasing diagnostic trouble codes (DTCs). The possible status identifiers

are described below.

Status identifier	Explanation
Upper graph	When the signal value is above or below a maximum or minimum value that is considered to be a fault by the control module, an instantaneous fault is registered (i.e. a fault is active). The value may vary depending on the specific diagnostic trouble code (DTC). Examples of this are U > 11.5 V, U < 2 V or f < 10 Hz.
SI#01 (see the graph)	The test is active. The control module can only detect faults and store diagnostic trouble codes (DTC) when the test is running.
SI#02 (see the graph)	The test has been active. Indicates whether the control module was able to detect faults and store diagnostic trouble codes (DTC).
SI#03 (see the graph)	The control module detects an instantaneous fault. This information is used by the control module to determine if or when a diagnostic trouble code (DTC) should be stored. As soon as a signal exceeds the permitted value (compare with the upper graph), there is an instantaneous fault.
SI#04 (see the graph)	The control module has detected an instantaneous fault. An instantaneous fault has been detected at some stage.
SI#05	Lamp lighting / Text message. Information about whether the diagnostic trouble code (DTC) activates a warning lamp or text message in the combined instrument panel.
SI#06	The test is disabled because another fault has occurred. The diagnostic trouble code (DTC) is stored at the point of the base fault. If this leads to further faults, related diagnostic trouble codes (DTCs) are not stored.
SI#08 (see the graph)	Counter for instantaneous faults. When an instantaneous fault is detected by the control module, a counter counts up for as long as the fault exists. When the fault is no longer present, the counter counts down again. The diagnostic trouble code (DTC) is stored in the car if the counter reaches a certain maximum value. The maximum value varies between different diagnostic trouble codes (DTCs). The speed of the count depends on how long the fault can persist before it results in customer symptoms.
SI#09 (see the graph)	Maximum value of counter SI#08. There are a variety of ways that the counter value for instantaneous faults can be read off depending on how often the diagnostic has been run.
Lower graph	Validating diagnostic trouble codes (DTCs). The diagnostic trouble code (DTC) is stored when the counter for instantaneous faults has reached its maximum value.

Fig. 1: Status Identifier Graph

COUNTERS, DESCRIPTION

Counter
A useful fault-tracing tool is the Diagnostic Trouble Code (DTC) counter. The control module stores 6 different counters for each Diagnostic Trouble Code (DTC), which describes the occurrence. The counters can be used to determine when and how often a fault has been detected. Using the counters for the Diagnostic Trouble Code (DTC) it is possible to see if the fault has only been registered during the current operating cycle or whether it has been detected previously. If a fault is intermittent it is possible to determine how intermittent the fault is by studying the values of the different counters.

Example:

- Counter 1 = 15 Counts the number of operating cycles since the fault was last validated.
- Counter 3 = 69 Counts the number of operating cycles since the fault was first validated.
- Counter 4 = 1 Counts how many times the fault has occurred since the first time the fault was first validated.
- Counter 5 = 91764 The counter adds the time in seconds for which the control module has been operating since the fault was first validated and the diagnostic trouble code (DTC) was stored.
- Counter 6 = 0 The counter adds the time in seconds for which the test, the diagnostic, has run since the fault was first validated and the diagnostic trouble code (DTC) was stored.
- Counter 7 = 0 The counter adds the time in seconds for which the fault has been validated since the fault was first validated and the diagnostic trouble code (DTC) was stored.

In the examples given above, counter 1 gives the number of operating cycles where the diagnostic was run without a fault being detected. Counting takes place from when the fault was last detected. Counter 3 is the total number of operating cycles regardless of whether the diagnostic was run or not. Counter 4 shows the number of operating cycles where the diagnostic detected a fault . Counters 3 and 4 start to count from the first operating cycle after the operating cycle when the fault was first detected.
In the example, counter 4 = 1, which means that the fault was detected twice. One can see that no fault was detected during the relevant operating cycle. Depending on the number of operating cycles and the customer's driving pattern, it can assist in ruling out this control module from the customer's current problems. The counters can help us understand how intermittent the fault can be. If the counters 1 = 0, 3 = 0 and 4 = 0 it indicates that there have not been any operating cycles since the fault was detected and that the fault was probably generated in the workshop.
For an operating cycle to be recognized certain requirements may be necessary, for example, increasing the engine coolant temperature. In certain cases ignition on, ignition off and ignition on again are counted as an operating cycle.
Counter 5 can be useful if the fault was detected in this operating cycle. The time can be used to determine more exactly when the fault occurred.

NOTE:

Not all counters need be implemented in a control module, this varies from system to system. The possible counters are described below.

Counter	Function
A (see the graph) Counter 1	The graph illustrates the time at which a fault occurs. In the illustration the control module has detected a fault in the second cycle. This fault has then occurred a total of 5 times. The counter can be read off for each diagnostic trouble code (DTC) in the control module in which this is implemented. Operating cycles are marked with vertical lines. An operating cycle usually begins at ignition on and finishes when the ignition is switched off.
C#1 (see the graph)	Counts the number of operating cycles since the fault was *last*

Counter 2	validated. This information can be used to determine whether the fault is active during the current operating cycle or not. The fault is present now if the value is zero. This counter is also used for most systems to give "Permanent fault" and " Intermittent fault" text messages in VIDA when reading off a diagnostic trouble code (DTC).
C#3 (see the graph) Counter 3	Counts the number of operating cycles since the fault was *first* validated. When a fault has been validated, the counter will count up by 1 for each subsequent operating cycle. The same as counter C#1 but monitors the number of cycles since the first fault occurred.
C#4 (see the graph) Counter 4	Counts the number of operating cycles in which the fault was validated since it was first validated. Counts the number of times the fault has occurred since the first time.
C#5 Counter 5	The counter assesses the number of seconds the control module has been operating since the fault was first validated and the diagnostic trouble code (DTC) was stored. The time the control module has been operating is only counted when it is active, not in "sleep mode".
C#6 Counter 6	The counter assesses the number of seconds the test (the diagnosis) has been operating since the fault was first validated and the diagnostic trouble code (DTC) was stored.
C#7 Counter 7	The counter assesses the number of seconds the fault has been valid since it was first validated and the diagnostic trouble code (DTC) was stored.

Fig. 2: Diagnostic Trouble Code (DTC) Counter Graph

VEHICLE COMMUNICATION INFORMATION, PASSENGER DOOR MODULE (PDM) (2005-12)

DESCRIPTION OF ACTIVATIONS

ACTIVATING COMPONENTS AND FUNCTIONS

The following components/parameters can be activated in alternative ways:

- The up/down control for the front passenger window
- Power window motor, up/down
- Lock cable M1
- Lock cable M2
- Door mirror motor
- Defroster
- Door mirror lamp
- Door open warning lamp (does not apply to all vehicle).

DESCRIPTION OF PARAMETERS

THE FOLLOWING PARAMETERS CAN BE READ OFF:

- The status of the front passenger window up-control
- The status of the front passenger window down-control
- The status of the front passenger window auto-control
- The status of the up-motor for the power window
- The status of the down-motor for the power window
- Lock cable M1, status
- Lock cable M2, status
- Lock cable M3, status
- Door open warning lamp, status (does not apply to all vehicles)
- The status of the control for the door mirror
- Defroster, status
- Door mirror lamp, status
- Outside temperature, value

NOTE: The outside temperature can only be read off from the control module on the right-hand side of the car.

- Power supply, value
- Signal supply, value
- Door mirror position X axis, value (does not apply to all vehicles)
- Door mirror position Y axis, value (does not apply to all vehicles).

READING OFF EXTENDED DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION, PASSENGER DOOR MODULE

CONTENTS

Select type of description.

- see **DESCRIPTION OF FROZEN VALUES PASSENGER DOOR MODULE**
- see **STATUS IDENTIFIER, DESCRIPTION**
- see **COUNTERS, DESCRIPTION**

DESCRIPTION OF FROZEN VALUES PASSENGER DOOR MODULE

EXPLANATION

Not all the parameters described need to be implemented in the control module. This varies from system to system.

Frozen values are parameter values that are stored when a diagnostic trouble code (DTC) is stored.

BATTERY VOLTAGE, VALUE

Measurement range: 0-25.5 V.

Normal value when the generator (GEN) is charging: 13.0-14.5 V.

DISTANCE, VALUE

Measurement range: 0-1048575 km.

The value indicates the total mileage of the car at the time the diagnostic trouble code (DTC) was stored.

PASSENGER COMPARTMENT TEMPERATURE, VALUE

Measurement range: -60-195°C.

OUTSIDE TEMPERATURE, VALUE

Measurement range: -128-127.75°C.

ENGINE RUNNING, STATUS

The status displays whether the engine was running when the diagnostic trouble code (DTC) was stored.

No = the engine was not running

Yes = the engine was running

TIME, VALUE

The value displays the time that has passed since the diagnostic trouble code (DTC) was stored.

ACCESSORIES AND EQUIPMENT

CHECKING CONTROL OF THE POWER DOOR MIRROR (2005-12)

CHECKING CONTROL OF THE POWER DOOR MIRROR

CHECKING THE CONNECTORS

Fig. 1: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the power door mirror connector and connectors 54/10 and 54/11. Check for contact resistance and

oxidation
- Ignition on.

  Check that the power door mirror can be operated.

  Other information:

  - To access the connector for the power door mirror, see **REAR VIEW MIRROR, REPLACING**
  - see **CHECKING WIRING AND TERMINALS**

Do the door mirror controls operate?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE COMPONENTS AND WIRING**

CHECKING THE COMPONENTS AND WIRING

Check the cable between control module terminal #5B and ground: Left or right seat support. Check for an open-circuit.

If a fault is found replace the cable.

If no fault is found, replace the power door mirror.

Other information:

- see **SIGNAL SPECIFICATION**
- see **CONNECTING THE BREAKOUT BOX**
- To access and replace the power door mirror, see **REAR VIEW MIRROR, REPLACING**
- see **CHECKING WIRING AND TERMINALS**

- **Continue**

  Refer to **SYMPTOM VERIFICATION**

SYMPTOM VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CHECKING OPENING USING THE KEY (2003-04)

CHECKING OPENING USING THE KEY

This fault-tracing assumes that the lock cylinder is not mechanically defective.

Check door control module connector A and the lock unit connector. Check for contact resistance and oxidation.

Check the cable between door control module connector terminal #A6 and lock unit connector terminal #4. Check for an open-circuit.

Check the cable between door control module connector terminal #A12 and lock unit connector terminal #1. Check for an open-circuit.

Check the cable between door control module connector terminal #A13 and lock unit connector terminal #5. Check for an open-circuit.

Replace the lock unit if no fault is found.

Other information:

- For further information about signals and other values, see **SIGNAL SPECIFICATION**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access the driver/passenger door module (DDM/PDM) connector, see **DRIVER'S DOOR MODULE/PASSENGER DOOR MODULE (DDM/PDM), REPLACING**
- To access and replace the lock unit, see **LOCK MECHANISM FRONT SIDE DOOR, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 18: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

FAULT-TRACING INFORMATION

Condition

No DTCs stored.

Possible Source

- Open-circuit in the lock cables
- Oxidation in the connectors
- Defective lock unit.

Fault symptom[s]

- Cannot be operated with a key from the driver's door.

CHECKING OPENING USING THE KEY (2005-12)

CHECKING OPENING USING THE KEY

This fault-tracing assumes that the lock cylinder is not mechanically defective.

Check door control module connector A and the lock unit connector. Check for contact resistance and oxidation.

Check the cable between door control module connector terminal #A6 and lock unit connector terminal #4. Check for an open-circuit.

Check the cable between door control module connector terminal #A12 and lock unit connector terminal #1. Check for an open-circuit.

Check the cable between door control module connector terminal #A13 and lock unit connector terminal #5. Check for an open-circuit.

If no fault was found, replace the lock unit.

Other information:

- see **SIGNAL SPECIFICATION**
- see **CONNECTING THE BREAKOUT BOX**
- To access the driver/passenger door module (DDM/PDM) connector, see **PASSENGER DOOR MODULE (PDM), REPLACING**
- To access or replace the lock unit, see **LOCK MECHANISM FRONT SIDE DOOR, REPLACING**
- see **CHECKING WIRING AND TERMINALS**

- **Continue**

  Refer to **SYMPTOM VERIFICATION**

SYMPTOM VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 19: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 20: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.

  Try locking the central locking system using the key from the driver's door.

Does the unlocking function?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CHECKING POWER RETRACTABLE DOOR MIRRORS (2003-04)

CHECKING THE POWER RETRACTABLE DOOR MIRRORS

CHECKING UNSYNCHRONIZED DOOR MIRRORS

Fig. 21: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Unsynchronized door mirrors, where one door mirror retracts while the other opens when the button is activated, are remedied as follows.

- Ignition off
- Disconnect the fuse for the power door mirror and then reinstall the fuse
- Ignition on
- Press the button for deploying and retracting the power retractable door mirrors.

FAULT-TRACING INFORMATION

Condition

No DTCs stored.

Possible Source

- One of the two door modules was disconnected while the door mirrors were deployed or retracted.

Fault symptom[s]

- The electrically folding mirrors are not synchronized.

CHECKING THE "BLIND SPOT INFORMATION SYSTEM" (BLIS) (2007-12)

CHECKING THE "BLIND SPOT INFORMATION SYSTEM" (BLIS)

CHECKING TEXT MESSAGE IN DRIVER INFORMATION MODULE (DIM)

HINT: By holding in the trip odometer reset button for 10 seconds the text ID for the relevant text message is displayed in the Driver Information Module (DIM).

- Start the car.
- Depress the trip odometer reset button. Hold the button depressed until the relevant text ID is displayed in the Driver Information Module (DIM).
- Scroll between the messages in the Driver Information Module (DIM) by pressing the READ button.

1. Text-ID 160. Refer to **INFORMATION**.
2. Text-ID 148, 149, or 150. Refer to **CHECKING LENS**.
3. Text-ID 147 or no relevant message. Refer to **CHECKING THE FUNCTION**

INFORMATION

The text message means that the system for the moment has some difficulties in functioning satisfactorily. This depends completely on external factors and applies especially at dawn and dusk when the system does not know if it is to use day mode or night mode. This message does not indicate any malfunction and shall not generate any component replacement.

- Inform the customer of the system's limitations - see user manual for more information.

Fig. 22: Identifying Driver's Side (Rear-View) Door Mirror And Blind Spot Camera
Courtesy of VOLVO CARS CORPORATION

CHECKING LENS

- Remove the key from the ignition switch.
- Clean the camera lens according to instructions in the user manual.
- Check the heater in the lens by spraying on a thin layer of frost using freeze spray. Make sure that the mist disappears.
- If the heater works correctly, inform the customer that the system as a whole and about the system's technical limitations. See user manual for information.
- If the heater does not work, replace the rear-view mirror in question.

Other information:

- Replacing a component

Fig. 23: Identifying Driver's Side (Rear-View) Door Mirror And Blind Spot Camera
Courtesy of VOLVO CARS CORPORATION

Has any rear-view mirror been replaced?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  OKAY: Troubleshooting has been completed.

CHECKING THE FUNCTION

- Drive a short test-drive and check if text-id 147 is seen in the driver information module. Speed during the test-drive must mainly be above 10 km/h and the test-drive should include at least one stop where the start key is removed from the ignition.
- If the text message is not seen, the system is fully functional. Then the customer complaint is due to technical limitations in the system. Inform the customer of the system's limitations - see user manual for more information.

Fig. 24: Identifying Driver's Side (Rear-View) Door Mirror And Blind Spot Camera
Courtesy of VOLVO CARS CORPORATION

Is there a relevant text message?

- **YES**

  Refer to **CHECKING COMPONENTS AND SWITCHES**

- **NO**

  OKAY: Troubleshooting has been completed.

VERIFICATION

- Drive a test-drive. Speed during the test-drive must mainly be above 10 km/h and the test-drive should include at least one stop where the start key is removed from the ignition.
- Check that the message in Driver information module (DIM) has disappeared and that the function works satisfactorily.

Fig. 25: Identifying Driver's Side (Rear-View) Door Mirror And Blind Spot Camera
Courtesy of VOLVO CARS CORPORATION

Is there a relevant text message?

- **YES**

  Refer to **INFORMATION**

- **NO**

  OKAY: Troubleshooting has been completed.

CHECKING COMPONENTS AND SWITCHES

- Switch off the engine.
- Start the engine and check if the diodes on left and right side flash three times each.
- If any diode does not flash three times, check it.

  Check the diode by measuring the resistance across it or connect it to voltage and check that it lights up.

- If the diode does not work, replace it.
- If the diode works, check all relevant connectors.
- If no fault is detected, replace rear-view mirror.

Other information:

- see **REAR VIEW MIRROR EXTERNAL**

Fig. 26: Identifying Driver's Side (Rear-View) Door Mirror And Blind Spot Camera
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REAR VIEW MIRROR EXTERNAL

NOTE: Removal steps in this procedure may contain installation details.

Remove the door panel. See **REPLACING THE FRONT DOOR SIDE PANEL**.

Fig. 27: Identifying Rear View Mirror Trim Panel Removal

Install in the reverse order.

REMOVING THE PANEL FROM THE FRONT SIDE DOOR

Fig. 29: Removing Screws, Clips, And Cover From Door Panel
Courtesy of VOLVO CARS CORPORATION

Remove the cover from the mirror by pulling it straight outwards.

Detach the side piece handle at the bottom edge. Use a weatherstrip tool.

Remove:

- the two screws
- the eight clips.

Twist the panel outwards and upwards.

Disconnect the mechanical cable for the inner door opener.

Disconnect the connectors.

CHECKING THE CENTRAL LOCKING SWITCH (2003-04)

CHECKING THE CENTRAL LOCKING SWITCH

CHECKING FUSES

Fig. 30: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check that fuse 11C/35 (if driver door module (DDM) is on the left) or 11C/36 (if driver door module (DDM) is on the right) in the passenger compartment fusebox is intact.

Fig. 31: Fuse Holder (Passenger Compartment)
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

The driver/passenger door module (DDM/PDM) has registered an internal fault.

CAUTION: A new control module is delivered without software. The control module must be programmed when it has been replaced.

After replacing the control module the window position must be initialized.

Move the window to its upper limit position using manual control.

Initialize the window.

From model year 2003 inclusive, the window will lower approximately 10 centimeters and then close again during initialization.

Other information:

- For information about programming and replacing the driver/passenger door module (DDM/PDM), see **DRIVER'S DOOR MODULE/PASSENGER DOOR MODULE (DDM/PDM), REPLACING** .

Fig. 32: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Possible Source

- Defective control unit
- Defective fuse.

Fault symptom[s]

- Cannot be operated from central-locking switch unit.

CHECKING THE CENTRAL LOCKING SWITCH (2005-12)

CHECKING THE CENTRAL LOCKING SWITCH

CHECKING FUSES

Fig. 33: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check that the fuse in the passenger compartment fusebox is undamaged.

Fig. 34: Fuse Holder (Passenger Compartment)

Do the door mirror controls operate?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Check the cable between control module terminal #5B and ground: Left or right seat support. Check for an

open-circuit.

If a fault is found replace the cable.

If no fault is found replace the power door mirror.

Other information:

- For further information about signals and other values, see **SIGNAL SPECIFICATION**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX** .
- To access and replace the power door mirror, see **REAR VIEW MIRROR, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 40: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

FAULT-TRACING INFORMATION

Condition

No DTCs stored.

Possible Source

- Open-circuit or shorting to power supply in the cable.
- Faulty power door mirror.

Fault symptom[s]

- Outer door mirror adjustment not working

CHECKING THE ELECTRIC REAR-VIEW MIRROR HEATING (2003-04)

CHECKING THE ELECTRICAL HEATING IN THE POWER DOOR MIRRORS

CHECKING COMPONENTS AND WIRING

If the car is equipped with a 10-pin connector

Check the cable between door control module terminal #10B and power door mirror terminal #4. Check for an open-circuit. Check for a short-circuit to supply voltage.

If the car is equipped with a 16-pin connector

Check the cable between door control module terminal #10B and power door mirror terminal #6. Check for an open-circuit. Check for a short-circuit to supply voltage.

Remedy as necessary.

Try replacing the power door mirror if no fault was found.

Other information:

- When the button is not depressed, the voltage between terminal #10B on the control module connector and ground must be 0 V
- For further information about signals and other values, see **SIGNAL SPECIFICATION**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access and replace the power door mirror, see **REAR VIEW MIRROR, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 42: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 43: Connector, Green (16-Pin)
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Possible Source

- Open circuit or short circuit to voltage supply on wire
- Defective rear-view electric mirror.

Fault symptom[s]

- Mist on windows and/or external rear-view mirrors.

CHECKING THE ELECTRIC WINDOW LIFT (2003-04)

CHECKING THE POWER WINDOW MECHANISM

CHECKING THE LIMIT POSITION

Check that the window reaches its upper limit position.

Does the window reach its upper limit position?

- **YES**

  Refer to **CHECKING COMPONENTS AND WIRING**

- **NO**

  Refer to **CHECKING THE WINDOW CONTROLS**

CHECKING COMPONENTS AND WIRING

Fig. 44: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Check that fuse 11C/35 or 11C/36 in the passenger compartment integrated relay / fusebox is intact.

Check the cable between control module terminal #4B and the power window motor #3. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Check the cable between control module terminal #3B and the power window motor #6. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Check the cable between control module terminal #16A and the power window motor #4. Check for a short-circuit to ground. Check for an open-circuit. Check for a short-circuit to supply voltage.

Check the cable between control module terminal #19A and the power window motor #1. Check for a short-circuit to ground. Check for an open-circuit. Check for a short-circuit to supply voltage.

Check the cable between control module terminal #7B and the battery. Check for a short-circuit to ground. Check for an open-circuit.

Check the cable between control module terminal #5B and ground: Left or right front seat support. Check for a short-circuit to ground. Check for an open-circuit.

Replace the cable if a fault is found.

- Ignition on
- Try to operate the window lift mechanism to its limit positions (manually and automatically).

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access the driver/passenger door module (DDM/PDM), see **PASSENGER DOOR MODULE (PDM), REPLACING**
- To access and replace the power window mechanism, see **WINDOW LIFT MECHANISM FRONT SIDE DOOR, REPLACING**
- After checking all wiring (and replacing faulty wiring), pass a current across the motor and check that it operates
- see **CHECKING WIRING AND TERMINALS** .

Fig. 45: Identifying Connector
Courtesy of VOLVO CARS CORPORATION

Fig. 46: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE VOLTAGE**

CHECKING THE WINDOW CONTROLS

Press the VCT2000 symbol. Read off to check that the automatic window controls for up and down are

functioning on the front door controls.

HINT: Automatic window control is achieved by moving the control two stages.

Fig. 47: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Do the controls function?

- **YES**

  Refer to **REINITIATING THE WINDOW POSITIONS**

- **NO**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

CAUTION: A new driver/passenger door module (DDM/PDM) is supplied without software. The control module must be programmed when it has been replaced. For further information about programming and replacing the control module, see PASSENGER DOOR MODULE (PDM), REPLACING .

After replacing the control module the window position must be initialized.

Move the window to its upper limit position using manual control.

Initialize the window.

From model year 2003 inclusive, the window will lower approximately 10 centimeters and then close again during initialization.

Fig. 48: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

CHECKING THE VOLTAGE

Fig. 49: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Activate the power window lift motor and take a reading across the motor. Voltage should be 12 V.

  Other information:

  - To access and replace the power window mechanism, see **WINDOW LIFT MECHANISM FRONT SIDE DOOR, REPLACING** .

Is the voltage 12 V?

- **YES**

Refer to **REPLACING THE COMPONENT**

- **NO**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

Replace the window lift mechanism. See **WINDOW LIFT MECHANISM FRONT SIDE DOOR, REPLACING** .

- Ignition on
- Move the window to its upper limit position using manual control
- Initialize the window
- From model year 2003 inclusive, the window will lower approximately 10 centimeters and then close again during initialization
- Try to operate the window lift mechanism to its limit positions (manually and automatically).

Fig. 50: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

REINITIATING THE WINDOW POSITIONS

Move the window to its upper limit position using manual control.

Initialize the window.

From model year 2003 inclusive, the window will lower approximately 10 centimeters and then close again during initialization.

Fig. 51: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

FAULT-TRACING INFORMATION

Condition

No DTCs stored.

Possible Source

- Open-circuit, short-circuit to ground or short-circuit to supply voltage in the cable
- Defective power window lift motor.
- Defective power window lift control.

Fault symptom[s]

- Power window mechanism does not operate.
- Automatic window closure does not function.

CHECKING THE NEAR-SIDE LIGHTING (2003-04)

CHECKING THE LOCAL LIGHTING

CHECKING THE CONNECTORS

Fig. 52: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 53: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Check the connectors for the power door mirrors for contact resistance and oxidation according to **CONTACT RESISTANCE AND OXIDATION** .

  Check for damage carefully.

- Ignition on.

  Other information:

  - To access the connector for the power door mirror, see **OUTSIDE TEMPERATURE SENSOR DOOR MIRROR, REPLACING** .

Fig. 54: Identifying 10-Pin Power Door Mirror Connector Terminal
Courtesy of VOLVO CARS CORPORATION

Fig. 55: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the lamp in the power door mirror working?

- **YES**

OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

If the car is equipped with a 10-pin connector

Check the cable between door control module terminal #10B and power door mirror terminal #4 for an open-circuit according to **OPEN-CIRCUIT, PERMANENT FAULTS** , check for a short-circuit to supply voltage according to **SHORT-CIRCUIT TO SUPPLY VOLTAGE. PERMANENT FAULTS** .

Check the cable between door control module terminal #8B and power door mirror terminal #6 for an open-circuit according to **OPEN-CIRCUIT, PERMANENT FAULTS** .

If the car is equipped with a 16-pin connector

Check the cable between door control module terminal #10B and power door mirror terminal #6 for an open-circuit according to **OPEN-CIRCUIT, PERMANENT FAULTS** , check for a short-circuit to supply voltage according to **SHORT-CIRCUIT TO SUPPLY VOLTAGE. PERMANENT FAULTS** .

Check the cable between door control module terminal #8B and power door mirror terminal #13 for an open-circuit according to **OPEN-CIRCUIT, PERMANENT FAULTS** .

Remedy as necessary.

Other information:

- For further information about signals and other values, see **SIGNAL SPECIFICATION** .
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX** .
- To access the connector for the power door mirror, see **OUTSIDE TEMPERATURE SENSOR DOOR MIRROR, REPLACING** .
- To replace the bulb in the power door mirror, see **BULB, GROUND LIGHTING, DOOR MIRROR, REPLACING** .

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Possible Source

- Open circuit or short circuit to voltage supply on wire
- Defective lamp.

Fault symptom[s]

- Near-side lighting does not work.

CHECKING THE OUTSIDE TEMPERATURE SENSOR (2005-12)

CHECKING THE OUTSIDE TEMPERATURE SENSOR

CHECKING THE CONNECTORS

Fig. 59: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 60: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connector on the right power door mirror. Check for contact resistance and oxidation. Remedy if necessary.

  In particular, check for any damage

- Reinstall the components, reconnect the connectors etc.
- Ignition on.

  Check the outside temperature.

  Other information:

- To access the connector for the power door mirror, see **REAR VIEW MIRROR, REPLACING**
- see **CHECKING WIRING AND TERMINALS**

Fig. 61: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the temperature within its permitted range?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING FOR A SHORT-CIRCUIT**

CHECKING FOR A SHORT-CIRCUIT

Check the cable between right hand door control module #14A and power door mirror #2. Check for an open-circuit.

Check the cable between right hand door control module terminal #18A and power door mirror terminal #3. Check for a short-circuit to ground. Check for an open-circuit.

Replace the cable if a fault is found.

Replace the outside temperature sensor if no fault is found.

Other information:

- see **SIGNAL SPECIFICATION**
- see **CONNECTING THE BREAKOUT BOX**
- To access the connector for the power door mirror, see **REAR VIEW MIRROR, REPLACING**
- To replace the outside temperature sensor, see **OUTSIDE TEMPERATURE SENSOR DOOR MIRROR, REPLACING**
- see **CHECKING WIRING AND TERMINALS**

Fig. 62: Connector, Green (16-Pin)
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 63: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 64: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

Check the outside temperature.

Fig. 65: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the temperature within its permitted range?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  VERIFICATION FAILED: The fault should have been detected and remedied. As this is not the case fault-tracing has failed. Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CHECKING THE OUTSIDE TEMPERATURE SENSOR (2003-2004)

CHECKING THE OUTSIDE TEMPERATURE SENSOR

CHECKING THE CONNECTORS

Fig. 66: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 67: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Remedy the connector on the right power door mirror. Check for contact resistance and oxidation.

  In particular, check for any damage

- Reinstall the components, reconnect the connectors etc.
- Ignition on.

  Check the outside temperature.

  Other information:

- To access the connector for the power door mirror, see **REAR VIEW MIRROR, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 68: Identifying 10-Pin Power Door Mirror Connector Terminal
Courtesy of VOLVO CARS CORPORATION

Fig. 69: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the temperature within its permitted range?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING FOR A SHORT-CIRCUIT**

CHECKING FOR A SHORT-CIRCUIT

If the control module is equipped with a 10-pin connector

Check the cable between right hand door control module #14A and power door mirror #1. Check for an open-circuit.

Check the cable between right hand door control module terminal #18A and power door mirror terminal #3. Check for a short-circuit to ground. Check for an open-circuit.

If the control module is equipped with a 16-pin connector

Check the cable between right hand door control module #14A and power door mirror #2. Check for an open-circuit.

Check the cable between right hand door control module terminal #18A and power door mirror terminal #3. Check for a short-circuit to ground. Check for an open-circuit.

Replace the cable if a fault is found.

Replace the outside temperature sensor if no fault is found.

Other information:

- For further information about signals and other values, see **SIGNAL SPECIFICATION**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access the connector for the power door mirror, see **REAR VIEW MIRROR, REPLACING**

Courtesy of VOLVO CARS CORPORATION

Fig. 72: Connector, Green (16-Pin)
Courtesy of VOLVO CARS CORPORATION

FAULT-TRACING INFORMATION

Condition

No DTCs stored.

Possible Source

- Open-circuit or short-circuit to ground in the cable.

Fault symptom[s]

- Cabin temperature does not correspond to value set
- Poor heating in compartment
- Outside temperature gauge not functioning
- Mist on rear window and door mirrors

CHECKING THE POWER RETRACTABLE DOOR MIRRORS (2005-12)

CHECKING THE POWER RETRACTABLE DOOR MIRRORS

CHECKING UNSYNCHRONIZED DOOR MIRRORS

Fig. 73: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

If a door mirror folds inwards at the same time as the other folds outwards when the button for folding the mirrors is activated, the mirrors are unsynchronized.

Remedy unsynchronized door mirrors according to the following instructions.

- Ignition off
- Disconnect the fuse for the power door mirror and then reinstall the fuse
- Ignition on
- Press the button for deploying and retracting the power retractable door mirrors.

- **Continue**

Refer to **SYMPTOM VERIFICATION**

SYMPTOM VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 74: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 75: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

Test both the door mirrors to their limit positions using the controls. The mirrors should move in the corresponding direction.

After repairing power folding door mirrors:

Check whether the power door mirrors are synchronized by pressing the button for retraction and deployment of the mirrors.

Are the controls working?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CHECKING THE POWER WINDOW MECHANISM (2005-12)

CHECKING THE POWER WINDOW MECHANISM

CHECKING THE LIMIT POSITION

Check that the window reaches its upper limit position.

Does the window reach its upper limit position?

- **YES**

  Refer to **CHECKING THE COMPONENTS AND WIRING**

- **NO**

  Refer to **CHECKING THE WINDOW CONTROLS**

CHECKING THE COMPONENTS AND WIRING

Fig. 76: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Check that the fuses are intact.

Check the cable between control module terminal #4B and the power window motor #3. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Check the cable between control module terminal #3B and the power window motor #6. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Check the cable between control module terminal #16A and the power window motor #4. Check for a short-circuit to ground. Check for an open-circuit. Check for a short-circuit to supply voltage.

Check the cable between control module terminal #19A and the power window motor #1. Check for a short-circuit to ground. Check for an open-circuit. Check for a short-circuit to supply voltage.

Check the cable between control module terminal #7B and the battery. Check for a short-circuit to ground. Check for an open-circuit.

Check the cable between control module terminal #5B and ground. Check for a short-circuit to ground. Check for an open-circuit.

Replace the cable if a fault is found.

- Ignition on
- Try to operate the window lift mechanism to its limit positions (manually and automatically).

Other information:

- see **SIGNAL SPECIFICATION**
- see **CONNECTING THE BREAKOUT BOX**
- see **PASSENGER DOOR MODULE (PDM), REPLACING**
- see **WINDOW LIFT MECHANISM FRONT SIDE DOOR, REPLACING**
- see **CHECKING WIRING AND TERMINALS**

Fig. 77: Identifying Connector
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE VOLTAGE**

CHECKING THE VOLTAGE

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ACCESSORIES AND BODY, CAB

Doors And Lids - Symptom Verification

INFORMATION AND VERIFICATION, DOORS (2003-2011)

INFORMATION AND VERIFICATION, DOORS

Symptom and function description

The power windows are operated using the switches in the doors.

The control panel in the driver's door manages the functions for the electric power windows in all doors, child locks in the rear doors and the central locking.

The control panel in the passenger door manages the functions in the passenger doors and the central locking.

The control panels in the rear doors manage the power windows in the respective rear door.

Power windows work in ignition positions I and II. After driving and after the ignition key has been removed, the windows can still be opened or closed, as long as none of the front doors is open.

Manual operation

Press the control down slightly or pull it up slightly. The power windows go up or down for as long as the control is affected.

Automatic control

Press the control down fully or pull it up fully, and then release. The side windows then open or close automatically.

NOTE: The automatic up function on the passenger side is only available on certain markets.

Using the control panel for the central locking at the door opening handle, all doors and the boot lid can be locked or unlocked at the same time.

Child lock can be activated in ignition positions I and II by pressing the button in the control panel.

When the LED in the button illuminates, the rear power windows are locked.

When the child locks are activated, the power windows can only be operated from the control panel in the driver's door.

Verification

Access to the vehicle is necessary for the following checks.

- Ignition on.

Check the function of the relevant control panel buttons.

Check that the control responds as expected.

INFORMATION AND VERIFICATION, LOCKING/UNLOCKING (2003)

SYMPTOM AND FUNCTION DESCRIPTION

For locking and unlocking to be possible, the following conditions must be met:

- The battery in the remote key control must have sufficient voltage. If the battery starts to deteriorate, the transmission strength is reduced.
- The remote control must be within the normal distance from the vehicle's remote receiver.
- The key belonging to the vehicle must not be in the ignition when locking.

NOTE: **Communication between the remote control and the remote receiver can, in exceptional cases, be interrupted due to increased surrounding radiation, e. g. from TV and radio transmitters, mobile telephones or electrical metering devices that are remotely read.**

HINT: For more information, see Design and Function.

Verification

Check the central locking system by standing outside of the vehicle. Try to lock and unlock the vehicle with the remote control, all doors should lock and unlock.

Also check that the boot lid locks and unlocks.

Check using all the vehicle's remote controls.

Pre-check:

- That the text REMOTE CONTROL REPLACE BATTERY was not visible on the Driver information module (DIM) display.

If the function fails, when one of the remote keys is used, the fault probably lies with the individual remote key.

INFORMATION AND VERIFICATION, LOCKING/UNLOCKING (2004-2011)

SYMPTOM AND FUNCTION DESCRIPTION

For locking and unlocking to be possible, the following conditions must be met:

- The battery in the remote key control must have sufficient voltage. If the battery starts to deteriorate, the transmission strength is reduced.
- The remote control must be within the normal distance from the vehicle's remote receiver.
- The key belonging to the vehicle must not be in the ignition when locking.

Remote control functions

1. Unlock.
2. Open tailgate.
3. Panic function.
4. Home safe lighting.
5. Lock.
6. Folding/opening key.

NOTE: **Communication between the remote control and the remote receiver can, in exceptional cases, be interrupted due to increased surrounding radiation, e. g. from TV and radio transmitters, mobile telephones or electrical metering devices that are remotely read.**

Verification

Check the central locking system by standing outside of the vehicle. Try to lock and unlock the vehicle with the remote control, all doors should lock and unlock.

Also check that the boot lid locks and unlocks.

Check using all the vehicle's remote controls.

Pre-check:

- That the text REMOTE CONTROL REPLACE BATTERY was not visible on the Driver information module (DIM) display.

If the function fails, when one of the remote keys is used, the fault probably lies with the individual remote key.

SIGNAL SPECIFICATION, REAR ELECTRONIC MODULE (REM)

REAR ELECTRONIC MODULE (REM) CONNECTORS A-E

Fig. 1: Identifying Rear Electronic Module (REM) And Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Connector A, terminals #A1-#A20

The following values are measured between the relevant terminal and terminal #E1 (power ground) unless otherwise stated.

