Checking the fault cause

Check the fault cause as follows:

1. Ignition off
2. Disconnect the MOST connector from the multimedia module (MMM)
3. Connect the MOST cable to special tool see **9512867**
4. Ignition on
5. Activate the infotainment system
6. Check that the communication on the MOST network is functioning by reading off the status of the MOST locked parameter for at least 30 seconds. The parameter indicates whether the MOST network is closed and communication possible. Click the VCT2000 symbol to read off the status of the MOST network.
7. If the parameter displays that the MOST network is not correctly connected, check the receiving control module in the same way as above.

The communication on the MOST network is working if the menu text is displayed. If this is the case, the fault cause is in the multimedia module (MMM). Continue the fault-tracing by checking the component.

The communication on the MOST network is not working if the menu text is not displayed. The fault cause is then in the MOST cable for the next control module. Continue the fault-tracing by checking the fiber optic cable.

Checking cable

- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the MOST cable if no fault is found in the MOST terminal.

Checking the component

- Check the power supply and the ground terminal for the multimedia module (MMM)
- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the multimedia module (MMM) if no fault is found.

Remedy as necessary.

CHECKING CABLE AND COMPONENT

Fig. 121: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the MOST cable connector from the infotainment control module (ICM)
- Ignition on
- Activate the infotainment system.

  Check visually whether the infotainment control module (ICM) is emitting light from the MOST connector.

  The control module is defective if the infotainment control module (ICM) is not emitting light.

  If the infotainment control module (ICM) is transmitting light, the fault is in the MOST cable for the next control module.

  Check the MOST connection. Check for dirt, loose connections and damage.

Replace the MOST cable if no fault is found in the MOST terminal.

Remedy as necessary.

Checking the fault cause

Check the fault cause as follows:

1. Ignition off.

2. Unplug the MOST-connector from Accessory USB unit (AUU).
3. Connect the MOST cable to special tool: see **9512867**
4. Ignition on.
5. Activate the infotainment system.
6. Check that the communication on the MOST-net works by reading out the status for the parameter **MOST locked** for at least 30 seconds. The parameter indicates whether the MOST network is closed and communication possible. Click on the VCT2000 symbol to obtain a MOST network status reading.
7. If the parameter shows that the MOST network is not closed, check the receiving control module in the same way as described above.

The communication on the MOST network is working if the menu text is displayed. The cause of the fault is in the Accessory USB unit (AUU). Continue the fault-tracing by checking the component.

The communication on the MOST network is not working if the menu text is not displayed. The fault cause is then in the MOST cable for the next control module. Continue the fault-tracing by checking the fiber optic cable.

Checking the cable

- Check the MOST connection. Check for dirt, loose connections and damage.
- Replace the MOST cable if no fault is found in the MOST terminal.

Checking the component

- Check the audio module (AUD) power supply and ground connection for the Accessory USB unit (AUU).
- Check the MOST connection. Check for dirt, loose connections and damage.
- If no fault is found, replace the Accessory USB unit (AUU).

Remedy as necessary.

Other information

Courtesy of VOLVO CARS CORPORATION

Fig. 127: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Using VCT2000 (Volvo Scan Tool) Activate the infotainment system and select the radio.

  Check whether there is sound from the radio in the loudspeakers.

Is the sound of the radio coming through the loudspeakers?

- **YES**

VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-DC01: CONTROL MODULE COMMUNICATION. FAULTY SIGNAL (2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-DC01

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-DC01**

NO COMMUNICATION (2003, 2004)

Special tools:

see **9512867**

CHECKING THE WIRING AND COMPONENT

The infotainment control module (ICM) has detected an open-circuit in communication on the MOST network.

The MOST network is a fiber optic ring network. This means that all control modules which are connected to the network must be powered and grounded for the infotainment system to work. If, for any reason, a control module is unable to handle (receive or transmit) signals onwards on the MOST network, or if there is an open-circuit in the fiber optic cable, the infotainment control module (ICM) will shut down all functionality.

Communication on the fiber optic net is one-directional. The control modules on the MOST network receive light signals, amplify them and then send them onwards. The MOST connectors for the control modules contain two fiber optic cables, one for incoming and one for outgoing signals.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can either be caused by interference when starting the MOST network, or by intermittent faults in the power supply/ground for one of the control modules in the network. The fault is evaluated depending on how it occurs. If the fault recurs, fault-trace for permanent faults.

It can be difficult to diagnose intermittent faults using a ring break diagnostic because for this to work the fault must occur during the diagnostic.

If the fault is permanent, perform a ring break diagnostic to locate the open-circuit.

- **Continue**

  Refer to **CHECKING FOR OPEN-CIRCUITS**

CHECKING FOR OPEN-CIRCUITS

Fig. 128: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Ring break diagnostic

A ring break diagnostic should be run to determine whether the fault has occurred.

To carry out a full ring break diagnostic of the MOST system, proceed as follows:

1. Switch off the ignition and remove the key
2. Remove the fuse for the antenna module (ATM)
3. Wait at least 3 minutes
4. Ignition on
5. Reinstall the fuse for the antenna module (ATM) within 25 seconds
6. Wait at least 30 seconds after switching on the ignition before reading off the position of the open-circuit.

Other information:

- For information about fuses, see the appropriate service information.
- **Continue**

  Refer to **READING OFF THE POSITION OF THE OPEN-CIRCUIT**

CHECKING CABLE AND COMPONENT

If the result of the ring break diagnostic is POOR, the infotainment control module (ICM) is receiving a signal on the MOST network. However it is unable to decode the signals because the luminance of the signals is too weak or the signals are distorted.

If the result from the ring break diagnostic is OK, the fault is intermittent.

Fault-tracing using the ring break diagnostic assumes that the fault is permanent or active when the test is run, i. e. the system is powered having been off.

HINT: If diagnostic trouble code (DTC) ICM-DC01 is intermittent, read off the status of the ring break diagnostic from the frozen values in Vehicle communication.

HINT: Note that the antenna module (ATM) is not normally included in a ring break diagnostic if the fuse is not removed. This means that the position of the open-circuit moves one step backwards in the MOST network.

HINT: On fully equipped vehicles, if the open-circuit position is 0, this may be because of:

- Subwoofer module (SUB)
- The fiber optic cable between the subwoofer module (SUB) and the antenna module (ATM)
- Antenna module (ATM)
- The fiber optic cable between the antenna module (ATM) and the infotainment control module (ICM)
- The optical switch in the infotainment control module (ICM). This means that the infotainment control module (ICM) is not able to interpret the incoming signal correctly.

Check the communication on the MOST network by bypassing the control modules one by one on the MOST network as follows:

- Ignition off
- Disconnect the MOST connector from the relevant control module
- Connect the MOST cable to special tool see **9512867**
- Ignition on
- Activate the infotainment system
- Check that the communication on the MOST network is functioning by reading off the status of the MOST locked parameter for at least 30 seconds. The parameter indicates whether the MOST network is closed and communication possible.

If the communication on the MOST network is stable when a control module is disconnected, check the power supply and the ground terminal on the relevant control module. Check for intermittent faults. Try replacing the component if no fault is found.

Click the VCT2000 symbol to read off the status of the MOST network.

Fig. 129: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

- **Continue**

  Refer to **VERIFICATION**

READING OFF THE POSITION OF THE OPEN-CIRCUIT

Fig. 131: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Reading off the result from a ring break diagnostic

  Click the VCT2000 symbol to read off the result of the ring break diagnostic.

  As well as the result from the ring break diagnostic, a list of the control modules included in the MOST network is provided for that car.

  The following result can be obtained from a ring break diagnostic:

  If the fault occurs when the ring break diagnostic is run, the result will be presented as an open-circuit position.

If the fault does not occur when the ring break diagnostic is run, the result will be OK. If this is the case, select alternative 3 below.

- If the diagnostic indicates an open-circuit in the communication on the MOST network, the result will be an open-circuit position
- The result will be OK if there is no fault on the MOST network
- If the infotainment control module (ICM) receives a signal on the MOST network but is unable to decode it because the luminance is weak or the signals are distorted, the result will be POOR.

Determining the position of the open-circuit

The position of the open-circuit is calculated by working backwards in the MOST network from the infotainment control module (ICM).

NOTE: The ring break diagnostic only counts backwards, irrespective of which, or how many control modules, are installed in the car. To determine the position of the open-circuit, check the list to, see which control modules are installed in that particular car. Then count backwards following the determined order. The number of control modules can vary between 3-8.

Two examples are outlined below:

- The first open-circuit position corresponds to 0. This means that the open-circuit is in the antenna module (ATM) or in the cable between the antenna module (ATM) and the infotainment control module (ICM)
- If the position is 1, go one step backwards in the chain. The open-circuit is in the subwoofer module (SUB) or in the cable between the subwoofer module (SUB) and the antenna module (ATM). The open-circuit can also be caused by the optical switch in the antenna module (ATM) being damaged so that the antenna module (ATM) is not able to interpret the incoming signal from the subwoofer module (SUB) correctly.

  NOTE: The subwoofer module (SUB) is not standard. If one is not installed, the open-circuit position 1 applies to the audio module (AUD).

Select the alternative for the control module to be checked.

Alternative 1: Refer to CHECKING CABLE AND COMPONENT

Antenna module (ATM)

Subwoofer module (SUB)

Audio module (AUD)

CD player module (MP2)

Alternative 2: Refer to CHECKING CABLE AND COMPONENT

Phone module (PHM)

MD player module (MP1)

Multimedia module (MMM)

Infotainment control module (ICM)

Alternative 3: Refer to CHECKING CABLE AND COMPONENT

The result from the ring break diagnostic indicates that the MOST network is OK.

The result from the ring break diagnostic is POOR.

Other information:

- For information about location and order of control modules in the MOST network, see **LOCATION OF COMPONENTS**

Checking the fault cause

Check the fault cause as follows:

1. Ignition off
2. Disconnect the MOST connector from the antenna module (ATM)
3. Connect the MOST cable to special tool see **9512867**
4. Ignition on

5. Activate the infotainment system
6. Check that the communication on the MOST network is functioning by reading off the status of the MOST locked parameter for at least 30 seconds. The parameter indicates whether the MOST network is closed and communication possible
7. If the parameter displays that the MOST network is not correctly connected, check the receiving control module in the same way as above.

The communication on the MOST network is working if the menu text is displayed. If this is the case, the fault cause is in the antenna module (ATM). Continue the fault-tracing by checking the component.

The communication on the MOST network is not working if the menu text is not displayed. The fault cause is then in the MOST cable for the next control module. Continue the fault-tracing by checking the fiber optic cable.

Checking cable

- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the MOST cable if no fault is found in the MOST terminal.

Checking the component

- Check the power supply and the ground terminal for the antenna module (ATM)
- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the antenna module (ATM) if no fault is found.

Remedy as necessary.

Click the VCT2000 symbol to read off the status of the MOST network.

Other information:

- Ignition on.

  Using VCT2000 (Volvo Scan Tool) Activate the infotainment system and select the radio.

  Check whether there is sound from the radio in the loudspeakers.

Is the sound of the radio coming through the loudspeakers?

- **YES**

VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

NO COMMUNICATION (2005)

Special tools:

see **9512867**

CHECKING THE WIRING AND COMPONENT

The infotainment control module (ICM) has detected an open-circuit in communication on the MOST network.

The MOST network is a fiber optic ring network. This means that all control modules which are connected to the network must be powered and grounded for the infotainment system to work. If, for any reason, a control module is unable to handle (receive or transmit) signals onwards on the MOST network, or if there is an open-circuit in the fiber optic cable, the infotainment control module (ICM) will shut down all functionality.

Communication on the fiber optic net is one-directional. The control modules on the MOST network receive light signals, amplify them and then send them onwards. The MOST connectors for the control modules contain two fiber optic cables, one for incoming and one for outgoing signals.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can either be caused by interference when starting the MOST network, or by intermittent faults in the power supply/ground for one of the control modules in the network. The fault is evaluated depending on how it occurs. If the fault recurs, fault-trace for permanent faults.

It can be difficult to diagnose intermittent faults using a ring break diagnostic because for this to work the fault must occur during the diagnostic.

If the fault is permanent, perform a ring break diagnostic to locate the open-circuit.

- **Continue**

  Refer to **CHECKING FOR OPEN-CIRCUITS**

CHECKING FOR OPEN-CIRCUITS

Fig. 151: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Ring break diagnostic

A ring break diagnostic should be run to determine whether the fault has occurred.

To carry out a full ring break diagnostic of the MOST system, proceed as follows:

1. Switch off the ignition and remove the key
2. Remove the fuse for the antenna module (ATM)
3. Wait at least 3 minutes
4. Ignition on
5. Reinstall the fuse for the antenna module (ATM) within 25 seconds
6. Wait at least 30 seconds after switching on the ignition before reading off the position of the open-circuit.

Other information:

- For information about fuses, see the appropriate service information.
- **Continue**

  Refer to **READING OFF THE POSITION OF THE OPEN-CIRCUIT**

CHECKING CABLE AND COMPONENT

If the result of the ring break diagnostic is POOR, the infotainment control module (ICM) is receiving a signal on the MOST network. However it is unable to decode the signals because the luminance of the signals is too weak or the signals are distorted.

If the result from the ring break diagnostic is OK, the fault is intermittent.

Fault-tracing using the ring break diagnostic assumes that the fault is permanent or active when the test is run, i. e. the system is powered having been off.

HINT: If diagnostic trouble code (DTC) ICM-DC01 is intermittent, read off the status of the ring break diagnostic from the frozen values in Vehicle communication.

HINT: Note that the antenna module (ATM) is not normally included in a ring break diagnostic if the fuse is not removed. This means that the position of the open-circuit moves one step backwards in the MOST network.

HINT: On fully equipped vehicles, if the open-circuit position is 0, this may be because of:

- Subwoofer module (SUB)
- The fiber optic cable between the subwoofer module (SUB) and the antenna module (ATM)
- Antenna module (ATM)
- The fiber optic cable between the antenna module (ATM) and the infotainment control module (ICM)
- The optical switch in the infotainment control module (ICM). This means that the infotainment control module (ICM) is not able to interpret the incoming signal correctly.

Check the communication on the MOST network by bypassing the control modules one by one on the MOST network as follows:

- Ignition off
- Disconnect the MOST connector from the relevant control module
- Connect the MOST cable to special tool see **9512867**
- Ignition on
- Activate the infotainment system
- Check that the communication on the MOST network is functioning by reading off the status of the MOST locked parameter for at least 30 seconds. The parameter indicates whether the MOST network is

closed and communication possible.

If the communication on the MOST network is stable when a control module is disconnected, check the power supply and the ground terminal on the relevant control module. Check for intermittent faults. Try replacing the component if no fault is found.

Click the VCT2000 symbol to read off the status of the MOST network.

Fig. 152: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

READING OFF THE POSITION OF THE OPEN-CIRCUIT

Fig. 154: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Reading off the result from a ring break diagnostic

  Click the VCT2000 symbol to read off the result of the ring break diagnostic.

  As well as the result from the ring break diagnostic, a list of the control modules included in the MOST network is provided for that car.

  The following result can be obtained from a ring break diagnostic:

  If the fault occurs when the ring break diagnostic is run, the result will be presented as an open-circuit position.

If the fault does not occur when the ring break diagnostic is run, the result will be OK. If this is the case, select alternative 3 below.

- If the diagnostic indicates an open-circuit in the communication on the MOST network, the result will be an open-circuit position
- The result will be OK if there is no fault on the MOST network
- If the infotainment control module (ICM) receives a signal on the MOST network but is unable to decode it because the luminance is weak or the signals are distorted, the result will be POOR.

Determining the position of the open-circuit

The position of the open-circuit is calculated by working backwards in the MOST network from the infotainment control module (ICM).

NOTE: The ring break diagnostic only counts backwards, irrespective of which, or how many control modules, are installed in the car. To determine the position of the open-circuit, check the list to, see which control modules are installed in that particular car. Then count backwards following the determined order. The number of control modules can vary between 3-8.

Two examples are outlined below:

- The first open-circuit position corresponds to 0. This means that the open-circuit is in the antenna module (ATM) or in the cable between the antenna module (ATM) and the infotainment control module (ICM)
- If the position is 1, go one step backwards in the chain. The open-circuit is in the subwoofer module (SUB) or in the cable between the subwoofer module (SUB) and the antenna module (ATM). The open-circuit can also be caused by the optical switch in the antenna module (ATM) being damaged so that the antenna module (ATM) is not able to interpret the incoming signal from the subwoofer module (SUB) correctly.

  NOTE: The subwoofer module (SUB) is not standard. If one is not installed, the open-circuit position 1 applies to the audio module (AUD).

Select the alternative for the control module to be checked.

Alternative 1: Refer to CHECKING CABLE AND COMPONENT

Antenna module (ATM)

Subwoofer module (SUB)

Audio module (AUD)

CD player module (MP2)

Alternative 2: Refer to CHECKING CABLE AND COMPONENT

Phone module (PHM)

MD player module (MP1)

Multimedia module (MMM)

Infotainment control module (ICM)

Alternative 3: Refer to CHECKING CABLE AND COMPONENT

The result from the ring break diagnostic indicates that the MOST network is OK.

The result from the ring break diagnostic is POOR.

Other information:

- For information about location and order of control modules in the MOST network, see **LOCATION OF COMPONENTS**

Fig. 155: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

Checking the fault cause

Check the fault cause as follows:

1. Ignition off
2. Disconnect the MOST connector from the antenna module (ATM)
3. Connect the MOST cable to special tool see **9512867**
4. Ignition on

5. Activate the infotainment system
6. Check that the communication on the MOST network is functioning by reading off the status of the MOST locked parameter for at least 30 seconds. The parameter indicates whether the MOST network is closed and communication possible
7. If the parameter displays that the MOST network is not correctly connected, check the receiving control module in the same way as above.

The communication on the MOST network is working if the menu text is displayed. If this is the case, the fault cause is in the antenna module (ATM). Continue the fault-tracing by checking the component.

The communication on the MOST network is not working if the menu text is not displayed. The fault cause is then in the MOST cable for the next control module. Continue the fault-tracing by checking the fiber optic cable.

Checking cable

- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the MOST cable if no fault is found in the MOST terminal.

Checking the component

- Check the power supply and the ground terminal for the antenna module (ATM)
- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the antenna module (ATM) if no fault is found.

Remedy as necessary.

Click the VCT2000 symbol to read off the status of the MOST network.

Other information:

- To access or replace the antenna module (ATM), see **RECEIVER GPS, TMC (ATM), REPLACE**
- For information about checking the power supply and ground terminal, see **CHECKING THE POWER SUPPLY AND GROUND TERMINALS**
- For information about signals, see **SIGNAL SPECIFICATION**
- see **OPTICAL WIRING HARNESS CHECK**
- For information about checking and replacing the MOST cable, see **FIBER OPTIC CABLE HARNESS, REPAIRING**
- For information about location and order of control modules in the MOST network, see **LOCATION OF COMPONENTS** .

Checking the fault cause

Check the fault cause as follows:

1. Ignition off
2. Disconnect the MOST connector from the subwoofer module (SUB)
3. Connect the MOST cable to special tool see **9512867**
4. Ignition on
5. Activate the infotainment system
6. Check that the communication on the MOST network is functioning by reading off the status of the MOST locked parameter for at least 30 seconds. The parameter indicates whether the MOST network is closed and communication possible

7. If the parameter displays that the MOST network is not correctly connected, check the receiving control module in the same way as above.

The communication on the MOST network is working if the menu text is displayed. If this is the case, the fault cause is in the bypassed control module. Continue the fault-tracing by checking the component.

The communication on the MOST network is not working if the menu text is not displayed. The fault cause is then in the MOST cable for the next control module. Continue the fault-tracing by checking the fiber optic cable.

Checking cable

- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the MOST cable if no fault is found in the MOST terminal.

Checking the component

- Check the power supply and the ground terminal for the subwoofer module (SUB)
- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the subwoofer module (SUB) if no fault is found.

Click the VCT2000 symbol to read off the status of the MOST network.

Remedy as necessary.

Other information:

- To access or replace the subwoofer module (SUB), see **SUBWOOFER MODULE (SUB), REPLACING**

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

NO COMMUNICATION (2006)

Special tools:

see **9512867**

CHECKING THE WIRING AND COMPONENT

The infotainment control module (ICM) has detected an open-circuit in communication on the MOST network.

The MOST network is a fiber optic ring network. This means that all control modules which are connected to the network must be powered and grounded for the infotainment system to work. If, for any reason, a control module is unable to handle (receive or transmit) signals onwards on the MOST network, or if there is an open-circuit in the fiber optic cable, the infotainment control module (ICM) will shut down all functionality.

Communication on the fiber optic net is one-directional. The control modules on the MOST network receive light signals, amplify them and then send them onwards. The MOST connectors for the control modules contain two fiber optic cables, one for incoming and one for outgoing signals.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can either be caused by interference when starting the MOST network, or by intermittent faults in the power supply/ground for one of the control modules in the network. The fault is evaluated depending on how it occurs. If the fault recurs, fault-trace for permanent faults.

It can be difficult to diagnose intermittent faults using a ring break diagnostic because for this to work the fault must occur during the diagnostic.

If the fault is permanent, perform a ring break diagnostic to locate the open-circuit.

- **Continue**

  Refer to **CHECKING FOR OPEN-CIRCUITS**

CHECKING FOR OPEN-CIRCUITS

Fig. 174: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Ring break diagnostic

A ring break diagnostic should be run to determine whether the fault has occurred.

To carry out a full ring break diagnostic of the MOST system, proceed as follows:

1. Switch off the ignition and remove the key
2. Remove the fuse for the antenna module (ATM)
3. Wait at least 3 minutes
4. Ignition on
5. Reinstall the fuse for the antenna module (ATM) within 25 seconds
6. Wait at least 30 seconds after switching on the ignition before reading off the position of the open-circuit.

Other information:

- For information about fuses, see the appropriate service information.
- **Continue**

  Refer to **READING OFF THE POSITION OF THE OPEN-CIRCUIT**

CHECKING CABLE AND COMPONENT

If the result of the ring break diagnostic is POOR, the infotainment control module (ICM) is receiving a signal on the MOST network. However it is unable to decode the signals because the luminance of the signals is too weak or the signals are distorted.

If the result from the ring break diagnostic is OK, the fault is intermittent.

Fault-tracing using the ring break diagnostic assumes that the fault is permanent or active when the test is run, i. e. the system is powered having been off.

HINT: If diagnostic trouble code (DTC) ICM-DC01 is intermittent, read off the status of the ring break diagnostic from the frozen values in Vehicle communication.

HINT: Note that the antenna module (ATM) is not normally included in a ring break diagnostic if the fuse is not removed. This means that the position of the open-circuit moves one step backwards in the MOST network.

HINT: On fully equipped vehicles, if the open-circuit position is 0, this may be because of:

- Subwoofer module (SUB)
- The fiber optic cable between the subwoofer module (SUB) and the antenna module (ATM)
- Antenna module (ATM)
- The fiber optic cable between the antenna module (ATM) and the infotainment control module (ICM)
- The optical switch in the infotainment control module (ICM). This means that the infotainment control module (ICM) is not able to interpret the incoming signal correctly.

Check the communication on the MOST network by bypassing the control modules one by one on the MOST network as follows:

- Ignition off
- Disconnect the MOST connector from the relevant control module
- Connect the MOST cable to special tool see **9512867**
- Ignition on
- Activate the infotainment system
- Check that the communication on the MOST network is functioning by reading off the status of the MOST locked parameter for at least 30 seconds. The parameter indicates whether the MOST network is

closed and communication possible.

If the communication on the MOST network is stable when a control module is disconnected, check the power supply and the ground terminal on the relevant control module. Check for intermittent faults. Try replacing the component if no fault is found.

Click the VCT2000 symbol to read off the status of the MOST network.

Fig. 175: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

  Refer to **VERIFICATION**

READING OFF THE POSITION OF THE OPEN-CIRCUIT

Fig. 177: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Reading off the result from a ring break diagnostic

  Click the VCT2000 symbol to read off the result of the ring break diagnostic.

  As well as the result from the ring break diagnostic, a list of the control modules included in the MOST network is provided for that car.

  The following result can be obtained from a ring break diagnostic:

  If the fault occurs when the ring break diagnostic is run, the result will be presented as an open-circuit position.

If the fault does not occur when the ring break diagnostic is run, the result will be OK. If this is the case, select alternative 3 below.

- If the diagnostic indicates an open-circuit in the communication on the MOST network, the result will be an open-circuit position
- The result will be OK if there is no fault on the MOST network
- If the infotainment control module (ICM) receives a signal on the MOST network but is unable to decode it because the luminance is weak or the signals are distorted, the result will be POOR.

Determining the position of the open-circuit

The position of the open-circuit is calculated by working backwards in the MOST network from the infotainment control module (ICM).

NOTE: The ring break diagnostic only counts backwards, irrespective of which, or how many control modules, are installed in the car. To determine the position of the open-circuit, check the list to, see which control modules are installed in that particular car. Then count backwards following the determined order. The number of control modules can vary between 3-8.

Two examples are outlined below:

- The first open-circuit position corresponds to 0. This means that the open-circuit is in the antenna module (ATM) or in the cable between the antenna module (ATM) and the infotainment control module (ICM)
- If the position is 1, go one step backwards in the chain. The open-circuit is in the subwoofer module (SUB) or in the cable between the subwoofer module (SUB) and the antenna module (ATM). The open-circuit can also be caused by the optical switch in the antenna module (ATM) being damaged so that the antenna module (ATM) is not able to interpret the incoming signal from the subwoofer module (SUB) correctly.

  NOTE: The subwoofer module (SUB) is not standard. If one is not installed, the open-circuit position 1 applies to the audio module (AUD).

Select the alternative for the control module to be checked.

Alternative 1: Refer to CHECKING CABLE AND COMPONENT

Antenna module (ATM)

Subwoofer module (SUB)

Audio module (AUD)

CD player module (MP2)

Alternative 2: Refer to CHECKING CABLE AND COMPONENT

Phone module (PHM)

MD player module (MP1)

Multimedia module (MMM)

Infotainment control module (ICM)

Alternative 3: Refer to CHECKING CABLE AND COMPONENT

The result from the ring break diagnostic indicates that the MOST network is OK.

The result from the ring break diagnostic is POOR.

Other information:

- For information about location and order of control modules in the MOST network, see **LOCATION OF COMPONENTS**

Checking the fault cause

Check the fault cause as follows:

1. Ignition off
2. Disconnect the MOST connector from the antenna module (ATM)
3. Connect the MOST cable to special tool see **9512867**
4. Ignition on

5. Activate the infotainment system
6. Check that the communication on the MOST network is functioning by reading off the status of the MOST locked parameter for at least 30 seconds. The parameter indicates whether the MOST network is closed and communication possible
7. If the parameter displays that the MOST network is not correctly connected, check the receiving control module in the same way as above.

The communication on the MOST network is working if the menu text is displayed. If this is the case, the fault cause is in the antenna module (ATM). Continue the fault-tracing by checking the component.

The communication on the MOST network is not working if the menu text is not displayed. The fault cause is then in the MOST cable for the next control module. Continue the fault-tracing by checking the fiber optic cable.

Checking cable

- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the MOST cable if no fault is found in the MOST terminal.

Checking the component

- Check the power supply and the ground terminal for the antenna module (ATM)
- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the antenna module (ATM) if no fault is found.

Remedy as necessary.

Click the VCT2000 symbol to read off the status of the MOST network.

Other information:

- To access or replace the antenna module (ATM), see **RECEIVER GPS, TMC (ATM), REPLACE**

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Using VCT2000 (Volvo Scan Tool) Activate the infotainment system and select the radio.

  Check whether there is sound from the radio in the loudspeakers.

Is the sound of the radio coming through the loudspeakers?

- **YES**

VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-DC02: CONTROL MODULE COMMUNICATION. SIGNAL MISSING (2007-2008)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-DC02

Condition

Fig. 197: Infotainment Control Module
Courtesy of VOLVO CARS CORPORATION

The infotainment control module (ICM) checks that the status of the MOST network is MOST-LOCK. MOST-LOCK means that the network is closed and that communication is possible.

Diagnostic trouble code (DTC) ICM-DC02 is stored if the infotainment control module (ICM) registers that the MOST network is not in MOST-LOCK mode.

ICM-DC02 can be detected when the ignition is in position I or II for at least 5 seconds.

Substitute Value

- None.

Possible Source

- Dirty or damaged MOST cable connector
- Open-circuit in the MOST cable
- The MOST transceiver is defective in one of the control modules in the MOST network
- No power supply to a control module in the MOST network.

Fault symptom[s]

- Audio unit not working
- The display does not light
- Functions in the infotainment system are not working
- No or reduced carphone functionality.

NO COMMUNICATION

see **NO COMMUNICATION**

ICM-DC02: CONTROL MODULE COMMUNICATION. SIGNAL MISSING (2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-DC02

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-DC02**

NO COMMUNICATION (2003, 2004)

Special tools:

see **9512867**

CHECKING THE WIRING AND COMPONENT

The infotainment control module (ICM) has detected an open-circuit in communication on the MOST network.

The MOST network is a fiber optic ring network. This means that all control modules which are connected to the network must be powered and grounded for the infotainment system to work. If, for any reason, a control module is unable to handle (receive or transmit) signals onwards on the MOST network, or if there is an open-circuit in the fiber optic cable, the infotainment control module (ICM) will shut down all functionality.

Communication on the fiber optic net is one-directional. The control modules on the MOST network receive light signals, amplify them and then send them onwards. The MOST connectors for the control modules contain two fiber optic cables, one for incoming and one for outgoing signals.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can either be caused by interference when starting the MOST network, or by intermittent faults in the power supply/ground for one of the control modules in the network. The fault is evaluated depending on how it occurs. If the fault recurs, fault-trace for permanent faults.

It can be difficult to diagnose intermittent faults using a ring break diagnostic because for this to work the fault must occur during the diagnostic.

If the fault is permanent, perform a ring break diagnostic to locate the open-circuit.

- **Continue**

  Refer to **CHECKING FOR OPEN-CIRCUITS**

CHECKING FOR OPEN-CIRCUITS

Fig. 198: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Ring break diagnostic

A ring break diagnostic should be run to determine whether the fault has occurred.

To carry out a full ring break diagnostic of the MOST system, proceed as follows:

1. Switch off the ignition and remove the key
2. Remove the fuse for the antenna module (ATM)
3. Wait at least 3 minutes
4. Ignition on
5. Reinstall the fuse for the antenna module (ATM) within 25 seconds
6. Wait at least 30 seconds after switching on the ignition before reading off the position of the open-circuit.

Other information:

- For information about fuses, see the appropriate service information.
- **Continue**

  Refer to **READING OFF THE POSITION OF THE OPEN-CIRCUIT**

CHECKING CABLE AND COMPONENT

If the result of the ring break diagnostic is POOR, the infotainment control module (ICM) is receiving a signal on the MOST network. However it is unable to decode the signals because the luminance of the signals is too weak or the signals are distorted.

If the result from the ring break diagnostic is OK, the fault is intermittent.

Fault-tracing using the ring break diagnostic assumes that the fault is permanent or active when the test is run, i. e. the system is powered having been off.

HINT: If diagnostic trouble code (DTC) ICM-DC01 is intermittent, read off the status of the ring break diagnostic from the frozen values in Vehicle communication.

HINT: Note that the antenna module (ATM) is not normally included in a ring break diagnostic if the fuse is not removed. This means that the position of the open-circuit moves one step backwards in the MOST network.

HINT: On fully equipped vehicles, if the open-circuit position is 0, this may be because of:

- Subwoofer module (SUB)
- The fiber optic cable between the subwoofer module (SUB) and the antenna module (ATM)
- Antenna module (ATM)
- The fiber optic cable between the antenna module (ATM) and the infotainment control module (ICM)
- The optical connector in the infotainment control module (ICM). This means that the infotainment control module (ICM) is not able to interpret the incoming signal correctly.

Check the communication on the MOST network by bypassing the control modules one by one on the MOST network as follows:

- Ignition off
- Disconnect the MOST connector from the relevant control module
- Connect the MOST cable to special tool see **9512867**
- Ignition on
- Activate the infotainment system
- Check that the communication on the MOST network is functioning by reading off the status of the MOST locked parameter for at least 30 seconds. The parameter indicates whether the MOST network is

closed and communication possible.

If the communication on the MOST network is stable when a control module is disconnected, check the power supply and the ground terminal on the relevant control module. Check for intermittent faults. Try replacing the component if no fault is found.

Click the VCT2000 symbol to read off the status of the MOST network.

Fig. 199: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

READING OFF THE POSITION OF THE OPEN-CIRCUIT

Fig. 201: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Reading off the result from a ring break diagnostic

  Click the VCT2000 symbol to read off the result of the ring break diagnostic.

  As well as the result from the ring break diagnostic, a list of the control modules included in the MOST network is provided for that car.

  The following result can be obtained from a ring break diagnostic:

  If the fault occurs when the ring break diagnostic is run, the result will be presented as an open-circuit position.

If the fault does not occur when the ring break diagnostic is run, the result will be OK. If this is the case, select alternative 3 below.

- If the diagnostic indicates an open-circuit in the communication on the MOST network, the result will be an open-circuit position
- The result will be OK if there is no fault on the MOST network
- If the infotainment control module (ICM) receives a signal on the MOST network but is unable to decode it because the luminance is weak or the signals are distorted, the result will be POOR.

Determining the position of the open-circuit

The position of the open-circuit is calculated by working backwards in the MOST network from the infotainment control module (ICM).

NOTE: The ring break diagnostic only counts backwards, irrespective of which, or how many control modules, are installed in the car. To determine the position of the open-circuit, check the list to, see which control modules are installed in that particular car. Then count backwards following the determined order. The number of control modules can vary between 3-8.

Two examples are outlined below:

- The first open-circuit position corresponds to 0. This means that the open-circuit is in the antenna module (ATM) or in the cable between the antenna module (ATM) and the infotainment control module (ICM)
- If the position is 1, go one step backwards in the chain. The open-circuit is in the subwoofer module (SUB) or in the cable between the subwoofer module (SUB) and the antenna module (ATM). The open-circuit can also be caused by the optical connector in the antenna module (ATM) being damaged so that the antenna module (ATM) is not able to interpret the incoming signal from the subwoofer module (SUB) correctly.

  NOTE: The subwoofer module (SUB) is not standard. If one is not installed, the open-circuit position 1 applies to the audio module (AUD).

Select the alternative for the control module to be checked.

Alternative 1: Refer to CHECKING CABLE AND COMPONENT

Antenna module (ATM)

Subwoofer module (SUB)

Audio module (AUD)

CD player module (MP2)

Alternative 2: Refer to CHECKING CABLE AND COMPONENT

Phone module (PHM)

MD player module (MP1)

Multimedia module (MMM)

Infotainment control module (ICM)

Alternative 3: Refer to CHECKING CABLE AND COMPONENT

The result from the ring break diagnostic indicates that the MOST network is OK.

The result from the ring break diagnostic is POOR.

Other information:

- For information about location and order of control modules in the MOST network, see **LOCATION OF COMPONENTS**

CHECKING CABLE AND COMPONENT

Select the control module to be checked from the list.

1. Antenna module (ATM). Refer to **CHECKING CABLE AND COMPONENT**

2. Subwoofer module (SUB). Refer to **CHECKING CABLE AND COMPONENT**

3. Audio module (AUD). Refer to **CHECKING CABLE AND COMPONENT**

4. CD player module (MP2). Refer to **CHECKING CABLE AND COMPONENT**

CHECKING CABLE AND COMPONENT

Select the control module to be checked from the list.

1. Phone module (PHM). Refer to **CHECKING CABLE AND COMPONENT**

2. MD player module (MP1). Refer to **CHECKING CABLE AND COMPONENT**

3. Multimedia module (MMM). Refer to **CHECKING CABLE AND COMPONENT**

4. Infotainment control module (ICM). Refer to **CHECKING CABLE AND COMPONENT**

CHECKING CABLE AND COMPONENT

Fig. 204: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Checking the fault cause

Check the fault cause as follows:

1. Ignition off
2. Disconnect the MOST connector from the antenna module (ATM)
3. Connect the MOST cable to special tool see **9512867**
4. Ignition on

5. Activate the infotainment system
6. Check that the communication on the MOST network is functioning by reading off the status of the MOST locked parameter for at least 30 seconds. The parameter indicates whether the MOST network is closed and communication possible
7. If the parameter displays that the MOST network is not correctly connected, check the receiving control module in the same way as above.

The communication on the MOST network is working if the menu text is displayed. If this is the case, the fault cause is in the antenna module (ATM). Continue the fault-tracing by checking the component.

The communication on the MOST network is not working if the menu text is not displayed. The fault cause is then in the MOST cable for the next control module. Continue the fault-tracing by checking the fiber optic cable.

Checking cable

- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the MOST cable if no fault is found in the MOST terminal.

Checking the component

- Check the power supply and the ground terminal for the antenna module (ATM)
- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the antenna module (ATM) if no fault is found.

Remedy as necessary.

Click the VCT2000 symbol to read off the status of the MOST network.

Checking the fault cause

Check the fault cause as follows:

1. Ignition off
2. Disconnect the MOST connector from the subwoofer module (SUB)
3. Connect the MOST cable to special tool see **9512867**
4. Ignition on
5. Activate the infotainment system
6. Check that the communication on the MOST network is functioning by reading off the status of the MOST locked parameter for at least 30 seconds. The parameter indicates whether the MOST network is closed and communication possible

7. If the parameter displays that the MOST network is not correctly connected, check the receiving control module in the same way as above.

The communication on the MOST network is working if the menu text is displayed. If this is the case, the fault cause is in the bypassed control module. Continue the fault-tracing by checking the component.

The communication on the MOST network is not working if the menu text is not displayed. The fault cause is then in the MOST cable for the next control module. Continue the fault-tracing by checking the fiber optic cable.

Checking cable

- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the MOST cable if no fault is found in the MOST terminal.

Checking the component

- Check the power supply and the ground terminal for the subwoofer module (SUB)
- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the subwoofer module (SUB) if no fault is found.

Click the VCT2000 symbol to read off the status of the MOST network.

Remedy as necessary.

Other information:

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Using VCT2000 (Volvo Scan Tool) Activate the infotainment system and select the radio.

  Check whether there is sound from the radio in the loudspeakers.

Is the sound of the radio coming through the loudspeakers?

- **YES**

VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

NO COMMUNICATION (2005)

Special tools:

see **9512867**

CHECKING THE WIRING AND COMPONENT

The infotainment control module (ICM) has detected an open-circuit in communication on the MOST network.

The MOST network is a fiber optic ring network. This means that all control modules which are connected to the network must be powered and grounded for the infotainment system to work. If, for any reason, a control module is unable to handle (receive or transmit) signals onwards on the MOST network, or if there is an open-circuit in the fiber optic cable, the infotainment control module (ICM) will shut down all functionality.

Communication on the fiber optic net is one-directional. The control modules on the MOST network receive light signals, amplify them and then send them onwards. The MOST connectors for the control modules contain two fiber optic cables, one for incoming and one for outgoing signals.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can either be caused by interference when starting the MOST network, or by intermittent faults in the power supply/ground for one of the control modules in the network. The fault is evaluated depending on how it occurs. If the fault recurs, fault-trace for permanent faults.

It can be difficult to diagnose intermittent faults using a ring break diagnostic because for this to work the fault must occur during the diagnostic.

If the fault is permanent, perform a ring break diagnostic to locate the open-circuit.

- **Continue**

  Refer to **CHECKING FOR OPEN-CIRCUITS**

CHECKING FOR OPEN-CIRCUITS

Fig. 221: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Ring break diagnostic

A ring break diagnostic should be run to determine whether the fault has occurred.

To carry out a full ring break diagnostic of the MOST system, proceed as follows:

1. Switch off the ignition and remove the key
2. Remove the fuse for the antenna module (ATM)
3. Wait at least 3 minutes
4. Ignition on
5. Reinstall the fuse for the antenna module (ATM) within 25 seconds
6. Wait at least 30 seconds after switching on the ignition before reading off the position of the open-circuit.

- **Continue**

  Refer to **READING OFF THE POSITION OF THE OPEN-CIRCUIT**

CHECKING CABLE AND COMPONENT

If the result of the ring break diagnostic is POOR, the infotainment control module (ICM) is receiving a signal on the MOST network. However it is unable to decode the signals because the luminance of the signals is too weak or the signals are distorted.

If the result from the ring break diagnostic is OK, the fault is intermittent.

Fault-tracing using the ring break diagnostic assumes that the fault is permanent or active when the test is run, i. e. the system is powered having been off.

HINT: If diagnostic trouble code (DTC) ICM-DC01 is intermittent, read off the status of the ring break diagnostic from the frozen values in Vehicle communication.

HINT: Note that the antenna module (ATM) is not normally included in a ring break diagnostic if the fuse is not removed. This means that the position of the open-circuit moves one step backwards in the MOST network.

HINT: On fully equipped vehicles, if the open-circuit position is 0, this may be because of:

- Subwoofer module (SUB)
- The fiber optic cable between the subwoofer module (SUB) and the antenna module (ATM)
- Antenna module (ATM)
- The fiber optic cable between the antenna module (ATM) and the infotainment control module (ICM)
- The optical connector in the infotainment control module (ICM). This means that the infotainment control module (ICM) is not able to interpret the incoming signal correctly.

Check the communication on the MOST network by bypassing the control modules one by one on the MOST network as follows:

- Ignition off
- Disconnect the MOST connector from the relevant control module
- Connect the MOST cable to special tool see **9512867**
- Ignition on
- Activate the infotainment system
- Check that the communication on the MOST network is functioning by reading off the status of the MOST locked parameter for at least 30 seconds. The parameter indicates whether the MOST network is closed and communication possible.

If the communication on the MOST network is stable when a control module is disconnected, check the power supply and the ground terminal on the relevant control module. Check for intermittent faults. Try replacing the

component if no fault is found.

Click the VCT2000 symbol to read off the status of the MOST network.

Fig. 222: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

  Refer to **VERIFICATION**

READING OFF THE POSITION OF THE OPEN-CIRCUIT

Fig. 224: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Reading off the result from a ring break diagnostic

  Click the VCT2000 symbol to read off the result of the ring break diagnostic.

  As well as the result from the ring break diagnostic, a list of the control modules included in the MOST network is provided for that car.

  The following result can be obtained from a ring break diagnostic:

  If the fault occurs when the ring break diagnostic is run, the result will be presented as an open-circuit position.

If the fault does not occur when the ring break diagnostic is run, the result will be OK. If this is the case, select alternative 3 below.

- If the diagnostic indicates an open-circuit in the communication on the MOST network, the result will be an open-circuit position
- The result will be OK if there is no fault on the MOST network
- If the infotainment control module (ICM) receives a signal on the MOST network but is unable to decode it because the luminance is weak or the signals are distorted, the result will be POOR.

Determining the position of the open-circuit

The position of the open-circuit is calculated by working backwards in the MOST network from the infotainment control module (ICM).

NOTE: The ring break diagnostic only counts backwards, irrespective of which, or how many control modules, are installed in the car. To determine the position of the open-circuit, check the list to, see which control modules are installed in that particular car. Then count backwards following the determined order. The number of control modules can vary between 3-8.

Two examples are outlined below:

- The first open-circuit position corresponds to 0. This means that the open-circuit is in the antenna module (ATM) or in the cable between the antenna module (ATM) and the infotainment control module (ICM)
- If the position is 1, go one step backwards in the chain. The open-circuit is in the subwoofer module (SUB) or in the cable between the subwoofer module (SUB) and the antenna module (ATM). The open-circuit can also be caused by the optical connector in the antenna module (ATM) being damaged so that the antenna module (ATM) is not able to interpret the incoming signal from the subwoofer module (SUB) correctly.

  NOTE: The subwoofer module (SUB) is not standard. If one is not installed, the open-circuit position 1 applies to the audio module (AUD).

Select the alternative for the control module to be checked.

Alternative 1:

Antenna module (ATM)

Subwoofer module (SUB)

Audio module (AUD)

CD player module (MP2)

Alternative 2:

Phone module (PHM)

MD player module (MP1)

Multimedia module (MMM)

Infotainment control module (ICM)

Alternative 3:

The result from the ring break diagnostic indicates that the MOST network is OK.

The result from the ring break diagnostic is POOR.

Other information:

5. Activate the infotainment system
6. Check that the communication on the MOST network is functioning by reading off the status of the MOST locked parameter for at least 30 seconds. The parameter indicates whether the MOST network is closed and communication possible

7. If the parameter displays that the MOST network is not correctly connected, check the receiving control module in the same way as above.

The communication on the MOST network is working if the menu text is displayed. The fault cause is then in the CD module (MP2). Continue the fault-tracing by checking the component.

The communication on the MOST network is not working if the menu text is not displayed. The fault cause is then in the MOST cable for the next control module. Continue the fault-tracing by checking the fiber optic cable.

Checking cable

- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the MOST cable if no fault is found in the MOST terminal.

Checking the component

- Check the power supply and the ground terminal for the CD player module (MP2)
- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the CD player module (MP2) if no fault is found.

Click the VCT2000 symbol to read off the status of the MOST network.

Remedy as necessary.

Other information:

- To access or replace the CD module (MP2), see **MINIDISC / CD CONTROL MODULE, REPLACING**

Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Activate the infotainment system and select the radio.

  Check whether there is sound from the radio in the loudspeakers.

Is the sound of the radio coming through the loudspeakers?

- **YES**

VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

NO COMMUNICATION (2006)

Special tools:

see **9512867**

CHECKING THE WIRING AND COMPONENT

The infotainment control module (ICM) has detected an open-circuit in communication on the MOST network.

The MOST network is a fiber optic ring network. This means that all control modules which are connected to the network must be powered and grounded for the infotainment system to work. If, for any reason, a control module is unable to handle (receive or transmit) signals onwards on the MOST network, or if there is an open-circuit in the fiber optic cable, the infotainment control module (ICM) will shut down all functionality.

Communication on the fiber optic net is one-directional. The control modules on the MOST network receive light signals, amplify them and then send them onwards. The MOST connectors for the control modules contain two fiber optic cables, one for incoming and one for outgoing signals.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can either be caused by interference when starting the MOST network, or by intermittent faults in the power supply/ground for one of the control modules in the network. The fault is evaluated depending on how it occurs. If the fault recurs, fault-trace for permanent faults.

It can be difficult to diagnose intermittent faults using a ring break diagnostic because for this to work the fault must occur during the diagnostic.

If the fault is permanent, perform a ring break diagnostic to locate the open-circuit.

- **Continue**

  Refer to **CHECKING FOR OPEN-CIRCUITS**

CHECKING FOR OPEN-CIRCUITS

Fig. 244: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Ring break diagnostic

A ring break diagnostic should be run to determine whether the fault has occurred.

To carry out a full ring break diagnostic of the MOST system, proceed as follows:

1. Switch off the ignition and remove the key
2. Remove the fuse for the antenna module (ATM)
3. Wait at least 3 minutes
4. Ignition on
5. Reinstall the fuse for the antenna module (ATM) within 25 seconds
6. Wait at least 30 seconds after switching on the ignition before reading off the position of the open-circuit.

- **Continue**

  Refer to **READING OFF THE POSITION OF THE OPEN-CIRCUIT**

CHECKING CABLE AND COMPONENT

If the result of the ring break diagnostic is POOR, the infotainment control module (ICM) is receiving a signal on the MOST network. However it is unable to decode the signals because the luminance of the signals is too weak or the signals are distorted.

If the result from the ring break diagnostic is OK, the fault is intermittent.

Fault-tracing using the ring break diagnostic assumes that the fault is permanent or active when the test is run, i. e. the system is powered having been off.

HINT: If diagnostic trouble code (DTC) ICM-DC01 is intermittent, read off the status of the ring break diagnostic from the frozen values in Vehicle communication.

HINT: Note that the antenna module (ATM) is not normally included in a ring break diagnostic if the fuse is not removed. This means that the position of the open-circuit moves one step backwards in the MOST network.

HINT: On fully equipped vehicles, if the open-circuit position is 0, this may be because of:

- Subwoofer module (SUB)
- The fiber optic cable between the subwoofer module (SUB) and the antenna module (ATM)
- Antenna module (ATM)
- The fiber optic cable between the antenna module (ATM) and the infotainment control module (ICM)
- The optical connector in the infotainment control module (ICM). This means that the infotainment control module (ICM) is not able to interpret the incoming signal correctly.

Check the communication on the MOST network by bypassing the control modules one by one on the MOST network as follows:

- Ignition off
- Disconnect the MOST connector from the relevant control module
- Connect the MOST cable to special tool see **9512867**
- Ignition on
- Activate the infotainment system
- Check that the communication on the MOST network is functioning by reading off the status of the MOST locked parameter for at least 30 seconds. The parameter indicates whether the MOST network is closed and communication possible.

If the communication on the MOST network is stable when a control module is disconnected, check the power supply and the ground terminal on the relevant control module. Check for intermittent faults. Try replacing the

component if no fault is found.

Click the VCT2000 symbol to read off the status of the MOST network.

Fig. 245: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

READING OFF THE POSITION OF THE OPEN-CIRCUIT

Fig. 247: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Reading off the result from a ring break diagnostic

  Click the VCT2000 symbol to read off the result of the ring break diagnostic.

  As well as the result from the ring break diagnostic, a list of the control modules included in the MOST network is provided for that car.

  The following result can be obtained from a ring break diagnostic:

  If the fault occurs when the ring break diagnostic is run, the result will be presented as an open-circuit position.

If the fault does not occur when the ring break diagnostic is run, the result will be OK. If this is the case, select alternative 3 below.

- If the diagnostic indicates an open-circuit in the communication on the MOST network, the result will be an open-circuit position
- The result will be OK if there is no fault on the MOST network
- If the infotainment control module (ICM) receives a signal on the MOST network but is unable to decode it because the luminance is weak or the signals are distorted, the result will be POOR.

Determining the position of the open-circuit

The position of the open-circuit is calculated by working backwards in the MOST network from the infotainment control module (ICM).

NOTE: The ring break diagnostic only counts backwards, irrespective of which, or how many control modules, are installed in the car. To determine the position of the open-circuit, check the list to, see which control modules are installed in that particular car. Then count backwards following the determined order. The number of control modules can vary between 3-8.

Two examples are outlined below:

- The first open-circuit position corresponds to 0. This means that the open-circuit is in the antenna module (ATM) or in the cable between the antenna module (ATM) and the infotainment control module (ICM)
- If the position is 1, go one step backwards in the chain. The open-circuit is in the subwoofer module (SUB) or in the cable between the subwoofer module (SUB) and the antenna module (ATM). The open-circuit can also be caused by the optical connector in the antenna module (ATM) being damaged so that the antenna module (ATM) is not able to interpret the incoming signal from the subwoofer module (SUB) correctly.

  NOTE: The subwoofer module (SUB) is not standard. If one is not installed, the open-circuit position 1 applies to the audio module (AUD).

Select the alternative for the control module to be checked.

Alternative 1:

Antenna module (ATM)

Subwoofer module (SUB)

Audio module (AUD)

CD player module (MP2)

Alternative 2:

Phone module (PHM)

MD player module (MP1)

Multimedia module (MMM)

Infotainment control module (ICM)

Alternative 3:

The result from the ring break diagnostic indicates that the MOST network is OK.

The result from the ring break diagnostic is POOR.

Other information:

Checking the fault cause

Check the fault cause as follows:

1. Ignition off
2. Disconnect the MOST connector from the antenna module (ATM)

3. Connect the MOST cable to special tool see **9512867**
4. Ignition on
5. Activate the infotainment system
6. Check that the communication on the MOST network is functioning by reading off the status of the MOST locked parameter for at least 30 seconds. The parameter indicates whether the MOST network is closed and communication possible
7. If the parameter displays that the MOST network is not correctly connected, check the receiving control module in the same way as above.

The communication on the MOST network is working if the menu text is displayed. If this is the case, the fault cause is in the antenna module (ATM). Continue the fault-tracing by checking the component.

The communication on the MOST network is not working if the menu text is not displayed. The fault cause is then in the MOST cable for the next control module. Continue the fault-tracing by checking the fiber optic cable.

Checking cable

- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the MOST cable if no fault is found in the MOST terminal.

Checking the component

- Check the power supply and the ground terminal for the antenna module (ATM)
- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the antenna module (ATM) if no fault is found.

Remedy as necessary.

Click the VCT2000 symbol to read off the status of the MOST network.

  Refer to **VERIFICATION**

CHECKING CABLE AND COMPONENT

Fig. 262: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Checking the fault cause

Check the fault cause as follows:

1. Ignition off
2. Disconnect the MOST connector from the multimedia module (MMM)
3. Connect the MOST cable to special tool see **9512867**
4. Ignition on
5. Activate the infotainment system
6. Check that the communication on the MOST network is functioning by reading off the status of the MOST locked parameter for at least 30 seconds. The parameter indicates whether the MOST network is closed and communication possible

7. If the parameter displays that the MOST network is not correctly connected, check the receiving control module in the same way as above.

The communication on the MOST network is working if the menu text is displayed. If this is the case, the fault cause is in the multimedia module (MMM). Continue the fault-tracing by checking the component.

The communication on the MOST network is not working if the menu text is not displayed. The fault cause is then in the MOST cable for the next control module. Continue the fault-tracing by checking the fiber optic cable.

Checking cable

- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the MOST cable if no fault is found in the MOST terminal.

Checking the component

- Check the power supply and the ground terminal for the multimedia module (MMM)
- Check the MOST connection. Check for dirt, loose connections and damage
- Replace the multimedia module (MMM) if no fault is found.

Click the VCT2000 symbol to read off the status of the MOST network.

Remedy as necessary.

Other information:

- To access / replace the multimedia module (MMM), see **MULTIMEDIA MODULE (MMM), REPLACING**
- For information about checking the power supply and ground terminal, see **CHECKING THE VOLTAGE / GROUND TERMINAL (2003-2006)**
- For information about signals, see **SIGNAL SPECIFICATION**
- For information about checking and replacing the MOST cable, see **FIBER OPTIC CABLE HARNESS, REPAIRING**
- see **OPTICAL WIRING HARNESS CHECK**
- For information about location and order of control modules in the MOST network, see **LOCATION OF COMPONENTS** .

Fig. 263: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

  Refer to **VERIFICATION**

CHECKING CABLE AND COMPONENT

Fig. 264: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the MOST cable connector from the infotainment control module (ICM)
- Ignition on
- Activate the infotainment system.

  Check visually whether the infotainment control module (ICM) is emitting light from the MOST connector.

  The control module is defective if the infotainment control module (ICM) is not emitting light.

  If the infotainment control module (ICM) is transmitting light, the fault is in the MOST cable for the next control module.

Check the MOST connection. Check for dirt, loose connections and damage.

Replace the MOST cable if no fault is found in the MOST terminal.

Remedy as necessary.

Other information:

- To access / replace the infotainment control module (ICM), see **INFOTAINMENT CONTROL MODULE (ICM), REPLACING**
- For information about checking and replacing the MOST cable, see **FIBER OPTIC CABLE HARNESS, REPAIRING**
- For information about location and order of control modules in the MOST network, see **LOCATION OF COMPONENTS** .

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 265: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 266: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Activate the infotainment system and select the radio.

  Check whether there is sound from the radio in the loudspeakers.

Is the sound of the radio coming through the loudspeakers?

- **YES**

VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

NO COMMUNICATION

see **NO COMMUNICATION**

ICM-E001: CONTROL MODULE COMMUNICATION. INTERNAL FAULT (2003-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-E001

Condition

Fig. 1: Identifying Control Module Communication
Courtesy of VOLVO CARS CORPORATION

The control modules transmit and receive information via a standardized serial communication method - CAN (Control Area Network). The diagnostic trouble code (DTC) is stored if the control module registers serious interference (CAN communication blocked).

NOTE: **In the event of system communication problems, it is not possible to communicate with the control module. Therefore it will only be possible to read off the diagnostic trouble code (DTC) if the fault is intermittent.**

Substitute Value

- The control module shuts itself off ("bus-off")

  HINT: The control module will remain shut off until the power supply is broken (15, 30, X). When the power supply is connected the control module will make a new attempt to communicate.

Possible Source

- Short-circuit between the control area network (CAN) wiring
- Open-circuit in the control area network (CAN) wiring
- Internal fault in the control module

- Internal fault in another control module in the same part of the control area network (CAN).

Fault symptom[s]

- Display does not light
- Audio unit not working
- The radio buttons on the steering wheel do not function
- The navigation buttons on the steering wheel do not function.

INTERNAL FAULT

see **INTERNAL FAULT**

ICM-E003: CONFIGURATION FAULT. SOFTWARE FAULT (2003-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-E003

Condition

Fig. 2: Identifying Control Module Communication
Courtesy of VOLVO CARS CORPORATION

The control module compares its configuration ID with the signal configuration transmitted on the control area network (CAN) by the central electronic module (CEM). If the configuration IDs do not correspond the fault code is stored. The diagnostic trouble code (DTC) is also stored if the communication between the control module and the central electronic module (CEM) is interrupted.

NOTE: **In the event of an open-circuit in both the control area network (CAN) cables, it is not possible to communicate with the control module. Therefore it will only be possible to read off the diagnostic trouble code (DTC) if this type of fault is intermittent. When the diagnostic trouble code (DTC) is stored, the control module responds to the diagnostic command, however normal control area network (CAN) communication does not work. ("Expulsion mode")**

Substitute Value

- None.

Possible Source

- Faulty control area network (CAN) configuration ID. (The node is not intended for this car, for example a used control module with different software/hardware.)
- Open-circuit in the control area network (CAN) wiring between the control module and the central electrical module (CEM).

Fault symptom[s]

- Display does not light
- Audio unit not working
- The radio buttons on the steering wheel do not function
- The navigation buttons on the steering wheel do not function.

CONFIGURATION FAULT

CHECKING FOR PERMANENT OR INTERMITTENT FAULTS

Check to, see if any symptoms reported by the customer remain.

Are any symptoms reported by the customer still present?

- **YES**

  Refer to **INFORMATION**

- **NO**

  Refer to **INTERMITTENT FAULT**

INFORMATION

The control module has registered a software fault. The software does not correspond to the other configurations in the car.

A possible cause of the fault is that a used control module has been installed in the car. If this is the case, the cause of the fault has probably been discovered.

New software, corresponding to the configuration of the rest of the car, can be downloaded after consultation with the customer.

INTERMITTENT FAULT

The control module previously registered a software fault. The software did not correspond to the configuration of the rest of the car. The control module has detected that the fault is no longer present.

ICM-E010: POWER SUPPLY. SIGNAL TOO LOW (2003-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-E010

Condition

Fig. 3: Identifying Control Module Communication
Courtesy of VOLVO CARS CORPORATION

The infotainment control module (ICM) checks the power supply.

Diagnostic trouble code (DTC) ICM-E010 is stored if the control module registers that the power supply is more than 3 V below the supply to the central electronic module (CEM).

Diagnostic trouble codes (DTCs) can be detected with the ignition in positions I or II.

Substitute Value

- None.

Possible Source

- Open-circuit or short-circuit to ground in the power supply to the Infotainment Control Module (ICM)
- Contact resistance, oxidation or loose connections in the power supply to the control module
- Relay, infotainment defective.

Fault symptom[s]

- Audio unit not working
- The display does not light
- Functions in the infotainment system are not working
- No or reduced carphone functionality.

SIGNAL TOO LOW

CHECKING COMPONENTS AND WIRING

Check the connector on the infotainment control module (ICM). Check for contact resistance and oxidation and damage.

Check the fuse for the infotainment control module (ICM).

Check the relay for the infotainment system on the central electronic module (CEM).

HINT: A diagnostic trouble code (DTC) is stored in the central electronic module (CEM) if there is a fault in the deployment of the fuse for the infotainment system.

Check the power supply cable between the fuse for the infotainment system and relay terminal #3 and between relay terminal #1 and infotainment control module (ICM) terminal #1 (#A1). Check for an open-circuit. Check for a short-circuit to ground.

Check the ground lead between infotainment control module (ICM) terminal #10 (#A10) and the ground terminal. Check for an open-circuit. Check for a short-circuit to supply voltage. Also check the ground terminal for contact resistance and oxidation.

Remedy as necessary.

Other information:

- To access or replace the infotainment control module (ICM), see **INFOTAINMENT CONTROL MODULE (ICM), REPLACING**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For information about signals, see **SIGNAL SPECIFICATION**
- see **CONTENTS**

MMM-1000: CONTROL MODULE. INTERNAL FAULT (2007-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION MMM-1000

Condition

The multimedia module (MMM) checks internal control module components.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Difference between the written and read data in the control module.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Start-up of the control module.

NOTE: **The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.**

Fig. 11: Identifying Multimedia Module (MMM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Damaged multimedia module (MMM).

Fault symptom[s]

- Navigation; No Functionality

INTERNAL FAULT

REPLACING A COMPONENT

The multimedia module (MMM) has registered an internal fault.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up of the multimedia module (MMM) or may be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs. If the fault recurs, replace the multimedia module (MMM).

In the event of a permanent fault, replace the multimedia module (MMM).

Remedy as necessary.

Other information

- see **MULTIMEDIA MODULE (MMM), REPLACING**

FAULT-TRACING INFORMATION

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

MMM-1000: CONTROL MODULE. INTERNAL FAULT (2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION MMM-1000

Condition

Fig. 13: Identifying Multimedia Module (MMM)
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) MMM-1000 is stored if the multimedia module (MMM) registers a difference between the written and read data.

Diagnostic trouble code (DTC) MMM-1000 can be diagnosed when the ignition is on.

Substitute Value

- None.

Possible Source

- Difference between the written and read data in the control module.

Fault symptom[s]

- The multimedia system is not working.

INTERNAL FAULT

REPLACING THE COMPONENT

The multimedia module (MMM) has registered an internal fault.

If the fault is intermittent it means that it has been registered previously but is no longer present. Intermittent faults can occur for a number of different reasons. The fault is evaluated depending on how it occurs. If the fault recurs, replace the Multimedia Module (MMM).

In the event of a permanent fault, replace the multimedia module (MMM). See **MULTIMEDIA MODULE (MMM), REPLACING** .

HINT: After replacement, up to 15 minutes of mixed driving may be necessary before the control module is calibrated and displays correct traffic information.

Remedy as necessary.

see **INTERNAL FAULT**

MMM-2000: CONTROL MODULE. INTERNAL FAULT (2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION MMM-2000

Condition

Fig. 18: Identifying Multimedia Module (MMM)
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) MMM-2000 is stored if the multimedia module (MMM) registers abnormal DVD player function.

Diagnostic trouble code (DTC) MMM-2000 can be diagnosed when the ignition is on.

Substitute Value

- None.

Possible Source

- The output signal quality is poor or disc rotation is unstable after ten attempts.
- Software fault in the control module.

Fault symptom[s]

- Information on the display is not updated.

INTERNAL FAULT

REPLACING THE COMPONENT

The multimedia module (MMM) has registered an internal fault.

It may be possible to remedy the fault by downloading new software into the control module. This makes the upgraded software more tolerant to short, intermittent disruptions. The software in Multimedia module (MMM) is upgraded with a cd-disc.

If the fault recurs, replace the multimedia module (MMM).

see **MULTIMEDIA MODULE (MMM), REPLACING**

HINT: After replacement, up to 15 minutes of mixed driving may be needed before the control module is calibrated and shows correct traffic information.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION MMM-5020

Condition

The multimedia module (MMM) checks internal control module components.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Problem reading the data from the hard disk.
- The fault is active for longer than two minutes.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Reading data from the hard disk.

NOTE: **The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.**

Fig. 32: Identifying Multimedia Module (MMM)

Substitute Value

- None.

Possible Source

- Damaged multimedia module (MMM).

Fault symptom[s]

- Fault message displayed on display
- Navigation; No Functionality

INTERNAL FAULT

REPLACING A COMPONENT

The multimedia module (MMM) has registered an internal fault.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up of the multimedia module (MMM) or may be a different type of fault which occurs on different occasions.

The problem could be due to a damaged sector on the harddrive. Transfer map information from the DVD to the hard drive in the multimedia module (MMM).

If the fault recurs, replace the multimedia module (MMM).

Other information

- see **MULTIMEDIA MODULE (MMM), REPLACING**

FAULT-TRACING INFORMATION

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

MMM-6000: CONTROL MODULE FAULTY CONFIGURATION (2007-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION MMM-6000

Condition

The multimedia module (MMM) uses settings from the vehicle configuration file in the central electronic module (CEM).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The control module's configuration does not correspond with the vehicle's vehicle configuration.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Start-up of the control module.

NOTE: **The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.**

Fig. 34: Identifying Multimedia Module (MMM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- The Multimedia module (MMM) is not intended for this vehicle, for example a used control module with different software/hardware has been used.
- Invalid or faulty data obtained from the vehicle configuration file.

Fault symptom[s]

- Navigation; No Functionality
- Car position on map is incorrect

FAULTY CONFIGURATION

FAULT-TRACING INFORMATION

The fault is due to one of the following:

- The Multimedia module (MMM) is not intended for this vehicle, for example a used control module with different software/hardware has been used. Check that the correct control module is installed in the car.
- Configuring the control module. Transfer map information from the DVD to the hard drive in the multimedia module (MMM).

MP1-0002 CONTROL MODULE. INTERNAL FAULT (2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION MP1-0002

Condition

Fig. 38: Diagnostic Trouble Code (DTC) Information MP1-0002
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) MP1-0002 is stored if the MD module (MP1) registers an internal fault.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- None.

Possible Source

- Internal fault in the control module.

Fault symptom[s]

- The MD player is not working.

INTERNAL FAULT

REPLACING THE COMPONENT

The MD player has registered an internal fault.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up of the MD player or may be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs. If the fault recurs, replace the MD player.

In the event of a permanent fault, replace the MD player.

Remedy as necessary.

MP1-0007 EJECT BUTTON. ACTIVATED TOO LONG (2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION MP1-0007

Condition

Fig. 50: Diagnostic Trouble Code (DTC) Information MP1-0002
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) MP1-0007 is stored if the MD module (MP1) registers that the eject button has been pressed for longer than 3 minutes.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- None.

Possible Source

- The eject button has been pressed for more than 3 minutes.

Fault symptom[s]

- The mini disc cannot be removed.

ACTIVATED TOO LONG

EJECT BUTTON

The MD module (MP1) has registered that the eject button has been pressed for more than 3 minutes.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up of the minidisc player or can be another type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs. If the fault recurs, replace the MD module (MP1).

For permanent faults, manually check that the eject button has not stuck in the pressed in position.

Remedy as necessary.

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

RDAR-0004 ANTENNA, SATELLITE RADIO. SIGNAL TOO HIGH (2007-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION RDAR-0004

Condition

The remote digital audio receiver module (RDAR) checks the signal from the satellite antenna.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- High antenna signal.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position I and II.

Fig. 84: Identifying Remote Digital Audio Receiver Module (RDAR)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Antenna circuit is short circuited to supply voltage.

Fault symptom[s]

- Digital Radio; No Functionality

SIGNAL TOO HIGH

CHECKING THE WIRING

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

RDAR-0005 INCORRECT COMPONENT INSTALLED (2007-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION RDAR-0005

Condition

The control module compares its configuration ID with the signal configuration transmitted on the control area network (CAN) by the central electronic module (CEM).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The vehicle's configuration is incorrect.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position I and II.

Fig. 89: Identifying Remote Digital Audio Receiver Module (RDAR)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- The function is not accessible according to the vehicle's configuration file in the Central electronic module (CEM).

Fault symptom[s]

- Digital Radio; No Functionality

CONFIGURATION FAULT

SOFTWARE FAULT

The vehicle's configuration file, which is stored in the central electronic module (CEM), does not indicate that the vehicle is equipped with a digital radio receiver.

- Remedy the fault by loading new software into the Central Electronic Module (CEM).
- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

RDAR-0006 CONTROL MODULE. CONFIGURATION FAULT (2007-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION RDAR-0006

Condition

The remote digital audio receiver module (RDAR) compares its configuration ID with the signal configuration the central electronic module (CEM) transmits on the CAN network. If the configuration IDs do not correspond the fault code is stored.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The configurations IDs do not correspond.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position I and II.

Fig. 92: Identifying Remote Digital Audio Receiver Module (RDAR)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Incorrect CAN configuration ID. (The node is not intended for this vehicle, e. g. used control module with other software/hardware.)

Fault symptom[s]

- Digital Radio; No Functionality

CONFIGURATION FAULT

SOFTWARE FAULT

The control module has registered that the information about the vehicle's configuration is missing in the control module, or that it does not match the software that is downloaded in the control module.

- Download new software to the Remote Digital Audio Receiver (RDAR).

Fig. 93: Identifying Remote Digital Audio Receiver Module (RDAR)
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Check that the radio is working and that the reception is acceptable.

Is the radio playing through the loudspeakers?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

RDAR-0007 CONTROL MODULE. CONFIGURATION FAULT (2007-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION RDAR-0007

Condition

The remote digital audio receiver module (RDAR) checks internal control module components.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Incorrect or no settings in the local configuration file.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position I and II.

Fig. 96: Identifying Remote Digital Audio Receiver Module (RDAR)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Software was not downloaded upon replacement of the remote digital audio receiver (RDAR).
- No local configuration file in the remote digital audio receiver (RDAR).

Fault symptom[s]

- Digital Radio; No Functionality

CONFIGURATION FAULT

see **CONFIGURATION FAULT**

RDAR-0008 CONTROL MODULE. OVERHEATED (2007-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION RDAR-0008

Condition

The remote digital audio receiver module (RDAR) checks its internal temperature.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Temperature exceeds a specific value.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position I and II.

Fig. 97: Identifying Remote Digital Audio Receiver Module (RDAR)

Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Temperature in the component or system too high.

Fault symptom[s]

- Digital Radio; No Functionality

OVER HEATED

REPLACING THE COMPONENT

The remote digital audio receiver (RDAR) has registered internal overheating in the control module.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults may be due to interference upon start-up or may be another type of fault that can recur at different times. The fault is evaluated depending on how it occurs. If the fault recurs, replace the remote digital audio module (RDAR). If the fault recurs, replace the remote digital audio module (RDAR).

In the event of a permanent fault, replace the Remote Digital Audio Receiver (RDAR).

Remedy as necessary.

Other information

- see **LOCATION OF COMPONENTS**
- see **SATELLITE RADIO CONTROL MODULE**

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

RDAR-0009 BATTERY VOLTAGE. FAULTY SIGNAL (2007-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION RDAR-0009

Condition

The remote digital audio receiver module (RDAR) checks the supply voltage relative to the voltage in the central electronic module (CEM).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Feed voltage is 2 V lower than the voltage in Central electronic module (CEM).

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position I and II.

Fig. 101: Identifying Remote Digital Audio Receiver Module (RDAR)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Contact resistance.
- Damaged supply voltage cable.

Fault symptom[s]

- Digital Radio; No Functionality

FAULTY SIGNAL

CHECKING FUSES AND POWER SUPPLY

Fig. 102: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

The remote digital audio receiver (RDAR) is suppled power from the central electronic module (CEM) via a fuse.

Check if the fuse for the Remote Digital Audio Receiver (RDAR) is half burned by testing with a new fuse.

HINT: A half burned fuse can cause intermittent faults.

- Ignition on.

Check the supply voltage to the Remote Digital Audio Receiver (RDAR) by:

- Measure the voltage between control module connectors #C784-1 and #C784-2.
- Measuring the battery voltage.

If the difference between the control module's supply voltage and the battery voltage is greater than 2 V, the malfunction is in the supply cable.

If the difference is less than 2 V there may be an internal malfunction in the phone module (PHM).

- Remedy as necessary.

Other information

- see **SIGNAL SPECIFICATION**
- see **LOCATION OF COMPONENTS**
- see **CONTENTS**
- see **SATELLITE RADIO CONTROL MODULE**

- **Continue**

  Refer to **VERIFICATION**

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

BPM-1101: CONTROL MODULE CONFIGURATION FAULT (2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION BPM-1101

Condition

The Bluetooth phone module (BPM) checks the version of the local configuration file.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The local configuration file is the incorrect version.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition on and battery voltage between 9 and 16 V.

Fig. 105: Identifying Bluetooth Phone Module (BPM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- The local configuration file is the incorrect version.

Fault symptom[s]

- Bluetooth Telephone: No Functionality

FAULT-TRACING

CHECKING SOFTWARE

The Bluetooth phone module (BPM) has registered that the local configuration file is the incorrect version.

This may be due to a fault in the software in the Bluetooth phone module (BPM). Remedy the fault by downloading new software into the Bluetooth phone module (BPM).

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

BPM-1102: CONTROL MODULE INTERNAL FAULT (2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION BPM-1102

Condition

Bluetooth phone module (BPM) checks its internal status.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The control module has an internal memory error.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition on and battery voltage between 9 and 16 V.

Fig. 109: Identifying Bluetooth Phone Module (BPM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Internal fault in the control module.

Fault symptom[s]

- Bluetooth Telephone: No Functionality

FAULT-TRACING

FAULT-TRACING INFORMATION

Use the following information and general checks during fault-tracing.

NOTE: Check that the fuses are intact. For locations, see the instruction manual, cover for fuse box, fuse ratings or similar.

1. Check, if possible, relevant functions in the vehicle using buttons/controls/test drives to determine the status of the fault.

   NOTE: If the vehicle does not show any of the given symptoms in the diagnostic trouble code information (DTC), this may mean that the fault is intermittent or that the control module is not detecting the fault at this moment.

2. Use the diagnostic trouble code's **frozen values** , **status identifiers** and **counter** to determine the operating conditions when the fault was detected, the fault's current status and any degree of intermittence of the fault.
3. Check and fault-trace according to **the fault causes** that are specified in the **diagnostic trouble code (DTC) information** .
4. Use **VIDA Vehicle communication** . Read off the parameters, activate components and functions, carry out quick tests and checking routines for the diagnostic trouble codes to identify the fault.
5. Check relevant components according to **Component specifications** .
6. Check relevant signals using **wiring diagram** , **signal specification** and **breakout box** .

NOTE: More information is available in Design and function .

Remedy as necessary.

Other information

  Refer to **INFORMATION**

DESCRIPTION OF FROZEN VALUES

EXPLANATION

Frozen values are parameter values that are stored when a diagnostic trouble code (DTC) is stored.

Not all parameters can be read off for all diagnostic trouble codes (DTCs). The parameter values can only be read off where they can provide more information about the prevailing circumstances when the diagnostic trouble code (DTC) was stored.

PARAMETERS, VALUE

TOTAL MILEAGE

Measurement range: 0 - 1.000.000 km.

The value indicates the vehicle's total mileage when the Diagnostic Trouble Code (DTC) was generated.

MECU POWER SUPPLY

Measurement range: 0 - 24 V.

Normal range: 12.0 - 14.5 V.

The value indicates the supply voltage to the central electronic module (CEM) when the diagnostic trouble code (DTC) was stored.

GLOBAL TIME

The value displays the time that has passed since the diagnostic trouble code (DTC) was stored.

PASSENGER COMPARTMENT TEMPERATURE

Measurement range: -40 to +80 °C.

The value indicates the passenger compartment temperature when the diagnostic trouble code (DTC) was stored.

ENGINE RUNNING

Indicates whether the engine was running when the Diagnostic Trouble Code (DTC) was generated.

Value set:

Yes = the engine was running

No = The engine was not running

MODULE 1 CONNECTED

Indicates status at Bluetooth module 1.

Value set:

True = Module 1 is connected.

False = Module 1 is not connected.

MODULE 2 CONNECTED

Indicates status at Bluetooth module 2.

Value set:

True = Module 2 is connected.

False = Module 2 is not connected.

CONTROL MODULE POWER SUPPLY

Measurement range: 0 to 25.5 V

The value indicates the power supply to the Bluetooth phone module (BPM).

TEMPERATURE UNIT

Measurement range: -40 to 215 °C.

The value indicates the internal temperature in the Bluetooth phone module (BPM).

INFORMATION

FAULT-TRACING INFORMATION

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

BPM-1103: CONTROL MODULE INTERNAL FAULT (2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION BPM-1103

Condition

Bluetooth phone module (BPM) checks its internal status.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The control module has an internal memory error.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition on and battery voltage between 9 and 16 V.

Fig. 113: Identifying Bluetooth Phone Module (BPM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Internal fault in the control module.

Fault symptom[s]

- Bluetooth Telephone: No Functionality

FAULT-TRACING

see **FAULT-TRACING**

BPM-1105: CONTROL MODULE CONFIGURATION FAULT (2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION BPM-1105

Condition

At start, the Bluetooth phone module checks the vehicle configuration in question.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Vehicle configuration is not obtained within one minute.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition on and battery voltage between 9 and 16 V.

Fig. 114: Identifying Bluetooth Phone Module (BPM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Interference in communication between Bluetooth phone module (BPM) and Central electronic module (CEM).

Fault symptom[s]

- Bluetooth Telephone: No Functionality

FAULT-TRACING

see **FAULT-TRACING**

BPM-1106: CONTROL MODULE OVERHEATED (2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION BPM-1106

Condition

Bluetooth phone module (BPM) checks its internal temperature.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The temperature is too high.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition on and battery voltage between 9 and 16 V.

Fig. 115: Identifying Bluetooth Phone Module (BPM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Ambient temperature too high.
- Power consumption too high in the control module.

Fault symptom[s]

- Bluetooth Telephone: No Functionality

FAULT-TRACING

see **FAULT-TRACING**

BPM-1301: MICROPHONE INPUT. SIGNAL TOO LOW (2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION BPM-1301

Condition

Bluetooth phone module (BPM) checks the signal from the microphone. The microphone belongs to the Integrated Audio Module (IAM) and communicates with the Bluetooth phone module (BPM) via the MOST-net.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The microphone has too low signal.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition on and battery voltage between 9 and 16 V.

Fig. 116: Identifying Bluetooth Phone Module (BPM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Internal malfunction in the microphone.
- Internal fault in integrated audio module (IAM).
- Internal fault in the Bluetooth phone module (BPM).
- The MOST network is not working.

Fault symptom[s]

- Cellular phone/Other party cannot hear/Handsfree
- Cellular phone/Other party cannot hear/Unsure when/at all times

FAULT-TRACING

see **FAULT-TRACING**

BPM-1401: CONTROL MODULE INTERNAL FAULT (2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION BPM-1401

Condition

Bluetooth phone module (BPM) checks communication with Bluetooth chip.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Communication with Bluetooth chip is lost.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition on and battery voltage between 9 and 16 V.

Fig. 117: Identifying Bluetooth Phone Module (BPM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Internal fault in the control module.

Fault symptom[s]

- Bluetooth Telephone: No Functionality

FAULT-TRACING

see **FAULT-TRACING**

BPM-B100: CONTROL MODULE CONFIGURATION FAULT (2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION BPM-B100

Condition

The control module compares its configuration ID with the signal configuration transmitted on the control area

network (CAN) by the central electronic module (CEM).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The vehicle configuration has not been obtained.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition on and battery voltage between 9 and 16 V.
- Ignition on for at least 60 seconds.

Fig. 118: Identifying Bluetooth Phone Module (BPM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Interference in communication between Bluetooth phone module (BPM) and Central electronic module (CEM).
- Incorrect configuration ID (the control module is not intended for this vehicle, for example it is a used control module with different software/hardware).

Fault symptom[s]

- Bluetooth Telephone: No Functionality

FAULT-TRACING

see **FAULT-TRACING**

BPM-B101: CONTROL MODULE CONFIGURATION FAULT (2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION BPM-B101

Condition

The control module compares its configuration ID with the signal configuration transmitted on the control area network (CAN) by the central electronic module (CEM).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- At least one parameter in the vehicle configuration file is incorrect.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition on and battery voltage between 9 and 16 V.
- Ignition on for at least 60 seconds.