The values are measured with the control module in "Active mode".

NOTE: **It is important to connect the breakout box and check the ground terminals before taking readings.**

U = DC in volts (V).

Ubat = battery voltage in volts (V).

Ulow = Voltage close to 0 V.

NC = Not connected

NC* = grounded via capacitor (C=22nF)

Terminal, breakout box	Terminal, control module	Signal type	Ignition off Active / not active	Ignition on Active / not active	Other
#A01	#A1	Spare input (30)	U~Ubat	U~Ubat	At no input
#A02	#A2	Fuel level sensor, left-hand side (+). Switched signal, 5/35 ms.	U~Ulow	U=0.54-3.96 V	Full: 0.54 V Empty: 3.96 V For Bi-fuel cars this applies to the LPG gas tank The terminal is not used if the tank is PZEVEVAP or EVAP 2.
#A03	#A3	Reserve output (switch to ground)	U~Ulow	U~Ulow	
#A04	#A4	Stop lamp, relay driver from the central electronic module (CEM)	U~Ulow / Ubat	U~Ulow / Ubat	
#A05	#A5	-	-	-	
#A06	#A6	Reserve, analog input signal	NC*	NC*	
#A07	#A7	Signal ground (-)	U~Ulow	U~Ulow	
#A08	#A8	Fuel level sensor, right-hand side (+). Switched signal, 5/35 ms.	U~Ulow	U=0.54-3.96 V	Full: 0.54 V Empty: 3.96 V
#A09	#A9	Spare input (30)	U~Ubat	U~Ubat	At no input
#A10	#A10	Fuel level sensor common ground	U~Ulow	U~Ulow	
#A11	#A11	Reserve, analog input signal	NC*	NC*	
#A12	#A12	Signal ground (-)	U~Ulow	U~Ulow

#B28	#E8	Reserve	U~Ulow	U~Ulow	NC

RESISTANCE VALUES, FUEL LEVEL SENSOR

Fig. 2: Fuel Level Sensor Terminals
Courtesy of VOLVO CARS CORPORATION

Readings for the left fuel level sensor are taken between terminals #5 and #6.

Readings for the right fuel level sensor are taken between terminals #7 and #6.

The following table lists the fuel level sensor resistance and the corresponding fuel volume.

Resistance (ohm)	Fuel volume (liters)
12	40
38	35
66	30
96	25
130	20
171	15
223	10
297	5
383	1

SIGNAL SPECIFICATION, ABS CONTROL MODULE

All values given are between the relevant terminal in column 1 and terminal #A8 or #A24 (ground), unless otherwise indicated in brackets.

NOTE: **It is important that the breakout box is connected and that the ground terminals have been checked before readings are taken.**

U=	DC voltage in volts (V)	Ubat =	battery voltage (V)
I =	current in amperes (A)	Ulow =	voltage approximately 0 V

Breakout box terminal	Control module terminal	Signal type	Ignition on	Other
#A1	#1	Front left wheel sensor signal	Tooth against sensor: Iapprox.14 mA Uapprox.9 V Cover against sensor: Iapprox.7 mA Uapprox.10 V (at normal system voltage)	The wheel sensors generate a current for the control module. When the pulse wheel rotates, the sensor generates a pulsed current (quadratic wave) where the strength of the current depends on the position of the pulse wheel. The frequency increases with speed.
#A2	#2	Front left wheel sensor power supply	U = Ubat	-
#A3	#3	-	-	-
#A4	#4	15l-supply (power supply	U = Ubat	-

		from ignition switch)		
#A5	#5	Rear left wheel sensor signal	Tooth against sensor: Iapprox.14 mA Uapprox.9 V Cover against sensor: Iapprox.7 mA Uapprox.10 V (at normal system voltage)	The wheel sensors generate a current for the control module. When the pulse wheel rotates, the sensor generates a pulsed current (quadratic wave) where the strength of the current depends on the position of the pulse wheel. The frequency increases with speed.
#A6	#6	Rear left wheel sensor power supply	U = Ubat	-
#A7	#7	-	-	-
#A8	#8	Power and signal ground (measured to battery negative terminal)	Uapprox.Ulow	-
#A9	#9	30-supply inlet and outlet valves (power supply from the battery to the intake and exhaust valves)	Uapprox.Ubat	Power supply to the in and outlet valves and signal to the control module.
#A10	#10	Control modules communication cable (CAN L)	U=2-3V	-
#A11	#11	Control modules communication cable (CAN H)	U=2-3V	-
#A12	#12	-	-	-
#A13	#13	-	-	-
#A14	#14	Stop lamp switch signal (applies only to AWD TRACS)	Open: Uapprox.Ulow Closed: Uapprox.Ubat.	The stop lamp switch closes when braking.
#A15	#15	-	-	-
#A16	#16	-	-	-
#A17	#17	-	-	-
#A18	#18	Stop lamp switch signal	Open: Uapprox.Ulow Closed: Uapprox.Ubat	The stop lamp switch closes when braking.
#A19	#19	Front right wheel sensor signal	Tooth against sensor: Iapprox.14 mA Uapprox.9 V Cover against sensor: Iapprox.7 mA Uapprox.10 V (at normal system voltage)	The wheel sensors generate a current for the control module. When the pulse wheel rotates, the sensor generates a pulsed current (quadratic wave) where the strength of the

				current depends on the position of the pulse wheel. The frequency increases with speed.
#A20	#20	Power supply, rear right wheel sensor	U = Ubat	-
#A21	#21	-	-	-
#A22	#22	Power supply, rear right wheel sensor	U = Ubat	The wheel sensor receives 12 V from the control module.
#A23	#23	Rear right wheel sensor signal	Tooth against sensor: Iapprox.14 mA Uapprox.9 V Cover against sensor: Iapprox.7 mA Uapprox.10 V (at normal system voltage)	The wheel sensors generate a current for the control module. When the pulse wheel rotates, the sensor generates a pulsed current (quadratic wave) where the strength of the current depends on the position of the pulse wheel. The frequency increases with speed.
#A24	#24	Power and signal ground (measured to battery negative terminal)	Uapprox.Ulow	-
#A25	#25	30-supply pump motor (power supply from the battery)	Uapprox.Ubat	-

SIGNAL SPECIFICATION, AUDIO CONTROL MODULE

CONNECTING THE BREAKOUT BOX AND CHECKING THE GROUND TERMINAL

CAUTION: Before starting to measure, the breakout box must be connected and the ground connections must be checked. See CHECKING VOLTAGE / GROUND CONNECTION, MEDIA/INFOTAINMENT .

DEFINITIONS

DC voltage in volts (V)	U_{low} = Voltage near 0 V
	U_{bat} = Battery voltage

THE AUDIO CONTROL MODULE, GREEN CONNECTOR

Fig. 3: Identifying Terminals Of Audio Control Module Gray Connector
Courtesy of VOLVO CARS CORPORATION

NOTE: The connectors on the adapter cable must have the correct color-coding for the signal table to match.

Before taking any readings, see **CHECKING VOLTAGE / GROUND CONNECTION, MEDIA/INFOTAINMENT** .

Control module terminal	Breakout box terminal	Signal type	Ignition on	Miscellaneous
A1	#15	30 supply	U_{bat}	-

SIGNAL TABLE

Terminal	Signal type	Ignition on	Miscellaneous
#E1	Power supply	12 V	To left display screen terminal #2.
#E2	Wake-up signal	approximately 11-11.5 V	To left screen terminal #3. Upon start-up of the system and when there are communication faults with the screen, the voltages switches between 0 V and 11-11.5 V, 3 times.
#E3	CAN signal (+)	U= 2.5-2.8 V	Internal CAN network

			between control module and display screens. Left display screen terminal #4.
#E4	CAN signal (-)	U= 2.5-2.8 V	Internal CAN network between control module and display screens. Left display screen terminal #5.
#E5	IR control signal for system (in)	U=approx. 4 V when no IR signal received	From left screen terminal #12. Lowers upon signal receipt.
#E6	Ground terminal	$U=U_{low}$	For audio signal to left display screen #11.
#E7	Audio signal (out)	Analog signal	To left display screen terminal #9. Left audio channel.
#E8	Audio signal (out)	Analog signal	To left display screen terminal #10. Right audio channel.
#E9	-	-	-
#E10	Video signal (out)	Analog signal	To left display screen terminal #8. Video (+).
#E11	Video signal (out)	Analog signal	To left display screen terminal #7. Video (-).
#E12	Ground terminal	$U=U_{low}$	To left display screen terminal #1.
#E13	Power supply	12 V	To right display screen terminal #2.
#E14	Wake-up signal	approximately 11-11.5 V	To right screen terminal #3. Upon start-up of the system and when there are communication faults with the screen, the voltages switches between 0 V and 11-11.5 V, 3 times.
#E15	CAN signal (+)	U= 2.5-2.8 V	Internal CAN network between control module and display screens. Right display screen terminal #4.
#E16	CAN signal (-)	U= 2.5-2.8 V	Internal CAN network between control module and display screens. Right display screen terminal #5.
#E17	IR control signal for system (in)	U=approx. 4 V when no IR signal received	From right screen terminal #12. Lowers upon signal receipt.
#E18	Ground terminal	$U=U_{low}$	For audio signal to right display screen terminal #11.
			To right display screen

#E19	Audio signal (out)	Analog signal	terminal #10. Left audio channel.
#E20	Audio signal (out)	Analog signal	To right display screen terminal #9. Right audio channel.
#E21	-	-	-
#E22	Video signal (out)	Analog signal	To right display screen terminal #8. Video (+).
#E23	Video signal (out)	Analog signal	To right display screen terminal #7. Video (-).
#E24	Ground terminal	$U=U_{low}$	To right display screen terminal #1.

SIGNAL SPECIFICATION, RTI

CONNECTING THE BREAKOUT BOX AND CHECKING THE GROUND TERMINAL

NOTE: **Before taking readings, the breakout box must be connected and the ground terminal must be checked. See CONNECTING THE BREAKOUT BOX TO THE ROAD TRAFFIC INFORMATION (RTI) CONTROL MODULE .**

DEFINITIONS

DC voltage in volts (V)	Ulow = Voltage near V
	Ubat = Battery voltage

RTI CONTROL MODULE

Fig. 18: Identifying Connector (F) Terminals
Courtesy of VOLVO CARS CORPORATION

Before taking any readings, see **CONNECTING THE BREAKOUT BOX AND CHECKING THE GROUND TERMINAL**.

The RTI control module terminals A1-A22 correspond to terminals #1-#22 on the breakout box.

Control module terminal	Breakout box terminal	Signal type	Ignition on	Other
A1	#1	30-supply (power supply from battery)	Ubat	-
A2	#2	-	-	-
A3	#3	-	-	-
A4	#4	-	-	-
A5	#5	-	-	-
A6	#6	-	-	-
A7	#7	Signal (+) with map information from the CD-ROM changer	Digital signal	V_H =0.68 +/- 0.2 V, V_L =0.5 +/- 0.1 V
A8	#8	-	-	-
A9	#9	-	-	-
A10	#10	CANH signal	U = 2-3 V	-
A11	#11	Ground (Measured to battery negative terminal)	Ulow	-
A12	#12	-	-	-
A13	#13	-	-	-
A14	#14	-	-	-
A15	#15	-	-	-
A16	#16	-	-	-
A17	#17	-	-	-
A18	#18	-	-	-
A19	#19	Signal (-) with map information from the CD-ROM changer	Digital signal	V_H =0.68 +/- 0.2 V, V_L =0.5 +/- 0.1 V
A20	#20	Screen ground, signal cables to CD-ROM changer	Ulow	-
A21	#21	-	-	-
A22	#22	CANL signal	U = 2-3 V	-

RTI CONTROL MODULE (TO TV RECEIVER)

Fig. 19: Identifying M2D Control Module (FORTV Executive. Rear Seat Entertainment, Generation 3.1/3.2, Premier TV Receiver) Connector
Courtesy of VOLVO CARS CORPORATION

Before taking any readings, see **CONNECTING THE BREAKOUT BOX AND CHECKING THE GROUND TERMINAL**.

The RTI control module terminals B1-B14 correspond to terminals #43-#56 on the breakout box.

Control module terminal	Breakout box terminal	Signal type	Ignition on	Other
B1	#43	Video signal, TV	Analog signal	1 V p-p +/- 0.2 V
B2	#44	Synchronizing signal, TV	Digital signal	0-5 V
B3	#45	-	-	-
B4	#46	-	-	-
B5	#47	-	-	-
B6	#48	30 supply	Ubat	-
B7	#49	Signal ground, TV signals	Ulow	-
B8	#50	Screen ground, TV signals	Ulow	-
B9	#51	-	-	-
B10	#52	-	-	-
B11	#53	Signal, remote control TV	Digital signal	33.3 kHz carrier wave when the remote control is pressed
B12	#54	-	-	-
B13	#55	Ground (Measured to battery negative terminal)	Ulow	-
B14	#56	-	-	-

RTI CONTROL MODULE (TO DISPLAY)

Fig. 20: Connector, Green (16- Pin)
Courtesy of VOLVO CARS CORPORATION

Before taking any readings, see **CONNECTING THE BREAKOUT BOX AND CHECKING THE GROUND TERMINAL**.

The RTI control module terminals C1-C16 correspond to terminals #25-#40 on the breakout box.

Control module terminal	Breakout box terminal	Signal type	Ignition on	Other
C1	#25	Color signal (red), screen	Analog signal when red color is displayed	0.714 V p-p
C2	#26	Color signal (blue), screen	Analog signal when blue color is displayed	0.714 V p-p
C3	#27	Screen ground, video signals	Ulow	-
C4	#28	-	-	-
C5	#29	-	-	-
C6	#30	-	-	-
C7	#31	-	-	-
C8	#32	Color signal (green), display	Analog signal when green color is displayed	0.714 V p-p
C9	#33	Composite synch, display	Analog signal	0-5 V
C10	#34	Screen ground, cable to the screen	Ulow	-
C11	#35	Signal, display remote control	Digital signal	38 kHz carrier wave when the remote control is

				pressed
C12	#36	Serial bus to the display	Digital signal	Half duplex, start-stop synchronizing, 2400 BPS
C13	#37	-	-	-
C14	#38	Video signal to display	Analog signal	1 V p-p +/- 0.2 V
C15	#39	-	-	-
C16	#40	-	-	-

RTI CONTROL MODULE (TO CD-ROM CHANGER)

Fig. 21: Audio Control Module (Cable Between Audio Module & Amplifier)
Courtesy of VOLVO CARS CORPORATION

Before taking any readings, see **CONNECTING THE BREAKOUT BOX AND CHECKING THE GROUND TERMINAL**.

The RTI control module terminals D1-D6 correspond to terminals #42-#47 on the breakout box.

Control module terminal	Breakout box terminal	Signal type	Ignition on	Other
D1	#42	Clock signal from CD-ROM changer	Digital signal	Melbus protocol
D2	#43	Data signal from the CD ROM changer	Digital signal	Melbus protocol
D3	#44	-	-	-
D4	#45	Busy signal from CD-ROM changer	Digital signal	Melbus protocol
D5	#46	15 supply	Ubat	-

D6	#47	-	-	-
H		Screen ground, cable to the CD-ROM changer	Ulow	-

RTI CONTROL MODULE (TO AUDIO UNIT)

Fig. 22: Audio Control Module (Cable Between Audio Module & CD Changer/Navigation Unit)
Courtesy of VOLVO CARS CORPORATION

Before taking any readings, see **CONNECTING THE BREAKOUT BOX AND CHECKING THE GROUND TERMINAL**.

The RTI control module terminals E1-E8 correspond to terminal #16-#23 on the breakout box.

Control module terminal	Breakout box terminal	Signal type	Ignition on	Other
E1	#16	Clock signal to audio unit	Digital signal	Melbus protocol
E2	#17	Signal ground, sound	Ulow	-
E3	#18	15 supply	Ubat	-
E4	#19	Data signal to audio unit	Digital signal	Melbus protocol
E5	#20	Busy signal to audio unit	Digital signal	Melbus protocol
E6	#21	Left audio channel	Alternating current on sound to loudspeakers	150 mV rms +/- 38 mV (1 kHz 30% mod)
E7	#22	Right audio channel	Alternating current on sound to loudspeakers	150 mV rms +/- 38 mV (1 kHz 30% mod)
E8	#23	Voice guide channel	Alternating current on sound to loudspeakers (for voice guidance)	150 mV rms +/- 38 mV (1 kHz 30% mod)

H	Screen ground, cable to audio unit	Ulow	-	

RTI CONTROL MODULE (TO TV RECEIVER)

Fig. 23: Identifying RTI Control Module (To TV Receiver) Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Before taking any readings, see **CONNECTING THE BREAKOUT BOX AND CHECKING THE GROUND TERMINAL**.

The RTI control module terminals F1-F13 correspond to terminals #1-#13 on the breakout box.

Control module terminal	Breakout box terminal	Signal type	Ignition on	Other
F1	#1	Signal ground	Ulow	-
F2	#2	Left audio channel	Alternating current when there is sound to the loudspeaker	150 mV rms +/- 38 mV (1 kHz 30% mod)
F3	#3	-	-	-
F4	#4	Right audio channel	Alternating current when there is sound to the loudspeaker	150 mV rms +/- 38 mV (1 kHz 30% mod)
F5	#5	-	-	-
F6	#6	Voice guide channel	Alternating current when there is sound to the loudspeaker (during voice guidance)	150 mV rms +/- 38 mV (1 kHz 30% mod)
F7	#7	-	-	-

F8	#8	-	-	-
F9	#9	-	-	-
F10	#10	15 supply	Ubat	-
F11	#11	Busy signal to TV receiver	Digital signal	Melbus protocol
F12	#12	Clock signal to TV receiver	Digital signal	Melbus protocol
F13	#13	Data signal to TV receiver	Digital signal	Melbus protocol
H	Screen ground, cable to TV receiver	Ulow	-	

RTI CONTROL MODULE (TO GPS ANTENNA, GRAY CONNECTOR)

Fig. 24: Connector F, Carphone Antenna (Brown Connector), Single Hirose GT5
Courtesy of VOLVO CARS CORPORATION

Before taking any readings, see **CONNECTING THE BREAKOUT BOX AND CHECKING THE GROUND TERMINAL**.

Control module terminal	Signal type	Ignition on	Other
G1 (A)	Power supply and GPS signal	Analog signal	Supply 5 V (DC), signal 1.575 GHz
G2 (B)	Screen ground	Ulow	-

RTI CONTROL MODULE (TO TMC (FM-MPX) ANTENNA, BROWN CONNECTOR)

Fig. 25: Connector F, Carphone Antenna (Brown Connector), Single Hirose GT5
Courtesy of VOLVO CARS CORPORATION

Before taking any readings, see **CONNECTING THE BREAKOUT BOX AND CHECKING THE GROUND TERMINAL**.

Control module terminal	Signal type	Ignition on	Other
H1 (A)	Antenna signal	Analog signal	-
H2 (B)	Screen ground	Ulow	-

RTI CONTROL MODULE (TO FM-MPX ANTENNA, GREEN CONNECTOR)

Fig. 26: Connector F, Carphone Antenna (Brown Connector), Single Hirose GT5
Courtesy of VOLVO CARS CORPORATION

Before taking any readings, see **CONNECTING THE BREAKOUT BOX AND CHECKING THE**

GROUND TERMINAL.

Control module terminal	Signal type	Ignition on	Other
I1 (A)	Antenna signal	Analog signal	-
I2 (A)	Screen ground	Ulow	-

DISPLAY (TO RTI CONTROL MODULE AND "CHASSIS")

Fig. 27: Identifying Connector (F) Terminals
Courtesy of VOLVO CARS CORPORATION

Before taking any readings, see **CONNECTING THE BREAKOUT BOX AND CHECKING THE GROUND TERMINAL**.

Display terminals J1-J22 correspond to terminals #1-#22 on the breakout box.

Control module terminal	Breakout box terminal	Signal type	Ignition on	Other
J1	#1	Color signal (red), screen	Analog signal when red color is displayed	0.714 V p-p
J2	#2	Color signal (green), display	Analog signal when green color is displayed	0.714 V p-p
J3	#3	Color signal (blue), screen	Analog signal when blue color is displayed	0.714 V p-p
J4	#4	Synchronizing signal, TV	Digital signal	0-5 V
J5	#5	Screen ground, video signals	Ubat	-
J6	#6	Signal, display remote	Digital signal	38 kHz carrier wave

		control		when the remote control is pressed
J7	#7	-	-	-
J8	#8	Screen ground, cable to the screen	Ulow	-
J9	#9	Video signal to display	Analog signal	1 V p-p +/- 0.2 V
J10	#10	-	-	-
J11	#11	30-supply (power supply from battery)	Ubat	-
J12	#12	30-supply (power supply from battery)	Ubat	-
J13	#13	15 supply	Ubat	-
J14	#14	-	-	-
J15	#15	Ground (Measured to battery negative terminal)	Ulow	-
J16	#16	Ground (Measured to battery negative terminal)	Ulow	-
J17	#17	-	-	-
J18	#18	Serial bus from the control module	Digital signal	Half duplex, start-stop synchronizing, 2400 BPS
J19	#19	-	-	-
J20	#20	-	-	-
J21	#21	-	-	-
J22	#22	-	-	-

CD-ROM CHANGER (TO RTI CONTROL MODULE AND "CHASSIS")

Fig. 28: 10 CD Changer Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Before taking any readings, see **CONNECTING THE BREAKOUT BOX AND CHECKING THE GROUND TERMINAL**.

CD-ROM changer terminals K1-K5 correspond to #26-#30 on the breakout box.

Control module terminal	Breakout box terminal	Signal type	Ignition on	Other
K1	#26	Ground (Measured to battery negative terminal)	Ulow	-
K2	#27	30-supply (power supply from battery)	Ubat	-
K3	#28	Signal (+) with map information from the CD-ROM changer	Digital signal	V_H =0.68 +/- 0.2 V, V_L =0.5 +/- 0.1 V
K4	#29	Screen ground, signal cables to CD-ROM changer	Ulow	-
K5	#30	Signal (-) with map information from the CD-ROM changer	Digital signal	V_H =0.68 +/- 0.2 V, V_L =0.5 +/- 0.1 V

CD-ROM CHANGER (TO RTI CONTROL MODULE)

Fig. 29: Audio Control Module (Cable Between Audio Module & Amplifier)
Courtesy of VOLVO CARS CORPORATION

Before taking any readings, see **CONNECTING THE BREAKOUT BOX AND CHECKING THE GROUND TERMINAL**.

CD-ROM changer terminals L1-L6 correspond to #26-#31 on the breakout box.

Control module terminal	Breakout box terminal	Signal type	Ignition on	Other
L1	#26	Clock signal from the CD-ROM changer	Digital signal	Melbus protocol
L2	#27	Data signal from CD-ROM changer	Digital signal	Melbus protocol
L3	#28	-	-	-
L4	#29	Busy signal from the CD-ROM changer	Digital signal	Melbus protocol
L5	#30	15 supply	Ubat	-
L6	#31	-	-	-
H	Screen ground, cable to CD-ROM changer	Ulow	-	

TV RECEIVER (TO RTI CONTROL MODULE)

Fig. 30: Connector, Green (16- Pin)
Courtesy of VOLVO CARS CORPORATION

Before taking any readings, see **CONNECTING THE BREAKOUT BOX AND CHECKING THE GROUND TERMINAL**.

TV receiver terminals M1-M16 correspond to terminals #25-#40 on the breakout box.

Control module	Breakout box terminal	Signal type	Ignition on	Other

terminal				
M1	#25	Video signal, TV	Analog signal	1 V p-p +/- 0.2 V
M2	#26	Synchronizing signal, TV	Digital signal	0-5 V
M3	#27	-	-	-
M4	#28	-	-	-
M5	#29	-	-	-
M6	#30	-	-	-
M7	#31	30 supply	Ubat	-
M8	#32	Signal ground, TV signals	Ulow	-
M9	#33	Screen ground, TV signals	Ulow	-
M10	#34	-	-	-
M11	#35	-	-	-
M12	#36	-	-	-
M13	#37	Signal, remote control TV	Digital signal	33.3 kHz carrier wave when the remote control is pressed
M14	#38	-	-	-
M15	#39	Ground (Measured to battery negative terminal)	Ulow	-
M16	#40	-	-	-

TV RECEIVER (TO REVERSE CAMERA AND VIDEO)

Fig. 31: Identifying Connector (D) Terminals
Courtesy of VOLVO CARS CORPORATION

Before taking any readings, see **CONNECTING THE BREAKOUT BOX AND CHECKING THE GROUND TERMINAL**.

TV receiver terminals N1-N10 correspond to #47-#56 on the breakout box.

Control module terminal	Breakout box terminal	Signal type	Ignition on	Other
N1	#47	-	-	-
N2	#48	Power supply, rear camera	Ubat	-
N3	#49	Video signal, rear camera	-	-
N4	#50	Video signal ground, rear camera	Ulow	-
N5	#51	Video signal	-	-
N6	#52	Signal ground, video signals	Ulow	-
N7	#53	Left audio channel	Alternating current when there is sound to the loudspeaker	150 mV rms +/- 38 mV (1 kHz 30% mod)
N8	#54	Right audio channel	Alternating current when there is sound to the loudspeaker	150 mV rms +/- 38 mV (1 kHz 30% mod)
N9	#55	signal ground, audio	Ulow	-
N10	#56	-	-	-

TV RECEIVER (TO RTI CONTROL MODULE)

Fig. 32: Audio Control Module (Cable Between Audio Module & CD Changer/Navigation Unit)
Courtesy of VOLVO CARS CORPORATION

Before taking any readings, see **CONNECTING THE BREAKOUT BOX AND CHECKING THE GROUND TERMINAL**.

TV receiver terminals O1-O8 correspond to terminals #16-#23 on the breakout box.

Control module terminal	Breakout box terminal	Signal type	Ignition on	Other
O1	#16	Clock signal to TV receiver	Digital signal	Melbus protocol
O2	#17	Signal ground, sound	Ulow	-
O3	#18	15 supply	Ubat	-
O4	#19	Data signal to TV receiver	Digital signal	Melbus protocol
O5	#20	Busy signal to TV receiver	Digital signal	Melbus protocol
O6	#21	Left audio channel	Alternating current when there is sound to the loudspeaker	150 mV rms +/- 38 mV (1 kHz 30% mod)
O7	#22	Right audio channel	Alternating current when there is sound to the loudspeaker	150 mV rms +/- 38 mV (1 kHz 30% mod)
O8	#23	Voice guide channel	Alternating current when there is sound to the loudspeaker (during voice guidance)	-
H	Screen ground, cable to audio unit	Ulow	-	

TV RECEIVER (TO CD PLAYER)

Fig. 33: Identifying RTI Control Module (To TV Receiver) Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Before taking any readings, see **CONNECTING THE BREAKOUT BOX AND CHECKING THE GROUND TERMINAL**.

TV receiver terminals P1-P13 correspond to terminals #1-#13 on the breakout box.

Control module terminal	Breakout box terminal	Signal type	Ignition on	Other
P1	#1	signal ground	Ulow	-
P2	#2	Left audio channel	Alternating current when there is sound to the loudspeaker	150 mV rms +/- 38 mV (1 kHz 30% mod)
P3	#3	-	-	-
P4	#4	Right audio channel	Alternating current when there is sound to the loudspeaker	150 mV rms +/- 38 mV (1 kHz 30% mod)
P5	#5	-	-	-
P6	#6	Voice guide channel	Alternating current when there is sound to the loudspeaker (during voice guidance)	-
P7	#7	-	-	-
P8	#8	-	-	-
P9	#9	-	-	-
P10	#10	15 supply	Ubat	-
P11	#11	Busy signal to TV receiver	Digital signal	Melbus protocol
P12	#12	Clock signal to TV receiver	Digital signal	Melbus protocol
P13	#13	Data signal to TV receiver	Digital signal	Melbus protocol
H	Screen ground, cable to TV receiver	Ulow	-	

TV RECEIVER (TO TV TUNER A)

Fig. 34: Connector, Black (2-Pin)
Courtesy of VOLVO CARS CORPORATION

Before taking any readings, see **CONNECTING THE BREAKOUT BOX AND CHECKING THE GROUND TERMINAL**.

Control module terminal	Signal type	Ignition on	Other
Q1	Power supply and signal	Analog signal	The antenna signal is retained over DC EU: 48.5 -87.75 MHz 175.25 -229.75 MHz 471.25 -855.25 MHz JPN: 91.25 -103.75 MHz 175.25 -217.25 MHz 471.25 - 765.25 MHz
Q2	Power supply and signal	Analog signal	The antenna signal is retained over DC EU: 48.5 -87.75 MHz 175.25 -229.75 MHz 471.25 -855.25 MHz JPN: 91.25 -103.75 MHz 175.25 -217.25 MHz 471.25 - 765.25 MHz
H	Screen ground	Ulow	-

TV RECEIVER (TO TV TUNER B)

Fig. 35: Connector, Black (2-Pin)
Courtesy of VOLVO CARS CORPORATION

Before taking any readings, see **CONNECTING THE BREAKOUT BOX AND CHECKING THE GROUND TERMINAL**.

Control module terminal	Signal type	Ignition on	Other
R1	Power supply and signal	Analog signal	The antenna signal is retained over DC EU: 48.5 -87.75 MHz 175.25 -229.75 MHz 471.25 -855.25 MHz JPN: 91.25 -103.75 MHz 175.25 -217.25 MHz 471.25 - 765.25 MHz
R2	Power supply and signal	Analog signal	The antenna signal is retained over DC EU: 48.5 -87.75 MHz 175.25 -229.75 MHz 471.25 -855.25 MHz JPN: 91.25 -103.75 MHz 175.25 -217.25 MHz 471.25 - 765.25 MHz

COMMUNICATION DEVICES

Electrical system

COMMUNICATION DEVICES

BATTERY, PHONE MODULE (PHM), REPLACING

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATORY WORK

Fig. 1: Identifying Ignition Off Position
Courtesy of VOLVO CARS CORPORATION

Ignition off.

REMOVAL

Remove the Phone module (PHM). See: **PHONE MODULE (PHM), REPLACING (2006-2010)** .

Fig. 2: Identifying Phone Module, Bracket, And Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the screws, 4 pieces.
- the bracket.

Fig. 3: Identifying Screws For Phone Module Battery
Courtesy of VOLVO CARS CORPORATION

Remove:

- the cover
- the connector, 1 piece.
- the 2 screws
- the metal bracket
- the battery.

INSTALLATION

Install

- the battery
- the metal bracket
- the 2 screws
- the connector, 1 piece.
- the cover.

Fig. 4: Identifying Phone Module, Bracket, And Screws
Courtesy of VOLVO CARS CORPORATION

Install:

- the bracket
- the screws, 4 pieces.
- the Phone module (PHM). See: **PHONE MODULE (PHM), REPLACING (2006-2010)** .

FINISHING

Resetting counter

NOTE: The counter must be reset when a new reserve battery has been installed.

CHECKING THE GROUND TERMINAL, PHONE MODULE (PHM)

CONNECTING THE BREAKOUT BOX

Connect the breakout box according to **CONNECTING THE BREAKOUT BOX TO THE CARPHONE MODULE**.

Fig. 5: Breakout Box
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING THE GROUND TERMINAL**

CHECKING THE GROUND TERMINAL

Fig. 6: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 7: Disconnecting Control Unit
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Main unit disconnected.
- Switch off all equipment that takes power from the battery (courtesy lighting, radio etc).

Connect an ohmmeter between terminal #18 on the breakout box and the battery negative terminal.

Fig. 8: Breakout Box
Courtesy of VOLVO CARS CORPORATION

Fig. 9: Identifying Ohm Meter
Courtesy of VOLVO CARS CORPORATION

The ohmmeter should read approximately 0 ohms.

- **OK**

  OKAY: Troubleshooting has been completed.

- **NOT OK**

  Refer to **CHECKING FOR OPEN-CIRCUITS, CONTACT RESISTANCE AND OXIDATION**

CHECKING FOR OPEN-CIRCUITS, CONTACT RESISTANCE AND OXIDATION

Check ground terminal 31/84 and the wiring connected to it. Check for an open-circuit according to **OPEN-**

CIRCUIT, PERMANENT FAULTS . Check for contact resistance and oxidation according to **CONTACT RESISTANCE AND OXIDATION** .

Fig. 10: Identifying Ohm Meter
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

Fig. 11: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 12: Disconnecting Control Unit
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Module disconnected.
- Switch off all equipment that takes power from the battery (courtesy lighting, radio etc).

  Connect an ohmmeter between terminal #18 on the breakout box and the battery negative terminal.

Fig. 13: Identifying Ohm Meter
Courtesy of VOLVO CARS CORPORATION

The ohmmeter should read 0 ohms.

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should be diagnosed and remedied. Since this is not the case the fault-tracing process has failed.

Complete the fault-tracing for those fault or try again.

CONNECTING THE BREAKOUT BOX TO THE PHONE MODULE (PHM)

Special tools:

see **9511463**

see **9511509**

see **9511428**

CONNECTING THE BREAKOUT BOX

- Ignition off.
- Expose the carphone module according to **MEDIA, COMMUNICATION AND NAVIGATION - REMOVAL, REPLACEMENT & INSTALLATION** .

Check that the male and female terminals on the unit connectors are undamaged and secure (cannot be pressed in). Check that the cables to the female terminals are secured to the terminal pins.

Connect adapter see **9511463** (terminal A, B, C) or see **9511509** (terminal E) to the unit connectors (to the wiring) and connect the breakout box see **9511428** to the adapter.

Keypad / carphone module terminals:

Terminals #A1-#A22 correspond to terminals #1-#22 on the breakout box.

Terminals #B1-#B16 correspond to terminals #25-#40 on the breakout box.

Carphone box terminals:

Terminals #C1-#C16 correspond to terminals #25-#40 on the breakout box.

Carphone handset terminals:

Terminals #E1-#E8 correspond to terminals #32-#39 on the breakout box.

The breakout box is designed to facilitate reading off the control module input and output signals when the control module is connected; and the cable and component resistance when the control module is disconnected. The use of a breakout box reduces the risk of accidental short-circuited cables and damage to the connector pins.

For information about signals and other values, see **SIGNAL SPECIFICATION, KEYPAD UNIT / CARPHONE MODULE (PHM)** .

DOOR LOCKS & ANTI-THEFT SYSTEMS

Electrical system

DOOR LOCKS & ANTI-THEFT SYSTEMS

ADD/REMOVE KEY

ORDERING SOFTWARE / KEYS

NOTE: **To add a key, a key and software must be ordered.**

Only software needs to be ordered to erase a key.

Order a key and/or software according to 9438428 .

NOTE: **Keys can only be programmed or erased when the key and/or software have been delivered.**

The function must be checked if a new key has been added.

Use VIDA (Volvo Scan tool) to check that no diagnostic trouble codes have been stored during the work.

DOOR LOCKS & ANTI-THEFT SYSTEMS

Electrical system

DOOR LOCKS & ANTI-THEFT SYSTEMS

REPLACING THE SWITCH FOR THE LOCK UNIT / CARGO COMPARTMENT LIGHTING

REMOVAL

LOCK UNIT

The switch for the cargo compartment lighting is positioned in the lock unit.

Fig. 1: Identifying Screws & Switch For Lock Unit/Cargo Compartment Lighting
Courtesy of VOLVO CARS CORPORATION

- Remove the upholstery on the tailgate. This is to gain access to the entire lock unit mechanism
- Unhook the lever from the lock cylinder mechanism
- Remove the screws (3 x) from the lock unit. Remove the lock unit
- Disconnect the connector.

INSTALLATION

LOCK UNIT

Install:

1. the connector,
2. the three screws for the lock unit. Tighten the screws to **10 Nm** ,
3. the lever for the lock mechanism,
4. the upholstery.

ENTERTAINMENT SYSTEMS

Electrical system

ENTERTAINMENT SYSTEMS

CONNECTING THE BREAKOUT BOX TO THE AUDIO CONTROL MODULE

Special tools:

see **9511507**

see **9511428**

see **9511509**

CONNECTING THE BREAKOUT BOX

- Ignition off
- Expose the head unit / audio module. See **MEDIA, COMMUNICATION AND NAVIGATION - REMOVAL, REPLACEMENT & INSTALLATION** .

Check that the male and female terminals on the unit connectors are undamaged and secure (cannot be pressed in). Check that the cables to the female terminals are secured to the terminal pins.

NOTE: In order for the below connections to be made take note of the color codes of the connectors.

Connect adapter see **9511507** to the audio control module (wiring side). Connect breakout box see **9511428** to the adapter.

Audio control module terminals:

#A1-#A12 correspond to terminals #15-#26 on the breakout box (green connector).

#B1-#B12 correspond to terminals #1-#12 on the breakout box (gray connector).

Terminals #E1-#E8 correspond to terminals #16-#23 on the breakout box.

When connecting connector D, adapter see **9511509** must be used.

Terminals #D1-#D6 correspond to terminals #42-#47 on the breakout box.

The breakout box is designed to facilitate reading off the control module input and output signals when the control module is connected; and the cable and component resistance when the control module is disconnected. The use of a breakout box reduces the risk of accidental short-circuited cables and damage to the connector

pins.

For further information about signals and other values, see **SIGNAL SPECIFICATION, AUDIO CONTROL MODULE** .

CHECKING VOLTAGE / GROUND CONNECTION, MEDIA/INFOTAINMENT

CHECKING THE VOLTAGE FEED / GROUND CONNECTION

Voltage feed phone module (PHM)

Phone module (PHM) is supplied with voltage via a voltage input on the control module.

Voltage input #A5 (#5) has +30-feed via a fuse from the battery. In case of open circuit, it will not be possible to activate the telephone.

Checking voltage feed

Check the voltage feed cable from the battery to the phone module (PHM) #A5 (#5) for open circuit, loose connection, contact resistance and oxidation. Also check the fuse. The voltage shall be approx. battery voltage.

Ground connection phone module (PHM)

Phone module (PHM) has a ground input. The ground input from the control module is power ground and is connected to a grounding point in the body.

Checking ground connection

Check the ground cable between the phone module (PHM) #A6 (#6) and ground connection for open circuit, loose connection, contact resistance and oxidation. When ignition is on, the voltage-drop between the control module's ground connection and body ground connection may not exceed 0.5 V.

Remedy as necessary.

Other information:

- see **CONTENTS** .
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX** .
- For information on signals, see **SIGNAL SPECIFICATION** .

Fig. 1: Identifying Voltage Display

ENTERTAINMENT SYSTEMS

Electrical system

ENTERTAINMENT SYSTEMS

CONTROL MODULE, REAR AUDIO SEPARATION, REPLACING

REMOVAL

Move the seat to its front-most position.

Fig. 1: Identifying Control Module Location
Courtesy of VOLVO CARS CORPORATION

Remove the following items:

- the control module, pull from the Velcro strip
- the connector

INSTALLATION

Install the following items:

- the connector
- the control module, by pressing the control module so that it is secure

DESCRIPTION OF ACTIVATIONS AND READOUTS, FM

FREQUENCY BAND AM/FM

Click on the button **AM/FM** to change frequency band between AM and FM.

Readout value indicates frequency band in question or if the control module is off.

AM = frequency band AM.

FM = frequency band FM.

Off = control module off.

FREQUENCY

Clicking on the button>>| starts an automatic search for radio stations in the frequency band.

Radio stations with a signal strength of approx. 110 or higher are found automatically.

Readout value indicates frequency in question in MHz.

MAIN ANTENNA

By clicking on the button **Start readout 1** , the main antenna is activated. When the antenna has been activated, a readout is performed of the activation as well as the values for signal strength and noise level.

Readout value indicates if the main antenna is activated or deactivated.

On = main antenna activated.

Off = main antenna deactivated.

SUB-ANTENNA

By clicking on the button **Start readout 2** , the sub-antenna is activated. When the antenna has been activated, a readout is performed of the activation as well as the values for signal strength and noise level.

Readout value indicates if the sub-antenna is activated or deactivated.

On = sub-antenna activated.

Off = sub-antenna deactivated.

SIGNAL STRENGTH

The readout value applies to the active antenna.

Signal strength is presented as a number between 0 and 255. 0 means that no signal has been registered, and 255 means that highest possible signal strength has been reached.

NOISE LEVEL

The readout value applies to the active antenna.

Noise level is presented as a number between 0 and 15. 0 means that no noise has been registered, and 15 means

that highest possible noise level has been registered.

DESCRIPTION OF READOUTS, FM

FREQUENCY BAND AM/FM

Click on the button **AM/FM** to change frequency band between AM and FM.

Readout value indicates frequency band in question or if the control module is off.

AM = frequency band AM.

FM = frequency band FM.

Off = control module off.

FREQUENCY

Clicking on the button>>| starts an automatic search for radio stations in the frequency band.

Radio stations with a signal strength of approx. 110 or higher are found automatically.

Readout value indicates frequency in question in MHz.

MAIN ANTENNA

Readout value indicates if the main antenna is activated or deactivated.

On = main antenna activated.

Off = main antenna deactivated.

SUB-ANTENNA

Readout value indicates if the sub-antenna is activated or deactivated.

On = sub-antenna activated.

Off = sub-antenna deactivated.

SIGNAL STRENGTH

The readout value applies to the active antenna.

Signal strength is presented as a number between 0 and 255. 0 means that no signal has been registered, and 255 means that highest possible signal strength has been registered.

NOISE LEVEL

The readout value applies to the active antenna.

Noise level is presented as a number between 0 and 15. 0 means that no noise has been registered, and 15 means that highest possible noise level has been registered.

DESCRIPTION OF READOUTS, AM

FREQUENCY BAND AM/FM

Click on the button **AM/FM** to change frequency band between AM and FM.

Readout value indicates frequency band in question or if the control module is off.

AM = frequency band AM.

FM = frequency band FM.

Off = control module off.

FREQUENCY

Clicking on the button>>| starts an automatic search for radio stations in the frequency band.

Radio stations with a signal strength of approx. 75 or higher are found automatically.

Readout value indicates frequency in question in kHz.

SIGNAL STRENGTH

Signal strength is presented as a number between 0 and 255. 0 means that no signal has been registered, and 255 means that highest possible signal strength has been registered.

FAULT-TRACING

Electrical system

FAULT-TRACING

DESCRIPTION OF FROZEN VALUES, BLUETOOTH PHONE MODULE (BPM)

EXPLANATION

Not all the parameters described need to be implemented in the control module. This varies from system to system.

Frozen values are parameter values that are stored when a diagnostic trouble code (DTC) is stored.

BATTERY VOLTAGE, VALUE

Measurement range: 5-24 V.

Normal value when the alternator is charging: 13.0-14.5 V.

DISTANCE, VALUE

Measurement range: 0-1000000 km.

The value indicates the total mileage of the car at the time the diagnostic trouble code (DTC) was stored.

PASSENGER COMPARTMENT TEMPERATURE, VALUE

Measurement range: -40 to +80 °C.

OUTSIDE TEMPERATURE, VALUE

Measurement range: -40 to +80 °C.

ENGINE RUNNING, STATUS

The status displays whether the engine was running when the diagnostic trouble code (DTC) was stored.

No = the engine was not running

Yes = the engine was running

DESCRIPTION OF PARAMETERS

HINT: Certain parameters have different values depending whether the car was manufactured before or after week 39, 2001. Using VIDA (Volvo scan tool), perform "Reading off data for vehicle configuration " to, see the week of manufacture of the car.

FAILED START ATTEMPTS, VALUE

Reading of the number of failed attempts to start the heater.

If the counter reaches 3 the heater cannot start. A diagnostic trouble code (DTC) is stored in the central electronic module if the counter reaches 1 but the heater can still be started. To set the counter to zero erase the diagnostic trouble codes (DTCs).

OVERHEATING INCIDENTS, VALUE

Reading of the number of failed attempts to start the heater. If this parameter counts to 3 the heater cannot be started. To set the counter to zero erase the diagnostic trouble codes (DTCs).

SUCCESSFUL START ATTEMPTS, VALUE

Reading of the number of successful attempts to start the heater. If the heater can be started 10 times in succession the overheat counter is set to zero. The counter is also set to zero when the diagnostic trouble codes (DTCs) are erased.

COOLANT TEMPERATURE, VALUE

The coolant temperature in the heater.

For cars manufactured up to week 38, 2001 inclusive:

The heater cycles between 76 -89 °C (status 5).

For cars manufactured from week 39, 2001 inclusive:

The heater cycles between 76 -93 °C (status 5).

BATTERY VOLTAGE, VALUE

The normal value when the alternator is charging is 13.0- 14.0 V. Voltage shall be at least 10.5 V to start the heater.

Measurement range 0 and up.

HEATER RUN TIME, VALUE

Reading off the number of hours the heater has been running.

Measurement range: 0-65, 535 hours.

The heater is designed to run for approximately 4, 500 hours.

ADDITIONAL HEATER STATUS, VALUE

Heater operating status:

0: The heater has not started.

1: The heater starts. Heater self test. The glow plug is activated and then the heater fan.

2: The heater starts and the fuel pump is active. The control module awaits combustion for a certain period of time.

3: The heater runs. Normal heater operation.

4: The heater stops. The flame goes out.

5: The heater waits. Waiting for the engine coolant temperature to be low enough for the heater to start again.

6: The heater has stopped. The heater only has this status if a fault has occurred.

7: The flame is extinguished.

8: Residual heat. If, when the outside temperature is low, the driver is in the car and turns on the heater, the water pump starts in order to heat the passenger compartment.

9: Fuel pump activated. Used in production.

10: Activating the fuel pump. Used to avoid problems with the fuel pump sticking.

ACTUAL COMBUSTION FAN SPEED, VALUE

Measurement range 0 - 8000 RPM.

For cars manufactured up to week 38, 2001 inclusive:

Normal RPM approx. 4000-4500 RPM as well as at high RPM, approx. 8000 RPM.

For cars manufactured from week 39, 2001 inclusive:

Normal RPM approx.5000 RPM as well as at high RPM, approx. 8000 RPM.

DERIVED COMBUSTION FAN SPEED, VALUE

Measurement range 0 - 8000 RPM.

Displays the theoretical speed that the fan should have.

DEGREE OF MODULATION OF COMBUSTION FAN, VALUE

Measurement range 0 - 100 %.

Reading of the degree of pulse width modulation that the combustion fan is controlled by.

FUEL PUMP FREQUENCY, VALUE

Measurement range 0-10 Hz.

Reading off the pump frequency of the fuel pump.

For cars manufactured up to week 38, 2001 inclusive: In status no. 2 the pump operates at 4.9 Hz for diesel and 5.5 Hz for gasoline.

Cars manufactured from week 39, 2001 inclusive: In status no. 2 the pump operates at 5.7 Hz for diesel and 6.8 Hz for gasoline.

In status no. 3 the pump is controlled by the water temperature. In status nos. 4 and 7 the fuel pump is switched off (0 Hz). The fuel pump is not active in status nos. 1, 7, 5, 6 or 8.

DEGREE OF MODULATION OF GLOW PLUG, VALUE

Measurement range 0-100%.

Reading of the degree to which the glow plug is activated.

For cars manufactured up to week 38, 2001 inclusive:

In status no. 1 the glow plug is supplied completely (100%) or pulsed with the frequency 1 Hz. The degree of modulation of the glow plug depends on the voltage.

For cars manufactured from week 39, 2001 inclusive:

In status no. 1 the glow plug is supplied completely (100%) or pulsed with the frequency 10 Hz. The degree of modulation of the glow plug depends on the voltage.

FLAME MONITOR, VALUE

Measurement range: 0-5 V.

Reading out flame monitor's voltage.

The flame monitor registers the light intensity in the heater and is used to detect if there is a flame or not. The lower the light intensity that the flame monitor detects, the higher the voltage to the control module. The higher the light intensity that is registered, the lower the voltage.

The following applies when the control module uses the signal from the flame monitor to decide if there is a flame or not:

- If voltage is **higher than** approx. 2.5 V for a certain time, the control module considers that there is no flame.

- If voltage is **lower than** approx. 2.5 V for a certain time, the control module considers that there is a flame.

EXTENDED X-SUPPLY, STATUS

Indicates whether the ignition is on or off according to the control module.

SUPPLY VOLTAGE TO COMPONENTS, STATUS

Indicates whether the control module is sending supply voltage to the combustion fan, fuel pump and water pump.

On: Voltage

Off: No voltage

GLOW PLUG, STATUS

On: Glow plug activated.

Off: Glow plug not activated.

In status 1 the glow plug is on. In status 2 the glow plug is switched off when a flame is detected. Other statuses the glow plug is off.

WATER PUMP, STATUS

On: Water pump activated.

Off: Water pump not activated (status 6, 9 and 10).

FUEL LEVEL, STATUS

Fuel level OK: The control module registers that there are more than 4 liters of fuel in the fuel tank and the heater can be started.

Fuel level too low: The control module registers that there is less than 4 liters of fuel in the fuel tank and the heater cannot be started.

GENERAL INFORMATION

Electrical system

FAULT TRACING

SIGNAL SPECIFICATION, ENGINE CONTROL MODULE

General

All values given below are between the terminals stated in column 1 and breakout box terminal #B2. Control module terminals #A1-#A60 correspond to terminals #A1-#A60 on the breakout box, terminals #A61-#A70 correspond to terminals #B1-#B10 on the breakout box and terminals #B1-#B50 correspond to terminals #B10-#B60 on the breakout box.

NOTE: **It is important to connect the breakout box and check the ground terminals before taking readings.**

HINT: If the numbering of the connector is different from the numbering on the breakout box, the connector number is given first, terminal #A61, followed by the breakout box number in brackets, (terminal #B1). Example: #A61 (#B1).

U=	DC voltage in volts (V)	U A/C =	AC voltage in volts (V)
U_{bat} =	Battery voltage in volts (V)	f =	Frequency in Hertz (Hz)
U_{low} =	Voltage approximately 0 V	%pulse =	Pulse ratio (%)
t =	Time in milliseconds (ms)

SIGNAL SPECIFICATION, CARPHONE

General

All the values given below are between the respective connection in column 1 and connection #A6 in column 2 (power ground) unless otherwise stated in brackets.

NOTE: **It is important to connect the breakout box and check the ground terminals before taking readings.**

For information on:

- Connecting the breakout box, see **CONNECTING THE BREAKOUT BOX TO THE CARPHONE MODULE** .
- Checking ground connection, see **CHECKING VOLTAGE / GROUND CONNECTION, MEDIA/INFOTAINMENT** .

There may be several connections and connectors between control modules and components.

U=	DC voltage in volts (V)	U_{AC} =	AC voltage in volts (V)
U_{bat} =	Battery voltage (V)	f =	Frequency in Hertz (Hz)
U_{low} =	Voltage approx. 0 V	t =	Time in s (seconds)
PWM =	Pulse-width modulated signal in %

NAVIGATION SYSTEM

CONNECTING THE BREAKOUT BOX TO THE ROAD TRAFFIC INFORMATION (RTI) CONTROL MODULE

Special tools:

see **9511463**

see **9511509**

see **9511508**

see **9813194**

CONNECTING THE BREAKOUT BOX

- Ignition off
- Disconnect the required connections from the relevant unit.

Check that the male and female terminals on the unit connectors are undamaged and secure (cannot be pressed in). Check that the cables to the female terminals are secured to the terminal pins.

Other information:

- To access and replace the Road Traffic Information (RTI) control module, see **REMOVAL**
- To access and replace the CD-ROM player, see **CD READER, RTI (ROAD TRAFFIC INFORMATION), REPLACING**
- To access and replace the GPS receiver, see **ANTENNA, GPS, REPLACING**.

Different adapters are required depending on what terminal should be checked on the breakout box.

Terminals A, B, C, J and M should be connected to adapter see **9511463** .

Connect terminals D, E, F, L, O and P to adapter see **9511509** .

Terminal K should be connected to adapter see **9511508** .

Terminal N should be connected to adapter see **9813194** .

Road Traffic Information (RTI) Terminals:

Terminals #A1-#A22 correspond to terminals #1-#22 on the breakout box.

Terminals #B1-#B14 correspond to terminals #43-#56 on the breakout box.

Terminals #C1-#C16 correspond to terminals #25-#40 on the breakout box.

Terminals #D1-#D6 correspond to terminals #42-#47 on the breakout box.

Terminals #E1-#E8 correspond to terminals #16-#23 on the breakout box.

Terminals #F1-#F13 correspond to terminals #1-#13 on the breakout box.

CD-ROM changer terminals:

#J1-#J22 correspond to #1-#22 on the breakout box.

Display terminals:

#K1-#K5 correspond to #26-#30 on the breakout box.

Terminals #L1-#L6 correspond to terminals #26-#31 on the breakout box.

TV receiver terminals:

#M1-#M16 correspond to #25-#40 on the breakout box.

#N1-#N10 correspond to #47-#56 on the breakout box.

#O1-#O8 correspond to #16-#23 on the breakout box.

#P1-#P13 correspond to #1-#13 on the breakout box.

The breakout box is designed to facilitate reading off the control module input and output signals when the control module is connected; and the cable and component resistance when the control module is disconnected. The use of a breakout box reduces the risk of accidental short-circuited cables and damage to the connector pins.

For further information about signals and other values, see **SIGNAL SPECIFICATION, RTI** .

ANTENNA, GPS, REPLACING

REMOVAL

Fig. 1: Antenna Clip
Courtesy of VOLVO CARS CORPORATION

HINT: The GPS antenna is located underneath the parcel shelf. The GPS antenna can be removed through the cargo compartment.

- Press the clip (1) up
- Insert a hand through one of the holes in the panel. Unhook the lip (2) which is securing the antenna
- Remove the antenna through the hole
- Disconnect the connector.

INSTALLATION

- Connect the connector
- Install the lip on the antenna
- Install the clip fully using flat nose pliers. Pull the clip down through the hole.

NAVIGATION SYSTEM

Electrical system

NAVIGATION SYSTEM

ROAD TRAFFIC INFORMATION MODULE (RTI), REPLACING

REMOVAL

Fig. 1: Identifying Road Traffic Information Module
Courtesy of VOLVO CARS CORPORATION

- Fold down the side panel on the left-hand side of the cargo compartment.
- Release the clips for the front side panel in the cargo compartment. Fold down the panel.
- Disconnect the connectors.
- Remove the screw holding the control module.

Fig. 2: Identifying Road Traffic Information Module And Bracket
Courtesy of VOLVO CARS CORPORATION

- Unscrew the bracket from the control module.

INSTALLATION

- Screw the control module into place on the bracket.
- Screw the bracket into place in the car.
- Install the connectors.
- Reinstall the panel.

FINISHING

Check that no diagnostic trouble codes have been stored during the repair.

ACCESSORIES AND EQUIPMENT

General - Specifications, Mechanical

TIGHTENING TORQUE

GENERAL TIGHTENING TORQUE

NOTE: Screws coated with a locking fluid or self locking nuts must be replaced with new when reinstalled.

See the table below to find the tightening torques for components not included in the summary.

Nuts and screws which are not self locking can be reused provided that they are in good condition.

Thread	Tightening torque (Nm)
M5	5
M6	10
M7	17
M8	24
M10	50
M12	80
M14	130

SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS

NOTE: Screws coated with locking fluid or sealant must be replaced with new ones when reinstalled.

Always use **new screws and nuts** when angle tightening. Any exceptions to this rule will be indicated in the method.

Angle-tightening in tight spaces. See **SCREWED JOINT, TORQUE/ANGLE TIGHTENING**.

SCREWED JOINT, TORQUE/ANGLE TIGHTENING

Special tools:

9512050

SCREWED JOINT

There are a great number of torque spanner systems available on the market where the spanner grip can be replaced with other types. These wench grips are normally ideally suited to torque tightening screwed joints in poorly accessible places.

There may be occasions when torque tightening of a screwed joint must be followed by angle tightening and space does not allow the use of protractor (part number **9512050**). In these cases, use either a nut, a screw head or a tool. These are usually hexagonal and each corner is **60°** . If there are twelve edges, each corner is **30°** .

Fig. 1: Identifying Marked Nut

To angle tighten, mark the material and nut for example as illustrated and then tighten so that the markings are

opposite each other.

Two-colored exterior

If the car has two colours, both codes are written, divided by a "/". Then the main color is to the left of "/".

ACCESSORIES AND EQUIPMENT

Instrumentation - Diagnostic Trouble Codes And Associated Procedures

DIM-0001: DRIVING DISTANCE. INCORRECT VALUE (2003-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION DIM-0001

Condition

Fig. 1: Driver Information Module
Courtesy of VOLVO CARS CORPORATION

NOTE: The graphics in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the graphics is always correct.

The diagnostic trouble code (DTC) is stored if the driver information module (DIM) registers that the stored mileage value differs by more than 500 km from the most recently stored mileage. The diagnostic trouble code (DTC) is also stored if the voltage to the driver information module (DIM) is interrupted before the new mileage is stored in the central electronic module (CEM).

Substitute Value

- None.

Possible Source

- Software fault in the control module.

Fault symptom[s]

- No symptom.

DIM-0002: ABS-LAMP. FAULTY CIRCUIT (2003-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION DIM-0002

Condition

Fig. 2: Identifying ABS Warning Lamp
Courtesy of VOLVO CARS CORPORATION

NOTE: **The graphics in this service information are used for different model years and / or models. Some variation may occur. However, the essential information in the graphics is always correct.**

The diagnostic trouble code (DTC) is stored if the driver information module (DIM) detects an internal open-circuit in the circuit for the ABS warning lamp.

Substitute Value

- None.

Possible Source

- Software fault in the control module.

Fault symptom[s]

- The ABS warning lamp does not light
- General orange warning lamp lit.

FAULTY CIRCUIT

CHECKING THE FUNCTION OF THE LAMP

Fig. 3: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check whether the lamp lights when the ignition is on.

Does the lamp function?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **REPLACING THE DRIVER INFORMATION MODULE (DIM)**

REPLACING THE DRIVER INFORMATION MODULE (DIM)

Replace the driver information module (DIM). See **DRIVER INFORMATION MODULE (DIM), REPLACING** .

DIM-0003: SRS-LAMP. FAULTY CIRCUIT (2003-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION DIM-0003

Condition

Fig. 4: Identifying ABS Warning Lamp
Courtesy of VOLVO CARS CORPORATION

NOTE: **The graphics in this service information are used for different model years and / or models. Some variation may occur. However, the essential information in the graphics is always correct.**

The diagnostic trouble code (DTC) is stored if the driver information module (DIM) detects an internal open-circuit in the circuit for the SRS warning lamp.

Substitute Value

- None.

Possible Source

- Hardware fault

Fault symptom[s]

- The SRS warning lamp does not light
- General red warning lamp lit.

FAULTY CIRCUIT

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

Check and remedy any diagnostic trouble codes (DTCs) in the central electronic module (CEM) before fault-tracing this diagnostic trouble code (DTC).

Were diagnostic trouble codes (DTCs) stored in the central electronic module (CEM)?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE FUNCTION OF THE LAMP**

CHECKING THE FUNCTION OF THE LAMP

Fig. 5: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check whether the lamp lights when the ignition is on.

Does the lamp function?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **REPLACING THE DRIVER INFORMATION MODULE (DIM)**

REPLACING THE DRIVER INFORMATION MODULE (DIM)

Replace the driver information module (DIM). See **DRIVER INFORMATION MODULE (DIM), REPLACING** .

DIM-0005: RED WARNING LAMP FAULTY CIRCUIT (2003-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION DIM-0005

Condition

Fig. 6: Identifying ABS Warning Lamp
Courtesy of VOLVO CARS CORPORATION

NOTE: **The graphics in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the graphics is always correct.**

The diagnostic trouble code (DTC) is stored if the driver information module (DIM) detects an internal open-circuit in the circuit for the general red warning lamp.

Substitute Value

- None.

Possible Source

- Software fault in the control module.

Fault symptom[s]

- The general red warning lamp does not light.

FAULTY CIRCUIT

CHECKING THE FUNCTION OF THE LAMP

Fig. 7: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Activate the warning lamp.

Fig. 8: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

Does the lamp function?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **REPLACING THE COMBINED INSTRUMENT PANEL**

REPLACING THE COMBINED INSTRUMENT PANEL

Replace the driver information module (DIM). See **DRIVER INFORMATION MODULE (DIM), REPLACING** .

DIM-0006: ORANGE WARNING LAMP FAULTY CIRCUIT (2003-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION DIM-0006

Condition

Fig. 9: Identifying ABS Warning Lamp
Courtesy of VOLVO CARS CORPORATION

NOTE: **The graphics in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the graphics is always correct.**

The diagnostic trouble code (DTC) is stored if the driver information module (DIM) detects an internal open-circuit in the circuit for the general orange warning lamp.

Substitute Value

- None.

Possible Source

- Software fault in the control module.

Fault symptom[s]

- The general orange warning lamp does not light.

FAULTY CIRCUIT

CHECKING THE FUNCTION OF THE LAMP

Does the lamp function?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **REPLACING THE DRIVER INFORMATION MODULE (DIM)**

REPLACING THE DRIVER INFORMATION MODULE (DIM)

Replace the driver information module (DIM). See **DRIVER INFORMATION MODULE (DIM), REPLACING** .

DIM-0007: GLOBAL PARAMETER. INTERNAL FAULT (2005-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION DIM-0007

Condition

Fig. 12: Brake Control Module
Courtesy of VOLVO CARS CORPORATION

NOTE: The graphics in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the graphics is always correct.

The diagnostic trouble code (DTC) is stored if the control module detects that one of the global parameters used by the driver's information module (DIM) is not updated or defined.

Substitute Value

- None.

Possible Source

- Communication fault
- Incorrectly downloaded software in the central electronic module (CEM) (Carconfig).

Fault symptom[s]

- The driver information module (DIM) is not functioning.

INTERNAL FAULT

FAULT-TRACING INFORMATION

INFORMATION

There is no fault-tracing for this diagnostic fault code (DTC).

For further information on this diagnostic trouble code, see Diagnostic trouble code (DTC) information.

DIM-0007: GLOBAL PARAMETER. INTERNAL FAULT. (2003-04)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION DIM-0007

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION DIM-0007**

INTERNAL FAULT

FAULT-TRACING INFORMATION

INFORMATION

There is no fault-tracing for this diagnostic fault code (DTC).

For further information on this diagnostic trouble code, see Diagnostic trouble code (DTC) information.

DIM-000C: CONTROL MODULE. INTERNAL FAULT (2005-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION DIM-000C

Condition

Fig. 13: Driver Information Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the control module detects a damaged memory element.

Substitute Value

- None.

Possible Source

- Damaged memory in the instrument.

Fault symptom[s]

- The combined instrument panel is not functioning.

INTERNAL FAULT

DAMAGED MEMORY ELEMENT

The diagnostic trouble code (DTC) is stored if the control module has detected a damaged memory element in the driver information module (DIM). This can affect the control module, although not necessarily. Replace the driver information module (DIM) if the customer complains.

Do you want to replace the driver information module (DIM)?

- **YES**

Refer to **REPLACING THE COMBINED INSTRUMENT PANEL**

- **NO**

  FAULT NOT FOUND: Troubleshooting has been completed.

REPLACING THE COMBINED INSTRUMENT PANEL

Replace the combined instrument panel. See **DRIVER INFORMATION MODULE (DIM), REPLACING** .

DIM-000C: CONTROL UNIT. INTERNAL FAULT. INTERMITTENT FAULT (2003-04)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION DIM-000C

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION DIM-000C**

INTERNAL FAULT. INTERMITTENT FAULT

DEFECTIVE MEMORY ELEMENT

The diagnostic trouble code is displayed when the control unit has previously found a faulty memory element in the instrument but the fault is no longer there. This can affect the instrument but does not necessarily do so.

DIM-000C: CONTROL UNIT. INTERNAL FAULT. PERMANENT FAULT (2003-04)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION DIM-000C

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION DIM-000C**

INTERNAL FAULT. PERMANENT FAULT

DEFECTIVE MEMORY ELEMENT

The diagnostic trouble code is displayed when the control unit detects a defective memory element in the instrument. This can affect the instrument but does not necessarily do so. If the customer complains, replace the instrument.

Replace the instrument?

- **YES**

  Refer to **REPLACING THE COMBINED INSTRUMENT**

- **NO**

FAULT NOT FOUND: Troubleshooting has been completed.

REPLACING THE COMBINED INSTRUMENT

Replace the combined instrument as described in, see **DRIVER INFORMATION MODULE (DIM), REPLACING** .

DIM-E001: CONTROL MODULE COMMUNICATION. FAULTY COMMUNICATION (2005-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION DIM-E001

Condition

Fig. 14: Driver Information Module
Courtesy of VOLVO CARS CORPORATION

The control modules transmit and receive information via a standardized serial communication method - CAN (Control Area Network). The diagnostic trouble code (DTC) is stored if the control module registers serious interference on the low speed network (CAN communication blocked).

NOTE: **In the event of system communication problems, it is not possible to communicate with the control module. Therefore it will only be possible to read off the diagnostic trouble code (DTC) if the fault is intermittent.**

Substitute Value

- The control module shuts itself off ("bus-off").

HINT: The driver information module (DIM) will remain shut off until the power supply is broken (15, 30, X). When the power supply is connected the control module will make a new attempt to communicate.

Possible Source

- Short-circuit between the control area network (CAN) wiring
- Open-circuit in the control area network (CAN) wiring
- Internal fault in the control module
- Internal fault in another control module in the same part of the control area network (CAN).

Fault symptom[s]

- The ABS warning lamp is lit
- The SPIN warning lamp is lit
- The general red warning lamp is lit
- No vehicle speed display (because there is no signal to the combined instrument panel)
- No gauges working.

SIGNAL MISSING

see **SIGNAL MISSING**

DIM-E001: CONTROL MODULE COMMUNICATION. FAULTY COMMUNICATION (2003-04)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION DIM-E001

Condition

Fig. 15: Driver Information Module
Courtesy of VOLVO CARS CORPORATION

The control modules transmit and receive information via a standardized serial communication method - CAN (Controller Area Network). The diagnostic trouble code (DTC) is stored if the control module registers serious interference (CAN communication blocked).

NOTE: **In the event of system communication problems, it is not possible to communicate with the control module. Therefore it will only be possible to read off the fault if it is intermittent.**

Substitute Value

- The control module shuts itself off ("bus-off").

  HINT: The control module will remain shut off until the power supply is broken (15, 30, X). When the power supply is connected the control module will make a new attempt to communicate.

Possible Source

- Short-circuit between the control area network (CAN) wiring
- Open-circuit in the control area network (CAN) wiring
- Internal fault in the control module
- Internal fault in another control module in the same part of the control area network (CAN).

Fault symptom[s]

- No gauges are working
- The instrument lighting does not operate.

FAULTY COMMUNICATION

see **FAULTY COMMUNICATION**

DIM-E003: CONFIGURATION FAULT. FAULTY CONFIGURATION (2003-04)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION DIM-E003

Condition

Fig. 16: Driver Information Module
Courtesy of VOLVO CARS CORPORATION

The control module compares its configuration ID with the signal configuration transmitted on the control area network (CAN) by the central electronic module (CEM). If the configuration IDs do not correspond the fault code is stored. The diagnostic trouble code (DTC) is also stored if the communication between the control module and the central electronic module (CEM) is interrupted.

NOTE: **In the event of open-circuit in both the control area network (CAN) cables, it is not possible to communicate with the control module. Therefore it will only be possible to read off the diagnostic trouble code (DTC) if this type of fault is intermittent. When the diagnostic trouble code (DTC) is stored, the control module responds to the diagnostic command, however normal control area network (CAN) communication does not work. ("Expulsion mode")**

Substitute Value

- None.

Possible Source

- Faulty control area network (CAN) configuration ID. (The node is not intended for this car (for example a used control module with different software/hardware))
- Open-circuit in the control area network (CAN) wiring between the control module and the central electrical module (CEM).

Fault symptom[s]

- No gauges are working
- The instrument lighting does not operate.

FAULTY CONFIGURATION (2003)

see **FAULTY CONFIGURATION (2003)**

FAULTY CONFIGURATION (2004)

see **FAULTY CONFIGURATION (2004)**

DIM-E003: CONFIGURATION FAULT. FAULTY CONFIGURATION (2005-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION DIM-E003

Condition

The driver information module (DIM) compares its configuration ID with the signal configuration transmitted on the control area network (CAN) by the central electronic module (CEM). If the configuration IDs do not correspond the fault code is stored. The diagnostic trouble code (DTC) is also stored if the communication between the control module and the central electronic module (CEM) is interrupted.

NOTE: **In the event of an open-circuit in both the control area network (CAN) cables, it is not possible to communicate with the control module. Therefore it will only be possible to read off the diagnostic trouble code (DTC) if this type of fault is intermittent. When the diagnostic trouble code (DTC) is stored, the control module responds to the diagnostic commands. However, normal control area network (CAN) communication does not work ("Expulsion mode").**

Substitute Value

- None.

Possible Source

- Incorrect control area network (CAN) configuration ID (the control module is not intended for this car, for example it is a used control module with different software/hardware)
- Open-circuit in the control area network (CAN) wiring between the control module and the central electrical module (CEM).

Fault symptom[s]

- The driver information module (DIM) panel does not function if there is no CAN communication.

SIGNAL MISSING

ACCESSORIES AND EQUIPMENT

Instrumentation - General Diagnostics And Tests

CHECKING THE POWER SUPPLY AND GROUND (2003-04)

CHECKING POWER SUPPLY AND GROUND. PERMANENT FAULT

CHECKING SUPPLY

Check passenger compartment fuse 24 (11C/24:2).

Check the cable between combined instrument panel supply relay (2/29) terminal #3 and passenger compartment fuse 24 (11C/24:2). Check for an open-circuit according to **OPEN-CIRCUIT, PERMANENT FAULTS**. Check for a short-circuit to ground according to **SHORT-CIRCUIT TO GROUND, PERMANENT FAULTS**.

Check that the relay is not defective.

Check the cable between combined instrument panel terminal #6 and parking brake connector terminal #1 for a short-circuit to ground according to **SHORT-CIRCUIT TO GROUND, PERMANENT FAULTS**.

Check the cable between combined instrument panel terminal #1 and combined instrument panel supply relay (2/29) terminal #1. Check for an open-circuit according to **OPEN-CIRCUIT, PERMANENT FAULTS**. Check for a short-circuit to ground according to **SHORT-CIRCUIT TO GROUND, PERMANENT FAULTS**.

Check the cable between combined instrument panel terminal #14 and ground. Check for an open-circuit according to **OPEN-CIRCUIT, PERMANENT FAULTS**. Check for a short-circuit to supply voltage according to **SHORT-CIRCUIT TO SUPPLY VOLTAGE. PERMANENT FAULTS**.

Remedy as necessary

Other information:

- To connect the breakout box, see **CONNECTING THE DRIVER INFORMATION MODULE (DIM) TEST BOX**.

Fig. 1: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 2: Fuse Holder (Passenger Compartment)
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING THE GROUND TERMINAL**

CHECKING THE GROUND TERMINAL

Fig. 3: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Control module disconnected
- Switch off all power consuming equipment (courtesy lighting, radio etc).

Connect an ohmmeter between terminal #14 on the breakout box and the battery negative terminal.

Additional information

- To connect the breakout box, see **CONNECTING THE DRIVER INFORMATION MODULE (DIM) TEST BOX**
- For information about signals, see **DRIVER INFORMATION MODULE (DIM) SIGNAL DESCRIPTION** .

Fig. 4: Breakout Box
Courtesy of VOLVO CARS CORPORATION

Fig. 5: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

The ohmmeter should read approximately 0 ohms.

- **OK**

  OKAY: Troubleshooting has been completed.

- **NOT OK**

  Refer to **CHECKING FOR OPEN-CIRCUITS, CONTACT RESISTANCE AND OXIDATION**

CHECKING FOR OPEN-CIRCUITS, CONTACT RESISTANCE AND OXIDATION

Check ground terminal 31/83. Check for an open-circuit according to **OPEN-CIRCUIT, PERMANENT**

FAULTS. Check for contact resistance and oxidation according to **CONTACT RESISTANCE AND OXIDATION**.

Other information

Fig. 6: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

OPEN-CIRCUIT, PERMANENT FAULTS

Fig. 7: Checking For Open Circuit
Courtesy of VOLVO CARS CORPORATION

An open-circuit in a cable is indicated by a loss of one or more functions.

Chafed and broken cables or terminals that have come loose are common causes of faults in electrical systems.

Checks:

- Disconnect the connectors at both ends of the cable.

Connect an ohmmeter between the ends of the cable.

The ohmmeter should read approximately 0 ohms if there is no open-circuit in the cable.

Fig. 8: Identifying Control Module Installation
Courtesy of VOLVO CARS CORPORATION

Always check the control module and control module box connectors to ensure that their pins and sockets are not bent or damaged, as this can cause faults.

Check pins and terminals particularly for this fault.

SHORT-CIRCUIT TO GROUND, PERMANENT FAULTS

Fig. 9: Checking For Short Circuit To Ground
Courtesy of VOLVO CARS CORPORATION

A short-circuit between a live cable and ground is often indicated by the loss of a function or a fuse blowing when a current is passed through the cable.

Checks:

- Activate all switches and sensors in the circuit. Check whether the fuse blows
- Disconnect the connectors in the circuit to ensure that they do not affect readings.

Use an ohmmeter to take a resistance reading between the cable and ground.

The ohmmeter should read infinite resistance if no components are connected.

Check pins and terminals particularly for this fault.

SHORT-CIRCUIT TO SUPPLY VOLTAGE. PERMANENT FAULTS

Fig. 10: Checking For Short Circuit
Courtesy of VOLVO CARS CORPORATION

A short-circuit between a cable and supply voltage is often indicated by the loss of a function or a fuse blowing when voltage is passed through the cable.