Fig. 119: Identifying Bluetooth Phone Module (BPM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Interference in communication between Bluetooth phone module (BPM) and Central electronic module (CEM).
- Incorrect configuration ID (the control module is not intended for this vehicle, for example it is a used control module with different software/hardware).

Fault symptom[s]

- Bluetooth Telephone: No Functionality

FAULT-TRACING

FAULTY SOFTWARE

The control module has registered that invalid or incorrect data has been obtained from the vehicle configuration file.

This can be due to a fault in the Central electronic module (CEM).

Downloading new software

Remedy the fault by loading new software into the Central Electronic Module (CEM).

After downloading new software into the central electronic module (CEM), the new software must also be downloaded into the Bluetooth phone module (BPM)

Select "Continue" after programming.

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Courtesy of VOLVO CARS CORPORATION

Fig. 121: Identifying Connector(s) Reinstallation
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Reinstall the connectors, components etc.
- Ignition on.

  Check the function of the Bluetooth phone module (BPM).

Is the carphone working?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

BPM-E010: BATTERY VOLTAGE FAULTY SIGNAL (2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION BPM-E010

Condition

Bluetooth phone module (BPM) checks the voltage feed and compares it to the voltage over the Central electronic module (CEM).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The difference between the voltage of Bluetooth phone module (BPM) and Central electronic module (CEM) is greater than 2 V.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition on and battery voltage between 9 and 16 V.

Fig. 122: Identifying Bluetooth Phone Module (BPM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

Signal too high:

- Short-circuit to supply voltage in the cable.

Signal too low:

- Short-circuit to ground in the cable.
- Open-circuit in the power supply cable.

Fault symptom[s]

- Bluetooth Telephone: No Functionality

FAULT-TRACING

see **FAULT-TRACING**

PHM-0001: POWER SUPPLY. FAULTY SIGNAL (2003-2005)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-0001

Condition

Diagnostic trouble code (DTC) PHM-0001 is stored if the voltage to the phone module (PHM) deviates by more than 2.5 V from the central electronic module (CEM) voltage.

Diagnostic trouble code (DTC) PHM-0001 can be diagnosed with the ignition on (not key position 3) and when the battery voltage is 9-16 V.

Substitute Value

- None.

Possible Source

- Half-burned fuse for the phone module (PHM)
- Defective wiring
- Internal fault in the phone module (PHM).

Fault symptom[s]

- No or reduced carphone functionality.

FAULTY SIGNAL

CHECKING FUSES AND POWER SUPPLY

Fig. 123: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check whether the carphone fuse in the passenger compartment fusebox is half burned by trying a new fuse.

  HINT: A half burned fuse can cause intermittent faults.

  Check the power supply to the phone module (PHM) by:

  - measuring the voltage between phone module (PHM) connector A terminals #1 (#1) and A #2 (#2)
  - measure the battery voltage.

  The fault is in the power supply cable if the difference between the power supply for the phone module

(PHM) and battery voltage is greater than 2.5 V.

There may be an internal fault in the phone module (PHM) if the difference is less than 2.5 V.

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For information about signals and connectors, see **SIGNAL SPECIFICATION**
- To access or replace the phone module (PHM), see **PHONE MODULE (PHM), REPLACING**
- see **CONTENTS** .

Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on
- Switch on the carphone.

  Make a call so that both the handset and the hands-free system are used.

  Ignition off.

  Ignition on.

  Read off the diagnostic trouble codes (DTCs).

Check that the relevant diagnostic trouble code (DTC) has switched status from permanent to intermittent fault.

Fig. 128: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Has the status of the diagnostic trouble code (DTC) changed?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

PHM-0008: RESERVE MICROPHONE. SIGNAL TOO HIGH / SIGNAL MISSING (2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-0008

Condition

Fig. 129: Identifying Phone Module (PHM)
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the phone module (PHM) registers an open-circuit in the signal from the reserve microphone or a short-circuit to supply voltage in the signal. The reserve microphone is located behind the panel containing the SOS and ON CALL switches. The reserve microphone is used when a Volvo On Call service is connected and the phone module (PHM) does not have access to the microphone for the audio module (AUD).

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on (not key position 3) and when the battery voltage is between 9-16 V. The diagnostic trouble code (DTC) can only be diagnosed for a phone module (PHM) with Volvo On Call functionality.

Substitute Value

- None.

Possible Source

- Open-circuit in the cable between the phone module (PHM) and the reserve microphone
- Short-circuit to supply voltage in the cable between the phone module (PHM) and the reserve microphone.

Fault symptom[s]

- Messages in the display
- The microphone is not working.

SIGNAL TOO HIGH / SIGNAL MISSING

CHECKING THE COMPONENT AND WIRING

Fig. 130: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect connector A from the phone module (PHM)
- Disconnect the connector for the Volvo On Call switches.

  Check the cables for the internal microphone. Check for an open-circuit.

  Check between:

  - the connector for phone module (PHM) terminal A#15 (#15) and the connector for switch terminal #1 (#13)
  - terminals #14 (#14) and #2 (#14) on connector A for the phone module (PHM).

  Check the cables at control module connector A for the internal microphone. Check for a short-circuit to supply voltage.

  Check between:

  - terminals #15 (#15) and #3 (#3)
  - terminals #15 (#15) and #4 (#4)
  - terminals #15 (#15) and #5 (#5)
  - terminals #14 (#14) and #3 (#3)
  - terminals #14 (#14) and #4 (#4)
  - terminals #14 (#14) and #5 (#5).

  Try replacing the microphone if the cables are OK.

  Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

PHM-000A: RESERVE MICROPHONE. SIGNAL TOO LOW (2006-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-000A

Condition

Fig. 136: Identifying Phone Module (PHM)
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the phone module (PHM) detects a short-circuit to ground in the signal between the phone module (PHM) and the reserve microphone. The reserve microphone is located behind the panel containing the SOS and ON CALL switches. The reserve microphone is used when a Volvo On Call service is connected and the phone module (PHM) does not have access to the microphone for the audio module (AUD).

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on (not key position 3) and when the battery voltage is between 9-16 V. The diagnostic trouble code (DTC) can only be diagnosed for a phone module (PHM) with Volvo On Call functionality.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the cable between the phone module (PHM) and the reserve microphone.

Fault symptom[s]

- Messages in the display
- The microphone is not working.

SIGNAL TOO LOW

CHECKING THE COMPONENT AND WIRING

Fig. 137: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect connector A from the phone module (PHM)
- Disconnect the connector for the Volvo On Call switch.

Check the cables at control module connector A for the internal microphone. Check for a short-circuit to ground.

Check between:

- terminals #15 (#15) and #14 (#14)
- terminals #15 (#15) and #13 (#13)
- terminals #15 (#15) and #6 (#6).

Try replacing the microphone if the cables are OK.

Remedy as necessary.

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

PHM-000B: HANDSET CRADLE. SIGNAL TOO HIGH / SIGNAL MISSING

(2006-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-000B

Condition

Fig. 143: Identifying Handset Cradle
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the phone module (PHM) registers an open-circuit in the signal from the handset (cradle switch) or that there is a short-circuit to supply voltage in the signal.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on (not key position 3) and when the battery voltage is 9-16 V.

Substitute Value

- Only hands-free operates.

Possible Source

- Short-circuit to supply voltage in the cable (cradle signal) between the handset and the phone module (PHM)

- Open-circuit in the cable (cradle signal) between the handset and the phone module (PHM).

Fault symptom[s]

- The handset does not function.
- Message in the text display (applies only to phone modules (PHM) with Volvo On Call).

SIGNAL TOO HIGH / SIGNAL MISSING

CHECKING THE COMPONENT AND WIRING

Fig. 144: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off

- Disconnect connector A from the phone module (PHM).

  Check the cable for the cradle signal. Check for an open-circuit.

  Take a reading between control module connector A terminal #8 (#8) and handset connector terminal #4 (#24).

  Check control module connector A for the cradle signal. Check for a short-circuit to supply voltage.

  Check between:

  - terminals #8 (#8) and #7 (#7)
  - terminals #8 (8) and #5 (#5).

  Try replacing the handset or holder if the cable is OK.

  Remedy as necessary.

  Other information:

  - The cradle signal is approximately 5 V when the handset is not in the cradle
  - The cradle signal is approximately 0 V when the handset is in the cradle

PHM-000B: HANDSET CRADLE. SIGNAL TOO HIGH OR SIGNAL MISSING

(2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-000B

Condition

Diagnostic trouble code (DTC) PHM-000B is stored if the phone module (PHM) registers an open-circuit in the signal to the handset or cradle switch or a short-circuit to supply voltage.

Diagnostic trouble code (DTC) PHM-000B can be diagnosed with the ignition on (not key position 3) and when the battery voltage is 9-16 V.

Substitute Value

- Only hands-free operates.

Possible Source

- Short-circuit to supply voltage in the wiring (cradle signal) between the handset and the control module
- Open-circuit in the wiring (cradle signal) between the handset and the control module.

Fault symptom[s]

- The handset does not function.

SIGNAL TOO HIGH OR SIGNAL MISSING

CHECKING THE COMPONENT AND WIRING

Fig. 150: Identifying Ignition ON

Fig. 201: Identifying Handset Cradle
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the phone module (PHM) registers an open-circuit in the signal to the handset loudspeaker or a short-circuit to supply voltage in the signal.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on (not key position 3) and when the battery voltage is 9-16 V.

Substitute Value

- Only hands-free operates.

Possible Source

- Short-circuit to supply voltage (+12 V) in the cable (loudspeaker signal) between the handset and the

control module
- Open-circuit in the cable (loudspeaker signal) between the handset and the control module.

Fault symptom[s]

- The handset does not function.
- Message in the text display (applies only to phone modules (PHM) with Volvo On Call).

SIGNAL TOO HIGH / SIGNAL MISSING

CHECKING THE COMPONENT AND WIRING

Fig. 202: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect connector A from the phone module (PHM)
- Disconnect the handset connector.

Check the loudspeaker signal cable at control module connector A. Check for a short-circuit to supply voltage.

Check between:

- terminals #20 (#20) and #7 (#7)
- terminals #20 (#20) and #5 (#5).

Check the cable for the loudspeaker signal. Check for an open-circuit.

Take a reading between control module connector A terminal #20 (#20) and handset connector terminal #2 (#22).

Check the connectors for loose connections, damaged or bent terminal pins and oxidation.

Try replacing the carphone handset if no fault is found in the wiring.

Remedy as necessary.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

PHM-000F: HANDSET LOUDSPEAKER. SIGNAL TOO HIGH OR SIGNAL

MISSING (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION PHM-000F

Condition

Diagnostic trouble code (DTC) PHM-000F is stored if the phone module (PHM) registers an open-circuit in the signal to the speaker in the handset or a short-circuit to supply voltage.

Diagnostic trouble code (DTC) PHM-000F can be diagnosed with the ignition on (not key position 3) and when the battery voltage is 9-16 V.

Substitute Value

- Only hands-free operates.

Possible Source

- Short-circuit to supply voltage in the wiring (loudspeaker signal) between the handset and the control module
- Open-circuit in the wiring (speaker signal) between the handset and the control module.

Fault symptom[s]

- The handset does not function.

SIGNAL TOO HIGH OR SIGNAL MISSING

CHECKING COMPONENTS AND WIRING

Check the signal cable for the microphone between phone module (PHM) connector B terminal #14 (#56) and handset connector terminal #2 (#22). Check for a short-circuit to supply voltage.

Check the signal cable for the microphone between phone module (PHM) connector B terminal #14 (#56) and handset connector terminal #2 (#22). Check for an open-circuit.

Check the connectors for loose connections, damaged or bent terminal pins and oxidation.

Try replacing the carphone handset if no fault is found in the wiring.

Remedy as necessary.

ACCESSORIES AND BODY, CAB

Media, Communication And Navigation - Diagnostic Trouble Codes and Associated Procedures

IAM-2002: CONTROL MODULE. INTERNAL FAULT (2007-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION IAM-2002

Condition

Fig. 1: Identifying Integrated Audio Module (IAM)
Courtesy of VOLVO CARS CORPORATION

If the Integrated Audio Module (IAM) detects an internal fault in the CD changer, then the Diagnostic Trouble Code (DTC) is generated.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Nothing.

Possible Source

- Internal fault.

Fault symptom[s]

- CD changer inoperative.

INTERNAL FAULT

see **INTERNAL FAULT**

IAM-2003: CONTROL MODULE. INTERNAL FAULT (2007-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION IAM-2003

Condition

Fig. 2: Identifying Integrated Audio Module (IAM)
Courtesy of VOLVO CARS CORPORATION

If the Integrated Audio Module (IAM) detects an internal fault in the CD changer, then the Diagnostic Trouble Code (DTC) is generated.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Nothing.

Possible Source

- Internal fault.

Fault symptom[s]

- CD changer inoperative.

INTERNAL FAULT

IAM-3001: FRONT LEFT SPEAKER. SIGNAL TOO LOW (2007-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION IAM-3001

Condition

Fig. 5: Identifying Integrated Audio Module (IAM)
Courtesy of VOLVO CARS CORPORATION

If the Integrated Audio Module (IAM) registers that the signal is too low on the signal cable from the speaker in the left-hand front door, then the Diagnostic Trouble Code (DTC) is generated.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Nothing.

Possible Source

- Short circuit to ground on the signal cable between the control module and speaker in the left-hand front door.

Fault symptom[s]

- CD player inoperative.
- No sound from speakers.

SIGNAL TOO LOW

CHECKING THE WIRING

Fig. 6: Identifying Ignition OFF

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

IAM-3021: REAR LEFT SPEAKER. SIGNAL TOO LOW (2007-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION IAM-3021

Condition

Fig. 65: Identifying Integrated Audio Module (IAM)
Courtesy of VOLVO CARS CORPORATION

If the Integrated Audio Module (IAM) registers that the signal is too low on the signal cable from the speaker in the left-hand rear door, then the Diagnostic Trouble Code (DTC) is generated.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Nothing.

Possible Source

- Short circuit to ground on the signal cable between the control module and speaker in the left-hand rear door.

Fault symptom[s]

- CD player inoperative.
- No sound from speakers.

SIGNAL TOO LOW

CHECKING THE WIRING

Fig. 66: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 67: Disconnecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector to the Integrated Audio Module (IAM).

  Check the connections with regard to contact resistance, play and oxidation.

  Check the antenna cable between the Integrated Audio Module (IAM) and the speaker in the left-hand rear door with regard to short circuits to ground.

  Measure between:

  - Integrated audio module (IAM) terminal #A6 and speaker terminal #1 in the left rear door.
  - Integrated audio module (IAM) terminal #A13 and speaker terminal #2 in the left rear door.

Remedy as necessary.

IAM-3022: REAR LEFT SPEAKER. SIGNAL TOO HIGH (2007-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION IAM-3022

Condition

Fig. 71: Identifying Integrated Audio Module (IAM)
Courtesy of VOLVO CARS CORPORATION

If the Integrated Audio Module (IAM) registers that the signal is too high on the signal cable from the speaker in the left-hand rear door, then the Diagnostic Trouble Code (DTC) is generated.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Nothing.

Possible Source

- Short circuit to supply voltage on the signal cable between the control module and speaker in the left-hand rear door.

Fault symptom[s]

- CD player inoperative.
- No sound from speakers.

SIGNAL TOO HIGH

CHECKING THE WIRING

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION IAM-5001

Condition

The Integrated Audio Module (IAM) checks the direct current on the power supply cable for the USB connection.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Direct current (DC) is too low.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Activated control module.

NOTE: **The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.**

IAM-9001: CONTROL MODULE. CONFIGURATION FAULT (2007-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION IAM-9001

Condition

Fig. 137: Identifying Integrated Audio Module (IAM)
Courtesy of VOLVO CARS CORPORATION

If the Integrated Audio Module (IAM) registers a configuration error, then the Diagnostic Trouble Code (DTC) is generated.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Nothing.

Possible Source

- The control module is not configured.

Fault symptom[s]

- Audio system inoperative.

CONFIGURATION FAULT

CHECKING THE COMPONENT

The Integrated Audio Module (IAM) has registered a configuration error.

Try to reload the software in the Integrated Audio Module (IAM).

Fig. 138: Identifying Integrated Audio Module (IAM)
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  See: **VERIFICATION**

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on

  Load a CD disc and check that the media player is working.

Is the media player working?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  See: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

IAM-9002: CONTROL MODULE. OVERHEATED (2007-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION IAM-9002

Condition

Fig. 141: Identifying Integrated Audio Module (IAM)
Courtesy of VOLVO CARS CORPORATION

If the Integrated Audio Module (IAM) registers internal overheating in the control module, then the Diagnostic Trouble Code (DTC) is generated.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Nothing.

Possible Source

- Ambient temperature too high.
- Power consumption in control module too high.

Fault symptom[s]

- Audio system inoperative.

OVER HEATED

REPLACING THE COMPONENT

The Integrated Audio Module (IAM) has registered internal overheating in the control module.

If the fault is intermittent then this means that the fault has been registered earlier but is no longer present. Intermittent faults can be due to interference when starting up or can be another type of fault which can return on different occasions. Evaluation of the fault is made from case to case. If the fault returns, replace the Integrated Audio Module (IAM).

In the case of a permanent fault, change the integrated audio module (IAM).

Remedy as necessary.

ICM-1A02: CONTROL MODULE. FAULTY VOLTAGE (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1A02

Condition

Fig. 147: Identifying Infotainment Control Module (ICM)
Courtesy of VOLVO CARS CORPORATION

The infotainment control module (ICM) checks the 5 volt supply in the control module.

Diagnostic trouble code (DTC) ICM-1A02 is stored if the infotainment control module (ICM) registers that the 5 volt supply is higher than 5.5 V or lower than 4.5 V.

Diagnostic trouble code (DTC) ICM-1A02 can be detected when the ignition is in position I or II for at least 10 seconds and the battery voltage is > 9 V.

Substitute Value

- None.

Possible Source

- Defective control module.

Fault symptom[s]

- Audio unit not operating.

FAULTY VOLTAGE

CHECKING THE COMPONENT

The infotainment control module (ICM) has registered a fault in the internal voltage in the control module.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can occur for a number of different reasons. The fault is evaluated depending on how it occurs.

- Download the latest software to the Infotainment control module (ICM).
- Check that the control module works.
- If the control module does not work, replace control module.

Other information:

- To replace the infotainment control module (ICM), see **INFOTAINMENT CONTROL MODULE (ICM), REPLACING** .

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-1A03: CONTROL MODULE. FAULTY VOLTAGE (2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1A03

Condition

Fig. 151: Identifying Infotainment Control Module (ICM)
Courtesy of VOLVO CARS CORPORATION

The infotainment control module (ICM) checks the 3.3 volt supply in the control module.

Diagnostic trouble code (DTC) ICM-1A03 is stored if the infotainment control module (ICM) registers that the 3.3 volt supply is higher than 3.5 V or lower than 2.9 V.

Diagnostic trouble code (DTC) ICM-1A03 can be detected when the ignition is in position I or II for at least 10 seconds and the battery voltage is > 9 V.

Substitute Value

- None.

Possible Source

- Defective control module.

Fault symptom[s]

- Audio unit not operating.

FAULTY VOLTAGE

CHECKING THE COMPONENT

The infotainment control module (ICM) has registered an internal voltage fault in the control module.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can occur for a number of different reasons. The fault is evaluated depending on how it occurs.

Check the voltage in the infotainment control module (ICM) by clicking on the VCT2000 symbol.

Replace the infotainment control module (ICM) if the voltage is not with the range of 2.9 -3.5 V.

Remedy as necessary.

Other information:

- To replace the infotainment control module (ICM), see **INFOTAINMENT CONTROL MODULE (ICM), REPLACING** .

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-1A05: CONTROL MODULE. FAULTY VOLTAGE (2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1A05

Condition

Fig. 155: Identifying Infotainment Control Module (ICM)
Courtesy of VOLVO CARS CORPORATION

The infotainment control module (ICM) checks the voltage to the display screen.

Diagnostic trouble code (DTC) ICM-1A05 is stored if the infotainment control module (ICM) registers that the voltage supply to the display is higher than 80 V or lower than 40 V.

Diagnostic trouble code (DTC) ICM-1A05 can be detected when the ignition is in position I or II for at least 10 seconds, the battery voltage is > 9 V and the display is activated

Substitute Value

- None.

Possible Source

- Defective control module.

Fault symptom[s]

- Display does not light.

FAULTY VOLTAGE

CHECKING THE COMPONENT

The infotainment control module (ICM) has registered a fault in the voltage for the display.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can occur for a number of different reasons. The fault is evaluated depending on how it occurs.

Check the voltage for the display by clicking on the VCT2000 symbol.

Replace the infotainment control module (ICM) if the voltage is not with the range of 40 - 80 V.

Remedy as necessary.

Other information:

- To replace the infotainment control module (ICM), see **INFOTAINMENT CONTROL MODULE (ICM), REPLACING** .

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-1A51: COMMUNICATION WITH THE AUDIO MODULE (AUD). SIGNAL MISSING (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1A51

Condition

Fig. 159: Identifying Audio Control Module
Courtesy of VOLVO CARS CORPORATION

The infotainment control module (ICM) checks the communication with the audio module (AUD).

Diagnostic trouble code (DTC) ICM-1A51 is stored in the infotainment control module (ICM) if it registers a fault in the communication with the audio module (AUD).

Diagnostic trouble code (DTC) ICM-1A51 can be detected when the ignition is on for at least 20 seconds and the battery voltage is > 11 V.

Substitute Value

- None.

Possible Source

- Internal fault in the audio module (AUD)
- No Audio module (AUD).

Fault symptom[s]

- Audio unit not operating.

SIGNAL MISSING

CHECKING THE COMPONENT

The infotainment control module (ICM) has registered that there is no communication with the audio module (AUD).

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up of the audio module (AUD) or may be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs. If the fault recurs, replace the Audio module (AUD).

In the event of a permanent fault, replace the audio module (AUD).

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-1A52: COMMUNICATION WITH THE ANTENNA MODULE (ATM). SIGNAL MISSING (2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1A52

Condition

Fig. 164: Identifying Antenna Module (ATM)
Courtesy of VOLVO CARS CORPORATION

The infotainment control module (ICM) checks the communication with the antenna module (ATM).

Diagnostic trouble code (DTC) ICM-1A52 is stored in the infotainment control module (ICM) if it registers a fault in the communication with the antenna module (ATM).

Diagnostic trouble code (DTC) ICM-1A52 can be detected when the ignition is on for at least 20 seconds and the battery voltage is > 11 V.

Substitute Value

- None.

Possible Source

- Internal fault in the antenna module (ATM)
- No antenna module (ATM).

Fault symptom[s]

- The radio is not working.

SIGNAL MISSING

CHECKING THE COMPONENT

The infotainment control module (ICM) has registered that there is no communication with the antenna module (ATM).

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up of the antenna module (ATM) or may be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs. If the fault recurs, replace the antenna module (ATM).

If the fault is permanent, replace the antenna module (ATM).

ICM-1A53: COMMUNICATION WITH THE MULTIMEDIA MODULE (MMM). SIGNAL MISSING (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1A53

Condition

Fig. 169: Identifying Multimedia Module (MMM)
Courtesy of VOLVO CARS CORPORATION

The infotainment control module (ICM) checks the communication with the multimedia module (MMM).

Diagnostic trouble code (DTC) ICM-1A53 is stored in the infotainment control module (ICM) if it registers a fault in the communication with the multimedia module (MMM).

Diagnostic trouble code (DTC) ICM-1A53 can be detected when the ignition is on for at least 20 seconds and the battery voltage is > 11 V.

Substitute Value

- None.

Possible Source

- Internal fault in the multimedia module (MMM)
- No multimedia module (MMM).

Fault symptom[s]

- The navigation buttons on the steering wheel do not function
- No voice message.

SIGNAL MISSING

CHECKING THE COMPONENT

The infotainment control module (ICM) has registered that there is no communication with the multimedia module (MMM).

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up of the multimedia module (MMM) or may be a different type of fault which occurs on different occasions. - Ignition off
- Reinstall the connectors, components etc.
- Ignition on for at least 12 seconds.

  Make a call so that both the handset and the hands-free system are used.

Is the carphone working?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  See: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-1A58: COMMUNICATION WITH THE GLOBAL POSITIONING SYSTEM MODULE (GPS). SIGNAL MISSING (2007-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1A58

Condition

The infotainment control module (ICM) checks the communication with the global positioning system module (GPS).

The diagnostic trouble code is generated in the infotainment control module (ICM) if the ICM registers a communication error with the remote global positioning system module (GPS).

The diagnostic trouble code can be detected when the ignition is on at least 75 seconds and battery voltage is greater than 11 V.

Fig. 196: Identifying Global Positioning System Module (GPS)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Internal fault in the global positioning system module (GPS).
- No global positioning system module (GPS)

Fault symptom[s]

- Navigation; No Functionality

SIGNAL MISSING

CHECKING THE COMPONENT

The infotainment module (ICM) has registered loss of communication with the global positioning system module (GPS).

If the malfunction is intermittent, it means that the malfunction has been registered at an earlier time but the malfunction no longer remains. Intermittent faults can be caused by interference upon start-up of the global positioning system module (GPS) or may be a different type of fault that can recur at different times. If the problem recurs, replace the global positioning system module (GPS).

In the event of a permanent fault, replace the global positioning system module (GPS).

Remedy as necessary.

Other information:

- see **GLOBAL POSITIONING SYSTEM MODULE (GPS)**

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on for at least 12 seconds.

  Start up the GPS system. Check that the position of the vehicle on the map is correct. Also check that the current diagnostic trouble code (DTC) is not detected again after the Infotainment control module (ICM) has been active for at least 75 seconds.

Is the position of the car correct on the map?

- **YES**

VERIFIED: Troubleshooting has been completed.

- **NO**

  See: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-1A5A: COMMUNICATION WITH INTEGRATED AUDIO MODULE (IAM). SIGNAL MISSING (2007-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1A5A

Condition

The infotainment module (ICM) controls communication with the integrated audio module (IAM).

The diagnostic trouble code is generated in the infotainment control module (ICM) if the ICM registers a communication error with the integrated audio module (IAM).

The diagnostic trouble code can be detected when the ignition is on at least 75 seconds and battery voltage is greater than 11 V.

Fig. 200: Identifying Integrated Audio Module (IAM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Internal fault in integrated audio module (IAM).
- No integrated audio module (IAM).

Fault symptom[s]

- Audio system does not function

SIGNAL MISSING

CHECKING THE COMPONENT

The infotainment module (ICM) has registered loss of communication with the integrated audio module (IAM).

If the malfunction is intermittent, it means that the malfunction has been registered at an earlier time but the malfunction no longer remains. Intermittent faults can be caused by interference upon start-up of the integrated audio module (IAM) or may be a different type of fault that can recur at different times. If the problem recurs, replace the integrated audio module (IAM).

In the case of a permanent fault, change the integrated audio module (IAM).

Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-1A5B: COMMUNICATION WITH REMOTE DIGITAL AUDIO RECEIVER (RDAR) SIGNAL MISSING (2007-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1A5B

Condition

The infotainment control module (ICM) checks the communication with the Remote Digital Audio Receiver (RDAR).

The diagnostic trouble code is generated in the infotainment control module (ICM) if the ICM registers a communication error with the remote digital audio receiver module (RDAR).

The diagnostic trouble code can be detected when the ignition is on at least 75 seconds and battery voltage is greater than 11 V.

Fig. 205: Identifying Remote Digital Audio Receiver Module (RDAR)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Internal fault in the Remote Digital Audio Receiver (RDAR).
- No Remote Digital Audio Receiver (RDAR).

Fault symptom[s]

- Digital Radio; No Functionality

SIGNAL MISSING

CHECKING THE COMPONENT

The infotainment module (ICM) has registered loss of communication with the Remote Digital Audio Receiver (RDAR).

If the malfunction is intermittent, it means that the malfunction has been registered at an earlier time but the malfunction no longer remains. Intermittent faults can be caused by interference upon start-up of the remote digital audio receiver (RDAR) or may be a different type of fault that can recur at different times. If the fault recurs, replace the remote digital audio module (RDAR).

In the event of a permanent fault, replace the Remote Digital Audio Receiver (RDAR).

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  See: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-1A5C: COMMUNICATION WITH BLUETOOTH PHONE MODULE (BPM) SIGNAL MISSING (2011-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1A5C

Condition

The infotainment module (ICM) checks the communication with the Bluetooth phone module (BPM).

The diagnostic trouble code is stored if the control module detects:

- Fault in the communication with the Bluetooth phone module (BPM).

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- When the ignition has been on for at least 75 seconds and the battery voltage is above 11 V.

Fig. 210: Identifying Bluetooth Phone Module (BPM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Internal fault in the Bluetooth phone module (BPM).
- Bluetooth phone module (BPM) missing.

Fault symptom[s]

- Bluetooth Telephone: No Functionality

SIGNAL MISSING

CHECKING THE COMPONENT

The infotainment module (ICM) has registered loss of communication with the Bluetooth phone module (BPM).

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults may occur at start up of the Bluetooth phone module (BPM) or may be a different type of fault that occurs on different occasions. The fault is evaluated depending on how it occurs.

In the event of a permanent fault, replace the Bluetooth phone module (BPM).

Remedy as necessary.

  See: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-1A5D: COMMUNICATION WITH ACCESSORY USB UNIT (AUU) SIGNAL MISSING (2007-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1A5D

Condition

The infotainment module (ICM) checks the communication with the Accessory USB unit (AUU).

The diagnostic trouble code is stored if the control module detects:

- Fault in the communication with the Accessory USB unit (AUU).

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- When the ignition has been on for at least 75 seconds and the battery voltage is above 11 V.

Fig. 212: Identifying Accessory USB Unit (AUU)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Internal fault in the Accessory USB unit (AUU).
- No Accessory USB unit (AUU).

Fault symptom[s]

- USB unit/Does not work

SIGNAL MISSING

CHECKING THE COMPONENT

The infotainment module (ICM) has registered loss of communication with the Accessory USB unit (AUU).

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults may occur at start up of the Accessory USB unit (AUU) or may be a different type of fault that occurs on different occasions. The fault is evaluated depending on how it occurs.

In the event of a permanent fault, replace the Accessory USB unit (AUU).

Remedy as necessary.

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  See: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-1D01: CONTROL MODULE. INTERNAL FAULT (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1D01

Condition

Fig. 214: Identifying Infotainment Control Module (ICM)
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ICM-1D01 is stored if the infotainment control module (ICM) registers an internal fault.

Substitute Value

- None.

Possible Source

- Internal fault in the control module.

Fault symptom[s]

- Functions in the infotainment system do not work.

INTERNAL FAULT

REPLACING THE COMPONENT

The infotainment control module (ICM) has registered an internal fault.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up of the infotainment control module (ICM) or may be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs. If the fault recurs, replace the infotainment control module (ICM).

If the fault is permanent, replace the infotainment control module (ICM).

Remedy as necessary.

Other information:

- To replace the infotainment control module (ICM), see **INFOTAINMENT CONTROL MODULE (ICM), REPLACING** .

Fig. 215: Identifying Infotainment Control Module (ICM)
Courtesy of VOLVO CARS CORPORATION

ICM-1D03: CONTROL MODULE, NOT FULLY PROGRAMMED. INTERNAL FAULT (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1D03

Condition

Fig. 216: Identifying Infotainment Control Module (ICM)
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ICM-1D03 is stored if the infotainment control module (ICM) registers that the software download is not complete. Diagnostic trouble code (DTC) ICM-1D03 is stored even if the downloaded software is not compatible with the actual display/control module.

Substitute Value

- None.

Possible Source

- Software download not complete
- The software and display/control module are not compatible.

Fault symptom[s]

- Functions in the infotainment system are not working
- The display does not light.

INTERNAL FAULT

CHECKING THE COMPONENT

Diagnostic trouble code (DTC) ICM-1D03 indicates that the software download has failed. This may be because the software for an infotainment control module (ICM) with alphanumeric display has been downloaded into a module with a graphic display or vice-versa.

Check the software and display/control module by clicking on the VCT2000 symbol. Is the correct software installed for the display that is installed?

- If not, try programming the display/control module with the correct software. See 8691181
- If the display/control module and software are correct, try reloading the same software using 8691181 .

Fig. 217: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  See: **PROGRAMMING THE CONTROL MODULE**

PROGRAMMING THE CONTROL MODULE

Programming can be carried out when the software has been delivered.

Program the control module. See 8691181 .

ICM-1D07: CONTROL MODULE. INTERNAL FAULT (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1D07

Condition

Fig. 218: Identifying Infotainment Control Module (ICM)
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ICM-1D07 is stored if the infotainment control module (ICM) registers an internal fault.

Substitute Value

- None.

Possible Source

- Internal fault in the control module.

Fault symptom[s]

- Functions in the infotainment system do not work.

INTERNAL FAULT

see **INTERNAL FAULT**

ICM-1D08: CONTROL MODULE. INTERNAL FAULT (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1D08

Condition

Fig. 219: Identifying Infotainment Control Module (ICM)
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ICM-1D08 is stored if the infotainment control module (ICM) registers an internal fault.

Substitute Value

- None.

Possible Source

- Internal fault in the control module.

Fault symptom[s]

- The infotainment system flashes
- Functions in the infotainment system do not work.

INTERNAL FAULT

see **INTERNAL FAULT**

ICM-1D09: CONTROL MODULE. INTERNAL FAULT (2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1D09

Condition

Fig. 220: Identifying Infotainment Control Module (ICM)
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ICM-1D09 is stored if the infotainment control module (ICM) registers an internal fault.

Substitute Value

- None.

Possible Source

- Internal fault in the control module.

Fault symptom[s]

- The customer settings for the infotainment system disappear.

INTERNAL FAULT

see **INTERNAL FAULT**

ICM-1F20: LEFT KEYPAD. ACTIVATED TOO LONG (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1F20

Condition

Fig. 221: Identifying Left-Hand Keypad
Courtesy of VOLVO CARS CORPORATION

The infotainment control module (ICM) checks whether any buttons on the left-hand keypad have stuck.

Diagnostic trouble code (DTC) ICM-1F20 is stored if the control module registers that the button has been pressed in for longer than 3 minutes.

Substitute Value

- None.

Possible Source

- A button on the left-hand keypad has been active for more than 3 minutes
- A button has jammed in the pressed in position
- Short-circuit in the keypad unit.

Fault symptom[s]

- Buttons on the keypad unit are not working.

ACTIVATED TOO LONG

CHECKING THE COMPONENT

Fig. 222: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Read off which button was activated when the diagnostic trouble codes (DTCs) was set by clicking on the VCT2000 symbol.

  Check if the button is jammed due to dirt or some object preventing the button from returning.

  If the button does not spring back into place the keypad must be replaced.

  Remedy as necessary.

  Other information:

- To replace the left-hand keypad, see **INFOTAINMENT CONTROL MODULE (ICM), REPLACING**

Does the status of the button change?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  See: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-1F21: LEFT-HAND KEYPAD CIRCUIT 1. SIGNAL TOO HIGH / TOO LOW (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1F21

Condition

Fig. 228: Identifying Left-Hand Keypad
Courtesy of VOLVO CARS CORPORATION

The infotainment control module (ICM) checks the circuit for the CD, AM/FM buttons |<< and >|.

Diagnostic trouble code (DTC) ICM-1F21 is stored if the control module registers that the signal in the keypad circuit is too high or too low.

Substitute Value

- None.

Possible Source

- Short-circuit to ground or an open-circuit in the left-hand keypad unit
- Short-circuit to ground or an open-circuit in the cable for the keypad unit.

Fault symptom[s]

- Buttons on the keypad unit are not working.

SIGNAL TOO HIGH / LOW

CHECKING THE WIRING AND COMPONENT

Check the connections between the left-hand keypad and the infotainment control module (ICM). Check for contact resistance and oxidation. Check for loose connections. Check for damage in particular.

Visually check the cable between the keypad and the control module for damage.

If no faults were found, try a new keypad.

Remedy as necessary.

Other information:

- To replace the left-hand keypad, see **INFOTAINMENT CONTROL MODULE (ICM), REPLACING**

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1F27

Condition

Fig. 248: Identifying Right-Hand Keypad
Courtesy of VOLVO CARS CORPORATION

The infotainment control module (ICM) checks the circuit for the buttons PHONE, MY KEY, ENTER and EXIT.

Diagnostic trouble code (DTC) ICM-1F27 is stored if the control module registers that the signal in the keypad circuit is too high or too low.

Substitute Value

- None.

Possible Source

- Short-circuit to ground or an open-circuit in the right-hand keypad unit
- Short-circuit to ground or an open-circuit in the cable for the keypad unit.

Fault symptom[s]

- Buttons on the keypad unit are not working.

SIGNAL TOO HIGH / LOW

see **SIGNAL TOO HIGH / LOW**

ICM-1F28: RIGHT-HAND KEYPAD CIRCUIT 2. SIGNAL TOO HIGH / TOO LOW (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1F28

Condition

Fig. 249: Identifying Right-Hand Keypad
Courtesy of VOLVO CARS CORPORATION

The infotainment control module (ICM) checks the circuit for the buttons up, down and CD eject.

Diagnostic trouble code (DTC) ICM-1F28 is stored if the control module registers that the signal in the keypad circuit is too high or too low.

Substitute Value

- None.

Possible Source

- Short-circuit to ground or an open-circuit in the right-hand keypad unit
- Short-circuit to ground or an open-circuit in the cable for the keypad unit.

Fault symptom[s]

- Buttons on the keypad unit are not working.

SIGNAL TOO HIGH / LOW

see **SIGNAL TOO HIGH / LOW**

ICM-1F29: POWER BUTTON. SIGNAL TOO HIGH / LOW (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1F29

Condition

Fig. 250: Identifying Left-Hand Keypad
Courtesy of VOLVO CARS CORPORATION

The infotainment control module (ICM) checks the circuit for the POWER button.

Diagnostic trouble code (DTC) ICM-1F29 is stored if the control module registers that the signal in the keypad circuit is too high or too low.

Substitute Value

- None.

Possible Source

- Short-circuit to ground or an open-circuit in the left-hand keypad unit
- Short-circuit to ground or an open-circuit in the cable for the keypad unit.

Fault symptom[s]

- Buttons on the keypad unit are not working.

SIGNAL TOO HIGH / LOW

see **SIGNAL TOO HIGH / LOW**

ICM-1F30: POWER BUTTON. ACTIVATED TOO LONG (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1F30

Condition

Fig. 251: Identifying Left-Hand Keypad
Courtesy of VOLVO CARS CORPORATION

The infotainment control module (ICM) checks if the POWER button has jammed.

Diagnostic trouble code (DTC) ICM-1F30 is stored if the control module registers that the POWER button has been pressed in for longer than 3 minutes.

Substitute Value

- None.

Possible Source

- The POWER button has been activated for more than 3 minutes
- POWER button is jammed in the depressed position.

Fault symptom[s]

- Buttons on the keypad unit are not working.

ACTIVATED TOO LONG

CHECKING THE COMPONENT

Check if the POWER button is jammed due to dirt or some object preventing the button from returning.

If the POWER button does not spring back into place the keypad must be replaced.

Remedy as necessary.

Other information:

- To replace the left-hand keypad, see **INFOTAINMENT CONTROL MODULE (ICM), REPLACING**

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Activate and deactivate the infotainment unit by pressing the POWER button.

  Check that the infotainment unit activates and deactivates.

Is the function OK?

- **YES**

VERIFIED: Troubleshooting has been completed.

- **NO**

  See: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-1F31: SOUND BUTTON. ACTIVATED TOO LONG (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1F31

Condition

Fig. 255: Identifying Right-Hand Keypad
Courtesy of VOLVO CARS CORPORATION

The infotainment control module (ICM) checks if the SOUND button has jammed.

Diagnostic trouble code (DTC) ICM-1F31 is stored if the control module registers that the SOUND button has been pressed in for longer than 3 minutes.

Substitute Value

- None.

Possible Source

- The SOUND button has been activated for more than 3 minutes
- SOUND button is jammed in the depressed position.

Fault symptom[s]

- Buttons on the keypad unit are not working.

ACTIVATED TOO LONG

CHECKING THE COMPONENT

Check if the SOUND button is jammed due to dirt or some object preventing the button from returning.

If the SOUND button does not spring back into place the keypad must be replaced.

Remedy as necessary.

Other information:

- To replace the right-hand keypad, see **INFOTAINMENT CONTROL MODULE (ICM), REPLACING**

VERIFIED: Troubleshooting has been completed.

- **NO**

  See: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-1F32: VOLUME KNOB. SIGNAL MISSING (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1F32

Condition

Fig. 259: Identifying Left-Hand Keypad
Courtesy of VOLVO CARS CORPORATION

The infotainment control module (ICM) checks the signals from the switches in the VOLUME button.

Diagnostic trouble code (DTC) ICM-1F32 is stored if the control module registers that the signal from any of the switches is missing.

Substitute Value

- None.

Possible Source

- Short-circuit to ground or open-circuit in one of the switches in the VOLUME knob
- The switches have jammed.

Fault symptom[s]

- The VOLUME knob does not function.

SIGNAL MISSING

CHECKING THE COMPONENT

Check the connections between the left-hand keypad and the infotainment control module (ICM). Check for contact resistance and oxidation. Check for loose connections. Check for damage in particular.

Visually check the cable between the keypad and the control module for damage.

If no faults were found, try a new keypad.

Remedy as necessary.

Other information:

- To replace the cable / left-hand keypad, see **INFOTAINMENT CONTROL MODULE (ICM), REPLACING**

Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Activate the immobilizer control module (ICM) and turn the VOLUME knob.

  Check that volume increases and decreases.

Is the function OK?

- **YES**

VERIFIED: Troubleshooting has been completed.

- **NO**

  See: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-1F33: SELECTOR KNOB. SIGNAL MISSING (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1F33

Condition

Fig. 263: Identifying Right-Hand Keypad
Courtesy of VOLVO CARS CORPORATION

The infotainment control module (ICM) checks the signals from the switches in the SELECTOR button.

Diagnostic trouble code (DTC) ICM-1F33 is stored if the control module registers that the signal from any of the switches is missing.

Substitute Value

- None.

Possible Source

- Short-circuit to ground or open-circuit in one of the switches in the SELECTOR knob
- The switches have jammed.

Fault symptom[s]

- The SELECTOR knob does not function.

SIGNAL MISSING

CHECKING THE COMPONENT

Check the connections between the right-hand keypad and the infotainment control module (ICM). Check for contact resistance and oxidation. Check for loose connections. Check for damage in particular.

Visually check the cable between the keypad and the control module for damage.

If no faults were found, try a new keypad.

Remedy as necessary.

Other information:

- To replace the cable / left-hand keypad, see **INFOTAINMENT CONTROL MODULE (ICM), REPLACING**

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-1F34: VOLUME KNOB. FAULTY SIGNAL (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1F34

Condition

Fig. 267: Identifying Left-Hand Keypad
Courtesy of VOLVO CARS CORPORATION

The infotainment control module (ICM) checks the signals from the switches in the VOLUME button.

Diagnostic trouble code (DTC) ICM-1F34 is stored if the control module registers the same signal from the switches.

Substitute Value

- None.

Possible Source

- Short-circuit between the switches in the VOLUME knob.

Fault symptom[s]

- The VOLUME knob does not function.

FAULTY SIGNAL

CHECKING THE WIRING AND COMPONENT

Check the connections between the left-hand keypad and the infotainment control module (ICM). Check for contact resistance and oxidation. Check for loose connections. Check for damage in particular.

Visually check the cable between the keypad and the control module for damage.

If no faults were found, try a new keypad.

Remedy as necessary.

Other information:

- To replace the left-hand keypad, see **INFOTAINMENT CONTROL MODULE (ICM), REPLACING**

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Activate the immobilizer control module (ICM) and turn the VOLUME knob.

  Check that the sound volume increases with clockwise movement and decreases with counter-clockwise movement.

Is the function OK?

- **YES**

VERIFIED: Troubleshooting has been completed.

- **NO**

  See: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-1F35: SELECTOR KNOB. FAULTY SIGNAL (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1F35

Condition

Fig. 271: Identifying Right-Hand Keypad
Courtesy of VOLVO CARS CORPORATION

The infotainment control module (ICM) checks the signals from the switches in the SELECTOR button.

Diagnostic trouble code (DTC) ICM-1F35 is stored if the control signal registers the same signal from the switches.

Substitute Value

- None.

Possible Source

- Short-circuit between the switches in the SELECTOR knob.

Fault symptom[s]

- The SELECTOR knob does not function.

FAULTY SIGNAL

CHECKING THE WIRING AND COMPONENT

Check the connections between the right-hand keypad and the infotainment control module (ICM). Check for contact resistance and oxidation. Check for loose connections. Check for damage in particular.

Visually check the cable between the keypad and the control module for damage.

If no faults were found, try a new keypad.

Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-1F36: DISPLAY HEATER. FAULTY VOLTAGE (2007-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1F36

Condition

The infotainment control module (ICM) checks the voltage to display heating.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The signal is outside its normal range.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Activated display warm up.

Fig. 275: Identifying Infotainment Control Module (ICM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Internal fault in the Infotainment control module (ICM).

Fault symptom[s]

- Display lights up slowly

FAULTY VOLTAGE

CHECKING THE COMPONENT

The infotainment control module (ICM) has registered incorrect voltage to display heating.

- Replace the infotainment control module (ICM)

Other information:

- see **INFOTAINMENT CONTROL MODULE (ICM), REPLACING**
- **Continue**

  See: **VERIFICATION**

VERIFICATION

VERIFIED: Troubleshooting has been completed.

- **NO**

  See: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-1F38: DISPLAY TEMPERATURE SENSOR FAULTY VOLTAGE (2007-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-1F38

Condition

The Infotainment control module (ICM) checks warming-up of the display.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The value from the display temperature sensor is not within the acceptable range.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Activated control module.

Fig. 278: Identifying Infotainment Control Module (ICM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Internal fault in the Infotainment control module (ICM).
- Temperature not within acceptable range.

Fault symptom[s]

- Display lights up slowly

FAULTY SIGNAL

CHECKING THE COMPONENT

The infotainment control module (ICM) has registered that the temperature sensor in the display is not functioning correctly.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults may occur at start up of the infotainment control module (ICM), or may be a different type of fault that occurs on different occasions. The fault is evaluated depending on how it occurs.

If the fault is permanent, replace the infotainment control module (ICM).

Remedy as necessary.

Other information

- see **INFOTAINMENT CONTROL MODULE (ICM), REPLACING**

- Reinstall the connectors, components etc.
- Ignition on.

  Activate the infotainment control module (ICM) by pressing the POWER button.

  Check that the display lights.

  Check that the sound source can be selected and that playback is working.

Is the infotainment control module (ICM) working?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  See: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-6C70: ANTENNA MODULE (ATM) NOT APPROVED. FAULTY SIGNAL (2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-6C70

Condition

Fig. 282: Identifying Antenna Module (ATM)
Courtesy of VOLVO CARS CORPORATION

The serial number for each control module in the infotainment system is stored in the central electronic module (CEM). The stored numbers are compared with the serial numbers of the control modules at start up. If any number does not correspond, that particular control module is blocked and the function is not available. The blocking function for non-approved control modules is designated security on MOST.

The infotainment control module (ICM) checks whether the antenna module (ATM) is in the approved list stored in the central electronic module (CEM).

Diagnostic trouble code (DTC) ICM-6C70 is stored if the infotainment control module (ICM) registers that the antenna module (ATM) is not on the approved list.

Diagnostic trouble code (DTC) ICM-6C70 can be detected when the ignition is on for at least 12 seconds and the battery voltage is > 11 V and security on MOST is activated.

Substitute Value

- None.

Possible Source

- Replacing an antenna module (ATM) which is not approved in the list stored in the central electronic module (CEM)
- Software not downloaded when replacing the antenna module (ATM)
- Failed or incomplete software download for the antenna module (ATM).

Fault symptom[s]

- The radio is not working
- Traffic information is not displayed or updated.

FAULTY SIGNAL

CHECKING THE COMPONENT

The infotainment control module (ICM) has registered that the antenna module (ATM) is not approved according to the list stored in the central electronic module (CEM).

The cause of the fault is probably that software has not been downloaded or that the download failed when replacing the antenna module (ATM).

HINT: When downloading software after replacing a control module in the infotainment system, the serial number is stored in the central electronic module (CEM). This is so that the security on MOST function can approve the control module in the MOST network in the car.

If the fault remains after the software is downloaded, try replacing the antenna module (ATM).

Remedy as necessary.

Other information:

- To replace the antenna module (ATM), see **RECEIVER AM/FM (ATM), REPLACING** .

- **NO**

  See: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-6C71: AUDIO MODULE (AUD) NOT APPROVED. FAULTY SIGNAL (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-6C71

Condition

Fig. 287: Identifying Audio Control Module
Courtesy of VOLVO CARS CORPORATION

The serial number for each control module in the infotainment system is stored in the central electronic module (CEM). The stored numbers are compared with the serial numbers of the control modules at start up. If any number does not correspond, that particular control module is blocked and the function is not available. The blocking function for non-approved control modules is designated security on MOST.

The infotainment control module (ICM) checks whether the Audio module (AUD) is in the approved list stored in the central electronic module (CEM).

Diagnostic trouble code (DTC) ICM-6C71 is stored if the Infotainment Control Module (ICM) registers that the Audio module (AUD) is not on the approved list.

Diagnostic trouble code (DTC) ICM-6C71 can be detected when the ignition is on for at least 12 seconds and the battery voltage is > 11 V and security on MOST is activated.

Substitute Value

- None.

Possible Source

- Replacing an Audio module (AUD) which is not approved in the list stored in the central electronic module (CEM)
- Software not downloaded when replacing the Audio module (AUD)
- Failed or incomplete software download for the Audio module (AUD).

Fault symptom[s]

- No sound from the loudspeakers
- The headsets are not functioning.

FAULTY SIGNAL

CHECKING THE COMPONENT

The infotainment control module (ICM) has registered that the Audio module (AUD) is not approved according to the list stored in the central electronic module (CEM).

The cause of the fault is probably that software has not been downloaded or that the download failed when replacing the Audio module (AUD).

HINT: When downloading software after replacing a control module in the infotainment system, the serial number is stored in the central electronic module (CEM). This is so that the security on MOST function can approve the control module in the MOST network in the car.

ICM-6C72: MULTIMEDIA MODULE (MMM) NOT APPROVED. FAULTY SIGNAL (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-6C72

Condition

Fig. 292: Identifying Multimedia Module (MMM)
Courtesy of VOLVO CARS CORPORATION

The serial number for each control module in the infotainment system is stored in the central electronic module (CEM). The stored numbers are compared with the serial numbers of the control modules at start up. If any number does not correspond, that particular control module is blocked and the function is not available. The blocking function for non-approved control modules is designated security on MOST.

The infotainment control module (ICM) checks whether the Multimedia Module (MMM) is in the approved list stored in the central electronic module (CEM).

Diagnostic trouble code (DTC) ICM-6C72 is stored if the Infotainment Control Module (ICM) registers that the Multimedia Module (MMM) is not on the approved list.

Diagnostic trouble code (DTC) ICM-6C72 can be detected when the ignition is on for at least 12 seconds and the battery voltage is > 11 V and security on the MOST network is activated.

Substitute Value

- None.

Possible Source

- Replacing a Multimedia Module (MMM) which is not approved in the list stored in the central electronic module (CEM)
- Software not downloaded when replacing the Multimedia Module (MMM)
- Failed or incomplete software download for the multimedia module (MMM).

Fault symptom[s]

- The multimedia system is not working.

FAULTY SIGNAL

CHECKING THE COMPONENT

The infotainment control module (ICM) has registered that the Multimedia Module (MMM) is not approved according to the list stored in the central electronic module (CEM).

The cause of the fault is probably that software has not been downloaded or that the download failed when replacing the multimedia module (MMM).

HINT: When downloading software after replacing a control module in the infotainment system, the serial number is stored in the central electronic module (CEM). This is so that the security on MOST function can approve the control module in the MOST network in the car.

ICM-6C73: SUBWOOFER MODULE (SUB) NOT APPROVED. FAULTY SIGNAL (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-6C73

Condition

Fig. 297: Identifying Subwoofer Module (SUB)
Courtesy of VOLVO CARS CORPORATION

The serial number for each control module in the infotainment system is stored in the central electronic module (CEM). The stored numbers are compared with the serial numbers of the control modules at start up. If any number does not correspond, that particular control module is blocked and the function is not available. The blocking function for non-approved control modules is designated security on MOST.

The infotainment control module (ICM) checks whether the Subwoofer module (SUB) is in the approved list stored in the central electronic module (CEM).

Diagnostic trouble code (DTC) ICM-6C73 is stored if the Infotainment Control Module (ICM) registers that the Subwoofer module (SUB) is not on the approved list.

Diagnostic trouble code (DTC) ICM-6C73 can be detected when the ignition is on for at least 12 seconds and the battery voltage is > 11 V and security on the MOST network is activated.

Substitute Value

- None.

Possible Source

- Replacing a Subwoofer module (SUB) which is not approved in the list stored in the central electronic module (CEM)
- Software not downloaded when replacing the Subwoofer module (SUB)
- Failed or incomplete software download for the Subwoofer module (SUB).

Fault symptom[s]

- No sound from the Subwoofer module (SUB).

FAULTY SIGNAL

CHECKING THE COMPONENT

The infotainment control module (ICM) has registered that the Subwoofer module (SUB) is not approved according to the list stored in the central electronic module (CEM).

The cause of the fault is probably that software has not been downloaded or that the download failed when replacing the Subwoofer module (SUB).

HINT: When downloading software after replacing a control module in the infotainment system, the serial number is stored in the central electronic module (CEM). This is so that the security on MOST function can approve the control module in the MOST network in the car.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-6C74: MD MODULE (MP1) NOT APPROVED. FAULTY SIGNAL (2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-6C74

Condition

Fig. 302: Identifying MD Module (MP1)
Courtesy of VOLVO CARS CORPORATION

The serial number for each control module in the infotainment system is stored in the central electronic module (CEM). The stored numbers are compared with the serial numbers of the control modules at start up. If any number does not correspond, that particular control module is blocked and the function is not available. The blocking function for non-approved control modules is designated security on MOST.

The infotainment control module (ICM) checks whether the MD module (MP1) is in the approved list stored in the central electronic module (CEM).

Diagnostic trouble code (DTC) ICM-6C74 is stored if the infotainment control module (ICM) registers that the MD module (MP1) is not in the approved list.

Diagnostic trouble code (DTC) ICM-6C74 can be detected when the ignition is on for at least 12 seconds and the battery voltage is > 11 V and security on MOST is activated.

Substitute Value

- None.

Possible Source

- Replacing a MD module (MP1) which is not approved in the list stored in the central electronic module (CEM)
- Software not downloaded when replacing the MD control module (MP1)
- Failed or incomplete software download for the MD module (MP1).

Fault symptom[s]

- The MD player is not working.

FAULTY SIGNAL

CHECKING THE COMPONENT

The infotainment control module (ICM) has registered that the MD module (MP1) is not approved according to the list stored in the central electronic module (CEM).

The cause of the fault is probably that software has not been downloaded or that the download failed when replacing the MD module (MP1).

HINT: When downloading software after replacing a control module in the infotainment system, the serial number is stored in the central electronic module (CEM). This is so that the security on MOST function can approve the control module in the MOST network in the car.

If the fault remains after the software is downloaded, try replacing the MD module (MP1).

Remedy as necessary.

Other information:

- To replace the MD player (MP1), see **MINIDISC / CD CONTROL MODULE, REPLACING** .

Can the control module ID be read off?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  See: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-6C75: CD MODULE (MP2) NOT APPROVED. FAULTY SIGNAL (2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-6C75

Condition

Fig. 307: Identifying CD Module (MP2)
Courtesy of VOLVO CARS CORPORATION

The serial number for each control module in the infotainment system is stored in the central electronic module (CEM). The stored numbers are compared with the serial numbers of the control modules at start up. If any number does not correspond, that particular control module is blocked and the function is not available. The blocking function for non-approved control modules is designated security on MOST.

The infotainment control module (ICM) checks whether the CD module (MP2) is in the approved list stored in the central electronic module (CEM).

Diagnostic trouble code (DTC) ICM-6C75 is stored if the infotainment control module (ICM) registers that the CD module (MP2) is not in the approved list.

Diagnostic trouble code (DTC) ICM-6C75 can be detected when the ignition is on for at least 12 seconds and the battery voltage is > 11 V and security on the MOST network is activated.

Substitute Value

- None.

Possible Source

- Replacing a CD module (MP2) which is not approved in the list stored in the central electronic module (CEM)
- Software not downloaded when replacing the CD control module (MP2)
- Failed or incomplete software download for the CD module (MP2).

Fault symptom[s]

- The CD player does not work
- The CD changer does not work.

FAULTY SIGNAL

CHECKING THE COMPONENT

The infotainment control module (ICM) has registered that the CD module (MP2) is not approved according to the list stored in the central electronic module (CEM).

The cause of the fault is probably that software has not been downloaded or that the download failed when replacing the CD module (MP2).

HINT: When downloading software after replacing a control module in the infotainment system, the serial number is stored in the central electronic module (CEM). This is so that the security on MOST function can approve the control module in the MOST network in the car.

If the fault remains after the software is downloaded, try replacing the CD module (MP2).

Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-6C76: PHONE MODULE (PHM) NOT APPROVED. FAULTY SIGNAL (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-6C76

Condition

Fig. 312: Identifying Phone Module (PHM)
Courtesy of VOLVO CARS CORPORATION

The serial number for each control module in the infotainment system is stored in the central electronic module (CEM). The stored numbers are compared with the serial numbers of the control modules at start up. If any number does not correspond, that particular control module is blocked and the function is not available. The blocking function for non-approved control modules is designated security on MOST.

The infotainment control module (ICM) checks whether the phone module (PHM) is in the approved list stored in the central electronic module (CEM).

Diagnostic trouble code (DTC) ICM-6C76 is stored if the infotainment control module (ICM) registers that the phone module (PHM) is not in the approved list.

Diagnostic trouble code (DTC) ICM-6C76 can be detected when the ignition is on for at least 12 seconds and the battery voltage is > 11 V and security on MOST is activated.

Substitute Value

- None.

Possible Source

- Replacing a phone module (PHM) which is not approved in the list stored in the central electronic module (CEM)
- Software not downloaded when replacing the phone module (PHM)
- Failed or incomplete software download for the phone module (PHM).

Fault symptom[s]

- No or reduced carphone functionality.

FAULTY SIGNAL (2003-2005)

CHECKING THE COMPONENT

The infotainment control module (ICM) has registered that the phone module (PHM) is not approved according to the list stored in the central electronic module (CEM).

The cause of the fault is probably that software has not been downloaded or that the download failed when replacing the phone module (PHM).

HINT: When downloading software after replacing a control module in the infotainment system, the serial number is stored in the central electronic module (CEM). This is so that the security on MOST function can approve the control module in the MOST network in the car.

If the fault remains after the software is downloaded, try replacing the phone module (PHM).

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-6C77: GLOBAL POSITIONING MODULE (GPS) NOT VALID. FAULTY SIGNAL (2007-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-6C77

Condition

Fig. 319: Identifying Global Positioning System Module (GPS)
Courtesy of VOLVO CARS CORPORATION

The serial number for each control module in the infotainment system is stored in the central electronic module (CEM). The stored numbers are compared with the serial numbers of the control modules at start up. If any number does not correspond, that particular control module is blocked and the function is not available. The blocking function for non-approved control modules is designated security on MOST.

The infotainment control module (ICM) checks whether the global positioning system module (GPS) is on the validity list stored in the central electronic module (CEM).

The diagnostic trouble code is generated if the infotainment module (ICM) registers that the global positioning system module (GPS) is not on the valid list.

The diagnostic trouble code can be diagnosed with the ignition on for at least 12 seconds, battery voltage greater than 11 V and security on activated.

Substitute Value

- None.

Possible Source

- Replacement to a global positioning system module (GPS) that is not valid according to the list stored in the central electronic module (CEM).
- Software not downloaded at replacement of Global positioning system module (GPS).
- Failed or incomplete software download to the global positioning system module (GPS).

Fault symptom[s]

- Navigation; No Functionality

FAULTY SIGNAL

CHECKING THE COMPONENT

The infotainment module (ICM) has registered that the global positioning system module (GPS) is invalid according to the list stored in the central electronic module (CEM).

The cause of the fault is probably that no software has been downloaded or that the software download has failed after global positioning system module (GSP) replacement.

HINT: When downloading software after replacing a control module in the infotainment system, the serial number is stored in the central electronic module (CEM). This is so that the security on MOST function can approve the control module in the MOST network in the car.

If the fault persists after software download, try replacing the global positioning system module (GPS).

Remedy as necessary.

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on for at least 12 seconds.

  Start up the GPS system. Check that the position of the vehicle on the map is correct. Also check that the current diagnostic trouble code (DTC) is not detected again after the Infotainment control module (ICM) has been active for at least 75 seconds.

Is the position of the car correct on the map?

- **YES**

VERIFIED: Troubleshooting has been completed.

- **NO**

  See: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-6C79: INFOTAINMENT CONTROL MODULE (ICM) NOT VALID. FAULTY SIGNAL (2003-2012)

DIAGNOSTIC TROUBLE CODE INFORMATION ICM-6C79

Condition

Fig. 323: Identifying Infotainment Control Module (ICM)
Courtesy of VOLVO CARS CORPORATION

The central electronic module (CEM) stores the serial number of each control module of the infotainment system. Upon start, the stored numbers are compared to the control modules' serial numbers. If the numbers do not correspond, the control module in question is blocked and the function is non-operational. The function to block non-valid control modules is called security on MOST.

The infotainment control module (ICM) checks if it is included on the validity list stored in the central electronic module (CEM).

The diagnostic trouble code (DTC) is generated if the infotainment control module (ICM) registers that it is not included on the validity list.

The diagnostic trouble code (DTC) can be diagnosed with the ignition on for at least 12 seconds, battery voltage greater than 11 V and security on MOST activated.

Substitute Value

- Nothing.

Possible Source

- Replacement using an infotainment control (ICM) that is not valid according to the validity list stored in the central electronic module (CEM).
- Software not downloaded upon replacement of infotainment control module (ICM).
- Unsuccessful or incomplete software download to infotainment control module (ICM).

Fault symptom[s]

- Infotainment functions not operational.

FAULTY SIGNAL

CHECKING THE COMPONENT

The infotainment control module (ICM) has registered that it not valid according to the list stored in the central electronic module (CEM).

The cause of the problem is probably no or unsuccessful software download after infotainment control module (ICM) replacement.

HINT: During software download after control module replacement, the control module serial number is stored in the central electronic module (CEM). This allows the Security on MOST function to approve the control module in the vehicle MOST network.

If the fault remains after software download, try replacing the infotainment control module (ICM).

Remedy as necessary.

Other information

- see **INFOTAINMENT CONTROL MODULE (ICM), REPLACING**

Fig. 324: Identifying Infotainment Control Module (ICM)

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Activate the infotainment control module (ICM) by pressing the POWER button.

  Check that the display lights.

  Check that the sound source can be selected and that playback is working.

Is the infotainment control module (ICM) working?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  See: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-6C7A: INTEGRATED AUDIO MODULE (IAM) NOT VALID. FAULTY SIGNAL (2007-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-6C7A

Condition

Fig. 327: Identifying Integrated Audio Module (IAM)
Courtesy of VOLVO CARS CORPORATION

The serial number for each control module in the infotainment system is stored in the central electronic module (CEM). The stored numbers are compared with the serial numbers of the control modules at start up. If any number does not correspond, that particular control module is blocked and the function is not available. The blocking function for non-approved control modules is designated security on MOST.

The infotainment module (ICM) checks whether the integrated audio module (IAM) is on the valid list stored in the central electronic module (CEM).

The diagnostic trouble code is generated if the infotainment module (ICM) registers that the integrated audio module (IAM) is not on the valid list.

The diagnostic trouble code can be diagnosed with the ignition on for at least 12 seconds, battery voltage greater than 11 V and security on activated.

Substitute Value

- None.

Possible Source

- Replacement of invalid integrated audio module (IAM) according to the valid list stored in the central electronic module (CEM).
- No software download on replacement of integrated audio module (IAM).
- Failed or incomplete software download to the integrated audio module (IAM).

Fault symptom[s]

- Audio system does not function

FAULTY SIGNAL

CHECKING THE COMPONENT

The infotainment module (ICM) has registered that the integrated audio module (IAM) is invalid according to the list stored in the central electronic module (CEM).

The cause of the fault is probably that no software has been downloaded or that software downloading has failed after integrated audio module (IAM) replacement.

HINT: When downloading software after replacing a control module in the infotainment system, the serial number is stored in the central electronic module (CEM). This is so that the security on MOST function can approve the control module in the MOST network in the car.

If the fault persists after software download, try replacing the integrated audio module (IAM).

Remedy as necessary.

  See: **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ICM-6C7B: REMOTE DIGITAL AUDIO RECEIVER (RDAR) NOT VALID FAULTY SIGNAL (2007-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ICM-6C7B

Condition

Fig. 332: Identifying Remote Digital Audio Receiver Module (RDAR)
Courtesy of VOLVO CARS CORPORATION

The serial number for each control module in the infotainment system is stored in the central electronic module (CEM). The stored numbers are compared with the serial numbers of the control modules at start up. If any number does not correspond, that particular control module is blocked and the function is not available. The blocking function for non-approved control modules is designated security on MOST.

The infotainment module (ICM) checks whether the Remote Digital Audio Receiver (RDAR) is in the valid list stored in the central electronic module (CEM).

The diagnostic trouble code (DTC) is stored if the infotainment module (ICM) registers that the Remote Digital Audio Receiver (RDAR) is not in the valid list.

The diagnostic trouble code can be diagnosed with the ignition on for at least 12 seconds, battery voltage greater than 11 V and security on activated.

Substitute Value

- None.

Possible Source

- Replacement of the Remote Digital Audio Receiver (RDAR) invalid according to the valid list stored in the central electronic module (CEM).
- Software was not downloaded upon replacement of the remote digital audio receiver (RDAR).
- Unsuccessful or incomplete software download to the remote digital audio receiver (RDAR).

Fault symptom[s]

- Digital Radio; No Functionality

FAULTY SIGNAL

CHECKING THE COMPONENT

The infotainment module (ICM) has registered that the remote digital audio receiver (RDAR) is invalid according to the list stored in the central electronic module (CEM).

The cause of the fault is probably that no software has been downloaded or that software downloading has failed after Remote Digital Audio Receiver (RDAR) replacement.

HINT: When downloading software after replacing a control module in the infotainment system, the serial number is stored in the central electronic module (CEM). This is so that the security on MOST function can approve the control module in the MOST network in the car.

If the fault persists after software download, try replacing the Remote Digital Audio Receiver (RDAR).

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ACCESSORIES AND EQUIPMENT

Media, Communication And Navigation - General Diagnostics And Tests

CHECKING THE SUPPLY VOLTAGE/GROUND TERMINAL, PARKING ASSISTANCE CAMERA (PAC) (2007-12)

CHECKING THE POWER SUPPLY AND GROUND TERMINAL

POWER SUPPLY, PARKING ASSISTANCE CAMERA MODULE (PAC)

The parking assistance camera module (PAC) is supplied power via a voltage input on the control module.

When the ignition is in position II, the voltage input is supplied power.

- Voltage input terminal #A6 is supplied power via a fuse from central electronic module (CEM). This power input governs the supply of power to the parking assistance camera module (PAC). It will not be possible to activate the control module if there is an open-circuit.

Checking the power supply

Check the power supply cable from the central electronic module (CEM) to parking assistance camera module (PAC) terminal #A6 for open circuit, loose connection, contact resistance and oxidation. Check the fuse. The voltage must be approximately battery voltage.

Ground connection, parking assistance camera module (PAC)

The parking assistance camera module (PAC) has a ground input. The ground input from the control module is connected to a ground terminal in the body via a ground lead.

- Ground input #A15 is power ground and connected to the ground connection in the body.

Checking the ground terminal

Check the ground cable between parking assistance camera module (PAC) terminal #A15 and the ground connection for open circuit, loose connection, contact resistance and oxidation. When the ignition is on, the voltage drop between the parking assistance camera module (PAC) ground connection and the chassis connection may not be greater than 0.5 V.

Remedy as necessary.

Other information

- see **CHECKING WIRING AND TERMINALS**
- see **SIGNAL SPECIFICATION**

CHECKING THE SUPPLY/GROUND TERMINAL, MULTIMEDIA MODULE (MMM) (2003-12)

CHECKING THE VOLTAGE/GROUND TERMINAL (2003-06)

CHECKING THE POWER SUPPLY AND GROUND TERMINALS

Power supply multimedia module (MMM)

The multimedia module (MMM) is supplied with power via a power supply input on the control module.

When the ignition is on, the power input is powered and the multimedia module (MMM) is in active mode.

- Power input 1 (terminal #21 (#A1)) is supplied with power via a relay on the central electronic module (CEM). The relay is powered via a fuse from the battery. The relay coil can be diagnosed by the central electronic module (CEM). The multimedia module (MMM) will not be activated if there is an open-circuit.

Checking the power supply

Check the power supply cable from the battery to the relay on the central electronic module (CEM) and from the relay for the multimedia module (MMM) terminal #21 (#A1). Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. Check the fuse. The voltage must be approximately battery voltage when the ignition is on.

Ground terminal multimedia module (MMM)

The multimedia module (MMM) has a ground input. The ground input from the control module is connected via a ground lead to the ground terminal in the car body.

- Ground input 1 (terminal #25 (#A5) is power ground and is connected to the ground terminal in the car body.

Checking ground terminal

Check the ground lead between multimedia module (MMM) terminal #25 (#A5) and the ground terminal. Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. With the ignition on, the drop in voltage between the ground connection for the multimedia module (MMM) and the ground terminal must not be greater than 0.5 V.

Remedy as necessary.

Other information:

- see **CONTENTS**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX (2003-06)**

- For information about signals, see **SIGNAL SPECIFICATION**

Fig. 1: Identifying Voltage Display

CHECKING THE VOLTAGE/GROUND TERMINAL (2007-12)

CHECKING THE POWER SUPPLY AND GROUND TERMINALS

Power supply multimedia module (MMM)

The multimedia module (MMM) is supplied with power via a power supply input on the control module.

When the ignition is on, the power input is powered and the multimedia module (MMM) is in active mode.

- Power input 1 (terminal #21 (#A1)) is supplied with power via a relay on the central electronic module

(CEM). The relay is powered via a fuse from the battery. The relay coil can be diagnosed by the central electronic module (CEM). The multimedia module (MMM) will not be activated if there is an open-circuit.

Checking the power supply

Check the power supply cable from the battery to the relay on the central electronic module (CEM) and from the relay for the multimedia module (MMM) terminal #21 (#A1). Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. Check the fuse. The voltage must be approximately battery voltage when the ignition is on.

Ground terminal multimedia module (MMM)

The multimedia module (MMM) has a ground input. The ground input from the control module is connected via a ground lead to the ground terminal in the car body.

- Ground input 1 (terminal #25 (#A5) is power ground and is connected to the ground terminal in the car body.

Checking ground terminal

Check the ground lead between multimedia module (MMM) terminal #25 (#A5) and the ground terminal. Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. With the ignition on, the drop in voltage between the ground connection for the multimedia module (MMM) and the ground terminal must not be greater than 0.5 V.

Remedy as necessary.

Other information:

- see **CONTENTS**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX (2003-06)**
- For information about signals, see **SIGNAL SPECIFICATION**

Fig. 2: Identifying Voltage Display

CHECKING THE SUPPLY VOLTAGE/GROUND TERMINAL, INTEGRATED AUDIO MODULE (IAM) (2007-12)

CHECKING THE SUPPLY VOLTAGE/GROUND TERMINAL

CHECKING THE POWER SUPPLY AND GROUND TERMINALS

Power supply, Integrated Audio Module (IAM)

The Integrated Audio Module (IAM) is supplied with voltage via a voltage input on the control module.

With ignition on the voltage input is supplied with voltage and the Integrated Audio Module (IAM) is in active

mode.

- Voltage input 1 (#A1) is supplied with voltage via a fuse from the Central Electronic Module (CEM). The Integrated Audio Module (IAM) will not be activated in the event of open circuits.

Checking the power supply

Check the power supply cable from the battery to the Central Electronic Module (CEM) and from the Central Electronic Module (CEM) to the Integrated Audio Module (IAM) (#A1) with regard to open circuits, loose connections, contact resistance and corrosion. Check the fuse too. The voltage should be approximate battery voltage with the ignition on.

Ground terminal, Integrated Audio Module (IAM)

The Integrated Audio Module (IAM) has a ground input. The ground input from the control module is connected via a ground cable to the ground terminal in the body.

- Ground input 1 (#A8) is power ground and connected to the ground connection in the body.

Checking the ground terminal

Check the ground cable between Integrated Audio Module (IAM) terminal (#A8) and the ground terminal. Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. With the ignition on, the drop in voltage between the ground connection for the Integrated Audio Module (IAM) and the ground terminal must not be greater than 0.5 V.

Remedy as necessary.

CHECKING THE VOLTAGE/GROUND TERMINAL, AUDIO MODULE (AUD) (2003-06)

CHECKING THE VOLTAGE/GROUND TERMINAL

CHECKING THE POWER SUPPLY AND GROUND TERMINALS

Power supply audio module (AUD)

The power supply to the audio module (AUD) is via two power inputs on the control module.

When the ignition is on, both power inputs are powered and the audio module (AUD) is in active mode.

- Power input 1 (terminal #45 (#A1)) is supplied with power via a fuse from the battery. The audio module (AUD) will not be activated if there is an open-circuit
- Power input 2 (terminal #6 (#B6)) is supplied with power via a relay on the central electronic module (CEM). The relay is powered via a fuse from the battery. The relay coil can be diagnosed by the central electronic module (CEM). The audio module (AUD) will be activated when the power input is supplied with power. The audio module (AUD) will not be activated if there is an open-circuit.

Checking the power supply

Check the power supply cable from the battery to the relay on the central electronic module (CEM) and from the relay for the audio module (AUD) terminal #6 (#B6). Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. Check the fuse. The voltage must be approximately battery voltage when the ignition is on.

Check the power supply cable from the battery to audio module (AUD) terminal #45 (#A1). Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. Check the fuse. The voltage must be approximately battery voltage when the ignition is on.

Ground terminal audio module (AUD)

The audio module (AUD) has a ground input. The ground input from the control module is connected via a ground lead to the ground terminal in the car body.

- Ground input 1 (terminal #46 (#A2) is power ground and is connected to the ground terminal in the car body.

Checking ground terminal

Check the ground lead between audio module (AUD) terminal #46 (#A2) and the ground terminal. Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. With the ignition on, the drop in voltage between the ground connection for the audio module (AUD) and the ground terminal must not be greater than 0.5 V.

Remedy as necessary.

Other information:

- see **CONTENTS**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For information about signals, see **SIGNAL SPECIFICATION**

Fig. 4: Identifying Voltage Display

CHECKING THE VOLTAGE/GROUND TERMINAL, INFOTAINMENT CONTROL MODULE (ICM) (2003-12)

CHECKING THE VOLTAGE/GROUND TERMINAL

CHECKING THE POWER SUPPLY AND GROUND TERMINALS

Voltage reading infotainment control module (ICM)

The infotainment control module (ICM) is supplied with power via a power supply input on the control module.

When the ignition is on, the voltage input is supplied with power and the infotainment control module (ICM)

can be activated using the POWER button.

1. Power input terminal #1 (#A1) is supplied with power via a relay on the central electronic module (CEM). The relay is powered via a fuse from the battery. The relay coil can be diagnosed by the central electronic module (CEM). The infotainment control module (ICM) will not be activated if there is an open-circuit.

Checking the power supply

Check the power supply cable from the battery to the relay on the central electronic module (CEM) and from the relay for the infotainment control module (ICM) terminal #1 (#A1). Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. Check the fuse. The voltage must be approximately battery voltage when the ignition is on.

Ground terminal infotainment control module (ICM)

The control module has a ground input. The ground input from the control module is connected via a ground lead to the ground terminal in the car body.

1. Ground input terminal #10 (#A10) is power ground and is connected to the ground terminal in the car body.

Checking ground terminal

Check the ground lead between control module terminal #10 (#A10) and the ground terminal. Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. With the ignition on, the drop in voltage between the ground connection for the control module and the ground terminal must not be greater than 0.5 V.

Remedy as necessary.

Other information:

- see **CONTENTS**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For information about signals, see **SIGNAL SPECIFICATION**

Fig. 5: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

CHECKING THE VOLTAGE/GROUND TERMINAL, MD/CD MODULE (MP1/MP2) (2003-06)

CHECKING THE POWER SUPPLY AND GROUND TERMINALS

Power supply Media player Module (MP)

The power supply to the Media player Module (MP) is via two power inputs on the control module.

When the ignition is on, both power inputs are powered and the Media player Module (MP) is in active mode.

- Power input 1 (#A1) is supplied with power via a fuse from the battery. The Media player Module (MP)

will not be activated if there is an open-circuit

- Power input 2 (#A2) is supplied with power via a relay on the central electronic module (CEM). The relay is powered via a fuse from the battery. The relay coil can be diagnosed by the central electronic module (CEM). The Media player Module (MP) will be activated when the power input is supplied with power. The Media player Module (MP) will not be activated if there is an open-circuit.

Checking the power supply

Check the power supply cable from the battery to the relay on the central electronic module (CEM) and from the relay for the media player module (MP) terminal (#A2). Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. Check the fuse. The voltage must be approximately battery voltage when the ignition is on.

Check the power supply cable from the battery to media player module (MP) (#A1). Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. Check the fuse. The voltage must be approximately battery voltage when the ignition is on.

Ground terminal Media player Module (MP)

The Media player Module (MP) has a ground input. The ground input from the control module is connected via a ground lead to the ground terminal in the car body.

- Ground input terminal #1 (#A4) is power ground and is connected to the ground terminal in the car body.

Checking ground terminal

Check the ground lead between media player (MP) (#A4) and the ground terminal. Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. With the ignition on, the drop in voltage between the ground connection for the media player module (MP) and the ground terminal must not exceed 0.5 V.

Remedy as necessary.

CHECKING THE VOLTAGE/GROUND TERMINAL, REMOTE DIGITAL AUDIO RECEIVER (RDAR) (2007-12)

CHECKING THE SUPPLY VOLTAGE/GROUND TERMINAL

CHECKING THE POWER SUPPLY AND GROUND TERMINALS

Voltage supply, Remote Digital Audio Receiver (RDAR)

Remote Digital Audio Receiver (RDAR) is supplied with voltage via a voltage input on the control module.

Power input terminal #A-1 is directly supplied from the battery via a fuse.

Checking the power supply

Also check the power supply cable from the battery to the fuse in the fuse box, in the engine compartment and from the fuse for the Remote Digital Audio Receiver (RDAR). Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. Check the fuse. Voltage should be about equal to battery voltage.

Ground terminal, Remote Digital Audio Receiver (RDAR)

The control module has a ground input. The ground input from the control module is connected via a ground lead to the ground terminal in the car body.

Ground input terminal #A-2 is power ground and connected to the ground connection in the body.

Checking ground terminal

Check the ground cable between control module terminal #A-2 and the ground connection for open circuit, loose connection, contact resistance and oxidation. With the ignition on, the drop in voltage between the ground connection for the control module and the ground terminal must not be greater than 0.5 V.

Remedy as necessary.

Other information:

- see **CHECKING WIRING AND TERMINALS**
- see **SIGNAL SPECIFICATION**

CONNECTING THE BREAKOUT BOX, AUDIO MODULE (AUD) (2003-12)

CONNECTING THE BREAKOUT BOX

Special tools:

see **9511428**

see **9511507**

see **9512888**

Fig. 7: Breakout Box. Accessory Electronic Module
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Expose the audio module (AUD)
- Remove the fuse for the audio module (AUD).