Checks:

- Use a voltmeter to take readings at various points in the circuit while operating switches and sensors.

Voltmeter readings will depend on which circuit is tested and the status of switches and sensors.

Use an ohmmeter between the suspect cables to detect short-circuits between them.

The ohmmeter should read infinite resistance between cables not connected to each other in the circuit.

Check pins and terminals particularly for this fault.

CONTACT RESISTANCE AND OXIDATION

Fig. 11: Identifying Terminal Inspection
Courtesy of VOLVO CARS CORPORATION

In theory, the resistance across contacts, leads and terminals should be 0 ohms. However, there is always some resistance due to terminal oxidation.

If this resistance becomes too great the result will be a malfunction. The magnitude of the resistance before it causes a malfunction depends on the circuit load.

Cleaning female socket terminals and male pin terminals

Fig. 12: Apply Rust Solvent Spray Or Grease To Connectors
Courtesy of VOLVO CARS CORPORATION

NOTE: **Do not apply rust solvent spray or grease to the catalyst monitor sensor or instrument cluster connectors.**

- Ignition off
- Disconnect the battery negative terminal
- Use compressed air to clean the disconnected connector
- Apply rust solvent spray 1161422 to the disconnected connectors
- Blow clean using compressed air.

Greasing female terminals

Fig. 13: Identifying Grease Pressed Into Terminals
Courtesy of VOLVO CARS CORPORATION

NOTE: Note Do not fill the protective cover with grease.

- Press grease, P/N 1161417-9, into the female sockets directly from tube
- Check that all the terminal cavities are filled
- Use a loose male pin to ensure that the connection in the sockets is good. The pin should remain in position when pulled gently.

Fig. 14: Checking To Ensure Contact In Sockets Is Good
Courtesy of VOLVO CARS CORPORATION

CHECKING THE POWER SUPPLY AND GROUND INTERMITTENT FAULT

CHECKING THE POWER SUPPLY

Check interior fuse 24 (11C/24:2).

Check the wire between combined instrument power supply relay (2/29) 3 and interior fuse 24 (11C/24:2) for an open circuit as described in, see **OPEN-CIRCUIT, INTERMITTENT FAULTS**, and for a short circuit to ground as described in **SHORT-CIRCUIT TO GROUND, INTERMITTENT FAULTS**.

Check that the relay is not defective.

Check and measure wire between combined instrument 6 and handbrake contact 1 for a short circuit to ground as described in, see **SHORT-CIRCUIT TO GROUND, INTERMITTENT FAULTS**.

Check the wire between combined instrument 1 and combined instrument power supply relay (2/29) 1 for an open circuit as described in, see **OPEN-CIRCUIT, INTERMITTENT FAULTS**, and a short circuit to ground as described in **SHORT-CIRCUIT TO GROUND, INTERMITTENT FAULTS**.

Check the wire between combined instrument 14 and ground for an open circuit as described in, see **OPEN-CIRCUIT, INTERMITTENT FAULTS**, and for a short circuit to voltage supply as described in **SHORT-CIRCUIT TO SUPPLY VOLTAGE, INTERMITTENT FAULTS**.

Do the necessary corrective action.

Additional information:

- To connect the test box, see **CONNECTING THE DRIVER INFORMATION MODULE (DIM) TEST BOX**.

Fig. 15: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 16: Fuse Holder (Passenger Compartment)
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING THE GROUND TERMINALS**

CHECKING THE GROUND TERMINALS

Fig. 17: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Control unit disconnected.
- Switch off all battery loadings such as entrance lighting and radio.

Connect an ohmmeter between the battery negative lead and test box 14.

Additional information

- To connect the test box, see **CONNECTING THE DRIVER INFORMATION MODULE (DIM) TEST BOX**
- For information on signals and additional values, see **DRIVER INFORMATION MODULE (DIM) SIGNAL DESCRIPTION** .

Fig. 18: Breakout Box
Courtesy of VOLVO CARS CORPORATION

Fig. 19: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

The ohmmeter should display approximately 0 ohms.

- **OK**

  OKAY: Troubleshooting has been completed.

- **NOT OK**

  Refer to **CHECKING FOR OPEN CIRCUITS, CONTACT RESISTANCE AND OXIDATION**

CHECKING FOR OPEN CIRCUITS, CONTACT RESISTANCE AND OXIDATION

Check ground points 53/400 and 31/83 for an open circuit as described in, see **OPEN-CIRCUIT,**

INTERMITTENT FAULTS, and for contact resistance and oxidation as described in **CONTACT RESISTANCE AND OXIDATION**.

Additional information

Fig. 20: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

OPEN-CIRCUIT, INTERMITTENT FAULTS

Fig. 21: Checking For Open Circuit
Courtesy of VOLVO CARS CORPORATION

An open-circuit in a cable will be indicated by the loss of a function (or functions).

Chafed and broken leads are common causes of faults.

Checks:

- Disconnect the connectors at both ends of the cable.

Check the cables visually.

Connect an ohmmeter between the ends of the cable.

The ohmmeter should read approximately 0 ohms if there is no open-circuit in the cable.

Shake the cable lightly and pull on connectors during measurement to locate the damage.

If the reading is not correct. Replace the cable.

Fig. 22: Identifying Control Module Installation
Courtesy of VOLVO CARS CORPORATION

Always check the control module and control module box connectors to ensure that their pins and sockets are not bent or damaged, this may cause faults.

Check pins and terminals particularly carefully.

SHORT-CIRCUIT TO GROUND, INTERMITTENT FAULTS

Fig. 23: Checking For Short Circuit To Ground
Courtesy of VOLVO CARS CORPORATION

A short-circuit between a live cable and ground is often indicated by the loss of a function or a fuse blowing when a current is passed through the cable.

Checks:

- Check the cables visually.

  Activate all switches and sensors in the circuit. Check whether the fuse blows

- Disconnect the connectors in the circuit to ensure that they do not affect readings.

Connect an ohmmeter between cable and ground.

The ohmmeter should read infinite resistance if no components are connected.

Shake the cable lightly and pull on connectors during measurement to locate the damage.

If the reading is not correct, replace the cable.

SHORT-CIRCUIT TO SUPPLY VOLTAGE, INTERMITTENT FAULTS

Fig. 24: Checking For Short Circuit
Courtesy of VOLVO CARS CORPORATION

A short-circuit between a cable and supply voltage is often indicated by the loss of a function or a fuse blowing when a current is passed through the cable.

Checks:

- Check the cables visually.

  Use a voltmeter to take readings at various points in the circuit while operating switches and sensors.

The voltmeter reading depends on the circuit being tested and the positions of switches and sensors.

Use an ohmmeter between the suspect cables to detect short-circuits between them.

The ohmmeter should read infinite resistance between cables not connected to each other in the circuit.

Shake the cable lightly and pull on connectors during measurement to locate the damage.

If the reading is not correct. Replace the cable and/or continue according to **CONTACT RESISTANCE AND OXIDATION**.

CHECKING THE SUPPLY VOLTAGE/GROUND TERMINAL, DRIVER INFORMATION MODULE (DIM) (2005-12)

CHECKING THE VOLTAGE/GROUND TERMINAL

CHECKING THE POWER SUPPLY AND GROUND TERMINALS

Voltage supply, driver information module (DIM)

The driver information module (DIM) is powered via a power input on the driver information module (DIM).

Power input terminal #A3 is powered via a fuse from the central electronic module (CEM). The driver information module (DIM) will not be activated if there is an open-circuit.

Checking the power supply

Check the power supply cable from the battery to the central electronic module (CEM) and from the central electronic module (CEM) to driver information module (DIM) terminal #A3. Check for an open-circuit. Check for loose connections. Check for contact resistance. Check for oxidation. Check the fuse. The voltage must be approximately battery voltage when the ignition is on.

Ground terminal, driver information module (DIM)

The driver information module (DIM) has a ground input. The ground input from the control module is connected via a ground lead to the ground terminal in the car body.

- Ground input terminal #A4 is signal ground and is connected to the ground terminal in the car body.

Checking the ground terminal

Check the ground lead between control module terminal #A4 and the ground terminal. Check for an open-circuit. Check for loose connections. Check for contact resistance. Check for oxidation. With the ignition on, the drop in voltage between the ground connection for the control module and the ground terminal must not be greater than 0.5 V.

Remedy as necessary.

Other information:

- see **CHECKING WIRING AND TERMINALS**
- see **CONNECTING THE BREAKOUT BOX**
- see **SIGNAL SPECIFICATION**

CONNECTING THE BREAKOUT BOX, DRIVER INFORMATION MODULE (DIM) (2005-12)

CONNECTING THE BREAKOUT BOX

Special tools:

see **9512901**

see **9511428**

see **9511499**

see **9813190**

Fig. 25: Breakout Box
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Remove the fuse
- Remove the driver information module (DIM)
- Disconnect the control module connector.

Connect adapter see **9512901** to the control module connector. Connect breakout box see **9511428** and wiring see **9511499** to the adapter.

Alternatively, breakout box see **9813190** can be connected to the adapter.

Disconnect the breakout box in reverse order.

Other information:

- see **DRIVER INFORMATION MODULE (DIM), REPLACING**
- see **SIGNAL SPECIFICATION**

CONNECTING THE TEST BOX (2003-04)

CONNECTING THE DRIVER INFORMATION MODULE (DIM) TEST BOX

Special tools:

see **9511463**

see **9511428**

see **9511499**

see **9813190**

CONNECTING THE TEST BOX

Fig. 26: Breakout Box
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Remove interior fuse 24 (11C/24)
- Loosen the combined instrument as described in, see **DRIVER INFORMATION MODULE (DIM), REPLACING**
- Release control unit connector.

Connect adapter see **9511463** (22-16-14-pin) to control unit connector and connect test box see **9511428** and wire see **9511499** to adapter.

Alternatively connect test box see **9813190** to adapter.

Disconnect the test box in the reverse order.

Fig. 27: Identifying Control Module Connector & Locking Handle
Courtesy of VOLVO CARS CORPORATION

Additional information:

- To remove the combined instrument, see **DRIVER INFORMATION MODULE (DIM), REPLACING**
- For information about signals and other values, see **DRIVER INFORMATION MODULE (DIM) SIGNAL DESCRIPTION** .

PARKING ASSISTANCE, FRONT (2007-2012)

INTRODUCTION

see **INTRODUCTION**

PARKING ASSISTANCE, FRONT

NOTE: During installation the car and parts must maintain a temperature of at least

+20°C (68°F).

Fig. 13: Removing Ring
Courtesy of VOLVO CARS CORPORATION

Applies to cars with decor panel, standard version

- Performed on 2 sensors.

Applies to cars with decor panel, painted version

- Performed on 4 sensors.

Fig. 14: Cleaning The Sensors Again
Courtesy of VOLVO CARS CORPORATION

Applies to cars with decor panel, standard version

- Clean 2 sensors. Use: Isopropanol
- Allow to dry.

Applies to cars with decor panel, painted version

- Clean 4 sensors. Use: Isopropanol
- Allow to dry.

Fig. 15: Matting Down The Surface
Courtesy of VOLVO CARS CORPORATION

Applies to cars with decor panel, standard version

- Carefully mat down the surface on 2 sensors. Use Glasspaper, grade P1000

Applies to cars with decor panel, painted version

- Carefully mat down the surface on 4 sensors. Use Glasspaper, grade P1000

APPLIES TO ALL MODELS

Fig. 16: Cleaning The Sensors Again
Courtesy of VOLVO CARS CORPORATION

- Clean the sensors again. Use: Isopropanol
- Allow to dry.
- Avoid contact with the cleaned surfaces.

Fig. 17: Protect the Electrical Connectors
Courtesy of VOLVO CARS CORPORATION

CAUTION: Protect the connections' contact surfaces against paint.

- Paint the 2 sensors in the same color code as the vehicle.
- Use Volvo Touch-up paint. (Only use base coat.)
- Use: Volvo 2-K Varnish. P/N: **31335447**

NOTE: Also read the instructions on the spray can.

Fig. 18: Protect the Electrical Connectors
Courtesy of VOLVO CARS CORPORATION

CAUTION: Protect the connections' contact surfaces against paint.

Applies to cars with decor panel, painted version, gloss

- Use Volvo Touch-up paint. Color code: **938** . (Only use base coat.)
- Use: Volvo 2-K Varnish. P/N: **31335447**

NOTE: Also read the instructions on the spray can.

Applies to cars with decor panel, painted version, matt

- Use Volvo Touch-up paint. Color code: **426** . (Only use base coat.)
- Use Volvo Varnish. P/N: **9437467**

APPLIES TO ALL MODELS

Fig. 19: Installing Ring
Courtesy of VOLVO CARS CORPORATION

CAUTION: The paint must have dried after the first application.

Fig. 20: Identifying Ignition Switch Turned To Position 0
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition switch to position 0.

NOTE: Wait at least one minute before unplugging the connectors or removing other electrical equipment.

Fig. 21: Detaching The Panel
Courtesy of VOLVO CARS CORPORATION

- Detach the panel by carefully bending apart at the lower edge. Bend between the panel and bumper casing until the first catch releases. Then pull the panel straight out so that all catches release.

Fig. 22: Identifying Clips
Courtesy of VOLVO CARS CORPORATION

- Remove the 2 clips.

Fig. 23: Identifying Cover For The Headlight Washer
Courtesy of VOLVO CARS CORPORATION

- Pull the cover for the headlight washer straight up.

Fig. 24: Loosening The Cover From The Nozzle
Courtesy of VOLVO CARS CORPORATION

- Hold the washer with pliers.
- Loosen the cover from the nozzle acc. to figure.
- Let the washer carefully slide back and repeat the step on the car's other side.

NOTE: Take care not to scratch the bumper.

Fig. 25: Prying At The Corner And Pulling Straight Out
Courtesy of VOLVO CARS CORPORATION

- Use a pry tool and carefully bend between the fender and the corner of the bumper casing so that the top catch releases.
- Pull the casing straight out until all catches have released.

Fig. 26: Identifying 2 Screws
Courtesy of VOLVO CARS CORPORATION

- Open the engine hood.
- Remove the 2 screws.

Fig. 27: Removing The Bumper Casing
Courtesy of VOLVO CARS CORPORATION

- Lift the bumper casing forward.
- Loosen the quick-coupling for the headlight washer.
- Loosen the connector for fog lights.
- Remove the bumper casing.

Fig. 28: Cutting Away The Corner On The Plastic Foam
Courtesy of VOLVO CARS CORPORATION

- Cut away the corner on the plastic foam acc. to figure.
- Done on both sides.

Fig. 29: Cut At The Markings With a Keyhole Saw
Courtesy of VOLVO CARS CORPORATION

- Localize the markings where the plastic foam was removed.
- Saw out acc. to the markings with a keyhole saw. At the top edge the slot shall be sawed through the outer casing, plastic foam and inner casing at the same time.
- Repeat the step on the car's other side.

Fig. 30: Removing Headlight Washer On Both Sides
Courtesy of VOLVO CARS CORPORATION

- Remove the headlight washer on both sides by removing the clip (1) and screws (2).

Fig. 31: Marking Relation of The Quick-Coupling To The Bumper Casing
Courtesy of VOLVO CARS CORPORATION

- Mark out where the quick-coupling is located in relation to the bumper casing.
- Remove the headlight washers with hoses.

Fig. 32: Parting Outer And Inner Casing
Courtesy of VOLVO CARS CORPORATION

- Part outer and inner casing by loosening the 8 catches at the same time as the casings are pulled apart, and continue to pull apart the casings until all catches release.

Fig. 33: Cutting Out The Slots
Courtesy of VOLVO CARS CORPORATION

- Localize the 2 markings on the outside of the inner casing's right and left side.
- Saw out the slots with a keyhole saw.

Fig. 34: Locating Markings On The Inside Of The Outer Casing
Courtesy of VOLVO CARS CORPORATION

- Localize the 2 markings on the inside of the outer casing's right and left side.
- Mark center with a scribe (marking scraper).

Fig. 35: Locating Markings On The Inside Of The Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Localize the 2 markings on the inside of the trim panel.
- Mark center with a scribe (marking scraper).

Fig. 36: Enlarge The Holes With Tool 9997234
Courtesy of VOLVO CARS CORPORATION

- Drill holes in the markings' center with a **O 3 mm (1/8")** drill bit. Drill from the trim panel and bumper casing inside.
- Drill out the holes. Use a **O10 mm (13/32")** diameter drill bit.
- Enlarge the holes in the trim panel and bumper casing with hole tool **part no. 9997234** . The hole tool's support sleeve shall be on the inside and the cutting part on the outside of the bumper casing.

Fig. 37: Cleaning Around the Holes and Applying Activator
Courtesy of VOLVO CARS CORPORATION

- Clean the trim panel and bumper casing inside with a mild soap solution.
- Clean around the holes and the markings using an isopropyl cleaning cloth.
- Allow to dry.
- Apply a thin layer of activator, **part no. 8637076** , to the cleaned surfaces and let dry for approx. 10 min.

Fig. 38: Cleaning The Surface (1) and Applying Activator
Courtesy of VOLVO CARS CORPORATION

- Take 4 holders from the kit and clean the surface (1) illustrated using isopropyl.
- Allow to dry.
- Apply a thin and even coat of activator to the cleaned surfaces and allow to dry for at least 10 minutes.

Fig. 39: Identifying Joint Between The Sill Panels
Courtesy of VOLVO CARS CORPORATION

- Use a pry tool, carefully bend loose and remove the cover panel over the joint between the sill panels.

Fig. 40: Loosen The Sill Panel (1) And The Right Panel (2)
Courtesy of VOLVO CARS CORPORATION

- Loosen the sill panel (1) and the right panel (2) of the center console.

Fig. 41: Identifying Sound Proofing Bracket
Courtesy of VOLVO CARS CORPORATION

- Remove the screws and sound proofing bracket.
- Fold aside the floor mat so that the hole to the engine compartment becomes visible.

Fig. 42: Pushing Up Catch On Top Side
Courtesy of VOLVO CARS CORPORATION

- Remove the panel in the right front seat attachment on the second seat row by pressing in the lock catch (1) on the top side and pull the panel forward.
- Remove the screw.

Fig. 43: Identifying The Seat Panel
Courtesy of VOLVO CARS CORPORATION

- press in the catches (1) and remove the seat panel.
- Remove the screw.

Fig. 44: Removing Screws Lifting Out The Seat.
Courtesy of VOLVO CARS CORPORATION

- Fold the backrest forward and push the seat as far forward as possible. On cars with two rows of seats the seat cannot be pushed forward.
- Remove both rear panels (1) by pulling them straight up.
- Remove the screws.
- Lift out the seat.

CAUTION: Exercise care when doing this so that the trim or door panels are not damaged.

Fig. 45: Releasing The Seat Belt
Courtesy of VOLVO CARS CORPORATION

- Loosen the upper part of the sill moulding on the rear edge and loosen the seat belt from the end fitting. The belt is loosened by carefully pressing with a weatherstrip tool on the lock lug so that the seat belt releases from the end fitting.

Fig. 46: Pulling The Sill Moulding Upwards
Courtesy of VOLVO CARS CORPORATION

- Pull the sill moulding upwards until the 3 clips release.
- Angle the sill moulding out from the B-post panel.

Fig. 47: Folding Up The Floor Hatch (1)
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Fold up the floor hatch (1). If the floor hatch is equipped with a grocery bag holder, the holder is secured with a strap on both ends of the storage compartment. Detach the straps.
- Remove the storage compartment under the floor hatch.
- Remove the floor hatch by folding it almost completely closed and pulling it backwards from the mountings until it releases.

Applies to cars with three rows of seats and integrated carrier bag holder on the underside of the floor hatch

- Fold up the floor hatch (1).
- Detach the two straps on the panel under this. Lift up the rear edge of the panel, fold the floor hatch back towards the panel and lift out the floor hatch with the panel.

Applies to cars with three rows of seats without an integrated carrier bag holder

- Fold up the floor hatch (1) at the rear edge and lift it out.

APPLIES TO ALL MODELS

Fig. 48: Remove Right And Left Floor Hatches
Courtesy of VOLVO CARS CORPORATION

- Remove the floor hatches (1) on the right and left side.

Fig. 49: Removing The Side Panels
Courtesy of VOLVO CARS CORPORATION

- Remove the side panels on the right and left side.

Fig. 50: Installing The Metal Clip Around The Panel Edge
Courtesy of VOLVO CARS CORPORATION

- Take the short cable harness from the kit.
- Remove the taped connector from the cable.
- Install the larger connector (1) with cable tie/metal clip from the kit.
- Secure the tie strap around the connector and install the metal clip around the panel edge on the right-hand side of the car.

Fig. 51: Identifying Cable
Courtesy of VOLVO CARS CORPORATION

- Pull the end of the cable with the loose pins into the engine compartment.
- Route the cable (1) as illustrated. Place it under the cable duct and expansion tank so that it is concealed.

NOTE: Make sure that the cable is positioned so that it is not damaged by heat or wear.

- Clamp it in with tie straps from the kit.

Fig. 52: Identifying Rubber Grommet
Courtesy of VOLVO CARS CORPORATION

- Raise the car.
- Remove the engine splash guard.
- Remove the plug from the hole in the passenger compartment. It is located under the cowl panel's insulation.

If the car has a rubber grommet without any space for more cables:

- Remove the existing rubber grommet and replace it with the rubber grommet from the kit. Cut off the tip of one of the rubber teats.

If the car has a rubber grommet with space for more cables:

- Cut off the tip of the unused rubber teat.

Fig. 53: Routing The Cable In Through The Hole
Courtesy of VOLVO CARS CORPORATION

- Route the cable by the cable duct (1) and along behind the drain pipe (2). Secure using a cable tie at the cable duct.
- Route the cable behind the cowl panel insulation (3) down along to the hole for the rubber grommet.
- Lubricate the cable with normal soap so that the cable slides easily in the rubber grommet.
- Thread the rubber grommet on the cable.
- Route the cable in through the hole and press in the rubber bushing in the hole so that it seals properly.
- Pull the cable again so that the correct length remains outside the passenger compartment.
- Make sure that the cable's heating hose is in contact against the rubber grommet and secure it with a tie strap.

APPLIES TO ALL MODELS

Fig. 54: Identifying Connector
Courtesy of VOLVO CARS CORPORATION

- Take the connector and loosen the lock.
  1. Blue (BL)
  2. Green (GN)
  3. Violet (VO)
  4. Yellow (Y)
  5. White (W)
  6. Black (SB)
- Install the cable ends' pins in the connector acc. to:
  1. Blue (BL)
  2. Green (GN)
  3. Violet (VO)
  4. Yellow (Y)
  5. White (W)
  6. Black (SB)
- Press back the connector's catch.

Fig. 55: Connecting Cable From The Kit
Courtesy of VOLVO CARS CORPORATION

- Take the long cable from the kit and connect it to the connector which has just been prepared.

Fig. 56: Cable Clamped In At Air Duct
Courtesy of VOLVO CARS CORPORATION

- Guide the cable down between the carpet and the door sill as far as possible to the floor and route it along the right-hand side of the car on to the rear edge of the right-hand rear door's opening.
- Route the cable by the front right-hand seat mounting on the right-hand seat in the second row of seats.
- Pull away the mat from the front edge of the right-hand side panel in the cargo compartment.
- Route the cable harness along the right side of the right seat's placement in the second row of seats, towards the front edge of the rear wheel housing.
- Route it further on the left-hand side of the seat belt's lower mounting, between the support bracket for the right-hand seat and wheel housing, and out at the left-hand side of the wheel housing.
- Clamp the cable harness into the hole in the seat mounting front member, and in the rear hole in the horizontal panel at the right-hand side of the seat. Use tie straps (1) from the kit.

Fig. 57: Identifying Cable At Rear Edge Of Right-Hand Side Panel
Courtesy of VOLVO CARS CORPORATION

Applies to cars with three rows of seats

- Guide in a wire or cable (1) at the rear edge of the right-hand side panel and along its inside, above the load securing eyelet brackets.
- Route the wire/cable to the front edge of the side panel.

Fig. 58: Identifying Cable Harness
Courtesy of VOLVO CARS CORPORATION

Applies to cars with three rows of seats

- Tape the cable (2) to the wire and route it on at the rear edge of the side panel.

Fig. 59: Pulling The Side Panel Away
Courtesy of VOLVO CARS CORPORATION

Applies when the rear side panel must be removed to facilitate cable routing. Remove:

- four covers.
- four screws.

- one clip.
- Detach the C and D panels at the lower edge.
- Pull the side panel away and lift it off.

Fig. 60: Cable Routing
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Route the cable on the left-hand side of the seat belt's mounting at the front edge of the wheel housing, inside the carpet at the front edge of the side panel, between the side panel and the rear cargo floor support, to the tailgate.

APPLIES TO ALL MODELS

Fig. 61: Routing The Cable Along The Existing Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Continue to route the cable along the existing cable harness below the tailgate.
- Secure the cable with tie straps from the kit.

Fig. 62: Loosening The Control Module
Courtesy of VOLVO CARS CORPORATION

- Loosen the control module that is attached with Velcro tape.

Fig. 63: Connect To The Middle Connection
Courtesy of VOLVO CARS CORPORATION

- Connect the routed cable's connector to the middle connection.
- Reinstall the control module.
- Return to the work with the bumper casing.

Fig. 64: Installing Tape On The Holders
Courtesy of VOLVO CARS CORPORATION

- Remove the protective film from one side of the double-backed tape.
- Install the tape on the four holders.

Fig. 65: Install The Centering Tool In The Holder
Courtesy of VOLVO CARS CORPORATION

- Remove the remaining protective film on one of the holders.
- Install the centering tool in the holder acc. to figure.

Fig. 66: Pressing The Holder In The Bumper Casing
Courtesy of VOLVO CARS CORPORATION

- Press in the holder in the bumper casing.

NOTE: **The holders shall be installed facing in the direction as shown in the figure.**

The holders must be installed horizontally and in line with the bumper casing.

- Repeat the steps for the other holders.

Fig. 67: Reinstalling The Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Reinstall the trim panel.

Fig. 68: Placing Plastic Foam Support In The Outer Casing
Courtesy of VOLVO CARS CORPORATION

- Loosen the plastic foam support from the bumper casing's inner casing and place it in the outer casing.

Fig. 69: Installing Sensors And Connectors (1), Routing Harness (2)
Courtesy of VOLVO CARS CORPORATION

- Install the sensors and plug in the connectors (1).
- Place the cable harness between the plastic foam support and outer casing (2).

Fig. 70: Attaching The Cable Harness With Butyl Tape
Courtesy of VOLVO CARS CORPORATION

Left outer sensor

- Clean the surface by the arrow with isopropyl and then apply primer to get better adhesion.
- Attach the cable harness with butyl tape at the marked point.

Fig. 71: Attaching The Cable Harness With Butyl Tape
Courtesy of VOLVO CARS CORPORATION

Left inner sensor

- Attach the cable harness with butyl tape at the marked points.

Fig. 72: Attaching The Cable Harness With Butyl Tape
Courtesy of VOLVO CARS CORPORATION

Right inner sensor

- Attach the cable harness with butyl tape at the marked points.

Fig. 73: Attaching The Cable Harness With Butyl Tape
Courtesy of VOLVO CARS CORPORATION

Right outer sensor

- Attach the cable harness with butyl tape at the marked points.

NOTE: The cable may not end up on the cover for the towing eye (1).

Fig. 74: Assemble Outer And Inner Casing
Courtesy of VOLVO CARS CORPORATION

- Assemble outer and inner casing and, at the same time, insert the cable harness through the inner casing.

NOTE: Make sure that all catches fully engage.

- Reinstall the headlight washers.

Fig. 75: Connecting The Connector For The Sensors
Courtesy of VOLVO CARS CORPORATION

- Hold the bumper up against the car and connect the connector for the sensors to the connector clamped to the car.
- Reinstall the bumpers by repeating the instructions in the steps for removal in reverse order.

Install:

- the sound barrier
- the sill trim panels
- side panel on the center console.
- panel over the joint between the door sills
- the seatbelt

NOTE: Check that the seat belt is secure by jerking it hard in an upwards direction.

- The seat, torque screws with **50 Nm (36.8 lbf. ft.)**
- the seat panels
- the side panels
- the floor hatches.

Fig. 76: Identifying VIDA (Service Information) To Program Software
Courtesy of VOLVO CARS CORPORATION

- Download software (application) for the accessory's function according to service information in VIDA (Volvo scan tool).

ACCESSORIES AND EQUIPMENT

Instrumentation - Specifications, Electrical/Electronic

SIGNAL DESCRIPTION, DRIVER INFORMATION MODULE (DIM) (2003-04)

SIGNAL DESCRIPTION

All the values given below are measured between the respective connection in column 1 and connection 14 (signal ground) if not otherwise specified.

NOTE: **It is important that the test box is connected and the ground points checked before testing begins.**

U =	DC voltage (V)	f =	frequency in Hertz (Hz)
Ubat =	battery voltage (V)	t =	period time in milliseconds (ms)
Ulow =	Voltage close to 0 V		-

Connect the test box	Connect.	Signal type	Ignition on	Idle
43	1	Power supply Ext X	U=Ubat	
44	2	Communication wire control units (CANH)	U=2.5-3.5 V	
45	3	Communication wire control units (CANL)	U=1.5-2.5 V	
46	4	Background lamp signal	Lamp off: U=Ubat Lamp on: U=Ulow	
47	5	Brake fluid level signal (+)	Lamp off: U=Ubat Lamp on: U=Ulow	
48	6	Parking brake signal (+)	Lamp off:U=Ubat Lamp on:U=Ulow	
49	7	-	-	-
50	8	Communication wire control units (CANH)	U= 2.5-3.5 V	
51	9	Communication wire control units (CANL)	U=1.5-2.5V	
52	10	-	-	-
53	11	-	-	-
54	12	-	-	-
55	13	-	-	-
56	14	Signal ground	U=Ulow	

SIGNAL DESCRIPTION, DRIVER INFORMATION MODULE (DIM) (2005-12)

SIGNAL DESCRIPTION

All values contained below are between the relevant terminal and signal ground, unless otherwise indicated in brackets.

NOTE: **It is important to connect the breakout box and check the ground terminals before taking readings.**

U=	DC voltage in volts (V)	U_{AC} =	AC voltage in volts (V)
U_{bat} =	Battery voltage (V)	f =	Frequency in Hertz (Hz)
U_{low} =	Voltage approximately 0 V	t =	Time in seconds (s)

Fig. 1: Identifying 10-Bit Connector
Courtesy of VOLVO CARS CORPORATION

SIGNAL TABLE CONNECTOR A

Control module terminal	Breakout box terminal	Signal type	Ignition on
#A1	#1	-	-
#A2	#2	Signal malfunction indicator lamp (MIL)	Lamp off: U = U_{bat} Lamp on: U = U_{low}
#A3	#3	Power supply Extended X	U = U_{bat}
#A4	#10	Signal ground	U = U_{low}
#A5	#9	Signal (+) brake fluid level	Lamp off: U = U_{bat} Lamp on: U = U_{low}
#A6	#8	Signal (+) parking brake	Lamp off: U = U_{bat} Lamp on: U = U_{low}

#A7	#7	Control modules communication cable (CAN L)	U = 1.5-2.5 V
#A8	#6	Control modules communication cable (CAN H)	U = 2.5-3.5 V
#A9	#5	Control modules communication cable (CAN L)	U = 1.5-2.5 V
#A10	#4	Control modules communication cable (CAN H)	U = 2.5-3.5 V

ACCESSORIES AND EQUIPMENT

Instrumentation - Symptom Related Diagnostic Procedures

CHECKING LAMPS AND NEEDLES (2005-12)

CHECKING LAMPS AND NEEDLES

ACTIVATING LAMPS

Fig. 1: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Activate the system test procedures. Check whether the relevant needle or lamp operates correctly.

All needles must move from min to max and back again.

The lamps must flash (not the malfunction indicator lamp (MIL) or turn signal indicator lamps).

The light level in the instrumentation is also checked.

All parts of the instrumentation flash.

Remedy as necessary.

Other information:

- see **DRIVER INFORMATION MODULE (DIM), REPLACING**

Fig. 2: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

CHECKING THE BACKGROUND LAMP (LAMP COMES ON) (2003-04)

CHECKING THE BACKGROUND LAMP (LAMP COMES ON)

CHECKING THE WIRES

Check and measure the wire between combined instrument 4 and engine control module connector B46 for a short circuit to ground as described in, see **SHORT-CIRCUIT TO GROUND, PERMANENT FAULTS**.

Additional information:

- To connect the test box, see **CONNECTING THE DRIVER INFORMATION MODULE (DIM) TEST BOX** .

Fig. 3: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Is there a fault?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  FAULT NOT FOUND: Troubleshooting has been completed.

VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 4: Belt Routing/Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 5: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect connectors, install components, etc.
- Engine running.
- Check that the malfunction indicator light (MIL) is off.

  Activate the malfunction indicator light (MIL).

Fig. 6: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Does the lamp work correctly?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

SHORT-CIRCUIT TO GROUND, PERMANENT FAULTS

Fig. 7: Checking For Short Circuit To Ground
Courtesy of VOLVO CARS CORPORATION

A short-circuit between a live cable and ground is often indicated by the loss of a function or a fuse blowing when a current is passed through the cable.

Checks:

- Activate all switches and sensors in the circuit. Check whether the fuse blows
- Disconnect the connectors in the circuit to ensure that they do not affect readings.

Use an ohmmeter to take a resistance reading between the cable and ground.

The ohmmeter should read infinite resistance if no components are connected.

TROUBLE-SHOOTING INFORMATION

Condition

- No diagnostic trouble codes displayed
- No diagnostic trouble codes are stored in the engine control module
- Fault is permanent.

Possible Source

- Wire short circuited to ground.

Fault symptom[s]

- Background lamp is on.

CHECKING THE BACKGROUND LAMP (LAMP DOES NOT COME ON) (2003-04)

CHECKING THE BACKGROUND LAMP (LAMP DOES NOT COME ON)

CHECKING THE WIRES

Check and measure the wire between combined instrument 4 and engine control module connector B 46 for an open circuit as described in, see **SHORT-CIRCUIT TO GROUND, PERMANENT FAULTS**, and a short circuit to voltage supply as described in **SHORT-CIRCUIT TO SUPPLY VOLTAGE. PERMANENT FAULTS**.

Additional information:

- To connect the test box, see **CONNECTING THE DRIVER INFORMATION MODULE (DIM) TEST BOX** .

Fig. 8: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Is there a fault?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  FAULT NOT FOUND: Troubleshooting has been completed.

VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 9: Belt Routing/Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 10: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect connectors, install components, etc.
- Engine running.
- Check that the malfunction indicator light (MIL) is off.

  Activate the malfunction indicator light (MIL).

Fig. 11: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Does the lamp work correctly?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

SHORT-CIRCUIT TO SUPPLY VOLTAGE. PERMANENT FAULTS

Fig. 12: Checking For Short Circuit
Courtesy of VOLVO CARS CORPORATION

A short-circuit between a cable and supply voltage is often indicated by the loss of a function or a fuse blowing when voltage is passed through the cable.

Checks:

- Use a voltmeter to take readings at various points in the circuit while operating switches and sensors.

Voltmeter readings will depend on which circuit is tested and the status of switches and sensors.

Use an ohmmeter between the suspect cables to detect short-circuits between them.

The ohmmeter should read infinite resistance between cables not connected to each other in the circuit.

TROUBLE-SHOOTING INFORMATION

Condition

- No diagnostic trouble codes displayed
- No diagnostic trouble codes are stored in the engine control module
- Fault is permanent.

Possible Source

- Wire short circuited to voltage supply
- Open circuit in wire.

Fault symptom[s]

- Background lamp does not come on.

CHECKING THE BRAKE FLUID LEVEL GUARD (2003-04)

CHECKING THE BRAKE FLUID LEVEL GUARD

CHECKING THE WIRE AND HANDBRAKE CONTACT

Fig. 13: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Check function of brake fluid level guard. Measure the voltage between brake fluid level guard 1 and 2.

  When fluid level is low the voltage should be 0 V, and when level is full the voltage should be 12. See **DRIVER INFORMATION MODULE (DIM), REPLACING**.

  Check wires between combined instrument 5, and brake fluid level guard 1 for a short circuit to ground as described in, see **SHORT-CIRCUIT TO GROUND, PERMANENT FAULTS**.

  Additional information:

  - To connect the test box, see **CONNECTING THE DRIVER INFORMATION MODULE (DIM) TEST BOX** .

Fig. 14: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

Is there a fault?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  FAULT NOT FOUND: Troubleshooting has been completed.

VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 15: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 16: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect the connectors, install the components, etc.
- Fill brake fluid to maximum level.
- Ignition on.

  Brake fluid lamp should not be on.

Does fault still exist?

- **YES**

  Refer to **INFORMATION**

- **NO**

  VERIFIED: Troubleshooting has been completed.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

DRIVER INFORMATION MODULE (DIM), REPLACING

PREPARATIONS

NOTE: **Read off data from the control module before replacing the control module. This is carried out via VIDA communication. The current data must be entered into the new control module after replacement.**

DRIVER INFORMATION MODULE (DIM), REPLACING

Fig. 17: Identifying Ignition Key Off
Courtesy of VOLVO CARS CORPORATION

Ignition off.

Remove the key.

NOTE: **The key must be removed to ensure that the ignition is not switched on by mistake.**

NOTE: **After the key has been removed: Wait 1 minute before starting work.**

Remove:

- the surround from the driver information module (DIM). See **COMBINED INSTRUMENT PANEL**

SURROUND .

Fig. 18: Combined Instrument Panel And Screws
Courtesy of VOLVO CARS CORPORATION

- the 4 screws
- the connector
- driver information module (DIM).

INSTALLING THE DRIVER INFORMATION MODULE (DIM)

Install:

In reverse order.

ORDERING SOFTWARE AND PROGRAMMING CONTROL MODULES

Order the software. See 9438293 .

Program the new control module. See 9438293 .

FINISHING WORK

The customer parameters must be programmed after replacing the control module. The clock must also be reset. Finally, check that no diagnostic trouble codes (DTCs) were stored during replacement. Information about programming control modules and reading off diagnostic trouble codes (DTCs) can be found under VIDA communication.

TROUBLE-SHOOTING INFORMATION

Condition

- No diagnostic trouble codes displayed
- Normal amount of brake fluid present
- Fault is permanent.

Possible Source

- Level sensor faulty
- Wire short circuited to ground.

Fault symptom[s]

- Brake fluid level lamp is on.

CHECKING THE BRAKE FLUID LEVEL SENSOR (2005-12)

CHECKING THE BRAKE FLUID LEVEL SENSOR

CHECKING THE CABLE AND PARKING BRAKE SWITCH

Fig. 19: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the function of the brake fluid level switch. Take readings between brake fluid level switch terminals #1 and #2.

  In the event of low fluid level the voltage must be 0 V. In the event of full fluid level the voltage should be 12 V.

  Check and remedy the wiring between driver information module (DIM) terminal #6 and brake fluid level switch terminal #1. Check for a short-circuit to ground. See **SHORT-CIRCUIT TO GROUND, PERMANENT FAULTS**.

  Other information:

- see **CONNECTING THE BREAKOUT BOX** .

Were any faults found?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  FAULT NOT FOUND: Troubleshooting has been completed.

VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 20: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 21: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect the connectors, install the components, etc.
- Fill brake fluid to maximum level.
- Ignition on.

  Brake fluid lamp should not be on.

Does fault still exist?

- **YES**

  Refer to **INFORMATION**

- **NO**

  VERIFIED: Troubleshooting has been completed.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CHECKING THE GROUND POINTS (DIM) (2003-04)

CHECKING THE GROUND TERMINALS

Fig. 22: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Control unit disconnected.
- Switch off all battery loadings such as entrance lighting and radio.

Connect an ohmmeter between the battery negative lead and test box 14.

Additional information

- To connect the test box, see **CONNECTING THE DRIVER INFORMATION MODULE (DIM) TEST BOX**
- For information on signals and additional values, see **DRIVER INFORMATION MODULE (DIM) SIGNAL DESCRIPTION** .

Fig. 23: Breakout Box
Courtesy of VOLVO CARS CORPORATION

Fig. 24: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

The ohmmeter should display approximately 0 ohms.

- **OK**

  OKAY: Troubleshooting has been completed.

- **NOT OK**

  Refer to **CHECKING FOR OPEN CIRCUITS, CONTACT RESISTANCE AND OXIDATION.**

CHECKING FOR OPEN CIRCUITS, CONTACT RESISTANCE AND OXIDATION

Check ground points 53/400 and 31/83 for an open circuit as described in, see **OPEN-CIRCUIT,**

PERMANENT FAULTS, and for contact resistance and oxidation as described in **CONTACT RESISTANCE AND OXIDATION**.

Additional information

Fig. 25: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 26: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Control unit disconnected.
- Switch off all battery loadings such as entrance lighting and radio.

Connect an ohmmeter between the battery negative lead and test box 14.

Additional information

- To connect the test box, see **CONNECTING THE DRIVER INFORMATION MODULE (DIM) TEST BOX**
- For information on signals and additional values, see **DRIVER INFORMATION MODULE (DIM) SIGNAL DESCRIPTION** .

Fig. 27: Breakout Box
Courtesy of VOLVO CARS CORPORATION

Fig. 28: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

The ohmmeter should display approximately 0.

- **OK**

  VERIFIED: Troubleshooting has been completed.

- **NOT OK**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

OPEN-CIRCUIT, PERMANENT FAULTS

Fig. 29: Checking For Open Circuit
Courtesy of VOLVO CARS CORPORATION

An open-circuit in a cable is indicated by a loss of one or more functions.

Chafed and broken cables or terminals that have come loose are common causes of faults in electrical systems.

Checks:

- Disconnect the connectors at both ends of the cable.

Connect an ohmmeter between the ends of the cable.

The ohmmeter should read approximately 0 ohms if there is no open-circuit in the cable.

Fig. 30: Identifying Control Module Installation
Courtesy of VOLVO CARS CORPORATION

Always check the control module and control module box connectors to ensure that their pins and sockets are not bent or damaged, as this can cause faults.

CONTACT RESISTANCE AND OXIDATION

Fig. 31: Identifying Terminal Inspection
Courtesy of VOLVO CARS CORPORATION

In theory, the resistance across contacts, leads and terminals should be 0 ohms. However, there is always some resistance due to terminal oxidation.

If this resistance becomes too great the result will be a malfunction. The magnitude of the resistance before it causes a malfunction depends on the circuit load.

Checks:

- Check the cables visually.

Cleaning female socket terminals and male pin terminals

Fig. 32: Apply Rust Solvent Spray Or Grease To Connectors
Courtesy of VOLVO CARS CORPORATION

NOTE: **Do not apply rust solvent spray or grease to the catalyst monitor sensor or instrument cluster connectors.**

- Ignition off
- Disconnect the battery negative terminal
- Use compressed air to clean the disconnected connector
- Apply rust solvent spray 1161422 to the disconnected connectors
- Blow clean using compressed air.

Greasing female terminals

Fig. 33: Identifying Grease Pressed Into Terminals
Courtesy of VOLVO CARS CORPORATION

NOTE: Do not fill the protective cover with grease.

- Press grease, P/N 1161417-9, into the female sockets directly from tube
- Check that all the terminal cavities are filled
- Use a loose male pin to ensure that the connection in the sockets is good. The pin should remain in position when pulled gently.

Fig. 34: Checking To Ensure Contact In Sockets Is Good
Courtesy of VOLVO CARS CORPORATION

CHECKING THE KEY WARNING FUNCTION (2003-04)

CHECKING THE KEY WARNING FUNCTION

Fig. 35: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.
- Read the value for the key warning signal by clicking on the symbol for VCT 2000.

  Value of key warning should change when the door opens and closes.

Fig. 36: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Does the input signal value change?

- **YES**

  Refer to **CHECKING THE DRIVER INFORMATION MODULE**

- **NO**

  FAULT NOT FOUND: Troubleshooting has been completed.

CHECKING THE DRIVER INFORMATION MODULE

Fig. 37: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  With door open and key in ignition lock a noise should sound from the driver information module.

Can the key warning function be heard when the door is open?

- **YES**

  Refer to **INFORMATION**

- **NO**

  Refer to **REPLACING THE DRIVER INFORMATION MODULE**

REPLACING THE DRIVER INFORMATION MODULE

CAUTION: A new control unit is supplied without software. The new control unit must be programmed before it will work.

For information on programming and replacing the control unit, see **DRIVER INFORMATION MODULE (DIM), REPLACING** .

INFORMATION

No faults found in the driver information module.

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

For the key warning function to work, the key needs to be in the ignition lock and the vehicle door open.

Possible Source

- Fault in sound mechanism in driver information module.

Fault symptom[s]

- Sound function in driver information module does not work.

CHECKING THE LAMPS AND DIALS (2003-04)

CHECKING LAMPS AND NEEDLES

ACTIVATING LAMPS

Fig. 38: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Activate the system test procedures and check whether the relevant needle or lamp operates correctly. All needles must move from minimum to maximum and back again, and the lamps must flash (except for the MIL and the indicator light for the turn signal lamps).

  The light level in the instrumentation is also checked.

  All parts of the instrumentation flash.

  Remedy as necessary

  Other information:

- To replace the lamps, see **DRIVER INFORMATION MODULE (DIM), REPLACING**
- To replace the combined instrument panel, see **DRIVER INFORMATION MODULE (DIM), REPLACING** .

Fig. 39: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

- No diagnostic trouble codes displayed
- Fault is permanent.

Possible Source

- Lamp defective
- Internal fault
- Fault in another control unit which is sending signal to DIM control unit.

Fault symptom[s]

- A dial in the instrument displays a faulty value.

CHECKING THE OIL PRESSURE (2003-04)

CHECKING THE OIL PRESSURE

CHECKING THE WIRES

Check wire between oil pressure guard 1 and engine control unit 26A for a short circuit to voltage supply as described in, see **SHORT-CIRCUIT TO SUPPLY VOLTAGE. PERMANENT FAULTS**, a short circuit to ground as described in **SHORT-CIRCUIT TO GROUND, PERMANENT FAULTS** and an open circuit as described in **OPEN-CIRCUIT, PERMANENT FAULTS**.

HINT: The voltage should be 0 V in 1 with closed oil pressure contact (lamp on) and 12 V with an open circuit (lamp off).

Do the necessary corrective action.

Additional information:

- To connect the test box, see **CONNECTING THE DRIVER INFORMATION MODULE (DIM) TEST BOX** .

Fig. 40: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

- No diagnostic trouble codes displayed.

Possible Source

- Defective oil pressure guard
- Open circuit, short circuit to voltage supply or short circuit to ground on the wire.

Fault symptom[s]

- One or more warning lamps do not work
- Low oil pressure warning lamp is on.

CHECKING THE PARKING BRAKE (INDICATOR LAMP LIT) (2005-12)

CHECKING THE PARKING BRAKE (INDICATOR LAMP LIT)

CHECK IN PROGRESS

Read off the status of the lamp.

The status must be "ON" when the parking brake is applied and "OFF" when the parking brake is released.

Other information:

- see **CONNECTING THE BREAKOUT BOX**

Fig. 41: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Are these values correct?

- **YES**

FAULT NOT FOUND: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE CABLE AND PARKING BRAKE SWITCH**

CHECKING THE CABLE AND PARKING BRAKE SWITCH

Check the function of the parking brake switch. Remedy if necessary.

HINT: Parking brake terminal 1 must only be grounded when the parking brake is applied (lamp lit).

Check the cable between combined instrument panel terminal #5 and parking brake connector terminal #1. Check for a short-circuit to ground. Remedy if necessary.

Other information:

- see **CONNECTING THE BREAKOUT BOX**
- see **CHECKING WIRING AND TERMINALS**

CHECKING THE PARKING BRAKE (INDICATOR LAMP NOT LIT) (2005-12)

CHECKING THE PARKING BRAKE (INDICATOR LAMP NOT LIT)

CHECK IN PROGRESS

- Set parking brake.

  Read off the status of the lamp.

  The status must be "ON" when the parking brake is applied and "OFF" when the parking brake is released.

Fig. 42: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Are these values correct?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING THE CABLE AND PARKING BRAKE SWITCH**

CHECKING THE CABLE AND PARKING BRAKE SWITCH

Check the function of the parking brake switch. Measure the voltage between terminal #1 and ground.

HINT: Terminal pin 1 must be grounded when the parking brake is applied.

Check the cable between combined instrument panel terminal #5 and parking brake connector terminal #1. Check for an open-circuit. Check for a short-circuit to supply voltage. Remedy if necessary.

Other information:

- see **CONNECTING THE BREAKOUT BOX**
- see **CHECKING WIRING AND TERMINALS**

Were any faults found?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  FAULT NOT FOUND: Troubleshooting has been completed.

VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 43: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 44: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect the connectors, install the components, etc.
- Ignition on.
- Handbrake on.

Does the lamp work correctly?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CHECKING THE PARKING BRAKE (WARNING LAMP DOES NOT COME ON) (2003-04)

CHECKING THE PARKING BRAKE (WARNING LAMP DOES NOT COME ON)

CHECKING THE INPUT

- Handbrake on.

  Read status of lamp.

  When handbrake is on status should be "ON", and when handbrake is released status should be "OFF".

  Additional information:

  - To connect the test box, see **CONNECTING THE DRIVER INFORMATION MODULE (DIM) TEST BOX** .

Fig. 45: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Are the values correct?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING THE WIRE AND HANDBRAKE CONTACT**

CHECKING THE WIRE AND HANDBRAKE CONTACT

Check function of handbrake switch. Measure the voltage between 1 and ground.

HINT: When handbrake is on, pin 1 should be grounded.

Check and measure the wire between combined instrument 6 and handbrake contact 1 for an open circuit as described in, see **OPEN-CIRCUIT, PERMANENT FAULTS**, and for a short circuit to voltage supply as described in **SHORT-CIRCUIT TO SUPPLY VOLTAGE. PERMANENT FAULTS**.

Additional information:

- To connect the test box, see **CONNECTING THE DRIVER INFORMATION MODULE (DIM) TEST BOX** .

Fig. 46: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Is there a fault?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  FAULT NOT FOUND: Troubleshooting has been completed.

VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 47: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 48: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect the connectors, install the components, etc.
- Ignition on.
- Handbrake on.

Does the lamp work correctly?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

TROUBLE-SHOOTING INFORMATION

Condition

- No diagnostic trouble codes displayed
- Fault is permanent
- Handbrake on.

Possible Source

- Lamp defective
- Wire short circuited to voltage supply
- Open circuit in wire
- Handbrake contact does not work.

Fault symptom[s]

- Parking brake warning lamp does not come on.

CHECKING THE PARKING BRAKE (WARNING LAMP ON) (2003-04)

CHECKING THE PARKING BRAKE (WARNING LAMP ON)

CHECKING THE INPUT

Read status of lamp.

When handbrake is on status should be "ON", and when handbrake is released status should be "OFF".

Additional information:

- To connect the test box, see **CONNECTING THE DRIVER INFORMATION MODULE (DIM) TEST BOX** .

Fig. 49: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Are the values correct?

- **YES**

  FAULT NOT FOUND: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE WIRE AND HANDBRAKE CONTACT**

CHECKING THE WIRE AND HANDBRAKE CONTACT

Check and measure handbrake switch function.

HINT: Handbrake pin 1 is only grounded when handbrake is on (lamp on).

Check and measure wire between combined instrument 6 and handbrake contact 1 for a short circuit to ground as described in, see **SHORT-CIRCUIT TO GROUND, PERMANENT FAULTS**.

Additional information:

- To connect the test box, see **CONNECTING THE DRIVER INFORMATION MODULE (DIM) TEST BOX** .

Fig. 50: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

- No diagnostic trouble codes displayed
- Fault is permanent
- Hand brake not on.

Possible Source

- Wire short circuited to ground
- Handbrake contact does not work.

Fault symptom[s]

- Parking brake warning lamp on.

CHECKING THE POWER SUPPLY (2003-04)

CHECKING SUPPLY

Check passenger compartment fuse 24 (11C/24:2).

Check the cable between combined instrument panel supply relay (2/29) #3 and passenger compartment fuse 24 (11C/24:2) for an open-circuit according to **OPEN-CIRCUIT, PERMANENT FAULTS** and a short-circuit to ground according to **SHORT-CIRCUIT TO GROUND, PERMANENT FAULTS**.

Check that the relay is not defective.

Check the cable between combined instrument panel #1 and parking brake connector #1 for a short-circuit to ground according to **SHORT-CIRCUIT TO GROUND, PERMANENT FAULTS**.

Check the cable between combined instrument panel #1 and combined instrument panel supply relay (2/29) #1 for an open-circuit according to **OPEN-CIRCUIT, PERMANENT FAULTS** and a short-circuit to ground according to **SHORT-CIRCUIT TO GROUND, PERMANENT FAULTS**.

Check the cable between combined instrument panel #14 and ground for an open-circuit according to **OPEN-CIRCUIT, PERMANENT FAULTS** and a short-circuit to supply voltage according to **SHORT-CIRCUIT TO SUPPLY VOLTAGE. PERMANENT FAULTS**.

Remedy as necessary

Other information:

- To connect the breakout box, see **CONNECTING THE DRIVER INFORMATION MODULE (DIM) TEST BOX** .
- For other values, see **DRIVER INFORMATION MODULE (DIM) SIGNAL DESCRIPTION** .

Fig. 51: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

Fig. 52: Fuse Holder (Passenger Compartment)
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  FAULT NOT FOUND: Troubleshooting has been completed.

VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 53: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 54: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect the connectors, install the components, etc.
- Ignition on.

Do control and warning lamps come on when ignition is on?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

TROUBLE-SHOOTING INFORMATION

Condition

- No diagnostic trouble codes displayed
- Fault is permanent.

Possible Source

- Wire short circuited to ground
- Wire short circuited to voltage supply
- Open circuit in wire
- Defective fuse.

Fault symptom[s]

- No control or warning lamps are on when ignition is on.

PROGRAMMING THE SERVICE PARAMETERS (2003-04)

PROGRAMMING THE SERVICE PARAMETERS

The following data can be programmed in the driver information module (DIM).

Programming of:

- New meter indication.
- Conditions for activation of Service Reminder Lamp (SRL), distance covered for service, service time and engine service time.
- Instrument displaying zeros for driving distance.
- Temperature unit.
- Trip computer unit (applies only to cars with trip computers).
- 12 or 24 hour clock display.

- **Continue**

Refer to **SELECTING THE INSTRUMENT TYPE**

SELECTING THE INSTRUMENT TYPE

Select the appropriate alternative depending on whether the instrument is set for kilometers or miles. If the speedometer range is from 0-260 it is a kilometre instrument and if the range is from 0-160 it is a miles instrument.

1. Km. Refer to **RESETTING THE ODOMETER SETTING**.
2. Miles. Refer to **RESETTING THE ODOMETER SETTING**

RESETTING THE ODOMETER SETTING

RESETTING THE ODOMETER SETTING (KM)

- Ignition on

CAUTION: It is only possible to program this parameter once and then only if the reading is below 500 km. It may be illegal to change the odometer setting in the driver information module (DIM).

To reset the odometer setting, click the VCT2000 symbol.

Fig. 55: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **PROGRAMMING THE DISTANCE COVERED FOR SERVICE**

RESETTING THE ODOMETER SETTING

RESETTING THE ODOMETER SETTING (MILES)

- Ignition on

CAUTION: It is only possible to program this parameter once and then only if the reading is below 310 miles. It may be illegal to change the odometer setting in the driver information module (DIM).

To reset the odometer setting, click the VCT2000 symbol.

Fig. 56: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **PROGRAMMING DISTANCE CONDITIONS FOR SERVICE**

PROGRAMMING THE DISTANCE COVERED FOR SERVICE

PROGRAMMING THE DISTANCE COVERED FOR SERVICE (KM)

Fig. 57: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  There are three service parameter units which can be programmed. Using this parameter, the number of km (miles) is set which the car must cover before the SRL lamp switches on. (Service reminder lamp)

  Choices can be made between 5000, 7500, 10000, 15000 or 20000 km (miles).

Read the programmed data.

If the service parameter is to be changed, mark the desired value in the scrolling list and start the programming.

Fig. 58: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **PROGRAMMING THE SERVICE TIME PARAMETERS**

PROGRAMMING DISTANCE CONDITIONS FOR SERVICE

Fig. 59: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  There are three programmable service parameters. This parameter is used to set the number of miles a car can be driven before the Service Reminder Indicator (SRI) is lit. (Service reminder lamp)

  2, 500, 5, 000, 6000, 7, 500, 10, 000 or 12, 000 miles can be selected.

  Read off the parameter that is programmed.

  To change the service parameter, mark the desired value in the scrolling list and start programming.

Fig. 60: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **PROGRAMMING THE SERVICE TIME PARAMETERS**

PROGRAMMING THE SERVICE TIME PARAMETERS

Fig. 61: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

There are three service parameters that can be programmed. This parameter is used to set the number of months before the Service Reminder Indicator (SRI) lights.

The following options are available:

- 6 months

- 12 months

Read the input data.

If the service parameter is to be changed, key the necessary value into the scrolling list and start the programming.

Fig. 62: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **PROGRAMMING THE ENGINE SERVICE TIME PARAMETERS**

PROGRAMMING THE ENGINE SERVICE TIME PARAMETERS

There are three service parameter units which can be programmed. Using these parameters, the number of hours is set which the engine may run before the SRL lamp switches on. (Service reminder lamp).

The permitted settings are 500, 750 or 1000 hours.

Read the input data.

If the service parameter is to be changed, key the necessary value into the scrolling list and start the programming.

Fig. 63: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **PROGRAMMING OF ZEROS (CUSTOMER PREFERENCE)**

PROGRAMMING OF ZEROS (CUSTOMER PREFERENCE)

The zeros in the instrument can be set to be displayed or hidden. If the zeros are displayed, all the positions before the number of kilometres covered are filled with zeros, and if the zeros are hidden these positions remain blank.

Read the input data.

If the value is to be changed, enter the necessary value into the scrolling list and start the programming.

Fig. 64: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **PROGRAMMING UNITS OF MEASUREMENT FOR TEMPERATURE (CUSTOMER PROGRAMMABLE)**

PROGRAMMING UNITS OF MEASUREMENT FOR TEMPERATURE (CUSTOMER PROGRAMMABLE)

The units of measurement for the temperature can be set.

Options are: Celsius or Fahrenheit.

Read off the parameter that is programmed.

To change the value, mark the desired value in the scrolling list and start programming.

Fig. 65: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **PROGRAMMING OF TRIP COMPUTER UNIT (CUSTOMER PREFERENCE)**

PROGRAMMING OF TRIP COMPUTER UNIT (CUSTOMER PREFERENCE)

A desired unit may be set for the trip computer if you have purchased this function. The permitted choices are litres, GB gallons or US gallons.

Read the input data.

If the value is to be changed, enter the necessary value into the scrolling list and start the programming.

Fig. 66: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **PROGRAMMING OF CLOCK BY CUSTOMER**

PROGRAMMING OF CLOCK BY CUSTOMER

The clock may be displayed.

This may be either a 12 hour display or 24 hour display.

Read the input data.

If the value is to be changed, key the necessary value into the scrolling list and start the programming.

Fig. 67: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

ACCESSORIES AND BODY, CAB

Media, Communication And Navigation - Cleaning, Inspection and Adjustment

COMMUNICATION RADIO, MOBILE TELEPHONE

VOLVO ON CALL, ACTIVATION

ACTIVATION PROCEDURE

Access the Volvo On Call database. Volvo VIDA is necessary.

VOLVO ON CALL, DEACTIVATION (CANCELING)

DEACTIVATION PROCEDURE

To deactivate Volvo On Call at the request of the customer, switch off the internal SIM card for the Volvo On Call subscription.

VOLVO ON CALL, RE-ACTIVATION

RE-ACTIVATION PROCEDURE

Reactivating Volvo On Call is carried out when the subscription has previously expired.

ACCESSORIES AND EQUIPMENT

Media, Communication And Navigation - Component Location

COMPONENT LOCATION, AUDIO MODULE (AUD) (2003-06)

LOCATION OF COMPONENTS

Fig. 1: Identifying Audio Module (AUD) Components

ACCESSORIES AND BODY, CAB

Media, Communication And Navigation - Diagnostic Trouble Codes and Associated Procedures

PHM-0013: CONTROL MODULE. INTERNAL FAULT (2003-2005)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-0013

Condition

Diagnostic trouble code (DTC) PHM-0013 is stored if the phone module (PHM) registers an internal fault in the power supply.

Diagnostic trouble code (DTC) PHM-0013 can be diagnosed with the ignition on (not key position 3) and when the battery voltage is 9-16 V.

Substitute Value

- None.

Possible Source

- Internal fault in the power supply to the phone module (PHM).

Fault symptom[s]

- No or reduced carphone functionality.

INTERNAL FAULT

REPLACING THE COMPONENT

The phone module (PHM) has registered an internal fault.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up of the control module or may be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs. If the fault recurs, replace the control module.

In the event of a permanent fault, replace the control module. See **PHONE MODULE (PHM), REPLACING** .

Remedy as necessary.

- **Continue**

  See: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

PHM-0013: CONTROL MODULE. INTERNAL FAULT (2006-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-0013

Condition

Fig. 2: Identifying Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the phone module (PHM) registers an internal fault in the power supply.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on (not key position 3) and when the battery voltage is 9-16 V.

Substitute Value

- None.

Possible Source

- Internal fault in the power supply to the phone module (PHM).

Fault symptom[s]

- No or reduced carphone functionality.
- Message in the text display (applies only to phone modules (PHM) with Volvo On Call).

INTERNAL FAULT

REPLACING THE COMPONENT

The phone module (PHM) has registered an internal fault.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults may be due to interference at start up of the control module or may be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs. If the fault recurs, replace the control module.

In the event of a permanent fault, replace the control module.

Remedy as necessary.

Other information

  See: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

PHM-0014: CARPHONE ANTENNA. SIGNAL TOO HIGH / SIGNAL MISSING (2006-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-0014

Condition

Fig. 4: Identifying Carphone Antenna
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the phone module (PHM) registers an open-circuit or a short-circuit to +12 V in the cable for the carphone antenna signal.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on (not key position 3) and when the battery voltage is 9-16 V.

Substitute Value

- None.

Possible Source

- Open-circuit in the cable (carphone antenna signal) from the antenna to the control module
- Short-circuit to +12 V in the cable (carphone antenna signal)
- Contact resistance, oxidation or loose connections in the connectors.

Fault symptom[s]

- No or poor reception in the carphone.

SIGNAL TOO HIGH OR SIGNAL MISSING

CHECKING THE COMPONENT AND WIRING

Fig. 5: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect connector C from the phone module (PHM)
- Disconnect connector A from the phone module (PHM).

Check the cable for the carphone antenna. Check for a short-circuit to supply voltage.

Check between:

- connector A terminal #5 (#5) and connector C terminal #1
- connector A terminal #5 (#5) and connector C terminal #2.

Check the cable for the carphone antenna. Check for an open-circuit.

Take a reading on the antenna cable connector between terminals #1 and #2. If the antenna cable is OK, the resistance must be approximately 10 kohms.

Check the connectors for loose connections, damaged or bent terminal pins and oxidation.

Try replacing the carphone antenna if the cables are OK.

Remedy as necessary.

Other information:

- see **SIGNAL SPECIFICATION**
- see **CONNECTING THE BREAKOUT BOX**
- see **LOCATION OF COMPONENTS**

Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on
- Activate the carphone.

  Make a call so that both the handset and the hands-free system are used.

  - Ignition off.
  - Ignition on.
  - Read off the diagnostic trouble codes (DTCs).
  - Check that the relevant diagnostic trouble code (DTC) has switched status from permanent to

intermittent fault.

Fig. 10: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Has the status of the diagnostic trouble code (DTC) changed?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  See: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

PHM-0014: CARPHONE ANTENNA. SIGNAL TOO HIGH OR SIGNAL

MISSING (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-0014

Condition

Diagnostic trouble code (DTC) PHM-0014 is stored if the phone module (PHM) registers an open-circuit or a short-circuit to +12 V in the wiring for the carphone antenna signal.

Diagnostic trouble code (DTC) PHM-0014 can be diagnosed with the ignition on (not key position 3) and when the battery voltage is 9-16 V.

Substitute Value

- None.

Possible Source

- Open-circuit in the wiring (carphone antenna signal) from the antenna to the control module
- Short-circuit to +12 V in the wiring (carphone antenna signal).

Fault symptom[s]

- No or poor reception in the carphone.

SIGNAL TOO HIGH OR SIGNAL MISSING

CHECKING COMPONENTS AND WIRING

Fig. 11: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check the antenna cable between the phone module (PHM) connector C and the carphone antenna connector in the right-hand A post. Check for a short-circuit to supply voltage.

  Check the antenna cable between control module connector A and the carphone antenna connector in the right-hand A-post. Check for an open-circuit.

  Check the connectors for loose connections, damaged or bent terminal pins and oxidation.

  Remedy as necessary.

  Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For information about signals and connectors, see **SIGNAL SPECIFICATION**
- To access or replace the control module, see **PHONE MODULE (PHM), REPLACING**
- To access and replace the carphone antenna, see **ANTENNA CARPHONE, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 12: Identifying 1-Bit Connector

Fig. 13: Breakout Box
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  See: **VERIFICATION**

- **NO**

  See: **CHECKING THE CONNECTORS AND WIRING**

CHECKING THE CONNECTORS AND WIRING

Raise the secondary lock on the connector in the right A-pillar.

Loosen the primary lock and remove the insulator.

Carefully remove the antenna from the headlining.

Measure the resistance between the signal line and screen ground on the connector. The resistance must be approximately 0 ohms.

Measure the resistance between screen ground and ground. The resistance must be infinite.

Carefully remove the three screws that hold the antenna's circuit board.

Carefully lift up the circuit board from the mounting point so that there is no contact between the circuit board and the casing.

Measure the resistance between the signal line and screen ground. The resistance must be infinite. If the resistance is infinite there is a short-circuit between the signal line and screen ground.

Remedy as necessary.

Other information

- see **ANTENNA CARPHONE, REPLACING**
- see **CONNECTORS, REPAIR**

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

PHM-0015: CONTROL MODULE. INTERNAL FAULT (2006-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-0015

Condition

Fig. 36: Identifying Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the phone module (PHM) registers an internal fault.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on (not key position 3) and when the battery voltage is 9-16 V.

Substitute Value

- None.

Possible Source

- Internal fault in the phone module (PHM).

Fault symptom[s]

- No or reduced carphone functionality.
- Message in the text display (applies only to phone modules (PHM) with Volvo On Call).

INTERNAL FAULT

see **INTERNAL FAULT**

PHM-0015: CONTROL MODULE. INTERNAL FAULT (2003-2005)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-0015

Condition

Diagnostic trouble code (DTC) PHM-0015 is stored if the phone module (PHM) registers an internal fault.

Diagnostic trouble code (DTC) PHM-0015 can be diagnosed with the ignition on (not key position 3) and when the battery voltage is 9-16 V.

Substitute Value

- None.

Possible Source

- Internal fault in the phone module (PHM).

Fault symptom[s]

FAULT-TRACING INFORMATION

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

PHM-0020: HANDSET MICROPHONE. SIGNAL TOO HIGH / SIGNAL MISSING (2006-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-0020

Condition

Fig. 38: Identifying Handset Cradle
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the phone module (PHM) registers an open-circuit or a short-circuit to +12 V in the microphone signal to the handset.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on (not key position 3) and when the battery voltage is 9-16 V.

Substitute Value

- Only hands-free operates.

Possible Source

- Short-circuit to +12 V in the cable (microphone signal) between the handset and the control module
- Open-circuit in the cable (microphone signal) between the handset and the control module
- Contact resistance, oxidation or loose connections in the connectors.

Fault symptom[s]

- The carphone handset is not working.
- Message in the text display (applies only to phone modules (PHM) with Volvo On Call).

SIGNAL TOO HIGH / SIGNAL MISSING

CHECKING THE COMPONENT AND WIRING

Fig. 39: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect connector A from the phone module (PHM)
- Disconnect the handset connector.

  Check the microphone signal cable at control module connector A. Check for a short-circuit to supply voltage.

  Check between:

- terminals #19 (#19) and #7 (#7)
- terminals #19 (#19) and #5 (#5).

Check the cable for the microphone signal. Check for an open-circuit.

Take a reading between control module connector terminal A#19 (#19) and handset connector terminal #1 (#21).

Check the connectors for loose connections, damaged or bent terminal pins and oxidation.

Try replacing the carphone handset or holder if no fault is found in the cable.

Remedy as necessary.

CHECKING COMPONENTS AND WIRING

Fig. 53: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect connector A for the phone module (PHM).
- Disconnect the handset's connector.

Check the microphone signal's cable on the control module's connector A for short-circuit to voltage.

Check between:

- #19 (#19) and #7 (#7).
- #19 (#19) and #5 (#5).

Check the microphone signal's cable for open circuit.

Measure between the control module's connector A #19 (#19) and the handset's connector #1 (#21).

Check the connectors for loose connections, damaged or bent pins as well as oxidation.

If no malfunction was found on the cable, try replacing the handset or holder.

Remedy as necessary.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

PHM-0022: HANDSET SUPPLY. SIGNAL TOO HIGH (2006-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-0022

Condition

Fig. 65: Identifying Handset Cradle
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the phone module (PHM) registers a short-circuit to +12 V in the power supply to the handset.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on (not key position 3) and when the battery voltage is 9-16 V.

Substitute Value

- Only hands-free operates.

Possible Source

- Short-circuit to +12 V in the cable (power supply) from the phone module (PHM) to the handset.

Fault symptom[s]

- The carphone handset is not working.
- Message in the text display (applies only to phone modules (PHM) with Volvo On Call).

SIGNAL TOO HIGH

CHECKING THE COMPONENT AND WIRING

Fig. 66: Identifying Ignition ON

PHM-0030: RESERVE BATTERY. VOLTAGE TOO LOW (2006-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-0030

Condition

Fig. 94: Identifying Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the phone module (PHM) detects that the capacity of the internal reserve battery is too low. The reserve battery is in the phone module (PHM). The reserve battery is used when a Volvo On Call service is connected and the phone module (PHM) does not have access to the power supply from the main battery.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on (not key position 3) and when the battery voltage is between 9-16 V. The diagnostic trouble code (DTC) can only be diagnosed for a phone module (PHM) with Volvo On Call functionality.

Substitute Value

- None.

Possible Source

- The capacity of the internal reserve battery is too low.

Fault symptom[s]

- Volvo On Call/Does not work
- Text window and warning symbol/Text message

VOLTAGE TOO LOW

REPLACING THE COMPONENT

PHM-003A: INTERNAL ANTENNA. SIGNAL MISSING (2006-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-003A

Condition

Fig. 99: Identifying Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the phone module (PHM) detects an open-circuit in the signal to the internal reserve antenna. The reserve antenna is in the phone module (PHM). The reserve antenna is used when a Volvo On Call service is connected and the normal telephone antenna is not functioning.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on (not key position 3) and when the battery voltage is between 9-16 V. The diagnostic trouble code (DTC) can only be diagnosed for a phone module (PHM) with Volvo On Call functionality.

Substitute Value

- None.

Possible Source

- Open-circuit in the signal to the internal reserve antenna.

Fault symptom[s]

- Messages in the display.
- No or poor carphone reception.

SIGNAL MISSING

REPLACING THE COMPONENT

Fig. 100: Identifying Ignition OFF

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

PHM-0063: LIGHTING SWITCH. SIGNAL TOO HIGH / SIGNAL MISSING

(2006-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-0063

Condition

Fig. 109: Identifying Phone Module (PHM)
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the phone module (PHM) detects an open-circuit or a short-circuit to supply voltage in the signal for lighting the Volvo On Call switches. The lighting for the Volvo On Call switches is powered via the phone module (PHM). The power supply is a PWM signal (Pulse Width Modulated).

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on (not key position 3) and when the battery voltage is between 9-16 V. The diagnostic trouble code (DTC) can only be diagnosed for a phone module (PHM) with Volvo On Call functionality.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the cable for lighting the Volvo On Call switch
- Open-circuit in the cable for lighting the Volvo On Call switch.

Fault symptom[s]

- No or reduced Volvo On Call functionality.

SIGNAL TOO HIGH / SIGNAL MISSING

CHECKING THE COMPONENT AND WIRING

Fig. 110: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off

- Disconnect connector A from the phone module (PHM)
- Disconnect the connector for the Volvo On Call switch.

HINT: There is probably a short-circuit to supply voltage in one of the cables if the ON CALL/SOS switch lights too brightly. There is probably an open-circuit in the cables if the ON CALL/SOS switch does not light at all.

Check the cables for control module connector A for lighting the switch. Check for a short-circuit to supply voltage.

Check between:

- terminals #3 (#3) and #5 (#5)
- terminals #4 (#4) and #5 (#5).

Check the cables for lighting the switch. Check for an open-circuit.

Check between:

- control module connector A terminal #4 (#4) and the connector for switch terminal #4 (#16)
- control module connector A terminal #3 (#3) and the connector for switch terminal #3 (#15).

Try replacing the switch if the cables are OK.

Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

PHM-0065: VOLVO ON CALL SWITCH. SIGNAL TOO LOW OR SIGNAL

MISSING (2006-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-0065

Condition

Fig. 123: Identifying Phone Module (PHM)
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the phone module (PHM) detects an open-circuit or a short-circuit to ground in the signals for either the SOS or the ON CALL switch.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on (not key position 3) and when the battery voltage is between 9-16 V. The diagnostic trouble code (DTC) can only be diagnosed for a phone module (PHM) with Volvo On Call functionality.