Connect adapter see **9511463** to the control module connector (wiring side). Connect breakout box see **9511428** to the adapter. Audio module (AUD) terminals #C1-#C22 correspond to terminals #1-#22 on the breakout box. Connect adapter see **9511507** to the control module connector (wiring side). Connect breakout box see **9511428** to the adapter. Audio module (AUD) terminals #A1-#A2 correspond to terminals #45-#46 on the breakout box. Connect adapter see **9512888** to the control module connector. Connect breakout box see **9511428** to the adapter. Audio module (AUD) terminals #B1-#B16 correspond to terminals #1-#16 on the breakout box.

The breakout box is designed to facilitate reading off the control module input and output signals when the control module is connected and cable and component resistance when the control module is disconnected. The use of a breakout box reduces the risk of accidental short-circuited cables and damage to the connector pins

Disconnecting breakout box

In reverse order.

NOTE: Before the control module can be checked and readings taken, the removed fuses must first be installed.

Other information:

- For information about signals, see **SIGNAL SPECIFICATION**

CONNECTING THE BREAKOUT BOX, INFOTAINMENT CONTROL MODULE (ICM) (2003-12)

CONNECTING THE BREAKOUT BOX

Fig. 8: Breakout Box. Accessory Electronic Module

CHECKING THE VOLTAGE/GROUND TERMINAL, PHONE MODULE (PHM) (2003-04)

CHECKING THE VOLTAGE/GROUND TERMINAL

CHECKING THE POWER SUPPLY AND GROUND TERMINALS

Power supply, phone module (PHM)

The phone module (PHM) is powered via a power input on the control module.

Power input #A1 (#1) is supplied with +30 from the battery via a fuse. It will not be possible to activate the carphone if there is an open-circuit.

Checking the power supply

Check the power supply cable from the battery to phone module (PHM) terminal #A2 (#2). Check for an open-circuit. Check for loose connections. Check for contact resistance. Check for oxidation. Check the fuse. The voltage must be approximately battery voltage.

Ground terminal, phone module (PHM)

The phone module (PHM) has a ground input. The ground input from the control module is power ground and is connected to the ground terminal in the car body.

Checking the ground terminal

Check the ground lead between phone module (PHM) terminal #A1 (#1) and the ground terminal. Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. With the ignition on, the drop in voltage between the ground connection for the control module and the ground terminal must not be greater than 0.5 V.

Remedy as necessary.

Other information:

- see **CONTENTS**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For information about signals, see **SIGNAL SPECIFICATION**

Fig. 12: Identifying Voltage Display

CHECKING THE VOLTAGE/GROUND TERMINAL, BLUETOOTH PHONE MODULE (BPM) (2011-12)

CHECKING THE SUPPLY VOLTAGE/GROUND TERMINAL

POWER SUPPLY BLUETOOTH PHONE MODULE (BPM)

The Bluetooth phone module (BPM) is powered via two power inputs on the control module. When the ignition is on, the power input is powered and the control module is in active mode.

1. The power inputs 1 (#C1-31) and 2 (#C1-32) are powered via one an the same fuse from the battery. This power input is used to power the memory in the control module. In the event of an open-circuit, the control module will be reset and adaptation values and diagnostic trouble codes (DTCs) will disappear.

Checking the power supply

Check the power supply cable from the battery to infotainment control module (ICM) terminal #C1-1 (#1). Check for an open-circuit. Check for loose connections. Check for contact resistance. Check for oxidation. Check the power supply cables from the ignition switch to Bluetooth phone module (BPM) terminals #C1-31 and #C1-32. Check for an open-circuit. Check for loose connections. Check for contact resistance. Check for oxidation. Check the fuse. The voltage should be approx. the same as the battery voltage.

Ground terminal Bluetooth phone module (BPM)

The Bluetooth phone module (BPM) has two ground terminals.

- Ground inputs (#C1-15 and #C1-16) are both power ground and connected to the ground terminal in the car body.

Checking the ground terminal

Check the ground cable. Check for loose connections, contact resistance and oxidation. Check for an open-circuit. With the ignition on, the drop in voltage between the ground connection for the control module and the ground terminal must not be greater than 0.5 V.

Remedy as necessary.

Other information

- see **SIGNAL SPECIFICATION**
- see **CHECKING WIRING AND TERMINALS**

CHECKING THE VOLTAGE/GROUND TERMINAL, PHONE MODULE (PHM) (2006-12)

CHECKING THE SUPPLY VOLTAGE/GROUND TERMINAL

CHECKING THE POWER SUPPLY AND GROUND TERMINALS

Power supply, phone module (PHM)

The phone module (PHM) is powered via a power input on the control module.

Power input #A5 (#5) is supplied with +30 from the battery via a fuse. It will not be possible to activate the carphone if there is an open-circuit.

Checking the power supply

Check the power supply cable from the battery to phone module (PHM) terminal #A5 (#5). Check for an open-circuit. Check for loose connections. Check for contact resistance. Check for oxidation. Check the fuse. The voltage must be approximately battery voltage.

Ground terminal, phone module (PHM)

The phone module (PHM) has a ground input. The ground input from the control module is power ground and is connected to the ground terminal in the car body.

Checking the ground terminal

Check the ground lead between phone module (PHM) terminal #A6 (#6) and the ground terminal. Check for an open-circuit. Check for loose connections. Check for contact resistance. Check for oxidation. With the ignition on, the drop in voltage between the ground connection and the ground terminal must not be greater than 0.5 V.

Remedy as necessary.

Other information

- see **SIGNAL SPECIFICATION**
- see **CHECKING WIRING AND TERMINALS**

CHECKING VOLTAGE/GROUND CONNECTION, PHONE MODULE (PHM) (2005)

CHECKING VOLTAGE/GROUND CONNECTION

From week 46 year 2004, a new diagnosis system was introduced for phone module (PHM) on XC90.

Vehicles built up to and incl. week 45 year 2004: **CHECKING THE VOLTAGE/GROUND TERMINAL**

Vehicles built from and incl. week 46 year 2004: **CHECKING VOLTAGE/GROUND CONNECTION**

CONNECTING THE BREAKOUT BOX, PHONE MODULE (PHM) (2003-04)

CONNECTING THE BREAKOUT BOX

Special tools:

see **9511463**

see **9511508**

see **9813190**

see **9512888**

GENERAL INFORMATION

Check that the male and female terminals on the connectors are undamaged and secure (cannot be pressed in). Check that the cables to the female terminals are secured to the terminal pins.

The breakout box is designed to facilitate reading off the control module input and output signals when the control module is connected, and the cable and component resistance when the control module is disconnected. The use of a breakout box reduces the risk of accidental short-circuited cables and damage to the connector pins.

CONNECTING THE BREAKOUT BOX

- Ignition off
- To expose the phone module (PHM) connectors, see **PHONE MODULE (PHM), REPLACING**
- To expose the handset connectors, see **HANDSET, REPLACING**
- To expose the connector for the SIM card reader, see **INFOTAINMENT CONTROL MODULE (ICM), REPLACING** .

Connect breakout box see **9813190** to the adapter.

Phone module (PHM)

- Connect adapter see **9511463** to control module connectors A and B
- For connector A, terminals #A1-#A22 correspond to terminals #1-#22 on the breakout box
- For connector B, terminals #B1-#B14 correspond to terminals #43-#56 on the breakout box.

Handset

- Connect adapter see **9511508** to the handset connector
- Terminals #1-#5 on the connector correspond to terminals #21-#25 on the breakout box.

SIM card holder

- Connect adapter see **9512888** to the SIM card holder connector
- Terminals #1-#6 on the connector correspond to terminals #21-#26 on the breakout box.

CONNECTING THE BREAKOUT BOX, PHONE MODULE (PHM) (2005)

CONNECTING THE BREAKOUT BOX

see **9512888**

GENERAL INFORMATION

Check that the male and female terminals on the connectors are undamaged and secure (cannot be pressed in). Check that the cables to the female terminals are secured to the terminal pins.

The breakout box is designed to facilitate reading off the control module input and output signals when the control module is connected, and the cable and component resistance when the control module is disconnected. The use of a breakout box reduces the risk of accidentally short-circuiting cables and damaging the connector pins.

CONNECTING THE BREAKOUT BOX

- Ignition off
- For releasing the connectors from the Phone module (PHM), see

Connect breakout box see **9511428** to the adapter.

Phone module (PHM)

- Connect adapter see **9511463** to the control module connector A.
- Connect adapter see **9512888** to control module connector B.
- For connector A, terminals #A1-#A22 correspond to terminals #1-#22 on the breakout box
- For connector B, terminals #B1-#B6 correspond to terminals #21-#26 on the breakout box.

Handset

- Connect adapter see **9511508** to the handset connector.
- Terminals #1-#5 on the connector correspond to terminals #21-#25 on the breakout box.

SIM card holder

- Connect adapter see **9512888** to the SIM card holder connector.
- Terminals #1-#6 on the connector correspond to terminals #21-#26 on the breakout box.

Switch Volvo On Call

- Connect adapter see **9511508** to the connector for the switches.
- Terminals #1-#7 on the connector correspond to terminals #13-#19 on the breakout box.

Other information

- see **SIGNAL SPECIFICATION**
- see **HANDSET, REPLACING**
- see **SWITCH VOLVO ON CALL, REPLACING (2006-10)**

CHECKING THE VOLTAGE/GROUND TERMINAL, ANTENNA MODULE (ATM) (2003-06)

CHECKING THE POWER SUPPLY AND GROUND TERMINALS

Power supply, antenna module (ATM)

The antenna module (ATM) is powered via a power input on the control module.

Power input terminal #A1 is supplied with +30 from the battery via a fuse. It will not be possible to activate the antenna module (ATM) if there is an open-circuit.

Checking the power supply

Check the power supply cable from the battery to antenna module (ATM) terminal #A1. Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. Check the fuse. The voltage should be approximately battery voltage.

Ground terminal, antenna module (ATM)

The antenna module (ATM) is connected to the chassis ground at fixed points in the body.

Checking ground terminal

Check that the casing on the antenna module (ATM) is properly connected to the body. Check for loose connections. Check for contact resistance and oxidation. With the ignition on, the drop in voltage between the mounting points for the control module and the body must not be greater than 0.5 V.

Remedy as necessary.

Other information:

- see **CONTENTS**
- For information about signals, see **SIGNAL SPECIFICATION**

Fig. 13: Identifying Voltage Display

CHECKING THE VOLTAGE/GROUND TERMINAL, SUBWOOFER MODULE (SUB) (2003-08)

CHECKING THE VOLTAGE/GROUND TERMINAL

CHECKING THE POWER SUPPLY AND GROUND TERMINALS

Power supply, Subwoofer module (SUB)

The Subwoofer module (SUB) is supplied with power via a power supply input on the control module.

When the ignition is on, the power input is powered and the Subwoofer module (SUB) is in active mode.

- Power input 1 (terminal #53 (#A3)) is supplied with power via a relay on the rear electronic module (REM). The relay is activated via a relay connected to the central electronic module (CEM). The relay on the rear electronic module (REM) is supplied with power from the battery via a fuse. The relay coil on the central electronic module (CEM) can be diagnosed and is supplied with power from the battery via a fuse. The Subwoofer module (SUB) will not be activated in the event of an open-circuit in any of the connections.

Checking the power supply

Check the power supply cable from the battery to the relay on the rear electronic module (REM) and from the relay for the Subwoofer module (SUB) terminal #53 (#A3). Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. Check the fuse. The voltage must be approximately battery voltage when the ignition is on.

Check the cable from the relay on the central electronic module (CEM) to the relay on the rear electrical module (REM). Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. Also check the fuse for the relay. The voltage must be approximately battery voltage when the ignition is on

Ground terminal Subwoofer module (SUB)

The Subwoofer module (SUB) has a ground input. The ground input from the control module is connected via a ground lead to the ground terminal in the car body.

- Ground input 1 (terminal #51 (#A1) is power ground and is connected to the ground terminal in the car body.

Checking ground terminal

Check the ground lead between subwoofer module (SUB) terminal #53 (#A3) and the ground terminal. Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. With the ignition on, the drop in voltage between the ground connection for the subwoofer module (SUB) and the ground terminal must not be greater than 0.5 V.

Remedy as necessary.

Other information:

- see **CONTENTS**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For information about signals, see **SIGNAL SPECIFICATION**

Fig. 14: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

CONNECTING THE BREAKOUT BOX, SUBWOOFER MODULE (SUB) (2003-08)

CONNECTING THE BREAKOUT BOX

Special tools:

see **9512843**

see **9511428**

Fig. 15: Breakout Box. Accessory Electronic Module
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Expose the Subwoofer module (SUB).

Connect adapter see **9512843** to the control module connector (wiring side). Connect breakout box see **9511428** to the adapter. Subwoofer module (SUB) terminals #A1-#A4 correspond to terminals #51-#54 on the breakout box.

The breakout box is designed to facilitate reading off the control module input and output signals when the control module is connected and cable and component resistance when the control module is disconnected. The use of a breakout box reduces the risk of accidental short-circuited cables and damage to the connector pins

Disconnecting breakout box

In reverse order.

NOTE: **Before the control module can be checked and readings taken, the removed fuses must first be installed.**

Other information

- For information about signals, see **SIGNAL SPECIFICATION**

CHECKING THE SUPPLY VOLTAGE/GROUND TERMINAL, GLOBAL POSITIONING SYSTEM MODULE (GPS) (2007-12)

CHECKING THE SUPPLY VOLTAGE/GROUND TERMINAL

CHECKING THE POWER SUPPLY AND GROUND TERMINALS

Power supply, global positioning system module (GPS)

The global positioning system module (GPS) is powered via a power input on the control module.

1. The power input terminal #1 (#B1) is powered via a fuse from the central electronic module (CEM). It will not be possible to activate the global positioning system module (GPS) if there is an open-circuit.

Checking the power supply

Check the power supply cable from the battery to the central electronic module (CEM) and from the central electronic module (CEM) to global positioning system module (GPS) terminal #1 (#B1). Check for an open-circuit. Check for loose connections. Check for contact resistance. Check for oxidation. Check the fuse. The voltage must be approximately battery voltage when the ignition is on.

Ground terminal, global positioning system module (GPS)

The global positioning system module (GPS) has a ground input. The ground input from the control module is connected via a ground lead to the ground terminal in the car body.

- Ground input 1 (#B5) is power ground and connected to the ground connection in the body.

Checking the ground terminal

Check the ground cable between Global positioning system module (GPS) terminal (#B5) and the ground terminal. Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. With the ignition on, the voltage drop between the global positioning system module (GPS) ground connection and chassis connection may not be greater than 0.5 V.

Remedy as necessary.

NOTE: **There are two versions of cable harness for the tunnel console, with or without preparations for Digital TV receivers.**

The images in the installation instructions show cable harness without Digital TV receiver.

INSTALLATION

Fig. 1: Pressing In Catches And Pulling Headrest Upwards
Courtesy of VOLVO CARS CORPORATION

- Slide both the front seats all the way back and upwards all the way at the front and rear edge.
- Press the headrest downwards.
- Find the headrest's two locks on the back of the seat. Press in the catches and pull the headrest upwards at the same time.
- The seats may require lowering slightly at the rear edge again so that the headrest can be pulled out of the backrest completely. Therefore lower the seat as much as possible so that the headrest can be released and removed. Remove the headrest on both front seats and allow the seats to remain in the same position.

Fig. 2: Removing Tunnel Console Side Panels
Courtesy of VOLVO CARS CORPORATION

- Remove both the side panels from the tunnel console.

Fig. 3: Identifying Removal Of Soundproofing Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the sound barrier on the driver's side by first removing the two screws and then prizing it away at the top edge.

Fig. 4: Removing The Tunnel Compartment
Courtesy of VOLVO CARS CORPORATION

- Pull the handle (1), move the tunnel compartment backward and lift it away (2).

Fig. 5: Removing Cover
Courtesy of VOLVO CARS CORPORATION

- Remove the cover. It shall not be re-used.

Fig. 6: Prying Off Gear Selector Panel At Rear Edge
Courtesy of VOLVO CARS CORPORATION

Applies to cars with automatic gearbox

- Turn the ignition key to position II.
- Move the gear selector lever to its rearmost position.
- Use a weatherstrip and pry off the gear selector panel at the rear edge.

Fig. 7: Identifying Ignition Switch Turned To Position 0
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position 0.

NOTE: **Wait at least three minutes before unplugging the connectors or removing other electrical equipment.**

Fig. 8: Pressing In Catches And Removing Panel
Courtesy of VOLVO CARS CORPORATION

- Press in the catches underneath and remove the panel.

Fig. 9: Removing Small Storage Compartment
Courtesy of VOLVO CARS CORPORATION

- Remove the small storage compartment.

APPLIES TO CARS WITH TELEPHONE

Fig. 10: Disconnecting Telephone Cable
Courtesy of VOLVO CARS CORPORATION

- Unhook and disconnect the connector (1).
- Disconnect the telephone cable from the load-removing grommet (2).
- Release the telephone cable.
- Remove the handset.
- Remove the screw (3).
- Push the catch to one side (4).
- Remove the telephone cradle.

Fig. 11: Removing Tunnel Console Upper Section Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the six screws.

Fig. 12: Removing Tunnel Console Upper Section
Courtesy of VOLVO CARS CORPORATION

- Lift up and remove the upper section.
- At the same time disconnect the connector to the AUX socket.

Fig. 13: Removing Connector
Courtesy of VOLVO CARS CORPORATION

- Disconnect the connector. Press in the catches and unhook it from the tunnel console.

Fig. 14: Removing Tunnel Console
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws and lift out the tunnel console.

Fig. 15: Positioning Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Take the cable harness (C) from the kit and position it as illustrated.
- The junction (1) must be at the rear edge of the SRS control module. The cable marked with blue tape must go to the right seat and the other to the left seat. The cable with 2 x 4 pin connectors must be routed forward on the driver's side.

Fig. 16: Routing Cable
Courtesy of VOLVO CARS CORPORATION

- Route the cables in the join for the floor mats further along the seat rail.
- Position the cable in a loop under the seat.

Fig. 17: Routing Cable
Courtesy of VOLVO CARS CORPORATION

- Take the cable with the two 4 pin connectors and route forward on the driver's side.

CARRY OUT ON BOTH SIDES OF THE SEATS

Fig. 18: Removing Seat Side Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the screw for the seat's side panel.

Fig. 19: Removing Panel
Courtesy of VOLVO CARS CORPORATION

- Turn the panel upwards at the front edge.
- Unhook it from the seat at the rear edge.

Fig. 20: Removing Lumbar Support Adjustment Knob
Courtesy of VOLVO CARS CORPORATION

- Remove the knob for the lumbar support adjustment by removing the cover using a small screwdriver and pull the knob straight off.

Fig. 21: Inserting Long Cable Tie For Adjusting Lumbar Support
Courtesy of VOLVO CARS CORPORATION

- Take a long cable tie from the kit and insert it through the hole for adjusting the lumbar support and inside the upholstery. The cable tie must be routed between the thin foam of the upholstery and the support pad.

Illustrations A and B

Fig. 22: Taping Cable Terminal Ends
Courtesy of VOLVO CARS CORPORATION

- Remove cable harness (A) from the kit.
- Tape the cable terminals on the cable tie. Tape together as flat as possible. (Image B) Route the cable harness through and out at the headrest hole.
- Remove the cable tie from the cable harness.

Fig. 23: Headrest Hole
Courtesy of VOLVO CARS CORPORATION

Fig. 24: Routing Cable
Courtesy of VOLVO CARS CORPORATION

Applies to the right-hand front seat

- Thread the cable tie from the headrest's inner mounting down to the hole for lumbar adjustment. The cable tie must be routed between the upholstery's thin foam and the protective pad (also, see image 29).

Fig. 25: Routing Cable
Courtesy of VOLVO CARS CORPORATION

Applies to the left-hand front seat.

- Thread the cable tie from the headrest's outer mounting down to the hole for lumbar adjustment. The cable tie must be routed between the upholstery's thin foam and the protective pad.

Fig. 26: Taping And Routing Cable
Courtesy of VOLVO CARS CORPORATION

Applies to both seats

- Tape the cable harness on the cable tie. Tape as flat as possible.
- Pull it up towards the upper edge of the seat and out through the hole for the headrest.
- Remove the cable tie and tape from the cable harness.

Fig. 27: Cable Harness Terminal Identification
Courtesy of VOLVO CARS CORPORATION

CAUTION: There are two brown cables in the cable harness.

The brown cable to terminal 4 is twinned with the blue cable to terminal 3.

Position:

1. Not connected.
2. White (W)
3. Blue (BL)
4. Brown (BN)
5. Red/White (R/W)
6. Red (R)
7. Black (SB)
8. Brown (BN)
9. Yellow (Y)
10. Green (GN)
11. Gray (GR)
12. Pink (P)

Fig. 28: Connecting Cable Harness Terminals
Courtesy of VOLVO CARS CORPORATION

- Take the grey connector from the kit. Connect the cable harness terminals.
- Press in the connector's catch.

Fig. 29: Adjusting Cable Harness Length
Courtesy of VOLVO CARS CORPORATION

- Adjust the length on the cable harness so that the connector protrudes **140mm** . The cable harness must be positioned in front of the hole for the headrest.

Fig. 30: Installing Cable Harness Under Protective Pad
Courtesy of VOLVO CARS CORPORATION

- Using your fingers, press the cable harness under the protective pad, the cable harness must not press out the upholstery after installation.
    1. 1. Padding
    2. 2. Protective pad

Fig. 31: Pulling Upholstery Over Headrest
Courtesy of VOLVO CARS CORPORATION

- Take the headrest and the upholstery from the kit. Pull the upholstery over the headrest.

Fig. 32: Pulling Upholstery Corners Over
Courtesy of VOLVO CARS CORPORATION

- Pull the two corners of the upholstery over.

Fig. 33: Installing Upholstery Onto Cutouts
Courtesy of VOLVO CARS CORPORATION

- Hook the upholstery onto the two cutouts.

Fig. 34: Upholstery Reinforcements
Courtesy of VOLVO CARS CORPORATION

- Fold in the upholstery's two reinforcements.

Fig. 35: Identifying Hole Under Upholstery
Courtesy of VOLVO CARS CORPORATION

- Fold up the upholstery's reinforcement.
- Locate the hole under the upholstery on the side of the headrest.

NOTE: The inward facing side in the car.

- Make a mark for making a hole using a piece of tape.
- Fold back the upholstery's reinforcement.

Fig. 36: Installing Clips
Courtesy of VOLVO CARS CORPORATION

- Install the 5 clips.

Fig. 37: Folding In Upholstery's Mounting
Courtesy of VOLVO CARS CORPORATION

- Fold in the upholstery's mounting.

Fig. 38: Installing Display In Headrest
Courtesy of VOLVO CARS CORPORATION

- Take the display from the kit.
- Install on the headrest.

Fig. 39: Aligning Display In Headrest's Cutouts
Courtesy of VOLVO CARS CORPORATION

- Align the display in the headrest's two cutouts.

Fig. 40: Installing Headrest Display
Courtesy of VOLVO CARS CORPORATION

- Install the two screws.

Fig. 41: Identifying Hole Under Upholstery
Courtesy of VOLVO CARS CORPORATION

- Locate the hole under the upholstery on the headrest side, marked with tape.
- Make a hole in the upholstery using a scriber or an awl.

NOTE: The inward facing side in the car.

Fig. 42: Installing Coat Hook
Courtesy of VOLVO CARS CORPORATION

- Take the coat hook from the kit.
- Press into the hole.
- Tap it in lightly using a plastic hammer so that it secures properly.

Fig. 43: Positioning Cable Harness In The Panel Cutout
Courtesy of VOLVO CARS CORPORATION

- Position the panel on the seat.
- Position the cable harness in the panel's cutout.

Fig. 44: Installing Headrest
Courtesy of VOLVO CARS CORPORATION

- Install the headrest on the seat.
- Only slide it down so that the distance between the seat and lower edge of the headrest is approximately **50mm** .

Fig. 45: Connecting Headrest Connector
Courtesy of VOLVO CARS CORPORATION

- Connect the connector and push the headrest down to the locked position.
- Check that the head restraint has locked into place by pulling it upwards.

Fig. 46: Checking Headrest For Correct Alignment
Courtesy of VOLVO CARS CORPORATION

- Check that the headrest upholstery is correctly aligned against the panel.
- Repeat steps 18-45 for the other side.

APPLIES TO THE RIGHT-HAND FRONT SEAT AND CARS WITHOUT HEATED SEATS

Fig. 47: Installing Clip With Cable Tie On The Plate Edge
Courtesy of VOLVO CARS CORPORATION

- Take a clip with cable tie from the kit and install it on the plate edge on the left-hand side of the right-hand seat.

Fig. 48: Route And Secure Cable Under Seat
Courtesy of VOLVO CARS CORPORATION

- Take the cable harness from the headrest and pull forward, in underneath the seat. Follow the cable harness for the seat belt buckle.
- Tighten the cable tie (1).
- Secure the cable using two cable ties (2).

APPLIES TO THE RIGHT-HAND FRONT SEAT AND CARS WITH HEATED SEATS

Fig. 49: Route And Secure Cable Under Seat
Courtesy of VOLVO CARS CORPORATION

- Take the cable harness from the headrest and pull forward, in underneath the seat. Follow the cable harness for the heating element.
- Secure the cable using three cable ties (1).

APPLIES TO THE RIGHT-HAND FRONT SEAT

Fig. 50: Route And Secure Cable Under Seat
Courtesy of VOLVO CARS CORPORATION

- Route the cable harness in an arc under the seat.
- Secure it using three cable ties in the existing cable harness.

Fig. 51: Route And Secure Cable Under Seat
Courtesy of VOLVO CARS CORPORATION

- Take a piece of foam tape from the kit and cut it in the center.
- Fold the seat forward slightly and connect the cable harness from the floor to the connector (1).
- Tape one cut piece of foam tape around the connectors.
- Place a cable tie on each side of the connectors and tighten.
- Check that the cable harness is not trapped when the seat is slid forwards and backwards.

The right-hand seat means the passenger seat

- Fold the backrest forward and backwards and check that the cable harness is not trapped when folding the backrest.

APPLIES TO THE LEFT-HAND SEAT AND CARS WITHOUT HEATED SEATS

Fig. 52: Installing Clip With Cable Tie On The Plate Edge
Courtesy of VOLVO CARS CORPORATION

- Take a clip with cable tie from the kit and install it on the plate edge on the right-hand side of the left-hand seat.

Fig. 53: Route And Secure Cable Under Seat
Courtesy of VOLVO CARS CORPORATION

- Take the cable harness from the headrest and pull forward, underneath the seat. Follow the cable harness for the seat belt buckle.
- Tighten the cable tie (1).
- Secure the cable using two cable ties (2).

APPLIES TO THE LEFT-HAND FRONT SEAT AND CARS WITH HEATED SEATS

Fig. 54: Route And Secure Cable Under Seat
Courtesy of VOLVO CARS CORPORATION

- Take the cable harness from the headrest and pull forward, in underneath the seat. Follow the cable harness for the heating element.

- Secure the cable using three cable ties (1).

APPLIES TO THE LEFT-HAND FRONT SEAT.

Fig. 55: Route And Secure Cable Under Seat
Courtesy of VOLVO CARS CORPORATION

- Route the cable harness under the seat.
- Connect the cable harness from the floor to the connector (1).
- Secure it using a cable tie in the existing cable harness or in a bracket.
- Tape one cut piece of foam tape around the connectors.
- Place a cable tie on each side of the connectors and tighten.
- Check that the cable harness is not trapped when the seat is slid forwards and backwards.

The left-hand seat means the passenger seat

- Fold the backrest forward and backwards and check that the cable harness is not trapped when folding the backrest.

Fig. 56: Removing Ashtray
Courtesy of VOLVO CARS CORPORATION

- Fold the ashtray out, press it down and remove

Fig. 57: Pulling Out Cup Holder To It's Position Limit
Courtesy of VOLVO CARS CORPORATION

- Pull out the cup holder to its limit position.

Fig. 58: Removing The Cup Holder
Courtesy of VOLVO CARS CORPORATION

- Turn the tunnel console.
- Lift up the catch and remove the cup holder.

Fig. 59: Removing The Lower Section's Four Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the four screws.

Fig. 60: Removing The Lower Section
Courtesy of VOLVO CARS CORPORATION

- Pull the opening handle.
- Remove the two screws and lift off the lower section.

Fig. 61: Removing Console Cover
Courtesy of VOLVO CARS CORPORATION

- Fold the cover up and remove the two screws.
- Remove the cover by sliding it forward. The cover will not be reused.

Fig. 62: Removing 12V Socket Plug
Courtesy of VOLVO CARS CORPORATION

- Remove the plug for the 12 V socket.
- Remove the two rubber supports.

Fig. 63: Removing Inner Section Of Ashtray
Courtesy of VOLVO CARS CORPORATION

- Lift up the two catches and remove the inner section of the ashtray. It will not be reused.

Fig. 64: Removing 12V Socket
Courtesy of VOLVO CARS CORPORATION

- Release the two catches and remove the 12 V socket.

Fig. 65: Marking Tunnel Console's Storage Compartment For Drilling
Courtesy of VOLVO CARS CORPORATION

- Mark as illustrated on the tunnel console's storage compartment.
- Pre-drill using a **2.5 mm (3/32")** bit.
- Drill out the hole. Use a **35 mm (1 3/8")** diameter hole saw.
- Smooth off the hole edges.

APPLIES WHEN THE TUNNEL CONSOLE IS NOT PREPARED FOR THE RSE SYSTEM

Fig. 66: Marking Tunnel Console's Upper Section For Drilling
Courtesy of VOLVO CARS CORPORATION

- Mark as illustrated on the tunnel console's upper section.
- Drill using a **5mm (13/64")** bit.

Fig. 67: Marking Tunnel Console's Upper Section For Cutting
Courtesy of VOLVO CARS CORPORATION

- Mark as illustrated on the tunnel console's upper section.
- Saw and cut out the hole according to the markings.

Fig. 68: Routing Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Take the lower section of the cover and cable harness (B) from the kit.
- Insert the end with the three (4 x with Digital TV receiver) connectors through the hole.
- Install the rubber grommet.

Fig. 69: Securing Cable Harness With Tie Strap
Courtesy of VOLVO CARS CORPORATION

- Secure the cable harness with a tie strap.

Fig. 70: Connecting DVD Unit
Courtesy of VOLVO CARS CORPORATION

- Take the DVD unit and 4 M4x6 screws from the kit.
- Connect the three (4 x with Digital TV receiver) connectors to the DVD unit.

Fig. 71: Install DVD Unit In The Lower Section Of The Cover
Courtesy of VOLVO CARS CORPORATION

- Place the DVD unit in the lower section of the cover as illustrated. Ensure that the cable harness goes under the DVD unit and does not protrude towards the open button or screw tower.
- Install the four screws and tighten.

Fig. 72: Installing Cover
Courtesy of VOLVO CARS CORPORATION

- Take the cover's upper section and 4 screws, PF5x16, from the kit.
- Install the cover.

Fig. 73: Installing Cover Screws
Courtesy of VOLVO CARS CORPORATION

- Turn the cover, install the four screws and tighten to **3 Nm (2.2 lbf. ft.)** .

Fig. 74: Routing Cable
Courtesy of VOLVO CARS CORPORATION

- Route the cable harness in from the DVD unit through the drilled hole and down on the right-hand side of the tunnel console.
- Install the rubber grommet.
- Check that the rubber grommet's flanges are against the console.

Fig. 75: Connecting Green Connector To AV Panel
Courtesy of VOLVO CARS CORPORATION

- Take the AV panel from the kit.
- Connect the green connector to it.

Fig. 76: Installing 12V Socket
Courtesy of VOLVO CARS CORPORATION

- Install the 12 V socket to the panel.

Fig. 77: Securing Cable Harness Clips On AV Panel Flange
Courtesy of VOLVO CARS CORPORATION

- Secure the cable harness clips on the flange of the AV panel.

Fig. 78: Installing Panel
Courtesy of VOLVO CARS CORPORATION

- Press the panel into place.
- Secure the panel with one screw (ST 3.5x13) from the kit.

Fig. 79: Installing Tunnel Console Components
Courtesy of VOLVO CARS CORPORATION

- Reinstall the rubber support, the ashtray and the plug for the 12 V socket.

Fig. 80: Installing Tunnel Console Cover
Courtesy of VOLVO CARS CORPORATION

- Install the cover on the tunnel console and tighten with the two screws.

Fig. 81: Checking Tunnel Console Cover Operation With New Components Installed
Courtesy of VOLVO CARS CORPORATION

- Open and close the cover three times.
- Check that the lock at the front edge works and that the rubber bushings are in place.
- The cable harness should be in a loop as illustrated.

Fig. 82: Turning Console And Routing Cable
Courtesy of VOLVO CARS CORPORATION

- Turn the console and route the cable harness as illustrated.

Fig. 83: Routing Cable Through Lower Section Of The tunnel Console
Courtesy of VOLVO CARS CORPORATION

- Thread the cable harness out through the square cut out on the lower section of the tunnel console.
- Secure the two clips of the cable harness on the plastic flanges.
- Tighten the lower section using the 6 screws.

Fig. 84: Securing Cable With Cable Tie
Courtesy of VOLVO CARS CORPORATION

- Take a cable tie and secure the 12V socket's cable by the clip on the cable harness from the DVD unit.
- The cable tie catch should point towards the outer side of the tunnel console.
- Reinstall the cup holder.

Fig. 85: Marking Opening Handle Of Tunnel Console For Drill Holes
Courtesy of VOLVO CARS CORPORATION

- Make marks for drill holes on the opening handle for the tunnel console as illustrated.
- Pre-drill using a **2.5 mm (3/32")** bit.

- Drill out the hole using a **6 mm (15/64")** drill bit.

Fig. 86: Installing Cover
Courtesy of VOLVO CARS CORPORATION

- Take the cover and 2 x PF5x12 screws from the kit.
- Install the cover on the opening handle.

Digital TV receivers must then be installed:

Continue with the installation instructions: TV receiver, digital.

Fig. 87: Installing Front Tunnel Console And Connectors For RSE System
Courtesy of VOLVO CARS CORPORATION

- Reinstall the front tunnel console and at the same time pull up the connectors for the RSE system, 12 V socket and telephone if applicable.

Fig. 88: Connecting The 4 Pin Black Connector
Courtesy of VOLVO CARS CORPORATION

- Connect the 4 pin black connector from the cable harness (B) to the one disconnected from the AUX socket.

Fig. 89: Removing The AUX Socket
Courtesy of VOLVO CARS CORPORATION

- Take the upper panel for the front tunnel console.
- Remove the AUX socket by releasing the catches at the front and rear edge.

Fig. 90: Connecting AUX Socket
Courtesy of VOLVO CARS CORPORATION

- Take the new AUX socket from the kit and connect it to the 7 pin connector from cable harness (B).
- Install the socket in the panel with the connector's catch backwards.

Fig. 91: Installing Tunnel Console Upper Panel
Courtesy of VOLVO CARS CORPORATION

- Install the tunnel console's upper panel.
- Check that the panel hooks securely at the front edge.
- Reinstall the tunnel console's 8 screws and tighten them.

APPLIES TO CARS WITH TELEPHONE

Fig. 92: Installing Telephone Cable
Courtesy of VOLVO CARS CORPORATION

- Reinstall the telephone cradle with the screws (3).
- Route the telephone cable.
- Install the telephone cable in the load-removing grommet (2).
- Connect the connector (1).

Fig. 93: Connecting 12V Socket
Courtesy of VOLVO CARS CORPORATION

- Connect the connector for the 12V socket.

Fig. 94: Connecting RSE System Connectors
Courtesy of VOLVO CARS CORPORATION

- Take the rear tunnel console.
- Connect the two connectors for the RSE system (3 x with Digital TV-receiver.)
- Take two pieces of foam tape from the kit and wrap them around the connectors. Cut off the foam tape excess.

Fig. 95: Installing Connectors
Courtesy of VOLVO CARS CORPORATION

- Insert the connectors into the tunnel console.
- Hook the connector on for the 12 V socket.
- Slide the rear tunnel console forwards in its grooves until it locks and check that the cable harness is not trapped.

Fig. 96: Routing Cable
Courtesy of VOLVO CARS CORPORATION

- Take the cable with the 2 x 4 pin connector and route forward on the driver's side.
- Fold the carpet to one side and place the cable underneath.

Fig. 97: Identifying Location Of Grey, 4 Pin, Power Supply Connector
Courtesy of VOLVO CARS CORPORATION

- Locate the 4 pin, grey connector for the power supply. It is secured on the thick cable harness under the dashboard on the driver's side.

NOTE: The pre-routed connector is already connected on certain versions.

Fig. 98: Connecting Cable Harness Connector
Courtesy of VOLVO CARS CORPORATION

- Connect the cable harness to the existing connector (1).
- Wrap a piece of foam tape around the connected connectors and cut off the excess.
- Install the connector (2) on the car's existing cable harness using a cable tie.

NOTE: **The pre-routed connector is already connected on certain versions. In such a case, disconnect it and connect both connectors from the new cable harness. Wrap a piece of foam tape around the connectors.**

Reinstall:

- the small storage compartment
- the panel at the gear selector
- side panels
- the sound barrier

Fig. 99: VIDA Logo
Courtesy of VOLVO CARS CORPORATION

- Install the batteries in the remote control and headsets.
  - Product specifications
  - Design and Function
  - 39 Media, communication and navigation
  - 393 Equipment for entertainment
  - Rear seat entertainment system
  - Design
- Region code the DVD player. Information is in VIDA under:
  - Product specifications
  - Design and Function
  - 39 Media, communication and navigation
  - 393 Equipment for entertainment
  - Rear seat entertainment system
  - Design

To activate the TV function

1. Aim the remote control at the screen and press DAY/NIGHT ("on/off") for approx. 5 seconds until SERVICE MENU is displayed.
2. Enter code 1971, press OK.
3. Select SET TV, press OK.
4. Select TV connected, press OK.
5. Exit.

INSTALLING DECALS

Fig. 100: Installing Decals
Courtesy of VOLVO CARS CORPORATION

- Take the black decal from the kit.
- Clean the area (1) where the decal will be located. Use a mixture of 30% windscreen washer fluid and 70% water. Wipe dry.
- Remove the backing paper from the adhesive side of the decal. Secure the decal as illustrated.
- Press the decal into place properly.

MULTIMEDIA MONITOR WITH DVD. RSE (2007-2009)

MULTIMEDIA MONITOR WITH DVD. RSE

INSTALLATION

Fig. 101: Pressing In Catches And Pulling Headrest Upwards
Courtesy of VOLVO CARS CORPORATION

- Slide both the front seats all the way back and upwards all the way at the front and rear edge.
- Press the headrest downwards.
- Find the headrest's two locks on the back of the seat. Press in the catches and pull the headrest upwards at the same time.
- The seats may require lowering slightly at the rear edge again so that the headrest can be pulled out of the backrest completely. Therefore lower the seat as much as possible so that the headrest can be released and removed. Remove the headrest on both front seats and allow the seats to remain in the same position.

Fig. 102: Identifying Ignition Switch OFF & Disconnected Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position 0.
- Disconnect the battery negative lead.

NOTE: **Wait at least three minutes before unplugging the connectors or removing other electrical equipment.**

Fig. 103: Removing Tunnel Console Side Panels
Courtesy of VOLVO CARS CORPORATION

- Remove both the side panels from the tunnel console.

Fig. 104: Identifying Removal Of Screws And Soundproofing Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the sound barrier on the driver's side by first removing the two screws and then prizing it away at the top edge.

Fig. 105: Removing Tunnel Compartment
Courtesy of VOLVO CARS CORPORATION

- Pull the handle (1), move the tunnel compartment backward and lift it away (2).

Fig. 106: Removing Cover
Courtesy of VOLVO CARS CORPORATION

- Remove the cover. It shall not be re-used.

Fig. 107: Prying Off Gear Selector Panel At Rear Edge
Courtesy of VOLVO CARS CORPORATION

Applies to cars with automatic gearbox

- Turn the ignition key to position II.
- Move the gear selector lever to its rearmost position.
- Use a weatherstrip and pry off the gear selector panel at the rear edge.

Fig. 108: Pressing In Catches And Removing Panel
Courtesy of VOLVO CARS CORPORATION

- Press in the catches underneath and remove the panel.

Fig. 109: Removing Small Storage Compartment
Courtesy of VOLVO CARS CORPORATION

- Remove the small storage compartment.

Fig. 110: Removing The Telephone Cable
Courtesy of VOLVO CARS CORPORATION

Applies to cars with telephone

- Unhook and disconnect the connector (1).
- Disconnect the telephone cable from the load-removing grommet (2).
- Release the telephone cable.
- Remove the handset.
- Remove the screw (3).
- Push the catch to one side (4).
- Remove the telephone cradle.

Fig. 111: Removing Upper Section Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the 6 screws.

Fig. 112: Removing Upper Section
Courtesy of VOLVO CARS CORPORATION

- Lift up and remove the upper section.
- At the same time disconnect the connector to the AUX socket.

Fig. 113: Disconnect The Connector
Courtesy of VOLVO CARS CORPORATION

- Disconnect the connector. Press in the catches and unhook it from the tunnel console.

Fig. 114: Removing Tunnel Console
Courtesy of VOLVO CARS CORPORATION

- Remove the 2 screws and lift out the tunnel console.

Fig. 115: Positioning The Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Take the cable harness (B) from the kit and position it as illustrated.
- The junction (1) must be at the rear edge of the SRS control module. The cable marked with blue tape must go to the right seat and the other to the left seat. The cable with 2 x 4 pin connectors must be routed forward.

Fig. 116: Routing Cable
Courtesy of VOLVO CARS CORPORATION

- Route the cables in the join for the floor mats further along the seat rail.
- Position the cable in a loop under the seat.

Fig. 117: Routing Cable
Courtesy of VOLVO CARS CORPORATION

- Take the cable with the 2 x 4 pin connector and route forward on the driver's side.

CARRY OUT ON BOTH SIDES OF THE SEATS

Fig. 118: Removing Seats Side Panel Screw
Courtesy of VOLVO CARS CORPORATION

- Remove the screw for the seat's side panel.

Fig. 119: Turning Panel Upwards
Courtesy of VOLVO CARS CORPORATION

- Turn the panel upwards at the front edge.
- Unhook it from the seat at the rear edge.

Fig. 120: Removing Lumbar Support Adjustment Knob
Courtesy of VOLVO CARS CORPORATION

- Remove the knob for the lumbar support adjustment by removing the cover using a small screwdriver and pull the knob straight off.

Fig. 121: Installing Cable Tie
Courtesy of VOLVO CARS CORPORATION

- Take a long cable tie from the kit and insert it through the hole for adjusting the lumbar support and inside the upholstery. The cable tie must be routed between the thin foam of the upholstery and the support pad.

Fig. 122: Taping Cable Terminals Together
Courtesy of VOLVO CARS CORPORATION

- Remove cable harness (A) from the kit.
- Tape the cable terminals together on the cable tie. Tape as flat as possible.
- Remove the cable tie from the cable harness.

Fig. 123: Remove Cable From Cable Harness
Courtesy of VOLVO CARS CORPORATION

Fig. 124: Routing Cable
Courtesy of VOLVO CARS CORPORATION

Applies to the right-hand front seat

- Thread the cable tie from the headrest's inner mounting down to the hole for lumbar adjustment. The cable tie must be routed between the upholstery's thin foam and the protective pad (also, see image 30).

Fig. 125: Routing Cable
Courtesy of VOLVO CARS CORPORATION

Applies to the left-hand front seat.

- Thread the cable tie from the headrest's outer mounting down to the hole for lumbar adjustment. The cable tie must be routed between the upholstery's thin foam and the protective pad (also, see image 30).

Fig. 126: Tape Cable Harness On The Cable Tie
Courtesy of VOLVO CARS CORPORATION

Applies to both seats

- Tape the cable harness on the cable tie. Tape as flat as possible.
- Pull it up towards the upper edge of the seat and out through the hole for the headrest.
- Remove the cable tie and tape from the cable harness.

Fig. 127: Pin Color Identification
Courtesy of VOLVO CARS CORPORATION

- Terminal 1-5 - Color
- 1 - Black (SB)
- 2 - Red/White (R/W)
- 3 - Violet/Grey (VO/GR)
- 4 - Green (GN)

- 5 - White (W)

- Terminal 6-12 - Color (grey cable harness)
- 6 - Orange (OR) Shield, braided
- 7 - Pink (P)
- 8 - Grey (GR)
- 9 - Yellow (Y)
- 10 - Green (GN)
- 11 - Brown (BN)
- 12 - White (W)

Fig. 128: Installing Grey Connector
Courtesy of VOLVO CARS CORPORATION

- Take the grey connector from the kit. Connect the cable harness terminals.

- Slide the connector's catch in.

Fig. 129: Adjusting Length Of Cable
Courtesy of VOLVO CARS CORPORATION

- Adjust the length of the cable harness so that the connector protrudes approximately **20mm (13/16")** .

Fig. 130: Installing Cable Harness Under Protective Pad
Courtesy of VOLVO CARS CORPORATION

- Using your fingers, press the cable harness under the protective pad, the cable harness must not press out the upholstery after installation.

1. 1. Padding
2. 2. Protective pad

Fig. 131: Identifying Hole Under Upholstery
Courtesy of VOLVO CARS CORPORATION

- Take the headrest from the kit.
- Locate the hole under the upholstery on the side of the headrest.

NOTE: the inward facing side in the car.

- Make a hole in the upholstery using a scriber or an awl.

Fig. 132: Installing Coat Hook
Courtesy of VOLVO CARS CORPORATION

- Take the coat hook from the kit.
- Press into the hole.
- Tap it in lightly using a plastic hammer so that it secures properly.

Fig. 133: Connecting Headrest Connectors
Courtesy of VOLVO CARS CORPORATION

- Install the headrest on the seat.
- Only slide it down so that the distance between the seat and lower edge of the headrest is approximately **70mm (2 3/4 ")** .
- Connect the connector to the headrest.

Fig. 134: Installing Connector
Courtesy of VOLVO CARS CORPORATION

- Insert the connector diagonally forwards through the hole in the headrest, at the same as moving the headrest down on the seat to the locked position.
- Check that the headrest is secure by pulling it upwards.

Fig. 135: Securing Cable To Plate Edge On Left Hand Side
Courtesy of VOLVO CARS CORPORATION

Applies to cars without electrically heated seats

- Take a clip with cable tie from the kit and install it on the plate edge on the left-hand side of the right-hand seat.

Fig. 136: Routing And Securing Cable Under The Seat
Courtesy of VOLVO CARS CORPORATION

Applies to cars without electrically heated seats

- Take the cable harness from the headrest and pull forward, in underneath the seat. Follow the cable harness for the seat belt buckle.
- Tighten the cable tie (1).
- Secure the cable using two cable ties (2).

Fig. 137: Routing And Securing Cable Under The Seat
Courtesy of VOLVO CARS CORPORATION

Applies to cars with electrically heated seats

- Take the cable harness from the headrest and pull forward, in underneath the seat. Follow the cable harness for the heating element.
- Secure the cable using three cable ties (1).

Fig. 138: Routing And Securing Cable Under The Seat
Courtesy of VOLVO CARS CORPORATION

Applies to the right-hand front seat

- Route the cable harness in an arc under the seat.
- Secure it using three cable ties in the existing cable harness.

Fig. 139: Routing And Securing Cable Under The Seat
Courtesy of VOLVO CARS CORPORATION

Applies to the right-hand front seat

- Take a piece of foam tape from the kit and cut it in the center.
- Fold the seat forward slightly and connect the cable harness from the floor to the connector (1).
- Tape one cut piece of foam tape around the connectors.
- Place a cable tie on each side of the connectors and tighten.
- Check that the cable harness is not trapped when the seat is slid forwards and backwards.

The right-hand seat means the passenger seat

- Fold the backrest forward and backwards and check that the cable harness is not trapped when folding the backrest.

Fig. 140: Securing Cable To Plate Edge On Right Hand Side
Courtesy of VOLVO CARS CORPORATION

Applies to cars without electrically heated seats

- Take a clip with cable tie from the kit and install it on the plate edge on the right-hand side of the left-hand seat.

Fig. 141: Routing And Securing Cable Under The Seat
Courtesy of VOLVO CARS CORPORATION

Applies to cars without electrically heated seats

- Take the cable harness from the headrest and pull forward, in underneath the seat. Follow the cable harness for the seat belt buckle.
- Tighten the cable tie (1).
- Secure the cable using two cable ties (2).

Fig. 142: Routing And Securing Cable Under The Seat
Courtesy of VOLVO CARS CORPORATION

Applies to cars with electrically heated seats

- Take the cable harness from the headrest and pull forward, in underneath the seat. Follow the cable harness for the heating element.
- Secure the cable using three cable ties (1).

Fig. 143: Routing And Securing Cable Under The Seat
Courtesy of VOLVO CARS CORPORATION

Applies to the left-hand front seat.

- Route the cable harness under the seat.
- Connect the cable harness from the floor to the connector (1).
- Secure it using a cable tie in the existing cable harness or in a bracket.
- Tape one cut piece of foam tape around the connectors.
- Place a cable tie on each side of the connectors and tighten.
- Check that the cable harness is not trapped when the seat is slid forwards and backwards.

The left-hand seat means the passenger seat

- Fold the backrest forward and backwards and check that the cable harness is not trapped when folding the backrest.

Fig. 144: Removing Ashtray
Courtesy of VOLVO CARS CORPORATION

- Fold the ashtray out, press it down and remove.

Fig. 145: Pulling Out Cup Holder To Its Limit Position
Courtesy of VOLVO CARS CORPORATION

- Pull out the cup holder to its limit position.

Fig. 146: Removing Cup Holder
Courtesy of VOLVO CARS CORPORATION

- Turn the tunnel console.
- Lift up the catch and remove the cup holder.

Fig. 147: Removing Console Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the 4 screws.

Fig. 148: Removing The Lower Section
Courtesy of VOLVO CARS CORPORATION

- Pull the opening handle.
- Remove the 2 screws and lift off the lower section.

Fig. 149: Removing Console Cover Hinge Screws
Courtesy of VOLVO CARS CORPORATION

- Fold the cover up and remove the 2 screws.
- Remove the cover by sliding it forward. The cover will not be reused.

Fig. 150: Removing 12V Socket Plug
Courtesy of VOLVO CARS CORPORATION

- Remove the plug for the 12 V socket.
- Remove the 2 rubber supports.

Fig. 151: Identifying Catches
Courtesy of VOLVO CARS CORPORATION

- Lift up the 2 catches and remove the inner section of the ashtray. It will not be reused.

Fig. 152: Removing The 12V Socket
Courtesy of VOLVO CARS CORPORATION

- Release the 2 catches and remove the 12 V socket.

Fig. 153: Marking Tunnel Console's Storage Compartment
Courtesy of VOLVO CARS CORPORATION

- Mark as illustrated on the tunnel console's storage compartment.
- Pre-drill using a **2.5 mm (3/32")** bit.
- Drill out the hole. Use a **35 mm (1 3/8")** diameter hole saw.
- Smooth off the hole edges.

APPLY WHEN THE TUNNEL CONSOLE IS NOT PREPARED FOR THE RSE SYSTEM

Fig. 154: Marking Tunnel Console's Upper Section
Courtesy of VOLVO CARS CORPORATION

- Mark as illustrated on the tunnel console's upper section.
- Drill using a **5mm (13/64")** bit.

Fig. 155: Marking Tunnel Console's Upper Section
Courtesy of VOLVO CARS CORPORATION

- Mark as illustrated on the tunnel console's upper section.
- Saw and cut out the hole according to the markings.

Fig. 156: Inserting Cable Harness Through Hole
Courtesy of VOLVO CARS CORPORATION

- Take the lower section of the cover and cable harness (C) from the kit.
- Insert the end with the 3 connectors through the hole.
- Install the rubber grommet.

Fig. 157: Securing With Tie Strap
Courtesy of VOLVO CARS CORPORATION

- Secure the cable harness with a tie strap.

Fig. 158: Installing DVD Unit
Courtesy of VOLVO CARS CORPORATION

- Take the DVD unit and 4 M4x6 screws from the kit.
- Connect the 3 connectors to the DVD unit.

Fig. 159: Place DVD Unit In The Lower Section Of The Cover
Courtesy of VOLVO CARS CORPORATION

- Place the DVD unit in the lower section of the cover as illustrated. Ensure that the cable harness goes under the DVD unit and does not protrude towards the open button or screw tower.
- Install the 4 screws and tighten.

Fig. 160: Installing Cover
Courtesy of VOLVO CARS CORPORATION

- Take the cover's upper section and 4 screws, PF5x16, from the kit.
- Install the cover.

Fig. 161: Installing Cover
Courtesy of VOLVO CARS CORPORATION

- Turn the cover, install the 4 screws and tighten to **3 Nm (2.2 lbf. ft.)** .

Fig. 162: Routing Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Route the cable harness in from the DVD unit through the drilled hole and down on the right-hand side of the tunnel console.
- Install the rubber grommet.
- Check that the rubber grommet's flanges are against the console.

Fig. 163: Connecting Green Connector To AUX Panel
Courtesy of VOLVO CARS CORPORATION

- Take the AUX panel from the kit.
- Connect the green connector to it.

Fig. 164: Installing Socket To Panel
Courtesy of VOLVO CARS CORPORATION

- Install the 12 V socket to the panel.

Fig. 165: Securing Cable To Flange
Courtesy of VOLVO CARS CORPORATION

- Secure the cable harness clips on the flange of the AUX panel.

Fig. 166: Installing Panel
Courtesy of VOLVO CARS CORPORATION

- Press the panel into place.
- Secure the panel with one screw (ST 3.5x13) from the kit.

Fig. 167: Installing Console Components
Courtesy of VOLVO CARS CORPORATION

- Reinstall the rubber support, the ashtray and the plug for the 12 V socket.

Fig. 168: Installing Center Console Cover
Courtesy of VOLVO CARS CORPORATION

- Install the cover on the center console and tighten with the 2 screws

Fig. 169: Checking Center Console Cover Operation With New Components Installed
Courtesy of VOLVO CARS CORPORATION

- Open and close the cover three times.
- Check that the lock at the front edge works and that the rubber bushings are in place.
- The cable harness should be in a loop as illustrated.

Fig. 170: Routing Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Turn the console and route the cable harness as illustrated.

APPLY WHEN THE TUNNEL CONSOLE IS NOT PREPARED FOR THE RSE SYSTEM.

Fig. 171: Identifying Markings On Tunnel Console's Lower Section
Courtesy of VOLVO CARS CORPORATION

- Mark as illustrated on the tunnel console's lower section.
- Saw and cut out according to the markings.
- File down the edges.

Fig. 172: Drilling Location And Dimensions
Courtesy of VOLVO CARS CORPORATION

- Mark as illustrated.
- Drill out the markings using a **5 mm (13/64")** diameter drill bit.

Fig. 173: Drilling Location And Dimensions
Courtesy of VOLVO CARS CORPORATION

- Mark out further drill holes as illustrated
- Drill out the markings using a **5 mm (13/64")** diameter drill bit.

Fig. 174: Inserting Cable Ties
Courtesy of VOLVO CARS CORPORATION

- Insert 2 cable ties through the drilled holes.
- Tighten the cable ties so that the create an eyelet.

Fig. 175: Installing Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Insert the cable harness through the eyelets and out through the newly created cut out.

Fig. 176: Positioning Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Position the cable harness correctly and ensure that it protrudes approx. 120 mm (4 23/32").

Fig. 177: Securing Cable With Cable Ties
Courtesy of VOLVO CARS CORPORATION

- Tighten the cable ties and cut off the protruding part.
- Install the lower section of the console using the 6 screws.

APPLIES WHEN THE TUNNEL CONSOLE IS PREPARED FOR THE RSE SYSTEM.

Fig. 178: Installing Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Thread the cable harness out through the square cut out on the lower section of the tunnel console.
- Secure the 2 clips of the cable harness on the plastic flanges.
- Tighten the lower section using the 6 screws.

Fig. 179: Securing Cable With Cable Ties
Courtesy of VOLVO CARS CORPORATION

- Take a cable tie and secure the 12V socket's cable by the clip on the cable harness from the DVD unit.
- The cable tie catch should point towards the outer side of the tunnel console.
- Reinstall the cup holder.

Fig. 180: Drill Holes On Opening Handle For Tunnel Console
Courtesy of VOLVO CARS CORPORATION

- Make marks for drill holes on the opening handle for the tunnel console as illustrated.
- Pre-drill using a **2.5 mm (3/32")** bit.
- Drill out the hole using a **6 mm (15/64 ")** drill bit.

Fig. 181: Installing Cover
Courtesy of VOLVO CARS CORPORATION

- Take the cover and 2 PF5*12 screws from the kit.
- Install the cover on the opening handle.

Fig. 182: Installing Front Center Console
Courtesy of VOLVO CARS CORPORATION

- Reinstall the front center console and at the same time pull up the connectors for the RSE system, 12 V socket and telephone if applicable.

Fig. 183: Connecting 4 Pin Black Connector
Courtesy of VOLVO CARS CORPORATION

- Connect the 4 pin black connector from the cable harness (B) to the one disconnected from the AUX socket.
- Take foam tape from the kit and wrap it around the connector. Cut off the foam tape excess.

Fig. 184: Remove The AUX Socket
Courtesy of VOLVO CARS CORPORATION

- Take the upper panel for the front center console.
- Remove the AUX socket by releasing the catches at the front and rear edge.

Fig. 185: Connecting The AUX Socket
Courtesy of VOLVO CARS CORPORATION

- Take the new AUX socket from the kit and connect it to the 7 pin connector from cable harness (B).
- Install the socket in the panel with the connector's catch backwards.

Fig. 186: Installing Tunnel Console's Upper Panel
Courtesy of VOLVO CARS CORPORATION

- Install the tunnel console's upper panel.
- Check that the panel hooks securely at the front edge.
- Reinstall the tunnel console's 8 screws and tighten.

Fig. 187: Installing Telephone Cable
Courtesy of VOLVO CARS CORPORATION

Applies to cars with telephone

- Reinstall the telephone cradle with the screws (3).
- Route the telephone cable.
- Install the telephone cable in the load-removing grommet (2).
- Connect the connector (1).

Fig. 188: Connecting 12V Socket Connector
Courtesy of VOLVO CARS CORPORATION

- Connect the connector for the 12V socket.

Fig. 189: Connecting DVD System Connectors
Courtesy of VOLVO CARS CORPORATION

- Take the rear tunnel console.
- Connect the 2 connectors from the DVD system.
- Take two pieces of foam tape from the kit and wrap them around the connectors. Cut off the foam tape excess.

Fig. 190: Installing Connectors Into Tunnel Console
Courtesy of VOLVO CARS CORPORATION

- Insert the connectors into the tunnel console.
- Hook the connector on for the 12 V socket.
- Slide the rear tunnel console forwards in its grooves until it locks and check that the cable harness is not trapped.

Fig. 191: Identifying Ignition In ON Position and Connecting Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position II.
- Reconnect the battery negative lead.
- Turn the ignition key to position 0.

Fig. 192: Routing Cable
Courtesy of VOLVO CARS CORPORATION

- Take the cable with the 2 x 4 pin connector and route forward on the driver's side.
- Fold the carpet to one side and place the cable under the carpet.

Fig. 193: Identifying Location Of Grey, 4 Pin, Power Supply Connector
Courtesy of VOLVO CARS CORPORATION

- Locate the 4 pin, grey connector for the power supply. It is secured on the thick cable harness under the dashboard on the driver's side.

NOTE: The pre-routed connector is already connected on certain versions.

Fig. 194: Identifying Cable Harness Connectors
Courtesy of VOLVO CARS CORPORATION

- Connect the cable harness to the existing connector (1).
- Wrap a piece of foam tape around the connected connectors and cut off the excess.
- Install the connector (2) on the car's existing cable harness using a cable tie.

NOTE: **The pre-routed connector is already connected on certain versions. In such a case, disconnect it and connect both connectors from the new cable harness. Wrap a piece of foam tape around the connectors.**

Reinstall:

- the small storage compartment.
- the panel at the gear selector.
- side panels.
- the sound proofing.

- Install batteries in the remote control and headsets.
- Carry out region coding of the DVD player. Information is available in VIDA under: " Product specifications/Design and Function /39 Media, communication and navigation/393 equipment for entertainment/Rear seat entertainment system/Design".

Fig. 195: Installing Decal
Courtesy of VOLVO CARS CORPORATION

Installing decals

- Take the black decal from the kit.
- Clean the area (1) where the decal will be located. Use a mixture of 30% windscreen washer fluid and 70% water. Wipe dry.
- Remove the backing paper from the adhesive side of the decal. Secure the decal as illustrated.
- Press the decal into place properly.

NAVIGATION SYSTEM, RTI (2007-2012)

CARS EQUIPPED WITH SRS/SIPS (AIRBAG)

see **CARS EQUIPPED WITH SRS/SIPS (AIRBAG)**

CAUTION

see **CAUTION**

NAVIGATION SYSTEM, RTI

NOTE: This accessory requires software unique to the car.

NOTE: For European users, the TMC unit, part number 6849907, can be purchased separately.

PREPARATIONS

Fig. 196: Identifying VIDA (Service Information) To Program Software
Courtesy of VOLVO CARS CORPORATION

- Download the software for the accessory's function following the service information in VIDA (Volvo scan tool).

NOTE: The software must be loaded before installing the accessory.

Fig. 197: Identifying Ignition Switch OFF & Disconnected Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Place the driver's seat in its rearmost position.
- Turn the ignition switch to position 0.
- Disconnect the battery negative lead

NOTE: Wait at least three minutes before unplugging the connectors or removing other electrical equipment.

Illustration A

Fig. 198: Removing Loudspeaker Grille From Dashboard
Courtesy of VOLVO CARS CORPORATION

Remove the loudspeaker grille as follows:

- Take a piece of welding rod **1.5 mm (1/16")** . Bend it 90° at one end, **L=5 mm (13/64")** . The other end is bent to create a handle.
- First insert the bent end in the joint between the loudspeaker grille and the dashboard approximately as illustrated, until it engages.
- Turn the welding rod 90°so that the bent section catches the underneath of the loudspeaker grille. The welding rod may need moving along the joint to be turned.

Illustration B

Fig. 199: Removing Loudspeaker Grille From Dashboard
Courtesy of VOLVO CARS CORPORATION

- Pull upwards until the loudspeaker grille detaches, it is securely fastened by four clips.

NOTE: Do not damage the dashboard.

- Place the loudspeaker grille to one side.

Illustration C

Fig. 200: Removing Loudspeaker
Courtesy of VOLVO CARS CORPORATION

Applies to cars without center loudspeakers

- Remove the bracket for the loudspeaker grille by removing the five screws and pulling the grille up from the dashboard.

Illustration D

Fig. 201: Removing Loudspeaker
Courtesy of VOLVO CARS CORPORATION

Applies to cars with a centrally mounted loudspeaker

- Remove the five screws in the loudspeaker. Pull the loudspeaker up slightly from the dashboard and disconnect the connector.

Fig. 202: Prying Off Gear Selector Panel At Rear Edge
Courtesy of VOLVO CARS CORPORATION

Applies to cars with automatic gearbox

- Turn the ignition key to position II.
- Move the gear selector lever to its rearmost position.
- Carefully pry off the gear level panel at the rear edge using a weatherstrip tool. Pull the panel backwards to access the screws for the climate control panel.

Fig. 203: Removing Screws And Radio/AC Unit From Center Console
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws holding the bracket to the climate control panel and the control module.
- Pull out the bracket at the lower edge and pull it downwards away from the top edge.
- Disconnect the connectors from the climate control panel, control module and CD player and/or Minidisc player connectors, if applicable.

Fig. 204: Removing Center Console Left-Hand Side Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the center console's left-hand side panel by first pulling it away starting at the front edge and then backwards until all the clips have released.

Fig. 205: Identifying GPS Unit
Courtesy of VOLVO CARS CORPORATION

Image A. Applies to cars with Volvo on call (VOC)

- Remove the 4 VOC GPS tuner screws, the tuner will not be reused.

Fig. 206: Removing GPS Component Connections
Courtesy of VOLVO CARS CORPORATION

Image B. Applies to cars with Volvo on call (VOC)

- Remove:
  1. 1- connection to the Global Positioning System (GPS) antenna.
  2. 2- connection to MOST.
  3. 3- existing power supply to GPS tuner.

NOTE: Cable connection (3) will no longer be used, clamp the connector in a suitable location.

DO NOT APPLY TO CARS WITH VOLVO ON CALL (VOC)

Fig. 207: Bending Out Carpet Tabs

Courtesy of VOLVO CARS CORPORATION

- Bend up the four punched out carpet tabs under the left-hand front seat.

Fig. 208: Removing Rivets
Courtesy of VOLVO CARS CORPORATION

- Take the four rivet nuts from the kit and install them in the pre-punched holes under the carpet tabs.
- Take rivet tool **P/N 9512782** and tighten the rivet nuts. If necessary: Remove the mounting bracket for front-rear seat adjustment (applies to cars with manual seats).

INSTALLING THE ANTENNA CABLE

Fig. 209: Removing Passenger Side Sound Barrier
Courtesy of VOLVO CARS CORPORATION

- Remove the sound barrier on the right-hand side by first removing the two screws and then prizing it away at the top edge.

Fig. 210: Dashboard End Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the panel on the right-hand end of the dashboard.

Fig. 211: Removing Grab Handle Tabs
Courtesy of VOLVO CARS CORPORATION

- Pry off the covers on the grab handle in the right-hand front door and remove the screws under them.

Fig. 212: Removing Weatherstrip
Courtesy of VOLVO CARS CORPORATION

- Pull of the weatherstrip (1) for the door at the A-pillar.
- Remove the right-hand A-post panel by carefully pulling it out by the upper edge until the clips inside release. Pull it up from the mounting in the dashboard.

NOTE: Do not damage the headlining.

Fig. 213: Folding Down Cover And Squeezing Catches Together
Courtesy of VOLVO CARS CORPORATION

- Fold down the cover (1) by carefully pulling the front edge of the cover down.
- Press the catches (2) together. Pull the front edge of the panel down and then pull off at the rear edge.

Fig. 214: Removing Front Interior Lighting Console
Courtesy of VOLVO CARS CORPORATION

- Detach the rear-view mirror and front interior lighting (1) by first removing the two screws (2) and then pressing in the eight catches (3) around the interior lighting.
- Carefully pull the components downwards and allow them to hang from their cables. The interior lighting is secured in the roof by clips (4).
- Remove the connector for the rain sensor (if applicable).

Fig. 215: Installing GPS Antenna
Courtesy of VOLVO CARS CORPORATION

- **NOTE When installing the GPS antenna where there is already a GSM antenna, move the GSM section to the GPS antenna supplied with the kit. Make sure that the earth for the screen is correctly positioned when installing.**

Fig. 216: Aligning Antenna Lugs With Grooves In Bracket
Courtesy of VOLVO CARS CORPORATION

- Wrap foam tape around the entire cable before installing.
- Install the new antenna. Carefully bend the headlining downward and slide the antenna backward and inwards. Align the antenna lugs (1) with the grooves in the bracket (2)
- Insert the cable on the top of the roof panel's front edge. Pull it further along, out towards the right-hand A-post so that it is concealed at the top the headlining.
- Reinstall the bracket with rear-view mirror. Tighten the screws to **10 Nm (7.5 lbf. ft.)** .
- Reinstall the panel and lock using the cover.
- If there is a rain sensor, route the cable so that it lies underneath the antenna. Reinstall the connector.

Fig. 217: Antenna Cover
Courtesy of VOLVO CARS CORPORATION

- Install the cover over the antenna.
    1. For cars with a rain sensor, use the larger cover from the kit.

2. For cars without a rain sensor, use the smaller cover from the kit.

Fig. 218: Routing Cables Above Headlining
Courtesy of VOLVO CARS CORPORATION

- Route the cable above the headlining, all the way to the A-post.
- Route the cable down from the headlining and along the right-hand A-post
- Tape the cable onto the existing cable harness at points (1).

WARNING: Do not route over the inflatable curtain as this may affect the function in the event of a collision.

Fig. 219: Connecting And Routing The Cables
Courtesy of VOLVO CARS CORPORATION

- Wrap foam tape around the entire cable before installing
- Take the extension cable from the kit. Insert it down between the A-post and the right-hand side of the

dashboard, continue along the right-hand end of the dashboard and pull out at the front edge of the floor.

- Pull the cable to the left, along the front edge of the floor and up to the inside of the center console.
- Connect both connectors (1) at the A-post to each other.
- Wrap foam tape around the connectors to prevent rattling.

INSTALLING CABLE HARNESS AND ANTENNA CABLE

Fig. 220: Identifying Fiber Optic Cables
Courtesy of VOLVO CARS CORPORATION

Applies to cars with Volvo on call (VOC)

- Take the cable harness from the kit. The fiber optic cable connections on the cable harness will not be used.
- Wrap foam tape around the connectors for the fiber optic cables to prevent rattling.

Fig. 221: Routing Cables Along Air Duct
Courtesy of VOLVO CARS CORPORATION

- Take the two cable harnesses, fiber optic cable harness (1) with the cable harness for the power supply (2), and the cable harness for the display screen (3), from the kit. Route them up along the air duct on the left-hand side of the center console.

NOTE: Do not damage the fiber optic cables. They must not be bent to a radius less than 30mm (1 11/64") as they can damage and affect the function of the Multimedia Module (MMM).

- The fiber optic cable harness (1) with the cable harness for the power supply (2), are placed inside the center console.

NOTE: In cases where the TMC cable (Europe) requires to be routed in the same way as cable harness (1). The double connection must be connected to IAM.

- The blue connector in cable harness (2) and cable harness (3) is routed up to the outlet in the dashboard.
- Pull the cable harnesses backwards, in front of the carpet on the center console's left-hand side, under the left-hand seat's seat rail, and out through the carpet join under the seat.

Does not apply to cars with (VOC)

- Route the antenna cable (4) in the same direction as cable harness (1) to Multimedia Module (MMM).

- Reinstall the A post panel.
- Tighten the grab handle to **10 Nm (7.5 lbf. ft.)** and reinstall the covers.
- Reinstall the rubber trim in the right-hand front door.
- Reinstall the panel on the dashboard end face.
- Reinstall the soundproofing panel on the right-hand side.

INSTALLING AND CONNECTING THE DISPLAY SCREEN.

Fig. 222: Installing Bracket For Display Screen
Courtesy of VOLVO CARS CORPORATION

- Install the bracket for the display screen by moving the screen unit up in the bracket from underneath.
- Tighten the display screen unit by the bracket using screws from the kit.

Fig. 223: Connecting Multimedia Module Cables
Courtesy of VOLVO CARS CORPORATION

Applies to cars without center loudspeakers

- Connect the cables from the Multimedia Module (MMM) (1) to the display screen (2).
- Install the display screen with the bracket in the dashboard. Use the existing screws (3).
- Take the new loudspeaker grille from the kit and press it into the dashboard.

Fig. 224: Connecting The Three Cables
Courtesy of VOLVO CARS CORPORATION

Applies to cars with a centrally mounted loudspeaker

- Connect the three cables (1) to the display screen and the centrally mounted loudspeaker.
- Press the display screen and bracket into the dashboard. Tighten using the five existing screws (2).
- Press the new loudspeaker grille, from the kit, into place on the dashboard.

Fig. 225: Identifying Power Supply Cable Harness (Gray) Connector Location
Courtesy of VOLVO CARS CORPORATION

- Connect the gray connector from the power supply cable harness to the existing connector.
- Secure the excess gray connector.

Fig. 226: Connecting The TMC Wiring
Courtesy of VOLVO CARS CORPORATION

- Connect the TMC cable (Europe) as illustrated.
- Connect the TMC wiring between IAM and the existing connector in the car's cable harness.

DO NOT APPLY TO CARS WITH VOLVO ON CALL (VOC)

Fig. 227: Connecting Wiring To IAM
Courtesy of VOLVO CARS CORPORATION

- NOTE: It is important that the wiring is connected to the IAM and not the ICM. Do not mix up the fiber optic connections in the existing cable network.

Fig. 228: MOST Cable
Courtesy of VOLVO CARS CORPORATION

- Take the MOST cable from the kit and connect it between IAM and existing MOST cable.

Fig. 229: Identifying Bend Protection
Courtesy of VOLVO CARS CORPORATION

- Take the bend protection from the kit and attach it with tape as illustrated. The bend protection is to prevent the fiber optic cable from bending too much, being damaged and risking malfunction of the accessory.
- When reinstalling the center console, the fiber optic cable to MOST must be positioned so that it does not get trapped when the center console is reinstalled.

CONNECTING AND INSTALLING THE MULTIMEDIA MODULE (MMM)

Fig. 230: Multimedia Module
Courtesy of VOLVO CARS CORPORATION

- Take the Multimedia Module (MMM) from the kit and remove the protective plug from the connector to the fiber optic cable connection.

Fig. 231: Identifying Terminal Identification For Multimedia Module
Courtesy of VOLVO CARS CORPORATION

Connect the pre-routed cables to the Multimedia Module (MMM)

- the cable (1) for the display screen.
- cable (2) to the car's fiber optic cable system.
- cable (3) to the power supply.
- cable (4) to the Global Positioning System (GPS) antenna.
- cable (5) to TMC (Europe).

Applies to cars with Volvo On Call (VOC)

- Secure the cable excess for the GPS antenna in a suitable location.
- When connecting cable (2), existing cables must be used, not those supplied in the kit.

Fig. 232: Installing Multimedia Module
Courtesy of VOLVO CARS CORPORATION

- Take four screws from the kit, place the Multimedia Module (MMM) mounting brackets above the rivet nuts and tighten the unit.
- Conceal the cables under the carpet at the rear of the Multimedia Module (MMM).
- Bend the carpet tabs back over the screws.

NOTE: Do not damage the fiber optic cables. They must not be bent to a radius less than 30mm (1 11/64") as they may become damaged and affect the function of the Multimedia Module (MMM).

INSTALLING THE KEYPAD IN THE STEERING WHEEL

Fig. 233: Removing Instrument Panel Cover
Courtesy of VOLVO CARS CORPORATION

- Position the steering wheel in its lowest and rearmost position.
- Remove the surround for the combined instrument panel and the upper steering wheel cover by first removing the screws (1) and then pull the surround off backwards, it is attached by two clips at the rear edge.
- Then carefully pry off the upper steering wheel cover using a plastic weatherstrip tool, it is secured by two clips on the inside of each long side.
- Remove and place the modules to one side.

Fig. 234: Steering Wheel Turned 90°
Courtesy of VOLVO CARS CORPORATION

- Turn the steering wheel 90° to the position shown in the illustration and so that the two holes on the back side are accessible.

Fig. 235: Identifying Screwdriver Inserted In Back Of Steering Wheel & Locating End Of Locking Spring
Courtesy of VOLVO CARS CORPORATION

- Insert a screwdriver in the hole along the rear edge of the steering wheel perpendicular to the rear surface of the steering wheel.
- Insert the screwdriver as far as possible to find the end of the locking spring (1).
- Place the end of the screwdriver on the top of the locking spring.
- Move the screwdriver upwards towards the upper edge of the hole (2) until the spring releases and one side of the steering wheel module detaches from the mounting.
- Turn the steering wheel 180° and repeat the operation on the other side.
- Turn the steering wheel to a neutral position.

Fig. 236: Identifying Airbag Removal
Courtesy of VOLVO CARS CORPORATION

- Fold the steering wheel module out
- Unplug the two connectors (1) to the airbag transmitter cables.

NOTE: The connectors are tightly secured. However, tools must not be used when removing.

- Place the steering wheel module to one side.

Fig. 237: Removing Steering Wheel Components
Courtesy of VOLVO CARS CORPORATION

Remove:

- the screw (1) and detach the ground lead.
- the horn connector (2) and keypads.

- the three screws (3) and lift out the horn ring (4).

Fig. 238: Attaching Template Using Tie Strap
Courtesy of VOLVO CARS CORPORATION

- Turn the steering wheel to the left so that the right-hand side of the steering wheel points to the left.
- Take the cutting template from the kit and secure it to the right-hand side of the steering wheel as illustrated.
- Attach the template using a tie strap.

Fig. 239: Cutting Steering Wheel Template For Keypad
Courtesy of VOLVO CARS CORPORATION

- Set the steering wheel in a suitable position and cut-out following the template. Use a small knife.

NOTE: **When cutting, make sure to hold the knife so that the cuts are perpendicular to the back side of the steering wheel. This will reduce the risk of cutting a hole that is too large since the edge around the keypad is**

only a few millimeters larger than the keypad itself.

Fig. 240: Cutting For Proper Fitting
Courtesy of VOLVO CARS CORPORATION

- Cut away some of the material on the back side of the steering wheel spoke.
- Test and cut until the keypad fits properly.

Fig. 241: Installing Keypad
Courtesy of VOLVO CARS CORPORATION

- Remove the keypad, two screws and clamp from the kit.
- Ensure that the cable is underneath the steering wheel spoke (When the steering wheel is straight).
- Insert the keypad into the hole in the steering wheel with the text on the keypad facing up. Press until it connects securely against the steering column cover.

Fig. 242: Identifying Screws & Keypad Clamp
Courtesy of VOLVO CARS CORPORATION

- Install the screws and attach the keypad with the clamp around the steering wheel spoke.

Fig. 243: Identifying Horn Ring Position
Courtesy of VOLVO CARS CORPORATION

- Position the horn ring and position it as illustrated.
- Plug in the installed keypad connector to the terminal on the back side of the keypad on the right-hand side of the horn ring. The cable from the installed keypad is very short and it is not easy to plug into the connector.

- Reinstall the horn. Ensure that the three springs are in place and check that the ground lead is not trapped.
- Tighten the screws alternately to **6.5 Nm (5 lbf. ft.)** .
- Reinstall the ground lead. Tighten.
- Plug in the horn connector and keypads.
- Check the function of the horn ring by pressing around the entire edge.

Fig. 244: Checking Springs And Routing Cable
Courtesy of VOLVO CARS CORPORATION

- Check that the two springs (1) are in position
- Position the steering wheel module and press the two airbag transmitter cable connectors firmly in place.

NOTE: The cables must be routed through the existing holder (2).

- Insert the two lugs on the back side of the steering wheel module into the two springs and make sure the transmitter cables are not obstructed.
- Press the steering wheel module firmly into its mountings. Two clearly audible clicks should be heard.
- Reinstall the surround for the combined instrument panel and the steering wheel cover.

Fig. 245: Identifying Ignition In ON Position and Connecting Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position II.
- Connect the battery negative lead.

XC90

see **XC90**

TV RECEIVER, DIGITAL (2008-2012)

TV-RECEIVER, DIGITAL

NOTE: When installing Digital TV-receiver on car with existing RSE-system, start by changing the cable harness for the tunnel console. See installation instructions Multimedia monitor with DVD, Dual screen .

Fig. 246: Pushing Up Catch On Top Side
Courtesy of VOLVO CARS CORPORATION

- Remove the right front seat mounting's panel of the second row's right seat by pressing down the pawl (1) on top and pulling it forward. Remove the screw underneath.

Fig. 247: Removing Front Seat Mountings
Courtesy of VOLVO CARS CORPORATION

- Remove the panel for the front seat mountings of the second row's right seat/center seat by pressing down the pawls (1) on top and pulling the panel forward. Remove the screw for the right seat.

Fig. 248: Removing Seat
Courtesy of VOLVO CARS CORPORATION

- Fold down the backrest.
- Remove the seat links and bolts.
- Lift out the seat.

NOTE: This step should be performed carefully to avoid damaging interior or door panel.

Fig. 249: Removing Panel Between Door Seals
Courtesy of VOLVO CARS CORPORATION

- Carefully pry loose and remove the panel located over the joint between the door sills on the right side.

Fig. 250: Pressing Lock Lug With Weather Strip Tool
Courtesy of VOLVO CARS CORPORATION

- Loosen the upper part of the sill molding at the rear edge and loosen the seat belt from the end-fitting. The belt is loosened by carefully pressing with a weatherstrip tool on the lock lug so that it releases from the end-fitting.