Substitute Value

- None.

Possible Source

- Open-circuit in the cable between the phone module (PHM) and the ON CALL switch

- Open-circuit in the cable between the phone module (PHM) and the SOS switch
- Short-circuit to ground in the cable between the phone module (PHM) and the ON CALL switch
- Short-circuit to ground in the cable between the phone module (PHM) and the SOS switch.

Fault symptom[s]

- Messages in the display
- No or reduced Volvo On Call functionality.

SIGNAL TOO LOW OR SIGNAL MISSING

CHECKING THE COMPONENT AND WIRING

Fig. 124: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect connector A from the phone module (PHM).

Check the cables for the Volvo On Call switch at control module connector A. Check for a short-circuit to ground.

Check between:

- terminals #2 (#2) and #13 (#13)
- terminals #2 (#2) and #14 (#14)
- terminals #2 (#2) and #6 (#6).

Check the cables for the Volvo On Call switch. Check for an open-circuit.

Take a reading between control module connector A terminal #2 (#2) and the connector for switch terminal #6 (#18).

Try replacing the switch if the cables are OK.

Remedy as necessary.

Other information:

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

PHM-0066: VOLVO ON CALL SWITCH. SIGNAL TOO HIGH (2006-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-0066

Condition

Fig. 130: Identifying Phone Module (PHM)
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the phone module (PHM) detects a short-circuit to supply voltage in the signals for either the SOS or the ON CALL switch.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on (not key position 3) and when the battery voltage is between 9-16 V. The diagnostic trouble code (DTC) can only be diagnosed for a phone module (PHM) with Volvo On Call functionality.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the cable between the phone module (PHM) and the SOS switch
- Short-circuit to supply voltage in the cable between the phone module (PHM) and the On Call switch.

Fault symptom[s]

- Messages in the display.
- No or reduced Volvo On Call functionality.

SIGNAL TOO HIGH

CHECKING THE COMPONENT AND WIRING

Fig. 131: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect connector A from the phone module (PHM).

Check the cables for the Volvo On Call switch. Check for a short-circuit to supply voltage.

Take a reading between control module connector A terminals #2 (#2) and #5 (#5).

Try replacing the switch if the cable is OK.

Remedy as necessary.

PHM-0067: RESERV BATTERY. NOT CONNECTED (2006-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-0067

Condition

Fig. 137: Identifying Control Module
Courtesy of VOLVO CARS CORPORATION

The spare battery is located in the Phone module (PHM) and used when a Volvo On Call service is connected and the Phone module (PHM) does not have access to voltage supply from the main battery.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The internal auxiliary battery is damaged or not connected.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- At least 30 days have passed since the last test or after an activation of checking the auxiliary battery.
- Battery voltage between 9 - 16 V.
- Ignition off for at least 10 seconds.

Substitute Value

- None.

Possible Source

- The internal reserve battery is not connected to the phone module (PHM)

- The internal reserve battery is damaged.
- Capacity too low on the spare battery.

Fault symptom[s]

- Volvo On Call/Does not work
- Text window and warning symbol/Text message

NOT CONNECTED

CHECKING THE COMPONENT

Fig. 138: Identifying Ignition OFF

Is the carphone working?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  See: **INFORMATION**

PHM-0068: SIM CARD HOLDER. SIGNAL MISSING (2006-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-0068

Condition

Fig. 142: Identifying Sim Card Holder
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the phone module (PHM) registers that there is no signal from the external SIM card reader.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on (not key position 3) and when the battery voltage is 9-16 V.

Substitute Value

- None.

Possible Source

- Open-circuit in the cable between the SIM card reader and the control module
- Fault in the SIM card reader
- The SIM card holder is not properly pressed into the SIM card reader.

Fault symptom[s]

- The SIM card reader is not working.

SIGNAL MISSING

CHECKING THE COMPONENT AND WIRING

Check the cable between phone module (PHM) connector B and the connector for the SIM card reader. Check for an open-circuit.

Check between:

- control module connector terminal B#1 (#21) and SIM card reader connector terminal #1

- control module connector terminal B#2 (#22) and SIM card reader connector terminal #2
- control module connector terminal B#3 (#3) and SIM card reader connector terminal #3
- control module connector terminal B#4 (#4) and SIM card reader connector terminal #4
- control module connector terminal B#5 (#5) and SIM card reader connector terminal #5
- control module connector terminal B#6 (#6) and SIM card reader connector terminal #6.

Check the connectors for loose connections, damaged or bent terminal pins and oxidation.

Try replacing the SIM card reader if no fault is found in the cable.

Remedy as necessary.

Other information:

  See: **INFORMATION**

PHM-0068: SIM CARD READER. SIGNAL MISSING (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-0068

Condition

Diagnostic trouble code (DTC) PHM-0068 is stored if the phone module (PHM) registers that there is no signal from the external SIM card reader.

Diagnostic trouble code (DTC) PHM-0068 can be diagnosed with the ignition on (not key position 3) and when the battery voltage is 9-16 V.

Substitute Value

- None.

Possible Source

- Open-circuit in the wiring between the SIM card reader and the control module
- Fault in the SIM card reader
- The SIM card holder is not properly pressed into the SIM card reader.

Fault symptom[s]

- The SIM card reader is not working.

SIGNAL MISSING

CHECKING THE COMPONENT AND WIRING

Check the wiring between phone module (PHM) connector A and the SIM card reader connector. Check for an open-circuit.

Take readings between:

- control module connector A terminal #9 (#9) and SIM card reader connector terminal #1
- control module connector A terminal #8 (#8) and SIM card reader connector terminal #2
- control module connector A terminal #7 (#7) and SIM card reader connector terminal #3
- control module connector A terminal #21 (#21) and SIM card reader connector terminal #4
- control module connector A terminal #19 (#19) and SIM card reader connector terminal #5
- control module connector A terminal #20 (#20) and SIM card reader connector terminal #6.

Check the connectors for loose connections, damaged or bent terminal pins and oxidation.

Try replacing the SIM card reader if no fault is found in the cable.

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For information about signals and connectors, see **SIGNAL SPECIFICATION**
- To access and replace the control module, see **PHONE MODULE (PHM), REPLACING**
- To access or replace the SIM card reader, see **INFOTAINMENT CONTROL MODULE (ICM),**

REPLACING

- see **CHECKING WIRING AND TERMINALS** .

Select one of the above alternatives.

- **1**

  See: **SIGNAL MISSING**

- **2**

  See: **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Check the cable between connector B to phone module (PHM) and the SIM-card reader's connector for open circuit.

Check between:

- control module's connector B#1 (#21) and SIM-card reader's connector #1
- control module's connector B#2 (#22) and SIM-card reader's connector #2
- control module's connector B#3 (#3) and SIM-card reader's connector #3
- control module's connector B#4 (#4) and SIM-card reader's connector #4
- control module's connector B#5 (#5) and SIM-card reader's connector #5
- control module's connector B#6 (#6) and SIM-card reader's connector #6.

Check the connectors for loose connections, damaged or bent pins as well as oxidation.

If no malfunction was found on the cable, try replacing the SIM-card reader.

Remedy as necessary.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

PHM-006A: COMMUNICATION PROBLEMS MOST. INTERNAL FAULT (2003-2005)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-006A

Condition

Diagnostic trouble code (DTC) PHM-006A is stored if the phone module (PHM) registers a fault in the MOST communication.

Diagnostic trouble code (DTC) PHM-006A can be diagnosed with the ignition on (not key position 3) and when the battery voltage is 9-16 V.

Substitute Value

- None.

Possible Source

- Fault in the connection to MOST
- Fault in the MOST transceiver for the phone module (PHM).

Fault symptom[s]

- No or reduced carphone functionality
- Functions in the infotainment system do not work.

INTERNAL FAULT

CHECKING CONTROL MODULES ON THE MOST NETWORK

The phone module (PHM) has registered a fault in the communication on the MOST network. This is either due to a fault in the MOST transceiver for the phone module (PHM) or because of interrupted communication on the MOST network.

Start the fault-tracing by checking whether other control modules on the MOST network function by listening to the radio or a CD / MiniDisc.

Are the other control modules on the MOST network working?

- **YES**

  See: **REPLACING THE COMPONENT**

- **NO**

See: **FAULT-TRACING MOST**

REPLACING THE COMPONENT

If the other control modules on the MOST network are working normally, there is probably an internal fault in the phone module (PHM).

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up of the phone module (PHM) or may be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs. If the fault recurs, replace the control module.

In the event of a permanent fault, replace the control module.

Remedy as necessary.

Other information:

- To access or replace the control module, see **PHONE MODULE (PHM), REPLACING** .

Fig. 167: Identifying Phone Module (PHM)
Courtesy of VOLVO CARS CORPORATION

- **Continue**

See: **INFORMATION**

FAULT-TRACING MOST

If other control modules on the MOST network are not working, MOST communication is not possible. The fault may be an open-circuit on the MOST cable or because a control module is not working. The phone module (PHM) can only diagnose that it is unable to communicate on the MOST network, but not where the fault is. Continue the fault-tracing therefore by reading off diagnostic trouble codes (DTCs) from the infotainment control module (ICM) and then following the relevant fault-tracing procedures.

- **Continue**

OKAY: Troubleshooting has been completed.

INFORMATION

FAULT-TRACING INFORMATION

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

PHM-006B: CONTROL MODULE MEMORY FAULT. INTERNAL FAULT (2006-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-006B

Condition

Fig. 168: Identifying Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the phone module (PHM) registers an internal fault.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on (not key position 3) and

when the battery voltage is 9-16 V.

Substitute Value

- None.

Possible Source

- Internal fault in the control module.

Fault symptom[s]

- No or reduced carphone functionality.
- Message in the text display (applies only to phone modules (PHM) with Volvo On Call)

INTERNAL FAULT

see **INTERNAL FAULT**

PHM-006B: CONTROL MODULE. INTERNAL FAULT (2003-2005)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-006B

Condition

Diagnostic trouble code (DTC) PHM-006B is stored if the phone module (PHM) registers an internal fault.

Diagnostic trouble code (DTC) PHM-006B can be diagnosed with the ignition on (not key position 3) and when the battery voltage is 9-16 V.

Substitute Value

- None.

Possible Source

- Internal fault in the control module.

Fault symptom[s]

- No or reduced carphone functionality.

INTERNAL FAULT

REPLACING THE COMPONENT

The phone module (PHM) has registered an internal fault.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up of the phone module (PHM) or may be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs. If the fault recurs, replace the control module.

In the event of a permanent fault, replace the control module. See **PHONE MODULE (PHM), REPLACING** .

Remedy as necessary.

PHM-006C: HANDSET CRADLE. SIGNAL TOO LOW (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-006C

Condition

Diagnostic trouble code (DTC) PHM-006C is stored if the phone module (PHM) registers that there is a short-circuit to ground in the signal to the handset or cradle switch.

Diagnostic trouble code (DTC) PHM-006C can be diagnosed with the ignition on (not key position 3) and when the battery voltage is 9-16 V.

Substitute Value

- Only hands-free operates.

Possible Source

- Short-circuit to ground in the wiring (cradle signal) between the handset and the control module.

Fault symptom[s]

- The handset does not function.

SIGNAL TOO LOW

CHECKING THE COMPONENT AND WIRING

Fig. 170: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check the cradle signal cable between phone module (PHM) connector B terminal #12 (#54) and handset connector terminal #4 (#24). Check for a short-circuit to ground.

  Try replacing the handset if the wiring is OK.

  Remedy as necessary.

  Other information:

  - The cradle signal is approximately 2.9-3.7 V when the handset is in use
  - The cradle signal is approximately 1.6-2.1 V when the handset is in the cradle
  - To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
  - For information about signals and connectors, see **SIGNAL SPECIFICATION**
  - To access and replace the control module, see **PHONE MODULE (PHM), REPLACING**
  - To access or replace the handset, see **HANDSET, REPLACING**

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-006C

Condition

Fig. 177: Identifying Handset Cradle
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the phone module (PHM) registers a short-circuit to ground in the signal to the handset (cradle switch).

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on (not key position 3) and when the battery voltage is 9-16 V.

Substitute Value

- Only hands-free operates.

Possible Source

- Short-circuit to ground in the cable (cradle signal) between the handset and the control module.

Fault symptom[s]

- The handset does not function.
- Message in the text display (applies only to phone modules (PHM) with Volvo On Call).

SIGNAL TOO LOW

CHECKING THE COMPONENT AND WIRING

Fig. 178: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect connector A from the phone module (PHM).

Check the cable for the cradle signal. Check for a short-circuit to ground.

Check between:

- terminals #8 (#8) and #18 (#18) on control module connector A
- terminals #8 (#8) and #6 (#6) on control module connector A.

Try replacing the handset if the wiring is OK.

Remedy as necessary.

Other information:

- The cradle signal is approximately 5 V when the handset is in use
- The cradle signal is approximately 0 V when the handset is in the cradle

PHM-0070: CONTROL MODULE. INCORRECT SOFTWARE (2006-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-0070

Condition

The phone module (PHM) has an internal parameter file that tells the control module how it is configured. The software in the Phone module (PHM) checks that the internal parameter file is correct.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Start-up of the control module.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The parameter file is of the wrong format.

Fig. 199: Identifying Phone Module (PHM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None

Possible Source

- Incorrect internal parameter file.

Fault symptom[s]

- Cellular phone/Does not work
- Cellular phone/Other cellular phone problems

FAULTY SOFTWARE

FAULTY SOFTWARE

Problems with the local parameter file are remedied by downloading new software to the Phone module (PHM).

- Load new software into the control module.

PHM-0080: VOLVO ON CALL SWITCH. INCORRECT KEYPAD INSTALLED (2006-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-0080

Condition

Fig. 203: Identifying Phone Module (PHM)
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if a phone module (PHM) without Volvo On Call functionality registers that the Volvo On Call switches are incorrectly connected to the control module.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on (not key position 3) and when the battery voltage is between 9-16 V. The diagnostic trouble code (DTC) can only be diagnosed for a phone module (PHM) without Volvo On Call functionality.

Substitute Value

- None.

Possible Source

- The switches for Volvo On Call are incorrectly installed and connected in a vehicle that should have a phone module (PHM) without Volvo On Call functionality
- A phone module (PHM) without Volvo On Call functionality is incorrectly installed in a vehicle that should be equipped with Volvo On Call.

Fault symptom[s]

- No or reduced Volvo On Call functionality.

INCORRECT KEYPAD INSTALLED

CHECKING THE COMPONENT

Fig. 204: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  The fault is because the Volvo On Call switches were mistakenly connected to a phone module (PHM) without Volvo On Call functionality.

  Use the VCT2000 (or appropriate scan tool) to check whether the phone module (PHM) in the vehicle is prepared for Volvo On Call functionality.

Remedy as necessary.

- **NO**

  See: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

PHM-0082: VOLVO ON CALL SWITCH. ACTIVATED TOO LONG (2006-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-0082

Condition

Fig. 210: Identifying Phone Module (PHM) Connector
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the phone module (PHM) detects that the switch for ON CALL or SOS is pressed in for longer than two minutes.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on (not key position 3) and when the battery voltage is between 9-16 V. The diagnostic trouble code (DTC) can only be diagnosed for a phone module (PHM) with Volvo On Call functionality.

Substitute Value

- None. The phone module (PHM) makes a call to Volvo On Call Customer Service Center for as long as the switch is pressed in.

Possible Source

- The switch for Volvo On Call is stuck in the pressed in position
- Unintentionally long activation of the switch.

Fault symptom[s]

- No or reduced Volvo On Call functionality.

ACTIVATED TOO LONG

CHECKING THE COMPONENT

Fig. 211: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check if the switch is sticking due to dirt or there is an obstruction preventing the switch from returning.

  NOTE: **If the SOS- or ON CALL-button is held pressed in for at least two seconds one of the services will be activated. The phone module (PHM) will then make a call to Volvo On Call Service Center. An activated ON CALL service can be cancelled by pressing the NO button twice. An activated SOS service can only be cancelled by the Volvo On Call Customer Service Center.**

  The keypad must be replaced if the switch does not spring back and the fault is not due to dirt or an external object.

Use the VCT2000 (or appropriate scan tool) to check how the phone module (PHM) interprets the status of the switch.

Other information:

- see **SIGNAL SPECIFICATION**
- see **CONNECTING THE BREAKOUT BOX**
- see **LOCATION OF COMPONENTS**

  VERIFICATION FAILED: The fault should have been detected and remedied. As this is not the case fault-tracing has failed. Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

PHM-E001: CONTROL MODULE COMMUNICATION. FAULTY COMMUNICATION (2006-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-E001

Condition

Fig. 220: Identifying Control Module
Courtesy of VOLVO CARS CORPORATION

The control modules transmit and receive information via a standardized serial communication method - CAN (Control Area Network). The diagnostic trouble code (DTC) is stored if the control module registers serious interference on the low speed network (CAN communication blocked).

NOTE: **In the event of system communication problems, it is not possible to communicate with the control module. Therefore it will only be possible to read off the diagnostic trouble code (DTC) if the fault is intermittent.**

Substitute Value

- The control module shuts itself off ("bus-off").

HINT: The control module will remain shut off until the power supply is broken (15, 30, X). When the power supply is connected the control module will make a new attempt to communicate.

Possible Source

- Short-circuit between the control area network (CAN) wiring
- Open-circuit in the control area network (CAN) wiring
- Internal fault in the control module

- Internal fault in another control module in the same part of the control area network (CAN).

Fault symptom[s]

- No or reduced carphone functionality
- No or reduced Volvo On Call functionality.

FAULTY COMMUNICATION

see **FAULTY COMMUNICATION**

PHM-E001: CONTROL MODULE COMMUNICATION. FAULTY COMMUNICATION (2003-2005)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-E001

Condition

Fig. 221: Identifying Phone Module (PHM)
Courtesy of VOLVO CARS CORPORATION

The control modules transmit and receive information via a standardized serial communication method - CAN (Control Area Network). The diagnostic trouble code (DTC) is stored if the control module registers serious interference (CAN communication blocked).

NOTE: In the event of system communication problems, it is not possible to communicate with the control module. Therefore it will only be possible to read off the diagnostic trouble code (DTC) if the fault is intermittent.

Substitute Value

- The control module shuts itself off ("bus-off").

  HINT: The control module will remain shut off until the power supply is broken (15, 30, X). When

the power supply is connected the control module will make a new attempt to communicate.

Possible Source

- Short-circuit between the control area network (CAN) wiring
- Open-circuit in the control area network (CAN) wiring
- Internal fault in the control module
- Internal fault in another control module in the same part of the control area network (CAN).

Fault symptom[s]

- None.

FAULTY COMMUNICATION

see **FAULTY COMMUNICATION**

PHM-E003: CONFIGURATION FAULT. FAULTY CONFIGURATION (2006-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-E003

Condition

The control module compares its configuration ID with the signal configuration transmitted on the control area network (CAN) by the central electronic module (CEM). If the configuration IDs do not correspond the fault code is stored. The diagnostic trouble code (DTC) is also stored if the communication between the control module and the central electronic module (CEM) is interrupted.

NOTE: **In the event of an open-circuit in both the control area network (CAN) cables, it is not possible to communicate with the control module. Therefore it will only be possible to read off the diagnostic trouble code (DTC) if this type of fault is intermittent. When the diagnostic trouble code (DTC) is stored, the control module responds to the diagnostic commands. However, the normal CAN communication does not function. ("Expulsion mode")**

Substitute Value

- None.

Possible Source

- Faulty control area network (CAN) configuration ID. (The node is not intended for this car (for example a used control module with different software/hardware))
- Open-circuit in the control area network (CAN) wiring between the control module and the central

electrical module (CEM).

Fault symptom[s]

- No or reduced carphone functionality
- No or reduced Volvo On Call functionality.

FAULTY CONFIGURATION

GENERAL INFORMATION

In order to check the control area network (CAN) cables, the resistance in the network must be measured. The resistance between the two controller area network (CAN) wiring, with the network connected 60 ohms. The resistance can differ depending on the configuration of the car. Permitted values are 55-65 ohms. This applies to both the high speed side network and the low speed side network.

HINT: Note which diagnostic trouble codes (DTCs) are stored in each control module. This facilitates fault-tracing considerably.

Also check if the diagnostic trouble codes (DTCs) for failed communication are stored in the central electronic module (CEM). If this is the case: first fault-trace according to these diagnostic trouble codes (DTCs).

Other information

- see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK (2005-2012)**

- **Continue**

  See: **CHECKING THE RESISTANCE OF THE CONTROL AREA NETWORK (CAN) CABLES**

CHECKING THE RESISTANCE OF THE CONTROL AREA NETWORK (CAN) CABLES

- Disconnect the battery negative lead. The power to the network must be cut when taking resistance readings. The reading may otherwise be incorrect.

  NOTE: Also read: BATTERY, DISCONNECTING

- Connect the adapter wiring to the central electronic module (CEM).

  HINT: Where a breakout box cannot be used, take readings from the rear of the affected connectors if possible. This prevents terminal pins and socket housings being damaged.

  When taking readings on the low speed network

  - When taking readings on the low speed network, the adapter wiring should be connected to the central electronic module (CEM) and the readings taken from there. The readings can also be taken

in the connector for the power seat module (PSM). The advantage of using the adapter wiring connected to the central electronic module (CEM) is that all control modules can be connected to the network when taking readings and there is access to both the high speed and the low speed networks.

This resistance reading only measures main arteries in the low speed network, not the junctions for the road traffic information module (RTI), accessory electronic module (AEM), power seat module (PSM), phone module (PHM), audio module (AUM), driver's door module (DDM) and passenger door module (PDM).

When taking readings on the high speed network

- When taking readings on the high speed network, the readings should be taken at the engine control module (ECM) using adapter wiring. The engine control module (ECM) must be connected. This resistance reading only takes readings from the main arteries in the high speed network.

Connect the ohmmeter to the terminals for CAN-L and CAN-H on the relevant network. Work the connectors and twist the cable harness. The resistance must be approximately 60 ohms. Permitted values are 55-65 ohms.

Other information

- see **CONNECTING THE BREAKOUT BOX**
- see **CHECKING WIRING AND TERMINALS**

Fig. 222: Identifying Ignition OFF & Negative Battery Cable Disconnected
Courtesy of VOLVO CARS CORPORATION

Fig. 223: Checking For Open Circuit
Courtesy of VOLVO CARS CORPORATION

Is the value OK?

- **YES**

  See: **CHECKING A SHORT-CIRCUIT IN CAN CABLES**

- **NO**

  See: **IDENTIFYING FAULT CAUSES IN THE CAN NETWORK**

CHECKING A SHORT-CIRCUIT IN CAN CABLES

Connect an ohmmeter between the relevant CAN cable (CAN-L and CAN-H) and the power supply, and between the CAN cable and ground. Twist the connectors and turn the cable harness to different positions at each reading to determine any intermittent short-circuits.

Take the following readings:

- The resistance between CAN-L and ground
- The resistance between CAN-L and voltage

- The resistance between CAN-H and ground
- The resistance between CAN-H and voltage.

The resistance must be infinite or very high in all cases (greater than 1 Mohms).

HINT: The reading can be taken from the same connector if the CAN cables, power supply and ground are exposed. If possible, take readings on the rear of the connector to prevent damage to the terminals in the connector. If this is not possible, use the adapter wiring or loose terminal pins to obtain a good contact.

Was a fault detected?

- **YES**

  See: **IDENTIFYING FAULT CAUSES IN THE CAN NETWORK**

- **NO**

  See: **CHECKING THE TRAFFIC LOAD ON THE CAN CABLES**

CHECKING THE TRAFFIC LOAD ON THE CAN CABLES

Fig. 224: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Connect the battery
- Ignition on

Also read: **BATTERY, DISCONNECTING**

Faults in the CAN network may be due to a control module sending faulty messages that disrupt "normal" communication. When messages are sent incorrectly, this results in a considerable increase in the amount of traffic on the CAN network. Check the load by measuring the average voltage value on the CAN cables in relation to ground.

Connect a voltmeter between CAN-L and ground. The voltage must be approximately 2.3 V.

Then connect a voltmeter between CAN-H and ground. The voltage must be approximately 2.8 V.

HINT: If possible measure from the rear of the affected connectors so that they are not damaged.

Is the value OK?

- **YES**

  See: **DOWNLOADING NEW SOFTWARE**

- **NO**

  See: **IDENTIFYING A CONTROL MODULE IN THE CAN NETWORK**

IDENTIFYING FAULT CAUSES IN THE CAN NETWORK

- Disconnect a control module that disconnects the CAN network (a control module that has four terminals to the CAN network).

  HINT: For the low speed network, suitable places for disconnecting the network are at the steering wheel module (SWM), the driver information module (DIM) or the climate control module (CCM).

  In the event of a short-circuit between one of the CAN cables and voltage or ground, the fault can be located by disconnecting a control module that disconnects the CAN network. Readings can then be taken to determine on which side of the disconnected control module the fault is located.

  Connect an ohmmeter between the CAN cable and supply voltage or ground. Take readings at both ends of the CAN network where the network is disconnected. Twist and bend the cable harness to locate any intermittent short-circuits. The resistance must be infinite or very high (greater than 1Mohms).

  If a fault can be localized in one direction, disconnect the network at a point further down on the CAN network in the direction in which the fault was discovered and repeat the reading. In this way, try to identify where in the network the fault might be located.

  HINT: A short-circuit between the CAN cables and supply voltage or ground may be in either the wiring or in a control module.

  Rectify the wiring as necessary. Replace the control module if the fault has been localized to a control module.

- **Continue**

  See: **VERIFICATION**

IDENTIFYING A CONTROL MODULE IN THE CAN NETWORK

Fig. 225: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Connect the battery

  Also read: **BATTERY, DISCONNECTING**

- Ignition on

  If the load on the CAN network is too high, this may be due to a control module sending faulty messages on the CAN network (known as a disruptive control module). The fault may also be due to an intermittent short-circuit to supply voltage or ground in one of the CAN cables. This results in the control modules on the CAN network starting to send faulty messages. The faults can occur without a diagnostic trouble code (DTC) being stored by the control modules. The voltage can be measured between the CAN cables in order to check the load on the CAN network.

Connect a voltmeter between the CAN cables. If the communication on the network is correct, the average voltage value should be approximately 0.5 V (0.4 V to 0.6 V). If there is a fault in the communication, the voltage reading will be approximately 0.7 V or higher.

In order to identify from which control module the faulty communication is being transmitted, cut the supply voltage to one control module at a time and check the voltage in the CAN cables again. The easiest way to cut the supply voltage is to remove a fuse. Repeat until the voltage between the CAN cables drops to approximately 0.5 V.

HINT: When the probable faulty control module has been identified, connect and disconnect the supply voltage to the control module a number of times to verify that the fault appears and disappears.

NOTE: Do not cut the power to the central electronic module (CEM) unless it is the last control module left to check.

The control module that is communicating incorrectly must be replaced. Remedy as necessary.

NOTE: Following a fault involving "disruptive" control modules, other modules may remain in "Limp-Home mode" even after switching the ignition off and on a number of times. To remedy this, disconnect and reconnect the battery negative terminal to restore the control modules to normal function.

Was a fault detected?

- **YES**

  See: **VERIFICATION**

- **NO**

  See: **DOWNLOADING NEW SOFTWARE**

IDENTIFYING FAULT CAUSES IN THE CAN NETWORK

- Disconnect a control module that disconnects the CAN network (a control module that has four terminals to the CAN network).

  HINT: For the low speed network, suitable places for disconnecting the network are at the steering wheel module (SWM), the driver information module (DIM) or the climate control module (CCM).

  In the event of an open-circuit or a short-circuit between the CAN cables, the fault can be localized by disconnecting a control module that disconnects the CAN network. Readings can then be taken to determine on which side of the disconnected control module the fault is located.

  Connect an ohmmeter between the CAN cables. Take readings at both ends of the CAN network where

the network is disconnected. Twist and bend the cable harness to locate any intermittent short-circuits. The resistance must be 120 ohm.

If a fault can be localized in one direction, disconnect the network at a point further down on the CAN network in the direction in which the fault was discovered and repeat the reading. In this way, try to identify where in the network the fault might be located.

Remedy the cables as necessary.

Was a fault detected?

- **YES**

  See: **VERIFICATION**

- **NO**

  See: **DOWNLOADING NEW SOFTWARE**

DOWNLOADING NEW SOFTWARE

HINT: If no other faults are found, new software can be downloaded to remedy the fault in the control module which stored the diagnostic trouble code (DTC). Downloading of software must occur after agreement with the customer.

Downloading of software occurs according to the replacement parts catalogue/Index Software components.

HINT: Install a bookmark on this side to continue fault-tracing after downloading new software.

- **Continue**

  See: **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 226: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Reinstall the connectors, components, etc.
- Ignition on
- Erase diagnostic trouble codes using the VCT2000 (or appropriate scan tool)
- Start the car. Allow the car to run for 10 minutes.
- Read off diagnostic trouble codes (DTCs).

Does the diagnostic trouble code (DTC) for a communication fault recur (CEM-1A5X or CEM-1A6X)?

Fig. 227: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

Does the diagnostic trouble code (DTC) recur?

- **YES**

  See: **INFORMATION**

- **NO**

  OKAY: Troubleshooting has been completed.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

PHM-E003: CONFIGURATION FAULT. FAULTY CONFIGURATION (2003-2005)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-E003

Condition

Fig. 228: Identifying Phone Module (PHM)
Courtesy of VOLVO CARS CORPORATION

The control module compares its configuration ID with the signal configuration transmitted on the control area network (CAN) by the central electronic module (CEM). If the configuration IDs do not correspond the fault code is stored. The diagnostic trouble code (DTC) is also stored if the communication between the control module and the central electronic module (CEM) is interrupted.

NOTE: **In the event of an open-circuit in both the control area network (CAN) cables, it is not possible to communicate with the control module. Therefore it will only be possible to read off the diagnostic trouble code (DTC) if this type of fault is intermittent. When the diagnostic trouble code (DTC) is stored, the control module responds to the diagnostic command, however normal control area network (CAN) communication does not work. ("Expulsion mode")**

Substitute Value

- None.

Possible Source

- Faulty control area network (CAN) configuration ID. (The node is not intended for this car, for example a used control module with different software/hardware.)
- Open-circuit in the control area network (CAN) wiring between the control module and the central electrical module (CEM).

Fault symptom[s]

- None.

FAULTY CONFIGURATION (2003)

see **FAULTY CONFIGURATION (2003)**

FAULTY CONFIGURATION (2004)

FAULTY CONFIGURATION (2005)

see **FAULTY CONFIGURATION**

PHM-E010: POWER SUPPLY. FAULTY SIGNAL (2006-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-E010

Condition

Fig. 229: Identifying Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the supply voltage to the phone module (PHM) differs by more than 2.5 V from the supply voltage to the central electronic module (CEM).

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on (not key position 3) and

when the battery voltage is 9-16 V.

Substitute Value

- None.

Possible Source

- Half-burned fuse for the phone module (PHM)
- Defective wiring
- Internal fault in the phone module (PHM).

Fault symptom[s]

- No or reduced carphone functionality.

FAULTY SIGNAL

CHECKING FUSES AND POWER SUPPLY

Fig. 230: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  The phone module (PHM) is powered via a fuse from the central electronic module (CEM).

  Check whether the fuse for the phone module (PHM) is half burned by testing using a new fuse.

  HINT: A half burned fuse can cause intermittent faults.

  Check the power supply to the phone module (PHM) by:

  - measuring the voltage between phone module (PHM) connector A terminals #5 (#5) and A #6 (#6)
  - measure the battery voltage.

The fault is in the power supply cable if the difference between the power supply for the control module and battery voltage is greater than 2.5 V.

There may be an internal fault in the phone module (PHM) if the difference is less than 2.5 V.

Remedy as necessary.

Has the status of the diagnostic trouble code (DTC) changed?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  See: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

PHM-E010: VOLTAGE FEED. INCORRECT SIGNAL (2005)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-E010

Condition

If the voltage to the phone module (PHM) differs by more than 2.5 V from the voltage to the central electronic module (CEM), the diagnostic trouble code is generated.

The diagnostic trouble code is diagnosed when the ignition is on (not key position 3) and when battery voltage is 9-16 V.

Substitute Value

- Nothing.

Possible Source

- Half-blown fuse for phone module (PHM).
- Damaged cable harness.
- Internal malfunction in phone module (PHM).

Fault symptom[s]

- No or reduced telephone function.

INCORRECT SIGNAL

CHECKING FUSE AND VOLTAGE FEED

Fig. 235: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on

  Phone module (PHM) is supplied with voltage via a fuse from central electronic module (CEM).

  Check if the fuse for the phone module (PHM) is half-blown by testing with a new fuse.

  HINT: A half-blown fuse can give intermittent malfunctions.

  Check the voltage feed to the phone module (PHM) by:

  - measuring the voltage between the phone module's connector A #5 (#5) and A #6 (#6)
  - measuring the battery voltage.

If the difference is greater than 2.5 V between the control module's feed voltage and the battery voltage, the malfunction is in the feed cable.

If the difference is less than 2.5 V there may be an internal malfunction in the phone module (PHM).

Remedy as necessary.

ATM-0001: ANTENNA MODULE (ATM). NON MATCHING (2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ATM-0001

Condition

Fig. 245: Identifying Antenna Module (ATM)
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ATM-0001 is stored if the antenna module (ATM) is not adapted to the same market as the car.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- None.

Possible Source

- The antenna module (ATM) is adapted for a different market than the car.

Fault symptom[s]

- No RDS functionality (this may happen for example if the car is adapted for the EU, US or AUS but the antenna module (ATM) is adapted for Japan)
- Not all frequencies are available.

ANTENNA MODULE (ATM), INCORRECTLY MATCHED

FAULT-TRACING INFORMATION

Diagnostic trouble code (DTC) ATM-0001 is stored if the antenna module (ATM) is not adapted to the same market as the car. For example an antenna module (ATM) for the Japanese market is installed in a car adapted for the EU, US or AUS.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up of the antenna module (ATM) or may be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs.

If the fault recurs, replace the antenna module (ATM).

If the fault is permanent, check that the radio wavebands and frequency settings are configured for the relevant market. This can be read off from vehicle communication for the central electronic module (CEM), reading off data for vehicle configuration, waveband and frequency settings radio. Replace the antenna module (ATM) if the radio is configured for the correct market.

Remedy as necessary.

Other information:

- To replace the antenna module (ATM), see **RECEIVER AM/FM (ATM), REPLACING** .
- **Continue**

  See: **VERIFICATION**

VERIFICATION

The information can be displayed again or the fault-tracing for this fault can be interrupted.

ATM-0002: TMC RECEIVER. CONFIGURATION FAULT (2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ATM-0002

Condition

Fig. 248: Identifying Antenna Module (ATM)
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ATM-0002 is stored if the antenna module (ATM) detects a traffic message channel (TMC) receiver even though the car is not configured for one.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- None.

Possible Source

- The car is not configured for a TMC receiver.

Fault symptom[s]

- Traffic information is not displayed in the navigation system.

CONFIGURATION FAULT

FAULT-TRACING INFORMATION

Diagnostic trouble code (DTC) ATM-0002 is stored if the antenna module (ATM) detects a TMC receiver even though the car is not configured for one. A possible cause of the fault is that a TMC receiver has been installed but the car configuration file has not been updated.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up of the antenna module (ATM) or may be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs.

ATM-0003: TMC RECEIVER. SIGNAL MISSING (2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ATM-0003

Condition

Fig. 251: Identifying Antenna Module (ATM)
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ATM-0003 is stored if the antenna module (ATM) does not detect a traffic message channel (TMC) receiver even though the car is configured for one.

The diagnostic trouble code (DTC) is also stored if there are communication problems between the antenna module (ATM) and the TMC receiver.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- None.

Possible Source

- The car does not have a TMC receiver
- Fault in the communication between the antenna module (ATM) and the TMC receiver.

Fault symptom[s]

- Traffic information is not displayed or is not updated.

TMC RECEIVER, SIGNAL MISSING

FAULT-TRACING INFORMATION

Diagnostic trouble code (DTC) ATM-0003 is stored if the car does not detect a TMC receiver even though the car is configured for one.

The diagnostic trouble code (DTC) is also stored if there are communication problems between the antenna module (ATM) and the TMC receiver.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up of the antenna module (ATM) or may be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs. If the fault recurs, replace the TMC receiver.

If the fault is permanent, check that a TMC receiver is installed. Install a TMC receiver if there isn't one. In other cases replace the TMC receiver.

Remedy as necessary.

  OKAY: Troubleshooting has been completed.

SUB-0001: CONTROL MODULE. INTERNAL FAULT (2003-2008)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION SUB-0001

Condition

Fig. 268: Identifying Subwoofer Module (Sub)
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) SUB-0001 is stored if the subwoofer module (SUB) registers an internal fault.

Diagnostic trouble code (DTC) SUB-0001 can be diagnosed when the ignition is on.