Fig. 251: Removing Seal Protection
Courtesy of VOLVO CARS CORPORATION

- Pull the sill protection upward until the three clips release. Angle out the sill protection from the B-pillar panel.

Fig. 252: Moving Link Backwards
Courtesy of VOLVO CARS CORPORATION

- Insert a screwdriver through the hole (1) on the right seat's left rear seat link and press in the pawl. Move the link backwards by prying with a screwdriver between the seat rail and the link.

Fig. 253: Identifying Cover And Screws Underneath Rear Headlining
Courtesy of VOLVO CARS CORPORATION

- Remove the rear roof panel covers and the screws beneath them.
- Carefully pry away the panel at the rear edge with a plastic weatherstrip tool.
- Pull the rear edge of the panel downwards until the four clips on the top have released.
- Unplug the connector for the lighting.
- Pull the panel backwards to release it.

Fig. 254: Removing Left Door Rubber Strip
Courtesy of VOLVO CARS CORPORATION

- Pull loose the rubber strip at the trailing edge of the left door opening, directly opposite the C-pillar panel.
- Carefully pry off the left C-post panel by the sides at the top with a plastic weatherstrip tool. Then pull until the three clips on the inside release. Do not damage the headlining or the panel.
- If a headphone socket is mounted, disconnect the connector to such.
- Remove the panel by pulling upwards slightly and unhooking it from the side panel.

Fig. 255: Loosening Pillar Panel
Courtesy of VOLVO CARS CORPORATION

- Carefully loosen the pillar panel. Start at the top and continue downwards until the three clips on the inside have released.
- Remove the connector on the D-pillar panel. Cars with D-pillar speakers have the connector located on the speaker.
- Remove the panel by pulling upwards slightly and unhooking it from the side panel.

Fig. 256: Opening Floor Hatch
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Open up the floor hatch (1). If the floor hatch is equipped with a grocery bag holder on the underside, then it is fastened with a strap on both sides of the storage box. Then these shall be loosened by first removing the storage box under the floor hatch and then removing the floor hatch by almost closing it and pulling it backwards out of its attachments.

Applies to cars with three rows of seats and integrated carrier bag holder on the underside of the floor hatch.

- Fold up the floor hatch (1).
- Loosen the two straps on the underlying panel. Lift up the trailing edge of the panel, fold the floor hatch back towards the panel and lift out the floor hatch and panel.

Applies to cars with three rows of seats without an integrated carrier bag holder.

- Open the floor hatch (1) at the trailing edge and lift it out.

Fig. 257: Removing Three Screws In Battery Holder
Courtesy of VOLVO CARS CORPORATION

- Remove the three screws on the battery holder and lift it out.
- Remove the battery cover.

Fig. 258: Removing Floor Covers
Courtesy of VOLVO CARS CORPORATION

- Remove both covers on the floor.

Fig. 259: Removing Panels
Courtesy of VOLVO CARS CORPORATION

- Remove both panels.

Fig. 260: Identifying Load Securing Eyelet
Courtesy of VOLVO CARS CORPORATION

- Fold out the load lashing eye on the right side.
- Take a scriber or special tool part no.**9995919** and insert the angled point in the hole in the top edge of the cover.
- Twist the scriber so it grips the rear of the cover (1) and pull it loose. This should be performed on both the front and rear load lashing eyes.

Fig. 261: Removing Rear Interior Side Paneling
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Remove the screws (2) on the load securing eyelets.
- Remove the cover (3), by prying off using a weatherstrip tool or a small screw driver.
- Remove the screws (4).
- Remove the panel by pulling it out slightly at the top edge so that the clips on the inside release. Then pull it straight up.
- Unplug the connector for the 12V socket.

Fig. 262: Removing Rear Interior Side Paneling
Courtesy of VOLVO CARS CORPORATION

Applies to cars with three rows of seats

- Fold up the left-hand seat in the third row of seats.

- Remove the screws (2) on the load securing eyelets.
- Remove the covers (3) by prying with a weatherstrip tool or a small screwdriver.
- Remove the screws (4).
- Remove the panel by pulling it out slightly at the top edge so that the clips on the inside release. Then pull it straight up.
- Unplug the connector for the 12V socket.

Fig. 263: Removing Clips
Courtesy of VOLVO CARS CORPORATION

- Remove the two clips.

Fig. 264: Installing Plastic Nuts
Courtesy of VOLVO CARS CORPORATION

- Install plastic nuts in the holes where the clips were located, as shown.

NOTE: Turn the plastic nut so that it faces the right way.

Fig. 265: Removing Cover Panel Under Tail Lamps
Courtesy of VOLVO CARS CORPORATION

- Remove the cover panel under the tail lamps on the right and left sides by carefully prying them loose using a weatherstrip tool.

Fig. 266: Loosen Rear Fog Light
Courtesy of VOLVO CARS CORPORATION

- Loosen the rear fog light at the front with a weatherstrip tool. Done on both sides.

Fig. 267: Removing Tail Light
Courtesy of VOLVO CARS CORPORATION

- Remove the tail light by removing the two nuts and pulling them back. Done on both sides.

Fig. 268: Installing Antenna Into Casing
Courtesy of VOLVO CARS CORPORATION

- Take antenna and holder from the kit.
- Place the antenna in the casing and the cable in the slot.
- Snap together the casing's top and bottom parts. Done twice.

Fig. 269: Installing The Holders On The Casing
Courtesy of VOLVO CARS CORPORATION

- Install the holders on the casing.
- Repeat the on the other casing.

Fig. 270: Pressing On Casing's Holders At Bottom Edge Of Plastic Console
Courtesy of VOLVO CARS CORPORATION

- Get antenna for left side (long cable) and unplug the grey connector.
- Insert casing with antenna in the outlet for fog lights.
- Press on the casing's holder on the plastic flange at the bottom edge of the plastic console.

Fig. 271: Routing Cable Through Bumper
Courtesy of VOLVO CARS CORPORATION

- Route the cable up through the bumper so that it comes out at the top of the plastic console.

Fig. 272: Removing Tape
Courtesy of VOLVO CARS CORPORATION

- Remove the top part of the foam tape that covers the hole.

Fig. 273: Routing Cable And Installing Strip Clamp
Courtesy of VOLVO CARS CORPORATION

- Get the rubber bushing from the kit and open it up with expander pliers.
- Insert the antenna cable. Route the cable so that the length of the cable between the bushing and the top of the plastic console is **250 mm** .
- Install a strip clamp around the collar on the rubber bushing so that it closes tightly around the cable.
- Cut off excess strip clamp.

Fig. 274: Routing Antenna Cable
Courtesy of VOLVO CARS CORPORATION

- Insert the antenna cable through the hole in the body so that it comes out in the passenger compartment.

Fig. 275: Checking Rubber Bushing Flange's Fit Appropriately
Courtesy of VOLVO CARS CORPORATION

- Check that the rubber bushing's flanges close tight against the body hole.

Fig. 276: Installing Strip Clamp To Metal Flange
Courtesy of VOLVO CARS CORPORATION

- Install the strip clamp on the sheet metal flange.
- Clamp down the antenna cable in the clamp.
- Cut off any excess strip clamp.
- Carry out on both sides.

Fig. 277: Inserting Strip Clamp Through Connector
Courtesy of VOLVO CARS CORPORATION

- Connect the removed antenna cable.
- Insert a strip clamp though the connector.
- Carry out on both sides.

Fig. 278: Clamping Down Connector And Cable
Courtesy of VOLVO CARS CORPORATION

- Clamp down the connector in existing cable harness (1).
- Clamp down the cable in existing cable harness with the strip clamp (2).
- Carry out on both sides.

Fig. 279: Routing The Cable
Courtesy of VOLVO CARS CORPORATION

- Route the antenna cable along existing cable harness over to the right side through the hole in the polystyrene plastic under the right member.

Fig. 280: Fastening Cable With Strip Clamps
Courtesy of VOLVO CARS CORPORATION

- Fasten the cable with strip clamps.

Fig. 281: Installing TV-Tuner Console
Courtesy of VOLVO CARS CORPORATION

- Get TV-tuner, console, as well as four screws from the kit.
- Tighten down the tuner on the console.

Fig. 282: Installing Connectors
Courtesy of VOLVO CARS CORPORATION

- Take the cable harness from the kit.
- Plug in the connectors in the order as shown.

NOTE: **Tighten the nuts on the antenna cables' contacts as much as possible with your fingers while the black part of the contact is held down. Then tighten the nuts (3) one complete turn with a wrench.**

Fig. 283: Installing Fuse Holder
Courtesy of VOLVO CARS CORPORATION

- Install fuse holders in the holes on the inside of the console.

Fig. 284: Fasten Console Screws From Kit
Courtesy of VOLVO CARS CORPORATION

- Fasten the console with screws from the kit.

NOTE: Cut away a piece of insulation for the lower attachment.

Fig. 285: Installing Strip Clamp On Tuner's Sheet Metal Flange
Courtesy of VOLVO CARS CORPORATION

- Install the strip clamp on the tuner's sheet metal flange.
- Clamp down the antenna cables.

Fig. 286: Installing Strip Clamp On Tuner's Sheet Metal Flange
Courtesy of VOLVO CARS CORPORATION

- Install the strip clamp on the tuner's sheet metal flange.
- Clamp down the cable harness.

Fig. 287: Installing Cable
Courtesy of VOLVO CARS CORPORATION

- Fold aside the noise absorbent so that the sheet metal flange is visible.
- Install the strip clamp on the sheet metal flange.
- Clamp down both cables (1).
- Fold back the noise absorbent.
- Clamp down both antenna cables and excess cable in existing cable harness.

Fig. 288: Routing The Cable
Courtesy of VOLVO CARS CORPORATION

- Route the cable harness along the wheel housing down to the belt anchor.
- Fasten with strip clamps.

Fig. 289: Securing The Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Fasten the cable harness in the belt anchor with strip clamp.

Fig. 290: Fold Up Floor Mat
Courtesy of VOLVO CARS CORPORATION

- Fold up the floor mat.

Fig. 291: Routing The Cable
Courtesy of VOLVO CARS CORPORATION

- Place the cable harness between polystyrene plastic and body under the floor mat so that it runs along the floor sides on to the tunnel.
- Make sure that the yellow marking on the cable harness is placed on the cable harness by the mat's edge at the tunnel.

Fig. 292: Installing Strip Clamp On Sheet Metal Flange
Courtesy of VOLVO CARS CORPORATION

- Install the strip clamp on the sheet metal flange.
- Fasten the cable harness.

Fig. 293: Installing Strip Clamp Around Cable By Yellow Marking
Courtesy of VOLVO CARS CORPORATION

- Install the strip clamp around the cable harness by the yellow marking and press to fasten the clamp on the parking brake console's flange.

Fig. 294: Cutting Strip Clamp And Removing Cover
Courtesy of VOLVO CARS CORPORATION

- Get the side panel.
- Cut away the strip clamp and remove the cover.

Fig. 295: Identifying Belt Holder
Courtesy of VOLVO CARS CORPORATION

- Remove the belt holder and rough up the fabric where the holder has been installed.

Fig. 296: Removing Rear Cup Holder
Courtesy of VOLVO CARS CORPORATION

- Remove the rear cup holder.

Illustrations A and B

Fig. 297: Measuring And Marking Panel
Courtesy of VOLVO CARS CORPORATION

- Measure and mark out on the inside of the side panel as shown.
- Saw according to markings.

Fig. 298: Saw Markings
Courtesy of VOLVO CARS CORPORATION

Fig. 299: Fill Edges
Courtesy of VOLVO CARS CORPORATION

- File down the edges.

Fig. 300: Sawing By Side Panel's Rear Cup Holder
Courtesy of VOLVO CARS CORPORATION

- Saw by the side panel's rear cup holder as shown.

Fig. 301: Fill Edges
Courtesy of VOLVO CARS CORPORATION

- File down the edges.

Fig. 302: Mark Middle Flanges
Courtesy of VOLVO CARS CORPORATION

- Take the casing from the kit.
- Mark out the middle on the three flanges with a scribe.
- Drill using a **3.5 mm** bit.

Fig. 303: Applying Tape
Courtesy of VOLVO CARS CORPORATION

- Fasten tape as shown.

Fig. 304: Temporarily Install Casing
Courtesy of VOLVO CARS CORPORATION

- Temporarily install the casing.

Fig. 305: Marking Drilled Holes
Courtesy of VOLVO CARS CORPORATION

- Mark the casing's three drilled holes on the tape.
- Remove the cover.

Fig. 306: Pre-Drilling Holes
Courtesy of VOLVO CARS CORPORATION

- Punch holes in the markings and through the panel with an awl or scribe. Remove the tape.
- Drill holes using a **7 mm** bit.

Fig. 307: Installing Casing
Courtesy of VOLVO CARS CORPORATION

- Install the casing. Check from the rear that the four catches have engaged.

Fig. 308: Loosening Insulation
Courtesy of VOLVO CARS CORPORATION

- Loosen the insulation at the top and on the sides.

NOTE: The insulation shall be left in place at the bottom.

Fig. 309: Tightening Casing
Courtesy of VOLVO CARS CORPORATION

- Tighten down the casing with three screws **PF5x14** and three washers.

Fig. 310: Installing Insulation
Courtesy of VOLVO CARS CORPORATION

- Fold back the insulation and fasten it with three pieces of tape.
- Reinstall the side panel.
- Reinstall removed parts in reverse order. Tightening torque seat screws **40 Nm** and load lashing eyes **25 Nm** .
- Continue according to installation instruction **Multimedia monitor with DVD, Dual Screen.**

USB/IPOD MUSIC INTERFACE (2007-2012)

USB/IPOD MUSIC INTERFACE

NOTE:

- **Cable harness A for USB**
- **Cable harness B for iPod**
- **Cable harness C for USB and iPod**

Fig. 311: Identifying Ignition Switch Turned To Position 0
Courtesy of VOLVO CARS CORPORATION

Applies to cars with external amplifier

- Slide the front seats back and upwards at the front edge.
- Turn the ignition key to position 0.

NOTE: **Wait at least three minutes before unplugging the connectors or removing other electrical equipment.**

Fig. 312: Identifying Ignition Switch OFF & Disconnected Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

Applies to cars with internal amplifier

- Slide the front seats back and upwards at the front edge.
- Turn the ignition key to position 0.
- Disconnect the battery negative lead.

NOTE: Wait at least three minutes before unplugging the connectors or removing other electrical equipment.

Fig. 313: Removing Tunnel Console Side Panels
Courtesy of VOLVO CARS CORPORATION

- Remove both the side panels from the tunnel console.

INSTALLING

Fig. 314: Connecting Control Module
Courtesy of VOLVO CARS CORPORATION

- Take the cable harness and control module from the kit. Connect the cable harness to the control module.

Fig. 315: Securing Cable With Cable Ties
Courtesy of VOLVO CARS CORPORATION

- Secure the cable harness to the control module using a cable tie.

Fig. 316: Folding Up Left Mounting Of Control Module
Courtesy of VOLVO CARS CORPORATION

- Fold up the left mounting of the control module.

Fig. 317: Applying Foam Tape
Courtesy of VOLVO CARS CORPORATION

- Take a piece of foam tape from the kit and cut in the middle. Place a piece on the right-hand mounting of the control module.

Fig. 318: Applying Foam Tape
Courtesy of VOLVO CARS CORPORATION

- Apply a piece of foam tape so that it covers half the upper edge and half the side edge.

Fig. 319: Control Module Location
Courtesy of VOLVO CARS CORPORATION

- Push the carpet on the right-hand side of the tunnel console to one side.
- Place the control module between the carpet and insulation. The right-hand mounting of the control module should be below the air duct.

APPLIES TO VEHICLES WITH EXTERNAL AMPLIFIER

Fig. 320: Removing Amplifier Screws
Courtesy of VOLVO CARS CORPORATION

- Slacken off the amplifier screws (1) under the right-hand front seat.

Fig. 321: Removing Left Hand Seat Piece
Courtesy of VOLVO CARS CORPORATION

- Remove the left-hand seat piece.

Fig. 322: Identifying Cable Harness Connectors
Courtesy of VOLVO CARS CORPORATION

- Take cable harness (D) from the kit. Route the end of the cable harness with connectors 1 and 2 under the carpet, from the amplifier to the tunnel console.

Fig. 323: Routing Cable
Courtesy of VOLVO CARS CORPORATION

- Follow the existing cable harness.

Fig. 324: Disconnecting Amplifier Connection
Courtesy of VOLVO CARS CORPORATION

- Disconnect the connector on the amplifier.

Fig. 325: Connecting Cable Harness's
Courtesy of VOLVO CARS CORPORATION

- Connect the connector that was disconnected from the amplifier to the connector on the new cable harness.
- Take a piece of foam tape from the kit and cut in the middle. Place a cut off piece of foam tape around the connectors.
- Connect the other connector to the amplifier.
- Reinstall the amplifier and the seat side piece.

Fig. 326: Removing Two 4 Pin Connectors
Courtesy of VOLVO CARS CORPORATION

- Route the two 4-pin connectors straight through the tunnel console.

Fig. 327: Connecting Control Module
Courtesy of VOLVO CARS CORPORATION

- Connect the connector to the control module.

Fig. 328: Securing Cables With Cable Ties
Courtesy of VOLVO CARS CORPORATION

- Secure the three cables (fiber optic, power and USB/iPod cables) in the existing cable harness using a cable tie.

NOTE: Observe caution, the fiber optic cable (1) is sensitive to bending and trapping. The bend radius must not be less than 25 mm.

APPLIES TO CARS WITH INTERNAL AMPLIFIER

Fig. 329: Prying Off Gear Selector Panel At Rear Edge
Courtesy of VOLVO CARS CORPORATION

Applies to cars with automatic gearbox

- Turn the ignition key to position II.
- Move the gear selector lever to its rearmost position.
- Use a weatherstrip and pry off the gear selector panel at the rear edge.

Fig. 330: Pressing In Catches And Removing Panel
Courtesy of VOLVO CARS CORPORATION

- Press in the catches and remove the panel.

Fig. 331: Removing Screws And Radio/AC Unit From Center Console
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws.
- Remove the audio/ ACC panel from the center console. Pull at the lower edge and then downwards until it releases from the mounting at the upper edge.

NOTE: Do not damage the removed components or the surrounding panels.

INSTALLATION, CONTINUED

Fig. 332: Disconnecting Media Player Fiber Optic Cable
Courtesy of VOLVO CARS CORPORATION

- Disconnect the connector for the fiber optic cable from the media player (IAM)

Fig. 333: Reconnecting Harness And Media Player
Courtesy of VOLVO CARS CORPORATION

- Take cable harness (D) and a piece of foam tape from the kit. Cut off the foam tape in the middle.
- Connect the connector that was disconnected from the media player to the connector on the new cable harness.
- Tape one cut piece of foam tape around the connectors.
- Connect the other connector to the media player.

Fig. 334: Routing Cable
Courtesy of VOLVO CARS CORPORATION

- Route the remaining connector down to the control module. Reinstall the audio/ACC panel.

Fig. 335: Connecting Control Module
Courtesy of VOLVO CARS CORPORATION

- Connect the connector to the control module.

INSTALLATION, CONTINUED

Fig. 336: Identifying Removal Of Screws And Soundproofing Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the sound barrier on the driver's side by first removing the two screws and then prizing it away at the top edge.

Fig. 337: Identifying 4 Pin (Grey) Pre-Routed Connector Location
Courtesy of VOLVO CARS CORPORATION

- Locate the 4-pin gray, pre-routed connector for the power supply. It is taped to the thick cable harness under the dashboard.

Fig. 338: Connecting Harness To Pre-Routed Connector
Courtesy of VOLVO CARS CORPORATION

- Connect the cable harness to the pre-routed connector (1).
- Tape one cut piece of foam tape around the connectors.

  The pre-routed connector is already connected on certain versions. Disconnect it and then connect both the connectors from the new cable harness in-between. Secure the connector (2) on the car's existing cable harness using a cable tie.

Fig. 339: Securing Excess Cable
Courtesy of VOLVO CARS CORPORATION

- Place any excess under the carpet.

APPLIES WHEN CONNECTING TO THE USB/IPOD PLAYER LOCATED IN THE GLOVE COMPARTMENT.

Fig. 340: Passenger Side Sound Barrier Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the sound barrier on the passenger side by first removing the two screws and then prizing it away at the top edge.

Fig. 341: Removing Glove Compartment
Courtesy of VOLVO CARS CORPORATION

- Remove the nine screws, route the glove compartment straight out and disconnect the connector.

Fig. 342: Drilling Location And Dimensions
Courtesy of VOLVO CARS CORPORATION

- Mark as illustrated on the outside of the glove compartment's end.
- Pre-drill using a **2.5 mm (3/32")** bit.
- Drill using a **30 mm (1 3/16")** hole saw.
- Smooth off the hole edges.

Fig. 343: Routing Cable
Courtesy of VOLVO CARS CORPORATION

- Route the cable for the USB/iPod under the carpet along the side of the tunnel console.

Fig. 344: Routing Cable Through Drilled Hole
Courtesy of VOLVO CARS CORPORATION

- Route the cable through the drilled hole.
- Thread the rubber grommet on to the cable and secure in the hole. The cable must protrude about 250 mm.

Fig. 345: Securing Table Using Cable Ties
Courtesy of VOLVO CARS CORPORATION

- Secure the cable using a cable tie on the damper spring's eyelets.
- Reinstall the glove compartment.

APPLIES WHEN CONNECTING TO THE USB/IPOD PLAYER LOCATED IN THE CD COMPARTMENT UNDER THE ARMREST.

Fig. 346: Removing Tunnel Compartment
Courtesy of VOLVO CARS CORPORATION

- Pull the handle, move the tunnel compartment backward and lift it away.

Fig. 347: Removing Cover
Courtesy of VOLVO CARS CORPORATION

- Remove the cover. It shall not be re-used.

Fig. 348: Removing Cover Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws and the cover panel.

Fig. 349: Drilling Location And Dimensions
Courtesy of VOLVO CARS CORPORATION

- Measure the front of the CD compartment as illustrated.
- Pre-drill using a **2.5 mm (3/32")** bit.
- Drill using a **30 mm (1 3/16")** hole saw.
- Smooth off the hole edges.

Fig. 350: Drilling Location And Dimensions
Courtesy of VOLVO CARS CORPORATION

Applies to cars without holes in the tunnel compartment.

- Measure the bottom of the tunnel console as illustrated.
- Pre-drill using a **2.5 mm (3/32")** bit.
- Drill using a **30 mm (1 3/16")** hole saw.
- Smooth off the hole edges.

Fig. 351: Drilling Dimensions
Courtesy of VOLVO CARS CORPORATION

- Measure the opening handle of the tunnel console as illustrated.
- Pre-drill using a **2.5 mm (3/32")** bit.
- Drill out the holes. Use a **6 mm (15/64")** diameter drill bit.

Fig. 352: Identifying Blind Cover Plug And Screws
Courtesy of VOLVO CARS CORPORATION

- Take the blind cover plug and two screws from the kit. Install the blind cover plug on the opening handle.

Fig. 353: Cable Routing
Courtesy of VOLVO CARS CORPORATION

- Route the USB/iPod cable from the control module up out of the rear section of the tunnel console.

Fig. 354: Identifying Cable Connector Routing
Courtesy of VOLVO CARS CORPORATION

- Route the cable through the drilled holes.
- Insert the rubber grommet onto the cable and secure in the hole. The cable protrusion should be approx. 200 mm.
- Reinstall the contact plate.
- Reinstall the tunnel compartment and at the same time place the excess cable under the tunnel compartment.

Fig. 355: Identifying Ignition In ON Position and Connecting Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

Applies to cars with Internal amplifier

- Turn the ignition key to position II.
- Reconnect the battery negative lead.

Fig. 356: Identifying VIDA (Service Information) To Program Software
Courtesy of VOLVO CARS CORPORATION

Reinstall:

- the panel to the gear selector
- sound proofing panels
- side panels
- Download the software for the accessory's function following the service information in VIDA (Volvo Scan Tool).

USB/IPOD MUSIC PLAYER (2009-2012)

USB/IPOD MUSIC PLAYER

Fig. 376: Cable Holder Installation Clip
Courtesy of VOLVO CARS CORPORATION

NOTE: **The opening on the cable holder must point upwards.**

Fig. 377: Identifying VIDA (Service Information) To Program Software
Courtesy of VOLVO CARS CORPORATION

- Reinstall the detached components in reverse order.
- Download software (application) for the accessory's function according to service information in VIDA (Volvo Scan Tool). See VIDA or accessories catalogue for article number on software.

USB/IPOD MUSIC PLAYER, INTERFACE, CRADLE (2008-2012)

USB/IPOD MUSIC PLAYER, INTERFACE, CRADLE

INSTALLATION

Fig. 378: Identifying Arm Rest Positioning
Courtesy of VOLVO CARS CORPORATION

Fig. 379: Identifying Position Cradle In Front Tunnel Compartment End
Courtesy of VOLVO CARS CORPORATION

- Position the cradle in the tunnel compartment's front end.

Fig. 380: Identifying Cradle In Front Tunnel Compartment Measurement
Courtesy of VOLVO CARS CORPORATION

Fig. 381: Positioning Cradle In Rear End Of Tunnel Console
Courtesy of VOLVO CARS CORPORATION

Applies to cars with DVD player (RSE)

- Position the cradle on the rear end in the tunnel console.

Fig. 382: Identifying Cradle In Rear End Of Tunnel Console Measurement
Courtesy of VOLVO CARS CORPORATION

Applies to cars with DVD player (RSE)

Fig. 383: Identifying Scriber Mark
Courtesy of VOLVO CARS CORPORATION

- Mark and make holes using a scriber or similar.

CAUTION: The hole must not be larger than 2 mm.

INSTALLATION, CONTINUED

Fig. 384: View Of Cradle Screws
Courtesy of VOLVO CARS CORPORATION

- Slacken off the screws.

Fig. 385: Identifying Cradle End Section
Courtesy of VOLVO CARS CORPORATION

- Remove the end section.

Fig. 386: Identifying Cradle Connector
Courtesy of VOLVO CARS CORPORATION

- The marking on the connector must be pointing outwards.

Fig. 387: View Of Connector Catches
Courtesy of VOLVO CARS CORPORATION

- Press in the catches and connect the connector.

Fig. 388: Identifying Rear Section Screws
Courtesy of VOLVO CARS CORPORATION

- Install the rear section and the screws.

Fig. 389: Identifying Connector Markings
Courtesy of VOLVO CARS CORPORATION

- Connect the connector with the marking pointing outwards.

Fig. 390: Identifying Connector Screw
Courtesy of VOLVO CARS CORPORATION

- Install the screw.

Fig. 391: Identifying Cradle Screws
Courtesy of VOLVO CARS CORPORATION

- Screw the cradle in the tunnel compartment.
- Try to feed in any excess wiring.

HANDSFREE, BLUETOOTH (2003-2012)

HANDSFREE, BLUETOOTH

NOTE: **There may be components in the accessories kit that are not used for this installation.**

NOTE: **When installing Velcro fasteners/tape the underlying surface must be kept at a temperature of at least +20° C (68°F).**

Wiring A is for vehicles with an internal amplifier that is located in the media player.

Wiring B and C is for vehicles with an external amplifier that is located under the right-hand front seat.

Vehicles from and including model year 07- with audio system Performance Sound have an internal amplifier.

Vehicles up to and including model year -06 with audio system Performance Sound have an external amplifier.

Cars with the High Performance and Premium Sound audio systems have external amplifier.

Place the manual for this accessory in a suitable place in the vehicle.

PREPARATIONS

Fig. 392: Positioning Shift Knob
Courtesy of VOLVO CARS CORPORATION

Applies to cars with automatic gearbox

- Turn the ignition key to position II.
- Move the gear selector lever to its rearmost position.

Fig. 393: Removing Gear Shift Selector Cover
Courtesy of VOLVO CARS CORPORATION

- Use a weatherstrip and pry off the gear selector panel at the rear edge.

Fig. 394: Removing Gear Shift Selector Cover
Courtesy of VOLVO CARS CORPORATION

- Press in the catches and remove the panel.

Fig. 395: Identifying Ignition Switch OFF And Disconnected Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Slide the right-hand front seat fully backwards and then fully upwards at the front edge.
- Turn the ignition switch to position 0.
- Disconnect the battery negative lead.

NOTE: **Wait at least three minutes before unplugging the connectors or removing other electrical equipment.**

Fig. 396: Identifying Removal Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws.

Fig. 397: Removing Center Console Unit
Courtesy of VOLVO CARS CORPORATION

- Remove the bracket with the A/C panel and radio from the center console. Pull from the lower edge and then downwards until it releases from the mounting at the upper edge.

NOTE: Do not damage the removed components or the surrounding panels.

- Unplug the connectors.

Fig. 398: Removing End Face Panel Form Dashboard
Courtesy of VOLVO CARS CORPORATION

- Remove the end face panel from the dashboard.

Fig. 399: Removing Center Console's Right-Hand Side Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the center console's right-hand side panel by pulling it away starting at the front edge and then backwards until all the clips have released.

Fig. 400: Removing Sound Proofing Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the screws and soundproofing panel.

Fig. 401: Removing Safety Handle
Courtesy of VOLVO CARS CORPORATION

- Remove the covers and screws for the grab handle on the A-pillar.

Fig. 402: Removing Weatherstrip And Panel
Courtesy of VOLVO CARS CORPORATION

- Pull of the weatherstrip (1) for the door at the A-pillar.
- Pull off the A-pillar panel at the upper edge and then straight upwards to remove it.

INSTALLING THE MICROPHONE

Fig. 403: Applying Foam Tape To Microphone Cable
Courtesy of VOLVO CARS CORPORATION

- Tape a 700 mm length piece of foam tape on the microphone cable starting 90 mm from the microphone.

Fig. 404: Cleaning Microphone And Headliner and Applying Velcro Strip
Courtesy of VOLVO CARS CORPORATION

- Clean the microphone and the headlining in the area illustrated, which corresponds to the size of the double-sided adhesive tape. Use a solution of 25% isoproanol and 75% water, as well as a lint free cloth.

  Dry with care, do not rub.

- Allow to dry.

NOTE: In cases where the area is heavily soiled or treated with cockpit shine. First clean using a washing up detergent (FAIRY or similar).

- Remove the backing tape from one side of the Velcro strip and press it onto the microphone.

Fig. 405: Installing Microphone
Courtesy of VOLVO CARS CORPORATION

- Remove the remaining protective film from the Velcro strip. Press the microphone securely into place.

NOTE: **The microphone must be pointing towards the driver. Make sure that it does not obstruct adjustment of the rear view mirror.**

Fig. 406: Routing Microphone Cable
Courtesy of VOLVO CARS CORPORATION

- Route the microphone cable under the rear view mirror's mounting and inside the headlining. Insert the cable using a weatherstrip tool.

Fig. 407: Identifying Headlining, Routed Cable And A-Pillar
Courtesy of VOLVO CARS CORPORATION

- Carefully pull down the headlining and route the cable above it, to the A-pillar.

Fig. 408: Identifying Cable Secured To A-Pillar With Foam Tape
Courtesy of VOLVO CARS CORPORATION

- Pull the cable down along the A-pillar to the dashboard.
- Cut off two 100x50mm pieces of foam tape in the middle.
- Secure the cable to the A-pillar using foam tape.

CAUTION: The inflatable curtain (IC) is located inside the A-pillar panel, it is important that the cable is not positioned on it.

Fig. 409: Routing Cable
Courtesy of VOLVO CARS CORPORATION

- Cut off one 100x50mm strip of foam tape in the middle.
- Secure the cable on the heater unit using the pieces of tape.
- Route the cable further in towards the center console.

CONNECTING THE EXTERNAL AMPLIFIER

APPLIES TO CARS WITH EXTERNAL AMPLIFIER.

Fig. 410: Removing Center Console's Left-Hand Side Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the center console's left-hand side panel by pulling it away starting at the front edge and then backwards until all the clips have released.

Fig. 411: Identifying Removal Of Screws And Soundproofing Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the sound proofing panel by first removing the two screws and then prying off the sound proofing panel at the top edge.

Fig. 412: Locating 4 Pin (Gray) Pre-Routed Connector
Courtesy of VOLVO CARS CORPORATION

- Locate the 4 pin, gray, pre-routed connector for the power supply. It comes from the thick cable harness under the dashboard on the right-hand side of the steering wheel

Fig. 413: Connecting Cable Harness C
Courtesy of VOLVO CARS CORPORATION

- Take cable harness C from the kit. Connect it to the existing connector.

  The pre-routed connector is already connected on certain versions. Disconnect the connector and connect both connectors from the new cable harness.

- Cut a 700 mm piece of foam tape into three pieces of the same length. Tape one piece around the connectors on the car's existing cable harness.

Fig. 414: Routing Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Route the cable harness backwards and across through the center console.

Fig. 415: Removing Amplifier Screws
Courtesy of VOLVO CARS CORPORATION

- Slacken off the amplifier screws (1) under the right-hand front seat.

Fig. 416: Removing Amplifier
Courtesy of VOLVO CARS CORPORATION

- Lift out the amplifier. Use a weatherstrip to raise it from its recessed position.
- Place it upside down as illustrated.
- Disconnect the connector.

Fig. 417: Removing Left Hand Seat Piece
Courtesy of VOLVO CARS CORPORATION

- Remove the left-hand seat piece.

Fig. 418: Routing Cable
Courtesy of VOLVO CARS CORPORATION

- Route the cable that was connected to the 4-pin connector from the center console to the amplifier under the carpet.

Fig. 419: View Of Foam Tape Pieces To Relay
Courtesy of VOLVO CARS CORPORATION

- Take the mute relay, two foam tape pieces and cable harness B from the kit.
- Connect the pre-routed cable harness and cable harness B to the relay.
- Tape the foam tape pieces around the relay.

Fig. 420: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Connect the connector that was disconnected from the amplifier to the connector from the mute relay.
- Tape one cut piece of foam tape around the connectors.
- Connect the other connector from the relay to the amplifier.

Fig. 421: Installing The Mute Relay
Courtesy of VOLVO CARS CORPORATION

- Place the mute-relay under the front left corner in the recess.
- Reinstall the amplifier and tighten it with the screws.

INSTALLING THE CONTROL PANEL

Fig. 422: Foam Tape Measurement On Cable
Courtesy of VOLVO CARS CORPORATION

- Tape a 700 mm length piece of foam tape on the cable starting 70 mm from the control panel.

Fig. 423: Cleaning Dashboard
Courtesy of VOLVO CARS CORPORATION

- Clean the area on the dashboard as illustrated, which corresponds to the size of the double-sided adhesive tape. Use a solution of 25% isoproanol and 75% water, as well as a lint free cloth.

  Dry with care, do not rub.

- Allow to dry.

NOTE: **In cases where the area is heavily soiled or treated with cockpit shine. First clean using a washing up detergent (FAIRY or similar).**

Fig. 424: Aligning Control Panel On Dashboard
Courtesy of VOLVO CARS CORPORATION

- Remove the protective film from the tape on the reverse of the control panel.
- Align and secure the control panel on the dashboard.

Fig. 425: Positioning The Cable
Courtesy of VOLVO CARS CORPORATION

- Pull the cable down to the opening in the center console. The cable must be positioned in the upper edge of the opening, approximately 10 mm from the corner.

INSTALLING THE CONTROL MODULE

INSTALLING

Fig. 426: Identifying Control Module Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Connect the cable harness (1) to the control module.
- Lock the catch (2).

Fig. 427: Cleaning Control Module
Courtesy of VOLVO CARS CORPORATION

- Clean the control module as illustrated. Use isopropanol.

Fig. 428: Cleaning Underneath Detached A/C Unit/Radio Bracket
Courtesy of VOLVO CARS CORPORATION

- Clean the surrounding areas, as illustrated, underneath the detached A/C unit/radio bracket. Use isopropanol.

Fig. 429: Identifying Velcro Fasteners
Courtesy of VOLVO CARS CORPORATION

- Take a Velcro strip and cut off two pieces of the same length
- Press the pieces together.
- Cut off two pieces of the same length again at the center.

Fig. 430: Removing Protective Film
Courtesy of VOLVO CARS CORPORATION

- Remove the protective film from one side of the Velcro strips, which were pressed together.
- Apply the Velcro strips on the control module and press.

Fig. 431: Installing Control Module
Courtesy of VOLVO CARS CORPORATION

- Remove the remaining protective file on the Velcro strips, align and install the control module as illustrated. Press onto the control module so that the tape adheres.

CONNECTING

APPLY TO CARS WITH INTERNAL AMPLIFIER.

Fig. 432: View Of Foam Tape Pieces To Relay
Courtesy of VOLVO CARS CORPORATION

- Take the mute relay, two foam tape pieces and cable harness A from the kit.
- Connect the connectors from the cable harness to the relay.
- Tape the foam tape pieces around the relay.

Fig. 433: Placing Relay With Cable Harness At Rear Edge Of Center Console
Courtesy of VOLVO CARS CORPORATION

- Place the relay with the cable harness at the rear edge of the opening on the center console.

Fig. 434: Connecting Connectors
Courtesy of VOLVO CARS CORPORATION

Applies to cars with internal amplifier

1. Connect cable harness A to the cable harness from the control module.

Applies to cars with external amplifier

1. Connect cable harness C to the cable harness from the control module.
2. Connect the microphone
3. Connect the control panel

- Take one of the cut pieces of thin foam tape and tape around the connectors.

Fig. 435: Applying Foam Around Connectors
Courtesy of VOLVO CARS CORPORATION

- Tape one cut piece of foam tape around the connectors.
- Place the connectors and excess cables in the bottom of the center console. Check that they do not rub against the bracket edges.

Fig. 436: Connecting Connectors
Courtesy of VOLVO CARS CORPORATION

Applies to cars with internal amplifier

- Connect the gray connector (1) in the new cable harness to the corresponding socket in the media player.
- Connect the gray connector (2) in the new cable harness to the gray connector (3) which was detached from the media player.
- Take one of the cut pieces of foam tape and tape around connectors (2) and (3).

Fig. 437: Installing Radio/A/C Unit
Courtesy of VOLVO CARS CORPORATION

- Plug in the connectors.
- Reinstall the radio/A/C unit by first hooking the upper edge into place. Then press upwards and angle in the lower section.

  At the same time check that the cable to the control panel is correctly positioned (see image 34).

- If the radio/A/C unit does not fit at the rear edge, check for trapped wiring.
- Reinstall the screws.

INSTALLATION, CONTINUED

Fig. 438: Identifying Ignition Switch ON And Connected Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Reinstall the detached components in reverse order.
- Turn the ignition key to position II.
- Reconnect the battery negative lead

Fig. 439: Control Panel Buttons
Courtesy of VOLVO CARS CORPORATION

Carry out a function test as follows:

- Turn the ignition key to position I.
- Turn on the radio.
- Check that the control panel for Bluetooth lights up.
- Press the button (1) in the middle of the control panel. The radio should mute and a voice should be heard.
- Press the button (2). The voice should stop and the radio sound should return.

HANDSFREE, MICROPHONE, SWAN NECK (2003-2008)

HANDSFREE, MICROPHONE, SWAN NECK

REMOVING

Fig. 440: Removing Center Console Left Side Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the center console's left side panel by first pulling it away at the front edge and continuing backwards until all the clips have released.

Fig. 441: Disconnect Battery Negative Lead
Courtesy of VOLVO CARS CORPORATION

- Slide the driver's seat fully forwards and then fully upwards from the rear edge.
- Turn the ignition switch to position 0.
- Disconnect the battery negative lead.

NOTE: **Wait at least three minutes before unplugging the connectors or removing other electrical equipment.**

Fig. 442: Prying Off Gear Selector Panel At Rear Edge
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position II.
- Move the gear selector lever to its rearmost position.
- Use a weatherstrip and pry off the gear selector panel at the rear edge.

Fig. 443: Pressing In Catches And Removing Panel
Courtesy of VOLVO CARS CORPORATION

- Press in the catches and remove the panel.

Fig. 444: Removing Screws And Radio/AC Unit From Center Console
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws.
- Remove the radio/AC unit from the center console. Pull from the lower edge and then downwards until it releases from the mounting at the upper edge.

NOTE: Do not damage the removed components or the surrounding panels.

- Unplug the connectors.

Fig. 445: Pressing In Catches And Pulling Headrest Upwards
Courtesy of VOLVO CARS CORPORATION

- Find the headrest's two locks on the back of the driver's seat. Press in the catches and pull the headrest upwards at the same time.

Fig. 446: Finding Grip Strip In Bottom Edge Of Upholstery
Courtesy of VOLVO CARS CORPORATION

- Find the grip strip (consists of two different strip profiles that are hooked into each other) in the bottom edge on the upholstery.

Fig. 447: Prying Apart Strips To Release Catch And Pulling Out Rear Part Of Upholstery With Strip
Courtesy of VOLVO CARS CORPORATION

- Get a weatherstrip tool and pry apart the strips so that the catch (1) releases.
- Pull out the rear part of the upholstery with strip (2).

Fig. 448: Inserting Curtain Wire Between Upholstery And Padding
Courtesy of VOLVO CARS CORPORATION

- Insert a curtain wire or similar from above and down on the back of the seat back, between the upholstery and padding.

Fig. 449: Taping Connector From Microphone Cable To End Of Wire
Courtesy of VOLVO CARS CORPORATION

- Tape the connector from the microphone cable to the end of the wire.
- Pull through the cable.
- Disconnect the cable from the wire.

Fig. 450: Placing Microphones Bracket Over Hole In Backrest And Press Down Headrest To Lock In Place
Courtesy of VOLVO CARS CORPORATION

- Place the microphone's bracket over the hole on the backrest.
- Point the microphone arm 45° forward. Press down the headrest so that it locks into place.
- Check that the headrest has locked into place by pulling it upwards.

Fig. 451: Routing Cable In Front Of Tube And Securing With Cable Tie To Large Connector
Courtesy of VOLVO CARS CORPORATION

- Route the cable in front of the tube (1).
- Secure the cable with a cable tie to the large connector (2).
- Reinstall the upholstery for the backrest.

Fig. 452: Laying Cable In Carpet Joint And Routing Cable Forward And Up In Center Console
Courtesy of VOLVO CARS CORPORATION

- Lay the cable in the carpet joint. Route the cable forward and up in the center console.

NOTE: **It is important that the cable has the right length so that the seat can move back and forth freely.**

Fig. 453: Finding Foam Tape With Connections For Bluetooth System In Bottom Of Center Consoles Opening
Courtesy of VOLVO CARS CORPORATION

- Find the foam tape with connections for the Bluetooth system in the bottom of the center console's opening. Open the foam tape.

Fig. 454: Connecting Microphone Cable
Courtesy of VOLVO CARS CORPORATION

- Loosen existing connection to the microphone.
- Connect the new microphone cable and reinstall the foam tape.

NOTE: Also secure the extra length of the microphone cable with the foam tape.

Fig. 455: Identifying Ignition In ON Position and Connecting Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Connect the connectors to the radio/AC unit.
- Reinstall the radio/AC unit by first hooking it on at the upper edge. Then press it upwards and angle in the lower part. At the same time, check that the cable to the control panel for Bluetooth ends up in the right position.
- If the radio/A/C unit does not fit at the rear edge, check that no cables have been trapped.
- Reinstall the screws.

- Reinstall the side panel.
- Turn the ignition key to position II.
- Reconnect the battery negative lead

TRACKER, VOLVO ON CALL (2005-2010)

TRACKER, VOLVO ON CALL

NOTE: This accessory requires software unique to the car.

REMOVAL/INSTALLATION

Fig. 456: Disconnect Battery Negative Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition switch to position 0.
- Disconnect the battery negative lead.

Fig. 457: Prying Off Gear Selector Panel At Rear Edge
Courtesy of VOLVO CARS CORPORATION

Applies to cars with automatic gearbox

- Turn the ignition key to position II.
- Move the gear selector lever to its rearmost position.
- Carefully prize away the gear lever panel at the rear edge using a weatherstrip tool.

Fig. 458: Pressing In Catches And Removing Panel
Courtesy of VOLVO CARS CORPORATION

- Press in the catches and remove the panel.

Fig. 459: Removing Tunnel Console Panels
Courtesy of VOLVO CARS CORPORATION

- Remove the left and right-hand side panels from the tunnel console. Pull them away at the front edge and continue backwards until all clips have released.

Fig. 460: Removing Tunnel Compartment
Courtesy of VOLVO CARS CORPORATION

- Pull the handle, move the tunnel compartment backward and lift it away.

Fig. 461: Removing Cover
Courtesy of VOLVO CARS CORPORATION

- Remove the cover.

Fig. 462: Removing Tunnel Console
Courtesy of VOLVO CARS CORPORATION

- Remove the screws and unplug the connectors.
- Lift away the tunnel console.

Fig. 463: Removing Screws And Radio/AC Unit From Center Console
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws holding the center console to the climate control panel and the control module.
- Pull out the center console at the lower edge and pull it away from the top edge.
- Unplug the connectors from the climate control panel and the control module.

NOTE: Do not damage the gear lever knob.

Fig. 464: Unplugging Connectors
Courtesy of VOLVO CARS CORPORATION

- Unplug the four connectors from the phone module (PHM). The larger connector has its catch underneath.

Fig. 465: Removing Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the screws.

Fig. 466: Removing Control Module
Courtesy of VOLVO CARS CORPORATION

- Place the cables and connectors beside the control module. Remove the control module by moving it forward until the guide pins release.

Fig. 467: Identifying Unit Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the four screws. Allow the console to remain.

NOTE: The console has different appearances depending on model year.

INSTALLATION, CONTINUED

Fig. 468: Installing Protective Metal Cover
Courtesy of VOLVO CARS CORPORATION

- Install the protective metal cover from the kit. It must be located on the outside of the existing console.

Fig. 469: Installing Kit Screws
Courtesy of VOLVO CARS CORPORATION

- Install the screw from the kit and tighten it three turns.
- Reinstall the four screws.
- Tighten all screws.

Fig. 470: Installing Control Module
Courtesy of VOLVO CARS CORPORATION

Reinstall:

- the control module with console

NOTE: **The protruding section of the console for the control module must be located above the existing console.**

- the screws

- the connectors.

Fig. 471: Identifying Screw Clips
Courtesy of VOLVO CARS CORPORATION

- Remove the existing screw clips.
- Install the new larger screw clips. Centre them against the existing holes.

Reinstall:

- the tunnel console with screws and connectors
- the side panels.

Fig. 472: Installing Center Console
Courtesy of VOLVO CARS CORPORATION

- Reinstall the center console by first hooking it in at the top edge and pressing it up, and then angling in the lower section.

Fig. 473: Installing Protective Metal Cover With Shear Screws
Courtesy of VOLVO CARS CORPORATION

- Install the protective metal cover with the shear screw.

NOTE: The bend on the upper section must point inward.

- Tighten the screws until the top is broken off.
- Reinstall the gear lever panel.

Fig. 474: Connecting Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position II.
- Reconnect the battery negative lead.
- Download the software for the accessory's function following the service information in VIDA (Volvo scan tool).

First download software P/N 30775679. Then download software P/N 30677028.

CAUTION: It is extremely important that the software is downloaded in the correct order.

Functionality check:

1. Start the phone module (PHM) by pressing the telephone's On button.

   The phone module starts and requests a telephone code.

2. Enter telephone code, 1234.

   The phone module approves the telephone code and requests a PIN code.

TRACKER, VOLVO ON CALL, ANTENNA (2007-2010)

TRACKER, VOLVO ON CALL, ANTENNA

PREPARATIONS

NOTE: When affixing the velcro tape, the surface and tape must be at a temperature of at least +20° C (68° F).

Fig. 475: Removing Cover Panel
Courtesy of VOLVO CARS CORPORATION

- Carefully pry off the cover panel at the bottom edge of the B-post panel so that it releases from the sill trim panel.

Fig. 476: Ignition Position To Zero
Courtesy of VOLVO CARS CORPORATION

- Slide the driver's seat all the way back and then move the front edge all the way up.
- Turn the ignition key to position 0.

NOTE: Wait at least three minutes before unplugging the connectors or removing other electrical equipment.

Fig. 477: Removing Sill Molding
Courtesy of VOLVO CARS CORPORATION

- Pry loose the sill molding at the front edge and then pull straight up.
- Angle the sill molding out from the B-post panel.

Fig. 478: Removing Rubber Seal
Courtesy of VOLVO CARS CORPORATION

- Lower the steering wheel to its lowest position and then move it rearward to its rearmost position.
- Remove the two screws at the top edge of the combined instrument panel border.
- Carefully use a weatherstrip tool to pry loose the rubber seal from the upper steering wheel cover. It is held in place with five clips.
- Remove the border by carefully pulling it rearward - first at the bottom edge and then at the top edge - until all clips have released.

Fig. 479: Removing Instrument Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the four screws for the combined instrument panel.
- Pull out the combined instrument panel. Disconnect the connector on the reverse of the combined instrument panel.

INSTALLING THE ANTENNA

Fig. 480: Remove Clip
Courtesy of VOLVO CARS CORPORATION

- Remove the antenna from the kit. Remove the clip.

Fig. 481: Cleaning Area For Application
Courtesy of VOLVO CARS CORPORATION

- Clean the smooth side of the antenna with isopropanol.

Fig. 482: Identifying Velcro Strip
Courtesy of VOLVO CARS CORPORATION

- Take the velcro tape and cut it in the middle.
- Press the cut pieces into one another.

Fig. 483: Installing Adhesive Tape On Antenna
Courtesy of VOLVO CARS CORPORATION

- Remove the backing film and press the tape into place on the antenna.

Fig. 484: Cleaning Top Of Harness
Courtesy of VOLVO CARS CORPORATION

- Clean the top of the cable harness duct with isopropanol.

Fig. 485: Fitting Antenna
Courtesy of VOLVO CARS CORPORATION

- Raise up the air duct slightly so that the antenna can be fitted. Remove the backing film and position the antenna. Press hard so that the tape fastens. The antenna is to be positioned edge to edge against the cable harness duct.

Fig. 486: Removing Panel
Courtesy of VOLVO CARS CORPORATION

- Pry off the rear edge of the panel on the left-hand end of the dashboard. Twist out the panel. Remove the panel.

Fig. 487: Removing Sealing
Courtesy of VOLVO CARS CORPORATION

- Remove the sealing strip at the dashboard.

Fig. 488: Routing Cable
Courtesy of VOLVO CARS CORPORATION

- Take the antenna cable and the end with the gray connector. Insert the cable through the opening (1) and route it along the bottom edge of the fuse holder. Route the cable through the top edge of the fuse holder (2) and on up to the installed antenna. Hide the cable behind the fuse holder.

Fig. 489: Securing Cable Using Cable Ties
Courtesy of VOLVO CARS CORPORATION

- Plug the connector into the antenna.
- Fasten the antenna cable to the existing cable harness using a cable tie.

INSTALLATION

Fig. 490: Removing Multimedia Module
Courtesy of VOLVO CARS CORPORATION

- Remove the four screws and lift forward the multimedia module (MMM).

NOTE: **Cars that do not have a navigation system have a global positioning system (GPS) instead. It is installed under a protective plate.**

Remove the protective plate and carry out the corresponding procedure on the GPS unit as for the multimedia module (MMM) in steps 16-18.

Fig. 491: Routing Cable
Courtesy of VOLVO CARS CORPORATION

- Guide the antenna cable in under the seat at the seam of the floor carpeting.

Fig. 492: Unplugging Antenna Cable From Module
Courtesy of VOLVO CARS CORPORATION

- Unplug the antenna cable's blue connector from the module (MMM).
- Plug in the routed cable.
- Fasten the unplugged connector to the routed cable using a cable tie. Reposition the control module.

Fig. 493: Routing Cable
Courtesy of VOLVO CARS CORPORATION

- Position the antenna cable between the sill and the floor carpeting.

Fig. 494: Installing Cable To Duct Holders
Courtesy of VOLVO CARS CORPORATION

- Fasten the antenna cable and any excess length at the two cable duct holders.

Reinstall:

- multimedia module (MMM)
- the sealing strip
- the sill trim panel
- the cover panel at the B-post
- the end face panel
- the combined instrument panel and its border.

INFORMATION

- Read through all of the instructions before starting installation.
- Notifications and warning texts are for your safety and to minimize the risk of something breaking during installation.
- Ensure that all tools stated in the instructions are available before starting installation.
- Certain steps in the instructions are only presented in the form of images. Explanatory text is also given for more complicated steps.
- In the event of any problems with the instructions or the accessory, contact your local Volvo dealer.

CONDITIONS

Melting adhesive	1161656

INFORMATION

- Read through all of the instructions before starting installation.
- Notifications and warning texts are for your safety and to minimize the risk of something breaking during installation.
- Ensure that all tools stated in the instructions are available before starting installation.
- Certain steps in the instructions are only presented in the form of images. Explanatory text is also given for more complicated steps.
- In the event of any problems with the instructions or the accessory, contact your local Volvo dealer.

CONDITIONS

Reinstall the removed parts in reverse order.

NAVIGATION SYSTEM, PORTABLE (2003-2012)

NAVIGATION SYSTEM, PORTABLE

NOTE: For information regarding the GARMIN device, see www. garmin. com.

NOTE: **Some steps in these installation instructions are presented with illustration only.**

ASSEMBLING THE HOLDER

NOTE: **Take care when handling the components, they are fragile and are easily damaged.**

Fig. 585: Identifying Wrench, Screws And Nuts
Courtesy of VOLVO CARS CORPORATION

- Take the three screws **M5x20 part no. 986956** and nuts from the kit.
- To prevent too great resistance when the nut for the holder is tightened, hold the screw and screw the nut on and off the threaded part of the screw. Carry this out on all screws and nuts.

Fig. 586: Identifying Removal Screws Holding Connector In Holder
Courtesy of VOLVO CARS CORPORATION

- Take special tool **9814104** (torx driver, torx 6), and unscrew the two screws holding the connector in the holder.
- Carefully push the connector to one side with the cable to expose the bottom of the holder.

Fig. 587: Identifying Spacers
Courtesy of VOLVO CARS CORPORATION

- Take the kit with the four spacers from the installation kit.

  Carefully pry off the spacer using **P/N 31212525** . The part number (1) is on the bottom of the spacer.

Fig. 588: Identifying Screws Inserted In Spacer
Courtesy of VOLVO CARS CORPORATION

- Take the three screws and insert them in the spacer fully.

Fig. 589: Applying Pieces Of Butyl Tape To Screws
Courtesy of VOLVO CARS CORPORATION

- Apply pieces of butyl tape to the screws so that the screw heads do not protrude outside the spacer when installing it.

Illustration A

Fig. 590: Identifying Spacer In Bottom Of Holder
Courtesy of VOLVO CARS CORPORATION

- Install the spacer in the bottom of the holder.

Illustration B

Fig. 591: Identifying Spacer Secured In Position
Courtesy of VOLVO CARS CORPORATION

- Ensure that the holder's two screw turrets align between the small pins in the oblong holes in the spacer. A click should be heard when the spacer is securely in position.

Fig. 592: Aligning Guide Hole With Pin
Courtesy of VOLVO CARS CORPORATION

- Place the connector in the bottom of the hole. The guide hole (1) in the connector's circuit board must align in the corresponding pin at the bottom of the holder and the holes (2) in the circuit board must be over the holder's screw turret.

Fig. 593: Identifying Connector Tightened To Holder With Torx Screws
Courtesy of VOLVO CARS CORPORATION

- Take the small torx screws and carefully tighten the connector to the holder. Ensure that the connector's circuit board is properly against the screw turret and that there is no play.
- Remove the butyl tape from the screws.

PREPARATIONS

Fig. 594: Identifying Ignition Switch OFF & Disconnected Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position 0.
- Disconnect the battery negative lead.

NOTE: **Wait at least three minutes before unplugging the connectors or removing other electrical equipment.**

Fig. 595: Removing Gear Selector Cover
Courtesy of VOLVO CARS CORPORATION

Applies to cars with automatic gearbox

- Turn the ignition key to position II.
- Move the gear selector lever to its rearmost position.
- Use a weatherstrip and pry off the gear selector panel at the rear edge.

Fig. 596: Pressing In Catches And Removing Panel
Courtesy of VOLVO CARS CORPORATION

- Press in the catches and remove the panel.

Illustration A

Fig. 597: Removing Center Console
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws.
- Remove the bracket with the A/C panel and radio from the center console. Pull from the lower edge and then downwards until it releases from the mounting at the upper edge.

NOTE: Do not damage the removed components or the surrounding panels.

Illustration B

Fig. 598: Protecting Tunnel Console And Unit
Courtesy of VOLVO CARS CORPORATION

- Lay out a cloth to protect the tunnel console and unit. Place as illustrated. Depending on the design the cable may need to be disconnected and the unit placed to one side.

Illustration A

Fig. 599: Removing Loudspeaker Grille (1 of 2)
Courtesy of VOLVO CARS CORPORATION

- Remove the loudspeaker grille as follows: Insert the special tool, **9995919** into the joint between the loudspeaker grille and the dashboard approximately as illustrated, until it engages.
- Twist the tool 90° so that the bent section engages with the underneath of the loudspeaker grille.

Illustration B

Fig. 600: Removing Loudspeaker Grille (2 of 2)
Courtesy of VOLVO CARS CORPORATION

- Pull upwards until the loudspeaker grille detaches. The loudspeaker grille is securely fastened by four clips. Move the tool closer to the clip to facilitate removal.

NOTE: Do not damage the dashboard.

- Lift out the loudspeaker grille

Fig. 601: Cutting Template
Courtesy of VOLVO CARS CORPORATION

- Take the template from the kit and cut it along the outer lines.

Fig. 602: Tape Template To Loudspeaker
Courtesy of VOLVO CARS CORPORATION

- Tape the template to the loudspeaker grille.

Fig. 603: Drilling Loudspeaker Grille
Courtesy of VOLVO CARS CORPORATION

Drill square to the loud speaker grille.

- Pre-drill the holes according to the template using a **3 mm (1/8")** drill bit.
- Remove the template.

Illustrations A and B

Fig. 604: Cutting Loudspeaker Grille
Courtesy of VOLVO CARS CORPORATION

- Turn over the loudspeaker grille and cut away some of the ribs on the underside so that the result corresponds with figure B.

Fig. 605: Loudspeaker Grille
Courtesy of VOLVO CARS CORPORATION

Fig. 606: Drilling Hole For Connection
Courtesy of VOLVO CARS CORPORATION

- Drill up the three holes for the cradle's feet using a **14 mm (9/16")** step drill.

Fig. 607: Drilling Hole For Connection
Courtesy of VOLVO CARS CORPORATION

- Take the step drill and drill out the hole for the connection in the holder using a **28 mm (1 7/64") drill bit** .

Fig. 608: Deburr And Bend Edges
Courtesy of VOLVO CARS CORPORATION

- Deburr and bend in the edges using a round file.

INSTALLATION

Illustration A

Fig. 609: Loudspeaker Grille
Courtesy of VOLVO CARS CORPORATION

- Take three nuts, washers and the cradle from the kit and secure on the loudspeaker grille.

Illustration B

Fig. 610: Retaining Nuts
Courtesy of VOLVO CARS CORPORATION

- Tighten the cradle.

Illustration A applies to cars up to and including model year -05

Fig. 611: Removing Loudspeaker
Courtesy of VOLVO CARS CORPORATION

Illustration B applies to cars from and including model year 06-

Fig. 612: Removing Loudspeaker
Courtesy of VOLVO CARS CORPORATION

- Remove the five screws. Lift up the loudspeaker and remove the connector.
- Put the loudspeaker to one side. New loudspeaker and console in the kit.

Illustration C

Fig. 613: Console Loudspeaker Grille Holding
Courtesy of VOLVO CARS CORPORATION

- On vehicles without a center loudspeaker there is a console holding the loudspeaker grille. On these vehicles the console remains in place and the cable is routed through the hole.

Fig. 614: Identifying Foam Tape
Courtesy of VOLVO CARS CORPORATION

- Take the cable harness and foam tape out of the kit. Remove the protective tape.

Fig. 615: Wrapping Fuse Holder With Foam Tape
Courtesy of VOLVO CARS CORPORATION

- Wrap the foam tape around the fuse holder to prevent rattling.

Fig. 616: Routing Cable
Courtesy of VOLVO CARS CORPORATION

NOTE: The cable harness is always routed on the right-hand side in the tunnel console and the center console up to the hole for the loudspeaker grille.

- Take hold of the long cable harness. Route the end with the small connector on the right-hand side in the center console, up and out through the hole for the loudspeaker grille/console loudspeaker grille.

Fig. 617: Climate Panel Unit Connector
Courtesy of VOLVO CARS CORPORATION

- Take out the unit with the climate panel and connect connector (1) removed from the 12V outlet on the female connector (2) on the routed cable.
- Connect the remaining connector to the 12V outlet.

Fig. 618: Removing Loudspeaker Grille
Courtesy of VOLVO CARS CORPORATION

Applies to cars up to and including model year 05

- Remove the loudspeaker grille and loudspeaker from the kit. Secure the loudspeaker using the supplied screws. The connections on the speakers should face right.

Illustration A applies to cars up to and including model year -05

Fig. 619: Removing Loudspeaker
Courtesy of VOLVO CARS CORPORATION

Illustration B applies to cars from and including model year 06-

Fig. 620: Removing Loudspeaker
Courtesy of VOLVO CARS CORPORATION

- Connect the connector to the loudspeaker. Route the cable to the cradle through the large hole in the speaker console.
- Tighten the console using the five existing screws.

Fig. 621: Connecting Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Take out the small cable from the kit and connect it to the recently routed cable harness.

Fig. 622: Loudspeaker And Cradle
Courtesy of VOLVO CARS CORPORATION

- Take the loudspeaker and cradle. Connect the connector on the small cable to the cradle.

Fig. 623: Installing Loudspeaker
Courtesy of VOLVO CARS CORPORATION

- Insert the cable in the hole for the loudspeaker/console and push on the loudspeaker grille.

Fig. 624: Securing Cable
Courtesy of VOLVO CARS CORPORATION

- Secure the two green connectors using a piece of butyl tape in a suitable place to prevent rattling.
- Tuck away the surplus cable in the bottom of the center console.
- Tie together with a cable tie.

Fig. 625: Installing Face Plate
Courtesy of VOLVO CARS CORPORATION

- Refit the unit. Ensure the cables and relay are positioned so that they are not crushed or rub.
- Tighten using the existing screws.

Fig. 626: Pressing In Catches And Removing Panel
Courtesy of VOLVO CARS CORPORATION

Fig. 627: Removing Gear Selector Cover
Courtesy of VOLVO CARS CORPORATION

Fig. 628: Identifying Ignition In ON Position and Connecting Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position II.
- Reconnect the battery negative lead.

ACCESSORIES AND BODY, CAB

Media, Communication And Navigation - Installation Instructions, Accessories

ADAPTER CABLE, RSE (REAR SEAT ENTERTAINMENT) (2003-2008)

ADAPTER CABLE, RSE (REAR SEAT ENTERTAINMENT)

REMOVAL

Fig. 1: Disconnect Battery Negative Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position 0
- Disconnect the battery negative lead.

NOTE: **Wait at least five minutes before disconnecting the connectors or removing other electrical equipment.**

REMOVAL

Fig. 2: Applies To Two-Wheel Drive Cars With Two Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

Applies to two-wheel drive cars with two rows of seats

- Remove the rear floor hatch (1) by folding it back slightly and pulling it backwards out of its mountings.

Applies to other cars with two rows of seats

- Fold up the rear floor hatch (1)
- If the floor hatch has a carrier bag holder on the lower side, it is secured in the car by two straps either side of the bottom of the carrier bag holder. Pull both straps away from the protruding mountings
- Remove the storage box from under the floor hatch. Lift out the storage box.

Applies to cars with three rows of seats and integrated carrier bag holder on the underside of the floor hatch

- Fold up the rear floor hatch (1)
- Disconnect the two straps on either side of the bottom of the carrier bag holder from the protruding mountings. Lift up the rear edge of the carrier bag holder, fold the floor hatch back towards the bottom and lift out the carrier bag holder.

Applies to cars with three rows of seats without an integrated carrier bag holder

- Fold up the rear floor hatch (1) at the rear edge and lift it out.

Applies to all models

- Lift out the right-hand side floor hatch (2). Lift the floor hatch straight up.

Fig. 3: Remove Right And Left-Hand Sides Rear Side Panels
Courtesy of VOLVO CARS CORPORATION

- Remove the rear side panels on the right and left-hand sides.

Fig. 4: Remove Rear Headlining Panel Cover
Courtesy of VOLVO CARS CORPORATION

- Remove the covers from the rear headlining panel. Remove the screws from inside the panels
- Carefully pry off the headlining panel at the rear edge using a plastic weatherstrip tool
- Grip the rear edge of the headlining panel. Pull the headlining panel down until all the clips on the inside release.

Applies to cars with three rows of seats

- Disconnect the connector for the rear roof lighting. Pull the panel backwards.

Fig. 5: Pull Off Top Edge Of Right-Hand D Pillar Panel
Courtesy of VOLVO CARS CORPORATION

- Carefully detach the D-post panels on the right and left-hand sides. Start at the top edge then pull down until the three clips release
- If the car has D-post loudspeakers: disconnect the connectors for the loudspeakers.

Illustration A

Fig. 6: Identifying Right-Hand Tail Lamp 13-Pin Connector
Courtesy of VOLVO CARS CORPORATION

- Locate the 13-pin connector at the right-hand tail lamp
- If the 13-pin connector is connected to the towbar wiring connector: disconnect the connectors from each other.

Illustration B

Fig. 7: View Of Green Connector (1) To The RSE System
Courtesy of VOLVO CARS CORPORATION

- Take the cable harness from the kit
- Connect the 13-pin connector for the cable harness to the existing connector at the right-hand tail lamp. Connect the other connector to the towbar wiring (if applicable)
- Connect the green connector (1) to the RSE system if this is installed in the car.

Fig. 8: Locating 15A Fuse In Position 9 In REM
Courtesy of VOLVO CARS CORPORATION

- Route the long single cable through the hole under the foam rubber to the battery
- Continue to route the cable along the existing cable harness behind the battery and on through the hole under the foam rubber, into the left-hand tail lamp
- Continue to route the cable together with the existing cable harness along the left-hand D-post up to the roof
- Install a 15A fuse in position 9 in REM.

Fig. 9: Identifying 14-Pin Connector
Courtesy of VOLVO CARS CORPORATION

- Locate the 14-pin connector (1) in the left-hand corner of the roof above the D-post
- Disconnect the clip for the connector from the roof by pulling the connector straight down from the roof
- Separate the connector.

Fig. 10: View Of Pressing The Catch
Courtesy of VOLVO CARS CORPORATION

- Disconnect the cable pin (1) in position 8 in the female terminal. Lift the red catches on the connector and press out the entire red plastic insert
- Using a thin, pointed object, press the catch holding the cable pin to one side. Pull out the cable at the same time.

Fig. 11: View Of Connecting Pin (1)
Courtesy of VOLVO CARS CORPORATION

- Connect the pin (1) that has just been disconnected to the 2-pin connector from the kit in position 1. (Use the same method as for the 14-pin connector)
- Connect the remaining cable (2) from the 2-pin connector for the adapter cable to position 8 in the 14-pin female terminal from the car. This final connection reconnects the power to the position from where the pin was previously removed
- Reinstall the plastic catches on the connectors
- Connect both connectors to the corresponding connectors
- Reinstall the 14-pin connector at the roof using the clip.

- Clamp the adapter cable to the existing cable harness at regular intervals
- Clamp at the points where the existing cable harness is secured in the car with clips.

RECONNECT

- Reconnect the battery negative lead
- Insert the key in the ignition and turn to position I
- Check that the RSE system is powered
- Reinstall the removed panels in reverse order.

AMPLIFIER (2003-2004)

AMPLIFIER

NOTE: This accessory requires software unique to the car.

REMOVAL

Fig. 12: View Of Right-Hand Seat Back To The Rearmost And Uppermost Position
Courtesy of VOLVO CARS CORPORATION

- Open the right-hand front door
- Slide the right-hand seat back to the rearmost and uppermost position.

Fig. 13: Identifying Amplifier Retaining Screws
Courtesy of VOLVO CARS CORPORATION

Fig. 14: View Of Front Edge Of Amplifier
Courtesy of VOLVO CARS CORPORATION

- Remove the three retaining screws holding the amplifier
- Lift up the front edge of the amplifier. Pull the amplifier upwards slightly. Disconnect the connectors on the reverse
- Place the amplifier to one side.

- Push the new amplifier down slightly in the recess and connect the connectors
- Position the amplifier. Secure the amplifier using the screws used for the existing amplifier.

FINISHING

- Program the software according to the service information in VIDA (Volvo scan tool).

CARPHONE HOLDER (2003)

CARPHONE HOLDER

PREPARATIONS

Fig. 15: Disconnect Battery Negative Lead
Courtesy of VOLVO CARS CORPORATION

- Position the driver's seat in the rearmost position
- Turn the ignition key to position 0
- Disconnect the battery negative lead.

NOTE: **Wait at least five minutes before disassembling the connectors or removing other electrical equipment.**

Illustration A

Fig. 16: Removing The Loudspeaker Grille
Courtesy of VOLVO CARS CORPORATION

Remove the loudspeaker grille as follows:

- Take a piece of 1.5 mm (1/16") diameter welding rod. Bend one end to 90° (L=5 mm (13/64")). The other

end is bent to form a handle

- Insert the first bent end down into the joint between the loudspeaker grille and the dashboard as illustrated, until it engages
- Twist the welding rod 90° so that the bent section engages with the underneath of the loudspeaker grille. It may be necessary to move the welding rod along the joint to twist the rod around.

Illustration B

Fig. 17: View Of Detached Loudspeaker Grille
Courtesy of VOLVO CARS CORPORATION

- Pull upwards until the loudspeaker grille detaches. The loudspeaker grille is securely fastened by four clips.

NOTE: Do not damage the dashboard.

- Place the loudspeaker grille to one side.

Illustration C applies to cars without a centrally-mounted loudspeaker

Fig. 18: Identifying Cars Without A Centrally-Mounted Loudspeaker
Courtesy of VOLVO CARS CORPORATION

- Remove the bracket for the loudspeaker grille by removing the five screws and pulling it up out of the dashboard.

Illustration D applies to cars with a centrally-mounted loudspeaker

Fig. 19: Identifying Cars With A Centrally-Mounted Loudspeaker
Courtesy of VOLVO CARS CORPORATION

- Remove the five screws in the loudspeaker. Pull up the loudspeaker slightly from the dashboard. Disconnect the connector.

Illustration E applies to cars with RTI (road traffic information)

Fig. 20: Identifying Cars With RTI (road Traffic Information) Display
Courtesy of VOLVO CARS CORPORATION

- Remove the five screws in the display for RTI (road traffic information). Pull up the display slightly from the dashboard. Disconnect the connectors. Disconnect the centrally-mounted loudspeaker connector if installed.

Fig. 21: Identifying Upper Steering Column Cover Removal
Courtesy of VOLVO CARS CORPORATION

- Lower the steering wheel to the lowermost position. Pull the steering wheel to the rearmost position
- Remove the two screws at the top edge of the combined instrument panel surround
- Carefully pry off the rubber seal from the upper steering column cover. Use a weatherstrip tool. It is secured with five clips
- Remove the surround by carefully pulling it backwards, first at the lower edge and then at the top edge until all the clips have released.

Fig. 22: View Of Combined Instrument Panel Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the four screws for the combined instrument panel
- Pull out the combined instrument panel. Disconnect the connector on the reverse of the combined instrument panel.

Fig. 23: Prying Off Gear Selector Panel At Rear Edge
Courtesy of VOLVO CARS CORPORATION

Applies to cars with automatic gearboxes

- Turn the ignition key to position II.

Applies to all models

- Move the gear selector lever to its rearmost position
- Carefully pry off the gear selector lever panel at the lower edge using a weatherstrip tool. Pull the panel

backwards to access the screws for the dashboard environment panel.

Fig. 24: Removing Screws And Radio/AC Unit From Center Console
Courtesy of VOLVO CARS CORPORATION

- Remove the screws holding the bracket for the dashboard environment panel and the control module
- Pull out the bracket at the lower edge. Pull downwards from the top edge of the center console
- Disconnect the connectors from the dashboard environment panel, control module. If applicable disconnect the CD player and/or Mini disc player connectors.

INSTALLING

Fig. 25: Identifying Carphone Holder Bracket Components
Courtesy of VOLVO CARS CORPORATION

- Take the carphone holder bracket, the reinforcement panel, the cover and screws from the kit
- Install the reinforcement panel (1) and the cover (2) in the bracket (3) using the screws (4).

Illustration A

Fig. 26: View Of Bracket To Dashboard
Courtesy of VOLVO CARS CORPORATION

- Position the entire unit (1) in the dashboard to mark out holes for the bracket. Adjust to achieve the optimum position. Do not press the unit hard against the dashboard, however, ensure that there are no gaps at the sides between the panel and the dashboard (2).

Illustration B

Fig. 27: View Of Bracket Hole Markings
Courtesy of VOLVO CARS CORPORATION

- Hold the unit securely and mark out the holes through the bracket
- Drill out the two holes using a 5 mm (13/64") diameter drill bit. Use a 25 mm (1") drill stop
- Remove any metal shavings
- Remove the cover and the reinforcement panel from the bracket.

Fig. 28: View Of Reinforcement Panel Screws
Courtesy of VOLVO CARS CORPORATION

- Take the reinforcement panel (1) and the two screws from the kit
- Position the carphone holder wiring so that it is routed on the reverse of the bracket as illustrated
- Insert the reinforcement panel through the hole for the center loudspeaker
- Install the bracket (2). Use the two screws (3). Tighten the bracket against the dashboard.

Fig. 29: Filing Out Groove For Cable To Handset Holder And For Installed Bracket
Courtesy of VOLVO CARS CORPORATION

- Mark out the hole for the wiring for the handset holder and bracket on the surround for the combined instrument panel
- File out a groove (1) in the surround for the combined instrument panel for the wiring for the handset holder
- File the hole so that it is large enough for any excess wiring to be routed through the hole and hidden on the inside of the dashboard

- File out a groove (2) for the installed bracket
- Smooth off the edges of the groove.

Fig. 30: Identifying Wire Routing
Courtesy of VOLVO CARS CORPORATION

- Route the wiring to the carphone holder from the hole for combined instrument panel. Position the wiring at the left air duct in the center console. Do not route more wiring than is required to secure the carphone holder
- Connect the combined instrument panel. Reinstall the combined instrument panel
- Reinstall the surround for the combined instrument panel. Tighten.

Fig. 31: Identifying Bracing Plate Components
Courtesy of VOLVO CARS CORPORATION

- Install the bracing plate (1) and the cover (2) in the bracket (3). Use the screw (4) (from the kit). Do not tighten fully yet
- Remove the mounting plate (5) for the carphone holder from the carphone holder. Tighten the mounting

plate using the screws (6) from the kit
- Tighten the screw (4).

Illustration A applies to Nokia

Fig. 32: Identifying Handset Holder Mounting Components
Courtesy of VOLVO CARS CORPORATION

- Tighten the carphone holder (1) onto the mounting plate (2) using the screw (3)
- Install the cover (4).

Illustration B applies to the Ericsson T28, T29, T39

Fig. 33: Identifying Handset Holder Mounting Components
Courtesy of VOLVO CARS CORPORATION

- Tighten the upper section of the carphone holder (1) onto the mounting plate (2) using the screw and washer (3)

- Press the lower section (4) of the carphone holder onto the upper section.

Illustration C applies to the Ericsson T20

Fig. 34: Identifying Carphone Holder Mounting Components
Courtesy of VOLVO CARS CORPORATION

- Tighten the carphone holder mounting (1) onto the mounting plate (2) using the screw and washer (3)
- Press the carphone holder (4) onto the mounting.

CONNECTING

- Connect the connectors to the dashboard environment panel and control module. If applicable connect the CD player and/or Mini disc player connectors
  1. the display for the RTI and the center loudspeaker if applicable
  2. the center loudspeaker
  3. the bracket for the loudspeaker grille
  4. the loudspeaker grille.
- Position the bracket. Tighten the bracket using the two screws. Reinstall the gear selector lever panel
  1. the display for the RTI and the center loudspeaker if applicable
  2. the center loudspeaker
  3. the bracket for the loudspeaker grille
  4. the loudspeaker grille.
- Reinstall (depending on the equipment of the car):
  1. the display for the RTI and the center loudspeaker if applicable
  2. the center loudspeaker
  3. the bracket for the loudspeaker grille
  4. the loudspeaker grille.

FINISHING

Fig. 35: Connecting Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position II
- Reconnect the battery negative lead.

CARS EQUIPPED WITH SRS/SIPS (AIRBAG)

WARNING: **Extra care must be taken when working on cars equipped with SRS/SIPS air bags. This is important to prevent:**

1. Personal injury

2. Damage to or malfunction of the SRS/SIPS system.

Work on the SRS/SIPS systems or related components must always be carried out by an authorized Volvo workshop.

Is the car equipped with SRS (supplemental restraint system)?

Cars equipped with a driver's airbag have the letters "SRS" imprinted on the center panel of the steering wheel. Cars equipped with driver's and passenger airbags are marked with "SRS" on both the steering wheel center panel and also on the dashboard close to the airbag.

If the car is equipped with SIPS (side impact protection system) a "SIPS" decal is marked on both the front seats.

Cars equipped with inflatable curtains have the marking "SRS" on one of the panels along the posts on the inside of the car.

Cars equipped with SRS (supplemental restraint system) also have an "SRS" decal on the front windscreen.

Do not damage the SRS wiring.

Do not trap, chafe, pierce or damage the SRS wiring. SRS wiring has orange casing and/or is plaited.

Steering and front suspension

The contact reel in the SRS system can easily be damaged when working on the steering wheel, steering shaft or steering gear.

SRS warning lamp

If the SRS warning lamp lights after repairs have been carried out, take the car to an authorized Volvo workshop.

SRS collision sensor control module

CAUTION

The ignition must be in position "0" and the key removed from the ignition switch if any connector in the SRS system is to be unplugged. Then wait at least one minute and disconnect the battery negative lead before unplugging any of the connectors. When work is completed, the ignition key must be turned to position "II" before reconnecting the battery negative lead.

XC90

The collision sensor control module is located on the tunnel under the center console, in front of the parking brake.

CAUTION

The air bag inflation areas must not be obstructed. Never place any objects, such as upholstery or accessories, within these areas. The panels must be able to open in the correct manner at the right time, otherwise there is an increased risk of personal injury in the event of a collision.

CD PLAYER/CHANGER (6 CD) (2003)

CD PLAYER/CHANGER (6 CD)

NOTE: This accessory requires software unique to the car.

No extra wiring is required when replacing the CD player with a CD changer.

PREPARATORY WORK

Fig. 36: Disconnect Battery Negative Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition switch to position 0
- Disconnect the battery negative lead.

NOTE: **Wait at least five minutes before disassembling the connectors or removing other electrical equipment.**

Fig. 37: Prying Off Gear Selector Panel At Rear Edge
Courtesy of VOLVO CARS CORPORATION

Applies to cars with automatic gearboxes

- Turn the ignition key to position II.

Applies to all models

- Move the gear selector lever to its rearmost position
- Carefully pry off the rear edge of the panel for the gear selector lever using a plastic weatherstrip tool. Pull the panel backwards to access the screws for the dashboard environment panel.

Fig. 38: Removing Screws And Radio/AC Unit From Center Console
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws holding the bracket for the dashboard environment panel and the control module.

NOTE: Pull out the bracket at the lower edge. Pull from the top edge of the center console.

- Disconnect the connectors from the dashboard environment panel, control module. If applicable disconnect the MiniDisc player connector.

Applies when replacing the CD player with a CD changer

- Disconnect the connector for the CD player.

Fig. 39: View Of Control Module Screws
Courtesy of VOLVO CARS CORPORATION

Fig. 40: Remove The Control Module
Courtesy of VOLVO CARS CORPORATION

Applies to all models

- Position the console with the control module and dashboard environment panel in a suitable position
- Remove the four screws on the reverse holding the control module at the console
- Press in the four catches in the sides of the control module so that they release. Carefully remove the control module.