Substitute Value

- None.

Possible Source

- Internal fault in the subwoofer module (SUB).

Fault symptom[s]

- No sound from the loudspeakers.

INTERNAL FAULT

REPLACING THE COMPONENT

The Subwoofer module (SUB) has registered an internal fault.

If the fault is intermittent it means that it has been registered previously but is no longer present. Intermittent faults can occur for a number of different reasons. The fault is evaluated depending on how it occurs. If the fault recurs, replace the Subwoofer module (SUB).

In the event of a permanent fault, replace the Subwoofer module (SUB). See **SUBWOOFER MODULE (SUB), REPLACING** .

Remedy as necessary.

INFORMATION

FAULT-TRACING INFORMATION

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

SUB-0002: CONTROL MODULE. INTERNAL FAULT (2003-2008)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION SUB-0002

Condition

Fig. 270: Identifying Subwoofer Module (Sub)
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) SUB-002 is stored if the subwoofer module (SUB) registers an open-circuit in the signal cable for voice coil 1 in the bass speaker.

Diagnostic trouble code (DTC) SRS-0002 can only be diagnosed when the power is on (12 V). In other words, the diagnostic trouble code (DTC) can only be diagnosed when the ignition is turned from position 0 to positions II.

Substitute Value

- None.

Possible Source

- Open-circuit in the signal cable from the amplifier and voice coil 1 in the subwoofer module (SUB).

Fault symptom[s]

- No sound from the loudspeakers
- Muffled sound from the loudspeaker.

INTERNAL FAULT

see **INTERNAL FAULT**

SUB-0003: CONTROL MODULE. INTERNAL FAULT (2003-2008)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION SUB-0003

Condition

Fig. 271: Identifying Subwoofer Module (Sub)
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) SUB-003 is stored if the subwoofer module (SUB) registers an open-circuit in the signal cable for voice coil 2 in the bass speaker.

Diagnostic trouble code (DTC) SUB-0003 can only be diagnosed when powered (12 V). In other words, the diagnostic trouble code (DTC) can only be diagnosed when the ignition is turned from position 0 to positions II.

Substitute Value

- None.

Possible Source

- Open-circuit in the signal cable from the amplifier and voice coil 2 in the subwoofer module (SUB).

Fault symptom[s]

- No sound from the loudspeakers
- Muffled sound from the loudspeaker.

INTERNAL FAULT

see **INTERNAL FAULT**

SUB-0004: CONTROL MODULE. INTERNAL FAULT (2003-2008)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION SUB-0004

Condition

Fig. 272: Identifying Subwoofer Module (Sub)
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) SUB-0004 is stored if the subwoofer module (SUB) registers that the signal on the signal cable to voice coil 1 in the bass loudspeaker is too high or too low.

Diagnostic trouble code (DTC) SUB-0004 can be diagnosed when the ignition is on.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the signal cable between the amplifier and voice coil 1 in the bass speaker.
- Short-circuit to ground in the signal cable between the amplifier and voice coil 1 in the bass speaker.

Fault symptom[s]

- No sound from the loudspeakers.

INTERNAL FAULT

see **INTERNAL FAULT**

SUB-0005: CONTROL MODULE. INTERNAL FAULT (2003-2008)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION SUB-0005

Condition

Fig. 273: Identifying Subwoofer Module (Sub)
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) SUB-0005 is stored if the subwoofer module (SUB) registers that the signal on the signal cable to voice coil 2 in the bass loudspeaker is too high or too low.

Diagnostic trouble code (DTC) SUB-0005 can be diagnosed when the ignition is on.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the signal cable between the amplifier and voice coil 2 in the bass speaker
- Short-circuit to ground in the signal cable between the amplifier and voice coil 2 in the bass speaker.

Fault symptom[s]

- No sound from the loudspeakers.

INTERNAL FAULT

see **INTERNAL FAULT**

SUB-0006: CONTROL MODULE. INTERNAL FAULT (2003-2008)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION SUB-0006

Condition

Fig. 274: Identifying Subwoofer Module (Sub)
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) SUB-0006 is stored if the Subwoofer module (SUB) registers too high a temperature. Diagnostic Trouble Code (DTC) SUB-0006 can be diagnosed with the ignition on.

Diagnostic trouble code (DTC) SUB-0006 can be diagnosed when the ignition is on.

Substitute Value

- Reduced output.

Possible Source

- Ambient temperature too hot

- Power consumption too high in the control module.

Fault symptom[s]

- Reduced volume
- No sound from the loudspeakers.

INTERNAL FAULT

see **INTERNAL FAULT**

SUB-XXXX: UNKNOWN DIAGNOSTIC TROUBLE CODE (DTC) FOR THE CURRENT CONTROL MODULE VERSION (2003-2008)

UNKNOWN DIAGNOSTIC TROUBLE CODE (DTC) FOR THE CURRENT CONTROL MODULE VERSION

READING OFF DIAGNOSTIC TROUBLE CODES (DTC)

Fig. 275: Identifying Ignition ON

  OKAY: Troubleshooting has been completed.

GPS-0001: ANTENNA GPS. SIGNAL MISSING (2007-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION GPS-0001

Condition

Fig. 277: Identifying Global Positioning System Module (GPS)
Courtesy of VOLVO CARS CORPORATION

The global positioning system module (GPS) continuously monitors the signal from the GPS antenna.

The diagnostic trouble code (DTC) is stored if the control module registers an open-circuit in the wiring from the GPS antenna.

The diagnostic trouble code (DTC) can be diagnosed when the global positioning system module (GPS) is activated

Substitute Value

- None.

Possible Source

- Open-circuit in the wiring between the GPS antenna and the global positioning system module (GPS)
- Damaged GPS antenna
- Contact resistance and/or oxidation.

Fault symptom[s]

- The position of the car on the map is incorrect.

SIGNAL MISSING

CHECKING THE WIRING

Fig. 278: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 279: Disconnecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector for the global positioning system module (GPS).

  Check the terminal. Check for contact resistance. Check for loose connections. Check for oxidation.

  Check the antenna cable between the global positioning system module (GPS) and the GPS antenna. Check for an open-circuit.

  Remedy as necessary.

  Other information

  - see **SIGNAL SPECIFICATION**

- see **LOCATION OF COMPONENTS**

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 281: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 282: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Park the car outdoors. Start up the GPS system. Check that the position of the car on the map is correct.

  HINT: Use a battery charger if the engine is not running.

  After a GPS unit has been replaced, it must search for satellites to fix the position. This can take up to 12 minutes.

Is the position of the car correct on the map?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  See: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

GPS-0002: ANTENNA GPS. SIGNAL TOO HIGH (2007-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION GPS-0002

Condition

Fig. 283: Identifying Global Positioning System Module (GPS)

Courtesy of VOLVO CARS CORPORATION

The global positioning system module (GPS) continuously monitors the signal from the GPS antenna.

The diagnostic trouble code (DTC) is stored if the global positioning system module (GPS) registers that the signal in the wiring from the GPS antenna is too high.

The diagnostic trouble code (DTC) can be diagnosed when the global positioning system module (GPS) is activated.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the wiring between the GPS antenna and the global positioning system module (GPS).

Fault symptom[s]

- The position of the car on the map is incorrect.

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

GPS-0003: CONTROL MODULE. INTERNAL FAULT (2007-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION GPS-0003

Condition

Fig. 289: Identifying Global Positioning System Module (GPS)

Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the global positioning system module (GPS) detects a damaged memory element inside the control module.

The diagnostic trouble code can be diagnosed upon start-up of the control module.

Substitute Value

- None.

Possible Source

- Internal fault in the global positioning system module (GPS).

Fault symptom[s]

- The position of the car on the map is incorrect.

INTERNAL FAULT

REPLACING THE COMPONENT

The global positioning system module (GPS) has registered an internal fault.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up or can be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs. Replace the global positioning system module (GPS) if the fault recurs.

Replace the global positioning system module (GPS) in the event of a permanent fault.

Remedy as necessary.

Other information

AUD-0004: LOUDSPEAKER LEFT REAR. SIGNAL MISSING (2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AUD-0004

Condition

Diagnostic trouble code (DTC) AUD-0004 is stored if the audio module (AUD) registers an open-circuit in the signal cable from the loudspeaker in the left rear door.

Substitute Value

- None.

Possible Source

- Open-circuit in the signal cable between the loudspeaker in the left rear door and the control module
- Open-circuit in the loudspeaker.

Fault symptom[s]

- No sound from the loudspeakers.

SIGNAL MISSING

CHECKING COMPONENTS AND WIRING

Fig. 40: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 41: Disconnecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector for the loudspeaker in the left rear door.

Check the cable terminals. Check for contact resistance, loose connections and oxidation.

NOTE: **Only visually check the treble loudspeaker in the D-post for oxidation and loose connections. Do not carry out any electrical fault-tracing on the treble loudspeaker.**

Check the cable terminals in the female and male sections of the connector. The cable terminals must not be damaged or pressed back.

Check the signal cable between audio module (AUD) terminal #B4 and loudspeaker terminal #2 in the left rear door. Check for an open-circuit.

Check the signal cable between audio module (AUD) terminal #B12 and loudspeaker terminal #1 in the left rear door. Check for an open-circuit.

Check loudspeaker connector terminals #1 and #2 in the left rear door. Check for an open-circuit

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access or replace the audio module (AUD), see **AUDIO MODULE (AUD), REPLACING**
- To access and replace the loudspeaker in the rear side door, see **LOUDSPEAKER, REAR SIDE DOOR, REPLACING**
- For information about signals, see **SIGNAL SPECIFICATION**
- see **CONTENTS** .

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Check that sound can be heard from the loudspeakers from the Audio module (AUD) by trying the radio FM/AM, CD or MD player.

Do the loudspeakers work?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

AUD-0005: LOUDSPEAKER RIGHT REAR. SIGNAL MISSING (2007-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AUD-0005

Condition

Fig. 47: Identifying Loudspeaker
Courtesy of VOLVO CARS CORPORATION

If the Audio module (AUD) registers open circuit on the signal cable from the rear right loudspeaker, the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed when Audio module (AUD) is activated.

Substitute Value

- None.

Possible Source

- Open circuit on the signal cable between the rear right loudspeaker and the control module.
- Open-circuit in the loudspeaker.

Fault symptom[s]

- No sound from the loudspeakers.

SIGNAL MISSING

CHECKING THE COMPONENT AND WIRING

Fig. 48: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 49: Disconnecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Unplug the connector for the rear right loudspeaker.

Check the cable terminals. Check for contact resistance, loose connections and oxidation.

NOTE: **Only visually check the treble loudspeaker. Check for oxidation and loose connections. Do not carry out any electrical fault-tracing on the treble loudspeaker.**

Check the cable terminals in the female and male sections of the connector. The cable terminals must not be damaged or pressed back.

Check the signal cable between the Audio module (AUD) #B5 and the right rear loudspeaker #2 for open circuit.

Check the signal cable between the Audio module (AUD) #B13 and the right rear loudspeaker #1 for open circuit.

Check the rear right loudspeaker's connector #1 and #2 for open circuit.

Remedy as necessary.

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Check that sound can be heard from the loudspeakers from the Audio module (AUD) by trying the radio FM/AM, CD or MD player.

Do the loudspeakers work?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

AUD-000A: LOUDSPEAKER RIGHT REAR. SHORT-CIRCUIT TO GROUND (2007-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AUD-000A

Condition

Fig. 109: Identifying Loudspeaker
Courtesy of VOLVO CARS CORPORATION

If the Audio module (AUD) registers too high or too low signal on the signal cable to the rear right loudspeaker,

the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed when Audio module (AUD) is activated.

Substitute Value

- None.

Possible Source

- The signal cable between the rear right-hand loudspeaker and the control module has a short-circuit to ground.

Fault symptom[s]

- No sound from the loudspeakers.

SHORT-CIRCUIT TO GROUND

CHECKING THE CABLE

Fig. 110: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 111: Disconnecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector for the rear right-hand treble loudspeaker/upper loudspeaker.
- Disconnect the 16-pin connector for the audio module (AUD).

  HINT: Both the treble loudspeakers and right-hand rear loudspeakers are connected on the following signal cables.

  Check the cable terminals in the female and male sections of the connector. The cable terminals must not be damaged or pressed back.

  Check the signal cable between the Audio module (AUD) terminal #B5 and the rear right loudspeaker terminal #2. Check for a short-circuit to ground.

Check the signal cable between the Audio module (AUD) terminal #B13 and the rear right loudspeaker terminal #1. Check for a short-circuit to ground.

Remedy as necessary.

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Check that the sound is heard from speaker for Audio module (AUD) by trying the radio FM/AM or the cd-player.

Is the function OK?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

AUD-000A: LOUDSPEAKER RIGHT REAR. SIGNAL TOO HIGH / LOW (2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AUD-000A

Condition

Diagnostic trouble code (DTC) AUD-000A is stored if the audio module (AUD) registers that the signal on the signal cable from the loudspeaker in the right rear door is too high or too low.

Diagnostic trouble code (DTC) AUD-000A can be diagnosed when the ignition is on.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the signal cable between the control module and the loudspeaker in the right rear door
- Short-circuit to ground in the signal cable between the control module and the loudspeaker in the right rear door.

Fault symptom[s]

- No sound from the loudspeakers.

SIGNAL TOO HIGH / LOW

CHECKING THE CABLE

Fig. 115: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 116: Disconnecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector for the treble loudspeaker in the right-hand D-post
- Disconnect the 16-pin connector for the audio module (AUD).

  HINT: The treble loudspeaker in the right-hand D-post and the loudspeaker in the right-hand rear door are connected to these signal cables.

  Check the cable terminals in the female and male sections of the connector. The cable terminals must not be damaged or pressed back.

  Check the signal cable between audio module (AUD) terminal #B5 and loudspeaker terminal #2 in the right-hand D-post. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Check the signal cable between audio module (AUD) terminal #B13 and loudspeaker terminal #1 in the right-hand D-post. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

AUD-000B: LOUDSPEAKERS FRONT. SIGNAL TOO HIGH / LOW (2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AUD-000B

Condition

Diagnostic trouble code (DTC) AUD-000B is stored if the audio module (AUD) registers that the signal on the signal cable from the front loudspeaker is too high or too low.

Diagnostic trouble code (DTC) AUD-000B can be diagnosed when the ignition is on.

HINT: The signal cable to one or both of the front loudspeakers may be faulty.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the signal cables between the front loudspeakers and the control module
- Short-circuit to ground in the signal cables between the front loudspeakers and the control module.

Fault symptom[s]

- No sound from the loudspeakers.

SIGNAL TOO HIGH / LOW

CHECKING THE WIRING

Fig. 121: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 122: Disconnecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connectors for the front loudspeakers
- Disconnect the 16-pin connector for the audio module (AUD).

  HINT: Certain systems may have two loudspeakers connected on the same signal cable, one treble loudspeaker/upper loudspeaker and one front loudspeaker.

  Check the cable terminals in the female and male sections of the connector. The cable terminals must not be damaged or pressed back.

  Check the signal cable between audio module (AUD) terminal #B1 and loudspeaker terminal #2 in the front left door. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Check the signal cable between audio module (AUD) terminal #B9 and loudspeaker terminal #1 in the front left door. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Check the signal cable between audio module (AUD) terminal #B3 and loudspeaker terminal #2 in the front right door and the front right treble speaker. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Check the signal cable between audio module (AUD) terminal #B11 and loudspeaker terminal #1 in the front right door. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

AUD-000C: LOUDSPEAKER REAR. SIGNAL TOO HIGH / LOW (2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AUD-000C

Condition

Diagnostic trouble code (DTC) AUD-000C is stored if the audio module (AUD) registers that the signal on the signal cable from the rear loudspeaker is too high or too low.

Diagnostic trouble code (DTC) AUD-000C can be diagnosed when the ignition is on.

HINT: The signal cable to one or both of the rear loudspeakers may be faulty.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the signal cable between the rear loudspeakers and the control module
- Short-circuit to ground in the signal cables between the rear loudspeakers and the control module.

Fault symptom[s]

- No sound from the loudspeakers.

SIGNAL TOO HIGH / LOW

CHECKING THE WIRING

Fig. 127: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 128: Disconnecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connectors for the rear loudspeakers
- Disconnect the 16-pin connector for the audio module (AUD).

HINT: Certain systems may have two loudspeakers connected on the same signal cable, one treble loudspeaker in the D-post and one rear loudspeaker.

NOTE: The treble loudspeaker in the D-post is not included in all systems. Check whether the treble loudspeaker is included.

Check the cable terminals in the female and male sections of the connector. The cable terminals must not be damaged or pressed back.

Check the signal cable between audio module (AUD) terminal #B4 and loudspeaker terminal #2 in the rear left door. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Check the signal cable between audio module (AUD) terminal #B12 and loudspeaker terminal #1 in the rear left door. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Check the signal cable between audio module (AUD) terminal #B5 and loudspeaker terminal #2 in the rear right door. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Check the signal cable between audio module (AUD) terminal #B13 and loudspeaker terminal #1 in the rear right door. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

AUD-000D: CONTROL MODULE. OVER HEATED (2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AUD-000D

Condition

Fig. 133: Identifying Audio Control Module
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) AUD-000D is stored if the audio module (AUD) registers internal overheating in the control module.

Diagnostic trouble code (DTC) AUD-000D can be diagnosed when the ignition is on.

Substitute Value

- Reduced control module power handling capacity or the control module switches off.

Possible Source

- Ambient temperature too high
- Power consumption too high in the control module.

Fault symptom[s]

- No sound from the loudspeakers when the control module is switched off.

OVER HEATED

REPLACING THE COMPONENT

The audio module (AUD) has registered an internal fault.

If the fault is intermittent it means that it has been registered previously but is no longer present. Intermittent faults can occur for a number of different reasons. The fault is evaluated depending on how it occurs. If the fault recurs, replace the Audio module (AUD).

In the event of a permanent fault, replace the audio module (AUD). See **AUDIO MODULE (AUD), REPLACING** .

Remedy as necessary.

Fig. 134: Identifying Audio Control Module

- **Continue**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

AUD-000E: MICROPHONE INPUT. SIGNAL MISSING (2007-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AUD-000E

Condition

Fig. 135: Identifying Microphone
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the audio module (AUD) registers an open-circuit in the signal cable to the microphone.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- None.

Possible Source

- Open-circuit in the signal cable between the microphone and the control module
- Damaged microphone.

Fault symptom[s]

- The microphone is not working.

SIGNAL MISSING

CHECKING THE COMPONENT AND WIRING

Fig. 136: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 137: Disconnecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector for the microphone.

  Check the cable terminals. Check for contact resistance, loose connections and oxidation.

  Check the cable terminals in the female and male sections of the connector. The cable terminals must not be damaged or pressed back.

  Check the signal cable between audio module (AUD) terminal #B8 and microphone input terminal #A2 (pin B). Check for an open-circuit.

  Check the signal cable between audio module (AUD) terminal #B16 and microphone input terminal #A1 (pin A). Check for an open-circuit.

Check the resistance between terminal #A1 (pin A) and #A2 (pin B) in the microphone connector. The resistance should be between 100 ohms - 10 kohms.

Remedy as necessary.

- None.

Possible Source

- Short-circuit to ground in the signal cable between the microphone and the control module
- Short-circuit between the signal cables to the microphone.

Fault symptom[s]

- The microphone is not working.

SIGNAL LOW

CHECKING COMPONENTS AND WIRING

Fig. 170: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 171: Disconnecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector for the microphone in the rear view mirror
- Disconnect the 16-pin connector for the audio module (AUD).

  Check the cable terminals in the female and male sections of the connector. The cable terminals must not be damaged or pressed back.

  Check the signal cable between audio module (AUD) terminal #B8 and microphone input terminal #A2 (pin B). Check for ground.

  Check the signal cable between audio module (AUD) terminal #B16 and microphone input terminal #A1 (pin A). Check for ground.

Check the resistance between terminal #A1 (pin A) and #A2 (pin B) in the microphone connector. The resistance should be between 100 ohms - 10 kohms.

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access or replace the audio module (AUD), see **AUDIO MODULE (AUD), REPLACING**
- To access or replace the microphone, see **MICROPHONE, REPLACING**
- For information about signals, see **SIGNAL SPECIFICATION**
- see **CONTENTS** .

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 175: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 176: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Check that the microphone input functions by activating the microphone appropriately. Make a telephone call using the handsfree system or use the voice control function.

Does the microphone function?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

AUD-0011: BUTTONS HEADSET 1. SIGNAL MISSING (2003-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AUD-0011

Condition

Fig. 177: Identifying Buttons Headset Component
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) AUD-0011 is stored if the audio module (AUD) registers an open-circuit in the signal cable to the buttons at headset output 1.

Diagnostic trouble code (DTC) AUD-0011 can be diagnosed when the ignition is on.

Substitute Value

- None.

Possible Source

- Open-circuit in the signal cable between headset output 1 and the control module
- Open-circuit in the headset panel (defective headset panel).

Fault symptom[s]

- The buttons for the headset output are not working.

SIGNAL MISSING (2003-2006)

CHECKING COMPONENTS AND WIRING

Fig. 178: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 179: Disconnecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector for the left headset panel.

  Check the buttons for the left headset output 1. Test the buttons by changing between previous and next track selection and changing between CD/MD and radio.

  Check the connectors. Check for loose connections and oxidation.

  Check the cable terminals in the female and male sections of the connector. The cable terminals must not be damaged or pressed back.

  Check the signal cable between audio module (AUD) terminal #C15 and headset terminal #10 in the left C-post. Check for an open-circuit.

Check the signal cable between audio module (AUD) terminal #C16 and headset output 1 terminal #8 in the left C-post. Check for an open-circuit.

Check the resistance between terminals #8 and #10 in the connector for the left headset panel. The resistance must be approximately 39 kohms.

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access or replace the audio module (AUD), see **AUDIO MODULE (AUD), REPLACING**
- For information about signals, see **SIGNAL SPECIFICATION**

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

AUD-0016: BUTTONS HEADSET 3. SIGNAL TOO LOW (2003-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AUD-0016

Condition

Fig. 252: Identifying Buttons Headset Component
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) AUD-0016 is stored if the audio module (AUD) registers that the signal to the buttons for headset output 3 is too low.

Diagnostic trouble code (DTC) AUD-0016 can be diagnosed when the ignition is on.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the signal cable between headset output 3 and the control module
- Short-circuit between the signal cables to headset output 3
- Short-circuit in the headset panel (defective headset panel).

Fault symptom[s]

- The buttons for the headset output are not working.

SIGNAL LOW (2003-2006)

CHECKING COMPONENTS AND WIRING

Fig. 253: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 254: Disconnecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector for the right headset panel
- Disconnect the 22-pin connector for the audio module (AUD).

  Check the cable terminals in the female and male sections of the connector. The cable terminals must not be damaged or pressed back.

  Check the signal cable between audio module (AUD) terminal #C20 and headset output terminal #10 in the right C-post. Check for a short-circuit to ground.

  Check the signal cable between audio module (AUD) terminal #C21 and headset output 3 terminal #8 in the right C-post. Check for a short-circuit to ground.

Check the resistance between terminals #C20 and #C21 in the connector for the audio module (AUD). The resistance must be infinite.

Check the resistance between terminals #8 and #10 in the connector for the right headset panel. The resistance must be approximately 39 kohms.

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access or replace the audio module (AUD), see **AUDIO MODULE (AUD), REPLACING**
- For information about signals, see **SIGNAL SPECIFICATION**
- see **CONTENTS** .

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

AUD-0017: BUTTONS HEADSET 4. SIGNAL MISSING (2003-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AUD-0017

Condition

Fig. 267: Identifying Buttons Headset Component
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) AUD-0017 is stored if the audio module (AUD) registers an open-circuit in the signal cable to the buttons at headset output 4.

Diagnostic trouble code (DTC) AUD-0017 can be diagnosed when the ignition is on.

Substitute Value

- None.

Possible Source

- Open-circuit in the signal cable between headset output 4 and the control module
- Open-circuit in the headset panel (defective headset panel).

Fault symptom[s]

- The buttons for the headset output are not working.

AUD-001B: CONTROL MODULE. SOFTWARE FAULT (2007-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AUD-001B

Condition

The Audio module (AUD) checks the software in the control module.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Incorrect or no settings in the local configuration file.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Start up of the MOST network.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 325: Identifying Control Module

Courtesy of VOLVO CARS CORPORATION

Substitute Value

- The control module assumes standard configuration.

Possible Source

- Software download is not complete.
- Damaged audio module (AUD).

Fault symptom[s]

- Poor or bad sound
- No sound from loudspeakers

INTERNAL FAULT

GENERAL INFORMATION

The diagnostic trouble code (DTC) is stored if the software has an incorrect version number.

The fault can be due to a customer or workshop replacing a control module without downloading new software for the replacement.

Corrective actions

1. Download the latest software to the Audio module (AUD).
2. If downloading new software did not help, replace the Audio module (AUD).

Other information

- To download software to the relevant control module, see appropriate catalog/Software index.
- see **AUDIO MODULE (AUD), REPLACING**

FAULT-TRACING INFORMATION

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

AUD-001C: CENTRE LOUDSPEAKER. SIGNAL MISSING (2007-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AUD-001C

Condition

The diagnostic trouble code (DTC) is stored if the Audio module (AUD) registers an open-circuit on the signal cable from the center loudspeaker.

The diagnostic trouble code can be diagnosed when Audio module (AUD) is activated.

Fig. 327: Identifying Center Loudspeaker
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Open-circuit on the signal cable between the center loudspeaker and the control module.
- Open-circuit in the loudspeaker.

Fault symptom[s]

- No sound from loudspeakers

- Ignition off
- Disconnect the connector for the center loudspeaker.

Check the cable terminals. Check for contact resistance, loose connections and oxidation.

NOTE: **Only visually check the treble loudspeaker. Check for oxidation and loose connections. Do not carry out any electrical fault-tracing on the treble loudspeaker.**

Check the cable terminals in the female and male sections of the connector. The cable terminals must not be damaged or pressed back.

Check the signal cable between audio module (AUD) terminal #B10 and center loudspeaker terminal #1. Check for an open-circuit.

Check the signal cable between audio module (AUD) terminal #B2 and center loudspeaker terminal #2. Check for an open-circuit.

HINT: Check the connector between the Audio module (AUD) and the center loudspeaker. Check for contact resistance, play and oxidation.

Check the center loudspeaker connector terminals #1 and 2. Check for an open-circuit.

Remedy as necessary.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

AUD-001D: CONTROL MODULE. INTERNAL FAULT (2007-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AUD-001D

Condition

The Audio module (AUD) checks the temperature at the transmitting diode in the MOST connector.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The temperature is too high.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Activated control module.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 333: Identifying Control Module

Courtesy of VOLVO CARS CORPORATION

Substitute Value

- Switched off control module.

Possible Source

- Ambient temperature too high.
- Power consumption too high in the control module.
- Damaged audio module (AUD).

Fault symptom[s]

- No sound from loudspeakers

INTERNAL FAULT

REPLACING A COMPONENT

The audio module (AUD) has registered an internal fault.

If the fault is intermittent it means that it has been registered previously but is no longer present. Intermittent faults can occur for a number of different reasons. The fault is evaluated depending on how it occurs. If the fault recurs, replace the audio module (AUD).

In the event of a permanent fault, replace the audio module (AUD).

Remedy as necessary.

AUD-0021: CONTROL MODULE. INTERNAL FAULT (2007-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AUD-0021

Condition

The diagnostic trouble code (DTC) is stored if the audio module (AUD) registers an internal fault.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Fig. 340: Identifying Audio Module (AUD)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Internal fault in the audio module (AUD).

Fault symptom[s]

- No sound from loudspeakers

INTERNAL FAULT

see **INTERNAL FAULT**

AUD-0022: CONTROL MODULE. INTERNAL FAULT (2007-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AUD-0022

Condition

The diagnostic trouble code (DTC) is stored if the audio module (AUD) registers an internal fault.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Fig. 341: Identifying Audio Module (AUD)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Internal fault in the audio module (AUD).

Fault symptom[s]

- No sound from loudspeakers

INTERNAL FAULT

see **INTERNAL FAULT**

AUD-0023: LOUDSPEAKER FRONT. SIGNAL TOO HIGH/SIGNAL TOO LOW (2007-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AUD-0023

Condition

Fig. 342: Identifying Loudspeaker
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the Audio module (AUD) registers that the signal on the signal cable from one or both front loudspeakers is too high or too low.

The diagnostic trouble code can be diagnosed when Audio module (AUD) is activated.

Substitute Value

- None.

Possible Source

- The signal cable between the loudspeaker in the right-hand door and the control module has a short-circuit to supply voltage.
- Short-circuit to voltage in the signal cable between the control module and the loudspeaker in the right door.
- Short-circuit to voltage in the signal cable between the control module and the loudspeaker in the left door.
- Short-circuit to ground in the signal cable between the control module and the loudspeaker in the left door.

Fault symptom[s]

- No sound from the loudspeakers.

SIGNAL TOO HIGH/SIGNAL TOO LOW

CHECKING THE CABLE

Fig. 343: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 344: Disconnecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector for the treble loudspeaker/upper loudspeaker in the right-hand door.
- Disconnect the connector for the treble loudspeaker/upper loudspeaker in the left-hand door.
- Disconnect the 16-pin connector for the audio module (AUD).

HINT: Both treble loudspeaker/upper loudspeakers and the right and left-hand front base loudspeakers are connected on the following signal cables.

Check the cable terminals in the female and male sections of the connector. The cable terminals must not be damaged or pressed back.

Check the signal cable between audio module (AUD) terminal #B3 and treble speaker/upper loudspeaker

terminal #2 in the right-hand door. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Check the signal cable between audio module (AUD) terminal #B11 and treble speaker/upper loudspeaker terminal #1 in the right-hand door. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Check the signal cable between audio module (AUD) terminal #B1 and treble speaker/upper loudspeaker terminal #2 in the left-hand door. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Check the signal cable between audio module (AUD) terminal #B9 and treble speaker/upper loudspeaker terminal #1 in the left-hand door. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Remedy as necessary.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

AUD-0024: LOUDSPEAKER REAR. SIGNAL TOO HIGH/SIGNAL TOO LOW (2007-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AUD-0024

Condition

Fig. 348: Identifying Loudspeaker
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the Audio module (AUD) registers that the signal on the signal

cable from one or both rear loudspeakers is too high or too low.

The diagnostic trouble code can be diagnosed when Audio module (AUD) is activated.

Substitute Value

- None.

Possible Source

- The signal cable between the rear left-hand loudspeaker and the control module has a short-circuit to supply voltage.
- The signal cable between the rear left-hand loudspeaker and the control module has a short-circuit to ground.
- The signal cable between the rear right-hand loudspeaker and the control module has a short-circuit to supply voltage.
- The signal cable between the rear right-hand loudspeaker and the control module has a short-circuit to ground.

Fault symptom[s]

- No sound from the loudspeakers.

SIGNAL TOO HIGH/SIGNAL TOO LOW

CHECKING THE CABLE

Fig. 349: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 350: Disconnecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector for the rear left-hand treble loudspeaker/upper loudspeaker.
- Disconnect the connector for the rear right-hand treble loudspeaker/upper loudspeaker.
- Disconnect the 16-pin connector for the audio module (AUD).

HINT: Both treble loudspeakers and the right and left-hand rear loudspeakers are connected on the following signal cables.

Check the cable terminals in the female and male sections of the connector. The cable terminals must not be damaged or pressed back.

Check the signal cable between audio module (AUD) terminal #B4 and treble speaker/upper loudspeaker

terminal #2 in the rear left. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Check the signal cable between audio module (AUD) terminal #B12 and treble speaker/upper loudspeaker terminal #1 in the rear left. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Check the signal cable between audio module (AUD) terminal #B5 and rear right-hand loudspeaker terminal #2. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Check the signal cable between audio module (AUD) terminal #B13 and the rear right-hand loudspeaker terminal #1. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Remedy as necessary.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

AUD-0025: CONTROL MODULE. INTERNAL FAULT (2007-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AUD-0025

Condition

The diagnostic trouble code (DTC) is stored if the audio module (AUD) registers an internal fault.

The diagnostic trouble code can be diagnosed when Audio module (AUD) is activated.

Fig. 354: Identifying Audio Module (AUD)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Internal fault in the audio module (AUD).

Fault symptom[s]

- No sound from loudspeakers

INTERNAL FAULT

see **INTERNAL FAULT**

AUD-0025: LOUDSPEAKER LEFT FRONT. FAULTY SIGNAL (2007-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AUD-0025

Condition

The Audio module (AUD) checks the signal in the signal cable to the loudspeaker in the left-hand front door.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The resistance is too low.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Activated control module.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 355: Identifying Loudspeaker
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Short circuit between signal cables to speaker.

Fault symptom[s]

- No sound from loudspeakers

FAULT-TRACING INFORMATION

FAULT-TRACING INFORMATION

Use the following information and general checks during fault-tracing.

NOTE: Check that the fuses are intact. For locations, cover for fuse box, fuse ratings or similar.

1. Check, if possible, relevant functions in the vehicle using buttons/controls/test drives to determine the status of the fault.

   NOTE: If the vehicle does not show any of the given symptoms in the diagnostic trouble code information (DTC), this may mean that the fault is intermittent or that the control module is not detecting the fault at this moment.

2. Use the diagnostic trouble code's **frozen values** , **status identifiers** and **counter** to determine the operating conditions when the fault was detected, the fault's current status and any degree of intermittence of the fault.
3. Check and fault-trace according to **the fault causes** that are specified in the **diagnostic trouble code (DTC) information** .
4. Use **VIDA Vehicle communication** . Read off the parameters, activate components and functions, carry out quick tests and checking routines for the diagnostic trouble codes to identify the fault.
5. Check relevant components according to **Component specifications** .
6. Check relevant signals using appropriate **wiring diagram** , **signal specification** and **breakout box** .

Remedy as necessary.

IAM-1001: AM/FM ANTENNA. NO SIGNAL (2007-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION IAM-1001

Condition

Fig. 372: Identifying Integrated Audio Module (IAM)
Courtesy of VOLVO CARS CORPORATION

If the Integrated Audio Module (IAM) does not detect a signal from the AM/FM antenna, then the Diagnostic Trouble Code (DTC) is generated.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Nothing.

Possible Source

- Open circuit on the cable harness between the antenna amplifier and Integrated Audio Module (IAM).
- Damaged antenna amplifier.
- Contact resistance and/or oxidation.

Fault symptom[s]

- Radio inoperative.
- Poor radio reception.

SIGNAL MISSING

CHECKING THE WIRING

Fig. 373: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 374: Disconnecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector to the Integrated Audio Module (IAM).

  Check the connections with regard to contact resistance, play and oxidation.

  Check the antenna cable between the Integrated Audio Module (IAM) and the antenna amplifier with regard to open circuits.

  Measure between:

  - Integrated Audio Module (IAM) #B1 and antenna amplifier #1.
  - Integrated Audio Module (IAM) #B2 and antenna amplifier #2.

If the vehicle is equipped with navigation system (does not apply to US) the antenna lead runs from Integrated Audio Module (IAM) #B1, via Multimedia module (MMM), to antenna amplifier #1.

Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

IAM-1002: AM/FM ANTENNA. FAULTY SIGNAL (2007-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION IAM-1002

Condition

Fig. 378: Identifying Integrated Audio Module (IAM)
Courtesy of VOLVO CARS CORPORATION

If the Integrated Audio Module (IAM) detects an erroneous signal from the AM/FM antenna, then the Diagnostic Trouble Code (DTC) is generated.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Nothing

Possible Source

- Short circuit on the cable harness between the antenna amplifier and Integrated Audio Module (IAM).

Fault symptom[s]

- Radio inoperative.
- Poor radio reception.

FAULTY SIGNAL

CHECKING THE WIRING

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

IAM-2001: CONTROL MODULE. INTERNAL FAULT (2007-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION IAM-2001

Condition

Fig. 384: Identifying Integrated Audio Module (IAM)
Courtesy of VOLVO CARS CORPORATION

If the Integrated Audio Module (IAM) detects an internal fault in the CD player, then the Diagnostic Trouble Code (DTC) is generated.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Nothing.

Possible Source

- Internal fault.

Fault symptom[s]

- CD player inoperative.

INTERNAL FAULT

REPLACING THE COMPONENT

The Integrated Audio Module (IAM) has registered an internal fault.

If the fault is intermittent then this means that the fault has been registered earlier but is no longer present. Intermittent faults can be due to interference when starting up or can be another type of fault which can return on different occasions. Evaluation of the fault is made from case to case. If the fault returns, replace the Integrated Audio Module (IAM).

In the case of a permanent fault, change the integrated audio module (IAM).

Remedy as necessary.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-6C7C: BLUETOOTH PHONE MODULE (BPM) NOT VALID FAULTY SIGNAL (2011-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-6C7C

Condition

Fig. 1: Identifying Bluetooth Phone Module (BPM)
Courtesy of VOLVO CARS CORPORATION

The serial number for each control module in the infotainment system is stored in the central electronic module (CEM). The stored numbers are compared with the serial numbers of the control modules at start up. If any number does not correspond, that particular control module is blocked and the function is not available. The blocking function for non-approved control modules is designated security on MOST.