Fig. 41: View Of Control Module Panel
Courtesy of VOLVO CARS CORPORATION

Applies to cars without a CD player

- Remove the small panel at the lower edge of the control module panel by prying up the catches and detaching the panel
- Place the panel to one side. The panel will not be reused.

INSTALLING THE CD PLAYER/CHANGER

Fig. 42: Identifying CD Player/Changer Screws
Courtesy of VOLVO CARS CORPORATION

- Insert the CD player/changer in the lower cut-out in the console. Ensure that the locating pins on the sides and on the reverse and the connector locate in the corresponding holes in the console
- Tighten the two screws from the kit and tighten the CD player
- For aftermarket installation of both a MiniDisc and CD player/changer, install the MiniDisc player

according to points 5 and 6 in these installation instructions.

Applies when replacing the CD player with a CD changer

- Remove the two screws retaining the CD player. Pull out the CD player
- Take the CD changer and slide it into the same place as the CD player was positioned
- Tighten the CD changer using the screws that secured the CD player.

Fig. 43: Inserting Control Module To Bracket
Courtesy of VOLVO CARS CORPORATION

Applies to all models

- Insert the control module in the bracket. Ensure that its guide moldings at the bottom edge align in the corresponding channels in the top edge of the dashboard environment panel. Press all the way around so that the four catches engage
- Tighten the control unit on the reverse using the four screws
- Position the bracket in the car, in front of the cut-out in the center console, leaning backwards towards the gear selector lever as illustrated.

Applies when replacing the CD player with a CD changer

- Connect all the previously disconnected connectors to the control module, dashboard environment panel and, if applicable, the MiniDisc player
- Connect the connector from the CD player to the CD changer. Position the bracket. Tighten the bracket using the two screws
- Reinstall the gear selector lever panel
- Continue to point 16.

ROUTING AND CONNECTING WIRING

NOTE: **The small thicker and stiffer orange cables in the cable harnesses are fibre optic and must be handled and routed very carefully. These cables cannot be bent as much as normal wiring, the bend radius must not be less than 3 cm.**

APPLIES TO CARS WITHOUT A FACTORY INSTALLED PLAYER, WHEN ONLY INSTALLING A CD PLAYER/CHANGER

Fig. 44: View Of Junction Cable (A)
Courtesy of VOLVO CARS CORPORATION

- Take the junction cable (A) from the kit. (Purchased separately)
- Connect the connect (1) on the junction cable to the corresponding connector on the CD player/changer.

NOTE: **Be very careful when connecting the connector in the CD player/changer. The terminal pins in this connector are thin. They are easily damaged and may become pressed into the player if the connector is not installed straight.**

- Locate the pre-routed, bridge connector (2) on the fibre optic cable in the center console, wrapped in foam tape
- Disconnect the connector (3) from the bridged connector (2). Connect it to connector (4) on the junction cable.

NOTE: **If installing a CD player and an RTI system at the same time, the junction cable for the RTI system must be connected first to the connector (3). This connector will then be in use, but there is a corresponding connector on the junction cable for the RTI system. Connect this to the connector (4).**

- Find the pre-routed grey connector (5) for power supply in the thick cable harness in the center console. The connector is located either in the center console or in the space above the accelerator pedal. To remove the panel above the accelerator panel, slacken off the two Torx screws and then pull the panel free from the clips on the outer edges and unhook it

- Connect the connector (5) to the remaining connector (6) on the junction cable
- Take half of the foam tape from the wiring kit and wrap it around the grey connectors (5, 6). Use the remaining foam tape to tape around the connectors (3, 4).

NOTE: **The junction cable must be routed around the bracket as illustrated. When reinstalling the bracket in the center console in the car, the junction cable must be held against the bracket as illustrated. This is to ensure that it remains in position.**

APPLIES TO CARS WITHOUT A FACTORY INSTALLED PLAYER, WHEN INSTALLING BOTH A MINIDISC AND CD PLAYER/CHANGER

Fig. 45: View Of Junction Cable (B)
Courtesy of VOLVO CARS CORPORATION

- Take out the junction cable (B) (purchased separately) with the four connectors
- Connect the connector (1) on the junction cable to the corresponding connector on the MiniDisc player and connector (2) to the corresponding connector in the CD player/changer. The connectors (1) and (2) are identical. It does not matter which connector is connected to which unit.

NOTE: **Be very careful when connecting the connectors in the MiniDisc/CD players. The terminal pins in these connectors are thin. They are easily damaged and may become pressed into the players if the connector is not installed straight.**

- Locate the pre-routed, bridge connector (3) on the fibre optic cable in the center console, wrapped in foam tape
- Disconnect the connector (4) from the bridged connector (3). Connect it to connector (5) on the junction cable.

NOTE: **If installing a CD player and an RTI system at the same time, the junction cable for the RTI system must be connected first to the connector (4). This**

connector will then be in use, but there is a corresponding connector on the junction cable for the RTI system. Connect this to the connector (5).

- Find the pre-routed grey connector (6) for power supply in the thick cable harness in the center console. The connector is located either in the center console or in the space above the accelerator pedal. To remove the panel above the accelerator panel, slacken off the two Torx screws and then pull the panel free from the clips on the outer edges and unhook it
- Connect the connector (6) to the remaining connector (7) on the junction cable
- Take half of the foam tape from the wiring kit and wrap it around the grey connectors (6, 7). Use the remaining foam tape to tape around the connectors (4, 5).

NOTE: The junction cable must be routed around the bracket as illustrated. When reinstalling the bracket in the center console in the car, the junction cable must be held against the bracket as illustrated. This is to ensure that it remains in position.

OPERATIONS 10-14 APPLY TO CARS WITH FACTORY-INSTALLED MINIDISC PLAYERS/CHANGERS

Fig. 46: Identifying Control Module And The Dashboard Environment Panel Connectors
Courtesy of VOLVO CARS CORPORATION

NOTE: If installing a CD player/changer and an RTI system at the same time, the RTI system must be connected according to the installation instructions. Then follow these installation instructions as if the RTI system was not installed. However use the connector in the MiniDisc player.

HINT: work from the right-hand seat.

- Remove approximately 20 cm of foam tape from the existing cable harness so that the wiring is unimpeded
- Reinstall the connectors for the control module and the dashboard environment panel. Do not connect the connector (1) to the MiniDisc player yet.

Fig. 47: Identifying MiniDisc Player Connectors
Courtesy of VOLVO CARS CORPORATION

- Take the connector (1) which was in the MiniDisc player and remove the connector (2) with the fibre optic cable from it. Use a small screwdriver or similar to lift the catch as illustrated. At the same time pull the fibre optic cable outwards to release the connector (2)
- Reinstall the connector (1) which is now without the connector (2) in the MiniDisc player.

NOTE: **Be very careful when connecting the connector in the MiniDisc player. The terminal pins in this connector are thin. They are easily damaged and may become pressed into the player if the connector is not installed straight.**

Illustration A

Fig. 48: Identifying Junction Cable (C)
Courtesy of VOLVO CARS CORPORATION

- Take the junction cable (C) (purchased separately) and locate its foam taped connector (3)

- Connect the small connector (2) with the fibre optic cables (disconnected in the previous step) to the connector (3) in the junction cable. There will be a click when the catch engages.

Illustration B

Fig. 49: Connect The Connector (4) From The Junction Cable
Courtesy of VOLVO CARS CORPORATION

- Connect the connector (4) from the junction cable to the CD player and the connector (5) from the junction cable to the connector (1) which was reinstalled in the MiniDisc player before.

NOTE: **Be very careful when connecting the connector in the CD player/changer. The terminal pins in this connector are thin. They are easily damaged and may become pressed into the player if the connector is not installed straight.**

- Find the pre-routed grey connector (6) for power supply in the thick cable harness in the center console. The connector is located either in the center console or in the space above the accelerator pedal. To remove the panel above the accelerator panel, slacken off the two Torx screws and then pull the panel free from the clips on the outer edges and unhook it
- Connect the connector (6) to the remaining connector (7) on the junction cable
- Take a small piece of the foam tape from the kit and wrap it around the grey connectors (6, 7) in the center console.

Fig. 50: View Of Load-Removing Grommets (1) Secured In The Fibre Optic Cable Loops
Courtesy of VOLVO CARS CORPORATION

HINT: work from the right-hand seat.

- Position the wiring so that it runs around the bracket as illustrated
- Take half of the remaining foam tape from the wiring kit and wrap it around the cables not already protected.

NOTE: There will be excess fibre optic wiring which should be placed in an loop as illustrated.

- Take the two load-removing grommets (1) from the wiring kit and secure it in the loops formed by the fibre optic cable as illustrated.

Fig. 51: Identifying Corner Clip And Tie Strap
Courtesy of VOLVO CARS CORPORATION

- Take the corner clip and tie strap from the wiring kit. Press it into place at the top of the underside of the bracket as illustrated
- Tighten the tie strap around the foam taped cable harness to secure the excess fibre optic wiring as illustrated
- Take the remaining strips of foam tape and tape the loop to prevent it from rattling.

FINISHING WORK

Fig. 52: Identifying Dashboard Environment Panel
Courtesy of VOLVO CARS CORPORATION

- Connect the previously disconnected connector to the control module and dashboard environment panel. Position the bracket. Tighten the bracket using the two screws
- Reinstall the gear selector lever panel
- Reinstall the panel above the accelerator pedal if removed.

Fig. 53: Connecting Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position II
- Reconnect the battery negative lead
- Program the software according to the service information in VIDA (Volvo scan tool).

CENTRE LOUDSPEAKER (2003-2011)

CENTRE LOUDSPEAKER

Illustration A

Fig. 54: Removing The Loudspeaker Grille
Courtesy of VOLVO CARS CORPORATION

Remove the loudspeaker grille as follows:

- Take a piece of 1.5 mm (1/16") diameter welding rod. Bend one end to 90° (L=5 mm (13/64")). The other end is bent to form a handle
- Insert the first bent end down into the joint between the loudspeaker grille and the dashboard as illustrated, until it engages
- Twist the welding rod 90° so that the bend section engages with the underneath of the loudspeaker grille. It may necessary to move the welding rod along the joint to twist the rod around.

Illustration B

Fig. 55: View Of Detached Loudspeaker Grille
Courtesy of VOLVO CARS CORPORATION

- Pull upwards until the loudspeaker grille detaches. The loudspeaker grille is securely fastened by four clips.

NOTE: Do not damage the dashboard.

- Place the loudspeaker grille to one side.

Fig. 56: Identifying Loudspeaker Cut-Out Bracket
Courtesy of VOLVO CARS CORPORATION

- Remove the five screws in the loudspeaker cut-out bracket
- Pull up the bracket and place to one side. The bracket will not be reused.

Fig. 57: View Of Pre-Routed Loudspeaker Connector
Courtesy of VOLVO CARS CORPORATION

- Take the new loudspeaker, connect the pre-routed connector in the dashboard to the loudspeaker
- Position the loudspeaker. Tighten the loudspeaker using the five screws positioned in the loudspeaker cut-out bracket
- Reinstall the loudspeaker grille.

FRONT DOOR, LOUDSPEAKERS (2003-2011)

FRONT DOOR, LOUDSPEAKERS

NOTE: **If loudspeakers without mid-range are to be mounted ignore point 4 onwards. Use the same mounting hole as for the existing loudspeaker.**

Fig. 58: Identifying Door Handle Hole
Courtesy of VOLVO CARS CORPORATION

- Remove the panel on the door handle. First insert a small screwdriver in the hole (1) in the lower section of the panel and press the catch on the inside at the same time as pulling the top edge of the panel upwards. If necessary use a plastic weatherstrip tool to pry up the top edge of the cover.

Fig. 59: Identifying Door Panel Treble Loudspeaker
Courtesy of VOLVO CARS CORPORATION

- Remove the treble loudspeaker (1) in the door panel. Pry it loose using a weatherstrip tool
- Remove the two screws (2) from under the panel
- Carefully pry off the door panel using the weatherstrip tool. Start at the lower edge and pry opposite the clips (3).

Fig. 60: Locating Loudspeaker Rivets
Courtesy of VOLVO CARS CORPORATION

- Disconnect the connectors (1) from the door control module and from the existing loudspeaker
- Remove the wire (2) from the door opener handle (3). First bend up the catches
- Remove the door panel

- Remove the panel (4) for the cable lead-in
- Drill out the rivets (5) from the existing loudspeaker. Use a **6 mm (1/4")** diameter drill bit
- Remove the loudspeakers and any rivet metal shavings from the rivet holes. Also remove any rivet metal shavings from the door.

Fig. 61: Identifying Mid-Range Oil Cloth Cut Out
Courtesy of VOLVO CARS CORPORATION

- Place the door panel on a suitable underlay, on a blanket or carpet, for example
- Carefully cut the oil cloth out from the inside of the loudspeaker grille. Cut along the edges of the smaller round hole where the mid-range element is to be positioned.

NOTE: Only cut through the oil cloth. Do not damage the underlying fabric.

Fig. 62: View Of New Loudspeaker In Place
Courtesy of VOLVO CARS CORPORATION

- Screw the new loudspeaker into place using the screws, washers and the nuts from the kit (1). The

washers must be positioned under the screw heads. Make a hole in the round piece of tape covering the screw hole to insert the rear screw

- Reinstall the panel (2) for the cable lead-in.
- Connect the connectors (3) to the loudspeaker and the module for the door controls
- Reinstall the mechanical cable (4) on the door opener handle (5)
- Reinstall the door panel, the treble loudspeaker and the door handle panel.

GLASS MOUNTED GSM COMBINED AERIAL (2003-2011)

CARS EQUIPPED WITH SRS/SIPS (AIRBAG)

see **CARS EQUIPPED WITH SRS/SIPS (AIRBAG)**

CAUTION

see **CAUTION**

GLASS MOUNTED GSM COMBINED AERIAL

CAUTION: The aerial must be removed from the external base module if using a carwash.

NOTE: When installing the aerial the window must remain at a temperature of at least +10°C.

PREPARATIONS

Fig. 63: View Of Centre Console Right-Hand Side Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the right-hand side panel from the center console. Pull off the panel starting at the front edge.

Then pull backwards until all the clips release.

Fig. 64: Disconnect Battery Negative Lead
Courtesy of VOLVO CARS CORPORATION

Applies to cars with power front seats

- Position the right-hand front seat so that the panels over the front and right rear seat mountings, and the small panel at the lower edge of the right-hand B-post are not obstructed. They will be removed later after disconnecting the battery negative lead.

Applies to all models

- Turn the ignition key to position 0
- Disconnect the battery negative lead.

NOTE: **Wait at least five minutes before disassembling the connectors or removing other electrical equipment.**

Fig. 65: Prying Off Gear Selector Panel At Rear Edge
Courtesy of VOLVO CARS CORPORATION

Applies to cars with automatic gearboxes

- Turn the ignition key to position II.

Applies to all models

- Move the gear selector lever to its rearmost position
- Carefully pry off the gear selector lever panel at the lower edge using a weatherstrip tool. Pull the panel backwards to access the screws for the dashboard environment panel.

Fig. 66: Removing Screws And Radio/AC Unit From Center Console
Courtesy of VOLVO CARS CORPORATION

- Remove the screws holding the bracket for the dashboard environment panel and the control module
- Pull out the bracket at the lower edge. Pull downwards from the top edge of the center console

- Disconnect the connectors from the dashboard environment panel, control module. If applicable disconnect the CD player and/or Mini disc player connectors.

Fig. 67: View Of Front Seat Front Edge Cover
Courtesy of VOLVO CARS CORPORATION

- Remove the cover (1) on the left front mounting on the right-hand front seat by prying off the front edge
- Pry off the front edge of the right panel (2). Remove the panel.

Fig. 68: Prizing Right-Hand Rear Mounting Of Cover Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the panel on the right rear mounting on the right-hand front seat. Pry it up slightly at the rear edge and then pull it back / upwards.

Fig. 69: Prizing Away Cover Panel Over Joint Between Door Sills On Right-Hand Side, At Lower Edge, Using A Weatherstrip Tool
Courtesy of VOLVO CARS CORPORATION

- Carefully pry off and remove the panel above the joint between the right-hand door sills, at the lower edge using a weatherstrip tool.

Fig. 70: Right-Hand Front Door's Sill Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Detach the sill trim panel for the right-hand front door. Pull off the panel starting at the front edge until the clip releases. Continue backwards until the remaining clips have released
- Unhook the sill trim panel from the B-post panel.

Fig. 71: Pushing Up Catch On Top Side
Courtesy of VOLVO CARS CORPORATION

- Remove the panel in the right-hand front seat mounting on the right-hand seat in the second row. Push up the catch (1) on the top. Pull the panel forward.

Fig. 72: Removing Cover Panel
Courtesy of VOLVO CARS CORPORATION

- Fold the backrest on the right-hand seat in the second row forward as far as possible. Slide the front seat forward as far as possible. (On cars with two rows of seats, the second row is secured.)
- Remove the cover (1) for the right rear seat mounting by prying off the rear edge.

Illustration A

Fig. 73: Removing Sill Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the sill trim panel for the right-hand rear door. Pull the rear edge until the clips release. Continue forwards until the remaining clips have released.

Applies to cars with two rows of seats

- On cars with two rows of seats the seat cannot be slid forwards. To remove the sill trim panel; Start by folding the backrest forward when pulling the rear edge of sill trim panel loose. Then reposition the backrest to raise the seat cushion and provide more room for removing the sill trim panel. It is securely positioned. Do not damage the panel and surrounding components.

Illustration B

Fig. 74: Identifying Sill Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Unhook from the B-post panel and place in the second/third row of seats.

Fig. 75: Identifying Centre Floor Hatch
Courtesy of VOLVO CARS CORPORATION

Applies to cars with three rows of seats and integrated carrier bag holder on the under side of the center floor hatch

- Fold the rear center floor hatch up
- Detach the two straps from the panel underneath. Lift up the panel at the rear edge. Fold the floor hatch back towards the panel and lift out the floor hatch and the panel.

Applies to cars with three rows of seats without integrated carrier bag holders

- Lift up the center rear floor hatch at the rear edge and lift it out.

Fig. 76: Removing Two Center Floor Hatches By Lifting Them Slightly
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Remove the two center floor hatches. First lift up slightly and then pull them loose from the mountings at the front edge. If the rear center floor hatch has a carrier bag holder on the lower side, the floor hatch is secured by a strap on each of the shorter sides of the storage box. These must be removed
- Remove the two storage boxes from underneath.

Fig. 77: Remove Right And Left Side Glove Box
Courtesy of VOLVO CARS CORPORATION

Applies to all models

- Remove the right-hand side floor hatch (1).

Fig. 78: Folding Side Panel From Right-Hand Side Of Cargo Compartment
Courtesy of VOLVO CARS CORPORATION

- Remove the folding side panel from the right-hand side in the cargo compartment.

Fig. 79: Remove Rear Headlining Panel Cover
Courtesy of VOLVO CARS CORPORATION

- Remove the cover and the screws for the rear headlining
- Carefully pry off the panel at the rear edge using a weatherstrip tool
- Pull the rear edge of the panel downwards until all clips in the inside have released
- **Applies to cars with three rows of seats:** Disconnect the connector for the rear roof lighting. Pull the panel backward.

Fig. 80: Pull Off Top Edge Of Right-Hand D Pillar Panel
Courtesy of VOLVO CARS CORPORATION

- Carefully detach the D-post panels on the right and left-hand sides starting at the top edge. Continue downwards until all three clips have released
- Remove the panel by pulling upwards slightly and unhooking from the side panel. If applicable, disconnect the connector for the D-post loudspeaker.

INSTALLING THE COMBINED AERIAL

Fig. 81: View Of Inner Base Module Connector
Courtesy of VOLVO CARS CORPORATION

- Clean the surface where the inner base module is to be positioned using the cleaning cloth from the kit
- Wipe dry
- Remove the backing from the inner base module
- Position the inner base module horizontally on the side window, in line with the rear end of the headlining. The upper rear corner of the inner base module must be positioned edge to edge with the tinted area of the side widow as illustrated.

Fig. 82: Pressing Antenna Into Place On Outer Base Module
Courtesy of VOLVO CARS CORPORATION

- Install the aerial on the external base module.

Fig. 83: Identifying External Base Module Positioning
Courtesy of VOLVO CARS CORPORATION

- Clean the surface where the external base module is to be positioned using the cleaning cloth from the kit
- Wipe dry
- Remove the backing from the external base module. Press the external base module into place on the side window opposite the inner base module
- Press hard on points 1, 2, 3, 4 and 5, in order, for 3-4 seconds
- Ensure that the tape is sealed around the external base module. For optimum adhesion, heat the glass. Use a hairdryer or similar.

CABLE ROUTING AND CONNECTING THE COMBINED AERIAL

Fig. 84: View Of Aerial Cable Route Along Existing Wiring At Rear Edge Of Side Window
Courtesy of VOLVO CARS CORPORATION

- Route the aerial cable down along the existing wiring at the rear edge of the side window down to the rear edge of the wheel arch

- Clamp the aerial cable at the existing wiring using the tie straps from the kit.

Fig. 85: View Of Routing Aerial Cable On Right-Hand Side Of Cargo Floor Support
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Route the aerial cable on the right-hand side of the cargo floor support, inside the front edge of the floor carpet in the right-hand rear door opening. Continue along the right-hand side of the car.

Fig. 86: View Of Inserting Cable (1) At Rear Edge Of Right-Hand Side Panel
Courtesy of VOLVO CARS CORPORATION

Applies to cars with three rows of seats

- Insert a cable (1) at the rear edge of the right-hand side panel and along the inside of the panel, above the mountings for the load securing eyelets and to the front edge of the side panel
- Tape the end to the aerial cable (2) at the cable. Pull the cable with the aerial cable from the front edge of

the side panel.

Fig. 87: Route The Pre-Routed Aerial Cable (1) On The Reverse Of The Air Duct
Courtesy of VOLVO CARS CORPORATION

- Route the pre-routed aerial cable (1) on the reverse of the air duct (at the front edge of the wheel arch) to the left-hand side of the seat belt lower mounting and along the rear door sill. Continue inside the floor carpet to the front door opening
- Clamp the cable harness in the hole in the front member for the seat mounting and in the rear hole in the horizontal panel at the right-hand side of the seat. Use the tie straps (2) (from the kit).

Fig. 88: Identifying Cable Routing Through Carpet
Courtesy of VOLVO CARS CORPORATION

- Pull up the left and right sides of the carpet at the right-hand front seat slightly. Insert a cable (1) underneath the carpet at the front edge of the air ducts on the right-hand side of the center console. Pull out the cable at the right-hand door sill as illustrated
- Tape the aerial cable (2) at the pre-routed cable. Route the cable to the right-hand side of the center

console
- Route the aerial cable up at the air ducts and pull along in the center console
- Connect the aerial cable to the cable from the carphone holder.

Reinstall:

- the floor carpets
- the bracket with dashboard environment panel and control module in the center console
- the gear selector lever panel
- the sill trim panels in the doors
- the panel above the joints for the sill trim panels
- the cover and panels for the seats
- the right-hand side floor hatch
- Reinstall the D-post panel and the headlining and any relevant connectors
- Reinstall the folding panel.

Fig. 89: Connecting Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position II
- Reconnect the battery negative lead
- Reinstall the storage boxes and floor hatches
- Reinstall the right-hand side panel on the center console.

XC90

see **XC90**

GLASS MOUNTED GSM COMBINED ANTENNA (2003-2011)

GLASS MOUNTED GSM COMBINED ANTENNA

PREPARATION

NOTE: **When installing on the rear windscreen, the antenna must not be installed on the heating loops in the windscreen. However, the antenna is not affected by the area of the windscreen shaded black.**

The antenna is positioned as described below:

NOTE: **The temperature of the windscreen must not be lower than +10°C.**

Illustration A does not apply to the S40, V40, S60, V70 (00-) or S80

Fig. 90: Identifying Antenna Location
Courtesy of VOLVO CARS CORPORATION

Windscreen. In the top right-hand corner of the windscreen.

Illustration B does not apply to the S60 or S80

Fig. 91: Identifying Antenna Location
Courtesy of VOLVO CARS CORPORATION

Rear windscreen, 4 door. At the top center of the rear windscreen.

Illustration C does not apply to the V70 (00-)

Fig. 92: Identifying Antenna Location
Courtesy of VOLVO CARS CORPORATION

Right rear side window, 5 door. At the top rearmost point of the side window.

Fig. 93: Pressing Antenna Into Place On Outer Base Module
Courtesy of VOLVO CARS CORPORATION

- Press the antenna into place on the outer base module.

INSTALLING THE EXTERNAL BASE MODULE

Illustration A does not apply to the S40, V40, S60, V70 (00-) or S80

Fig. 94: Identifying Antenna Mounting Location
Courtesy of VOLVO CARS CORPORATION

Illustration B does not apply to the S60 or S80

Fig. 95: Identifying Antenna Mounting Location
Courtesy of VOLVO CARS CORPORATION

Illustration C does not apply to the V70 (00-)

Fig. 96: Identifying Antenna Mounting Location
Courtesy of VOLVO CARS CORPORATION

- Check the location (as illustrated). Ensure that the antenna is clear of the windscreen trim and wiper blade. Ensure that the antenna can be removed from the external base module when washing the car etc.
- Carefully clean the surface of the glass. Use the cleaning cloth supplied. Wipe dry using a rag.
- For optimum adhesion, warm the glass. Use a hairdryer for example.

Fig. 97: Press Points For External Base Module
Courtesy of VOLVO CARS CORPORATION

- Remove the backing from the external base module. Secure the external base module on the windscreen. Press hard on points 1, 2, 3, 4 and 5, in order, for 3-4 seconds.
- Ensure that the tape is sealed around the external base module.

INSTALLING THE INTERNAL BASE MODULE

Fig. 98: Installing Internal And External Base Modules
Courtesy of VOLVO CARS CORPORATION

Templates are provided to facilitate installation of the internal base module. The templates are necessary because the black shading on the windscreen may conceal the external base module.

- Cut out the two templates provided with the illustrations.
- Align one template on the installed external base module. Secure it using tape.
- Carefully clean the interior surface of the glass. Use the cleaning cloth supplied. Wipe dry using a rag.

- Install the second template on the interior, edge to edge with the external template.

The internal and external base modules must be positioned directly opposite each other.

- Install the internal module in the cut-out of the second template. Install the internal module base in the same way as the external module base.
- Remove the templates.

ROUTING THE ANTENNA CABLE

The clips in the kit are used to secure the antenna cable, to the windscreen frame for example.

WARNING: **Do not secure the antenna cable to the inflatable curtains.**

Illustration A does not apply to the S40, V40, S60, V70 (00-) or S80

Fig. 99: Identifying Cable Routed Via A Post And Under Dashboard To Telephone
Courtesy of VOLVO CARS CORPORATION

- Windscreen. Route the cable via the A post and on under the dashboard to the telephone.

Illustration B does not apply to the S40, S60 or S80

Fig. 100: Identifying Antenna Cable Routing
Courtesy of VOLVO CARS CORPORATION

- Rear windscreen 4 door. Route the cable inside the panel via roof, down at the A post and under the dashboard to the telephone.

Illustration C does not apply to the V40 or V70 (00-)

Fig. 101: Identifying Antenna Cable Routing
Courtesy of VOLVO CARS CORPORATION

- Right rear side window, 5 door. Route the cable inside the panel via the roof, down at the A post and on under the dashboard to the telephone.

NOTE: **Route the cable far enough down the bottom edge of the rear windscreen so that the cable is clear of the gas generator for the inflatable curtain.**

Illustration F does not apply to the S40, S60 or S80

Fig. 102: Identifying Cable Routed From Side Of Rear Windscreen Via Roof To Telephone
Courtesy of VOLVO CARS CORPORATION

- Rear windscreen, 4 door with high level stop (brake) lamps. Route the cable from the side of the rear windscreen via the roof to the telephone.

FINISHING

- Align the antenna so that it is vertical to the ground.

HANDS FREE UNIT FOR CARPHONE, UNIVERSAL (2003-2004)

CARS EQUIPPED WITH SRS/SIPS (AIRBAG)

see **CARS EQUIPPED WITH SRS/SIPS (AIRBAG)**

CAUTION

see **CAUTION**

HANDS FREE UNIT FOR CARPHONE, UNIVERSAL

NOTE: This accessory is connected to the electrical system of the car. It requires software unique to the car.

PREPARATIONS

Fig. 103: Identifying Centre Console Side Panels
Courtesy of VOLVO CARS CORPORATION

- Remove the left and right-hand side panels from the center console. Pull the panels free at the front edge and continue backwards until all the clips have released.

Applies to cars with power front seats

- Position the right-hand front seat so that:
  - the covers over the right-hand rear and both front seat mountings are not blocked
  - the small panel at the lower edge of the right-hand B-post panel is not obstructed
  - the screws for amplifier under the seat can be undone.

Fig. 104: Disconnect Battery Negative Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position 0
- Disconnect the battery negative lead.

NOTE: Wait at least five minutes before disconnecting the connectors or removing other electrical equipment.

Removing the loudspeaker grille:

Illustration A

Fig. 105: Removing The Loudspeaker Grille
Courtesy of VOLVO CARS CORPORATION

- Take a length of **1.5 mm (1/16")** diameter welding rod. Bend one end to 90°, L=5 mm (13/64")
- Bend the other end to form a handle
- Insert the first bent end into the joint between the loudspeaker grille and the dashboard as illustrated, until it engages
- Twist the welding rod 90° so that the bent section engages with the underneath of the loudspeaker grille. It may be necessary to move the welding rod along the joint so that it can be twisted around.

Illustration B

Fig. 106: View Of Detached Loudspeaker Grille
Courtesy of VOLVO CARS CORPORATION

- Pull up until the loudspeaker grille detaches. The grille is well secured using four clips.

NOTE: Do not damage the dashboard.

- Place the loudspeaker grille to one side.

Illustration A applies to cars without a centrally-mounted loudspeaker

Fig. 107: Identifying Cars Without A Centrally-Mounted Loudspeaker
Courtesy of VOLVO CARS CORPORATION

- Remove the bracket for the loudspeaker grille. Remove the five screws and pulling the bracket up out of the dashboard.

Illustration B applies to cars with a centrally-mounted loudspeaker

Fig. 108: Identifying Cars With A Centrally-Mounted Loudspeaker
Courtesy of VOLVO CARS CORPORATION

- Remove the five screws from the loudspeaker. Pull the loudspeaker slightly out of the dashboard. Disconnect the connector.

Illustration C applies to cars with RTI (road traffic information)

Fig. 109: Identifying Cars With RTI (road Traffic Information) Display
Courtesy of VOLVO CARS CORPORATION

- Remove the five screws in the display for RTI (road traffic information). Pull up the display slightly from the dashboard. Disconnect the connectors
- Disconnect the loudspeaker for the centrally-mounted if installed.

Fig. 110: Identifying Upper Steering Column Cover Removal
Courtesy of VOLVO CARS CORPORATION

- Lower the steering wheel to the lowest position. Pull the steering wheel to the rearmost position
- Remove the two screws at the top edge of the combined instrument panel surround
- Carefully pry off the rubber seal from the upper steering column cover. Use a weatherstrip tool. It is secured with five clips
- Remove the surround by carefully pulling it backwards, first at the lower edge and then at the top edge until all the clips have released.

Fig. 111: View Of Combined Instrument Panel Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the four screws for the combined instrument panel
- Pull out the combined instrument panel. Disconnect the connector on the reverse of the combined instrument panel.

Fig. 112: Prying Off Gear Selector Panel At Rear Edge
Courtesy of VOLVO CARS CORPORATION

Applies to cars with automatic gearboxes

- Turn the ignition key to position II.

Applies to all models

- Move the gear selector lever to its rearmost position
- Carefully pry off the gear selector lever panel at the rear edge using a weatherstrip tool. Pull the panel backwards to access the screws for the dashboard environment panel.

Fig. 113: Removing Screws And Radio/AC Unit From Center Console
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws holding the bracket for the dashboard environment panel and the control module
- Pull out the bracket at the lower edge. Pull downwards from the top edge of the center console

- Disconnect the connectors from the dashboard environment panel and control module
- Disconnect the connectors for the CD-player and/or Mini disc player if applicable.

PREPARATIONS, CARPHONE HOLDER

Fig. 114: Identifying Carphone Holder Bracket Components
Courtesy of VOLVO CARS CORPORATION

- Take the carphone holder bracket, the reinforcement plate, the cover and screws from the kit
- Install the reinforcement plate (1) and the cover (2) in the bracket (3) using the screws (4).

Illustration A

Fig. 115: View Of Bracket To Dashboard
Courtesy of VOLVO CARS CORPORATION

- Position the entire unit (1) in the dashboard to mark out the holes for the bracket. Adjust to achieve the optimum position. Do not press the unit hard against the dashboard. However, ensure that there are no

gaps at the sides between the panel and the dashboard (2).

Illustration B

Fig. 116: View Of Bracket Hole Markings
Courtesy of VOLVO CARS CORPORATION

- Hold the unit in place and mark out the holes through the bracket
- Drill out the two holes using a **5 mm (13/64")** diameter drill bit. Use a 25 mm (1") drill stop
- Remove any metal shavings
- Remove the cover and the reinforcement plate from the bracket.

Fig. 117: View Of Reinforcement Panel Screws
Courtesy of VOLVO CARS CORPORATION

- Take the reinforcement plate (1) and the two screws from the kit
- Position the carphone holder wiring, which is routed on the reverse of the bracket, as illustrated
- Insert the reinforcement plate through the hole for the center loudspeaker

- Install the bracket (2). Use the two screws (3). Tighten the bracket to the dashboard.

Fig. 118: Identifying The Wiring And The Bracket For The Handset Holder
Courtesy of VOLVO CARS CORPORATION

- Press the surround for the combined instrument panel into place
- Mark out the surround, as illustrated, where the cut-outs will be made for the wiring and the bracket for the handset holder
- Remove the surround. File out the groove (1) for the wiring for the handset. File the hole so that it is large enough for any excess wiring to be routed through the hole and hidden on the inside of the dashboard
- File out a groove (2) for the bracket for the handset holder
- Smooth off the edges of the groove.

Fig. 119: Identifying Wire Routing
Courtesy of VOLVO CARS CORPORATION

- Route the wiring for the carphone holder from the hole for combined instrument panel. Position the wiring at the left air duct in the center console. Do not route more wiring than is required to secure the

carphone holder.

INSTALLING THE MICROPHONE

Fig. 120: View Of Left-Hand End Of The Dashboard
Courtesy of VOLVO CARS CORPORATION

- Pry off the rear edge of the panel on the left-hand end of the dashboard. Twist out the panel. Remove the panel.

Fig. 121: Identifying Grab Handle Covers
Courtesy of VOLVO CARS CORPORATION

- Pry up the covers on the grab handle at the arrows. Remove the screws underneath
- Pull off the rubber strip from the door opening.

Fig. 122: Identifying Top Edge Of The A-Post Panel
Courtesy of VOLVO CARS CORPORATION

- Pull off the top edge of the A-post panel. Pull the panel straight up to remove it.

Fig. 123: View Of Mounting Plate Position
Courtesy of VOLVO CARS CORPORATION

- Take the mounting plate from the kit. Position the mounting plate on the top end of the A-post panel. If the microphone is already installed in the mounting plate, remove it. It is secured by two hooks on the long sides
- Mark out and drill the holes for the mounting plate. Use a **3 mm (1/8")** diameter drill bit
- Remove any metal shavings.

Fig. 124: Identifying A-Post Panel Mount Plate Screws
Courtesy of VOLVO CARS CORPORATION

- Install the mounting plate on the A-post panel using two screws from the kit.

CAUTION: The inflatable curtain (IC) is located inside the A-post panel. It is important to file off the screws securing the mounting plate if necessary, so that they just fit through the panel.

- **Check how much of the screws protrudes on the reverse. Unscrew the screws. File off the screws to the correct length**
- **Reinstall the screws.**

Fig. 125: Identifying Microphone Placement
Courtesy of VOLVO CARS CORPORATION

- Press the microphone from the kit into place on the mounting plate.

Fig. 126: View Of Microphone Cable Route On Inside Of A-Post Panel
Courtesy of VOLVO CARS CORPORATION

- Route the microphone cable on the inside of the A-post panel. Secure the cable using pieces of butyl tape.

Fig. 127: View Of Microphone Cable In Through The Left-Hand End Of The Dashboard
Courtesy of VOLVO CARS CORPORATION

- Press the A-post panel into place. Install the screws. Tighten to **10 Nm (7 lbf. ft.)**
- Press the covers into place over the screws
- Route the microphone cable in through the left-hand end of the dashboard, into the space for the combined instrument panel and into the center console
- Secure the cable where it runs under the combined instrument panel using pieces of butyl tape
- Connect the combined instrument panel. Reinstall the combined instrument panel
- Reinstall the surround for the combined instrument panel. Tighten
- Reinstall the left-hand end panel on the dashboard.

INSTALLING THE CARPHONE HOLDER

Fig. 128: Identifying Carphone Holder Bracket Components
Courtesy of VOLVO CARS CORPORATION

- Install the reinforcement plate (1) and the cover (2) in the bracket (3). Use the screw (4) from the kit. Do not tighten fully yet
- Remove the mounting plate (5) for the carphone holder from the carphone holder. Tighten the mounting plate using the screws (6) from the kit
- Tighten the screw (4)
- Install the carphone holder on the mounting plate
- Route unnecessary excess wiring into the hole for the combined instrument panel.

Fig. 129: Identifying Correctly Aligned Mounting Lug Connectors
Courtesy of VOLVO CARS CORPORATION

- Route the cable for the carphone holder to the center console and out to the right-hand side of the center console

- Connect the cable for the carphone holder to the cable for the hands free box.

NOTE: Ensure that the connector is correctly aligned. The two mounting lugs on the reverse must be in their grooves.

Fig. 130: View Of Clamp Connector On The Right-Hand Side Of Centre Console
Courtesy of VOLVO CARS CORPORATION

- Clamp the connector on the right-hand side of the center console, where there is no risk of it being damaged.

CONNECTION TO THE AMPLIFIER

Fig. 131: Identifying Amplifier Screws
Courtesy of VOLVO CARS CORPORATION

- Slacken off the 3 screws (1) for the amplifier under the right-hand front seat.

Fig. 132: Identifying Amplifier Connectors
Courtesy of VOLVO CARS CORPORATION

- Lift out the amplifier. Use a weatherstrip tool to lift it up from its sunken position
- Disconnect the connectors in the amplifier
- Take the wiring from the kit.

Fig. 133: Identifying Amplifier Green Connectors
Courtesy of VOLVO CARS CORPORATION

- Connect one of the green connectors (1) on the hands free cable to the amplifier and the other to the green connector that was connected to the amplifier (2)
- Reach under the floor carpet and push the insulation material to one side
- Take the end of the hands free cable with grey connectors in the other hand. Insert the connectors under the floor carpet through the hole where the amplifier was positioned
- Lift up the floor carpet and make room for your hands to meet under it
- Take the cable and carefully route it into the center console.

Fig. 134: Identifying Cable Guide Under Carpet
Courtesy of VOLVO CARS CORPORATION

- Pull up the left and right-hand sides of the carpet a little
- Insert a wire (1) under the carpet at the front edge of the air ducts on the right-hand side of the center console, and route it out at the right-hand door sill
- Take the single cable going to the Accessory Electronic Module (AEM). Tape the cable to the wire
- Route the cable forward from the carpet at the right-hand door sill.

INSTALLING THE HANDS FREE BOX

Fig. 135: Identifying Free Box To Bracket
Courtesy of VOLVO CARS CORPORATION

- Take two screws and nuts from the kit. Tighten the hands free box to the bracket.

Fig. 136: Identifying Hands Free Box Components
Courtesy of VOLVO CARS CORPORATION

- Connect the wiring for the hands free box as illustrated
  - the cable to the microphone (1)
  - the cable to the carphone holder (2)
  - the large cable harness (3).

Fig. 137: Identifying Hands Free Box Bracket Bolts
Courtesy of VOLVO CARS CORPORATION

Fig. 138: Identifying Removal Of Screws And Soundproofing Panel
Courtesy of VOLVO CARS CORPORATION

- Turn down the bracket and the hands free box
- Install the hands free box in the hole for the dashboard environment panel
- Take two screws and nuts from the kit. Install the bracket with the hands free box on the existing bracket at the lower edge of the center console.

NOTE: Ensure that the none of the wiring is trapped.

- Locate the grey (GR) pre-routed connector (1) for power supply. This comes from the heavy duty cable harness, either under the dashboard on the right-hand side of the steering wheel, immediately above the accelerator pedal (AP), or if the car has a Mini disc player and/or CD-player, the connector may be on the junction cable for these components.

Cars which do not have a pre-routed connector in the cut-out for the radio

- Remove the soundproofing panel on the left-hand side. First remove the two screws, then pry off the soundproofing panel at the top edge (see illustration B).

Applies to all models

- Take the cable harness with the two grey (GR) connectors which was previously connected to the hands free box. Route it out through the left-hand side of the center console to the existing connector
- Connect the pre-routed connector to the corresponding connector (2) on the routed cable harness
- Secure the excess connector (3)
- Clamp the cable harness so that it is not in contact with any sharp edges and is not at risk of any other damage.

CABLE ROUTING TO THE ACCESSORY ELECTRONIC MODULE (AEM)

Fig. 139: Identifying Soundproofing Panel
Courtesy of VOLVO CARS CORPORATION

- Detach the soundproofing panel on the right-hand side of the center console. First remove the two screws. Then pry off the panel at the top edge.

Fig. 140: View Of Front Seat Front Edge Cover
Courtesy of VOLVO CARS CORPORATION

Fig. 141: Prizing Right-Hand Rear Mounting Of Cover Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the panel on the right-hand rear mounting. Pry it up slightly at the rear edge and then pull it back / upwards.

Fig. 142: Prizing Away Cover Panel Over Joint Between Door Sills On Right-Hand Side, At Lower Edge, Using A Weatherstrip Tool
Courtesy of VOLVO CARS CORPORATION

- Remove the panel over the joint between the door sills on the right-hand side. Carefully pry off the panel at the lower edge using a weatherstrip tool.

Fig. 143: Right-Hand Front Door's Sill Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the sill trim panel for the right-hand front door. Pull off the front edge of the sill trim panel so that the clip releases. Continue backwards until the remaining clips have released
- Unhook the sill trim panel from the B-post panel.

Fig. 144: Pushing Up Catch On Top Side
Courtesy of VOLVO CARS CORPORATION

Fig. 145: Removing Cover Panel
Courtesy of VOLVO CARS CORPORATION

- Fold the backrest forward and slide the front seat forward as far as possible. (On cars with two rows of seats, the second row is fixed.)
- Remove the cover (1) for the right rear seat mounting by prying it off at the rear edge.

Illustration A

Fig. 146: Removing Sill Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the sill trim panel for the right-hand rear door. Pull off the rear edge so that the clips releases. Continue forwards until the remaining clips have released.

Applies to cars with two rows of seats

- On cars with two rows of seats the seat cannot be slid forwards. To remove the sill trim panel; Start by folding the backrest forward when pulling the rear edge of sill trim panel loose. Then re-position the

backrest to raise the seat cushion and provide more room for removing the sill trim panel. It is securely positioned. Do not damage the panel and surrounding components during removal.

Illustration B

Fig. 147: Identifying Sill Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Unhook the sill trim panel from the B-post panel. Position the panel in the second/third row of seats.

Fig. 148: Identifying Centre Floor Hatch
Courtesy of VOLVO CARS CORPORATION

Applies to cars with three rows of seats and integrated carrier bag holder on the underside of the center floor hatch

- Fold the rear center floor hatch up
- Detach the two straps from the panel below. Lift up the rear edge of the panel. Fold the floor hatch back towards the panel and lift out the floor hatch and the panel.

Applies to cars with three rows of seats without an integrated carrier bag holder

- Lift up the center rear floor hatch at the rear edge and lift it out.

Applies to cars with two rows of seats

- Remove the two center floor hatches. First lift them up slightly and then pull them loose from the mountings at the front edge
- If the rear center floor hatch has a carrier bag holder on the lower side, the floor hatch is secured by a strap on each of the shorter sides of the storage box. Undo these straps
- Remove the two storage boxes below.

Fig. 149: Remove Right And Left Side Glove Box
Courtesy of VOLVO CARS CORPORATION

- Remove the right-hand side floor hatch (1).

Fig. 150: Folding Side Panel From Right-Hand Side Of Cargo Compartment

Courtesy of VOLVO CARS CORPORATION

- Remove the folding side panel from the right-hand side in the cargo compartment.

Fig. 151: Cable Clamped In At Air Duct
Courtesy of VOLVO CARS CORPORATION

- Insert the cable harness between the carpet and the door sill towards the floor as far as it will go. Route it along the right-hand side of the car up to the rear edge of the door opening for the right-hand rear door
- Pull the cable harness up to the right-hand front seat mounting on the right-hand seat in the second row of seats
- Pull away the carpet from the front edge of the right-hand side panel in the cargo compartment
- Route the cable harness along the right-hand side of the right-hand seat in the second row of seats towards the front edge of the rear wheel arch. Route it onwards on the left-hand side of the lower mounting for the seat belt, between the support bracket for the right-hand seat and wheel arch, and out at the left-hand side of the wheel arch
- Clamp the cable harness in the hole in the front member for the seat mounting and in the rear hole in the horizontal plate at the right-hand side of the seat. Use the tie straps (1) (from the kit).

Applies to cars with three rows of seats Illustration A

Fig. 152: Identifying Cable At Rear Edge Of Right-Hand Side Panel
Courtesy of VOLVO CARS CORPORATION

- Insert a wire (1) at the rear edge of the right-hand side panel and along the inside of the panel, above the mountings for the load securing eyelets. Route the wire to the front edge of the side panel.

Illustration B

Fig. 153: Identifying Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Tape the cable harness (2) to the wire and pull it out of the rear edge of the side panel.

Fig. 154: Cable Routing
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Route the cable on the left-hand side of the seat belt mounting at the front edge of the wheel arch, inside the carpet at the front edge of the side panel, between the side panel and the rear of the cargo floor support, to the accessory electronic module (AEM).

CONNECTING TO THE ACCESSORY ELECTRONIC MODULE (AEM)

Fig. 155: Removing Panel By Pulling It Straight Up And Unhook It From Side Panel (1 Of 2)
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws from the bracket for the accessory electronic module (AEM) and lift up the entire unit. Cut off the tie straps if necessary.

Fig. 156: Removing Panel By Pulling It Straight Up And Unhook It From Side Panel
Courtesy of VOLVO CARS CORPORATION

- Disconnect the large connector from the accessory electronic module (AEM). First press in the catch (A). Pull the black locking handle (B) in the direction of the arrow until a click is heard. Disconnect the connector
- Disconnect the connector from the accessory electronic module.

Fig. 157: Black Terminal Pin By Inserting A Pointed Object Into Hole In Other End
Courtesy of VOLVO CARS CORPORATION

- Remove the black catch holding the black switch in place in the connector by pulling in the direction of the arrow
- Remove the black switch. Insert a pointed object in the hole on the other end of the connector. Press the switch out.

Fig. 158: Identifying Grey/White (GR/W) Cable From The Routed Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Connect the Grey/White (GR/W) cable from the routed cable harness to terminal 11 (tele-mute) in the black connector for the accessory electronic module (AEM).

NOTE: **The numerical markings are on the top and bottom of the black switch. However, the markings are extremely small so be careful when installing the two cables.**

- Reinstall the black switch in the connector. Lock into place using the catch
- Press the connector into the accessory electronic module (AEM). Secure using the black locking handle
- Reinstall the accessory electronic module (AEM) with the bracket and clamp the wiring using the tie strap from the kit.

NOTE: **If the car is to be equipped with the accessory windscreen aerial, it should be installed at this stage before the components on the right-hand side of the car are reinstalled.**

REINSTALL

- Reinstall the folding panel on the right-hand side in the cargo compartment
- Reinstall the right-hand side floor hatch
- Reinstall the carpet at the front edge of the right-hand side panel
- Reinstall the sill trim panel in the right-hand rear door
- Reinstall the cover(s) over the seat mountings on the second row of seats.

INSTALLING THE INTEGRAL ANTENNA

HINT: The Volvo windscreen antenna can also be used.

Fig. 159: Dashboard End Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the panel on the right-hand end of the dashboard.

Fig. 160: Pry Off Grab Handle Cover
Courtesy of VOLVO CARS CORPORATION

- Pry off the cover on the grab handle in the right-hand front door. Remove the screws below.

Fig. 161: Identifying Right-Hand A-Post Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the rubber strip (1) at the front edge of the right-hand front door
- Remove the right-hand A-post panel by carefully pulling the top edge of the panel outwards until the clip on the inside releases. Pull it up out of the mounting in the dashboard.

NOTE: Do not damage the headlining.

Fig. 162: Identifying Sun Visor Inner Mountings
Courtesy of VOLVO CARS CORPORATION

- Remove the sun visor from the inner mounting (1) on the right-hand side
- Carefully pry the cover (2) off. Remove the two screws (3) for the sun visor mounting
- Remove the inner mounting (1) by first prying up the catch as illustrated. Then insert a small screwdriver in the rear edge of the exposed hole and press the sprung catch forward to release it from the hole in the roof. A the same time pull the rear edge of the mounting downward/backwards so that the catch at the front edge and both catches at the sides release.

NOTE: Do not damage the headlining.

Fig. 163: Folding Down Cover And Squeezing Catches Together
Courtesy of VOLVO CARS CORPORATION

- Fold down the cover (1) by carefully pulling down the front edge of the cover
- Squeeze the catches (2). Pull the front edge of the panel downwards. Then pull the rear edge off.

Fig. 164: View Of Front Interior Lighting
Courtesy of VOLVO CARS CORPORATION

- Remove the rear view mirror and the front interior lighting (1). First remove the two screws (2) and then press in the eight catches (3) around the interior lighting
- Carefully pull the components downwards and allow them to hang by their wiring. (The interior lighting is secured to the roof using the clip (4).).

Fig. 165: Aligning Antenna Lugs With Grooves In Bracket
Courtesy of VOLVO CARS CORPORATION

- Install the new antenna. Carefully bend the headlining downward and slide the antenna backward and inwards. Align the antenna lugs (1) with the grooves in the bracket (2)
- Insert the cable at the inside of the front edge of the headlining. Route the cable out towards the right-hand A-post
- Secure the cable using butyl tape
- Reinstall the bracket and rear view mirror. Tighten the screws. Tighten to **10 Nm (7.5 lbf. ft.)**
- Reinstall the panel. Securely lock the panel using the cover.

Fig. 166: Identifying Cable Taped Onto Existing Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Route the cable down from the headlining along the right-hand A-post
- Tape the cable onto the existing cable harness as illustrated (1).

WARNING: Ensure that the cable is not routed over the inflatable curtain. This could compromise the function of the inflatable curtain in the event of an accident.

Fig. 167: Folding Back Carpet And Identifying Cable And Connectors
Courtesy of VOLVO CARS CORPORATION

- Push the carpet to one side by the right-hand front seat
- Take the extension cable (1) from the kit. Route the cable between the A-post and the right-hand side of the dashboard, continue along the right-hand end to the front edge of the floor
- Route the cable to the left along the front edge of the floor and up to the inside of the center console
- Connect the cable (1) to the corresponding cable (2) from the hands free box
- Connect both connectors (3) at the right A-post to each other
- Wrap foam tape around the connectors to prevent rattling.

REINSTALL

- Reinstall the A-post panel. Tighten the grab handle. Tighten to **10 Nm (7.5 lbf. ft.)** . Reinstall the cover
  - the display for the RTI and the center loudspeaker if applicable
  - the center loudspeaker
  - the bracket for the loudspeaker grille
  - the loudspeaker grille.
- Reinstall the rubber strip in the right-hand front door
  - the display for the RTI and the center loudspeaker if applicable
  - the center loudspeaker
  - the bracket for the loudspeaker grille
  - the loudspeaker grille.
- Reinstall the panel on the end of the dashboard
  - the display for the RTI and the center loudspeaker if applicable

  - the center loudspeaker
  - the bracket for the loudspeaker grille
  - the loudspeaker grille.
- Reinstall the sun visor. Tighten the screws. Tighten to **10 Nm (7.5 lbf. ft.)** . Also reinstall the cover and the inner mounting
  - the display for the RTI and the center loudspeaker if applicable
  - the center loudspeaker
  - the bracket for the loudspeaker grille
  - the loudspeaker grille.
- Fold the carpet on the right-hand side back into place
  - the display for the RTI and the center loudspeaker if applicable
  - the center loudspeaker
  - the bracket for the loudspeaker grille
  - the loudspeaker grille.
- Reinstall the panel on the door trim for the right-hand front door. Press the lower panel into place on the B-post
  - the display for the RTI and the center loudspeaker if applicable
  - the center loudspeaker
  - the bracket for the loudspeaker grille
  - the loudspeaker grille.
- Reinstall the soundproofing panel on the right and left-hand sides
  - the display for the RTI and the center loudspeaker if applicable
  - the center loudspeaker
  - the bracket for the loudspeaker grille
  - the loudspeaker grille.
- Reinstall the cover and panel on the right-hand front seat
  - the display for the RTI and the center loudspeaker if applicable
  - the center loudspeaker
  - the bracket for the loudspeaker grille
  - the loudspeaker grille.
- Connect the connectors to the dashboard environment panel and control module. Also connect the connectors for the CD-player and/or Mini disc player if applicable
  - the display for the RTI and the center loudspeaker if applicable
  - the center loudspeaker
  - the bracket for the loudspeaker grille
  - the loudspeaker grille.
- Position the bracket. Tighten the bracket using the two screws. Reinstall the gear selector lever panel
  - the display for the RTI and the center loudspeaker if applicable

    - the center loudspeaker
    - the bracket for the loudspeaker grille
    - the loudspeaker grille.
- Reinstall (depending on the equipment in the car):
    - the display for the RTI and the center loudspeaker if applicable
    - the center loudspeaker
    - the bracket for the loudspeaker grille
    - the loudspeaker grille.

REINSTALL

Fig. 168: Connecting Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Connect the connectors to the amplifier
- Reinstall the amplifier in its folded down position. Tighten the screws
- Turn the ignition key to position II
- Reconnect the battery negative lead
- Reinstall the storage boxes and floor hatch(es)
- Reinstall both the side panels on the center console
- Program the software using VCT2000 according to the service information in VIDA (Volvo scan tool).

XC90

see **XC90**

HANDS FREE UNIT FOR CARPHONE, UNIVERSAL (2003-2009)

HANDS FREE UNIT FOR CARPHONE, UNIVERSAL

NOTE: This accessory is connected to the electrical system of the car. It requires software unique to the car.

HINT: Points 30-43 apply to cars with an accessory electronic module (AEM).

PREPARATIONS

Fig. 169: Disconnect Battery Negative Lead
Courtesy of VOLVO CARS CORPORATION

- Slide back the front seats to the rearmost and uppermost positions
- Turn the ignition key to position 0
- Remove the key from the ignition switch (does not apply to cars with automatic gearboxes)
- Disconnect the battery negative lead.

NOTE: Wait at least five minutes before disconnecting the connectors or removing other electrical equipment.

Fig. 170: Removing Central Vents
Courtesy of VOLVO CARS CORPORATION

- Press in the clips so that the ventilation grille releases
- Remove the grille. Use a weatherstrip tool
- Remove the connector (1) for the hazard warning signal flasher.

Fig. 171: Removing Trim Strip On Dashboard
Courtesy of VOLVO CARS CORPORATION

- Remove the trim strip on the dashboard. First carefully pull the trim strip straight outwards, as close to the mounting point (1) as possible.

Fig. 172: Removing Gear Selector Lever Boot Panel
Courtesy of VOLVO CARS CORPORATION

- Detach the panel (1). Detach the gear selector lever boot using a weatherstrip tool.

Fig. 173: Panel With Boot And Screws
Courtesy of VOLVO CARS CORPORATION

- Move the gear selector lever to the rearmost position
- Pull the panel with the boot (1) backwards. Turn the panel as illustrated
- Remove the screws (2) from the climate control assembly.

Fig. 174: Angling Dashboard Environment Panel Outwards
Courtesy of VOLVO CARS CORPORATION

- Angle the dashboard environment panel outwards so that it is possible to insert a couple of fingers between the center console and the side of the dashboard environment panel
- Detach the dashboard environment panel by pulling it downwards while maintaining the same angle. Some force is required because the panel is tightly installed. Disconnect the connectors on the reverse of the dashboard environment panel. Place the dashboard environment panel to one side.

NOTE: If any of the outer hooks break off, these must be repaired.

Fig. 175: Removing Screws From Bracket For Radio
Courtesy of VOLVO CARS CORPORATION

- Remove the screws (1) from the radio bracket
- Pull the bracket with the radio outwards at the lower edge. Pull the whole unit downwards
- Disconnect the connectors from the radio. Place the radio to one side.

Fig. 176: Identifying Removal Of Rubber Seal From Upper Steering Column Cover
Courtesy of VOLVO CARS CORPORATION

- Lock the steering wheel in the lowest, rearmost position
- Remove the rubber seal from the upper steering column cover by carefully prying the 5 catches loose using a weatherstrip tool.

INSTALLING AND CABLE ROUTING THE HANDSET HOLDER

REMOVE

Fig. 177: Cover, Screws And Measurements
Courtesy of VOLVO CARS CORPORATION

- Mark out the cable cut-out in the panel as illustrated, 6 mm (15/64")
- Remove the cover (1). Remove the screws (2)
- Angle the upper edge of the panel outwards. Remove the panel
- File the cut out according to the markings.

Fig. 178: Identifying Removal Of Combined Instrument Panel Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the four screws for the combined instrument panel
- Pull out the combined instrument panel. Disconnect the connector on the reverse of the combined instrument panel
- Place the combined instrument panel to one side.

Fig. 179: Car Phone Holder Bracket And The Plate
Courtesy of VOLVO CARS CORPORATION

- Take the bracket and the mounting plate for the carphone holder from the kit
- Assemble the bracket and the mounting plate for the carphone holder. Use the screws and nuts from the kit to assemble them.

Fig. 180: Car Phone Holder And Hole Measurements
Courtesy of VOLVO CARS CORPORATION

- Mark out the holes for the carphone holder (1). First align the edge of the holder with the edge of the hole (2). Press the holder upwards by 3 mm (7/64"). Drill a hole using a **5 mm (13/64")** diameter drill bit. Use a **20 mm (3/4")** diameter drill stop
- Install the holder in the panel. Move the plate (3) through the hole for the vent. Screw the holder and the plate into place. Use the two screws from the kit.

Fig. 181: Side Panel
Courtesy of VOLVO CARS CORPORATION

- Slide the panel on the left-hand end of the dashboard backwards a little. Pull the existing grip. Remove the panel.

NOTE: **There are two variants of A-post panel mounting nearest the headlining. See illustrations A or B.**

Illustration A

Fig. 182: Identifying Door Sealing Molding And Safety Clip
Courtesy of VOLVO CARS CORPORATION

- Detach the door sill moulding (1) at the panel
- Pull the panel straight inwards into the car
- Lift up the panel
- Cut off the safety clip (2).

NOTE: Ensure that the guide lugs on the panel do not scratch the dashboard.

- Turn the safety clip a quarter turn. Remove the safety clip.

Illustration B

Fig. 183: Identifying Steel Clips
Courtesy of VOLVO CARS CORPORATION

- Detach the door sill moulding at the panel
- Remove the two steel clips
- Pull the panel straight inwards into the car
- Lift up the panel.

Fig. 184: Mounting Plate Hole Measurements
Courtesy of VOLVO CARS CORPORATION

- Mark out as illustrated. Drill the holes for the mounting plate. Use a **3 mm (1/8")** diameter drill bit

- Remove any metal shavings.

INSTALL

Fig. 185: Mounting Plate And Screws
Courtesy of VOLVO CARS CORPORATION

- Install the mounting plate on the A-post panel using two screws from the kit.

CAUTION: The inflatable curtain (IC) is located inside the A-post panel. It is important to file off the screws securing the mounting plate if necessary, so that they just fit through the panel.

- **Check how much of the screws protrudes on the reverse. Unscrew the screws. File off the screws to the correct length**
- **Reinstall the screws.**

Fig. 186: Identifying Microphone On Mounting Plate

Courtesy of VOLVO CARS CORPORATION

- Press the microphone from the kit into place on the mounting plate.

Fig. 187: Identifying Microphone Cable Routed Inside Of A-Post Panel
Courtesy of VOLVO CARS CORPORATION

- Route the microphone cable on the inside of the A-post panel. Secure the cable using pieces of butyl tape.

Fig. 188: Microphone Cable And Antenna Cable Routing
Courtesy of VOLVO CARS CORPORATION

- Install a new safety clip (point 14A). Alternatively ensure that the clips (point 14B) are correctly located. Check that the panel is correctly positioned so that the IC system is not affected.

NOTE: **It is important to use a new safety clip when installing in accordance with 14A.**

- Press the A-post panel into place

- Route the microphone cable in through the left-hand end of the dashboard, into the space for the combined instrument panel and into the center console
- Secure the cable where it runs under the combined instrument panel using pieces of butyl tape
- Connect the combined instrument panel. Reinstall the combined instrument panel
- Reinstall the surround for the combined instrument panel. Tighten
- Reinstall the left-hand end panel on the dashboard
- Reinstall the door sill moulding in the door opening.

Fig. 189: Identifying Removal Of Side Panel On Center Console And Sill Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the side panel (1). First twist the clip at the rear edge of the panel a 1/4 turn. Pull the rear edge of the panel outwards and backwards
- Remove the door trim strip panel (2).

Illustration A

Fig. 190: Identifying Handset Holder
Courtesy of VOLVO CARS CORPORATION

- Route the cable from the handset holder (1) through the hole behind the combined instrument panel into the center console. Continue down along the left-hand air duct and out into the space where the climate control assembly was located.

Illustration B

Fig. 191: Identifying Cable For Handset Holder
Courtesy of VOLVO CARS CORPORATION

- Reinstall the combined instrument panel. Ensure that the cable for the handset holder is positioned on the right-hand side underneath the combined instrument panel. Ensure that the wiring is not trapped
- Reinstall the panel for the combined instrument panel. Align the cable for the handset cradle in the filed out notch
- Pull any wiring excess into the center console
- Reinstall the rubber seal in the upper steering column cover
- Reinstall the trim strip on the dashboard.

Fig. 192: Handset Cradle
Courtesy of VOLVO CARS CORPORATION

- Press the handset cradle into the mounting plate until a click is heard
- When detaching the handset cradle: press down the lever on the right-hand side of the mounting plate.

Fig. 193: Identifying Removal Of Cover And Screws For Driver's Seat Front Mountings
Courtesy of VOLVO CARS CORPORATION

- Remove both covers (1) from the front mountings on the front driver's seat. Remove the screws (2) from the front mountings. New screws can be found in the kit
- Tip the seat backward slightly to route the wiring under the carpet.

Fig. 194: Identifying Removal Of Front Mounting Covers And Seat Base Screws
Courtesy of VOLVO CARS CORPORATION

Applies to cars with an amplifier

- Remove the covers (1) from the front mounting screws for the right-hand seat
- Remove the screws (2) from the seat base
- Tip the seat back.

Fig. 195: Removing Carpet Panel And Mat
Courtesy of VOLVO CARS CORPORATION

Applies to cars with an amplifier

- Remove the panel (1) on the right-hand side of the center console. Turn the clip at the rear edge of the panel through 90°. Pull the rear edge of the panel outward and backward
- Detach the carpet (2) by the front left mounting for the right-hand seat. Pull the carpet forward and to the right

- Fold the rear mat (3) backwards at an angle.

Fig. 196: Disconnecting Grey Connector From Amplifier
Courtesy of VOLVO CARS CORPORATION

Applies to cars with an amplifier

- Disconnect the grey connector (1) from the amplifier.

Applies to cars with an amplifier Illustration A

Fig. 197: Identifying Connectors
Courtesy of VOLVO CARS CORPORATION

- Take the black joint cable (from the kit) to the handset holder (1). Connect it to the cable from the handset holder that was routed down earlier
- Take the large cable harness from the kit. Position the green connectors (2) in the space where the radio will be located

- Route the cable with the grey connectors (3) on the right-hand side inside of the center console at the air ducts, alongside the cable harness for the amplifier and down to the amplifier (Illustration B).

Illustration B

Fig. 198: Identifying Wiring Clamped At Positions
Courtesy of VOLVO CARS CORPORATION

- Clamp the wiring at the positions (4). Use tie straps from the kit.

Fig. 199: Connecting Grey Male Terminal And Grey Connector To Remaining Terminal
Courtesy of VOLVO CARS CORPORATION

Applies to cars with an amplifier

- Connect the grey male terminal (1) in the pre-routed cable harness to the amplifier
- Connect the grey connector (2) that was disconnected from the amplifier to the remaining terminal (3) in the pre-routed cable harness.

Fig. 200: Connecting Black Joint Cable To Handset Holder And Positioning Grey And Green Connectors In Space For Radio
Courtesy of VOLVO CARS CORPORATION

Applies to cars without an amplifier

- Take the black joint cable (from the kit) to the handset holder (1). Connect it to the cable from the handset holder that was routed down earlier
- Take the large cable harness from the kit. Position the grey and green connectors (2) in the space where the radio will be located.

Fig. 201: Identifying Routed Cable Harnesses
Courtesy of VOLVO CARS CORPORATION

- Route the following three cable harnesses down:
  1. the cable harness with the white connector and a long single cable attached (1)
  2. the thin black cable to the microphone (2)
  3. the thick black cable from the handset holder in the space where the radio will be located (3).

- Route these cable harnesses inside the carpet, between the stay for the center console (4) and the front air duct (5). Continue backwards, then in front of the front mounting for the driver's seat and out through the carpet joint under the seat.

Fig. 202: Identifying Hands Free Box Tightened To Bracket
Courtesy of VOLVO CARS CORPORATION

- Take the bracket, screws and hands free box from the kit
- Tighten the hands free box to the bracket as illustrated.

Fig. 203: Connecting Routed Cable Harnesses To Hands Free Box
Courtesy of VOLVO CARS CORPORATION

- Connect the routed cable harnesses to the hands free box:
  1. the cable harness to the radio (1)
  2. the cable to the microphone (2)
  3. the cable to the handset holder (3).

Applies to cars with accessory electronic modules (AEM)

- Route the long cable, secured at the cable harness to the radio, under the carpet on the driver's side and out to the door sill. This will be connected to the accessory electronic module (AEM) later.

Applies to cars without an accessory electronic module (AEM)

- Insulate and hide the long cable that is secured at the cable harness to the radio. It will not be used.

CABLE ROUTING AND CONNECTION TO THE ACCESSORY ELECTRONIC MODULE (AEM)

Fig. 204: Identifying Seat Cushion
Courtesy of VOLVO CARS CORPORATION

- Pull the front edge of the seat cushion (1) upwards. Pull the seat cushion forward and lift out.

Fig. 205: Folding Left Hand Rear Backrest Forward
Courtesy of VOLVO CARS CORPORATION

- Fold the left hand rear backrest forward
- Remove the seat belt from the guide (1).

Fig. 206: Identifying Left-Hand Side Cushion
Courtesy of VOLVO CARS CORPORATION

- Insert your hand down the side of the lower section of the side cushion. Remove the left-hand side cushion
- Release the catches. At the same time lift the side cushion
- Place the cushion to one side
- Repeat the operation on the other side.

Fig. 207: Identifying Removal Of Sill Moulding For Left-Hand Rear Door
Courtesy of VOLVO CARS CORPORATION

- Remove the sill moulding from the left-hand rear door.

Fig. 208: Fold Cargo Compartment Carpet To One Side
Courtesy of VOLVO CARS CORPORATION

- Remove the cargo compartment carpet (1)
- Turn the clips (2) on the left and right-hand side panels
- Remove the two clips and the plastic nut at the lower edge of the panels
- Remove the panels
- Remove the two covers (3). Slacken off the two screws (4). Grasp the outer edges of the panel (5). Pull the panel inwards towards the center so that the clips release from the sides. Disconnect the connectors (6) for the cargo compartment lamps
- Remove the panel by pulling it straight upwards so that the clips release from the rear crossmember.

Fig. 209: Front Edge And Left Front Side Panel Clips
Courtesy of VOLVO CARS CORPORATION

- Remove the clips (1) from the left front side panel in the cargo compartment
- Remove the clips (2) from the front edge of the side panel

- Remove the panel.

Fig. 210: Identifying Routed Cable
Courtesy of VOLVO CARS CORPORATION

- Route the long cable (previously routed with the cable harness from the radio) under the carpet. Continue out to the left-hand side of the car
- Clamp the cable at the existing cable at the left-hand side of the cross member. Use a tie strap (1) from the kit
- Route the cable inside the carpet and under the cable ducts (2) and (3) along the left-hand side of the car towards the cargo compartment. Ensure that the cable is securely pressed down between the sills and carpets
- Route the cable under the existing wiring and the connectors by the cable duct (3).

Fig. 211: Cable Harness And Straps
Courtesy of VOLVO CARS CORPORATION

- Route the cable along the left-hand rear wheel arch to the rear cross member

- Continue to route the cable along the rear crossmember over the rear edge on the right-hand rear wheel well
- Secure the cable along the existing cable harnesses. Use the tie straps (1) (from the kit).

Fig. 212: AEM-Control Unit Connecting Plate Screw
Courtesy of VOLVO CARS CORPORATION

- Slacken off the screw (1) and the nut (1) a few turns in the lock facing for the rear accessory electronic module (AEM) for the right rear wheel well
- Pull the lock facing out to the right. Remove the lock facing.

Fig. 213: Accessory Electronic Module Out Of Bracket
Courtesy of VOLVO CARS CORPORATION

- Lift the accessory electronic module (AEM) out of the bracket.

Fig. 214: AEM Controller Connector
Courtesy of VOLVO CARS CORPORATION

- Disconnect the large connector from the accessory electronic module (AEM). First press in catch A. Pull back locking handle B in the direction of the arrow until a click is heard. Disconnect the connector
- Remove the connector from the accessory electronic module (AEM).

Fig. 215: Black Terminal Pin By Inserting A Pointed Object Into Hole In Other End
Courtesy of VOLVO CARS CORPORATION

- Remove the black catch holding the black switch in place in the connector by pulling in the direction of the arrow
- Remove the black switch by inserting a pointed object in the hole on the other end. Press the switch out.

Fig. 216: Connecting Pre-Routed Cable To Terminal 11 Of AEM Connector
Courtesy of VOLVO CARS CORPORATION

- Connect the pre routed cable to terminal 11 of the accessory electronic module (AEM) connector.

NOTE: Number markings can be found on the top and bottom of the black switch. The markings are very small. Ensure accuracy when installing the cable.

Fig. 217: Identifying AEM Controller Plate Installation
Courtesy of VOLVO CARS CORPORATION

- Reinstall the black switch in the connector. Lock into place using the catch
- Press the connector into the accessory electronic module (AEM). Secure using the black arm
- Reinstall the accessory electronic module (AEM). Secure any excess wiring
- Reinstall the lock facing above the accessory electronic module (AEM). Tighten the screw and the nut. Tighten to **10 Nm (8 lbf. ft.)** .

INSTALLING THE HANDS FREE BOX

HINT: Install the aerial according to the separate Installation Instructions.

Fig. 218: Identifying Position Of Hands Free Box And Bracket Under Driver's Seat
Courtesy of VOLVO CARS CORPORATION

- Tip the driver's seat back slightly
- Position the hands free box and the bracket with the mounting over the screw hole in the right front mounting for the driver's seat
- Fold the seat down towards the mountings. Check that the hands free box bracket is positioned under the seat rail
- Route all excess cable in under the carpet.

NOTE: Ensure that the none of the wiring is trapped.

- Tighten the front edge of the seat using the two new screws. Tighten to **40 Nm (30 lbf. ft.)**
- Reinstall the covers for the screws.

FINISHING WORK

Fig. 219: Clamping Handset Holder Cables Connectors At Coarse Cable Harness For Radio
Courtesy of VOLVO CARS CORPORATION

- Take a tie strap from the kit. Clamp the connectors to the handset holder at the larger cable harness to the radio. Ensure that the connectors are properly secured and do not rattle.

Fig. 220: Connecting Handset Holder Extension Cable Switch To Car Aerial, Cable Harness Connectors To Connectors For Radio, And Connectors To Radio
Courtesy of VOLVO CARS CORPORATION

Applies to cars with an amplifier

- Connect the switch from the handset holder extension cable (1) to the car aerial. The aerial is installed according to a separate Installation Instruction
- Connect the connector (2) for the new large cable harness to the connector (3) that was disconnected from the radio
- Connect the connector (4) to the radio
- Connect any other connectors removed from the radio

- Reinstall the radio.

Fig. 221: Connecting Handset Holder Extension Cable Switch To Car Aerial, Cable Harness Connectors To Connectors For Radio, And Connectors To Radio
Courtesy of VOLVO CARS CORPORATION

Applies to cars without an amplifier

- Connect the switch from the handset holder extension cable (1) to the car aerial. The aerial is installed according to a separate Installation Instruction
- Connect the new, large cable harness connectors (2) to the corresponding connectors removed from the radio (3)
- Connect the connectors (4) to the radio
- Connect any other connectors removed from the radio. Reinstall the radio.

Reinstall:

- the side panels at the center console
- the ventilation grille
- the dashboard environmental panel
- the panel around the gear selector lever
- the panels for the door sills.

- Take two new screws from the kit. Tighten the right seat. Tighten to **40 Nm (30 lbf. ft.)**
- Reinstall the covers for the screws.

Fig. 222: Connecting Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position II
- Connect the battery negative lead.

Reinstall:

- the panels in the cargo compartment
- the side cushion
- the backrest
- the seat cushion.

- Program the software according to the service information in VIDA (Volvo scan tool).

HANDSFREE (2003-2004)

CARS EQUIPPED WITH SRS/SIPS (AIRBAG)

see **CARS EQUIPPED WITH SRS/SIPS (AIRBAG)**

CAUTION

see **CAUTION**

HANDSFREE

NOTE: **This accessory is connected to the electrical system of the car. It requires software unique to the car.**

PREPARATIONS

Fig. 223: Identifying Centre Console Side Panels
Courtesy of VOLVO CARS CORPORATION

- Remove the left and right-hand side panels from the center console. Pull the panels free at the front edge and then backwards until all the clips have released.

Fig. 224: Disconnect Battery Negative Lead
Courtesy of VOLVO CARS CORPORATION

Applies to cars with power front seats

- Position the right-hand front seat so that the panels over the front and right rear seat mountings, and the small panel at the lower edge of the right-hand B-post are not obstructed. They will be removed later after disconnecting the battery negative lead
- Also position the left-hand front seat in a suitable position so that the hands free kit can be installed.

Applies to all models

- Turn the ignition key to position 0

- Disconnect the battery negative lead.

NOTE: **Wait at least five minutes before disassembling the connectors or removing other electrical equipment.**

Illustration A

Fig. 225: Removing The Loudspeaker Grille
Courtesy of VOLVO CARS CORPORATION

Remove the loudspeaker grille as follows:

- Take a length of **1.5 mm (1/16")** diameter welding rod. Bend one end to 90° (L=5 mm (13/64")). The other end is bent to form a handle
- Insert the first bent end down into the joint between the loudspeaker grille and the dashboard as illustrated, until it engages
- Twist the welding rod 90° so that the bent section engages with the underneath of the loudspeaker grille. It may be necessary to move the welding rod along the joint to twist the rod around.

Illustration B

Fig. 226: View Of Detached Loudspeaker Grille
Courtesy of VOLVO CARS CORPORATION

- Pull upwards until the loudspeaker grille detaches. The loudspeaker grille is securely fastened by four clips.

NOTE: Do not damage the dashboard.

- Place the loudspeaker grille to one side.

Illustration C applies to cars without a centrally-mounted loudspeaker

Fig. 227: Identifying Cars Without A Centrally-Mounted Loudspeaker
Courtesy of VOLVO CARS CORPORATION

- Remove the bracket for the loudspeaker grille by removing the five screws and pulling it up out of the dashboard.

Illustration D applies to cars with a centrally-mounted loudspeaker

Fig. 228: Identifying Cars With A Centrally-Mounted Loudspeaker
Courtesy of VOLVO CARS CORPORATION

- Remove the five screws in the loudspeaker. Pull up the loudspeaker slightly from the dashboard. Disconnect the connector.

Illustration E applies to cars with RTI (road traffic information)

Fig. 229: Identifying Cars With RTI (road Traffic Information) Display
Courtesy of VOLVO CARS CORPORATION

- Remove the five screws in the display for RTI (road traffic information). Pull up the display slightly from the dashboard. Disconnect the connectors. Disconnect the centrally-mounted loudspeaker connector if installed.

Fig. 230: Identifying Upper Steering Column Cover Removal
Courtesy of VOLVO CARS CORPORATION

- Lower the steering wheel to the lowermost position. Pull the steering wheel to the rearmost position
- Remove the two screws at the top edge of the combined instrument panel surround
- Carefully pry off the rubber seal from the upper steering column cover. Use a weatherstrip tool. It is secured with five clips
- Remove the surround by carefully pulling it backwards, first at the lower edge and then at the top edge until all the clips have released.

Fig. 231: View Of Combined Instrument Panel Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the four screws for the combined instrument panel
- Pull out the combined instrument panel. Disconnect the connector on the reverse of the combined instrument panel.

Fig. 232: Prying Off Gear Selector Panel At Rear Edge
Courtesy of VOLVO CARS CORPORATION

Applies to cars with automatic gearboxes

- Turn the ignition key to position II.

Applies to all models

- Move the gear selector lever to its rearmost position
- Carefully pry off the gear selector lever panel at the lower edge using a weatherstrip tool. Pull the panel backwards to access the screws for the dashboard environment panel.

Fig. 233: Removing Screws And Radio/AC Unit From Center Console
Courtesy of VOLVO CARS CORPORATION

- Remove the screws holding the bracket for the dashboard environment panel and the control module
- Pull out the bracket at the lower edge. Pull downwards from the top edge of the center console

- Disconnect the connectors from the dashboard environment panel, control module. If applicable disconnect the CD player and/or Mini disc player connectors.

INSTALLING THE CARPHONE HOLDER

Fig. 234: Identifying Carphone Holder Bracket Components
Courtesy of VOLVO CARS CORPORATION

- Take the carphone holder bracket, the reinforcement panel, the cover and screws from the kit
- Install the reinforcement panel (1) and the cover (2) in the bracket (3) using the screws (4).

Illustration A

Fig. 235: View Of Bracket To Dashboard
Courtesy of VOLVO CARS CORPORATION

- Position the entire unit (1) in the dashboard to mark out holes for the bracket. Adjust to achieve the optimum position. Do not press the unit hard against the dashboard, however, ensure that there are no

gaps at the sides between the panel and the dashboard (2).

Illustration B

Fig. 236: View Of Bracket Hole Markings
Courtesy of VOLVO CARS CORPORATION

- Hold the unit securely and mark out the holes through the bracket
- Drill out the two holes using a **5 mm (13/64")** diameter drill bit. Use a 25 mm (1") drill stop
- Remove any metal shavings
- Remove the cover and the reinforcement panel from the bracket.

Fig. 237: View Of Reinforcement Panel Screws
Courtesy of VOLVO CARS CORPORATION

- Take the reinforcement panel (1) and the two screws from the kit
- Position the carphone holder wiring so that it is routed on the reverse of the bracket as illustrated
- Insert the reinforcement panel through the hole for the center loudspeaker

- Install the bracket (2). Use the two screws (3). Tighten the bracket against the dashboard.

Fig. 238: Identifying The Wiring And The Bracket For The Handset Holder
Courtesy of VOLVO CARS CORPORATION

- Press the surround for the combined instrument panel into place
- Mark out the surround, following the sketch, where the cut-outs will be made for the wiring and the bracket for the handset holder
- Remove the surround. File out the groove (1) for the wiring for the handset. File the hole so that it is large enough for any excess wiring to be routed through the hole and hidden on the inside of the dashboard
- File out a groove (2) for the bracket for the handset holder
- Smooth off the edges of the groove.

Fig. 239: Identifying Wire Routing
Courtesy of VOLVO CARS CORPORATION

- Route the wiring to the carphone holder from the hole for combined instrument panel. Position the wiring at the left air duct in the center console. Do not route more wiring than is required to secure the carphone

holder

- Connect the combined instrument panel. Reinstall the combined instrument panel
- Reinstall the surround for the combined instrument panel. Tighten.

Fig. 240: Identifying Bracing Plate Components
Courtesy of VOLVO CARS CORPORATION

- Install the bracing plate (1) and the cover (2) in the bracket (3). Use the screw (4) (from the kit). Do not tighten fully yet
- Remove the mounting plate (5) for the carphone holder from the carphone holder. Tighten the mounting plate using the screws (6) from the kit
- Tighten the screw (4).

Illustration A applies to Nokia

Fig. 241: Identifying Handset Holder Mounting Components
Courtesy of VOLVO CARS CORPORATION

- Tighten the carphone holder (1) onto the mounting plate (2) using the screw (3)
- Install the cover (4).

Illustration B applies to the Ericsson T28, T29 and T39

Fig. 242: Identifying Handset Holder Mounting Components
Courtesy of VOLVO CARS CORPORATION

- Tighten the upper section of the carphone holder (1) onto the mounting plate (2) using the screw and washer (3)
- Press the lower section (4) of the carphone holder onto the upper section.

Illustration C applies to the Ericsson T20

Fig. 243: Identifying Carphone Holder Mounting Components
Courtesy of VOLVO CARS CORPORATION

- Tighten the carphone holder mounting (1) onto the mounting plate (2) using the screw and washer (3)

- Press the carphone holder (4) onto the mounting.

Fig. 244: Identifying Nokia Mounting Plate
Courtesy of VOLVO CARS CORPORATION

Applies to Nokia

- Install the mounting plate (1) on the bracket. Use the screws and nuts from the kit.

Fig. 245: Identifying Two Large Cable Harnesses From The Kit
Courtesy of VOLVO CARS CORPORATION

Applies to all models

- Take the two large cable harnesses from the kit. Connect them to each other.

INSTALLING THE HANDSFREE BOX

Illustration A applies to Ericsson

Fig. 246: Identifying Ericsson Handsfree Box Components
Courtesy of VOLVO CARS CORPORATION

- Take four screws and nuts from the kit. Tighten the handsfree box to the bracket
  - the wiring to the head restraint (1)
  - the wiring to the carphone holder (2)
  - the cable to the accessory electronic module (AEM) (3)
  - the joint cable (4) to the short cable for the handsfree box.
- Connect the wiring to the handsfree box as illustrated:
  - the wiring to the head restraint (1)
  - the wiring to the carphone holder (2)
  - the cable to the accessory electronic module (AEM) (3)
  - the joint cable (4) to the short cable for the handsfree box.

Illustration B applies to Nokia

Fig. 247: View Of Nokia Handsfree Box To The Mounting Plate

Courtesy of VOLVO CARS CORPORATION

- Tighten the handsfree box to the mounting plate (1) using the screw (2) from the kit
  the wiring to the head restraint (4)
  the cable to the carphone holder (5)
  the cable to the accessory electronic module (AEM) (6).
- Install the cover (3) over the screw
  the wiring to the head restraint (4)
  the cable to the carphone holder (5)
  the cable to the accessory electronic module (AEM) (6).
- Connect the wiring to the handsfree box as illustrated:
  the wiring to the head restraint (4)
  the cable to the carphone holder (5)
  the cable to the accessory electronic module (AEM) (6).

Applies to all models

- The remaining cable from the carphone holder, (5) in illustration A and (7) in illustration (B), is connected to the car aerial.

Fig. 248: Identifying Hands Free Box Bracket Bolts
Courtesy of VOLVO CARS CORPORATION

Applies to all models:

- Take two screws and nuts from the kit. Install the bracket with the handsfree box on the existing bracket at the lower edge of the center console.

NOTE: Ensure that the none of the wiring is trapped.

- Locate the grey (GR) pre-routed connector (1) for power supply. This comes from the heavy duty cable harness - either under the dashboard on the right-hand side of the steering column, immediately above the accelerator pedal (AP), or in the cut-out for the radio in the center console.

  The connector may be separate on the cable harness, or if the car has a MiniDisc player and / or CD player / changer, the connector may be on the junction cable for these components.

Cars which do not have a pre-routed connector in the cut-out for the radio:

- Remove the soundproofing panel on the left-hand side. First remove the two screws, then pry off the soundproofing panel at the top edge (see illustration B).

Applies to all models:

- Take the cable harness with the two grey (GR) connectors which was previously connected to the handsfree box. Pull it out through the left-hand side of the center console to the existing connector
- Connect the pre-routed connector to the corresponding connector (2) on the routed cable harness
- Secure the excess connector (3). Also clamp the cable harness so that it is not in contact with any sharp edges and is not at risk of any other damage.

Fig. 249: Identifying Removal Of Screws And Soundproofing Panel
Courtesy of VOLVO CARS CORPORATION

HEAD RESTRAINT PREPARATIONS

Fig. 250: Identifying Head Restraint Catches
Courtesy of VOLVO CARS CORPORATION

- Remove the driver's seat head restraint. Press in the catches while pulling the head restraint up.

Fig. 251: Identifying Removal Of Upholstery From Head Restraint
Courtesy of VOLVO CARS CORPORATION

Does not apply to cars with leather upholstery

- Remove the upholstery from the head restraint. If the zip fastener catch is missing: Disconnect the clamps at the ends of the zip fastener. Pull the zip fastener apart.

Fig. 252: Marking Up For Holes In Head Restraint Upholstery
Courtesy of VOLVO CARS CORPORATION

Does not apply to cars with leather upholstery

- Turn the head restraint upholstery inside out
- Mark up for holes on the right hand side of the head restraint. Mark from the underside (1) of the side 120 mm (4 23/32") upwards and mark out between the two seams (2) and (3).

Fig. 253: Punching Out Holes In Head Restraint Upholstery
Courtesy of VOLVO CARS CORPORATION

Does not apply to cars with leather upholstery

- Punch out the hole using the hole punch from the kit. Use a wooden or cork underlay
- Turn the upholstery the correct way
- Carefully pull the upholstery over the new head restraint with the microphone.

Applies to cars with leather upholstery

- Take the new leather upholstery from the kit
- Carefully pull the upholstery over the new head restraint with the microphone.

Fig. 254: Identifying Zip Fastener
Courtesy of VOLVO CARS CORPORATION

- Close the zip fastener. If the zip fastener catch is missing, use a suitable zip fastener catch from the kit. Close the zip fastener again. Lock the ends using staples for example
- Push the ends of the zip fastener inside the upholstery.

INSTALLING THE HEAD RESTRAINT

Fig. 255: Tape Switch From Microphone Cable To Curtain Wire
Courtesy of VOLVO CARS CORPORATION

- Insert a curtain wire from the bottom and upwards on the reverse of the backrest between the upholstery

and the padding

- Tape the switch from the microphone cable to the curtain wire. Pull down through the seat
- Install the new head restraint.

Fig. 256: View Of Cable Pulled Up The From Head Restraint
Courtesy of VOLVO CARS CORPORATION

- Pull up the cable from the head restraint. Position it under the upholstery and route it to the front of the backrest
- Lower the cable between the seat cushion and its panel and up to the joint in the carpet on the left-hand side of the center console.

NOTE: Ensure that the cable does not come into contact with loose components or sharp edges.

Fig. 257: View Of Handsfree Box Connector
Courtesy of VOLVO CARS CORPORATION

- Pull the cable from the head restraint into the carpet join inside the carpet. Pull it along the inside of the left-hand side of the tunnel console up to the center console, along the air duct and up to the handsfree box that was installed earlier.

NOTE: Pull enough of the cable out of the carpet join so that the seat can move between its limit positions without stretching or rubbing.

- Connect the connector (1) from the newly routed cable to the corresponding connector (2) for the handsfree box.

CABLE ROUTING TO THE ACCESSORY ELECTRONIC MODULE (AEM)

Fig. 258: Identifying Soundproofing Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the right-hand side soundproofing panel. First remove the two screws. Then pry off the panel at the top edge.

Fig. 259: View Of Front Seat Front Edge Cover
Courtesy of VOLVO CARS CORPORATION

- Remove the cover (1) on the left front mounting on the right-hand front seat by prying off the front edge
- Pry off the front edge of the right panel (2). Remove the panel.

Fig. 260: Prizing Right-Hand Rear Mounting Of Cover Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the panel on the right rear mounting on the right-hand front seat. Pry it up slightly at the rear edge and then pull it back / upwards.

Fig. 261: Prizing Away Cover Panel Over Joint Between Door Sills On Right-Hand Side, At Lower Edge, Using A Weatherstrip Tool
Courtesy of VOLVO CARS CORPORATION

- Remove the panel over the joint between the door sills on the right-hand side. Carefully pry off the panel at the lower edge using a weatherstrip tool.

Fig. 262: Right-Hand Front Door's Sill Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Detach the sill trim panel for the right-hand front door. Pull off the panel starting at the front edge until the clip releases. Continue backwards until the remaining clips have released
- Unhook the sill trim panel from the B-post panel.

Fig. 263: Pushing Up Catch On Top Side
Courtesy of VOLVO CARS CORPORATION

- Remove the panel in the right-hand front seat mounting on the right-hand seat in the second row. Push up the catch (1) on the top. Pull the panel forward.

Fig. 264: Removing Cover Panel
Courtesy of VOLVO CARS CORPORATION

- Fold the backrest on the right-hand seat in the second row forward as far as possible. Slide the front seat forward as far as possible. (On cars with two rows of seats, the second row is secured.)
- Remove the cover (1) for the right rear seat mounting by prying off the rear edge.

Illustration A

Fig. 265: Removing Sill Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the sill trim panel for the right-hand rear door. Pull the rear edge until the clips release. Continue forwards until the remaining clips have released.

Applies to cars with two rows of seats

- On cars with two rows of seats the seat cannot be slid forwards. To remove the sill trim panel; Start by folding the backrest forward when pulling the rear edge of sill trim panel loose. Then reposition the

backrest to raise the seat cushion and provide more room for removing the sill trim panel. It is securely positioned. Do not damage the panel and surrounding components.

Illustration B

Fig. 266: Identifying Sill Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Unhook the sill trim panel from the B-post panel. Position the panel in the second/third row of seats.

Fig. 267: Identifying Centre Floor Hatch
Courtesy of VOLVO CARS CORPORATION

Applies to cars with three rows of seats and integrated carrier bag holder on the underside of the center floor hatch

- Fold the rear center floor hatch up
- Detach the two straps from the panel underneath. Lift up the rear edge of the panel. Fold the floor hatch back towards the panel and lift out the floor hatch and the panel.

Applies to cars with three rows of seats without integrated carrier bag holders

- Lift up the center rear floor hatch at the rear edge and lift it out.

Applies to cars with two rows of seats

- Remove the two center floor hatches. First lift up slightly and then pull them loose from the mountings at the front edge. If the rear center floor hatch has a carrier bag holder on the lower side, the floor hatch is secured by a strap on each of the shorter sides of the storage box. These must be removed.

- Remove the two storage boxes from underneath.

Fig. 268: Remove Right And Left Side Glove Box
Courtesy of VOLVO CARS CORPORATION

Applies to all models

- Remove the right-hand side floor hatch (1).

Fig. 269: Folding Side Panel From Right-Hand Side Of Cargo Compartment
Courtesy of VOLVO CARS CORPORATION

- Remove the folding side panel from the right-hand side in the cargo compartment.

Fig. 270: Identifying Cable Guide Under Carpet
Courtesy of VOLVO CARS CORPORATION

- Pull up the left and right sides of the carpet at the right-hand front seat slightly. Insert a wire (1) under the carpet at the front edge of the air ducts on the right-hand side of the center console, and route it out at the right-hand door sill as illustrated
- Take the long cable harness (2) in the cable harness for the handsfree box. Route it up to the newly positioned wire. Tape the long cable harness to the wire
- Pull the cable harness out of the carpet at the right-hand door sill.

Fig. 271: Cable Clamped In At Air Duct
Courtesy of VOLVO CARS CORPORATION

- Insert the cable harness between the carpet and the door sill towards the carpet as far as it will go. Route it along the right-hand side of the car up to the rear edge of the door opening for the right-hand rear door
- Pull the cable harness up to the right-hand front seat mounting on the right-hand seat in the second row of seats
- Pull away the carpet from the front edge of the right-hand side panel in the cargo compartment
- Route the cable harness along the right-hand side of the right-hand seat in the second row of seats towards the front edge of the rear wheel arch. Route it onwards on the left-hand side of the lower mounting for the seat belt, between the support bracket for the right-hand seat and wheel arch, and out at the left-hand side of the wheel arch
- Clamp the cable harness in the hole in the front member for the seat mounting and in the rear hole in the horizontal panel at the right-hand side of the seat. Use the tie straps (1) (from the kit).

Applies to cars with three rows of seats Illustration A

Fig. 272: Identifying Cable At Rear Edge Of Right-Hand Side Panel
Courtesy of VOLVO CARS CORPORATION

- Insert a cable (1) at the rear edge of the right-hand side panel and along the inside of the panel, above the mountings for the load securing eyelets and to the front edge of the side panel.

Illustration B

Fig. 273: Identifying Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Tape the cable harness (2) to the wire and pull it out of the rear edge of the side panel.

Fig. 274: Cable Routing
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Route the cable on the left-hand side of the seat belt mounting at the front edge of the wheel arch, inside the carpet at the front edge of the side panel, between the side panel and the rear of the cargo floor support, to the accessory electronic module (AEM).

CONNECTING TO THE ACCESSORY ELECTRONIC MODULE (AEM)

Fig. 275: Removing Panel By Pulling It Straight Up And Unhook It From Side Panel (1 Of 2)
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws from the bracket for the accessory electronic module (AEM) and lift up the entire unit. Cut off the tie straps if necessary.

Fig. 276: Removing Panel By Pulling It Straight Up And Unhook It From Side Panel
Courtesy of VOLVO CARS CORPORATION

- Disconnect the large connector from the accessory electronic module (AEM). First press in the catch (A). Pull the black locking handle (B) in the direction of the arrow until a click is heard. Disconnect the connector
- Disconnect the connector from the accessory electronic module.

Fig. 277: Black Terminal Pin By Inserting A Pointed Object Into Hole In Other End
Courtesy of VOLVO CARS CORPORATION

- Remove the black catch holding the black switch in place in the connector by pulling in the direction of the arrow
- Remove the black switch. Insert a pointed object in the hole on the other end of the connector. Press the switch out.

Fig. 278: Identifying Grey/White (GR/W) Cable From The Routed Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Connect the Grey / White (GR/W) cable from the routed cable harness to terminal 11 (tele-mute) in the black connector for the accessory electronic module (AEM).

NOTE: **The number markings can be found on the top and bottom of the black switch. However, the markings are extremely small so be careful when installing the two cables.**

- Reinstall the black switch in the connector. Lock into place using the catch
- Press the connector into the Accessory Electronic module. Secure using the black locking handle
- Reinstall the accessory electronic module (AEM) with the bracket and clamp the wiring with the tie strap from the kit.

NOTE: If the car is equipped with the accessory windscreen aerial, it should be installed at this stage before the components on the right-hand side of the car are reinstalled.

- Reinstall the folding panel on the right-hand side in the cargo compartment
- Reinstall the right-hand side floor hatch
- Reinstall the carpet at the front edge of the right-hand side panel
- Reinstall the sill trim panel in the right-hand rear door
- Reinstall the cover(s) over the seat mountings on the second row of seats.

INSTALLING THE INTEGRAL AERIAL

Fig. 279: Dashboard End Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the panel on the right end of the dashboard.

Fig. 280: Pry Off Grab Handle Cover
Courtesy of VOLVO CARS CORPORATION

- Pry off the cover on the grab handle in the right-hand front door. Remove the screws.

Fig. 281: Identifying Right-Hand A-Post Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the rubber strip (1) at the front edge of the right-hand front door
- Remove the right-hand A-post panel by carefully pulling the top edge of the panel outwards until the clip on the inside releases. Pull up from the mounting in the dashboard.

NOTE: Do not damage the headlining.

Fig. 282: Identifying Sun Visor Inner Mountings
Courtesy of VOLVO CARS CORPORATION

- Remove the sun visor from the inner mounting (1) on the right-hand side
- Carefully pry the cover (2) off. Remove the two screws (3) for the sun visor mounting
- Remove the inner mounting (1) by first prying up the catch as illustrated. Then insert a small screwdriver in the rear edge of the exposed hole and press the sprung catch forward to release it from the hole in the roof. A the same time pull the rear edge of the mounting downward/backwards so that the catch at the front edge and both catches at the sides release.

NOTE: Do not damage the headlining.

Fig. 283: Folding Down Cover And Squeezing Catches Together
Courtesy of VOLVO CARS CORPORATION

- Fold down the cover (1) by carefully pulling down the front edge of the cover
- Squeeze the catches (2). Pull the front edge of the panel downwards. Then pull the rear edge off.

Fig. 284: View Of Front Interior Lighting
Courtesy of VOLVO CARS CORPORATION

- Remove the rear view mirror and the front interior lighting (1). First remove the two screws (2) and then press in the eight catches (3) around the interior lighting
- Carefully pull the components downwards and allow them to hang by their wiring. (The interior lighting is secured to the roof using the clip (4).).

Fig. 285: Aligning Antenna Lugs With Grooves In Bracket
Courtesy of VOLVO CARS CORPORATION

- Install the new aerial. Carefully bend the headlining downward and slide the aerial backward and inwards. Align the aerial lugs (1) with the grooves in the bracket (2)
- Insert the cable at the inside of the front edge of the headlining. Route the cable out towards the right-hand A-post
- Secure the cable using butyl tape
- Reinstall the bracket and rear view mirror. Tighten the screws. Tighten to **10 Nm (7.5 lbf. ft.)**
- Reinstall the panel. Securely lock the panel using the cover.

Fig. 286: Identifying Cable Taped Onto Existing Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Route the cable down from the headlining along the right A-post
- Tape the cable onto the existing cable harness as illustrated (1).

WARNING: Ensure that the cable is not routed over the inflatable curtain. This could compromise the function of the inflatable curtain in the event of an accident.

Fig. 287: Folding Back Carpet And Identifying Cable And Connectors
Courtesy of VOLVO CARS CORPORATION

- Push the carpet to one side by the right-hand front seat
- Take the extension cable (1) from the kit. Route the cable between the A-post and the right-hand side of the dashboard, continue along the right-hand end to the front edge of the floor
- Route the cable to the left along the front edge of the floor and up to the inside of the center console
- Connect the cable (1) to the corresponding cable (2) from the hands free box

- Connect both connectors (3) at the right A-post to each other
- Wrap the foam tape around the connectors to prevent rattling.

- Reinstall the A post panel. Tighten the grab handle. Tighten to **10 Nm (7.5 lbf. ft.)** . Reinstall the cover
  - the display for the RTI and the center loudspeaker if applicable
  - the center loudspeaker
  - the bracket for the loudspeaker grille
  - the loudspeaker grille.
- Reinstall the rubber strip in the right-hand front door
  - the display for the RTI and the center loudspeaker if applicable
  - the center loudspeaker
  - the bracket for the loudspeaker grille
  - the loudspeaker grille.
- Reinstall the panel on the end of the dashboard
  - the display for the RTI and the center loudspeaker if applicable
  - the center loudspeaker
  - the bracket for the loudspeaker grille
  - the loudspeaker grille.
- Reinstall the sun visor. Tighten the screws. Tighten to **10 Nm (7.5 lbf. ft)** . Reinstall the cover and the inner mounting
  - the display for the RTI and the center loudspeaker if applicable
  - the center loudspeaker
  - the bracket for the loudspeaker grille
  - the loudspeaker grille.
- Fold the carpet on the right-hand side back into place
  - the display for the RTI and the center loudspeaker if applicable
  - the center loudspeaker
  - the bracket for the loudspeaker grille
  - the loudspeaker grille.
- Reinstall the panel on the door trim for the right-hand front door. Press the B-post lower panel into place
  - the display for the RTI and the center loudspeaker if applicable
  - the center loudspeaker
  - the bracket for the loudspeaker grille
  - the loudspeaker grille.
- Reinstall the soundproofing panel on the right and left-hand sides
  - the display for the RTI and the center loudspeaker if applicable
  - the center loudspeaker
  - the bracket for the loudspeaker grille

the loudspeaker grille.

- Reinstall the cover and panel on the right-hand front seat
  - the display for the RTI and the center loudspeaker if applicable
  - the center loudspeaker
  - the bracket for the loudspeaker grille
  - the loudspeaker grille.
- Connect the connectors to the dashboard environment panel and control module. If applicable connect the CD player and/or Mini disc player connectors
  - the display for the RTI and the center loudspeaker if applicable
  - the center loudspeaker
  - the bracket for the loudspeaker grille
  - the loudspeaker grille.
- Position the bracket. Tighten the bracket using the two screws. Reinstall the gear selector lever panel
  - the display for the RTI and the center loudspeaker if applicable
  - the center loudspeaker
  - the bracket for the loudspeaker grille
  - the loudspeaker grille.
- Reinstall (depending on the equipment of the car):
  - the display for the RTI and the center loudspeaker if applicable
  - the center loudspeaker
  - the bracket for the loudspeaker grille
  - the loudspeaker grille.

Fig. 288: Connecting Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position II

- Reconnect the battery negative lead
- Reinstall the storage boxes and floor hatch(es)
- Reinstall both the side panels on the center console
- Program the software using VCT2000 according to the service information in VIDA (Volvo scan tool).

XC90

see **XC90**

HANDSFREE FOR CELLULAR PHONE, SYSTEM B, ENTRY LEVEL (2003-2004)

HANDSFREE FOR CELLULAR PHONE, SYSTEM B, ENTRY LEVEL

NOTE: **When installing antennas and Velcro tape, the underlying surface must be kept at a temperature of at least +20° C (68°F).**

Wiring A is for vehicles with an internal amplifier that is located in the media player.

Wiring B and C is for cars with an external amplifier, which is located under the right-hand front seat. Cars from and including model year -07 with audio system Performance Sound has an internal amplifier. Cars up to and including model year -06 with audio system Performance Sound has an external amplifier.

Cars with the High Performance and Premium Sound audio systems have external amplifier.

PREPARATIONS

Fig. 289: Disconnect Battery Negative Lead

Courtesy of VOLVO CARS CORPORATION

- Slide the right-hand seat all the way back and then completely upright at the front edge.
- Turn the ignition switch to position 0.
- Disconnect the battery negative lead.

NOTE: Wait at least three minutes before unplugging the connectors or removing other electrical equipment.

Removing the loudspeaker grille:

Fig. 290: Removing The Loudspeaker Grille
Courtesy of VOLVO CARS CORPORATION

- Take a piece of welding rod **1.5 mm (1/16")** . Bend it 90° at one end, **L = 5 mm (13/64")** .
- Bend the other end to make a handle.
- First insert the bent end in the joint between the loudspeaker grille and the dashboard approximately as illustrated, until it engages.
- Turn the welding rod 90°so that the bent section catches the underneath of the loudspeaker grille. The welding rod may need moving along the joint to be turned.

Fig. 291: View Of Detached Loudspeaker Grille
Courtesy of VOLVO CARS CORPORATION

- Pull upwards until the loudspeaker grille detaches. It is securely fastened by four clips.

NOTE: Do not damage the dashboard.

- Place the loudspeaker grille to one side.

Fig. 292: Identifying Cars With A Centrally-Mounted Loudspeaker
Courtesy of VOLVO CARS CORPORATION

- Remove the bracket for the loudspeaker grille by removing the five screws and pulling the grille up from the dashboard.
- Disconnect any connectors

Applies to cars with RTI (road traffic information)

Fig. 293: Identifying Cars With RTI (road Traffic Information) Display
Courtesy of VOLVO CARS CORPORATION

- Remove the five screws for the monitor. Pull the monitor up slightly from the dashboard and disconnect the connectors.

Fig. 294: Identifying Upper Steering Column Cover Removal
Courtesy of VOLVO CARS CORPORATION

- Lower the steering wheel to its lowest position and then move it rearward to its rearmost position.
- Remove the two screws at the top edge of the combined instrument panel border.
- Carefully use a weatherstrip tool to pry loose the rubber seal from the upper steering wheel cover. It is held in place with five hooks.
- Remove the border by carefully pulling it rearward - first at the bottom edge and then at the top edge - until all clips have released.

Fig. 295: View Of Combined Instrument Panel Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the four screws for the combined instrument panel.
- Pull out the combined instrument panel. Disconnect the connector on the reverse of the combined instrument panel.

Fig. 296: Prying Off Gear Selector Panel At Rear Edge
Courtesy of VOLVO CARS CORPORATION

Applies to cars with automatic gearbox

- Turn the ignition key to position II.

Applies to all models

- Move the gear selector lever to its rearmost position.
- Carefully prize away the gear lever panel at the rear edge using a weatherstrip tool.

Fig. 297: Pressing In Catches And Removing Panel
Courtesy of VOLVO CARS CORPORATION

- Press in the catches and remove the panel.

Fig. 298: Removing Screws And Radio/AC Unit From Center Console
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws.
- Remove the A/C / radio unit from the center console. Pull the bracket at the lower edge and then downwards until it releases from the mounting at the upper edge.

NOTE: Do not damage the removed components or the surrounding panels.

- Unplug the connectors.

PREPARATIONS, TELEPHONE HOLDER

Fig. 299: Identifying Telephone Holder's Bracket With Reinforcement Plate
Courtesy of VOLVO CARS CORPORATION

- Take the telephone holders bracket with reinforcement plate, cover and screws from the kit.
- Install the reinforcement plate (1) and cover (2) in the bracket (3) with screws (4) and screw (5).

Fig. 300: View Of Bracket To Dashboard
Courtesy of VOLVO CARS CORPORATION

- Place the entire unit (1) in the dashboard for marking the holes for the bracket. Adjust to achieve the best position. Do not press the unit hard against the dashboard but ensure that there are no gaps at the sides between the panel and dashboard (2).

Fig. 301: View Of Bracket Hole Markings
Courtesy of VOLVO CARS CORPORATION

- Hold the unit securely and mark out the holes through the bracket.
- Drill out the two holes using a **5 mm (13/64")** drill bit. Use a **25 mm (1")** drill stop.
- Remove any metal shavings.
- Remove the cover and reinforcement plate from the bracket.

Fig. 302: View Of Reinforcement Panel Screws
Courtesy of VOLVO CARS CORPORATION

- Take the reinforcement plate (1) and two screws from the kit.
- Place the telephone holders cables that are routed on the rear side of the bracket as illustrated.
- Insert the reinforcement plate through the hole for the central loudspeaker.
- Install the bracket (2) with the two screws (3). Tighten the bracket to the end of the dashboard.

Fig. 303: Identifying The Wiring And The Bracket For The Handset Holder
Courtesy of VOLVO CARS CORPORATION

- Press the surround on to the combined instrument panel.
- Make markings on the surround as illustrated, where cut-outs are to be made for the wiring and the bracket for the handset holder.
- Remove the surround and file out the groove (1) for the cables for the handset holder. The groove must be large enough for any excess cable to be pulled through.
- File out a groove (2) for the bracket for the handset holder.
- Smooth off the filed cut-outs.

Fig. 304: View Of Cable Routing From Mounting Plate
Courtesy of VOLVO CARS CORPORATION

- Route the cables from the mounting plate in the hole behind the combined instrument panel and continue to the center console. Do not route the cables in too much so that the mounting plate cannot be installed.

INSTALLING THE MICROPHONE

Fig. 305: View Of Left-Hand End Of The Dashboard
Courtesy of VOLVO CARS CORPORATION

- Pry off the rear edge of the panel on the left-hand end of the dashboard. Twist out the panel. Remove the panel.

Fig. 306: Identifying Grab Handle Covers
Courtesy of VOLVO CARS CORPORATION

- Pry up the cover on the grab handle by the posts and remove the screws from underneath.
- Pull off the rubber strip in the door opening.

Fig. 307: Identifying Top Edge Of The A-Post Panel
Courtesy of VOLVO CARS CORPORATION

- Pull off the A-pillar panel at the upper edge and then straight upwards to remove it.

Fig. 308: Cleaning Inside Of Windshield
Courtesy of VOLVO CARS CORPORATION

- Use isopropanol to clean the inside of the windshield (as illustrated).

Fig. 309: Removing Protective Film From Antenna
Courtesy of VOLVO CARS CORPORATION

- Take the antenna from the kit. Remove the protective film from the rear side.
- Position the antenna as illustrated and press it onto the windshield. Press securely so that the tape adheres.

Fig. 310: View Of Antenna Cable Route Along The A-Post
Courtesy of VOLVO CARS CORPORATION

- Route the antenna cable along the A-post, down toward the dashboard and out toward the end.
- Secure the cable using three tie straps.

CAUTION: The inflatable curtain (IC) is located inside the A-pillar panel, it is important that the cable is not positioned on it.

Fig. 311: View Of Mounting Plate Position
Courtesy of VOLVO CARS CORPORATION

- Take the mounting plate from the kit and position it on the A post panel's upper end as illustrated. If the microphone is already on the mounting plate, remove it. The microphone is attached by mounting hooks along the long sides.
- Mark out and drill the holes for the mounting plate. Use a **3 mm (1/8")** diameter drill bit.
- Remove any metal shavings.

Fig. 312: Identifying A-Post Panel Mount Plate Screws
Courtesy of VOLVO CARS CORPORATION

- Install the mounting plate on the A-post panel using two screws from the kit.

CAUTION: The inflatable curtain (IC) is located inside the A-post panel. It is important to file off the screws securing the mounting plate if necessary, so that they just fit through the panel.

- Check how much of the screws protrudes on the reverse. Unscrew the screws. File off the screws to the correct length.
- Reinstall the screws.

Fig. 313: Identifying Microphone Placement
Courtesy of VOLVO CARS CORPORATION

- Press the microphone from the kit into place on the mounting plate.

Fig. 314: View Of Microphone Cable Route On Inside Of A-Post Panel
Courtesy of VOLVO CARS CORPORATION

- Route the microphone cable on the inside of the A-post panel. Secure the cable using pieces of butyl tape.

Fig. 315: View Of Microphone Cable In Through The Left-Hand End Of The Dashboard
Courtesy of VOLVO CARS CORPORATION

- Press the A post panel into place. Install the screws and tighten them to **10 Nm (7 lbf. ft.)** .
- Press the covers over the screws into place.
- Pull the microphone cable and antenna cable through the dashboard's left-hand end, into the compartment for the combined instrument panel and into the microphone bracket.
- Secure the cable using pieces of butyl tape under the combined instrument panel.
- Connect the combined instrument panel and reinstall it.
- Reinstall the surround for the combined instrument panel and tighten.

INSTALLING THE TELEPHONE HOLDER

Fig. 316: Identifying Reinforcement Plate And Components
Courtesy of VOLVO CARS CORPORATION

- Install the reinforcement plate (1) and cover (2) in the bracket (3). Use screw (4).

- Check that the upper right-hand holes are opposite each other.
- Tighten the screw (4).
- Install the mounting plate (5) and tighten it with the screws (6).
- Feed the excess of the cables into the dashboard.

Fig. 317: View Of Telephone Holder On The Mounting Plate
Courtesy of VOLVO CARS CORPORATION

- Install the telephone holder on the mounting plate.

CONNECTION TO THE AMPLIFIER

APPLY TO CARS WITH EXTERNAL AMPLIFIER

Fig. 318: Identifying Centre Console Side Panels
Courtesy of VOLVO CARS CORPORATION

- Remove the center console's left and right-hand side panel by first pulling them away at the front edge

and continue backwards until all the clips have released.

Fig. 319: Identifying Removal Of Screws And Soundproofing Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the sound proofing panel by first removing the two screws and then prying off the sound proofing panel at the top edge.

Fig. 320: Locating 4 Pin, Gray, Pre-Routed Connector For The Power Supply
Courtesy of VOLVO CARS CORPORATION

- Locate the 4 pin, gray, pre-routed connector for the power supply. It comes from the thick cable harness under the dashboard on the right-hand side of the steering wheel

Fig. 321: Identifying Cable Harness C
Courtesy of VOLVO CARS CORPORATION

- Take cable harness C (marked C in the kit image) from the kit. Connect it to the existing connector. The pre-routed connector is already connected on certain cars.
- Disconnect this and connect both the connectors from the new cable harness.
- Install the loose connectors on the car's existing cable harness using a tie strap,

Fig. 322: View Of Cable Harness Route Backwards Through Center Console
Courtesy of VOLVO CARS CORPORATION

- Route the cable harness backwards and across through the center console.

Fig. 323: Identifying Amplifier Screws
Courtesy of VOLVO CARS CORPORATION

- Slacken off the amplifier screws (1) under the right-hand front seat.

Fig. 324: Identifying Amplifier Connector
Courtesy of VOLVO CARS CORPORATION

- Lift out the amplifier. Use a weatherstrip to raise it from its recessed position.
- Place the amplifier upside down as illustrated.
- Disconnect the connector at the arrow.

Fig. 325: Identifying Left-Hand Seat Piece
Courtesy of VOLVO CARS CORPORATION

- Remove the left-hand seat piece.

Fig. 326: View Of Amplifier Cable Under The Carpet
Courtesy of VOLVO CARS CORPORATION

- Pull the cable, that is connected to the 4 pin connector, out from the center console, under the carpet to the amplifier.

Fig. 327: View Of Foam Tape Pieces To Relay
Courtesy of VOLVO CARS CORPORATION

- Take cable harness B (marked B in the kit image), the mute relay and 2 pieces of foam tape from the kit.
- Connect cable harness B and the pre-routed cable harness C to the mute relay.
- Wrap the foam tape around the mute relay.

Fig. 328: Identifying Amplifier To The Connector On Cable Harness C
Courtesy of VOLVO CARS CORPORATION

- Connect the connector that was disconnected from the amplifier to the connector on cable harness C.
- Connect the connector on cable harness C to the amplifier.
- Secure the connected connectors using a tie-strap.

Fig. 329: Reinstalled Amplifier Screws
Courtesy of VOLVO CARS CORPORATION

- Place the mute-relay under the front left corner in the recess.
- Reinstall the amplifier and tighten it with the screws.

CARS WITH INTERNAL AMPLIFIER.

Fig. 330: View Of Foam Tape Pieces To Relay
Courtesy of VOLVO CARS CORPORATION

- Take cable harness A (marked A in the kit image), the mute relay and 2 pieces of foam tape from the kit
- Connect the connectors from the cable harness to the mute relay

Fig. 331: Identifying Cable Harness At Rear Edge Of Opening On Center Console
Courtesy of VOLVO CARS CORPORATION

- Place the relay with the cable harness at the rear edge of the opening on the center console.

Fig. 332: View Of Antenna Cable (1) To The Short Cable (2)
Courtesy of VOLVO CARS CORPORATION

- Connect the antenna cable (1) to the short cable (2) from the telephone holder mounting plate.

INSTALLING THE HANDSFREE CONTROL MODULE

Fig. 333: Cleaning Surrounding Areas Underneath Detached A/C / Radio Unit
Courtesy of VOLVO CARS CORPORATION

- Clean the surrounding areas, as illustrated, underneath the detached A/C / radio unit. Use isopropanol.

Fig. 334: Cleaning The Control Unit
Courtesy of VOLVO CARS CORPORATION

- Take the control unit from the kit and clean in the locations as shown in the image. Use isopropanol.

INSTALLING VELCRO

Fig. 335: Identifying Velcro Fasteners
Courtesy of VOLVO CARS CORPORATION

- Take a Velcro strip and cut off two pieces of the same length.
- Press the pieces together.
- Cut off two pieces of the same length again at the center

Fig. 336: Identifying Velcro Strips On The Control Module
Courtesy of VOLVO CARS CORPORATION

- Remove the protective backing tape from one side of the Velcro fasteners which were pressed together.
- Apply the Velcro strips on the control module and press.

Fig. 337: View Of Control Module In Position
Courtesy of VOLVO CARS CORPORATION

- Remove the remaining protective file on the Velcro strips, align and install the control module on the A/C / radio unit as illustrated. Press onto the control module so that the tape adheres.

Fig. 338: Identifying Adapter Wiring From The Kit Components
Courtesy of VOLVO CARS CORPORATION

- Take the adapter wiring from the kit.
  1. Adapter wiring (1) to the control module.
  2. The cable (2) from the microphone.
  3. The cable (3) from the power supply and mute relay.
  4. The cable (4) from the telephone holder.
- Connect the connectors as illustrated.
  1. Adapter wiring (1) to the control module.
  2. The cable (2) from the microphone.

3. The cable (3) from the power supply and mute relay.
4. The cable (4) from the telephone holder.

Fig. 339: View Of Secured Excess Wiring
Courtesy of VOLVO CARS CORPORATION

- Place the connectors and excess wiring at the bottom of the center console and secure them using a tie strap. Check that they do not rub against the edges of the bracket.

Fig. 340: Reinstall The A/C / Radio Unit
Courtesy of VOLVO CARS CORPORATION

- Reinstall the A/C / radio unit by first hooking the upper edge into place. Then press upwards and angle in the lower section.
- At the same time check that the cables are not trapped.
- Reinstall the screws.

Fig. 341: Identifying Ignition In ON Position and Connecting Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

Reinstall:

- panel for gear selector.
- the end face panel for the dashboard.
- sound proofing.
- seat piece.
- the side panels on the center console.
- Turn the ignition key to position II.
- Reconnect the battery negative lead.

INTEGRAL ANTENNA (2003)

CARS EQUIPPED WITH SRS/SIPS (AIRBAG)

see **CARS EQUIPPED WITH SRS/SIPS (AIRBAG)**

CAUTION

see **CAUTION**

INTEGRAL ANTENNA

PREPARATIONS

Fig. 342: Disconnect Battery Negative Lead
Courtesy of VOLVO CARS CORPORATION

- Position the driver's seat in the rearmost position
- Turn the ignition key to position 0
- Disconnect the battery negative lead.

NOTE: **Wait at least five minutes before disassembling the connectors or removing other electrical equipment.**

Fig. 343: Prying Off Gear Selector Panel At Rear Edge
Courtesy of VOLVO CARS CORPORATION

Applies to cars with automatic transmissions

- Turn the ignition key to position II.

Applies to all models

- Move the gear selector lever to its rearmost position
- Carefully pry off the gear selector lever panel at the lower edge using a weatherstrip tool. Pull the panel backwards to access the screws for the dashboard environment panel.

Fig. 344: Removing Screws And Radio/AC Unit From Center Console
Courtesy of VOLVO CARS CORPORATION

- Remove the screws holding the bracket for the dashboard environment panel and the control module
- Pull out the bracket at the lower edge. Pull downwards from the top edge of the center console
- Disconnect the connectors from the dashboard environment panel and control module. Disconnect the connectors for the Mini disc player and/or CD-player/changer if applicable.

Fig. 345: Right-Hand Side Sound Barrier
Courtesy of VOLVO CARS CORPORATION

- Remove the center console right-hand side panel. Pull off the panel starting at the front edge. Then pull backwards until all the clips release
- Remove the right-hand side soundproofing panel. First remove the two screws. Then pry off the panel at

the top edge.

Fig. 346: Prizing Away Cover Panel Over Joint Between Door Sills On Right-Hand Side, At Lower Edge, Using A Weatherstrip Tool
Courtesy of VOLVO CARS CORPORATION

- Carefully pry off the panel above the joint between the right-hand door sills, at the lower edge using a weatherstrip tool.

Fig. 347: Right-Hand Front Door's Sill Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the sill trim panel for the right-hand front door. Pull off the panel starting at the front edge until the clip releases. Continue backwards until the remaining clips have released
- Unhook the sill trim panel from the B-post panel and the panel at the lower edge of the B-post panel.

Fig. 348: Dashboard End Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the panel on the right end of the dashboard.

Fig. 349: Pry Off Grab Handle Cover
Courtesy of VOLVO CARS CORPORATION

- Pry off the cover on the grab handle in the right-hand front door. Remove the screws.

Fig. 350: Identifying Right-Hand A-Post Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the rubber strip (1) at the front edge of the right-hand front door
- Remove the right-hand A-post panel by carefully pulling the top edge of the panel outwards until the clip on the inside releases. Pull up from the mounting in the dashboard.

NOTE: Do not damage the headlining.

Fig. 351: Identifying Sun Visor Inner Mountings
Courtesy of VOLVO CARS CORPORATION

- Remove the sun visor from the inner mounting (1) on the right-hand side
- Carefully pry the cover (2) off. Remove the two screws (3) for the sun visor mounting
- To remove the headlining: Remove the inner mounting (1) by prying up as illustrated. Then carefully pull the mounting (secured by four catches) from the roof.

NOTE: Do not damage the headlining.

Fig. 352: Folding Down Cover And Squeezing Catches Together
Courtesy of VOLVO CARS CORPORATION

- Fold down the cover (1) by carefully pulling down the front edge of the cover
- Squeeze the catches (2). Pull the front edge of the panel downwards. Then pull the rear edge off.

Fig. 353: View Of Front Interior Lighting
Courtesy of VOLVO CARS CORPORATION

- Remove the rear view mirror and the front interior lighting (1). First remove the two screws (2) and then press in the eight catches (3) around the interior lighting
- Carefully pull the components downwards and allow them to hang by their wiring. (The interior lighting is secured to the roof using the clip (4).).

INSTALLING THE INTEGRAL ANTENNA

Fig. 354: Aligning Antenna Lugs With Grooves In Bracket
Courtesy of VOLVO CARS CORPORATION

- Install the new antenna. Carefully bend the headlining downward and slide the antenna backward and inwards. Align the antenna lugs (1) with the grooves in the bracket (2)
- Insert the cable at the inside of the front edge of the headlining. Route the cable out towards the right-hand A-post
- Secure the cable using butyl tape
- Reinstall the bracket and rear view mirror. Tighten the screws. Tighten to **10 Nm (7.5 lbf. ft)**
- Reinstall the panel. Securely lock the panel using the cover.

CABLE ROUTING AND CONNECTION

Fig. 355: Identifying Cable Taped Onto Existing Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Route the cable down from the headlining along the right A-post
- Tape the cable onto the existing cable harness as illustrated (1).

WARNING: Ensure that the cable is not routed over the inflatable curtain. This could compromise the function of the inflatable curtain in the event of an accident.

Fig. 356: Folding Back Carpet And Identifying Cable And Connectors
Courtesy of VOLVO CARS CORPORATION

- Push the carpet to one side by the right-hand front seat
- Take the extension cable (1) from the kit. Route the cable between the A-post and the right-hand side of the dashboard, continue along the right-hand end to the front edge of the floor
- Route the cable to the left along the front edge of the floor and up to the inside of the center console
- Connect the cable (1) to the corresponding cable (2) from the hands free box
- Connect both connectors (3) at the right A-post to each other
- Wrap the foam tape around the connectors to prevent rattling.

- Reinstall the A post panel. Tighten the grab handle. Tighten to **10 Nm (7.5 lbf. ft)** . Reinstall the cover
- Reinstall the rubber strip in the right-hand front door
- Reinstall the panel on the end of the dashboard
- Reinstall the sun visor. Tighten the screws. Tighten to **10 Nm (7.5 lbf. ft)** . Reinstall the cover and the inner mounting
- Fold the carpet on the right-hand side back into place
- Reinstall the panel on the door trim for the right-hand front door. Press the B-post lower panel into place
- Reinstall the soundproofing panel on the right-hand side
- Reinstall the right-hand side panel for the center console
- Connect the connectors to the dashboard environment panel. If applicable connect the CD player and/or Mini disc player connectors
- Position the bracket. Tighten the bracket using the two screws. Reinstall the gear selector lever panel.

Fig. 357: Connecting Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position II
- Reconnect the battery negative lead.

XC90

see **XC90**

LOUDSPEAKER, REAR DOOR (2003-2011)

LOUDSPEAKER, REAR DOOR

Illustration A

Fig. 358: Identifying Upper Panel On The Door Handle
Courtesy of VOLVO CARS CORPORATION

- Remove the upper panel on the door handle. First insert a small screwdriver in the hole (1) in the lower section of the panel and press the catch on the inside at the same time as pulling the top edge of the panel upwards. If necessary use a plastic weatherstrip tool to pry up the top edge of the cover.

Illustration B

Fig. 359: Carefully Pry Off The Door Panel Using The Weatherstrip Tool
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws (2) from under the panel
- Carefully pry off the door panel using the weatherstrip tool. Start at the lower edge and pry opposite the clips (3).

REMOVE

Fig. 360: Identifying Installation Of Loudspeaker, Moisture Inhibitor, Cable And Connectors
Courtesy of VOLVO CARS CORPORATION

- Disconnect the connector (1) from the door control module and from the existing loudspeaker
- Remove the wire (2) from the door opener handle (3). First bend up the catches
- Remove the panel
- Carefully remove the moisture inhibitor (4) at the front edge. This is carried out to install the nuts on the inside when installing the loudspeaker.

- Drill out the rivets (5) holding the loudspeakers. Use a **6 mm (1/4")** diameter drill bit
- Remove the loudspeakers and any rivet metal shavings from the holes. Remove the rivet sections from the door if necessary.

INSTALL

Fig. 361: Door Panel Components
Courtesy of VOLVO CARS CORPORATION

- Screw the new loudspeaker into place using the screws, washers and the nuts from the kit (1). The washers must be positioned under the screw heads
- Reinstall the moisture inhibitor
- Connect the connectors (2) to the loudspeaker and the module for the door controls
- Reinstall the mechanical cable (3) on the door opener handle (4)
- Reinstall the door panel, and the upper panel for the door handle.

MINIDISC PLAYER (2003-2010)

MINIDISC PLAYER

NOTE: This accessory requires software unique to the car.

PREPARATORY WORK

Fig. 362: Disconnect Battery Negative Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position 0
- Disconnect the battery negative lead.

NOTE: **Wait at least five minutes before disassembling the connectors or removing other electrical equipment.**

Fig. 363: Prying Off Gear Selector Panel At Rear Edge
Courtesy of VOLVO CARS CORPORATION

Applies to cars with automatic gearboxes

- Turn the ignition key to position II.

Applies to all models

- Move the gear selector lever to its rearmost position
- Carefully pry off the rear edge of the panel for the gear selector lever using a plastic weatherstrip tool. Pull the panel backwards to access the screws for the dashboard environment panel.

Fig. 364: Removing Screws And Radio/AC Unit From Center Console
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws holding the bracket for the dashboard environment panel and the control module.

NOTE: Pull out the bracket at the lower edge. Pull from the top edge of the center console.

- Disconnect the connectors from the dashboard environment panel, control module. If applicable disconnect the CD player connector.

Fig. 365: View Of Control Module Screws
Courtesy of VOLVO CARS CORPORATION

Fig. 366: Remove The Control Module
Courtesy of VOLVO CARS CORPORATION

- Position the console with the control module and dashboard environment panel in a suitable position
- Remove the four screws on the reverse holding the control module at the console
- Press in the four catches in the sides of the control module so that they release. Carefully remove the control module.

Fig. 367: Identifying Centre Console Locker From The Control Module
Courtesy of VOLVO CARS CORPORATION

- Remove the center console locker from the control module. First remove the two screws on the reverse. Then pry off the catches on the sides and underneath. Detach the center console locker
- Place the control module and center console locker to one side. The center console locker will not be reused.

INSTALLING THE MINIDISC PLAYER

Fig. 368: Insert The MiniDisc Player In The Upper Cut-Out In The Console
Courtesy of VOLVO CARS CORPORATION

- Insert the MiniDisc player in the upper cut-out in the console. Ensure that the locating pins on the sides and on the reverse and the connector locate in the corresponding socket in the bracket
- Take the two screws which secured the center console locker. Tighten the MiniDisc player
- For aftermarket installation of both a MiniDisc and CD player/changer, install the CD player/changer according to points 5 and 6 in these installation instructions.

Fig. 369: Inserting Control Module To Bracket
Courtesy of VOLVO CARS CORPORATION

- Insert the control module in the bracket. Ensure that its guide moldings at the bottom edge engage in the corresponding channels at the top of the dashboard environment channel. Press all the way around so that the four catches engage
- Tighten the control unit on the reverse using the four screws
- Position the bracket in the car, in front of the cut-out in the center console, leaning backwards towards the gear selector lever as illustrated.

ROUTING AND CONNECTING WIRING

NOTE: The small thicker and stiffer orange cables in the cable harnesses are fibre optic and must be handled and routed very carefully. These cables cannot be bent as much as normal wiring, the bend radius must not be less than 3 cm.

APPLIES TO CARS WITHOUT A FACTORY INSTALLED PLAYER, WHEN ONLY INSTALLING A MINIDISC PLAYER

Fig. 370: View Of Junction Cable (A)
Courtesy of VOLVO CARS CORPORATION

- Take the junction cable (A) from the kit (purchased separately)
- Connect the connect (1) on the junction cable to the corresponding connector on the MiniDisc player.

NOTE: Be very careful when connecting the connector in the MiniDisc player. The terminal pins in this connector are thin. They are easily damaged and may become pressed into the player if the connector is not installed straight.

- Locate the pre-routed, bridge connector (2) on the fibre optic cable in the center console, wrapped in foam tape
- Disconnect the connector (3) from the bridged connector (2). Connect it to connector (4) on the junction cable.

NOTE: If installing a MiniDisc player and an RTI system at the same time, the junction cable for the RTI system must be connected first to the connector (3). This connector will then be in use, but there is a corresponding connector on the junction cable for the RTI system. Connect this to the connector (4).

- Find the pre-routed grey connector (5) for power supply in the thick cable harness in the center console. The connector is located either in the center console or in the space above the accelerator pedal. To remove the panel above the accelerator panel, slacken off the two Torx screws and then pull the panel free

from the clips on the outer edges and unhook it

- Connect the connector (5) to the remaining connector (6) on the junction cable
- Take half of the foam tape from the wiring kit and wrap it around the grey connectors (5, 6). Use the remaining foam tape to tape around the connectors (3, 4).

NOTE: The junction cable must be routed around the bracket as illustrated. When reinstalling the bracket in the center console in the car, the junction cable must be held against the bracket as illustrated. This is to ensure that it remains in position.

APPLIES TO CARS WITHOUT A FACTORY INSTALLED PLAYER, WHEN INSTALLING BOTH A MINIDISC AND CD PLAYER/CHANGER

Fig. 371: Identifying Junction Cable (B)
Courtesy of VOLVO CARS CORPORATION

- Take out the junction cable (B) (purchased separately) with the four connectors
- Connect the connector (1) on the junction cable to the corresponding connector on the MiniDisc player and connector (2) to the corresponding connector in the CD player/changer. The connectors (1) and (2) are identical. It does not matter which connector is connected to which unit.

NOTE: Be very careful when connecting the connectors in the MiniDisc/CD players. The terminal pins in these connectors are thin. They are easily damaged and may become pressed into the players if the connector is not installed straight.

- Locate the pre-routed, bridge connector (3) on the fibre optic cable in the center console, wrapped in foam tape
- Disconnect the connector (4) from the bridged connector (3). Connect it to connector (5) on the junction cable.

NOTE: If installing a MiniDisc player and an RTI system at the same time, the

junction cable for the RTI system must be connected first to the connector (4). This connector will then be in use, but there is a corresponding connector on the junction cable for the RTI system. Connect this to the connector (5).

- Find the pre-routed grey connector (6) for power supply in the thick cable harness in the center console. The connector is located either in the center console or in the space above the accelerator pedal. To remove the panel above the accelerator panel, slacken off the two Torx screws and then pull the panel free from the clips on the outer edges and unhook it
- Connect the connector (6) to the remaining connector (7) on the junction cable
- Take half of the foam tape from the wiring kit and wrap it around the grey connectors (6, 7). Use the remaining foam tape to tape around the connectors (4, 5).

NOTE: The junction cable must be routed around the bracket as illustrated. When reinstalling the bracket in the center console in the car, the junction cable must be held against the bracket as illustrated. This is to ensure that it remains in position.

OPERATIONS 10-14 APPLY TO CARS WITH FACTORY-INSTALLED CD PLAYERS/CHANGERS

Fig. 372: Identifying Control Module And The Dashboard Environment Panel Connectors
Courtesy of VOLVO CARS CORPORATION

NOTE: If installing a MiniDisc player and an RTI system at the same time, the RTI system must be connected according to the installation instructions. Then follow these installation instructions as if the RTI system was not installed. However use the connector in the CD player/changer.

HINT: work from the right-hand seat.

- Remove approximately 20 cm of foam tape from the existing cable harness so that the wiring is unimpeded

- Reinstall the connectors for the control module and the dashboard environment panel. Do not connect the connector (1) to the CD player yet.

Fig. 373: Identifying MiniDisc Player Connectors
Courtesy of VOLVO CARS CORPORATION

- Take the connector (1) which was in the CD player/changer and remove the connector (2) with the fibre optic cable from it. Use a small screwdriver or similar to lift the catch as illustrated. At the same time pull the fibre optic cable outwards to release the connector (2)
- Reinstall the connector (1) which is now without the connector (2) in the CD player/changer.

NOTE: **Be very careful when connecting the connector in the CD player/changer. The terminal pins in this connector are thin. They are easily damaged and may become pressed into the player if the connector is not installed straight.**

Illustration A

Fig. 374: Identifying Junction Cable (C)
Courtesy of VOLVO CARS CORPORATION

- Take the junction cable (C) (purchased separately) and locate its foam taped connector (3)
- Connect the small connector (2) with the fibre optic cables (disconnected in the previous step) to the connector (3) in the junction cable. There will be a click when the catch engages.

Illustration B

Fig. 375: Identifying Connector (4)
Courtesy of VOLVO CARS CORPORATION

- Connect the connector (4) from the junction cable to the MiniDisc player and the connector (5) from the junction cable to the connector (1) which was reinstalled in the CD player/changer before.

NOTE: **Be very careful when connecting the connector in the MiniDisc player. The terminal pins in this connector are thin. They are easily damaged and may become pressed into the player if the connector is not installed straight.**

- Find the pre-routed grey connector (6) for power supply in the thick cable harness in the center console. The connector is located either in the center console or in the space above the accelerator pedal. To remove the panel above the accelerator panel, slacken off the two Torx screws and then pull the panel free from the clips on the outer edges and unhook it
- Connect the connector (6) to the remaining connector (7) on the junction cable
- Take a small piece of the foam tape from the kit and wrap it around the grey connectors (6, 7).

Fig. 376: View Of Load-Removing Grommets (1) Secured In The Fibre Optic Cable Loops
Courtesy of VOLVO CARS CORPORATION

HINT: work from the right-hand seat.

- Position the wiring so that it runs around the bracket as illustrated
- Take half of the remaining foam tape from the wiring kit and wrap it around the cables not already protected.

NOTE: There will be excess fibre optic wiring which should be placed in an loop as illustrated.

- Take the two load-removing grommets (1) from the wiring kit and secure it in the loops formed by the fibre optic cable as illustrated.

Fig. 377: Identifying Corner Clip And Tie Strap
Courtesy of VOLVO CARS CORPORATION

- Take the corner clip and tie strap from the wiring kit. Press it into place at the top of the underside of the bracket as illustrated
- Tighten the tie strap around the foam taped cable harness to secure the excess fibre optic wiring as illustrated
- Take the remaining strips of foam tape and tape the loop to prevent it from rattling.

FINISHING WORK

Fig. 378: Identifying CD Player/Changer
Courtesy of VOLVO CARS CORPORATION

- Connect all the previously disconnected connectors to the control module and the climate control panel if not already done. If the car has a CD player/changer, connect its connector.

NOTE: Be very careful when connecting the connector in the CD player/changer. The terminal pins in this connector are thin. They are easily damaged and may become pressed into the player if the connector is not installed straight.

- Position the bracket. Tighten the bracket using the two screws
- Reinstall the gear selector lever panel
- Reinstall the panel above the accelerator pedal if removed.

Fig. 379: Connecting Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position II
- Reconnect the battery negative lead
- Program the software according to the service information in VIDA (Volvo scan tool).

NEW MICROPHONE POSITION IN A-PILLAR FOR UNIVERSAL HANDSFREE (2004-2006)

POWER SUPPLY UNIT, RSE (REAR SEAT ENTERTAINMENT) (2004-2008)

POWER SUPPLY UNIT, RSE (REAR SEAT ENTERTAINMENT)

REMOVE

Fig. 380: Identifying Turning Ignition To Position 0
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position 0.

Fig. 381: Removing Rear Side Panel
Courtesy of VOLVO CARS CORPORATION

- Fold up and remove the floor hatch.
- Remove the side floor hatch.
- Remove the rear side panel.

Fig. 382: Battery And Protective Cover
Courtesy of VOLVO CARS CORPORATION

- Remove the bracket over the protective cover for the battery. The bracket is secured with three screws.
- Remove the protective cover for the battery.
- Remove the screw and detach the holder on the right-hand side of the battery.

Fig. 383: Positive And Negative Cables On Battery
Courtesy of VOLVO CARS CORPORATION

- Disconnect the battery negative lead and then the positive lead.
- Lift out the battery to make space for the power supply unit.

Fig. 384: Removing Rubber Grommet For Drainage Hose For Battery
Courtesy of VOLVO CARS CORPORATION

- Remove the rubber grommet for the drainage hose for the battery.

Fig. 385: Power Supply Cables
Courtesy of VOLVO CARS CORPORATION

- Connect the 12V cable harness to the power supply unit, color to color.
- Connect the power cable to the power supply unit.

Fig. 386: Routing Power Cable Out Through Hole In Cargo Compartment Floor
Courtesy of VOLVO CARS CORPORATION

- Position the power supply unit in the battery location as illustrated.
- Route the power cable out through the hole in the cargo compartment floor.

Fig. 387: Ground Screw On Right-Hand Side Of Rear Crossmember
Courtesy of VOLVO CARS CORPORATION

- Unscrew the existing ground screw (1) on the right-hand side of the rear crossmember.
- Install the routed black (SB) ground cable and tighten the ground screw firmly

Illustration A

Fig. 388: Route Cable Ends To Hole At Rear Of Floor Support
Courtesy of VOLVO CARS CORPORATION

- Route the remaining cable ends to the hole at the rear of the floor support on the right-hand side.

Illustration B

Fig. 389: Insert The Cable Ends Into The Small Fuse Holder
Courtesy of VOLVO CARS CORPORATION

- Insert the cable ends into the small fuse holder on the right-hand side of the floor support.

Fig. 390: Removing he Cover For RSE's Fuse Holder
Courtesy of VOLVO CARS CORPORATION

- Remove the cover for the RSE's fuse holder.

Fig. 391: Removing Fuses In Fuse Holder, 10A In Left-Hand Holder, 5A In Right-Hand Holder
Courtesy of VOLVO CARS CORPORATION

- Remove the fuses in the fuse holder, 10A in the left-hand holder, 5A in the right-hand holder.

Fig. 392: Installing Red Cable In Front Of Left-Hand Fuse Holder And Violet In Right-Hand Fuse Holder
Courtesy of VOLVO CARS CORPORATION

- Install the red (R) cable in the front of the left-hand fuse holder and the violet (VO) in the right-hand fuse holder.

NOTE: The cables must only be installed in the front of the fuse holder, otherwise there is a risk that the power supply unit will be irreparably damaged.

Both cables are connected to thinner cables under the fuse holder.

- Connect the power cable to the wall socket.

NOTE: **The power supply unit automatically adjusts itself to the prevailing voltage in the wall socket.**

- Test the system.

REINSTALL

After completed demonstration:

Fig. 393: Turning Ignition Key To Position II
Courtesy of VOLVO CARS CORPORATION

- Disconnect the cables from the small fuse box.
- Reinstall the fuses in the holders
- Reinstall the cover over the fuse holders.
- Detach the black (SB) ground cable from the ground terminal and tighten the screw firmly.
- Remove the power supply unit and its cables from the cargo compartment.
- Reinstall the battery.
- Reinstall the rubber grommet in the cargo compartment floor.
- Tighten the battery with the mounting to the floor. Torque tighten the screw to **24 Nm (18 lbf. ft.)** .
- Turn the ignition key to position II.
- Reconnect the battery leads, positive lead first, then the negative lead.
- Reinstall the protective cover over the battery. Reinstall the mounting bracket over the protective cover and torque tighten the screws to **24 Nm (18 lbf. ft.)** .
- Reinstall the rear side panel and the side floor hatch.
- Reinstall the rear floor hatch.

REAR SEAT ENTERTAINMENT (2003-2008)

REAR SEAT ENTERTAINMENT

CAUTION: Take care when cutting away the headlining. There is a risk of cutting off the cable harnesses and hose for the washer fluid.

Only use a sharp utility knife or similar for cutting into the headlining. Replace the blade when it becomes blunt.

WARNING: Protect skin, eyes and respiratory tracts using appropriate protective equipment so that they are not exposed to loose roof material.

PREPARATIONS

Fig. 394: Applies To Two-Wheel Drive Cars With Two Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

Applies to two-wheel drive cars with two rows of seats

- Remove the rear floor hatch (1) by folding it back slightly and pulling it backwards out of its mountings.

Applies to other cars with two rows of seats

- Fold up the rear floor hatch (1).
- If the floor hatch has a carrier bag holder on the lower side, it is secured in the car by two straps either side of the bottom of the carrier bag holder. Pull both straps away from the protruding mountings.
- Remove the storage box from under the floor hatch. Lift out the storage box.

Applies to cars with three rows of seats and integrated carrier bag holder on the underside of the floor hatch

- Fold up the rear floor hatch (1).
- Disconnect the two straps on either side of the bottom of the carrier bag holder from the protruding mountings. Lift up the rear edge of the carrier bag holder, fold the floor hatch back towards the bottom

and lift out the carrier bag holder.

Applies to cars with three rows of seats without an integrated carrier bag holder

- Fold up the rear floor hatch (1) at the rear edge and lift it out.

Applies to all models

- Remove the right-hand side floor hatch (2). Lift the floor hatch straight up.

REMOVE

Fig. 395: Remove Right And Left-Hand Sides Rear Side Panels
Courtesy of VOLVO CARS CORPORATION

- Remove the lower side panel on the right-hand side.

Illustration A

Fig. 396: Remove Rear Headlining Panel Cover
Courtesy of VOLVO CARS CORPORATION

- Remove the covers from the rear headlining panel. Unscrew the screws from inside the panels.
- Carefully pry off the headlining panel at the rear edge using a plastic weatherstrip tool.
- Grip the rear edge of the headlining panel. Pull the headlining panel down until all the clips on the inside release.

Applies to cars with three rows of seats

- Disconnect the connector for the rear roof lighting. Pull the panel backwards.

Illustration B

Fig. 397: Pull Off Top Edge Of Right-Hand D Pillar Panel
Courtesy of VOLVO CARS CORPORATION

- Carefully pull off the top edge of the right-hand D-post panel. Continue down until the three clips have released.
- For cars with D-post loudspeakers: disconnect the connectors for this loudspeaker.
- Remove the right-hand D-post panel by pulling upwards slightly and unhooking it from the side panel.

NOTE: Cars with Vehicle Identification Number CH -32000: Follow the instructions in the installation instructions for the adapter wiring.

Fig. 398: Identifying RSE System Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Take the RSE system cable harness from the kit. Connect the 5-pin connector to the connector beside the right-hand tail lamp.

Fig. 399: Identifying LCD Display Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Take the LCD display from the kit. Connect the 16-pin connector on the cable harness to the LCD display.

Fig. 400: View Of Display By Pressing The ON Button (1)
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position I.
- Hold the display unit so that the display can be folded out without hindrance.
- Fold out the display by pressing the ON button (1). Adjust the position of the display using the two buttons (2) in the middle of the control panel to achieve an opening angle of approximately 90 degrees.
- Interrupt the power supply by disconnecting the 16-pin connector from the display.
- Disconnect the 5-pin connector from the car.
- Turn the ignition key to position 0.

REAR HOLE-PUNCHING (FOR DVD UNIT)

Fig. 401: Identifying Rear Hole-Punching For DVD Unit
Courtesy of VOLVO CARS CORPORATION

- Temporarily borrow two 4.8x13 mm screws from the installation kit for the DVD player.
- Release the roof clip (1) located between the C-posts. Turn the clip 90° and work it out.

- Install the hole template. Press the hole template into place with the clip (1) and guide it up against the edge of the C-post (arrow).
- Secure the hole template at two points using the screws to ensure it is securely mounted against the headlining.
- Cut out the headlining along the inner contours of the hole template. Use a utility knife or similar. If the car has a mass movement sensor (MMS): Cut approximately 20 mm further in first (see alternative dotted line (2)). This is because there is wiring in the headlining. The wiring may need to be moved. Using a weatherstrip tool, pry the wiring away from the adhesive on the headlining. Do not damage the wiring when cutting the hole.

NOTE: Use a sharp knife. Applies to all cutting of the headlining.

- Remove the template and cut away the flanges on which the screws recently rested.
- Reinstall the roof clip (1).

APPLIES TO CARS WITH SUN ROOF

FRONT HOLE-PUNCHING (FOR LCD DISPLAY)

Fig. 402: Identifying Front Hole-Punching For LCD Display
Courtesy of VOLVO CARS CORPORATION

- Ensure that the headlining for the sun roof is pulled forward.
- Temporarily borrow three 4.8x13 mm screws from the installation kit for the DVD player.
- Install the hole template in position. Guide it up along the grab handles and secure it to the roof using the screws.
- Cut through the headlining according the dotted lines in the four large openings in the template. Only cut through the fabric. Alternatively use a pen to mark in the four narrow grooves as far out as possible on each side. The headlining can be cut through here once the cable harnesses and hoses found in this area have been moved.
- Remove the template and cut through the headlining at the parts between the four large openings, in order

to remove a large portion of the headlining.

Fig. 403: Identifying The Wiring (1) That Is Bonded To The Inside Of The Headlining
Courtesy of VOLVO CARS CORPORATION

- Remove the wiring (1) that is bonded to the inside of the headlining on the right and left-hand sides of the car. Use a weatherstrip tool to pry the wiring away from the bonding.
- Press the wiring out towards the sides of the car.

Fig. 404: Take Care When Cutting Away The Side Pieces Of The Headlining
Courtesy of VOLVO CARS CORPORATION

CAUTION: Take care when cutting away the side pieces of the headlining. There is a risk of cutting off the cable harnesses and the hose for the washer fluid.

Fig. 405: Identifying Cables Pressed Into Routed Side
Courtesy of VOLVO CARS CORPORATION

- Use a suitable section of plastic and apply it as protection for the cables when cutting out at the sides of the car.

  Press in the cables (1) which are routed to the side. Protect them with the section of plastic and carefully cut away the last side piece which was marked with a pen earlier.

  NOTE: Be careful with the electrical cables and the hose for washer fluid. Constantly check that they are not damaged.

CABLE ROUTING

Fig. 406: View Of Cable Harness For The RSE System
Courtesy of VOLVO CARS CORPORATION

- Take out the cable harness for the RSE system.

- Thread a suitable cable or wire between the holes in the headlining. Secure the end of the cable harness with the 5-pin connector to the wire which comes out from the hole for the DVD player.
- Route the end of the cable harness through to the second hole and remove it from the wire.

Fig. 407: Identifying The Hole For The LCD Screen's Roof Member
Courtesy of VOLVO CARS CORPORATION

- Thread a suitable cable or wire between the hole for the DVD player and the hole for the LCD screen roof member.
- Secure the cable harness' 16-pin connector to the wire. Route the cable so that the connector comes out at the LCD screen roof member. Detach the cable from the wire.

INSTALLING ROOF MEMBER BRACKETS

Fig. 408: Identifying Sunroof's Right-Hand Mounting Rail
Courtesy of VOLVO CARS CORPORATION

NOTE: Do not disturb the spacers located between the sun roof member and the roof.

It can be difficult to locate the spacers in position again.

- Unscrew the rear screw (1) in the sunroof right-hand mounting rail. Use a pair of pliers to pull it straight down from the hole. It is held in position by a plastic washer so significant force is required.

  Do this on the right and left-hand sides, and place the screws to one side.

- Take the bracket, the M6x40 mm screw and the washer from the kit (kit illustration A). Install the bracket loosely, with the screw through the longer hole, and slide it backwards.

Fig. 409: Identifying Same Rail Front Screw
Courtesy of VOLVO CARS CORPORATION

- Slacken off the front screw (1) in the same rail. Slide the bracket forwards. Secure the bracket using one M6x30 mm screw and washer from the kit.
- Tighten both screws. Tighten to **10 Nm (7.5 lbf. ft.)** .

- Install the roof member bracket in the same way on the other side.

INSTALLING THE ROOF MEMBER

Fig. 410: Identifying Four Plastic Threaded Plates And Four Spacer Clips
Courtesy of VOLVO CARS CORPORATION

- Take the roof member, four plastic threaded plates and four spacer clips from the kit.
- Install the threaded plates as illustrated.
- Install the spacer clips from the other side, so that they are properly secured to the threaded plates.
- Take two 140x50 mm pieces of tape from the kit. Cut to make four 70x50 mm pieces.
- Tape the threaded plates in position as illustrated.

Fig. 411: Install The Roof Member In The Newly Installed Brackets
Courtesy of VOLVO CARS CORPORATION

- Thread the roof member a little way under the rear edge of the headlining. It should be possible to slide the roof member back in under the front edge. Work the roof member into place by the screw holes. Ensure that the cut-outs in the ends of the member are facing backwards.
- Take the two M6x14 mm screws from the kit. Screw the roof member into the recently installed brackets.
- Tighten the screws. Tighten to **10 Nm (7.5 lbf. ft.)** .

INSTALLING THE LCD DISPLAY

Illustration A

Fig. 412: Identifying LCD Display Tie Strap
Courtesy of VOLVO CARS CORPORATION

- Cut off the tie strap (1).

Illustration B

Fig. 413: View Of LCD Display Screws
Courtesy of VOLVO CARS CORPORATION

- Position the LCD display against the center of the roof member. Guide the holes in the panel for the LCD display onto the spacer clips for the threaded plates.
- Take the 4x20 mm screws from the kit. Loosely screw the LCD display into place. Approximately 7 mm is required between the display and the member in order to install the panel.

Illustration C

Fig. 414: View Of Cable Harness Connector To LCD Display Connector
Courtesy of VOLVO CARS CORPORATION

- Connect the cable harness connector to the LCD display connector.
- Take the foam tape from the kit. Wrap the foam tape around the connector.
- The connector must be positioned in the member recess. Fix the connector using the 140x50 mm tape from the kit.

INSTALLING THE PANELS

Illustration A

Fig. 415: Identifying Roof Member Panel Clips
Courtesy of VOLVO CARS CORPORATION

- Take the panels for the roof member and the four plastic clips from the kit.

- Install the plastic clips in the clip pockets in the panels.

Illustration B

Fig. 416: View Of Roof Member Cut-Outs (1) By The LCD Display
Courtesy of VOLVO CARS CORPORATION

- Insert the panel hooks in the roof member cut-outs (1) by the LCD display and between the display and the member (2). Bend the panel down in the middle. Slide the panel up over the grab handle. Press the plastic clips for the panel into the holes (3) in the brackets.

NOTE: Do not damage the grab handle when sliding the headlining panel into position.

- Screw the display unit into place.
- Continue with point 27.

POINT - APPLIES TO CARS WITHOUT A SUN ROOF

Fig. 417: Identifying The Install Hole Template In Position
Courtesy of VOLVO CARS CORPORATION

- Temporarily borrow two 4.8x13 mm screws from the installation kit for the DVD player.
- Install the hole template in position. Guide it up along the grab handles and secure it to the roof using the screws.

Fig. 418: Headlining Along The Inner Contours Of The Hole Template
Courtesy of VOLVO CARS CORPORATION

- Cut out the headlining along the inner contours of the hole template. Use a utility knife or similar.

NOTE: Use a sharp knife. This applies to all cutting of the headlining.

CABLE ROUTING

- Route the wiring according to points 11 and 12.

INSTALLING ROOF MEMBER BRACKETS

Illustration A

Fig. 419: Identifying Narrow Bracket Clamp And The Four Threaded Plates
Courtesy of VOLVO CARS CORPORATION

HINT: Use suitable blocks or similar to make space between roof and headlining.

- Take the bracket, the narrow bracket clamp and the four threaded plates from the kit (kit illustration B).
- Install the threaded plates as illustrated.
- Install the spacer clips from the other side, so that they are properly secured to the threaded plates.
- Take two 140x50 mm pieces of tape from the kit. Cut to make four 70x50 mm pieces.
- Tape the threaded plates in position as illustrated.
- Take two nuts from the kit. Install the narrow bracket clamp (1) on the angled side of the bracket. Screw the clamp into place using the nuts.
- Slide the narrow bracket clamp so that it is as far out as possible in the slit holes. Rest the clamp on the angled surface. Tighten the nuts by hand.

Illustration B

Fig. 420: Identifying Wide Bracket Clamp
Courtesy of VOLVO CARS CORPORATION

- Hold the wide bracket clamp with the less folded edge forwards. Thread the clamp into the hole in the roof, on the rear side of the roof member. Work the bracket clamp into place so that it rests above the edges of the roof member and the headlining with the screws facing downwards.

NOTE: The less folded edge must be positioned above the edge of the roof member.

Fig. 421: Identifying Bracket Into Cut Out Hole With Narrow Bracket Clamp
Courtesy of VOLVO CARS CORPORATION

- Insert the bracket into the cut out hole with the narrow bracket clamp at the front, facing the knob.
- Unscrew the nuts holding the narrow bracket clamp. Slide the clamp over the edge of the roof member so that it hooks into place. Tighten the nuts so that the bracket remains attached.
- Lift up the rear end of the bracket. Align the screws for the suspended wide bracket clamp in the holes in the bracket. Screw in two nuts from the kit. Finger tighten.
- Check that both clamps on the bracket are correctly positioned around the roof member.
- Adjust the position of the bracket so that its hole is aligned with the hole in the roof member (1).

Fig. 422: Identifying Bracket Mount Screws
Courtesy of VOLVO CARS CORPORATION

- Tighten the four screws (1) for the catches so that the bracket is securely mounted. Work the bracket and further tighten if there is any play.

INSTALLING THE LCD DISPLAY

NOTE: Two people are required to connect and screw the LCD display into place.

Fig. 423: Identifying LCD Display Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Pull the cable harness for the LCD display out of the hole to facilitate connector connection.
- Hold up the display against the hole cut out in the roof. Connect the 16-pin connector on the cable harness to the connector from the LCD display.
- Take the foam tape from the kit. Wrap the foam tape around the cable harness.
- Lift the display towards the roof at the same time as pressing in the excess cable.

FINISHING

- Position the LCD display against the center of the bracket. Guide the holes in the panel for the LCD display onto the spacer clips for the threaded plates (see illustration 17 B).
- Take the 4x20 mm screws from the kit. Screw the display into place.

APPLIES TO ALL MODELS

INSTALLING THE DVD PLAYER IN THE BRACKET

Fig. 424: Identifying DVD Player In The Bracket
Courtesy of VOLVO CARS CORPORATION

- Take the two 140x50 mm pieces of tape from the kit.
- Install the pieces of tape (1) on the sides of the DVD player.

The tape will ensure that the DVD player is insulated from the bracket.

Fig. 425: Identifying DVD Player Bracket Washers

Courtesy of VOLVO CARS CORPORATION

- Install the 4 collared washers (1) from the inside in the bracket. Use butyl tape to hold them in place if necessary.
- Install the DVD player using the plastic washers (2) and the M4x8 mm screws (3).

NOTE: Longer screws can damage the DVD player and must therefore not be used.

The plastic washers on the inside and outside are there to separate the DVD player from the bracket.

INSTALLING THE DVD BRACKET TOGETHER WITH DVD

Fig. 426: View Of DVD Bracket Together With DVD
Courtesy of VOLVO CARS CORPORATION

- Take the DVD bracket together with the DVD player.
- Install it in the hole. Insert the locating pin (1) and press it backwards, towards the cargo compartment, so that the bracket is in contact with the mating surfaces (2).
- Take six 4.8x13 mm screws from the kit.
- Drill a **3.8 mm** diameter hole. Tighten a screw in one of the holes (3) in the bracket.
- Drill another **3.8 mm** diameter hole. Tighten a screw on the opposite side.
- Drill and screw the remaining holes.

FINISHING

Fig. 427: View Of Connectors Into The Corresponding Connector Sockets
Courtesy of VOLVO CARS CORPORATION

- Plug the connectors into the corresponding connector sockets in the DVD player.

Fig. 428: View Of DVD Player Cover
Courtesy of VOLVO CARS CORPORATION

- To make installation of the DVD player cover easier: Take two 4.8x13 mm screws from the kit. Create threads in the bracket by screwing in and unscrewing the screws.
- Take the cover for the DVD player from the kit. Slide the cover upwards and forwards until the two hooks (1) catch in the bracket cut-outs and the DVD player front is positioned in the opening. Ensure that the cover does not catch in the headlining.

NOTE: The cover must not scratch the front of the DVD player.

- Screw in the cover by hand using the two 4.8x13 mm screws.

CONNECTING THE CABLE HARNESS

Illustration A

Fig. 429: View Of D-Post Tie Straps
Courtesy of VOLVO CARS CORPORATION

- Route the cable with the five-pin connector down along the D-post to the existing connector by the right-hand tail lamp.
- Secure the cable to the existing cable harness as illustrated. Use four tie straps (1) from the kit.

Illustration B

Fig. 430: Identifying RSE System Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Connect the 5-pin connector to the existing connector beside the right-hand tail lamp.

INSTALLING DECALS

Fig. 431: Installing Decals
Courtesy of VOLVO CARS CORPORATION

- Take the yellow decal from the kit.
- Clean the area (1) where the decal will be located. Use a mixture of 30% windscreen washer fluid and 70% water. Wipe dry.
- Remove the backing paper from the adhesive side of the decal. Secure the decal as illustrated.
- Press the decal into place properly.

TEST THE SYSTEM

- Follow the instructions in the manual to test the system.
- Remove the transport protection disc from inside the DVD player.

REINSTALL

Reinstall:

- the side panels in the cargo compartment
- the headlining panel in the cargo compartment
- the floor hatch in the cargo compartment.

Vacuum clean and clean away roof material and other waste from the car.

SUBWOOFER (2003-2010)

CARS EQUIPPED WITH SRS/SIPS (AIRBAG)

see **CARS EQUIPPED WITH SRS/SIPS (AIRBAG)**

CAUTION

see **CAUTION**

XC90

see **XC90**

SUBWOOFER

NOTE: **This accessory requires software unique to the car**

NOTE:

- **Points 4 - 10, 12, 21 - 31 and 38 only apply to cars up to and including model year -2004 (CH -133999)**
- **Points 32 - 37 and 39 only apply to cars from model year 2005- (CH 134000-).**

PREPARATORY WORK

Fig. 432: Disconnect Battery Negative Lead
Courtesy of VOLVO CARS CORPORATION

- Move the left front seat as far forward as possible
- Turn the ignition key to position 0
- Disconnect the battery negative lead.

NOTE: **Wait at least five minutes before disassembling the connectors or removing other electrical equipment**

Illustration A

Fig. 433: Removing Two Center Floor Hatches By Lifting Them Slightly
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Fold up the center rear floor hatch slightly
- Remove the hatch by pulling it off the mountings at the front edge
- Remove the storage box underneath and lift it out. If the floor hatch has a carrier bag holder on the underneath, it is secured by a strap on each of the shorter sides of the storage box. These straps must be undone
- Remove the front floor hatch in the same way. (Applies to cars up to and including model year -2004 (CH -133999)).