The infotainment module (ICM) checks whether the Bluetooth phone module (BPM) is in the valid list stored in the central electronic module (CEM).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Bluetooth phone module (BPM) is not in the approved list.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- When the ignition is on for at least 12 seconds and the battery voltage is above 11 V and security on MOST is activated.

Substitute Value

- None.

Possible Source

- Replacement of the Bluetooth phone module (BPM) invalid according to the valid list stored in the Central electronic module (CEM).
- Software was not downloaded upon replacement of the Bluetooth phone module (BPM).
- Failed or incomplete software download to Bluetooth phone module (BPM).

Fault symptom[s]

- Bluetooth Telephone: No Functionality

FAULTY SIGNAL

CHECKING THE COMPONENT

The infotainment module (ICM) has registered that the Bluetooth phone module (BPM) is invalid according to the list stored in the central electronic module (CEM).

The cause of the fault is probably that no software has been downloaded or that software downloading has failed after replacing Bluetooth phone module (BPM).

HINT: When downloading software after replacing a control module, the serial number of the control module is stored in the central electronic module (CEM). This is so that the security on MOST function can approve the control module in the MOST network in the car.

If the fault persists after software download, try replacing the Bluetooth phone module (BPM).

Remedy as necessary.

Fig. 2: Identifying Bluetooth Phone Module (BPM)
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

- Ignition off.
- Reinstall the connectors, components etc.
- Ignition on.

Check the function of the Bluetooth phone module (BPM).

Is the carphone working?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-6C7D: ACCESSORY USB UNIT (AUU) NOT VALID FAULTY SIGNAL (2007-2012)

FAULTY SIGNAL

CHECKING THE COMPONENT

The infotainment module (ICM) has registered that the Accessory USB unit (AUU) is invalid according to the list stored in the central electronic module (CEM).

The cause of the fault is probably that no software has been downloaded or that software downloading has failed after replacing Accessory USB unit (AUU).

HINT: When downloading software after replacing a control module, the serial number of the control module is stored in the central electronic module (CEM). This is so that the security on MOST function can approve the control module in the MOST network in the car.

If the fault persists after software download, try replacing the Accessory USB unit (AUU).

Remedy as necessary.

  Refer to **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

- Ignition off.
- Reinstall the connectors, components etc.
- Ignition on.

Check function of the Accessory USB Unit (AUU).

Is the system working?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-6C7D

Condition

Fig. 4: Identifying Accessory USB Unit (AUU)
Courtesy of VOLVO CARS CORPORATION

The serial number for each control module in the infotainment system is stored in the central electronic module (CEM). The stored numbers are compared with the serial numbers of the control modules at start up. If any number does not correspond, that particular control module is blocked and the function is not available. The blocking function for non-approved control modules is designated security on MOST.

The infotainment control module (ICM) checks whether the Accessory USB unit (AUU) is in the approved list stored in the central electronic module (CEM).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Accessory USB unit (AUU) is not in the approved list.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- When the ignition is on for at least 12 seconds and the battery voltage is above 11 V and security on MOST is activated.

Substitute Value

- None.

Possible Source

- Replacement with an Accessory USB unit (AUU), which is not approved in the list stored in the central electronic module (CEM).
- Software was not downloaded upon replacement of the Accessory USB unit (AUU).
- Failed or incomplete software download to Accessory USB unit (AUU).

Fault symptom[s]

- USB unit/Does not work

ICM-DC00: CONTROL MODULE COMMUNICATION. INTERNAL FAULT (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-DC00

Condition

Fig. 5: Infotainment Control Module

Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ICM-DC00 is stored if the infotainment control module (ICM) registers a fault in the unit for controlling the MOST network.

Substitute Value

- None.

Possible Source

- Internal fault in the infotainment control module (ICM).

Fault symptom[s]

- Audio unit not working
- The display does not light
- Functions in the infotainment system are not working
- No or reduced carphone functionality.

INTERNAL FAULT

see **INTERNAL FAULT**

ICM-DC01: CONTROL MODULE COMMUNICATION. FAULTY SIGNAL (2007-2008)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-DC01

Condition

Fig. 6: Infotainment Control Module
Courtesy of VOLVO CARS CORPORATION

The infotainment control module (ICM) can detect an open-circuit in the MOST network after the ring break diagnostic has been run.

Diagnostic trouble code (DTC) ICM-DC01 is stored if an open-circuit is detected.

Substitute Value

- None.

Possible Source

- Dirty or damaged MOST cable connector
- Open-circuit in the MOST cable
- The MOST transceiver is defective in one of the control modules in the MOST network
- No power supply to a control module in the MOST network.

Fault symptom[s]

- Audio unit not working
- The display does not light

- Functions in the infotainment system are not working
- No or reduced carphone functionality.

NO COMMUNICATION

Special tools:

see **9512867**

CHECKING THE WIRING AND COMPONENT

The infotainment control module (ICM) has detected an open-circuit in communication on the MOST network.

The MOST network is a fiber optic ring network. This means that all control modules which are connected to the network must be powered and grounded for the infotainment system to work. If, for any reason, a control module is unable to handle (receive or transmit) signals onwards on the MOST network, or if there is an open-circuit in the fiber optic cable, the infotainment control module (ICM) will shut down all functionality.

Communication on the fiber optic net is one-directional. The control modules on the MOST network receive light signals, amplify them and then send them onwards. The MOST connectors for the control modules contain two fiber optic cables, one for incoming and one for outgoing signals.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can either be caused by interference when starting the MOST network, or by intermittent faults in the power supply/ground for one of the control modules in the network. The fault is evaluated depending on how it occurs. If the fault recurs, fault-trace for permanent faults.

It can be difficult to diagnose intermittent faults using a ring break diagnostic because for this to work the fault must occur during the diagnostic.

If the fault is permanent, perform a ring break diagnostic to locate the open-circuit.

- **Continue**

  Refer to **CHECKING FOR OPEN-CIRCUITS**

CHECKING FOR OPEN-CIRCUITS

Fig. 7: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

Ring break diagnostic

A ring break diagnostic should be run to determine whether the fault has occurred.

To carry out a full ring break diagnostic of the MOST system, proceed as follows:

1. Switch off the ignition and remove the key
2. Connect separate external voltage feed to the communication tool.
3. Disconnect the battery negative lead. See **BATTERY, DISCONNECTING**
4. Wait 1 minute.
5. Ignition switch position II.
6. Connect the battery negative terminal.
7. Wait at least 30 seconds after switching on the ignition before reading off the position of the open-circuit.

Other information:

- For information about fuses, see the appropriate service information.
- For information on battery location:**BATTERY, REPLACING**

- **Continue**

  Refer to **READING OFF THE POSITION OF THE OPEN-CIRCUIT**

CHECKING CABLE AND COMPONENT

If the result of the ring break diagnostic is POOR, the infotainment control module (ICM) is receiving a signal on the MOST network. However it is unable to decode the signals because the luminance of the signals is too weak or the signals are distorted.

If the result from the ring break diagnostic is OK, the fault is intermittent.

Fault-tracing using the ring break diagnostic assumes that the fault is permanent or active when the test is run, i. e. the system is powered having been off.

HINT: If diagnostic trouble code (DTC) ICM-DC01 is intermittent, read off the status of the ring break diagnostic from the frozen values in Vehicle communication.

Check the communication on the MOST network by bypassing the control modules one by one on the MOST network as follows:

- Ignition off
- Disconnect the MOST connector from the relevant control module
- Connect the MOST cable to special tool see **9512867**
- Ignition on
- Activate the infotainment system

- Check that the communication on the MOST network is functioning by reading off the status of the MOST locked parameter for at least 30 seconds. The parameter indicates whether the MOST network is closed and communication possible. Click the VCT2000 symbol to read off the status of the MOST network.

If the communication on the MOST network is stable when a control module is disconnected, check the power supply and the ground terminal on the relevant control module. Check for intermittent faults. Try replacing the component if no fault is found.

Fig. 8: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

READING OFF THE POSITION OF THE OPEN-CIRCUIT

Fig. 9: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

Reading off the result from a ring break diagnostic

Click the VCT2000 symbol to read off the result of the ring break diagnostic.

As well as the result from the ring break diagnostic, a list of the control modules included in the MOST network is provided for that car.

NOTE: Configuration in the illustration only applies to vehicles equipped with Audio module (AUD). In vehicles without Audio module (AUD), the Accessory USB unit (AUU) is located after the Integrated Audio Module (IAM).

The following results can be obtained from a ring break diagnosis:

- If the diagnostic indicates an open-circuit in the communication on the MOST network, the result will be an open-circuit position
- The result will be OK if there is no fault on the MOST network Continue by selecting option 3 below.
- If the infotainment control module (ICM) receives a signal on the MOST network but is unable to decode it because the luminance is weak or the signals are distorted, the result will be POOR. Continue by selecting option 3 below.

Determining the position of the open-circuit

The position of the open-circuit is calculated by working backwards in the MOST network from the infotainment control module (ICM).

NOTE: The ring break diagnostic always counts backwards, irrespective of which, or how many control modules, are installed in the vehicle. To determine the position of the open-circuit, check the list to, see which control modules are installed in that particular vehicle. Then count backwards following the determined order. The number of control modules can vary between 2 and 7.

Two examples are outlined below:

- First open circuit position is indicated by 1. This means that the open circuit is in the integrated audio module (IAM) or in the cable between the subwoofer (SUB) and the integrated audio module (IAM).
- First open circuit position is indicated by 4. This means that the open circuit is in Audio module (AUD) or in the cable between Audio module (AUD) and Accessory USB unit (AUU). The open

circuit may be caused by the optical connector in Accessory USB unit (AUU) being damaged. This means that Accessory USB unit (AUU) cannot interpret the incoming signal from Audio module (AUD).

Select the alternative for the control module to be checked.

Alternative 1: Refer to CHECKING CABLE AND COMPONENT

Remote Digital Audio Receiver (RDAR).

Audio module (AUD)

Integrated audio module (IAM).

Subwoofer Module (SUB)

Accessory USB unit (AUU).

Alternative 2: Refer to CHECKING CABLE AND COMPONENT

Phone module (PHM)

Global positioning system module (GPS).

Multimedia module (MMM)

Infotainment control module (ICM)

Alternative 3: Refer to CHECKING CABLE AND COMPONENT

The result from the ring break diagnostic indicates that the MOST network is OK.

The result from the ring break diagnostic is POOR.

Other information:

- For information on the location and arrangement of the MOST control modules:**LOCATION OF COMPONENTS**

Fig. 10: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 11: Control Module Diagram
Courtesy of VOLVO CARS CORPORATION

CHECKING CABLE AND COMPONENT

Select the control module to be checked from the list.

1. Remote Digital Audio Receiver (RDAR). Refer to **CHECKING CABLE AND COMPONENT**
2. Audio Control Module (AUD). Refer to **CHECKING CABLE AND COMPONENT**
3. Integrated audio module (IAM). Refer to **CHECKING CABLE AND COMPONENT**
4. Subwoofer Module (SUB). Refer to **CHECKING THE CABLE AND COMPONENT**
5. Accessory USB unit (AUU). Refer to **CHECKING THE CABLE AND COMPONENT**

CHECKING CABLE AND COMPONENT

Select the control module to be checked from the list.

1. Phone module (PHM). Refer to **CHECKING CABLE AND COMPONENT**
2. Global positioning system module (GPS). Refer to **CHECKING CABLE AND COMPONENT**
3. Multimedia module (MMM). Refer to **CHECKING CABLE AND COMPONENT**
4. Infotainment Control Module (ICM). Refer to **CHECKING CABLE AND COMPONENT**

CHECKING CABLE AND COMPONENT

Fig. 12: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

Checking the fault cause

Check the fault cause as follows:

1. Ignition off
2. Disconnect the MOST connector from Remote Digital Audio Receiver (RDAR).
3. Connect the MOST cable to special tool see **9512867**
4. Ignition on
5. Activate the infotainment system
6. Check that the communication on the MOST network is functioning by reading off the status of the MOST locked parameter for at least 30 seconds. The parameter indicates whether the MOST network is closed and communication possible Click the VCT2000 symbol to read off the status of the MOST network.
7. If the parameter displays that the MOST network is not correctly connected, check the receiving control module in the same way as above.

The communication on the MOST network is working if the menu text is displayed. The cause of the fault is then in the Remote Digital Audio Receiver (RDAR). Continue the fault-tracing by checking the component.

The communication on the MOST network is not working if the menu text is not displayed. The fault cause is then in the MOST cable for the next control module. Continue the fault-tracing by checking the fiber optic cable.

Checking cable

- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the MOST cable if no fault is found in the MOST terminal.

Checking the component

- Check the power supply and ground connection for the Remote Digital Audio Receiver (RDAR).
- Check the MOST connection. Check for dirt, loose connections and damage
- If no fault is found, replace the Remote Digital Audio Receiver (RDAR).

Remedy as necessary.

Other information:

- Remote Digital Audio Receiver (RDAR). See **SIGNAL SPECIFICATION**
- see **OPTICAL WIRING HARNESS CHECK**
- For information about checking and replacing the MOST cable, see **FIBER OPTIC CABLE HARNESS, REPAIRING**

Checking the fault cause

Check the fault cause as follows:

1. Ignition off
2. Disconnect the MOST connector from the audio module (AUD)
3. Connect the MOST cable to special tool see **9512867**
4. Ignition on
5. Activate the infotainment system
6. Check that the communication on the MOST network is functioning by reading off the status of the MOST locked parameter for at least 30 seconds. The parameter indicates whether the MOST network is closed and communication possible Click the VCT2000 symbol to read off the status of the MOST network.
7. If the parameter displays that the MOST network is not correctly connected, check the receiving control module in the same way as above.

The communication on the MOST network is working if the menu text is displayed. If this is the case, the fault cause is in the audio module (AUD). Continue the fault-tracing by checking the component.

The communication on the MOST network is not working if the menu text is not displayed. The fault cause is then in the MOST cable for the next control module. Continue the fault-tracing by checking the fiber optic cable.

Checking cable

- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the MOST cable if no fault is found in the MOST terminal.

Checking the component

- Check the power supply and the ground terminal for the audio module (AUD)
- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the audio module (AUD) if no fault is found.

Remedy as necessary.

Other information:

- To access or replace the audio module (AUD), see **AUDIO MODULE (AUD), REPLACING**
- see **CHECKING THE VOLTAGE / GROUND TERMINAL**

Checking the fault cause

Check the fault cause as follows:

1. Ignition off
2. Disconnect the MOST connector from the multimedia module (MMM)
3. Connect the MOST cable to special tool see **9512867**
4. Ignition on
5. Activate the infotainment system
6. Check that the communication on the MOST network is functioning by reading off the status of the MOST locked parameter for at least 30 seconds. The parameter indicates whether the MOST network is closed and communication possible Click the VCT2000 symbol to read off the status of the MOST network.
7. If the parameter displays that the MOST network is not correctly connected, check the receiving control module in the same way as above.

The communication on the MOST network is working if the menu text is displayed. If this is the case, the fault cause is in the multimedia module (MMM). Continue the fault-tracing by checking the component.

The communication on the MOST network is not working if the menu text is not displayed. The fault cause is then in the MOST cable for the next control module. Continue the fault-tracing by checking the fiber optic cable.

Checking cable

- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the MOST cable if no fault is found in the MOST terminal.

Checking the component

- Check the power supply and the ground terminal for the multimedia module (MMM)
- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the multimedia module (MMM) if no fault is found.

Remedy as necessary.

Other information:

- To access / replace the multimedia module (MMM), see **MULTIMEDIA MODULE (MMM), REPLACING**
- For information about checking the power supply and ground terminal, see **CHECKING THE VOLTAGE / GROUND TERMINAL (2007-2012)**
- see **SIGNAL SPECIFICATION**
- For information about checking and replacing the MOST cable, see **FIBER OPTIC CABLE HARNESS, REPAIRING**
- see **OPTICAL WIRING HARNESS CHECK**

- Ignition off
- Disconnect the MOST cable connector from the infotainment control module (ICM)
- Ignition on
- Activate the infotainment system.

  Check visually whether the infotainment control module (ICM) is emitting light from the MOST connector.

  The control module is defective if the infotainment control module (ICM) is not emitting light.

  If the infotainment control module (ICM) is transmitting light, the fault is in the MOST cable for the next control module.

  Check the MOST connection. Check for dirt, loose connections and damage.

Replace the MOST cable if no fault is found in the MOST terminal.

Remedy as necessary.

Other information:

- To access / replace the infotainment control module (ICM), see **INFOTAINMENT CONTROL MODULE (ICM), REPLACING**

Checking the fault cause

Check the fault cause as follows:

1. Ignition off.
2. Disconnect the MOST connector from the subwoofer module (SUB).
3. Connect the MOST cable to special tool: see **9512867**
4. Ignition on.
5. Activate the infotainment unit.
6. Check that the communication on the MOST-net works by reading out the status for the parameter **MOST locked** for at least 30 seconds. The parameter indicates whether the MOST network is closed and communication possible. Click on the VCT2000 symbol to obtain a MOST network status reading.
7. If the parameter shows that the MOST network is not closed, check the receiving control module in the same way as described above.

The communication on the MOST network is working if the menu text is displayed. If this is the case, the fault cause is in the subwoofer module (SUB). Continue the fault-tracing by checking the component.

The communication on the MOST network is not working if the menu text is not displayed. The fault cause is then in the MOST cable for the next control module. Continue the fault-tracing by checking the fiber optic cable.

Checking the cable

- Check the MOST connection. Check for dirt, loose connections and damage.
- Replace the MOST cable if no fault is found in the MOST terminal.

Checking the component

- Check the audio module (AUD) power supply and ground connection for the Accessory USB unit (AUU).
- Check the MOST connection. Check for dirt, loose connections and damage.
- If no fault is found, replace the Accessory USB unit (AUU).

Remedy as necessary.

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 38: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 39: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Using VCT2000 (Volvo Scan Tool) Activate the infotainment system and select the radio.

  Check whether there is sound from the radio in the loudspeakers.

Is the sound of the radio coming through the loudspeakers?

- **YES**

VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

SIGNAL SPECIFICATION

General

All the values given below are between the respective connection in column 1 and connection #A6 in column 2 (power ground) unless otherwise stated in brackets.

NOTE: **It is important to connect the breakout box and check the ground terminals before taking readings.**

For information on:

- Connecting the breakout box, see "Connecting the breakout box, phone module (PHM)".
- Checking ground connection, see "Checking voltage / ground connection, phone module (PHM)".

There may be several connections and connectors between control modules and components. For more information, see the appropriate service information.

U=	DC voltage in volts (V)	U_{AC} =	AC voltage in volts (V)
U_{bat} =	Battery voltage (V)	f =	Frequency in Hertz (Hz)
U_{low} =	Voltage approx. 0 V	t =	Time in s (seconds)
PWM =	Pulse-width modulated signal in %

ICM-DC01: CONTROL MODULE COMMUNICATION. FAULTY SIGNAL (2011-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-DC01

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-DC01**

NO COMMUNICATION

Special tools:

see **9512867**

CHECKING THE WIRING AND COMPONENT

The infotainment control module (ICM) has detected an open-circuit in communication on the MOST network.

The MOST network is a fiber optic ring network. This means that all control modules which are connected to the network must be powered and grounded for the infotainment system to work. If, for any reason, a control module is unable to handle (receive or transmit) signals onwards on the MOST network, or if there is an open-circuit in the fiber optic cable, the infotainment control module (ICM) will shut down all functionality.

Communication on the fiber optic net is one-directional. The control modules on the MOST network receive light signals, amplify them and then send them onwards. The MOST connectors for the control modules contain two fiber optic cables, one for incoming and one for outgoing signals.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can either be caused by interference when starting the MOST network, or by intermittent faults in the power supply/ground for one of the control modules in the network. The fault is evaluated depending on how it occurs. If the fault recurs, fault-trace for permanent faults.

It can be difficult to diagnose intermittent faults using a ring break diagnostic because for this to work the fault must occur during the diagnostic.

If the fault is permanent, perform a ring break diagnostic to locate the open-circuit.

- **Continue**

  Refer to **CHECKING FOR OPEN-CIRCUITS**

CHECKING FOR OPEN-CIRCUITS

Fig. 46: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Ring break diagnostic

A ring break diagnostic should be run to determine whether the fault has occurred.

To carry out a full ring break diagnostic of the MOST system, proceed as follows:

1. Switch off the ignition and remove the key
2. Connect separate external voltage feed to the communication tool.
3. Disconnect the battery negative lead. See **BATTERY, DISCONNECTING**
4. Wait 1 minute.
5. Ignition switch position II.
6. Connect the battery negative terminal.

7. Wait at least 30 seconds after switching on the ignition before reading off the position of the open-circuit.

Other information:

- For information about fuses, see the appropriate service information.
- For information on battery location:**BATTERY, REPLACING**

- **Continue**

  Refer to **READING OFF THE POSITION OF THE OPEN-CIRCUIT**

CHECKING CABLE AND COMPONENT

If the result of the ring break diagnostic is POOR, the infotainment control module (ICM) is receiving a signal on the MOST network. However it is unable to decode the signals because the luminance of the signals is too weak or the signals are distorted.

If the result from the ring break diagnostic is OK, the fault is intermittent.

Fault-tracing using the ring break diagnostic assumes that the fault is permanent or active when the test is run, i. e. the system is powered having been off.

HINT: If diagnostic trouble code (DTC) ICM-DC01 is intermittent, read off the status of the ring break diagnostic from the frozen values in Vehicle communication.

Check the communication on the MOST network by bypassing the control modules one by one on the MOST network as follows:

- Ignition off
- Disconnect the MOST connector from the relevant control module
- Connect the MOST cable to special tool see **9512867**
- Ignition on
- Activate the infotainment system
- Check that the communication on the MOST network is functioning by reading off the status of the MOST locked parameter for at least 30 seconds. The parameter indicates whether the MOST network is closed and communication possible. Click the VCT2000 symbol to read off the status of the MOST network.

If the communication on the MOST network is stable when a control module is disconnected, check the power supply and the ground terminal on the relevant control module. Check for intermittent faults. Try replacing the component if no fault is found.

Fig. 47: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

READING OFF THE POSITION OF THE OPEN-CIRCUIT

Fig. 48: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Reading off the result from a ring break diagnostic

  Click the VCT2000 symbol to read off the result of the ring break diagnostic.

  As well as the result from the ring break diagnostic, a list of the control modules included in the MOST network is provided for that car.

  NOTE: The figure shows the MOST-net with maximum number of possible control modules. The number of control modules can vary between 2 and 6.

  The following results can be obtained from a ring break diagnosis:

- If the diagnostic indicates an open-circuit in the communication on the MOST network, the result will be an open-circuit position
- The result will be OK if there is no fault on the MOST network Continue by selecting option 3 below.
- If the infotainment control module (ICM) receives a signal on the MOST network but is unable to decode it because the luminance is weak or the signals are distorted, the result will be POOR. Continue by selecting option 3 below.

Determining the position of the open-circuit

The position of the open-circuit is calculated by working backwards in the MOST network from the infotainment control module (ICM).

NOTE: **The ring break diagnostic always counts backwards, irrespective of which, or how many control modules, are installed in the vehicle. To determine the position of the open-circuit, check the list to, see which control modules are installed in that particular vehicle. Then count backwards following the determined order. The number of control modules can vary between 2 and 6.**

Two examples are outlined below:

- First open circuit position is indicated by 1. This means that the open circuit is in the Integrated Audio Module (IAM) or in the cable between the Bluetooth phone module (BPM) and the Integrated Audio Module (IAM).
- First open circuit position is indicated by 3. This means that the open circuit is in the Audio module (AUD) or in the cable between the Audio module (AUD) and the Multimedia module (MMM). The open circuit may be caused by a damaged optical connector in the Multimedia module (MMM). This means that Multimedia module (MMM) cannot interpret the incoming signal from Audio module (AUD).

Select the alternative for the control module to be checked.

Alternative 1: Refer to CHECKING CABLE AND COMPONENT

Remote Digital Audio Receiver (RDAR).

Audio module (AUD)

Integrated audio module (IAM).

Alternative 2: Refer to CHECKING CABLE AND COMPONENT

Phone module (PHM)

Bluetooth phone module (BPM).

Multimedia module (MMM)

Infotainment control module (ICM)

Alternative 3: Refer to CHECKING CABLE AND COMPONENT

The result from the ring break diagnostic indicates that the MOST network is OK.

The result from the ring break diagnostic is POOR.

Other information:

- see **LOCATION OF COMPONENTS**

Fig. 49: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

Fig. 50: Control Module Diagram
Courtesy of VOLVO CARS CORPORATION

CHECKING CABLE AND COMPONENT

Select the control module to be checked from the list.

1. Remote Digital Audio Receiver (RDAR). Refer to **CHECKING CABLE AND COMPONENT**
2. Audio Control Module (AUD). Refer to **CHECKING CABLE AND COMPONENT**
3. Integrated audio module (IAM). Refer to **CHECKING CABLE AND COMPONENT**

CHECKING CABLE AND COMPONENT

Select the control module to be checked from the list.

1. Phone module (PHM). Refer to **CHECKING CABLE AND COMPONENT**
2. Bluetooth phone module (BPM). Refer to **CHECKING CABLE AND COMPONENT**
3. Multimedia module (MMM). Refer to **CHECKING CABLE AND COMPONENT**
4. Infotainment Control Module (ICM). Refer to **CHECKING CABLE AND COMPONENT**

CHECKING CABLE AND COMPONENT

Fig. 51: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Checking the fault cause

Check the fault cause as follows:

1. Ignition off
2. Disconnect the MOST connector from Remote Digital Audio Receiver (RDAR).
3. Connect the MOST cable to special tool see **9512867**
4. Ignition on
5. Activate the infotainment system
6. Check that the communication on the MOST network is functioning by reading off the status of the MOST locked parameter for at least 30 seconds. The parameter indicates whether the MOST network is closed and communication possible. Click the VCT2000 symbol to read off the status of the MOST

network.

7. If the parameter displays that the MOST network is not correctly connected, check the receiving control module in the same way as above.

The communication on the MOST network is working if the menu text is displayed. The cause of the fault is then in the Remote Digital Audio Receiver (RDAR). Continue the fault-tracing by checking the component.

The communication on the MOST network is not working if the menu text is not displayed. The fault cause is then in the MOST cable for the next control module. Continue the fault-tracing by checking the fiber optic cable.

Checking cable

- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the MOST cable if no fault is found in the MOST terminal.

Checking the component

- Check the power supply and ground connection for the Remote Digital Audio Receiver (RDAR).
- Check the MOST connection. Check for dirt, loose connections and damage
- If no fault is found, replace the Remote Digital Audio Receiver (RDAR).

Remedy as necessary.

Checking the fault cause

Check the fault cause as follows:

1. Ignition off
2. Unplug the MOST connector from the Bluetooth phone module (BPM).
3. Connect the MOST cable to special tool see **9512867**
4. Ignition on
5. Activate the infotainment system
6. Check that the communication on the MOST network is functioning by reading off the status of the

MOST locked parameter for at least 30 seconds. The parameter indicates whether the MOST network is closed and communication possible. Click the VCT2000 symbol to read off the status of the MOST network.

7. If the parameter displays that the MOST network is not correctly connected, check the receiving control module in the same way as above.

The communication on the MOST network is working if the menu text is displayed. If this is the case, the fault cause is in the global positioning system module (GPS). Continue the fault-tracing by checking the component.

The communication on the MOST network is not working if the menu text is not displayed. The fault cause is then in the MOST cable for the next control module. Continue the fault-tracing by checking the fiber optic cable.

Checking cable

- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the MOST cable if no fault is found in the MOST terminal.

Checking the component

- Check the global positioning system module (GPS) power supply and ground connection.
- Check the MOST connection. Check for dirt, loose connections and damage
- If no fault can be found, change the global positioning system module (GPS).

Remedy as necessary.

Checking the fault cause

Check the fault cause as follows:

1. Ignition off
2. Disconnect the MOST connector from the multimedia module (MMM)
3. Connect the MOST cable to special tool see **9512867**
4. Ignition on
5. Activate the infotainment system
6. Check that the communication on the MOST network is functioning by reading off the status of the

MOST locked parameter for at least 30 seconds. The parameter indicates whether the MOST network is closed and communication possible. Click the VCT2000 symbol to read off the status of the MOST network.

7. If the parameter displays that the MOST network is not correctly connected, check the receiving control module in the same way as above.

The communication on the MOST network is working if the menu text is displayed. If this is the case, the fault cause is in the multimedia module (MMM). Continue the fault-tracing by checking the component.

The communication on the MOST network is not working if the menu text is not displayed. The fault cause is then in the MOST cable for the next control module. Continue the fault-tracing by checking the fiber optic cable.

Checking cable

- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the MOST cable if no fault is found in the MOST terminal.

Checking the component

- Check the power supply and the ground terminal for the multimedia module (MMM)
- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the multimedia module (MMM) if no fault is found.

Remedy as necessary.

CHECKING CABLE AND COMPONENT

Fig. 69: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the MOST cable connector from the infotainment control module (ICM)
- Ignition on
- Activate the infotainment system.

  Check visually whether the infotainment control module (ICM) is emitting light from the MOST connector.

  The control module is defective if the infotainment control module (ICM) is not emitting light.

If the infotainment control module (ICM) is transmitting light, the fault is in the MOST cable for the next control module.

Check the MOST connection. Check for dirt, loose connections and damage.

Replace the MOST cable if no fault is found in the MOST terminal.

Remedy as necessary.

Other information:

- **Continue**

Refer to **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 71: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 72: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Using VCT2000 (Volvo Scan Tool) Activate the infotainment system and select the radio.

  Check whether there is sound from the radio in the loudspeakers.

Is the sound of the radio coming through the loudspeakers?

- **YES**

VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

NO COMMUNICATION

Special tools:

see **9512867**

CHECKING THE WIRING AND COMPONENT

The infotainment control module (ICM) has detected an open-circuit in communication on the MOST network.

The MOST network is a fiber optic ring network. This means that all control modules which are connected to the network must be powered and grounded for the infotainment system to work. If, for any reason, a control module is unable to handle (receive or transmit) signals onwards on the MOST network, or if there is an open-circuit in the fiber optic cable, the infotainment control module (ICM) will shut down all functionality.

Communication on the fiber optic net is one-directional. The control modules on the MOST network receive light signals, amplify them and then send them onwards. The MOST connectors for the control modules contain two fiber optic cables, one for incoming and one for outgoing signals.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can either be caused by interference when starting the MOST network, or by intermittent faults in the power supply/ground for one of the control modules in the network. The fault is evaluated depending on how it occurs. If the fault recurs, fault-trace for permanent faults.

It can be difficult to diagnose intermittent faults using a ring break diagnostic because for this to work the fault must occur during the diagnostic.

If the fault is permanent, perform a ring break diagnostic to locate the open-circuit.

- **Continue**

  Refer to **CHECKING FOR OPEN-CIRCUITS**

CHECKING FOR OPEN-CIRCUITS

Fig. 98: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

Ring break diagnostic

A ring break diagnostic should be run to determine whether the fault has occurred.

To carry out a full ring break diagnostic of the MOST system, proceed as follows:

1. Switch off the ignition and remove the key
2. Connect separate external voltage feed to the communication tool.
3. Disconnect the battery negative lead. See **BATTERY, DISCONNECTING**
4. Wait 1 minute.
5. Ignition switch position II.
6. Connect the battery negative terminal.
7. Wait at least 30 seconds after switching on the ignition before reading off the position of the open-circuit.

Other information:

- For information about fuses, see the appropriate service information.
- For information on battery location:**BATTERY, REPLACING**

- **Continue**

  Refer to **READING OFF THE POSITION OF THE OPEN-CIRCUIT**

CHECKING CABLE AND COMPONENT

If the result of the ring break diagnostic is POOR, the infotainment control module (ICM) is receiving a signal on the MOST network. However it is unable to decode the signals because the luminance of the signals is too weak or the signals are distorted.

If the result from the ring break diagnostic is OK, the fault is intermittent.

Fault-tracing using the ring break diagnostic assumes that the fault is permanent or active when the test is run, i. e. the system is powered having been off.

HINT: If diagnostic trouble code (DTC) ICM-DC01 is intermittent, read off the status of the ring break diagnostic from the frozen values in Vehicle communication.

Check the communication on the MOST network by bypassing the control modules one by one on the MOST network as follows:

- Ignition off
- Disconnect the MOST connector from the relevant control module
- Connect the MOST cable to special tool see **9512867**
- Ignition on
- Activate the infotainment system
- Check that the communication on the MOST network is functioning by reading off the status of the MOST locked parameter for at least 30 seconds. The parameter indicates whether the MOST network is closed and communication possible. Click the VCT2000 symbol to read off the status of the MOST network.

If the communication on the MOST network is stable when a control module is disconnected, check the power supply and the ground terminal on the relevant control module. Check for intermittent faults. Try replacing the component if no fault is found.

Fig. 99: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **VERIFICATION**

READING OFF THE POSITION OF THE OPEN-CIRCUIT

Fig. 100: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

Reading off the result from a ring break diagnostic

Click the VCT2000 symbol to read off the result of the ring break diagnostic.

As well as the result from the ring break diagnostic, a list of the control modules included in the MOST network is provided for that car.

NOTE: Configuration in the illustration only applies to vehicles equipped with Audio module (AUD). In vehicles without Audio module (AUD), the Accessory USB unit (AUU) is located after the Integrated Audio Module (IAM).

The following results can be obtained from a ring break diagnosis:

- If the diagnostic indicates an open-circuit in the communication on the MOST network, the result will be an open-circuit position
- The result will be OK if there is no fault on the MOST network. Continue by selecting option 3 below.
- If the infotainment control module (ICM) receives a signal on the MOST network but is unable to decode it because the luminance is weak or the signals are distorted, the result will be POOR. Continue by selecting option 3 below.

Determining the position of the open-circuit

The position of the open-circuit is calculated by working backwards in the MOST network from the infotainment control module (ICM).

NOTE: The ring break diagnostic always counts backwards, irrespective of which, or how many control modules, are installed in the vehicle. To determine the position of the open-circuit, check the list to, see which control modules are installed in that particular vehicle. Then count backwards following the determined order. The number of control modules can vary

between 2 and 6.

Two examples are outlined below:

- First open circuit position is indicated by 1. This means that the open-circuit is in the Multimedia module (MMM) or in the cable between the Integrated Audio Module (IAM) and the Multimedia module (MMM).
- First open circuit position is indicated by 3. This means that the open circuit is in Audio module (AUD) or in the cable between Audio module (AUD) and Accessory USB unit (AUU). The open circuit may be caused by the optical connector in Accessory USB unit (AUU) being damaged. This means that Accessory USB unit (AUU) cannot interpret the incoming signal from Audio module (AUD).

Select the alternative for the control module to be checked.

Alternative 1: Refer to CHECKING CABLE AND COMPONENT

Remote Digital Audio Receiver (RDAR).

Audio module (AUD)

Integrated audio module (IAM).

Accessory USB unit (AUU).

Alternative 2: Refer to CHECKING CABLE AND COMPONENT

Phone module (PHM)

Global positioning system module (GPS).

Multimedia module (MMM)

Infotainment control module (ICM)

Alternative 3: Refer to CHECKING CABLE AND COMPONENT

The result from the ring break diagnostic indicates that the MOST network is OK.

The result from the ring break diagnostic is POOR.

Other information:

- see **LOCATION OF COMPONENTS**

Fig. 101: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 102: Control Module Diagram

Checking the fault cause

Check the fault cause as follows:

1. Ignition off
2. Disconnect the MOST connector from Remote Digital Audio Receiver (RDAR).
3. Connect the MOST cable to special tool see **9512867**
4. Ignition on
5. Activate the infotainment system
6. Check that the communication on the MOST network is functioning by reading off the status of the MOST locked parameter for at least 30 seconds. The parameter indicates whether the MOST network is closed and communication possible. Click the VCT2000 symbol to read off the status of the MOST network.
7. If the parameter displays that the MOST network is not correctly connected, check the receiving control module in the same way as above.

The communication on the MOST network is working if the menu text is displayed. The cause of the fault is then in the Remote Digital Audio Receiver (RDAR). Continue the fault-tracing by checking the component.

The communication on the MOST network is not working if the menu text is not displayed. The fault cause is then in the MOST cable for the next control module. Continue the fault-tracing by checking the fiber optic cable.

Checking cable

- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the MOST cable if no fault is found in the MOST terminal.

Checking the component

- Check the power supply and ground connection for the Remote Digital Audio Receiver (RDAR).
- Check the MOST connection. Check for dirt, loose connections and damage
- If no fault is found, replace the Remote Digital Audio Receiver (RDAR).

Remedy as necessary.