Illustration B

Fig. 434: Fold Up The Centre Rear Floor Hatch
Courtesy of VOLVO CARS CORPORATION

Applies to cars with three rows of seats and the integrated carrier bag holder on the underside of the center floor hatch

- Fold up the center rear floor hatch (1)
- Release the two straps on the panel underneath. Lift up the panel at the rear edge. Fold back the floor hatch towards the panel. Lift out the floor hatch and panel.

Applies to the XC90 with three rows of seats without integrated carrier bag holders

- Fold up the center rear floor hatch (1) at the rear edge and lift it out.

Fig. 435: Identifying Side Floor Hatch (A) And The Folding Side Panel (B)
Courtesy of VOLVO CARS CORPORATION

- Remove the side floor hatch (A) and the folding side panel (B) on the left-hand side in the cargo compartment.

APPLIES TO CARS UP TO AND INCLUDING MODEL YEAR -2004 (CH -133999)

Fig. 436: Front Storage Box
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Remove the front storage compartment.

Fig. 437: Identifying Rear Panel On The Left Rear Mounting On The Left-Hand Front Seat
Courtesy of VOLVO CARS CORPORATION

- Remove the rear panel on the left rear mounting on the left-hand front seat. Pry up the rear edge of the panel slightly and then pull backwards and upwards.

Fig. 438: View Of Panel Above The Joint Between
Courtesy of VOLVO CARS CORPORATION

- Carefully pry off the panel above the joint between the left-hand door sills, at the lower edge. Use a weatherstrip tool.

Fig. 439: View Of Second Row Of Seats Catch (1)
Courtesy of VOLVO CARS CORPORATION

- Remove the panel for the front mounting on the left-hand seat in the second row of seats by pressing down the catch (1) on top and detaching the panel by pulling it forward
- Remove the screw underneath.

Fig. 440: Identifying Front Mountings On The Centre And Left-Hand Seat In The Second Row
Courtesy of VOLVO CARS CORPORATION

- Remove the panel for the front mountings on the center and left-hand seat in the second row. Press down the catches (1) on top and detach the panel by pulling it forward
- Remove the left-hand screw underneath.

Fig. 441: Identifying Folded Backrest On The Left-Hand Seat
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Fold the backrest on the left-hand seat in the second row of seats forwards.

Applies to cars with three rows of seats

- Fold the left-hand seat backrest forwards in the second row. Slide the backrest forward as far as possible.

Applies to all models

- Remove the covers for the rear mountings for the left-hand seat in the second row. Pry the covers off at the rear edge
- Remove the screws underneath.

Illustration A

Fig. 442: View Of Top Edge Of The Sill Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Detach the top edge of the sill trim panel to access the seat belt mounting in the end mounting.

Illustration B

Fig. 443: Seat Belt Mounting Locking Tab
Courtesy of VOLVO CARS CORPORATION

- Remove the seat belt from the end mounting. First carefully press down the lug as illustrated in illustration B so that the seat belt releases from the end mounting. Use a weatherstrip tool.

Illustration A

- Continue to pull off the sill trim panel until the remaining clips release
- Unhook the sill trim panel from the B-post panel. Place the sill trim panel in the cargo compartment
- Remove the seat.

NOTE: Lift the seat out of the passenger compartment carefully. Ensure that the mountings do not damage the door panels.

APPLIES TO ALL MODELS

Fig. 444: Identifying Left-Hand C-Post Panel And Plastic Weatherstrip Tools
Courtesy of VOLVO CARS CORPORATION

- Pull off the rubber strip at the rear edge of the door opening for the left-hand rear door opposite the left C-post panel
- Carefully pry off the left-hand C-post panel at the sides at the top edge. Use a plastic weatherstrip tool. Pull off until the three clips on the inside release. Do not damage the headlining or the panel
- Remove the panel by pulling upwards slightly and unhooking it from the side panel.

APPLIES TO CARS UP TO AND INCLUDING MODEL YEAR -2004 (CH -133999)

Fig. 445: Fold Up The Floor Carpet
Courtesy of VOLVO CARS CORPORATION

- Fold up the floor carpet. Secure the floor carpet using one of the seat belts
- Carefully fold up the insulation. Place a shim underneath so that the connector bridge can be exposed.

NOTE: Do not damage the insulation. It is brittle and breaks easily.

APPLIES TO ALL MODELS

Fig. 446: Remove Rear Headlining Panel Cover
Courtesy of VOLVO CARS CORPORATION

- Remove the covers and the screws underneath for the rear headlining
- Carefully pry off the panel at the rear edge. Use a plastic weatherstrip tool
- Pull the rear edge of the panel downwards until all clips on the inside have released
- Disconnect the connector for the rear roof lighting (applies to cars with three rows of seats)
- Pull the panel backwards to release it.

Fig. 447: Identifying D-Post Panel Removal From Side Panel
Courtesy of VOLVO CARS CORPORATION

- Pull off the left-hand D-post panel starting at the top edge. Then pull downwards until the three clips on the inside have released. Do not damage the panel
- Remove the panel by pulling upwards slightly and unhooking it from the side panel. Disconnect the connector if the car has a loudspeaker in the D-post.

Illustration A shows the removal of the cover for the load securing eyelets for all models

Fig. 448: Identifying Load Securing Eyelet
Courtesy of VOLVO CARS CORPORATION

- Fold out the load securing eyelet
- Insert a scriber with an angled tip into the hole in the top of the cover
- Turn the scriber so that the angled tip engages in the reverse of the cover (1). Pull the cover off.

Illustration B applies to cars with two rows of seats

Fig. 449: Cars With Two Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

Illustration C applies to cars with three rows of seats

Fig. 450: Cars With Three Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

- Fold up the seats in the third row (applies to cars with three rows of seats)
- Remove the screws (2) for the load securing eyelets in the left-hand side panel
- Remove the covers (3) over the front mountings for the left-hand side panel. Pry the covers off. Use a plastic weatherstrip tool or a small screwdriver
- Remove the screws (4)
- Remove the clip (5) at the bottom of the storage compartment in the panel (Applies to cars with three rows of seats)
- Pull up the panel slightly at the top edge so that the clips on the inside release. Remove the panel by pulling it straight upwards.

Illustration A

Fig. 451: Identifying Rear Electronic Module (REM)
Courtesy of VOLVO CARS CORPORATION

- Remove the rear electronic module (REM). First release the catch (1) on the top of the module
- Fold the module forwards. Lift it out of the mountings (2) and place it to one side.

Illustration B

Fig. 452: Identifying Left-Hand Wheel Arch Panel Support
Courtesy of VOLVO CARS CORPORATION

Applies to cars with three rows of seats

- Remove the panel support at the top edge of the left-hand wheel arch. The panel support is secured using two screws.

Fig. 453: View Of Insulation Panel Clips
Courtesy of VOLVO CARS CORPORATION

- Remove the insulation panel above and behind the left-hand wheel arch. The insulation panel is secured with two clips (1).

Fig. 454: Identifying Embossed Dotted Line
Courtesy of VOLVO CARS CORPORATION

- Go over the embossed dotted line on the reverse of the insulation panel using a marker pen (see the illustration)
- Cut out the insulation panel following the marking. Reinstall the insulation panel.

Fig. 455: View Of Cut Away Left Side Insulation Panel
Courtesy of VOLVO CARS CORPORATION

- Take the left side panel and carefully cut away the insulation on its reverse to expose an area in front of the subwoofer.

INSTALLING THE SUBWOOFER

Fig. 456: Installing The Subwoofer
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Take the subwoofer, the four screws and the washer from the kit
- Secure the subwoofer using the screws in the existing welded nuts above and behind the left-hand rear wheel arch. The washer must be positioned at the front/lower mounting of the subwoofer.

Applies to cars with three rows of seats

- Take the subwoofer and the four screws from the kit
- Secure the subwoofer using the two upper and the lower rear screws in the existing welded nuts. (The front/lower screw is the same as the rear screw for the panel support.)
- Reinstall and tighten the panel support. (The washer is not required).

Applies to all models

- Tighten the M6 screws. Tighten to **10 Nm (7 lbf. ft.)** . Tighten the M8 screw. Tighten to **24 Nm (18 lbf. ft.)** .

CABLE ROUTING AND CONNECTING TO THE FUSEBOX AND SUBWOOFER

APPLIES TO CARS UP TO AND INCLUDING MODEL YEAR -2004 (CH -133999)

Fig. 457: View Of Cable Harness Along The Upper Edge Of The Left-Hand Rear Wheel Well
Courtesy of VOLVO CARS CORPORATION

- Take the cable harness (A in the kit illustration) from the kit. Position the end of the cable harness, with two plastic connectors, at the rear of the fuse holder
- Route the cable harness along the upper edge of the left-hand rear wheel well. Continue along the front edge of the wheel arch, under the member for the rear mounting for the second row of seats and up to connector bridge under the left-hand seat on the second row of seats.

Fig. 458: Install The Cable On The Reverse Of The Fusebox In Position
Courtesy of VOLVO CARS CORPORATION

- Take the red cable from the cable harness. Install the cable on the reverse of the fusebox in position 13 and socket 2 as illustrated
- Take the 15 Amp fuse from the kit. Install the fuse in position 13 in the fusebox.

Fig. 459: Identifying Relay In Position MA2 In The Fusebox
Courtesy of VOLVO CARS CORPORATION

- Take the relay from the kit. Install the relay in position MA2 in the fusebox.

Fig. 460: View Of Red/white (R/W) Cable To Terminal 1
Courtesy of VOLVO CARS CORPORATION

- Connect the four contiguous cables on the reverse of the fusebox to relay position MA2 as follows:

  Red/white (R/W) cable to terminal 1

  Black (SB) cable to terminal 2

  Red (R) cable to terminal 3

  Violet (V) cable to terminal 4.

Fig. 461: View Of Clamping Cables With Tie Strap
Courtesy of VOLVO CARS CORPORATION

- Clamp the cables connected to the reverse of the fusebox at the cable harness for the fusebox. Use a tie strap (1) from the kit.

Fig. 462: Identifying The Two Connectors On Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Connect the two connectors on the cable harness to the two sockets underneath the amplifier section of the subwoofer.

Fig. 463: View Of Cable Harnesses Into Existing Subwoofer Clamp
Courtesy of VOLVO CARS CORPORATION

- Press the cable harnesses into place on the subwoofer into the existing clamp (1)
- Reinstall the fusebox
- Now adjust the routing of the cable harnesses up to the front edge of the wheel arch so that it reaches the subwoofer Carefully press the cable harness under the lower edge of the subwoofer so that it remains in place. Clamp the cable harness at point (2) using a cable harness from the kit.

Applies to cars with three rows of seats

- Ensure that the cable harness is positioned as far to the left as possible on the panel support for the left-hand side panel. This is to prevent the cable harness from being trapped
- Tape the cable harness at the panel support.

FINISHING

Fig. 464: Identifying Existing Ground Lead Screw

Courtesy of VOLVO CARS CORPORATION

- Slacken off the screw for the existing ground lead under the panel (1). Pull up and connect the routed ground lead (2) together with the existing ground lead. Tighten the screw.

Fig. 465: Identifying The 14 Pin Connector
Courtesy of VOLVO CARS CORPORATION

- Press down the catch on top of the largest connector (1) (14-pin). Pull it off the connector in the connector bridge.

Fig. 466: Identifying The Connector Pulled Out To Its Limit Position
Courtesy of VOLVO CARS CORPORATION

- Depress the catch on the red secondary lock on the connector. Pull the connector out to its limit position.

Fig. 467: View Of Terminal 13 On Reverse Of Connector
Courtesy of VOLVO CARS CORPORATION

- Take the violet cable and install it in terminal 13 on the reverse of the connector as illustrated
- Press the secondary lock into place on the connector. Reinstall the connector.

APPLIES TO CARS FROM MODEL YEAR 2005- (CH 134000-)

Fig. 468: Identifying Ground Lead (1) Through The Socket At The Rear Edge
Courtesy of VOLVO CARS CORPORATION

- Take the cable harness B (see the kit illustration) and position as illustrated
- Route the ground lead (1) through the socket at the rear edge of the left-hand floor support. Continue to route the cable behind the battery and up to the ground terminal at the rear crossmember on the right-hand side of the battery
- Remove the existing ground terminal. Install the routed ground lead
- Tighten the ground terminal securely.

Fig. 469: Identifying Two Bound Connectors On The Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Connect the two bound connectors on the cable harness to the two sockets underneath the amplifier section of the subwoofer.

Fig. 470: View Of Harness Connected To Subwoofer Existing Clamp
Courtesy of VOLVO CARS CORPORATION

- Press the cable harness connected to the subwoofer into the existing clamp.

Fig. 471: View Of Pressing The Catches To Rear Brown Connector
Courtesy of VOLVO CARS CORPORATION

- Press in the catches on the rear brown connector in the fuse holder in the cargo compartment. Turn up the lock arm as far as possible. Pull out the connector.

Fig. 472: Pull Apart Sides Of Holder For Connector And Pull Out Connector
Courtesy of VOLVO CARS CORPORATION

- Carefully pull apart the sides of the holder for the connector at the ends so that the connector can pass by the catches
- Pull the connector out.

Fig. 473: Identifying New Red (R) Cable To Terminal 19 In The Connector
Courtesy of VOLVO CARS CORPORATION

NOTE: Make a note of the position number of the connector. The position numbers are located on the ends of the connector and in the bottom of the fuse holder.

- Connect the new red (R) cable to terminal 19 in the connector. If the car is prepared for rear air conditioning (A/C) there is already a cable installed in this terminal. Disconnect the cable. Insulate the cable. Secure the cable. Press in the new red (R) cable instead
- Press the connector into its holder. Reinstall the connector to the fuse holder.

APPLIES TO CARS UP TO AND INCLUDING MODEL YEAR -2004 (CH -133999)

Fig. 474: Identifying Fibre Optic Cables To The Side Of The Connector Bridge
Courtesy of VOLVO CARS CORPORATION

- Carefully pull the cable splice for the existing orange fibre optic cables to the side of the connector bridge
- Disconnect the connectors from each other. First depress the catch (1) and then separate them.

APPLIES TO CARS FROM MODEL YEAR 2005- (CH 134000-)

Fig. 475: View Of Existing Orange Fibre Optic Cables, Under The Rear Fuse Holder
Courtesy of VOLVO CARS CORPORATION

- Carefully pull the pipe coupling to the existing orange fibre optic cables, under the rear fuse holder
- Disconnect the connectors from each other. First depress the catch (1) and then separate them.

APPLIES TO ALL MODELS

Fig. 476: View Of Blue Catch (1) In The Connector (2)
Courtesy of VOLVO CARS CORPORATION

- Detach approximately 10 cm of tape so that the wiring can move freely. Cut off the detached piece of tape
- Carefully press out the blue catch (1) in the connector (2). Do not damage the catch. It is small and falls out easily.

Fig. 477: Identifying Fibre Cable (1) From The Connector (2)
Courtesy of VOLVO CARS CORPORATION

- Remove the fibre cable (1) from the connector (2). First carefully pry up the locking tab (3) and at the same time pull off the fibre optic cable.

NOTE: **Do not open the locking tab more than is necessary as it is fragile and easy to break.**

Fig. 478: Identifying The Loose Fibre Optic Cable Protective Cap (1)
Courtesy of VOLVO CARS CORPORATION

- Take the pre-routed cable harness
- Carefully press out the blue catch (2) in the connector (3). Do not damage the catch
- Remove the protective cap (1) from the loose fibre optic cable in the cable harness.

Fig. 479: Identifying Fiber Optic Cable Connectors
Courtesy of VOLVO CARS CORPORATION

- Press in the fibre optic cable (1) (previously disconnected from the existing connector in the car) into the connector (3) until there is an audible click.

NOTE: The fibre optic cables must be positioned opposite each other so that they meet in the connector.

- Reinstall the blue catch
- Press the fibre optic cable (4) (from the routed cable harness) into place in the same position in the connector (2) where the existing fibre optic cable was disconnected previously. There must be an audible click
- Reinstall the blue catch
- Connect connectors 2 and 5 to each other.

FINISHING WORK

Fig. 480: Seat Belt Proper Routing
Courtesy of VOLVO CARS CORPORATION

- Reinstall the fibre optic cables and secure the two loose connectors at the existing cable harness. Use tape or tie straps from the kit.

NOTE: **Ensure that the fibre optic cables do not have a radius of more than 30 mm (1 3/16") and are not positioned so that there is a risk of being trapped or rubbed.**

- Remove the shim under the polystyrene insulation and then reinstall. (Applies to cars up to and including model year -2004 (CH -133999))
- Fold back the carpet. (Applies to cars up to and including model year -2004 (CH -133999))
- Reinstall the side panel and cover using screws. Tighten the screws for the load securing eyelets. Tighten to **24 Nm (18 lbf. ft)**
- Reinstall the D-post panel and connect the connector for the D-post loudspeaker (if applicable)
- Connect the connector for the lighting in the rear headlining (applies to cars with three rows of seats)
- Reinstall the rear headlining
- Reinstall the C-post panel. (Applies to cars up to and including model year -2004 (CH -133999))
- Reinstall the seat. Tighten the screws. Tighten to **48 Nm (35 lbf. ft)** . (Applies to cars up to and including model year -2004 (CH -133999))
- Reinstall the panel over the door sill and the panels over the seat mountings as well as the panel at the bottom edge of the B-post panel. (Applies to cars up to and including model year -2004 (CH -133999))

NOTE: **See the illustration**

NOTE: **A click should be heard when the seat belt is locked correctly into the end mounting.**

NOTE: **Check that the seat belt engages correctly in the end mounting by looking at the reverse of the mounting. The position of the lock facing against the end mounting, with the seat belt fully inserted, must be: A= Correct position. B= If the lock facing does not lock correctly against the end mounting (see A), replace the end mounting for a new one.**

NOTE: **Check that the seat belt is securely positioned by jerking the belt upwards.**

- Press the seat belt into the end mounting.

(Applies to cars up to and including model year -2004 (CH -133999))

- Re-position the seats
- Reinstall the folding panel.

Fig. 481: Connecting Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position II
- Reconnect the battery negative lead
- Reinstall the left-hand side floor hatch and the storage boxes
- Reposition the floor hatches
- Program the software according to the service information in VIDA (Volvo scan tool).

SWAN NECK MICROPHONE (2004-2008)

SWAN NECK MICROPHONE

INSTALL

Fig. 482: Identifying A-Pillar Trim
Courtesy of VOLVO CARS CORPORATION

Fig. 483: Identifying Hole Dimension & Location (1 Of 5)
Courtesy of VOLVO CARS CORPORATION

Fig. 484: Identifying Hole Dimension & Location (2 Of 5)
Courtesy of VOLVO CARS CORPORATION

Fig. 485: Identifying Hole Dimension & Location (3 Of 5)
Courtesy of VOLVO CARS CORPORATION

Fig. 486: Identifying Hole Dimension & Location (4 Of 5)
Courtesy of VOLVO CARS CORPORATION

Fig. 487: Identifying Hole Dimension & Location (5 Of 5)
Courtesy of VOLVO CARS CORPORATION

Fig. 488: Identifying Microphone
Courtesy of VOLVO CARS CORPORATION

TELEPHONE SPEAKER CUT-OUT, C-POST (2003-2011)

TELEPHONE SPEAKER CUT-OUT, C-POST

Fig. 489: Identifying Left-Hand C-Post Panel
Courtesy of VOLVO CARS CORPORATION

- Pull off the rubber strip at the rear edge of the door opening to the left-hand rear door opposite the left C-post panel
- Carefully pry off the left-hand C-post panel at the sides in the top edge using a plastic weatherstrip tool. Pull off until the three clips on the inside release. Do not damage the headlining or the panel
- Remove the panel by pulling upwards slightly and unhooking from the side panel.

Fig. 490: View Of Position The C-Post Panel With The Front Side Facing Down
Courtesy of VOLVO CARS CORPORATION

- Fold the backrest of the second row of seats forwards. The backrest will then be used as a work surface
- Position the C-post panel with the front side facing down on, for example, a block of wood to cut out holes for the receiver
- To prevent scratching the panel place a blanket or similar over the block of wood
- Fold the foam rubber out of the way.

Fig. 491: Identifying The Embossed Cut Section Inside The Panel
Courtesy of VOLVO CARS CORPORATION

- Cut out a hole in the panel following the embossing on the inside. Use a utility knife or similar.

NOTE: **Do not make the hole too large. The edges of the telephone speaker are only 1 mm (1/32") larger than the dimensions of the cut-out.**

- Test and adjust using a file until the telephone speaker is seated.

Fig. 492: Identifying Telephone Speaker Into C-Post Panel
Courtesy of VOLVO CARS CORPORATION

- Press the telephone speaker into the hole on the C-post panel
- Fold the foam rubber back into place.

Fig. 493: Identifying C-Post Panel With Speaker
Courtesy of VOLVO CARS CORPORATION

- Disconnect the existing cable secured at the C-post
- Make a hole in the foam rubber. Thread the connector through to the receiver cut-out
- Connect the connector to the telephone speaker cut-out.

  HINT: Connect the connector before pressing the telephone speaker into the hole on the C-post panel as there is limited space.

- Reinstall the C-post panel with the cut-out for the telephone speaker.

TREBLE LOUDSPEAKER, D-POST (2003-2011)

TREBLE LOUDSPEAKER, D-POST

PREPARATION

Fig. 494: Identifying Loudspeaker Grille In The D-Post
Courtesy of VOLVO CARS CORPORATION

- Remove the loudspeaker grille in the D-post (secured by two catches) by carefully prying loose at the rear edge using a weatherstrip tool.

INSTALL

Fig. 495: View Of Install The Treble Loudspeaker
Courtesy of VOLVO CARS CORPORATION

- Install the treble loudspeaker (marked LH for the left and RH for the right) on the reverse of the loudspeaker grille. Press into position.

Fig. 496: Reinstall The Loudspeaker Grille With The Loudspeaker
Courtesy of VOLVO CARS CORPORATION

- Connect the pre-routed cables to the treble loudspeaker. Reinstall the loudspeaker grille with the loudspeaker

- Repeat the operation on the other side.

TREBLE LOUDSPEAKERS, FRONT DOOR (2003-2011)

TREBLE LOUDSPEAKERS, FRONT DOOR

Fig. 497: Identifying The Panel At The Front Edge Of The Door
Courtesy of VOLVO CARS CORPORATION

- Remove the panel at the front edge of the door by carefully prying loose using a plastic weatherstrip tool.

NOTE: Leave the clips for the panel in the door.

- Place the panel to one side. The panel will not be reused
- Take the existing cable positioned behind the panel.

Fig. 498: Identifying Loudspeaker Connector
Courtesy of VOLVO CARS CORPORATION

- Take the panel with the loudspeakers from the kit. Pull off the pre-mounted clips (1) and place to one side. Similar clips are left in the door
- Connect the cable (2) prepared in procedure 1 to the connectors for the treble loudspeakers.

Fig. 499: Identifying Treble Loudspeakers Clips
Courtesy of VOLVO CARS CORPORATION

- Press the panel with the treble loudspeakers in the clips which are in the door
- Repeat the operation on the other side.

NAVIGATION SYSTEM, PORTABLE, INSTALLATION KIT TMC (2007-2011)

NAVIGATION SYSTEM, PORTABLE, INSTALLATION KIT TMC

Fig. 500: Identifying Ignition Switch OFF & Disconnected Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

Applies to cars with portable Navigation system installed

- Turn the ignition key to position 0.
- Disconnect the battery negative lead.

NOTE: **Wait at least three minutes before unplugging the connectors or removing other electrical equipment.**

Fig. 501: View Of Pry Off The Gear Selector Panel
Courtesy of VOLVO CARS CORPORATION

Applies to cars with automatic gearbox

- Turn the ignition key to position II.

Applies to all models

- Move the gear selector lever to its rearmost position.
- Use a weatherstrip and pry off the gear selector panel at the rear edge.

Fig. 502: Pressing In Catches And Removing Panel
Courtesy of VOLVO CARS CORPORATION

- Press in the catches and remove the panel.

Illustration A

Fig. 503: Identifying The Radio And A/C Panel Center Console
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws.
- Remove the bracket with the A/C panel and radio from the center console. Pull from the lower edge and then downwards until it releases from the mounting at the upper edge.

NOTE: Do not damage the removed components or the surrounding panels.

Illustration B

Fig. 504: View Of Tunnel Console
Courtesy of VOLVO CARS CORPORATION

- Lay out a cloth to protect the tunnel console and unit, as illustrated. Depending on the design the cable may need to be disconnected and the unit placed to one side.

Fig. 505: View Of Loudspeaker Grille Removal (1 of 2)
Courtesy of VOLVO CARS CORPORATION

Fig. 506: View Of Loudspeaker Grille Removal (2 of 2)
Courtesy of VOLVO CARS CORPORATION

- Pull upward until the loudspeaker grille detaches. The loudspeaker grille is securely fastened by four clips. Move the tool closer to the clips to facilitate removal.
- Lift out the loudspeaker grille.

NOTE: Do not damage the dashboard.

Fig. 507: Identifying GPS Cradle Connector
Courtesy of VOLVO CARS CORPORATION

- Disconnect the connector from the GPS cradle.

Fig. 508: View Of GPS Cable Splice
Courtesy of VOLVO CARS CORPORATION

- Carefully pull up the cable for the GPS cradle to access the cable splice.
- Separate the splice and place the shorter cable to one side. There is a new cable in the kit.

Fig. 509: Identifying Media Player Antenna Cable
Courtesy of VOLVO CARS CORPORATION

- Remove the antenna cable from the media player.

Fig. 510: View Of TMC Unit And Antenna Cable
Courtesy of VOLVO CARS CORPORATION

- Take the TMC unit and the antenna cable from the kit and connect the antenna cable to **OUT** on the TMC unit.

Fig. 511: View Of TMC Green Connector
Courtesy of VOLVO CARS CORPORATION

- Insert the long cable with the green connector from the TMC unit up between the air vent and through the hole in the loudspeaker grill, the same way as the previously routed cable.

Fig. 512: Connecting Green Connectors To Existing Cables
Courtesy of VOLVO CARS CORPORATION

- Take the remaining cable harness with the three connectors from the kit and connect the two green connectors to the routed and existing cable harness.

Illustration A

Fig. 513: Identifying Receptacle Housing Catch
Courtesy of VOLVO CARS CORPORATION

- Carefully pry up and remove the catch in the receptacle housing on the cable terminal for the socket marked **1** for the media player. Use a thin pointed object.

Illustration B

Fig. 514: Identifying Receptacle Housing Rear Edge Catch
Courtesy of VOLVO CARS CORPORATION

- Carefully pry up the two small catches at the rear edge of the receptacle housing and carefully pull out the cable terminal.

Fig. 515: Identifying Antenna Cable Receptacle Housing
Courtesy of VOLVO CARS CORPORATION

- Carefully push the catch up on the angled connector on the antenna cable, connected to the TMC unit, and pull the cable terminal out from the receptacle housing.

Fig. 516: Identifying Media Player Cable Housing
Courtesy of VOLVO CARS CORPORATION

- Take the newly removed receptacle housing and carefully push it into the loose cable terminal on the contact in the cable for the media player.

Fig. 517: Identifying Loose Cable Terminal
Courtesy of VOLVO CARS CORPORATION

- Take the loose cable terminal in the antenna cable and carefully secure it in the receptacle housing to the cables for the media player.

Fig. 518: Identifying Receptacle Housing Catch
Courtesy of VOLVO CARS CORPORATION

- Press the catch securely into the receptacle housing.

Fig. 519: Identifying Cable Terminal Connection
Courtesy of VOLVO CARS CORPORATION

- Connect the previously disconnected cable terminal on the cable from the media player's receptacle housing to **IN** on the TMC unit.

INSTALLING

Fig. 520: Identifying Foam Tape
Courtesy of VOLVO CARS CORPORATION

- Take foam tape from the kit.
- Cut off a suitable length for ferrite and all green connectors.
- Remove the masking tape.

Fig. 521: Wrap The Ferrite Using Foam Tape
Courtesy of VOLVO CARS CORPORATION

- Wrap the ferrite using foam tape.

Fig. 522: Wrap The Four Connectors Together With Foam Tape
Courtesy of VOLVO CARS CORPORATION

- Wrap the four connectors together with foam tape.

Fig. 523: Identifying Gray Connector To The GPS Cradle
Courtesy of VOLVO CARS CORPORATION

- Connect the gray connector to the GPS cradle.

Fig. 524: Secure Loudspeaker Grille
Courtesy of VOLVO CARS CORPORATION

- Secure the loudspeaker grille.

Fig. 525: Identifying Foam Tape
Courtesy of VOLVO CARS CORPORATION

- Take foam tape from the kit.
- Remove the masking tape.

Fig. 526: View Of TMC Unit With Foam Tape
Courtesy of VOLVO CARS CORPORATION

- Wrap the TMC unit with foam tape.

Fig. 527: Identifying Antenna Cable To Media Player
Courtesy of VOLVO CARS CORPORATION

- Connect the antenna cable to the media player.

Fig. 528: View Of TMC Unit And Cable Excess
Courtesy of VOLVO CARS CORPORATION

- Place the TMC unit together with the cable excess and other cables for the navigation equipment at the bottom of the center console in a way that prevents trapping and chafing.
- If **Navigation system portable** and **Navigation system, portable, Installation kit TMC** are installed at the same time, secure all excess with the cable tie from the navigation kit.

Fig. 529: Installing Media Player And Climate Panel
Courtesy of VOLVO CARS CORPORATION

- Reinstall the unit with the media player and climate panel.
- Tighten using the existing screws.

Fig. 530: Pressing In Catches And Removing Panel
Courtesy of VOLVO CARS CORPORATION

Fig. 531: Installing The Gear Selector Panel
Courtesy of VOLVO CARS CORPORATION

Fig. 532: Identifying Ignition In ON Position and Connecting Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position II.
- Reconnect the battery negative lead.

Applies to cars where Navigation system portable and Navigation system, portable, Installation kit TMC are all installed.

- First carry out steps of the Navigation system portable installation instructions.
- Then carry out steps of the Navigation system, portable, Installation kit TMC installation instructions.

SATELLITE RADIO, SIRIUS (2007-2011)

SATELLITE RADIO, SIRIUS

NOTE: **During installation, the surface and ambient temperature should be between +18-35°C (64-95°F).**

Do not wash the car within 72 hours after installation is completed.

Leave the car indoors for at least two hours after finishing installation if the outdoor temperature falls below +18°C (64°F) and/or if weather conditions are not dry.

Make sure to have good lighting when fastening the antenna with cable to the body.

PREPARATION

Fig. 533: Identifying "Ditch" Cleaning Areas
Courtesy of VOLVO CARS CORPORATION

- Clean the car from dirt and grease using a blend of washer fluid and water as marked. Wipe dry.
- Be particularly sure that the "ditches" around the antenna module panel are free of dirt and other contaminants.

REMOVE

Fig. 534: Fold Up The Centre Rear Floor Hatch (1)
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Fold up the center rear floor hatch (1). If the underside of the floor hatch is equipped with a grocery bag holder, the holder is secured with a strap on both ends of the storage compartment. Detach the straps.
- Remove the storage compartment under the floor hatch.
- Remove the floor hatch by folding it almost completely closed then pulling it backwards from its mountings until it releases.

Applies to cars with three rows of seats and integrated carrier bag holder on the underside of the center floor hatch

- Fold up the center rear floor hatch (1).
- Detach the two straps on the underlying panel. Lift up the rear edge of the panel, fold the floor hatch back towards the panel and lift out the floor hatch with the panel.

Applies to cars with three rows of seats without an integrated carrier bag holder

- Fold up the center rear floor hatch (1) at the rear edge and lift it out.

Applies to all models

- Remove the two side floor hatches (2).

Fig. 535: Removing Three Screws In Battery Holder
Courtesy of VOLVO CARS CORPORATION

- Remove the three screws on the battery holder and lift it out.
- Remove the battery cover.

Fig. 536: Identifying Ignition Switch OFF And Disconnected Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Set the ignition key to position **0** .
- Disconnect the battery negative lead.

NOTE: **Wait at least one minute before unplugging the connectors or removing other electrical equipment.**

Fig. 537: Identifying Right-Hand Side Folding Side Panel Of Cargo Compartment
Courtesy of VOLVO CARS CORPORATION

- Remove the folding side panel from the right-hand side of the cargo compartment.

Fig. 538: Identifying C-Post Panel Removal
Courtesy of VOLVO CARS CORPORATION

- Pull off the rubber strip at the rear edge of the door opening for the right-hand rear door opposite the right C-post panel.
- Carefully pry off the C-post panel sides at the top. Use a plastic weatherstrip tool. Then pull until the three clips on the inside release. Do not damage the headlining or the panel.
- If a headphone socket is mounted, disconnect the connector to such.
- Remove the panel by pulling upwards slightly and unhooking it from the side panel.

Fig. 539: Identifying Cover And Screws Underneath Rear Headlining
Courtesy of VOLVO CARS CORPORATION

- Remove the rear roof panel covers and the screws beneath them.
- Carefully pry off the panel at the rear edge. Use a plastic weatherstrip tool.
- Pull the rear edge of the panel downwards until the four clips on the top release.
- If the car is equipped with lighting in the panel, unplug the connector from the panel.
- Pull the panel backwards to release it.

Fig. 540: View Of D-Post Panel Removal
Courtesy of VOLVO CARS CORPORATION

- Carefully pull off the D-post panel. Start at the top edge then pull down until the three clips on the inside release. Do not damage the panel.
- Disconnect the connector on the D-post panel (if the car has a speaker in the D-post, the connector is in the speaker)
- Remove the panel by pulling upwards slightly and unhooking it from the side panel.

Illustration A shows the removal of the cover for the load securing eyelets

Fig. 541: Identifying Load Securing Eyelet
Courtesy of VOLVO CARS CORPORATION

- Fold out the load securing eyelet.
- Insert a scriber with an angled tip into the hole in the top of the cover.
- Turn the scriber so that the angled tip engages in the reverse of the cover (1). Pull the cover off.

Illustration B applies to cars with two rows of seats

Fig. 542: If The Car Is Equipped With A 12 V Socket, Remove Its Connector
Courtesy of VOLVO CARS CORPORATION

- If the car is equipped with a 12 V socket, remove its connector.

Illustration C applies to cars with three rows of seats

Fig. 543: Identifying Panel And Components
Courtesy of VOLVO CARS CORPORATION

- Fold up the seats in the third row (applies to cars with three rows of seats).
- Remove the screws (2) for the load securing eyelets in the right-hand side panel.
- Remove the covers (3) over the front mountings for the right-hand side panel. Pry the covers off. Use a plastic weatherstrip tool or a small screwdriver.
- Remove the screws (4).
- Remove the panel by pulling out the upper edge slightly so that the clips on the inside release. Pull the panel straight up.
- If the car is equipped with a 12 V socket, remove its connector.

Fig. 544: View Of Taillight Nuts
Courtesy of VOLVO CARS CORPORATION

Illustrations A and B

- Remove the two nuts holding the right taillight in place.

- Pull out the taillamp and place it at the right-hand side of the tailgate opening (Illustration B).

Fig. 545: View Of Stowed Taillight
Courtesy of VOLVO CARS CORPORATION

Fig. 546: View Of Upper Right-Hand Taillight
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws and remove the upper part of the right-hand taillight.

Fig. 547: Identifying Rubber Grommet And Cables
Courtesy of VOLVO CARS CORPORATION

- Remove the rubber grommet (with cables) of the right-hand taillight from the body.
- Pre-drill a **5 mm (3/16 ")** on the right-hand side of the rubber grommet.
- Drill out the hole using a **8 mm (5/16 ")** drill bit.

NOTE: Do not damage the adjacent cables.

INSTALL

Fig. 548: Clean The Marked Surface
Courtesy of VOLVO CARS CORPORATION

- Clean the marked surface from dirt and grease using a blend of washer fluid and water as marked. Wipe dry.
- Now clean the same area with isopropanol wipes and wipe dry.

Fig. 549: Clean The Marked Surfaces On The Roof And In The "Ditch" Around The Antenna Module Panel
Courtesy of VOLVO CARS CORPORATION

The antenna will be positioned in the space between the roof's center embossing and the embossing to the right of such on the right-hand side of the roof.

- Clean the marked surfaces on the roof and in the "ditch" around the antenna module panel. Use Cleaner-H part no. 1161436. Wipe dry.

Fig. 550: Identifying Antenna Positioning
Courtesy of VOLVO CARS CORPORATION

- Position the antenna and the first part of the cable in the center of the space between two of the roof plate's embossings. Make sure that the hooked part of the antenna cable ends up at the hooking of the roof plate.
- Use pieces of tape to mark out the positions of the antenna and cable.

Fig. 551: Remove Attachment Tape Protective Backing For The Antenna And Antenna Cable
Courtesy of VOLVO CARS CORPORATION

- Remove the protective backing from the attachment tape of the antenna and antenna cable.

Fig. 552: Identifying Antenna Cable's Bent Part
Courtesy of VOLVO CARS CORPORATION

- First position the antenna cables bent part and then continue to secure the cable and antenna along the tape markings.

  Press securely and hold for 30 seconds so that the tape adheres properly.

Fig. 553: Remove Some Of The Protective Backing From The Antenna Cable's Second Part
Courtesy of VOLVO CARS CORPORATION

- Remove some of the protective backing from the antenna cables second part.

Fig. 554: View Of Pressing The Casing So That It Fastens In The Bottom Of The "Ditch"
Courtesy of VOLVO CARS CORPORATION

- Now guide the casing of the second antenna part towards the first and under its tab (1).
- Press the casing so that it fastens in the bottom of the "ditch" using the part of the tape with the backing removed.

Fig. 555: Pressing Second Part Of Antenna Cable Into "Ditch"
Courtesy of VOLVO CARS CORPORATION

- Continue removing the protective backing from the second part of the antenna cable and press it into the bottom of the "ditch" while doing so.
- Continue until the antenna cable with casing has been affixed in the "ditch" around the antenna module panel. Use a weatherstrip tool to press the antenna into place in the "ditch" around the antenna module. Make sure that the antenna fastens properly around the corner of the antenna module.

Fig. 556: View Of Cable In Vertical Part Of Roof Edge
Courtesy of VOLVO CARS CORPORATION

- Press the antenna cable into place against the vertical part of the roof edge at the last **150 mm (5 15/16 ")** of the "ditch" but as far down to the bottom of the "ditch" as possible.

NOTE: The last part of the "ditch" is narrower and may vary from car to car.

Fig. 557: View Of Pressing Antenna Cable Routing
Courtesy of VOLVO CARS CORPORATION

- Now go over the entire antenna cable routing again and press it into place more.

Fig. 558: Route The Antenna Cable Inside The Taillight
Courtesy of VOLVO CARS CORPORATION

- Route the antenna cable inside the taillight as illustrated.
- Guide the cable through the rubber grommet and reinstall the rubber grommet in the body.

NOTE: Do not damage the antenna cable connector.

Fig. 559: Identifying Tape Pieces From The Kit To Fasten The Antenna Cable
Courtesy of VOLVO CARS CORPORATION

- Use tape pieces from the kit to fasten the antenna cable, pulling it taut as you affix each piece of tape.

NOTE: **Be sure not to tape the cable in a way that causes it to be in the way of the taillight's guides/guide pins or mounting holes.**

- Make sure that the cable makes a loop under the hole in the body, comes from underneath and goes into the rubber grommet to prevent water penetration at the rubber grommet.

Fig. 560: Identifying Tape To Fasten The Cable Loop Beneath The Rubber Grommet
Courtesy of VOLVO CARS CORPORATION

- Use a piece of tape to fasten the cable loop beneath the rubber grommet. Pull all excess length of cable into the cargo compartment.

Fig. 561: View Of Butyl Tape To Seal Antenna Cable In The Rubber Grommet
Courtesy of VOLVO CARS CORPORATION

- Use butyl tape to seal around the antenna cable in the rubber grommet on both sides.

Fig. 562: Identifying Antenna Cable Connector
Courtesy of VOLVO CARS CORPORATION

- Take the connector from the kit and press the antenna cable into it.
- Press the connector's catch into place.

NOTE: **Ensure that the antenna cable is secure in the connector to prevent contact breaks.**

Fig. 563: Identifying Band Clamps
Courtesy of VOLVO CARS CORPORATION

- Pull the cable into the cargo compartment. Make sure that the cable loop beneath the rubber grommet does not disappear.
- Move the bottom edge of the insulating panel aside and fit two band clamps with edge clips along the edge of the wheel housing approximately in the positions illustrated.

Fig. 564: Identifying Cable Harnesses Toward The First Clip In The Plate Flange
Courtesy of VOLVO CARS CORPORATION

- Pull the antenna cable down along the existing cable harnesses toward the first clip in the plate flange of the wheel housing.
- Use two clamps to clamp the cable around the wheel housing edge and two band clamps to clamp it at existing cable harnesses.

THERE ARE TWO VARIANTS OF ISOLATING PANELS.

Fig. 565: Identifying Perforated Section Of The Insulating Panel
Courtesy of VOLVO CARS CORPORATION

Illustration A

- Tear away the perforated section of the insulating panel completely so that the third mounting hole for the Sirius receive bracket is accessible.

Fig. 566: View Of Tear Away The Perforated Part Of The Insulating Panel
Courtesy of VOLVO CARS CORPORATION

Illustration B

- Tear away the perforated part of the insulating panel.
- Pull apart the perforation for the front and rear hole.

Fig. 567: Identifying Receiver In The Bracket
Courtesy of VOLVO CARS CORPORATION

- Position the receiver in the bracket and fasten with the four screws.

Fig. 568: View Of Fastened Sirius Receiver
Courtesy of VOLVO CARS CORPORATION

- Fasten the Sirius receiver with bracket using the three screws in the exposed holes. Tighten to **10 Nm (7.5 lbf. ft.)** .

Fig. 569: Connect The Pre-Routed Cables To Sirius Receiver
Courtesy of VOLVO CARS CORPORATION

- Connect the pre-routed cables and the routed antenna cable to the connectors in the bottom edge of the Sirius receiver.

Fig. 570: Identifying Ignition Switch ON And Connected Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Reinstall the upper taillight. Tighten the upper screw to **6 Nm (4.5 lbf. ft.)** and the lower one to **8 Nm (6 lbf. ft.)** .
- Reinstall the lower taillight and tighten.
- Reinstall the right-hand side panel in the cargo compartment. Tighten the screws of the load securing eyelets to **24 Nm (18 lbf. ft.)** .
- If the car is equipped with a 12 V socket, connect its connector.
- Plug in the speaker connector and reinstall the D-post panel.
- Plug in the connector of the rear roof lighting and reinstall the rear roof panel.

- Plug in the connector of the headphone socket and reinstall the B-post panel.
- Reinstall the folding side panel and the side floor hatch.
- Turn the ignition switch to position II and refit the negative battery cable.
- Reinstall the battery cover with its mounting.
- Reinstall the storage compartment and floor hatches in the cargo compartment.

Fig. 571: Identifying VIDA (Service Information) To Program Software
Courtesy of VOLVO CARS CORPORATION

Download software (application) for the accessory's function according to service information in VIDA (Volvo scan tool).

BLUETOOTH (2003-2009)

BLUETOOTH

NOTE: **There may be components in the accessories kit that are not used for this installation.**

NOTE: **When installing Velcro fasteners/tape the underlying surface must be kept at a temperature of at least +20° C (68°F).**

Place the manual for this accessory in a suitable place in the vehicle.

REMOVING

Fig. 572: Disconnect Battery Negative Lead
Courtesy of VOLVO CARS CORPORATION

- Slide the right-hand seat all the way back and then completely upright at the front edge.
- Turn the ignition switch to position 0.
- Disconnect the battery negative lead.

NOTE: **Wait at least three minutes before unplugging the connectors or removing other electrical equipment.**

Fig. 573: Prying Off Gear Selector Panel At Rear Edge
Courtesy of VOLVO CARS CORPORATION

Applies to cars with automatic gearbox

- Turn the ignition key to position II.

Applies to all models

- Move the gear selector lever to its rearmost position.
- Use a weatherstrip and pry off the gear selector panel at the rear edge.

Fig. 574: Pressing In Catches And Removing Panel
Courtesy of VOLVO CARS CORPORATION

- Press in the catches and remove the panel.

Fig. 575: Removing Screws And Radio/AC Unit From Center Console
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws.
- Remove the bracket with the A/C panel and radio from the center console. Pull from the lower edge and then downwards until it releases from the mounting at the upper edge.

NOTE: Do not damage the removed components or the surrounding panels.

- Remove the connectors.

Fig. 576: View Of End Face Panel On Dashboard
Courtesy of VOLVO CARS CORPORATION

- Remove the end face panel from the dashboard.

Fig. 577: Remove The Center Console's Right-Hand Side Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the center console's right-hand side panel by pulling it away starting at the front edge and then backwards until all the clips have released.

Fig. 578: Identifying Soundproofing Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the screws and soundproofing panel.

Fig. 579: Identifying Glove Compartment Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the 9 x screws, the glove box and disconnect the connector.

Fig. 580: Pry Off Grab Handle Cover
Courtesy of VOLVO CARS CORPORATION

- Remove the covers and screws for the grab handle on the A-pillar.

Fig. 581: Removing A-Pillar Weatherstrip
Courtesy of VOLVO CARS CORPORATION

- Pull of the weatherstrip (1) for the door at the A-pillar.
- Pull off the A-pillar panel at the upper edge and then straight upwards to remove it.

Fig. 582: Folding Down Cover And Squeezing Catches Together
Courtesy of VOLVO CARS CORPORATION

- Fold down the cover (1) by carefully pulling the front edge of the cover down.
- Press in the catches (2). At the same time pull the front edge of the panel downwards, and then unhook the rear edge.

Fig. 583: Identifying Screws And Catches
Courtesy of VOLVO CARS CORPORATION

- Remove the screws (1).
- Press in the catches (2)
- Carefully pull the interior lighting downwards and allow to hang from their cables.

Fig. 584: Identifying Foam Tape, Microphone Cable And 60mm Gap
Courtesy of VOLVO CARS CORPORATION

- Tape a 700 mm length piece of foam tape on the microphone cable starting 60 mm from the microphone.

Fig. 585: Identifying Routed Cable
Courtesy of VOLVO CARS CORPORATION

- Route the cable to the microphone by the black connector.

Fig. 586: Identifying Headlining, Routed Cable And A-Pillar
Courtesy of VOLVO CARS CORPORATION

- Carefully pull down the headlining and route the cable above it, to the A-pillar.

Fig. 587: Clean The Microphone And Ceiling Panel
Courtesy of VOLVO CARS CORPORATION

- Reinstall the ceiling panel and at the same time adjust the length of the cable.
- Clean the microphone and ceiling panel. Use isopropanol for example.
- Remove the protective film from one side of the Velcro strip and press onto the microphone.

Fig. 588: Identifying Microphone Placement
Courtesy of VOLVO CARS CORPORATION

- Remove the remaining protective film from the Velcro strip. Press the microphone securely into place.

NOTE: **Direct the microphone towards the driver. Make sure that it does not obstruct adjustment of the rear view mirror and insert the excess cable under the panel.**

Fig. 589: Identifying Cable Secured To A-Pillar With Foam Tape
Courtesy of VOLVO CARS CORPORATION

- Pull the cable down along the A-pillar to the dashboard.
- Cut off 2 x 100x50mm pieces of foam tape in the middle.
- Secure the cable to the A-pillar using foam tape.

CAUTION: The inflatable curtain (IC) is located inside the A-pillar panel, it is important that the cable is not positioned on it.

Fig. 590: View Of Securing Cable On Heater Unit With Tape
Courtesy of VOLVO CARS CORPORATION

- Cut off one 100x50mm strip of foam tape in the middle.
- Secure the cable on the heater unit using the pieces of tape.

Fig. 591: Identifying Centre Console Side Panels
Courtesy of VOLVO CARS CORPORATION

- Remove the center console's left-hand side panel by pulling it away starting at the front edge and then backwards until all the clips have released.

Fig. 592: Identifying Removal Of Screws And Soundproofing Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the sound proofing panel by first removing the two screws and then prying off the sound proofing panel at the top edge.

Fig. 593: Locating 4 Pin, Gray, Pre-Routed Connector For The Power Supply
Courtesy of VOLVO CARS CORPORATION

- Locate the 4 pin, gray, pre-routed connector for the power supply. It comes from the thick cable harness under the dashboard on the right-hand side of the steering wheel

Fig. 594: Identifying Cable Harness C
Courtesy of VOLVO CARS CORPORATION

- Take the cable harness with the two gray connectors. Connect this to the existing connector. The pre-routed connector is already connected on certain versions.
- Disconnect this and connect both the connectors from the new cable harness.
- Cut a 700 mm piece of foam tape into three pieces of the same length. Tape one piece around the connectors on the car's existing cable harness.

Fig. 595: View Of Cable Harness Route Backwards Through Center Console
Courtesy of VOLVO CARS CORPORATION

- Route the cable harness backwards and across through the center console.

Fig. 596: Identifying Amplifier Screws
Courtesy of VOLVO CARS CORPORATION

- Slacken off the amplifier screws (1) under the right-hand front seat.

Fig. 597: Identifying Amplifier Connector
Courtesy of VOLVO CARS CORPORATION

- Lift out the amplifier. Use a weatherstrip to raise it from its recessed position.
- Place it upside down as illustrated.
- Disconnect the connector.

Fig. 598: Identifying Left-Hand Seat Piece
Courtesy of VOLVO CARS CORPORATION

- Remove the left-hand seat piece.

Fig. 599: View Of Amplifier Cable Under The Carpet
Courtesy of VOLVO CARS CORPORATION

- Route the cable that was connected to the 4-pin connector from the center console to the amplifier under the carpet.

Fig. 600: View Of Foam Tape Pieces To Relay
Courtesy of VOLVO CARS CORPORATION

- Connect the pre-routed cable and T cable to the mute relay.
- Tape two thick pieces of foam tape around the mute relay.

Fig. 601: Identifying Amplifier To The Connector On Cable Harness C
Courtesy of VOLVO CARS CORPORATION

- Connect the connector that was disconnected from the amplifier to the connector from the mute relay.
- Tape one cut piece of foam tape around the connectors.
- Connect the other connector from the mute-relay to the amplifier.

Fig. 602: Reinstalled Amplifier Screws
Courtesy of VOLVO CARS CORPORATION

- Place the mute-relay under the front left corner in the recess.
- Reinstall the amplifier and tighten it with the screws.

Fig. 603: Taping Piece Of Foam Tape On Cable Starting 70mm From Control Panel
Courtesy of VOLVO CARS CORPORATION

- Tape a 700 mm length piece of foam tape on the cable starting 70 mm from the control panel.

Fig. 604: Clean The Area Around The Dashboard
Courtesy of VOLVO CARS CORPORATION

- Clean the area around the dashboard where the control panel is to be positioned. Use isopropanol for example.

Fig. 605: View Of Control Panel Mounted On Dashboard
Courtesy of VOLVO CARS CORPORATION

- Remove the protective film from the tape on the reverse of the control panel.
- Align and secure the control panel on the dashboard.

Fig. 606: View Of Cable Down To The Opening In The Center Console
Courtesy of VOLVO CARS CORPORATION

- Pull the cable down to the opening in the center console.

Fig. 607: View Of Control Module Clean Points
Courtesy of VOLVO CARS CORPORATION

- Clean the control module at the points illustrated, using isopropanol for example.

Fig. 608: Identifying Velcro Fasteners
Courtesy of VOLVO CARS CORPORATION

- Take a Velcro strip and cut off two pieces of the same length
- Press the pieces together.
- Cut off two pieces of the same length again at the center.

Fig. 609: View Of Velcro Strips On The Control Module
Courtesy of VOLVO CARS CORPORATION

- Remove the protective film from one side of the Velcro strips which were pressed together.
- Apply the Velcro strips on the control module and press.

Fig. 610: View Of Aligned And Installed Control Module
Courtesy of VOLVO CARS CORPORATION

- Remove the remaining protective file on the Velcro strips, align and install the control module as illustrated. Press onto the control module so that the tape adheres.

Fig. 611: Connecting Connectors
Courtesy of VOLVO CARS CORPORATION

- Connect the connectors
  1. 1. Adapter cable
  2. 2. Microphone
  3. 3. Control panel

Fig. 612: View Of Foam Tape Around The Connectors
Courtesy of VOLVO CARS CORPORATION

- Tape one cut piece of foam tape around the connectors.
- Place the connectors and excess cables in the bottom of the center console. Check that they do not rub against the bracket edges.

REINSTALL

Fig. 613: Reinstall The A/C / Radio Unit
Courtesy of VOLVO CARS CORPORATION

- Reinstall the center console by first hooking the upper edge into place. Then press upwards and angle in the lower section.
- At the same time check that the cable to the control panel is correctly positioned.
- Reinstall the screws.

Fig. 614: Connecting Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

Reinstall:

- panel for gear selector.
- A-pillar panel and screws and cover for grab handle.
- the rubber strips in the door opening.
- the end face panel for the dashboard.
- glove box.
- sound proofing panels.
- seat piece.
- the side panels on the center console.

BLUETOOTH, MUTE KIT (2003-2011)

BLUETOOTH, MUTE KIT

REMOVE

Fig. 615: View Of Panel Above The Joint Between The Sill Trim Panels
Courtesy of VOLVO CARS CORPORATION

- Carefully pry off the panel above the joint between the sill trim panels. Use a weatherstrip tool.
- Remove the cover panel.

Fig. 616: Right-Hand Front Door's Sill Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Detach the right-hand front doors sill trim panel. Pull it away at the front edge so that the clips release. Continue backwards until the remaining clips have released.
- Unhook the sill trim panel from the B-pillar panel.

Fig. 617: Pushing Up Catch On Top Side
Courtesy of VOLVO CARS CORPORATION

- Remove the panel in the right front seat attachment on the second seat row by pressing in the lock catch (1) on the top side and pull the panel forward.
- Remove the screw.

Fig. 618: View Of Seat Panel Catches
Courtesy of VOLVO CARS CORPORATION

- Press in the catches (1) and remove the seat panel.
- Remove the screw.

Fig. 619: View Of Rear Panel Screws
Courtesy of VOLVO CARS CORPORATION

- Fold the backrest forward and slide the seat forward as far as possible.
- On cars with two rows of seats the seat cannot be slid forwards.
- Remove both rear panels (1) by pulling them straight up.
- Remove the screws.
- Lift out the seat.

NOTE: Exercise care when doing this so that the trim or door panels are not damaged.

Fig. 620: Identifying Seat Belt Release With Weatherstrip Tool
Courtesy of VOLVO CARS CORPORATION

- Disconnect the upper part of the sill molding at the rear edge. Remove the seat belt from the end mounting.
- Using a weatherstrip tool, carefully press the locking tab so that the seat belt releases from the end

mounting.

Fig. 621: View Of Sill Molding Three Clips Release
Courtesy of VOLVO CARS CORPORATION

- Pull the sill molding upwards until the three clips release.
- Angle the sill moulding out from the B-post panel.

Fig. 622: View Of Folded Up The Floor Hatch
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Fold up the floor hatch (1). If the floor hatch is equipped with a grocery bag holder, the holder is secured with a strap on both ends of the storage compartment. Detach the straps.
- Remove the underlying storage compartment.
- Remove the floor hatch by folding it almost completely closed and pulling it backwards from the mountings until it releases.

Applies to cars with three rows of seats and integrated carrier bag holder on the underside of the floor hatch

- Fold up the floor hatch (1).
- Detach the two straps on the underlying panel. Lift up the rear edge of the panel, fold the floor hatch back towards the panel and lift out the floor hatch with the panel.

Applies to cars with three rows of seats without an integrated carrier bag holder

- Fold up the floor hatch (1) at the rear edge and lift it out.

Fig. 623: Remove Right And Left Side Glove Box
Courtesy of VOLVO CARS CORPORATION

- Remove the floor hatch (1).

Fig. 624: View Of Side Panel On The Right-Hand Side
Courtesy of VOLVO CARS CORPORATION

- Remove the side panel on the right-hand side.

Fig. 625: Disconnect Battery Negative Lead
Courtesy of VOLVO CARS CORPORATION

Only applies to cars with external amplifier

- Slide the right-hand seat all the way back and then completely upright at the front edge.
- Turn the ignition switch to position 0.

NOTE: **Wait at least three minutes before unplugging the connectors or removing other electrical equipment.**

Only applies to cars with internal amplifier

- Turn the ignition switch to position 0.
- Disconnect the battery negative lead.

NOTE: **Wait at least three minutes before unplugging the connectors or removing other electrical equipment.**

STEPS ONLY APPLY TO CARS WITH INTERNAL AMPLIFIER

Steps only apply to cars with internal amplifier.

Fig. 626: Remove The Center Console's Right-Hand Side Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the center console's right-hand side panel by pulling it away starting at the front edge and then backwards until all the clips have released.

Fig. 627: Identifying Soundproofing Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the screws and sound proofing bracket.

Fig. 628: Prying Off Gear Selector Panel At Rear Edge
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position II.
- Move the gear selector lever to its rearmost position.
- Use a weatherstrip and pry off the gear selector panel at the rear edge.

Fig. 629: Pressing In Catches And Removing Panel
Courtesy of VOLVO CARS CORPORATION

- Press in the catches and remove the panel.

Fig. 630: Removing Screws And Radio/AC Unit From Center Console
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws.
- Remove the bracket with the A/C panel and radio from the center console. Pull from the lower edge and then downwards until it releases from the mounting at the upper edge.

NOTE: Note how the cable is routed for the bluetooth system's control panel at the upper left-hand corner.

- Remove the connectors.

Fig. 631: View Of Front Mute Relay At The Rear Edge Of The Opening Of The Center Console
Courtesy of VOLVO CARS CORPORATION

- Lift out the front mute relay, which is positioned at the rear edge of the opening of the center console.

Fig. 632: Identifying Foam Tape
Courtesy of VOLVO CARS CORPORATION

- Lift up the foam tape slightly.
- Unplug the connectors.

Fig. 633: Connecting Cable Harnesses To Disconnected Connectors
Courtesy of VOLVO CARS CORPORATION

- Take the two cable harnesses from the kit and connect these to the removed connectors.

Fig. 634: Connecting New Cable Harnesses To Relay
Courtesy of VOLVO CARS CORPORATION

- Connect the new cable harnesses to the relay.
- Fold the tape back into place.

Fig. 635: Taping Foam Tape Around Connectors
Courtesy of VOLVO CARS CORPORATION

- Remove the foam tape from the kit and cut it in the center.
- Wrap some tape around each connector.
- Reinstall the relay.

Fig. 636: Identifying Yellow Cable On The Right-Hand Side Of The Center Console
Courtesy of VOLVO CARS CORPORATION

- Pull out the yellow cable on the right-hand side of the center console.

Fig. 637: Reinstall The A/C / Radio Unit
Courtesy of VOLVO CARS CORPORATION

- Plug in the connectors.
- Reinstall the radio / A/C unit by first hooking it at the upper edge. Then press upwards and angle the lower section in. At the same time, check that the cable for the control panel is correctly located.
- If the radio / A/C unit does not fit at the lower edge, check for trapped wiring.
- Reinstall the screws.

Fig. 638: View Of Cable From The Center Console To The Lower Section Of The Right-Hand A Pillar
Courtesy of VOLVO CARS CORPORATION

- Route the cable from the center console to the lower section of the right-hand A pillar under the carpet.

STEPS ONLY APPLY TO CARS WITH EXTERNAL AMPLIFIER

Steps only apply to cars with external amplifier.

Fig. 639: Identifying Amplifier Screws
Courtesy of VOLVO CARS CORPORATION

- Slacken off the amplifier screws (1) under the right-hand front seat.

Fig. 640: View Of Amplifier Lifted Out
Courtesy of VOLVO CARS CORPORATION

- Lift the amplifier out.
- Use a weatherstrip to remove it from its recessed position.
- Place it upside down as illustrated.

Fig. 641: Reinstalled Amplifier Screws
Courtesy of VOLVO CARS CORPORATION

- Take the mute relay that is under the front left-hand corner in the recess.

Fig. 642: Identifying Amplifier To The Connector On Cable Harness C
Courtesy of VOLVO CARS CORPORATION

Fig. 643: Identifying Foam Tape
Courtesy of VOLVO CARS CORPORATION

- Lift up the foam tape slightly.
- Unplug the connectors.

Fig. 644: Connecting Cable Harnesses To Disconnected Connectors
Courtesy of VOLVO CARS CORPORATION

- Take the two cable harnesses from the kit and connect these to the removed connectors.

Fig. 645: Connecting New Cable Harnesses To Relay
Courtesy of VOLVO CARS CORPORATION

- Connect the new cable harnesses to the relay.
- Fold the tape back into place.

Fig. 646: Taping Foam Tape Around Connectors
Courtesy of VOLVO CARS CORPORATION

- Remove the foam tape from the kit and cut it in the center.
- Wrap some tape around each connector.
- Reinstall the relay.

Fig. 647: View Of Cable Route From Location Of The Amplifier
Courtesy of VOLVO CARS CORPORATION

- Route the cable from the location of the amplifier, out under the seat at the joint for the floor mats and towards the sill.
- Do not damage the cable terminal when routing the cable.
- Reinstall the amplifier.

APPLIES TO ALL CARS

Fig. 648: Cable Clamped In At Air Duct
Courtesy of VOLVO CARS CORPORATION

Applies to all cars

- Guide the cable down between the carpet and the door sill as far as possible to the floor and route it along the right-hand side of the car on to the rear edge of the right-hand rear doors opening.
- Route the cable by the front right-hand seat mounting on the right-hand seat in the second row of seats.
- Pull away the mat from the front edge of the right-hand side panel in the cargo compartment.
- Route the cable harness along the right side of the right seat's placement in the second row of seats, towards the front edge of the rear wheel housing.
- Route it further on the left-hand side of the seat belt's lower mounting, between the support bracket for the right-hand seat and wheel housing, and out at the left-hand side of the wheel housing.

Fig. 649: Identifying Cable At Rear Edge Of Right-Hand Side Panel
Courtesy of VOLVO CARS CORPORATION

Applies to cars with three rows of seats

- Guide in a wire or cable (1) at the rear edge of the right-hand side panel and along its inside, above the load securing eyelet brackets.
- Route the wire/cable to the front edge of the side panel.

Fig. 650: Identifying Cable Harness
Courtesy of VOLVO CARS CORPORATION

Applies to cars with three rows of seats

- Tape the cable (2) to the wire (1) and pull it forward at the rear edge of the side panel.

Fig. 651: Cable Routing
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Route the cable on the left-hand side of the seat belt's mounting at the front edge of the wheel housing, inside the carpet at the front edge of the side panel, between the side panel and the rear cargo floor

support, to the Accessory Electronic Module (AEM).

Fig. 652: Removing Panel By Pulling It Straight Up And Unhook It From Side Panel (1 Of 2)
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws in the bracket for the Accessory Electronic Module (AEM) and lift up the entire unit.

Fig. 653: Removing Panel By Pulling It Straight Up And Unhook It From Side Panel
Courtesy of VOLVO CARS CORPORATION

- Disconnect the large connector on the Accessory Electronic Module (AEM). First press in the catch (A). Pull the black locking handle (B) in the direction of the arrow until a click is heard.
- Disconnect the connector from the accessory electronic module.

Fig. 654: Black Terminal Pin By Inserting A Pointed Object Into Hole In Other End
Courtesy of VOLVO CARS CORPORATION

- Remove the black catch holding the black connector socket in place in the connector by pulling in the direction of the arrow.
- Remove the black connector socket. Insert a pointed object in the hole on the other end of the connector. Press the connector socket out.

Fig. 655: View Of Yellow (Y) Cable To Terminal 11 (Telemute) In The Black Connector
Courtesy of VOLVO CARS CORPORATION

NOTE: The numerical markings on the top and bottom of the black terminal pin are extremely small, so be careful when installing the cable.

- Connect the yellow (Y) cable to terminal 11 (telemute) in the black connector for the Accessory Electronic Module (AEM).
- Reinstall the black switch in the connector. Lock into place using the catch.
- Press the connector into the Accessory Electronic module. Secure using the black locking handle.

- Reinstall the Accessory Electronic Module (AEM) with bracket.
- Secure the excess of the yellow cable using a tie strap.

Fig. 656: Identifying VIDA (Service Information) To Program Software
Courtesy of VOLVO CARS CORPORATION

Install:

- panel for gear selector.
- the sill trim panels.
- cover splice for sill trim panels.
- sound proofing.
- the side panel for the center console.
- the seatbelt.

NOTE: Check that the seat belt is secure by jerking it hard in an upwards direction.

- the seat. Tighten the screws to **50 Nm (36.8 lbf. ft.)** .
- seat moldings.
- the side panel.
- floor hatches.
- Turn the ignition key to position II.
- Reconnect the battery negative lead
- Download the software for the accessory's function following the service information in VIDA (Volvo scan tool).

Carry out a function test as follows:

- Turn the ignition key to position II.
- Turn on the radio.
- Check that the Bluetooth system's control panel lights up.
- Press the round button in the middle of the control panel. The radio should mute and a voice should be heard.
- Press the button with the red handset symbol. The voice should stop and the radio sound.

INFOTAINMENT LEVELS UPGRADE (2009-2010)

INFOTAINMENT LEVELS UPGRADING

Fig. 657: Prying Off Gear Selector Panel At Rear Edge
Courtesy of VOLVO CARS CORPORATION

Applies to cars with automatic gearbox

- Turn the ignition key to position II.

Applies to all models

- Move the gear selector lever to its rearmost position.
- Carefully pry off the gear level panel at the rear edge using a plastic weatherstrip tool and pull it backwards to access the screws for the climate control panel.

Fig. 658: Identifying Ignition Switch OFF & Disconnected Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

Applies to cars with manual gearbox

- Turn the ignition switch to position 0.

Applies to all models

- Disconnect the battery negative lead.

NOTE: Wait at least three minutes before disassembling the connectors or removing other electrical equipment.

Fig. 659: Removing Screws And Radio/AC Unit From Center Console
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws holding the bracket to the climate control panel and the control module.

NOTE: **Pull out the bracket at the lower edge and detach it from the top edge of the center console.**

- Disconnect the connectors from the climate control panel, control module and CD player.

Illustrations A and B

Fig. 660: View Of Control Module Screws
Courtesy of VOLVO CARS CORPORATION

- Position the bracket with control module and climate control panel appropriately.
- Remove the four screws on the reverse that hold the control module by the bracket.
- Depress the four catches in the sides of the control module so that they release and pull out the control module carefully.

Fig. 661: Remove The Control Module
Courtesy of VOLVO CARS CORPORATION

Fig. 662: Identifying CD Player Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws, pull out the CD player and place to one side. It will not be reused.

INSTALL

Fig. 663: Installing New CD Player From Kit
Courtesy of VOLVO CARS CORPORATION

- Take a new CD player from the kit, install and tighten using the existing screws.

Fig. 664: View Of Control Module
Courtesy of VOLVO CARS CORPORATION

Fig. 665: View Of Control Module Screws
Courtesy of VOLVO CARS CORPORATION

Fig. 666: Identifying Climate Control Panel And CD Player Screws
Courtesy of VOLVO CARS CORPORATION

- Connect the connectors to the control module, climate control panel and CD player and reinstall the unit in the center console. Ensure that the wiring on the reverse is correctly positioned and is not at risk of being trapped or chafed.

NOTE: Fibre-optic cables may not be bent with a radius less than 25 mm (1").

Fig. 667: Identifying Ignition In ON Position and Connecting Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position II.
- Reconnect the battery negative lead.

Fig. 668: Identifying VIDA (Service Information) To Program Software
Courtesy of VOLVO CARS CORPORATION

- Download the software for the accessory's function following the service information in VIDA (Volvo scan tool).

MOBILITY CONNECTION PACKAGE (2009-2011)

MOBILITY CONNECTION PACKAGE

NOTE: **When installing Velcro fasteners/tape, the underlying surface must be kept at a temperature of at least +20° C (68°F).**

Place the manual for this accessory in a suitable place in the vehicle.

PREPARATION

Fig. 669: Identifying Wrench, Screws And Nuts

Courtesy of VOLVO CARS CORPORATION

NOTE: Take care when handling the components, they are fragile and are easily damaged.

- Take the three screws **M5x20 part no. 986956** and nuts from the kit.
- To prevent excessive resistance when the nut for the holder is tightened, hold the screw and screw the nut on and off the threaded part of the screw. Carry this out on all screws and nuts.

Fig. 670: Identifying Removal Screws Holding Connector In Holder
Courtesy of VOLVO CARS CORPORATION

- Take special tool **9814104** (Torx driver, Torx 6), and unscrew the two screws holding the connector in the holder.
- Carefully push the connector to one side with the cable to expose the bottom of the holder.

Fig. 671: Identifying Spacers
Courtesy of VOLVO CARS CORPORATION

- Take the kit with the four spacers from the installation kit.
- Carefully pry off the spacer using **P/N 31212525** . The part number (1) is on the bottom of the spacer.

Fig. 672: Identifying Screws Inserted In Spacer
Courtesy of VOLVO CARS CORPORATION

- Take the three screws and insert them in the spacer fully.

Fig. 673: Applying Pieces Of Butyl Tape To Screws
Courtesy of VOLVO CARS CORPORATION

- Apply pieces of butyl tape to the screws so that the screw heads do not protrude outside the spacer when installing it.

Fig. 674: Identifying Spacer In Bottom Of Holder
Courtesy of VOLVO CARS CORPORATION

- Install the spacer in the bottom of the holder.

Fig. 675: Identifying Spacer Secured In Position
Courtesy of VOLVO CARS CORPORATION

- Ensure that the holders two screw turrets align between the small pins in the oblong holes in the spacer. A click should be heard when the spacer is securely in position.

Fig. 676: Aligning Guide Hole With Pin
Courtesy of VOLVO CARS CORPORATION

- Place the connector in the bottom of the hole. The guide hole (1) in the connector's circuit board must align in the corresponding pin at the bottom of the holder and the holes (2) in the circuit board must be over the holders screw turret.

Fig. 677: Identifying Connector Tightened To Holder With Torx Screws
Courtesy of VOLVO CARS CORPORATION

- Take the small Torx screws and carefully tighten the connector to the holder. Ensure that the connector's circuit board is properly against the screw turret and that there is no play.
- Remove the butyl tape from the screws.

Fig. 678: Identifying Ignition Switch OFF & Disconnected Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Slide the front seats back and upwards at the front edge.
- Turn the ignition key to position 0.
- Disconnect the battery negative lead.

NOTE: **Wait at least three minutes before unplugging the connectors or removing other electrical equipment.**

Fig. 679: Remove The Center Console's Right-Hand Side Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the center console's right and left-hand side panel by pulling away starting at the front edge and then backwards until all the clips have released.

Fig. 680: View Of End Face Panel On Dashboard
Courtesy of VOLVO CARS CORPORATION

- Remove the end face panel from the dashboard.

Fig. 681: Identifying Soundproofing Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the sound insulation on the right and left-hand sides by first removing the two screws and then prying off the sound insulation.

Fig. 682: View Of Pry Off The Gear Selector Panel
Courtesy of VOLVO CARS CORPORATION

Applies to cars with automatic gearbox

- Turn the ignition key to position II.

Applies to all models

- Move the gear selector lever to its rearmost position.
- Use a weatherstrip and pry off the gear selector panel at the rear edge.

Fig. 683: Pressing In Catches And Removing Panel
Courtesy of VOLVO CARS CORPORATION

- Press in the catches and remove the panel.

Fig. 684: Removing Screws And Radio/AC Unit From Center Console
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws.
- Remove the bracket with the A/C panel and radio from the center console. Pull from the lower edge and then downwards until it releases from the mounting at the upper edge.

NOTE: Do not damage the removed components or the surrounding panels.

- Unplug the connectors.

Illustration A

Fig. 685: View Of Removing Speaker Grille
Courtesy of VOLVO CARS CORPORATION

- Remove the loudspeaker grille as follows: Insert the special tool, **9995919** into the joint between the loudspeaker grille and the dashboard approximately as illustrated, until it engages.

- Twist the tool 90° so that the bent section engages with the underneath of the loudspeaker grille.

Illustration B

Fig. 686: Pull Upward Until The Loudspeaker Grille Detaches
Courtesy of VOLVO CARS CORPORATION

- Pull upward until the loudspeaker grille detaches, it is securely fastened by four clips. Move the tool closer to the clips to facilitate removal.

NOTE: Do not damage the dashboard.

- Lift out the loudspeaker grille.

Fig. 687: Identifying Template From The Kit And Cut It Along The Outer Lines
Courtesy of VOLVO CARS CORPORATION

- Take the template from the kit and cut it along the outer lines.

Fig. 688: Tape The Template To The Loudspeaker Grille
Courtesy of VOLVO CARS CORPORATION

- Tape the template to the loudspeaker grille.

Fig. 689: View Of Predrilled The Holes According To The Template
Courtesy of VOLVO CARS CORPORATION

- Drill at right angles to the loudspeaker grille.
- Predrill the holes according to the template using a **3 mm (1/8")** drill bit.
- Remove the template.

Illustrations A and B

Fig. 690: Identifying Ribs On The Underside Of Loudspeaker Grille
Courtesy of VOLVO CARS CORPORATION

- Turn over the loudspeaker grille and cut away some of the ribs on the underside so that the result corresponds with figure B.

Fig. 691: View Of Ribs Cut Out Of Grille
Courtesy of VOLVO CARS CORPORATION

Fig. 692: View Of Step Drilling Three Holes
Courtesy of VOLVO CARS CORPORATION

- Drill the three holes for the cradle's feet using a step drill **14 mm (9/16")** .

Fig. 693: View Of Drilling Out The Hole For The Connection
Courtesy of VOLVO CARS CORPORATION

- Take the step drill and drill out the hole for the connection in the holder using a **28 mm (1 7/64") drill bit** .

Fig. 694: Deburr And Bend In The Edges Using A Round File
Courtesy of VOLVO CARS CORPORATION

- Deburr and bend in the edges using a round file.

Illustration A

Fig. 695: Secure To The Loudspeaker Grille
Courtesy of VOLVO CARS CORPORATION

- Take three nuts, washer and the cradle out of the kit and secure to the loudspeaker grille.

Illustration B

Fig. 696: Tighten The Cradle
Courtesy of VOLVO CARS CORPORATION

- Tighten the cradle.

Illustration A

Fig. 697: Lift Up The Loudspeaker And Remove The Connector
Courtesy of VOLVO CARS CORPORATION

- Remove the five screws. Lift up the loudspeaker and remove the connector.
- Put the loudspeaker to one side. New loudspeaker and console in the kit.

Illustration B

Fig. 698: View Of Vehicles Without A Center Loudspeaker
Courtesy of VOLVO CARS CORPORATION

- On vehicles without a center loudspeaker there is a console holding the loudspeaker grille. On these vehicles the console remains in place and the cable is routed through the hole.

Fig. 699: View Of Piece Of Foam Tape From The Kit
Courtesy of VOLVO CARS CORPORATION

- Take a piece of foam tape from the kit and cut off as shown in the image.

Fig. 700: View Of Long Cable Harness (A) From The Kit
Courtesy of VOLVO CARS CORPORATION

- Take the long cable harness (A) from the kit.
- Wrap the larger piece of foam tape around the fuse holder to prevent rattling.

Fig. 701: Identifying Cable Harness Is Always Routed On The Right-Hand Side In The Tunnel Console
Courtesy of VOLVO CARS CORPORATION

- Take hold of the long cable harness. Route the end with the small connector on the right-hand side in the center console, up and out through the hole for the loudspeaker grille console.

Fig. 702: Identifying Console Screws
Courtesy of VOLVO CARS CORPORATION

- Connect the connector to the loudspeaker. Route the cable to the cradle through the large hole in the speaker console.
- Tighten the console using the five existing screws.

Fig. 703: View Of Small Cable (B) From The Kit And Connect To The Newly Routed Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Take out the small cable (B) from the kit and connect to the newly routed cable harness.
- Wrap the smaller piece of foam tape around the connectors.

Fig. 704: View Of Connect The Connector To The Cradle
Courtesy of VOLVO CARS CORPORATION

- Take the loudspeaker grille with cradle. Connect the connector to the cradle.

Fig. 705: View Of Pushing The Loudspeaker Grille
Courtesy of VOLVO CARS CORPORATION

- Insert the cable in the hole for the loudspeaker/console and push on the loudspeaker grille.

Fig. 706: View Of Connecting The Cable Harness To The Control Module
Courtesy of VOLVO CARS CORPORATION

- Take the cable harness (D) and control module from the kit. Connect the cable harness to the control module.

Fig. 707: Secure The Cable Harness To The Control Module Using A Cable Tie
Courtesy of VOLVO CARS CORPORATION

- Secure the cable harness to the control module using a cable tie.

Fig. 708: Fold Up The Left Mounting Of The Control Module
Courtesy of VOLVO CARS CORPORATION

- Fold up the left mounting of the control module.

Fig. 709: View Of Foam Tape On Right-Hand Mounting Of The Control Module
Courtesy of VOLVO CARS CORPORATION

- Take a piece of foam tape from the kit and cut in the middle. Place a piece on the right-hand mounting of the control module.

Fig. 710: View Of Foam Tape That Covers Half The Upper Edge And Half The Side Edge
Courtesy of VOLVO CARS CORPORATION

- Apply a piece of foam tape so that it covers half the upper edge and half the side edge.

Fig. 711: Identifying Control Module Between The Carpet And Insulation
Courtesy of VOLVO CARS CORPORATION

- Push the carpet on the right-hand side of the tunnel console to one side.
- Place the control module between the carpet and insulation. The right-hand mounting of the control module should be below the air duct.

Illustration A

Fig. 712: Identifying Cable Harness From Kit
Courtesy of VOLVO CARS CORPORATION

- Take cable harness (D) from the kit.

Illustration B

Fig. 713: View Of Connector Down To The Control Module
Courtesy of VOLVO CARS CORPORATION

- Route the connector down to the control module.

Fig. 714: View Of Connector (1) To The Control Module
Courtesy of VOLVO CARS CORPORATION

- Connect the connector (1) to the control module.

Fig. 715: View Of Connector (2) By The Side Of The Centre Console
Courtesy of VOLVO CARS CORPORATION

- Route the connector (2) by the side of the center console.

USB/IPOD PLAYER LOCATED IN THE GLOVE COMPARTMENT

NOTE: Following steps apply when connecting to the USB/iPod player located in the glove compartment.

Fig. 716: Identifying Glove Compartment Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the nine screws, route the glove compartment straight out and disconnect the connector.

Fig. 717: Identifying Drilled Holes Outside Of The Glove Compartment's End
Courtesy of VOLVO CARS CORPORATION

- Mark as illustrated on the outside of the glove compartments end.
- Pre-drill using a **2.5 mm (3/32")** bit.
- Drill using a **30 mm (1 3/16")** hole saw.
- Smooth off the hole edges.

Fig. 718: View Of Carpet Cable Routing For USB/iPod
Courtesy of VOLVO CARS CORPORATION

- Route the cable for the USB/iPod under the carpet along the outside of the tunnel console.

Fig. 719: Identifying Cable Through Rubber Grommet
Courtesy of VOLVO CARS CORPORATION

- Route the cable through the drilled hole.
- Thread the rubber grommet on to the cable and secure in the hole. The cable must protrude about **250 mm** .

Fig. 720: Secure The Cable Using A Cable Tie On The Damper Spring's Eyelets
Courtesy of VOLVO CARS CORPORATION

- Secure the cable using a cable tie on the damper springs eyelets.
- Reinstall the glove compartment.

USB/IPOD PLAYER LOCATED IN THE CD COMPARTMENT UNDER THE ARMREST.

NOTE: Apply when connecting to the USB/iPod player located in the cd compartment under the armrest.

Fig. 721: View Of Moving Tunnel Compartment Backward
Courtesy of VOLVO CARS CORPORATION

- Pull the handle, move the tunnel compartment backward and lift it away.

Fig. 722: View Of Cover Removed
Courtesy of VOLVO CARS CORPORATION

- Remove the cover. It shall not be re-used.

Fig. 723: View Of Contact Plate Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws and the contact plate.

Fig. 724: View Of CD Compartment Drill Marks
Courtesy of VOLVO CARS CORPORATION

- Measure the front of the CD compartment as illustrated.
- Pre-drill using a **2.5 mm (3/32")** bit.
- Drill using a **30 mm (1 3/16")** hole saw.
- Smooth off the hole edges.

Fig. 725: Identifying Of Drilled Markings On Bottom Of The Tunnel Console
Courtesy of VOLVO CARS CORPORATION

Applies to cars without holes in the bottom of the tunnel compartment.

- Measure the bottom of the tunnel console as illustrated.
- Pre-drill using a **2.5 mm (3/32")** bit.
- Drill out the hole. Use a **30 mm (1 3/16")** diameter hole saw.
- Smooth off the hole edges.

Fig. 726: Measure The Opening Handle Of The Tunnel Console
Courtesy of VOLVO CARS CORPORATION

- Measure the opening handle of the tunnel console as illustrated.
- Pre-drill using a **2.5 mm (3/32")** bit.
- Drill out the holes. Use a **6 mm (15/64")** diameter drill bit.

Fig. 727: Identifying Blind Cover Plug Screws
Courtesy of VOLVO CARS CORPORATION

- Take the blind cover plug and two screws from the kit. Install the blind cover plug on the opening handle.

Fig. 728: View Of Routed USB/iPod Cable From The Control Module
Courtesy of VOLVO CARS CORPORATION

- Route the USB/iPod cable from the control module up out of the rear section of the tunnel console.

Fig. 729: View Of Cable Through Rubber Grommet
Courtesy of VOLVO CARS CORPORATION

- Route the cable through the drilled holes.
- Thread the rubber grommet on to the cable and secure in the hole. The cable must protrude about **200 mm** .
- Reinstall the contact plate.
- Reinstall the tunnel compartment and at the same time place the excess cable under the tunnel compartment.

APPLIES TO ALL MODELS

Fig. 730: Pry Off Grab Handle Cover
Courtesy of VOLVO CARS CORPORATION

- Remove the covers and screws for the grab handle on the A-pillar.

Fig. 731: Removing A-Pillar Weatherstrip
Courtesy of VOLVO CARS CORPORATION

- Pull off the weatherstrip (1) for the door at the A-pillar.
- Pull off the A-pillar panel at the upper edge and then straight upwards to remove it.

Fig. 732: Identifying 90Mm Gap Of Foam Tape
Courtesy of VOLVO CARS CORPORATION

- Take the microphone and a **700 mm** long piece of foam tape from the kit.
- Tape the piece of foam tape on the cable, starting **90 mm** from the microphone.

Fig. 733: Cleaning Microphone And Headliner and Applying Velcro Strip
Courtesy of VOLVO CARS CORPORATION

- Clean the microphone and roof panel in the area illustrated, which corresponds to the size of the double-sided adhesive tape. Use a solution of **25% isopropanol and 75% water** , as well as a lint free cloth. Wipe dry carefully, do not rub.
- Allow to dry.

NOTE: In cases where the area is heavily soiled or treated with cockpit shine, first clean using a washing up detergent.

- Remove the backing tape from one side of the Velcro strip and press it onto the microphone.

Fig. 734: Press The Microphone Securely Into Place
Courtesy of VOLVO CARS CORPORATION

- Remove the remaining protective film from the Velcro strip. Press the microphone securely into place.

NOTE: **The microphone must be pointing towards the driver. Make sure that it does not obstruct adjustment of the rear view mirror.**

Fig. 735: View Of Cable Rear View Mirror Mounting
Courtesy of VOLVO CARS CORPORATION

- Route the microphone cable under the rear view mirror's mounting and inside the headlining. Insert the cable using a weatherstrip tool.

Fig. 736: Identifying Headlining, Routed Cable And A-Pillar
Courtesy of VOLVO CARS CORPORATION

- Carefully pull down the headlining and route the cable above it, to the A-pillar.

Fig. 737: Identifying Cable Secured To A-Pillar With Foam Tape
Courtesy of VOLVO CARS CORPORATION

- Pull the cable down along the A-pillar to the dashboard.
- Cut off two **100x50 mm** pieces of foam tape in the middle.
- Secure the cable to the A-pillar using foam tape.

CAUTION: The inflatable curtain (IC) is located inside the A-pillar panel, it is important that the cable is not positioned on it.

Fig. 738: View Of Cable Routed Towards The Center Console
Courtesy of VOLVO CARS CORPORATION

- Cut off one **100 x 50 mm** strip of foam tape in the middle.
- Secure the cable on the heater unit using the pieces of tape.
- Route the cable further in towards the center console.

Fig. 739: Taping Piece Of Foam Tape On Cable Starting 70mm From Control Panel
Courtesy of VOLVO CARS CORPORATION

- Take the control panel and a **700 mm** long piece of foam tape from the kit.
- Tape the piece of foam tape on the cable, starting **70 mm** from the control panel.

Fig. 740: Clean The Area On The Dashboard
Courtesy of VOLVO CARS CORPORATION

- Clean the area on the dashboard as illustrated, which corresponds to the size of the double-sided adhesive tape. Use a solution of **25% isopropanol and 75% water** , as well as a lint free cloth. Wipe dry carefully, do not rub.
- Allow to dry.

NOTE: **In cases where the area is heavily soiled or treated with cockpit shine, first clean using a washing up detergent.**

APPLIES TO ALL MODELS

Fig. 741: View Of Control Panel Mounted On Dashboard
Courtesy of VOLVO CARS CORPORATION

- Remove the protective film from the tape on the reverse of the control panel.
- Align and secure the control panel on the dashboard.

Fig. 742: View Of Cable Positioned In The Upper Edge Of The Opening
Courtesy of VOLVO CARS CORPORATION

- Pull the cable down to the opening in the center console. The cable must be positioned in the upper edge of the opening, approximately **10 mm** from the corner.

Fig. 743: Identifying Control Module Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Take the control module and cable harness (E) from the kit.

1. Plug in the connector.
2. Lock the catch.

Fig. 744: Identifying Cleaned Control Module
Courtesy of VOLVO CARS CORPORATION

- Clean the control module with **isopropanol** in the areas illustrated.

Fig. 745: Cleaning Surrounding Areas Underneath Detached A/C / Radio Unit
Courtesy of VOLVO CARS CORPORATION

- Clean the areas underneath the removed radio/A/C unit using **isopropanol** , as illustrated.

Fig. 746: Identifying Velcro Fasteners
Courtesy of VOLVO CARS CORPORATION

- Take a Velcro strip and cut off two pieces of the same length
- Press the pieces together.
- Cut off two pieces of the same length again at the center.

Fig. 747: View Of Velcro Strips On The Control Module
Courtesy of VOLVO CARS CORPORATION

- Remove the protective film from one side of the Velcro strips which were pressed together.
- Apply the Velcro strips on the control module and press.

Fig. 748: View Of Aligned And Installed Control Module
Courtesy of VOLVO CARS CORPORATION

- Remove the remaining protective file on the Velcro strips, align and install the control module as illustrated. Press onto the control module so that the tape adheres.

Fig. 749: View Of Foam Tape Pieces To Relay
Courtesy of VOLVO CARS CORPORATION

- Take the relay, two foam tape pieces and cable harness (F) from the kit.
- Connect the connectors from the cable harness to the relay.
- Tape the foam tape pieces around the relay.

Fig. 750: View Of Two Connectors Through Center Console
Courtesy of VOLVO CARS CORPORATION

- Route the two connectors through the center console and out on the rear side.

Fig. 751: Identifying Cable Harness Routing By Side Of Center Console
Courtesy of VOLVO CARS CORPORATION

- Route the cable harness by the side of the center console.

Fig. 752: Locating 4 Pin, Gray, Pre-Routed Connector For The Power Supply
Courtesy of VOLVO CARS CORPORATION

- Locate the 4 pin, grey connector for the power supply. It is secured on the thick cable harness under the dashboard.

NOTE: The pre-routed connector is already connected on certain versions.

Fig. 753: View Of Cable Harnesses
Courtesy of VOLVO CARS CORPORATION

- Connect cable harness (F) to the pre-routed connector (1).
- Connect cable harness (E) to the routed cable harness (F).
- Tape one cut piece of foam tape around the connected connectors.
- Secure the connector (2) on the car's existing cable harness using a cable tie.

NOTE: When the pre-routed connector is already connected, disconnect it and then

connect both the connectors from the new cable harnesses.

Fig. 754: View Of Excess Cable Under Carpet
Courtesy of VOLVO CARS CORPORATION

- Place any excess under the carpet.

Fig. 755: View Of Cable Harness At Rear Edge Of Center Console
Courtesy of VOLVO CARS CORPORATION

- Place the relay with the cable harness at the rear edge of the opening on the center console.

Fig. 756: Connecting Connectors
Courtesy of VOLVO CARS CORPORATION

- Connect the connectors for the Bluetooth system:

1. cable harness power supply
2. the microphone
3. the control panel

- Take one of the cut pieces of foam tape and tape around the connectors.

Fig. 757: View Of Connectors And Excess Cables In The Bottom Of The Center Console
Courtesy of VOLVO CARS CORPORATION

- Tape one cut piece of foam tape around the connectors.
- Place the connectors and excess cables in the bottom of the center console. Check that they do not rub against the bracket edges.

Fig. 758: View Of Gray Connector In The New Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Connect the gray connector (1) in the new cable harness (F) to the corresponding socket in the media player.
- Connect the gray connector (2) in the new cable harness (F) to connector (3) which was detached from the media player.
- Take one of the cut pieces of foam tape and tape around connectors (2) and (3).

Fig. 759: Identifying Connector And 12V Outlet To Female Connector
Courtesy of VOLVO CARS CORPORATION

- Connect the connector (1) that was removed from the 12V outlet to the female connector (2) on the routed cable harness (A).
- Connect the remaining connector to the 12V socket.

Fig. 760: View Of Cables Tied Together
Courtesy of VOLVO CARS CORPORATION

- Tuck away the surplus cable in the bottom of the center console.
- Tie together with a cable tie.

Fig. 761: View Of Media Player Connected
Courtesy of VOLVO CARS CORPORATION

- Connect the connector that was disconnected from the media player to the connector on the new cable harness (C).
- Take a piece of foam tape from the kit and cut it in the center.
- Tape one cut piece of foam tape around the connectors.
- Connect the other connector to the media player.

Fig. 762: Reinstall The A/C / Radio Unit
Courtesy of VOLVO CARS CORPORATION

- Connect the remaining connectors.
- Reinstall the radio / A/C unit by first hooking it at the upper edge. Then press upwards and angle the lower section in. At the same time, check that the cable for the control panel is correctly located.
- If the radio/A/C unit does not fit at the lower edge, check for trapped wiring.
- Reinstall the screws.
- Reinstall the detached components in reverse order.

Fig. 763: Identifying Ignition In ON Position and Connecting Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position II.
- Reconnect the battery negative lead.

Fig. 764: Identifying VIDA (Service Information) To Program Software
Courtesy of VOLVO CARS CORPORATION

- Download software for USB and iPod® Music Interface, according to the service information in VIDA (Volvo scan tool).

CHECK THE FUNCTION OF THE BLUETOOTH SYSTEM AS FOLLOWS:

Fig. 765: Identifying Bluetooth Unit
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position I.
- Turn the radio on. Wait 20 seconds.
- Check that the control panel for Bluetooth illuminates. Press the round button (81) in the middle of the control panel. The radio should then mute and a voice should be heard.
- Press the red handset button (2). The voice should now stop and the audio from the radio returns.

MULTIMEDIA MONITOR WITH DVD (2008)

MULTIMEDIA MONITOR WITH DVD

NOTE: **Kits A and B apply to cars with a sunroof.**

Kits C and D apply to cars without a sunroof.

CAUTION: Take care when cutting the headlining. There is a risk of cutting off the cable harnesses and hose for the rear washer.

Only use a sharp utility knife or similar for cutting into the headlining. Replace the blade when it becomes blunt.

WARNING: Protect skin, eyes and respiratory tracts using appropriate protective equipment so that they are not exposed to loose roof material.

PREPARATIONS

Fig. 766: View Of Folded Up The Floor Hatch
Courtesy of VOLVO CARS CORPORATION

- Fold up the floor hatch (1).

REMOVE

Fig. 767: View Of Floor Hatch
Courtesy of VOLVO CARS CORPORATION

- Remove the floor hatch on the right and left-hand side.

Fig. 768: View Of Panel Removal
Courtesy of VOLVO CARS CORPORATION

- Remove the panel on the right and left-hand side.

Fig. 769: Identifying Cover And Screws Underneath Rear Headlining
Courtesy of VOLVO CARS CORPORATION

- Remove the covers and the screws on the rear roof panel.
- Carefully pry off the panel at the rear edge. Use a weatherstrip tool.
- Pull the rear edge of the panel downwards until the four clips on the top release.
- Pull the panel backwards to release it.
- Unplug the connector for the lighting.

Fig. 770: View Of D-Post Panel Removal
Courtesy of VOLVO CARS CORPORATION

- Carefully pull off the top edge of the left-hand D-post panel. Continue down until the three clips have released.
- Disconnect the connectors for any loudspeakers.
- Remove the panel by pulling upwards slightly and unhooking it from the side panel.

APPLY TO CARS WITH A SUNROOF

CUTTING THE HEADLINING

Fig. 771: Identifying Headlining Screws From The Kit
Courtesy of VOLVO CARS CORPORATION

- Take three **4.8x19mm** screws from the kit.

  Install the hole template in position. Guide it up along the grab handles and secure it to the roof using the screws.

Fig. 772: View Of Outside Edges Of Template
Courtesy of VOLVO CARS CORPORATION

NOTE: Ensure that the headlining for the sunroof is pulled forward.

- Cut through the headlining according to the dotted lines in the four large openings in the template.

NOTE: When cutting the outside edges (1) of the template, the tip of the knife blade must point inwards, towards the middle of the car.

Fig. 773: Remove The Template And Cut Through The Headlining
Courtesy of VOLVO CARS CORPORATION

- Mark the headlining using a knife in the four narrow slits at the edge on each side of the template.

CAUTION: Move the cable harnesses and hoses that are in these areas, before cutting through the headlining.

Remove the template and cut through the headlining at the parts between the four large openings, in order to remove a large portion of the headlining.

Fig. 774: Identifying The Wiring (1) That Is Bonded To The Inside Of The Headlining
Courtesy of VOLVO CARS CORPORATION

- Remove the wiring (1) that is bonded to the inside of the headlining on the right and left-hand sides of the

car. Use a weatherstrip tool to pry the wiring away from the bonding.

- Press the wiring out towards the sides of the car.

Illustration A

Fig. 775: Take Care When Cutting Away The Side Pieces Of The Headlining
Courtesy of VOLVO CARS CORPORATION

CAUTION: Take care when cutting away the side pieces of the headlining. There is a risk of cutting off the cable harnesses and the hose for the rear washer.

Illustration B

Fig. 776: Identifying Cables Pressed Into Routed Side
Courtesy of VOLVO CARS CORPORATION

- Position a suitable piece of plastic to protect the wiring when cutting along the sides of the car.

Press in the cables (1) which are routed to the side. Protect them with the section of plastic and carefully cut away the last side piece which was marked with a pen earlier.

CAUTION: Continuously check that the cable harnesses and hoses for the rear washer are not damaged.

INSTALLING ROOF MEMBER BRACKETS

Fig. 777: Identifying Sunroof's Right-Hand Mounting Rail
Courtesy of VOLVO CARS CORPORATION

NOTE: Do not disturb the spacers located between the sun roof member and the roof. It can be difficult to locate the spacers in position again.

- Remove the rear screw (1) in the sunroof right-hand mounting rail. Use a pair of pliers to pull it straight down from the hole. It is held in position by a plastic washer so significant force is required.

NOTE: Make sure that the plastic washer and its spacer pipe do not fall out of position.

- Take the bracket, the **M6x40 mm** screw and the washer from the kit (kit illustration A). Install the bracket loosely, with the screw through the oval hole, and slide it backwards.

Fig. 778: Identifying Same Rail Front Screw
Courtesy of VOLVO CARS CORPORATION

- Remove the front screw (1) in the same rail. Use pliers to pull it straight down through the hole. It is held in place by a plastic washer so some force is required.

  NOTE: Make sure that the plastic washer and its spacer pipe do not fall out of position.

  Slide the bracket forwards and secure it using a **M6x30 mm** screw and washer from the kit.

- Tighten both screws, torque tighten **10 Nm (7.5 lbf. ft.)** .

- Install the roof member bracket in the same way on the other side.

INSTALLING THE ROOF MEMBER

Fig. 779: Identifying Four Plastic Threaded Plates And Four Spacer Clips
Courtesy of VOLVO CARS CORPORATION

- Take the roof member, four plastic threaded plates and four spacer clips from the kit.

NOTE: Volvo's logo on the member must be facing upwards.

- Install the threaded plates as illustrated.
- Install the spacer clips from the other side. Press hard so that they are properly secured to the threaded plates.
- Take a 140x70 mm piece of tape from the kit. Cut into four 35x70 mm pieces.
- Tape the threaded plates in position as illustrated.

Fig. 780: Install The Roof Member In The Newly Installed Brackets
Courtesy of VOLVO CARS CORPORATION

- Insert the roof member, with the removed member ends pointing backwards, slightly under the rear headlining edge. Then slide the member forwards so that it is under the front headlining edge slightly. Work it into place at the screw holes.
- Take four **M6x14 mm** screws from the kit. Install the roof member in the newly installed brackets.
- Tighten the screws, torque tighten **10 Nm (7.5 lbf. ft.)** .

INSTALLING THE CABLE HARNESS

Fig. 781: Route The End Of The Cable Harness To The D-Post
Courtesy of VOLVO CARS CORPORATION

- Take the cable harness from the kit.

  Insert a suitable piece of wire or similar (1300 mm in length) into the cut-out hole in the headlining, all the way to the left-hand D-post. Secure the end of the cable harness with the loose terminals in the wire.

- Route the end of the cable harness to the D-post and remove it from the wire.

Fig. 782: Route The Cable Harness Along The D-Post Down To The Sill
Courtesy of VOLVO CARS CORPORATION

- Route the cable harness along the D-post down to the sill.

Fig. 783: Route The Cable Harness Along The Sill
Courtesy of VOLVO CARS CORPORATION

- Route the cable harness along the sill.

Fig. 784: Route The Cable Harness To The Right-Hand Tail Lamp
Courtesy of VOLVO CARS CORPORATION

- Route the cable harness to the right-hand tail lamp.

Fig. 785: Green Connector Kit
Courtesy of VOLVO CARS CORPORATION

- Take the green connector from the kit. Connect the terminals as follows:

Position	Cable
1	Red/White (R/W)
2	White (W)
3	Blue (BL)
4	
5	Black (SB)

- Close the catches.

Fig. 786: Locate The Existing 5-Pin Connector
Courtesy of VOLVO CARS CORPORATION

- Locate the existing 5-pin connector which is taped to the car's cable harness. Connect the connector to the

routed cable harness.

INSTALLATION OF THE MULTIMEDIA MONITOR WITH DVD

Fig. 787: Identifying DVD Unit Routed Connector
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position I.
- Take the DVD unit from the kit and connect the routed connector.

CAUTION: Handle the DVD unit with care and do not subject it to knocks.

Fig. 788: Identifying DVD Unit Switch (1)
Courtesy of VOLVO CARS CORPORATION

- Hold the DVD unit so that the display can be folded out without hindrance.
- Fold out the display by pressing the switch (1).

- Cut the current again by disconnecting the connector from the unit.
- Turn the ignition key to position 0.

Fig. 789: Identifying DVD Unit Screws
Courtesy of VOLVO CARS CORPORATION

- Take four **PF4x25** screws from the kit.

  Connect the connector to the DVD unit. Position the unit towards the middle of the roof member, guide the cutout in the unit to the spacers of the threaded plates. Install the unit loosely using screws. Leave **7 mm** between the unit and the member so that the cover panel can be installed.

Fig. 790: View Of Tape From The Kit Cut Into Three Pieces
Courtesy of VOLVO CARS CORPORATION

- Take a 140x70 mm piece of tape from the kit. Cut into three pieces.
- Install the cable harness at the rear edge of the member using two pieces of tape.

INSTALLING THE PANELS

Fig. 791: Identifying Roof Member Panel Clips
Courtesy of VOLVO CARS CORPORATION

- Take the panels for the roof member and the four plastic clips from the kit.
- Install the plastic clips on the cover panels.

Fig. 792: Tape Both Handles To Protect Them When Installing The Cover Panels
Courtesy of VOLVO CARS CORPORATION

- Tape both handles to protect them when installing the cover panels.

Fig. 793: View Of Roof Member Cut-Outs (1) By The LCD Display
Courtesy of VOLVO CARS CORPORATION

- Insert the cover panel hooks into the roof member's cut-out (1) and above the DVD unit (2). Bend down the panel in the middle, move it up over the handle and press the plastic clips into the holes (3) of the brackets.

NOTE: Do not damage the grab handle when sliding the headlining panel into position.

- Screw the DVD unit into place.
- Continue with point 49.

Fig. 794: View Of Cable Harness Using Two Cable Ties In The Existing Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Secure the cable harness using two cable ties in the existing cable harness.

Fig. 795: View Of Three Cable Ties Along The D-Post Panel
Courtesy of VOLVO CARS CORPORATION

- Secure the cable harness using three cable ties along the D-post panel.

APPLY TO CARS WITHOUT A SUNROOF.

Fig. 796: Identifying Hole Template In Position
Courtesy of VOLVO CARS CORPORATION

- Take two **4.8x13 mm** screws from the kit.
- Install the hole template in position. Guide it up along the grab handles and secure it to the roof using the screws.

Fig. 797: View Of Headlining Along The Hole Template's Inner Contours
Courtesy of VOLVO CARS CORPORATION

- Cut out the headlining along the hole template's inner contours (dotted line) using utility knife or similar.

NOTE: Use a sharp knife. This applies to all cutting of the headlining.

Fig. 798: View Of Screws And Template Removal
Courtesy of VOLVO CARS CORPORATION

- Remove the screws and template.
- Cut out the remains and remove the piece from the headlining.

Fig. 799: Route The End Of The Cable Harness To The D-Post
Courtesy of VOLVO CARS CORPORATION

- Take the cable harness from the kit.

  Insert a suitable piece of wire or similar (1300 mm in length) into the cut-out hole in the headlining, all the way to the left-hand D-post. Secure the end of the cable harness with the loose terminals in the wire.

- Route the end of the cable harness to the D-post and remove it from the wire.

Fig. 800: Route The Cable Harness Along The D-Post Down To The Sill
Courtesy of VOLVO CARS CORPORATION

- Route the cable harness along the D-post down to the sill.

Fig. 801: Route The Cable Harness Along The Sill
Courtesy of VOLVO CARS CORPORATION

- Route the cable harness along the sill.

Fig. 802: Route The Cable Harness To The Right-Hand Tail Lamp
Courtesy of VOLVO CARS CORPORATION

- Route the cable harness to the right-hand tail lamp.

Fig. 803: Green Connector Kit
Courtesy of VOLVO CARS CORPORATION

- Take the green connector from the kit. Connect the terminals as follows:

Position	Cable
1	Red/White (R/W)
2	White (W)
3	Blue (BL)
4	
5	Black (SB)

- Close the catches.

Fig. 804: View Of Existing 5-Pin Connector
Courtesy of VOLVO CARS CORPORATION

- Locate the existing 5-pin connector which is taped to the car's cable harness. Connect the connector to the

routed cable harness.

Fig. 805: Identifying Four Plastic Threaded Plates And Four Spacer Clips
Courtesy of VOLVO CARS CORPORATION

- Take the roof member, four plastic threaded plates and four spacer clips from the kit.
- Install the threaded plates as illustrated.
- Install the spacer clips from the other side, so that they are properly secured to the threaded plates.
- Take a 140x70 mm piece of tape from the kit. Cut into four 35x70 mm pieces.
- Tape the threaded plates in position as illustrated.

Fig. 806: Identifying Narrow Bracket Clamp And Nuts
Courtesy of VOLVO CARS CORPORATION

- Take the narrow bracket clamp and two nuts from the kit. Install the bracket clamp (1) on the angled side of the bracket and install the nuts.
- Slide the narrow bracket clamp so that it is as far out as possible in the slit holes. Rest the clamp on the angled surface. Tighten the nuts by hand.

Fig. 807: View Of Bracket Clamp And Roof Member
Courtesy of VOLVO CARS CORPORATION

HINT: Use suitable blocks or similar to make space between roof and headlining.

- Take the wide bracket clamp from the kit and insert the smaller angles edge into the headlining's hole, on the rear side of the roof member. Work the bracket clamp (1) into place, so that it rests above the roof member's (2) and headlining's edges with the screws downwards.

NOTE: The less folded edge must be positioned above the edge of the roof member.

Fig. 808: Identifying Bracket Into Cut Out Hole With Narrow Bracket Clamp
Courtesy of VOLVO CARS CORPORATION

- Insert the bracket in the cut-out hole with the narrow bracket clamp pointing forwards.
- Unscrew the nuts holding the narrow bracket clamp. Slide the clamp over the edge of the roof member so that it hooks into place. Tighten the nuts so that the bracket remains attached.

- Lift up the rear end of the bracket. Align the screws for the suspended wide bracket clamp in the holes in the bracket. Screw in two nuts from the kit. Finger tighten.
- Check that both clamps on the bracket are correctly positioned around the roof member.
- Adjust the position of the bracket so that its hole is aligned with the hole in the roof member (1).

Fig. 809: Identifying Bracket Mount Screws
Courtesy of VOLVO CARS CORPORATION

- Tighten the four nuts (1) for the bracket clamps so that the bracket is securely mounted. Work the bracket and further tighten if there is any play.

Fig. 810: Identifying DVD Unit Routed Connector
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position I.
- Take the DVD unit from the kit and connect the routed connector.

CAUTION: Handle the DVD unit with care and do not subject it to knocks.

Fig. 811: Identifying DVD Unit Switch (1)
Courtesy of VOLVO CARS CORPORATION

- Hold the unit so that the display can be folded out without hindrance.
- Fold out the display by pressing the switch (1).
- Cut the current by disconnecting the connector from the unit.
- Turn the ignition key to position 0.

Fig. 812: Identifying DVD Unit Screws
Courtesy of VOLVO CARS CORPORATION

- Take four **PF4x25** screws from the kit.

  Connect the connector to the DVD unit. Lift the unit towards the roof and at the same time push in the cable excess. Position the unit towards the middle of the bracket, guide the cut-out in the unit to the spacers of the threaded plates. Install the unit using the screws.

Fig. 813: View Of Cable Harness Using Two Cable Ties In The Existing Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Secure the cable harness using two cable ties in the existing cable harness.

Fig. 814: View Of Three Cable Ties Along The D-Post Panel
Courtesy of VOLVO CARS CORPORATION

- Secure the cable harness using three cable ties along the D-post panel.

APPLIES TO ALL MODELS

Fig. 815: Installing Decals
Courtesy of VOLVO CARS CORPORATION

- Take the decal from the kit. Clean the area (1) where the decal is to be positioned using isopropanol.
- Pull off the protective paper from the adhesive side of the label and attach the label as illustrated. Press the label securely into place.

Reinstall:

- Panels in the cargo compartment.
- the headlining panel in the cargo compartment
- floor hatches in the cargo compartment.

Vacuum clean and clean away roof material and other waste from the car.

Set the DVD player's regional code

- Information can be found in VIDA under:
  Product specifications
  39 Media, communication and navigation
  393 Equipment for entertainment (radio/TV/VCR)
  Roof mounted system for rear seat entertainment
  Design

Functionality check

- Follow the instructions in the manual to check the system.

ACCESSORIES AND BODY, CAB

Media, Communication And Navigation - Removal, Replacement And Installation

COMMUNICATION RADIO, CARPHONE (2003-2005)

ANTENNA CARPHONE, REPLACING

REMOVAL AND INSTALLATION

PREPARATORY WORK

The illustrations in this service information are used for different model years and / or models. Some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE CARPHONE ANTENNA

Fig. 1: Identifying Ignition In OFF Position
Courtesy of VOLVO CARS CORPORATION

Ignition off.

Fig. 2: Aligning Interior Lighting On Gear Selector Module Antenna Locating Pins
Courtesy of VOLVO CARS CORPORATION

- Remove the right-hand A-post panel. See **PANEL A-POST, REPLACING**
- Remove the interior lighting. See **INTERIOR LIGHTING, REPLACING**
- Remove the right-hand sun visor and both snap fasteners. See **SUN VISOR, REPLACING** .

REMOVING THE CARPHONE ANTENNA

Fig. 3: Locating Antenna At Right Hand A-Post
Courtesy of VOLVO CARS CORPORATION

Carefully pry the headlining downwards at the front.

Remove the antenna from the mountings.

Expose the antenna cable and disconnect the connector positioned down by the right-hand A-post.

Remove the plastic cover.

INSTALLING THE CARPHONE ANTENNA

Install:

- the plastic cover
- the connector and antenna cable. Tape the antenna cable under the headlining
- the antenna
- the roof module. See **INTERIOR LIGHTING, REPLACING**
- the front edge of the headlining
- the sun visor and the snap fasteners. See **SUN VISOR, REPLACING**
- the right-hand A-post panel. See **PANEL A-POST, REPLACING** .

Test the function.

HANDSET, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

REPLACING

PREPARATORY WORK

Fig. 4: Identifying Ignition In OFF Position
Courtesy of VOLVO CARS CORPORATION

Ignition off.

Fig. 5: Removing Storage Compartment
Courtesy of VOLVO CARS CORPORATION

Remove the storage compartment. Release the catches using the handle at the lower edge and pull backwards as illustrated.

Fig. 6: Identifying Cover Removal
Courtesy of VOLVO CARS CORPORATION

Remove the carpet as illustrated.

REMOVING THE HANDSET

Fig. 7: Removing The Handset
Courtesy of VOLVO CARS CORPORATION

Disconnect the connector (1).

Disconnect the carphone cable from the load-removing grommet (2).

Release the carphone cable.

Remove the handset.

REMOVING THE CARPHONE HANDSET WALL

Remove screw (3).

Push the catch (4) to one side.

Remove the wall.

INSTALLING THE CARPHONE HANDSET WALL

Install the wall.

Install screw (3).

INSTALLING THE HANDSET

Fig. 8: Installing Carphone Cable
Courtesy of VOLVO CARS CORPORATION

Route the carphone cable.

Install the carphone cable in the load-removing grommet (2).

Connect the connector (1).

FINISHING WORK

Install the carpet.

Install the storage locker.

Test the function.

MICROPHONE, REPLACING

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE MICROPHONE, REAR VIEW MIRROR

Remove:

- both the sun visors. See **SUN VISOR, REPLACING**
- the roof module
- the connector (2) on top of the headlining.

Fig. 9: Identifying Rear View Mirror Microphone Cover
Courtesy of VOLVO CARS CORPORATION

Remove:

- the cover on the reverse of the mirror
- the spring.

Pull out the microphone.

INSTALLING THE MICROPHONE, REAR VIEW MIRROR

Install:

- the microphone

- the spring
- the cover
- the connector (2)
- the microphone cable.

Fig. 10: Locating Microphone Areas Of Risk
Courtesy of VOLVO CARS CORPORATION

NOTE: **Ensure that the microphone cable is not trapped. The risk areas (1) are marked on the illustration.**

NOTE: **Tape the microphone cable securely.**

- the roof module
- the sun visors.

PHONE MODULE (PHM), REPLACING

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATORY WORK

Fig. 11: Identifying Ignition In OFF Position
Courtesy of VOLVO CARS CORPORATION

Ignition off.

Remove the bracket for the dashboard environment panel/infotainment panel. See **MINIDISC / CD CONTROL MODULE, REPLACING**.

REMOVAL

Fig. 12: Identifying Phone Module
Courtesy of VOLVO CARS CORPORATION

Remove the 2 screws.

Disconnect the connectors.

Remove the phone module (PHM) and the bracket.

INSTALLATION

NOTE: **Vehicles that are built before chassis number 167156 require an adapter cable harness between the vehicle's connector and antenna for the new phone module (PHM).**

Fig. 13: Identifying Maximum Bend Radius Of Optic Cable
Courtesy of VOLVO CARS CORPORATION

NOTE: **Check that there is no dirt in the optical connectors.**

Connect the connectors

NOTE: **The bend radius of the optic cables and the antenna cables must not be less than 25 mm.**

Install the phone module (PHM) and the bracket.

Install and tighten the screws.

Fig. 14: Cutting Rounded Corner On Module For Installation
Courtesy of VOLVO CARS CORPORATION

HINT: To facilitate installation of the control module, the rounded corner can be cut even with the corner of the control module. See illustration.

FINISHING WORK

Install the bracket for the dashboard environment panel/infotainment panel. See **MINIDISC / CD CONTROL MODULE, REPLACING**.

NOTE: After replacing the phone module (PHM), new software must be ordered and the module programmed.

ORDERING SOFTWARE

Order the software. See 9438270 .

PROGRAMMING CONTROL MODULE

Program the new control module. See 9438270 .

CHECKING THE FUNCTION

Carry out a function test.

COMMUNICATION RADIO, MOBILE TELEPHONE (2006-2012)

ANTENNA CARPHONE, REPLACING

see **ANTENNA CARPHONE, REPLACING**

BATTERY VOLVO ON CALL (2011-2012)

REMOVAL

Fig. 15: Removing Backup Battery Casing
Courtesy of VOLVO CARS CORPORATION

Remove car phone module acc. to:**PHONE MODULE (PHM)**

NOTE: **Make sure that the backup battery capacity calculator is reset after installing a new backup battery.**

Fig. 16: Backup Battery Capacity Calculator
Courtesy of VOLVO CARS CORPORATION

INSTALLING

To install, reverse the removal procedure.

RESETTING

Reset according to: VIDA (Volvo scan tool) or equivilant.

BLUETOOTH CONTROL MODULE (2010)

To install, reverse the removal procedure.

PHONE MODULE (PHM), REPLACING (2006-2010)

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATORY WORK

REMOVING THE DASHBOARD ENVIRONMENT PANEL

Fig. 53: Identifying Ignition Off Position
Courtesy of VOLVO CARS CORPORATION

Ignition off.

Remove the bracket for the dashboard environment panel / infotainment panel. See: **MINIDISC / CD CONTROL MODULE, REPLACING**.

REMOVAL

REMOVING THE PHONE MODULE (PHM)

Fig. 54: Removing The Phone Module (PHM)
Courtesy of VOLVO CARS CORPORATION

Remove the 2 screws.

Disconnect the connectors.

Remove the phone module (PHM) and the bracket.

INSTALLATION

INSTALLING THE PHONE MODULE (PHM)

Fig. 55: Installing The Phone Module (PHM)
Courtesy of VOLVO CARS CORPORATION

NOTE: Check that there is no dirt in the optical connectors.

Connect the connectors.

NOTE: The bend radius of the optic cables and antenna cables must not be less than 25 mm.

Install:

- the phone module (PHM) and the bracket
- the 2 screws. Tighten.

Fig. 56: Cutting Rounded Corner Of Control Module For Installation
Courtesy of VOLVO CARS CORPORATION

HINT: To facilitate installation of the control module, the rounded corner can be cut even with the corner of the control module. See illustration.

FINISHING

INSTALLING THE DASHBOARD ENVIRONMENT PANEL

Install the bracket for the dashboard environment panel / infotainment panel. See: **MINIDISC / CD CONTROL MODULE, REPLACING**.

ORDERING SOFTWARE

NOTE: After replacing the phone module (PHM), new software must be ordered and the module programmed.

Order software. See: 9438270

VOLVO ON CALL

- Activate according to: **VOLVO ON CALL, ACTIVATION** .
- Reactivate according to: **VOLVO ON CALL, RE-ACTIVATION** .
- Deactivate according to: **VOLVO ON CALL, DEACTIVATION (CANCELING)** .

FUNCTION TEST

Perform function test.

SWITCH VOLVO ON CALL, REPLACING (2006-2010)

NOTE: The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATORY WORK

REMOVING THE VENTILATION VENT

Fig. 71: Identifying Ignition Off Position
Courtesy of VOLVO CARS CORPORATION

Ignition off.

Remove the ventilation vent. See: **VENTILATION VENTS PASSENGER COMPARTMENT, REPLACING** .

REMOVAL

REMOVING THE SWITCH

Fig. 72: Removing The Switch
Courtesy of VOLVO CARS CORPORATION

Remove the switch by prying the edges out at the catches using a electrician's screwdriver and pressing outwards.

INSTALLATION

INSTALLING THE SWITCH

Install:

- the switch
- the ventilation vent. See: **VENTILATION VENTS PASSENGER COMPARTMENT, REPLACING** .

ENTERTAINMENT EQUIPMENT (2003)

INFOTAINMENT CONTROL MODULE (ICM), REPLACING

see **INFOTAINMENT CONTROL MODULE (ICM), REPLACING**

ENTERTAINMENT EQUIPMENT (2004-2005)

CONTROL MODULE REAR SOUND SEPARATION, REPLACING

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVAL

REMOVING THE CONTROL MODULE

Fig. 73: Removing The Control Module
Courtesy of VOLVO CARS CORPORATION

Remove:

- the center console. See: **CENTER CONSOLE, REPLACING**
- the 4 screws (1)
- the 2 connectors (2)
- the control module.

INSTALLATION

INSTALLING THE CONTROL MODULE

Install:

- the control module
- the 4 screws
- the 2 connectors
- the center console. See: **CENTER CONSOLE, REPLACING** .

COOL BOX/ARMREST COMPONENTS, REPLACING

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATORY WORK

COOL BOX AND ARMREST VARIANTS

Cool box and armrest with DVD player. Has a new heavier duty hinge to allow for the DVD player as well as a unique cover.

Cool box and armrest without DVD player. Has a standard hinge and standard cover with an additional seal.

Ignition off.

REMOVING THE COOL BOX AND ARMREST

Fig. 74: Removing The Cool Box And Armrest
Courtesy of VOLVO CARS CORPORATION

NOTE: **Note the position of the connectors. Disconnect the connectors.**

Remove the 2 screws (1). Press in the catches on both sides (may be stiff). Pull the armrest backwards (2).

INSTALLING THE COOL BOX AND ARMREST

Install:

- the connectors
- slide the armrest in. Press the armrest into place
- the 2 screws. Tighten.

OUTER COVER

REMOVING THE OUTER COVER

Fig. 75: Removing The Outer Cover
Courtesy of VOLVO CARS CORPORATION

Open the cover fully.

Remove:

- the 4 screws
- the cover.

INSTALLING THE OUTER COVER

Install:

- the cover
- the 4 screws. Tighten.

COVER OVER THE OPENING HANDLE

REMOVING THE COVER OVER THE OPENING HANDLE

Fig. 76: Removing The Cover Over The Opening Handle
Courtesy of VOLVO CARS CORPORATION

Remove the outer cover. See: **CENTER CONSOLE, REPLACING** . Press the hinge shaft out towards the side (1). Release the handle.

INSTALLING THE COVER OVER THE OPENING HANDLE

Install the handle. Press the hinge shaft into place. Install the outer cover. See: **CENTER CONSOLE, REPLACING** .

ADAPTER PLATE

REMOVING THE ADAPTER PLATE

Fig. 77: Removing The Adapter Plate
Courtesy of VOLVO CARS CORPORATION

Remove:

- the outer cover. See: **CENTER CONSOLE, REPLACING**
- The DVD player. See: **DVD PLAYER, REPLACING**
- the opening handle. See: **COVER OVER THE OPENING HANDLE**
- the upper cover for the hinge. Lift the adapter plate to the upper position.

Fig. 78: Removing Inner Cover
Courtesy of VOLVO CARS CORPORATION

Remove:

- the 2 screws (1)
- the screw for the inner cover (2).

Fig. 79: Position Of Grooves
Courtesy of VOLVO CARS CORPORATION

NOTE: **Note the position for the grooves in the sides of the hinges facing the rotation shaft.**

Pull the sides off the hinges.

Fig. 80: Releasing Lower Cover For Hinge
Courtesy of VOLVO CARS CORPORATION

Release the lover cover for the hinge. Cut off the tie strap for the cable harness. Slide out the cable harness (1).

INSTALLING THE ADAPTER PLATE

Install:

- thread the cable harness into place
- the 2 tie straps for the cable harness
- the lower cover for the hinge

NOTE: Position of the hinge sides in relation to the rotation shaft.

- the sides of the hinges
- the screw for the inner cover
- the 2 screws for the hinge mounting
- the upper cover for the hinge. See: **COVER OVER THE OPENING HANDLE**
- The DVD player. See: **DVD PLAYER, REPLACING**
- the outer cover. See: **CENTER CONSOLE, REPLACING** .

DVD PLAYER, REPLACING

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVAL

REMOVING THE DVD PLAYER

Remove the cover from the armrest. See:**COOL BOX/ARMREST COMPONENTS, REPLACING**.

Fig. 81: DVD Player Connectors
Courtesy of VOLVO CARS CORPORATION

Disconnect the two connectors from the reverse of the DVD player.

Remove:

- the 4 screws
- The DVD player.

INSTALLATION

INSTALLING THE DVD PLAYER

Fig. 82: DVD Player Screws
Courtesy of VOLVO CARS CORPORATION

Install the DVD player on the inner cover on the armrest.

Install the 4 mounting screws for the DVD player.

Fig. 83: DVD Player Connectors
Courtesy of VOLVO CARS CORPORATION

Connect the two connectors on the reverse of the DVD player.

Install the cover on the armrest. See:**COOL BOX/ARMREST COMPONENTS, REPLACING**.

HEAD RESTRAINT WITH TV SCREEN, REPLACING

REMOVING HEAD RESTRAINTS

Fig. 84: Removing Head Restraints
Courtesy of VOLVO CARS CORPORATION

Press in the two catches. Press through the upholstery.

Lift up the head restraint approximately 3 cm.

Pull the connector out of the padding. Disconnect the connector.

Pull up the entire head restraint.

INSTALLING HEAD RESTRAINTS

Position the head restraint in the guide sleeves. Connect the connector and press it into place in the head restraint padding.

Press down the head restraint until the catches engage.

NOTE: **Lift the head restraint to check that the catches have engaged. It must not be possible to move the head restraint upwards.**

INFOTAINMENT CONTROL MODULE (ICM), REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATORY WORK

HINT: To determine whether the vehicle has a numeric display or a matrix display, shine a torch onto the display. The illustrations show which type it is.

NUMERIC DISPLAY

Fig. 85: Numeric Display
Courtesy of VOLVO CARS CORPORATION

MATRIX DISPLAY

Fig. 86: Matrix Display
Courtesy of VOLVO CARS CORPORATION

Fig. 87: Detaching Panel At Gear Selector Lever
Courtesy of VOLVO CARS CORPORATION

Move the gear selector to its rearmost position.

Detach the panel at the gear selector lever as illustrated and move it to one side.

Fig. 88: Identifying Bracket Lower Screws & Infotainment Control Module (ICM)
Courtesy of VOLVO CARS CORPORATION

CAUTION: Angle the infotainment / dashboard environment panel to one side. Do not disconnect the connectors.

Remove the screws from the bracket.

Angle out the infotainment / dashboard environment panel as illustrated.

Fig. 89: Identifying Ignition In OFF Position
Courtesy of VOLVO CARS CORPORATION

Move the gear selector lever to position P.

Ignition off.

Disconnect the connectors.

Fig. 90: Identifying Infotainment Module Connectors And Screws
Courtesy of VOLVO CARS CORPORATION

Remove the infotainment unit screws.

Release the clips and remove the infotainment unit from the bracket.

REMOVING THE INFOTAINMENT CONTROL MODULE (ICM) / DISPLAY, FRONT PANEL AND ELECTRICAL SWITCH MODULES

Fig. 91: Removing The Infotainment Control Module (ICM) / Display, Front Panel And Electrical Switch Modules
Courtesy of VOLVO CARS CORPORATION

Remove:

- The front panel, clips.

NOTE: **Check that both the fibre optic cables are secured in the panel by the CD tray.**

- The screws for the left and right-hand electrical switch modules.

Disconnect the connectors.

Remove:

- The electrical switch modules
- The screws for the display.

Disconnect the connectors.

INSTALLING THE INFOTAINMENT CONTROL MODULE (ICM) / DISPLAY, FRONT PANEL AND

ELECTRICAL SWITCH MODULES

Fig. 92: Panel Connectors
Courtesy of VOLVO CARS CORPORATION

Reconnect connectors.

Position the modules, starting with the display.

NOTE: Check that the cable harnesses are not trapped.

Install and tighten the screws.

NOTE: Check that both the fibre optics are secured in the panel. See the illustration.

Press the panel into place.

FINISHING WORK

Fig. 93: Identifying Maximum Bend Radius Of Optic Cable
Courtesy of VOLVO CARS CORPORATION

Press the infotainment unit into place on the bracket.

Install and tighten the screws.

Reconnect connectors.

NOTE: **The connectors for the MiniDisc and CD control modules are identical and can be switched.**

NOTE: **Check that there is no dirt in the optical connectors.**

NOTE: **The bend radius of the optic cables must not be less than 25mm.**

Fig. 94: Identifying Bracket Lower Screws & Infotainment Control Module (ICM)
Courtesy of VOLVO CARS CORPORATION

Angle in the infotainment / dashboard environment panel and bracket.

HINT: Align the upper section, press upwards, angle in the lower section.

Install the screws in the lower section of the bracket and tighten.

Install the panel at the gear selector lever.

NOTE: After replacing the infotainment control module (ICM) / display, new software must be ordered and programmed.

ORDERING SOFTWARE

Order the software. See 8691181 .

INFRARED TRANSMITTER HEAD RESTRAINT, REPLACING

NOTE: The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

REMOVAL

REMOVING THE INFRA RED TRANSMITTER

Fig. 95: Removing The Infra Red Transmitter
Courtesy of VOLVO CARS CORPORATION

Remove:

- the head restraint. See: **HEAD RESTRAINT FRONT SEAT BENCH TYPE** (2009-2012), **HEAD RESTRAINT FRONT SEAT (TYPE 1)**, **HEAD RESTRAINT FRONT SEAT (TYPE 2)** or **HEAD RESTRAINT FRONT SEAT (TYPE 3)**.
- the screw
- the infra red transmitter.

INSTALLATION

INSTALLING THE INFRA RED TRANSMITTER

Install:

- the infra red transmitter
- the screw

- the head restraint. See: **HEAD RESTRAINT FRONT SEAT BENCH TYPE** (2009-2012), **HEAD RESTRAINT FRONT SEAT (TYPE 1)**, **HEAD RESTRAINT FRONT SEAT (TYPE 2)** or **HEAD RESTRAINT FRONT SEAT (TYPE 3)**.

Remove:

- the rear cover
- the bolts, x6
- the top of the tunnel compartment.

Fig. 120: Removing Screws And Radio/AC Unit From Center Console
Courtesy of VOLVO CARS CORPORATION

CAUTION: Angle the infotainment / dashboard environment panel to one side. Do not disconnect the connectors.

Remove the screws from the bracket.

Angle out the infotainment / dashboard environment panel as illustrated.

Fig. 121: Identifying Ignition Off Position
Courtesy of VOLVO CARS CORPORATION

Place the gear selector in position P.

Ignition off

Disconnect the connectors.

Fig. 122: Removing Infotainment Unit
Courtesy of VOLVO CARS CORPORATION

Remove the infotainment unit screws.

Release the clips and remove the infotainment unit from the bracket.

REMOVING THE CONTROL MODULE

Fig. 123: Removing The Control Module
Courtesy of VOLVO CARS CORPORATION

Remove the screws.

Remove the control module.

INSTALLING THE CONTROL MODULE

NOTE: For tightening torques, see TIGHTENING TORQUE .

Fig. 124: Installing Control Module
Courtesy of VOLVO CARS CORPORATION

Install the control module.

Install the screws.

FINISHING WORK

Fig. 125: Fiber Optic Cable Movement Threshold
Courtesy of VOLVO CARS CORPORATION

Press the infotainment unit into place on the bracket.

Install the screws. Tighten.

Connect the connectors.

NOTE: **The control module connectors are identical and can be shifted. Make sure that there is no dirt in the optic contacts. The optic cables must not have a bend radius below 25 mm.**

Angle in the infotainment / dashboard environment panel and bracket.

HINT: Align the upper section and press it upwards so that the lower section can be worked in.

Install:

- 2 screws in the lower edge of the bracket
- the top of the tunnel compartment
- the bolts, x6
- the rear cover
- the panel at the gear selector lever.

ORDERING SOFTWARE

Order software for the control module. See: 30775887 .

CONTROL MODULE REAR SOUND SEPARATION, REPLACING

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVAL

REMOVING CENTER TUNNEL CONSOLE

Remove the rear center console acc. to: **CENTER CONSOLE, REPLACING** .

REMOVING REAR SOUND SEPARATION MODULE, VEHICLES WITHOUT COOLER

Fig. 126: Identifying Rear Sound Separation Module Screws And Connector (W/O Cooler)
Courtesy of VOLVO CARS CORPORATION

Remove:

- the 4 screws
- the connector, x1
- the control module.

REMOVING REAR SOUND SEPARATION MODULE, VEHICLES WITH COOLER

Fig. 127: Identifying Rear Sound Separation Module Screws And Connector (w/ Cooler)
Courtesy of VOLVO CARS CORPORATION

Remove:

- the 4 screws
- the connector, x1
- the control module.

INSTALLING REAR SOUND SEPARATION MODULE

Install:

- the control module
- the 4 screws
- the connector
- the center console. See: **CENTER CONSOLE, REPLACING** .

COOL BOX/ARMREST COMPONENTS, REPLACING

SCREEN/CIRCUIT BOARD, REPLACING

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVAL

REMOVING SCREEN/CIRCUIT BOARD

Fig. 128: Identifying Screen Removal
Courtesy of VOLVO CARS CORPORATION

Remove the screen's frame.

HINT: Begin on the side of the frame, for easier removal

Fig. 129: Identifying Screen Connector
Courtesy of VOLVO CARS CORPORATION

CAUTION: Prevent the risk of static electricity by touching a grounded object.

Carefully lift up the screen from the head restraint.

Remove the connector.

Fig. 130: Identifying Circuit Board Screws
Courtesy of VOLVO CARS CORPORATION

Remove the 2 screws.

Carefully lift up the circuit board.

Fig. 131: Identifying Circuit Board Connector
Courtesy of VOLVO CARS CORPORATION

INSTALLATION

Fig. 132: Identifying Foam Tape
Courtesy of VOLVO CARS CORPORATION

NOTE: **Check that there are two 6 mm x 50 mm (0.25 in x 2 in) pieces of foam tape as illustrated.**

INSTALLING CIRCUIT BOARD

Install:

- the connector
- the circuit board
- the bolts, x2

INSTALLING THE SCREEN

NOTE: **Always use a new frame when installing the screen.**

Install:

- the connector
- the screen
- the frame for the screen

UNIVERSAL BUS MODULE (USB)

Materials:	
Designation	**Part number**
Foam tape	3539834

REMOVAL

NOTE: **Removal steps in this procedure may contain installation details.**

Order software for the control module. See: 30732975 .

MOBILE COMPUTER SERVICES (2003-2006)

DISPLAY SCREEN / LOUDSPEAKER, RTI (ROAD TRAFFIC INFORMATION), REPLACING

REMOVAL AND INSTALLATION

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATORY WORK

Fig. 137: Identifying Ignition In OFF Position
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Remove the grille. Insert a weatherstrip tool through the center hole and pry loose. Use the reverse of the display screen as a lever.

REMOVING THE DISPLAY SCREEN / LOUDSPEAKER AND BRACKET

Fig. 138: Removing The Display Screen / Loudspeaker And Bracket
Courtesy of VOLVO CARS CORPORATION

Remove:

- the screws (2). Disconnect the connectors (1)
- the display screen and loudspeaker and bracket.

REMOVING THE DISPLAY

Fig. 139: Removing The Display
Courtesy of VOLVO CARS CORPORATION

Remove:

- the screws (3)
- the display screen (2) from the bracket (1).

REMOVING THE LOUDSPEAKER

Fig. 140: Identifying Loudspeaker, Screws & Connector
Courtesy of VOLVO CARS CORPORATION

Remove:

- the screws
- the loudspeaker from the bracket.

INSTALLING THE DISPLAY SCREEN / LOUDSPEAKER AND BRACKET

Fig. 141: Installing The Display Screen / Loudspeaker And Bracket
Courtesy of VOLVO CARS CORPORATION

Install:

- the display screen and loudspeaker in the bracket
- the screws. Connect the connectors (1)
- the display screen and/or loudspeakers and bracket in the dashboard
- the screws (2) and tighten
- the grille.

Test the function.

MULTIMEDIA MODULE (MMM), REPLACING

REMOVAL

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATORY WORK

The multimedia module (MMM) is under the left-hand front seat.

Fig. 142: Identifying Ignition In OFF Position
Courtesy of VOLVO CARS CORPORATION

Move the left-hand front seat to its rearmost position.

If there is one, remove the DVD from the DVD reader.

Ignition off.

REMOVING THE MULTIMEDIA MODULE (MMM)

Fig. 143: Removing The Multimedia Module (MMM)
Courtesy of VOLVO CARS CORPORATION

- Remove the screws
- Disconnect the connectors
- Remove the multimedia module (MMM).

INSTALLATION

INSTALLING THE MULTIMEDIA MODULE (MMM)

Fig. 144: Identifying Maximum Bend Radius Of Optic Cable
Courtesy of VOLVO CARS CORPORATION

- Connect the connectors.

NOTE: **Check that there is no dirt in the optic connectors. The bend radius of the optic cables must not be less than 25 mm .**

- Connect the connectors.
- Install the multimedia module (MMM) in the bracket
- Install the screws. Tighten.

ORDERING SOFTWARE

NOTE: **After replacing the multimedia module (MMM), new software must be ordered and programmed.**

Order the software. See 8696091 .

FINISHING WORK

Insert a DVD in the DVD reader.

Return the seat to its original position.

Test the function.

SWITCHES RTI (ROAD TRAFFIC INFORMATION), REPLACING

REMOVAL

Fig. 145: Identifying Removal Of Road Traffic Information Switches
Courtesy of VOLVO CARS CORPORATION

- Remove the steering wheel module
- Remove the keypad
- Remove the two screws from the mounting bracket
- Press the keypad out of the steering wheel cover.

INSTALLATION

Install in reverse order.

MOBILE COMPUTER SERVICES (2007-2012)

DISPLAY SCREEN / LOUDSPEAKER, RTI (ROAD TRAFFIC INFORMATION), REPLACING

see **DISPLAY SCREEN / LOUDSPEAKER, RTI (ROAD TRAFFIC INFORMATION), REPLACING**

GLOBAL POSITIONING SYSTEM MODULE (GPS)

NOTE: Removal steps in this procedure may contain installation details.

For vehicles with Volvo on Call but without MMM+

Fig. 146: GPS Module Location
Courtesy of VOLVO CARS CORPORATION

NOTE: Make sure that the component terminals are not bent or damaged.

NOTE: Make sure that the fiber optic cables are not bent to a radius of less than 25 mm.

Tighten, M6. See **TIGHTENING TORQUE**

ANTENNA WITH ANTENNA MOUNTING (ATM), REPLACING

REMOVAL

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATORY WORK

Fig. 148: Disconnecting Battery Negative Cable
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the battery negative lead. See: **BATTERY, DISCONNECTING**
- Remove the cantrail. See **PANEL CANTRAIL, REPLACING** . Remove the D-panels. See **PANEL D-POST, REPLACING** .

REMOVING THE ANTENNA HOLDER

Fig. 149: Removing The Antenna Holder
Courtesy of VOLVO CARS CORPORATION

- Disconnect the connectors at the AM/FM receiver
- Disconnect the wiring secured with clips in the antenna mounting
- Remove the screws.

NOTE: The ground lead on the center screw (applies to 7 seater versions).

- Carefully lift the antenna carrier back. Remove the antenna carrier
- Remove, see **RECEIVER AM/FM (ATM), REPLACING** and **RECEIVER GPS, TMC (ATM), REPLACE**.

INSTALLATION

INSTALLING THE ANTENNA CARRIER

Install:

- the receiver. See **RECEIVER AM/FM (ATM), REPLACING** and **RECEIVER GPS, TMC (ATM), REPLACE**
- the antenna holder

NOTE: **Check that the U clip at the front edge of the antenna mounting is secured in the mountings in the roof.**

- the screws. Tighten.

NOTE: **The ground lead on the center screw (applies to 7 seater versions).**

NOTE: **Check that there is no dirt in the optical connectors.**

Connect the connectors.

Fig. 150: Identifying Maximum Bend Radius Of Optic Cable
Courtesy of VOLVO CARS CORPORATION

NOTE: **The bend radius of the optic cables must not be less than 25 mm . Connect the connectors.**

FINISHING WORK

Install:

- see **PANEL D-POST, REPLACING** and the cantrail. See **PANEL CANTRAIL, REPLACING**

- the battery negative lead. See: **BATTERY, DISCONNECTING** .

Test the function.

AUDIO MODULE (AUD), REPLACING

MINIDISC / CD CONTROL MODULE, REPLACING

REMOVAL AND INSTALLATION

NOTE: As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATORY WORK

Fig. 151: Positioning Shift Knob
Courtesy of VOLVO CARS CORPORATION

Move the gear selector to its rearmost position.

Detach the panel at the gear selector lever as illustrated and move it to one side.

Fig. 152: Removing Gear Selector Cover
Courtesy of VOLVO CARS CORPORATION

Remove:

- the rear cover
- the 6 screws
- the top of the tunnel compartment.

Fig. 153: Identifying Bracket Lower Screws & Infotainment Control Module (ICM)
Courtesy of VOLVO CARS CORPORATION

CAUTION: Angle the infotainment / dashboard environment panel to one side. Do not disconnect the connectors.

Remove the screws from the bracket.

Angle out the infotainment / dashboard environment panel as illustrated.

Fig. 154: Identifying Ignition In OFF Position
Courtesy of VOLVO CARS CORPORATION

Move the gear selector lever to position P.

Ignition off.

Disconnect the connectors.

Fig. 155: Identifying Infotainment Module Connectors And Screws
Courtesy of VOLVO CARS CORPORATION

Remove the infotainment unit screws.

Release the clips and remove the infotainment unit from the bracket.

REMOVING THE MINIDISC / CD CONTROL MODULE

Fig. 156: Identifying Infotainment Control Module Removal
Courtesy of VOLVO CARS CORPORATION

CAUTION: If both a MiniDisc and CD control module is installed. Always remove the MiniDisc control module first.

Remove the screws.

Remove the MiniDisc and/or CD control module.

INSTALLING THE MINIDISC / CD CONTROL MODULE

NOTE: For tightening torques, see: TIGHTENING TORQUE .

Fig. 157: Installing The Minidisc / CD Control Module
Courtesy of VOLVO CARS CORPORATION

CAUTION: If installing both a MiniDisc and CD control module. Always install the CD unit first.

Install the MiniDisc / CD control module.

Install the screws.

FINISHING WORK

Fig. 158: Identifying Maximum Bend Radius Of Optic Cable
Courtesy of VOLVO CARS CORPORATION

Press the infotainment unit into place on the bracket.

Install the screws. Tighten.

Connect the connectors.

NOTE: **The connectors for the MiniDisc / CD control module are identical and can be switched.**

Check that there is no dirt in the optical connectors.

The bend radius of the optic cables must not be less than 25 mm .

Angle in the infotainment / dashboard environment panel and bracket.

HINT: Align the upper section and press it upwards so that the lower section can be worked in.

Install:

- 2 screws in the lower edge of the bracket

- the top of the tunnel compartment
- the 6 screws
- the rear cover
- the panel at the gear selector lever.

ORDERING SOFTWARE

Order software for the MiniDisc control module. See 8691146 .

Order software for the CD control module. See 8691147 .

RECEIVER AM/FM (ATM), REPLACING

REMOVAL

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

LOCATION

Fig. 159: AM/FM Receiver Location
Courtesy of VOLVO CARS CORPORATION

1. Receiver AM/FM (ATM)
2. Receiver TMC, see also, see **RECEIVER GPS, TMC (ATM), REPLACE**.
3. Receiver GPS, see also, see **RECEIVER GPS, TMC (ATM), REPLACE**.

PREPARATORY WORK

Fig. 160: Removing Aerial Mounting
Courtesy of VOLVO CARS CORPORATION

Remove the aerial mounting and the aerial. See **ANTENNA WITH ANTENNA MOUNTING (ATM), REPLACING**.

REMOVING THE AM/FM RECEIVER

Fig. 161: Removing The AM/FM Receiver
Courtesy of VOLVO CARS CORPORATION

CAUTION: The connector for the antenna cover is fragile. Be careful when removing/installing.

Remove:

- the connectors
- the screws
- the AM/FM receiver
- the GPS receiver if applicable. See **RECEIVER GPS, TMC (ATM), REPLACE** and TMC, see **RECEIVER GPS, TMC (ATM), REPLACE**.

INSTALLATION

INSTALLING THE AM/FM RECEIVER

- Install the GPS receiver if applicable, see **RECEIVER GPS, TMC (ATM), REPLACE** and TMC, see **RECEIVER GPS, TMC (ATM), REPLACE**.
- Align the AM/FM receiver
- Install and tighten the screws

CAUTION: The connector for the antenna cover is fragile. Be careful when removing/installing.

- Connect the connectors.

FINISHING WORK

Install the aerial mounting and the aerial. See **ANTENNA WITH ANTENNA MOUNTING (ATM), REPLACING**.

ORDERING SOFTWARE

NOTE: After replacing the AM/FM (ATM) receiver, new software must be ordered and programmed.

Order the software. See 8691145 .

Test the function.

RECEIVER GPS, TMC (ATM), REPLACE

NOTE: As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

LOCATION

Fig. 162: AM/FM Receiver Location
Courtesy of VOLVO CARS CORPORATION

1. The AM/FM receiver, see also, see **RECEIVER AM/FM (ATM), REPLACING**
2. Receiver TMC
3. Receiver GPS.

PREPARATORY WORK

Fig. 163: Identifying Ignition In OFF Position
Courtesy of VOLVO CARS CORPORATION

Ignition off.

Remove the cantrail. See **PANEL CANTRAIL, REPLACING** .

REMOVING THE RECEIVER GPS/TMC

Fig. 164: Removing The Receiver GPS/TMC
Courtesy of VOLVO CARS CORPORATION

NOTE: The TMC receiver must always be removed before the GPS receiver. See the illustration.

- Disconnect connector
- Remove the screws
- Remove the receiver.

INSTALLING THE GPS/TMC RECEIVER

Fig. 165: Installing The GPS/TMC Receiver
Courtesy of VOLVO CARS CORPORATION

NOTE: The GPS receiver must always be installed before the TMC receiver. See the illustration.

Align the receiver.

Install the screws. Tighten.

Connect any connectors

FINISHING WORK

Install the cantrail. See **PANEL CANTRAIL, REPLACING** .

Test the function.

SUBWOOFER MODULE (SUB), REPLACING

see **SUBWOOFER MODULE (SUB), REPLACING**

RADIO EQUIPMENT (2007-2012)

ANTENNA AMPLIFIER

NOTE: Removal steps in this procedure may contain installation details.

For AM/FM 1 antenna

Remove the right side panel. See **SIDE PANEL CARGO COMPARTMENT, REPLACEMENT** .

For FM 2 antenna

Remove the left side panel. See **SIDE PANEL CARGO COMPARTMENT, REPLACEMENT** .

Fig. 166: Antenna Location
Courtesy of VOLVO CARS CORPORATION

Tighten, M6. See **TIGHTENING TORQUE**

INSTALLATION

To install, reverse the removal procedure

AUDIO MODULE (AUD), REPLACING

PREPARATORY WORK

NOTE: As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Fig. 167: Moving Right-Hand Front Seat To Its Rearmost Position
Courtesy of VOLVO CARS CORPORATION

The audio module (AUD) is under the right front seat.

Move the right-hand front seat to its rearmost position.

Ignition off.

REMOVING THE CONTROL MODULE

Fig. 168: Identifying Screws
Courtesy of VOLVO CARS CORPORATION

Remove the screws.

Disconnect the connectors.

INSTALLING THE CONTROL MODULE

Fig. 169: Identifying Maximum Bend Radius Of Optic Cable
Courtesy of VOLVO CARS CORPORATION

NOTE: Check that there is no dirt in the optic connectors.

Reconnect connectors.

NOTE: The bend radius of the optic cables must not be less than 25 mm .

Install:

- audio module (AUD)
- the screws. Tighten.

ORDERING SOFTWARE

NOTE: After replacing the audio module (AUD), new software must be ordered and programmed.

Order the software. See 8691143 .

CENTRAL LOUDSPEAKER, REPLACING

The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

CENTER LOUDSPEAKER WITHOUT DISPLAY SCREEN, REPLACING

REMOVING THE CENTER LOUDSPEAKER WHERE THERE IS NO DISPLAY SCREEN

Fig. 170: Identifying Center Loudspeaker Removal (No Display Screen)
Courtesy of VOLVO CARS CORPORATION

Remove the loudspeaker grille. Use: see **9512943** protruding between the dashboard and the loudspeaker grille (at the arrows). Turn a quarter turn and pull up.

Remove the five screws.

Lift up the loudspeaker.

Remove the connector.

INSTALLING THE CENTER LOUDSPEAKER

Install:

- the connector for the loudspeaker

- the loudspeaker
- the 5 screws. Tighten.

Press the loudspeaker grille into place.

CENTER LOUDSPEAKER WITH DISPLAY SCREEN, REPLACING

REMOVING THE CENTER LOUDSPEAKER WHERE THERE IS A DISPLAY SCREEN

Fig. 171: Identifying Center Loudspeaker Removal (With Display Screen)
Courtesy of VOLVO CARS CORPORATION

Remove:

- the loudspeaker grille. Use: see **9512943** protruding between the dashboard and the loudspeaker grille (at the arrows). Turn a quarter turn and pull up
- the five screws.

Lift up the bracket for the loudspeaker / display screen.

Fig. 172: Identifying Loudspeaker, Screws & Connector
Courtesy of VOLVO CARS CORPORATION

Remove:

- the connector for the loudspeaker
- the four screws.

Lift out the loudspeaker.

INSTALLING THE CENTER LOUDSPEAKER WHERE THERE IS A DISPLAY SCREEN

Install:

- the loudspeaker
- the 4 screws. Tighten
- the connector for the loudspeaker
- the bracket for the loudspeaker / display screen
- the 5 screws. Tighten.

Press the cover / grille into place.

EXTRA AUDIO INPUT (AUX) (2009, 2010)

REMOVAL

Remove the tunnel compartment according to: **CENTER CONSOLE, REPLACING**

Fig. 173: Extra Audio Input Removal (1 of 6)
Courtesy of VOLVO CARS CORPORATION

Remove existing (AUX) cable harness.

Fig. 174: Extra Audio Input Removal (2 of 6)
Courtesy of VOLVO CARS CORPORATION

Fig. 175: Extra Audio Input Removal (3 of 6)
Courtesy of VOLVO CARS CORPORATION

Fig. 176: Extra Audio Input Removal (4 of 6)
Courtesy of VOLVO CARS CORPORATION

Fig. 177: Extra Audio Input Removal (5 of 6)
Courtesy of VOLVO CARS CORPORATION

Fig. 178: Extra Audio Input Removal (6 of 6)
Courtesy of VOLVO CARS CORPORATION

INSTALLATION

To install, reverse the removal procedure.

LOUDSPEAKER, D-POST, REPLACING

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE LOUDSPEAKER IN THE D-POST

Fig. 179: Removing The Loudspeaker In The D-Post
Courtesy of VOLVO CARS CORPORATION

Remove:

- the cover in the D-post panel
- the connector.

Unsnap the loudspeaker.

INSTALLING THE LOUDSPEAKER IN THE D-POST

Snap the loudspeaker into the bracket.

Install:

- the connector
- the cover in the D-post panel.

LOUDSPEAKER, FRONT SIDE DOOR, REPLACING

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Included in this method are methods for:

- the loudspeaker in the front side door. See **LOUDSPEAKER, FRONT SIDE DOOR, REPLACING**
- the **upper** loudspeaker in the front side door. See **UPPER LOUDSPEAKER FRONT SIDE DOOR, REPLACING**.

LOUDSPEAKER, FRONT SIDE DOOR, REPLACING

REMOVING THE LOUDSPEAKER FROM THE FRONT SIDE DOOR

Fig. 180: Removing The Loudspeaker From The Front Side Door
Courtesy of VOLVO CARS CORPORATION

Remove:

- the panel. See **PANEL FRONT SIDE DOOR, REPLACING**
- the rivets. See **REMOVING RIVET**
- the connector
- the loudspeaker.

Fig. 181: Removing The Loudspeaker From The Front Side Door
Courtesy of VOLVO CARS CORPORATION

INSTALLING THE LOUDSPEAKER IN THE FRONT SIDE DOOR

Install:

- the loudspeaker
- the connector
- the 3 rivets
- the panel. See **PANEL FRONT SIDE DOOR, REPLACING** .

UPPER LOUDSPEAKER FRONT SIDE DOOR, REPLACING

REMOVING THE UPPER LOUDSPEAKER FROM THE FRONT SIDE DOOR

Fig. 182: Removing The Upper Loudspeaker From The Front Side Door
Courtesy of VOLVO CARS CORPORATION

Remove:

- the loudspeaker panel
- the connector.

Replace the entire unit.

INSTALLING THE UPPER LOUDSPEAKER IN THE FRONT SIDE DOOR

Fig. 183: Installing The Upper Loudspeaker In The Front Side Door
Courtesy of VOLVO CARS CORPORATION

Install:

- the connector
- the loudspeaker panel.

LOUDSPEAKER, REAR SIDE DOOR, REPLACING

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE LOUDSPEAKER FROM THE REAR SIDE DOOR

Fig. 184: Removing The Loudspeaker From The Rear Side Door
Courtesy of VOLVO CARS CORPORATION

Remove:

- the panel. See **PANEL REAR SIDE DOOR, REPLACING**
- the rivets. See **REMOVING RIVET**
- the connector
- the loudspeaker.

INSTALLING THE LOUDSPEAKER IN THE REAR SIDE DOOR

Install:

- the loudspeaker
- the connector
- the 3 rivets
- the panel. See **PANEL REAR SIDE DOOR, REPLACING** .

REMOVING RIVET

Special tools	

T9814075 SPRAY GUN
Tool number: T9814075
Tool description: SPRAY GUN
Tool boards:

Materials:	
Designation	**Part number**
Thin rustproofing agent	1161682

NOTE: If the pop rivet spins, drill at a 45° angle against the pop rivet.

Pay attention to heat generation when drilling in pop rivet mounted in plastic part.

Remove drill burrs and any remains of the rivet.

If possible, put tape on the back to catch pop rivet.

Fig. 185: Applying Thin Rustproofing Agent
Courtesy of VOLVO CARS CORPORATION

To avoid rattling if it is not possible to remove remains of rivet.

Use: Thin rustproofing agent, 1161682

see **9814075**

CAUTION: Make sure that rustproofing agent does not run out, discoloring the

upholstery or other.

SATELLITE RADIO CONTROL MODULE

NOTE: Removal steps in this procedure may contain installation details.

Remove the right side panel. See **SIDE PANEL CARGO COMPARTMENT, REPLACEMENT** .

10 Nm

INSTALLATION

To install, reverse the removal procedure.

ORDERING SOFTWARE

Order software for the control module. See: 30775465 .

SUBWOOFER MODULE (SUB), REPLACING

NOTE: As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATORY WORK

Fig. 187: Identifying Ignition In OFF Position
Courtesy of VOLVO CARS CORPORATION

Ignition off.

Remove the left-hand side panel in the cargo compartment. See **SIDE PANEL CARGO COMPARTMENT, REPLACEMENT** .

REMOVAL

Fig. 188: Removing Subwoofer Module
Courtesy of VOLVO CARS CORPORATION

Disconnect the connectors at the control module.

Remove the screws.

Remove the bass speakers / subwoofer module (SUB).

NOTE: For tightening, see TIGHTENING TORQUE .

INSTALLATION

Fig. 189: Identifying Maximum Bend Radius Of Optic Cable
Courtesy of VOLVO CARS CORPORATION

Install the bass speakers / subwoofer module (SUB).

Install and tighten the screws.

NOTE: Check that there is no dirt in the optic connectors.

NOTE: The bend radius of the optic cables must not be less than 25 mm.

Reconnect connectors.

FINISHING WORK

Install the left-hand side panel in the cargo compartment. See **SIDE PANEL CARGO COMPARTMENT, REPLACEMENT** .

NOTE: After replacing the subwoofer module (SUB), new software must be ordered and programmed.

ORDERING SOFTWARE

Order the software. See 8691144 .

INSTALLATION

To install, reverse the removal procedure.

GLOVE COMPARTMENT

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVAL

REMOVING THE GLOVE COMPARTMENT

Fig. 213: Removing Air Duct Clip
Courtesy of VOLVO CARS CORPORATION

Remove:

- the end cover. It is secured with 3 hidden clips
- the clip for the air duct.

Fig. 214: Identifying 4 Hidden Clips
Courtesy of VOLVO CARS CORPORATION

Remove the panel inside the center console. It is secured with 4 hidden clips.

HINT: Use a weatherstrip tool.

Fig. 215: Locating 5 Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- any accessories on the center console
- the 5 screws.

CAUTION: There is a risk of the center console being scratched.

HINT: Tape the edge of the center console to protect it against scratches.

Fig. 216: Pulling Glove Compartment Straight Back
Courtesy of VOLVO CARS CORPORATION

Pull the glove compartment straight back into the vehicle to release the 2 hidden clips in the top edge.

NOTE: Note the position of the electric connections.

Disconnect the 2 connectors.

Fig. 217: Locating 4 Screws
Courtesy of VOLVO CARS CORPORATION

Remove the 4 screws for the inner glove compartment.

GLOVE COMPARTMENT

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVAL

REMOVING THE GLOVE COMPARTMENT

Fig. 218: Removing Air Duct Clip
Courtesy of VOLVO CARS CORPORATION

Remove:

- the end cover. It is secured with 3 hidden clips
- the clip for the air duct.

Fig. 219: Identifying 4 Hidden Clips
Courtesy of VOLVO CARS CORPORATION

Remove the panel inside the center console. It is secured with 4 hidden clips.

HINT: Use a weatherstrip tool.

Fig. 220: Locating 5 Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- any accessories on the center console
- the 5 screws.

CAUTION: There is a risk of the center console being scratched.

HINT: Tape the edge of the center console to protect it against scratches.

Fig. 221: Pulling Glove Compartment Straight Back
Courtesy of VOLVO CARS CORPORATION

Pull the glove compartment straight back into the vehicle to release the 2 hidden clips in the top edge.

NOTE: Note the position of the electric connections.

Disconnect the 2 connectors.

Fig. 222: Locating 4 Screws
Courtesy of VOLVO CARS CORPORATION

Remove the 4 screws for the inner glove compartment.

INSTALLATION

INSTALLING GLOVE COMPARTMENT

Fig. 223: Installation of Glove Compartment
Courtesy of VOLVO CARS CORPORATION

Install:

- the 4 screws for the inner glove compartment. Tighten
- the 2 connectors
- the glove compartment. Guide the glove compartment diagonally inside the center console
- the 2 hidden clips in the top edge of the glove compartment
- the 5 screws
- the clip for the air duct
- the end cover
- the panel inside the center console.

Remove any tape from the center console.

SIGNAL DESCRIPTION, PHONE MODULE (PHM) (2005)

SIGNAL DESCRIPTION

From week 46 year 2004, a new diagnosis system was introduced for phone module (PHM) on XC90.

Vehicles built up to and incl. week 45 year 2004: **SIGNAL SPECIFICATION**

Vehicles built from and incl. week 46 year 2004: **SIGNAL SPECIFICATION**

SIGNAL DESCRIPTION, PHONE MODULE (PHM) (2006-12)

SIGNAL SPECIFICATION

All the values given below are between the terminals stated in column 1 and terminal #1 in column 2 (signal ground). This applies unless otherwise indicated in brackets.

NOTE: It is important to connect the breakout box and check the ground terminals

before taking readings.

There may be several connections and connectors between the control module and components.

U=	DC voltage in volts (V)	U_{AC} =	AC voltage in volts (V)
U_{bat} =	Battery voltage (V)	f =	Frequency in Hertz (Hz)
U_{low} =	Voltage approximately 0 V	t =	Time in seconds
PWM =	Pulse width modulated signal as a %	-	-

DESCRIPTION OF FROZEN VALUES

EXPLANATION

Not all the parameters described need to be implemented in the control module. This varies from system to system.

Frozen values are parameter values that are stored when a diagnostic trouble code (DTC) is stored.

BATTERY VOLTAGE, VALUE

Measurement range: 8-16 V.

Normal value when the generator (GEN) is charging: 13.0-14.5 V.

DISTANCE, VALUE

Measurement range: 0-1048575 km.

The value indicates the total mileage of the car at the time the diagnostic trouble code (DTC) was stored.

PASSENGER COMPARTMENT TEMPERATURE, VALUE

Measurement range: -60 to 195 °C.

OUTSIDE TEMPERATURE, VALUE

Measurement range: -128 to 127.75 °C.

ENGINE RUNNING, STATUS

The status displays whether the engine was running when the diagnostic trouble code (DTC) was stored.

No = the engine was not running

Yes = the engine was running

-3 DB SWITCH, STATUS

The status indicates whether the -3 db switch was activated or not.

on = activated

off = not activated

TIME, VALUE

The value displays the time that has passed since the diagnostic trouble code (DTC) was stored.

STATUS IDENTIFIER, DESCRIPTION

Status identifier
There are different status identifiers that can be read off for each diagnostic trouble code (DTC). The control module tests each terminal almost continuously. By reading off the diagnostic trouble code (DTC) and the associated status identifier (which detects the fault and stores the DTC), information about the test is obtained. Not all status identifiers need to be implemented in one control module. This varies from system to system. All status identifiers are reset and start counting again each time the control module is powered up and when erasing diagnostic trouble codes (DTCs). The possible status identifiers are described below.

Status identifier	**Explanation**
Upper graph	When the signal value is above or below a maximum or minimum value that is considered to be a fault by the control module, an instantaneous fault is registered (i. e. a fault is active). The value may vary depending on the specific diagnostic trouble code (DTC). Examples of this are U > 11.5 V, U < 2 V or f < 10 Hz.
SI#01 (see the graph)	The test is active. The control module can only detect faults and store diagnostic trouble codes (DTC) when the test is running.
SI#02 (see the graph)	The test has been active. Indicates whether the control module was able to detect faults and store diagnostic trouble codes (DTC).
SI#03 (see the graph)	The control module detects an instantaneous fault. This information is used by the control module to determine if or when a diagnostic trouble code (DTC) should be stored. As soon as a signal exceeds the permitted value (compare with the upper graph), there is an instantaneous fault.
SI#04 (see the graph)	The control module has detected an instantaneous fault. An instantaneous fault has been detected at some stage.
SI#05	Lamp lighting / Text message. Information about whether the diagnostic trouble code (DTC) activates a warning lamp or text message in the combined instrument

	panel.
SI#06	The test is disabled because another fault has occurred. The diagnostic trouble code (DTC) is stored at the point of the base fault. If this leads to further faults, related diagnostic trouble codes (DTCs) are not stored.
SI#08 (see the graph)	Counter for instantaneous faults. When an instantaneous fault is detected by the control module, a counter counts up for as long as the fault exists. When the fault is no longer present, the counter counts down again. The diagnostic trouble code (DTC) is stored in the car if the counter reaches a certain maximum value. The maximum value varies between different diagnostic trouble codes (DTCs). The speed of the count depends on how long the fault can persist before it results in customer symptoms.
SI#09 (see the graph)	Maximum value of counter SI#08. There are a variety of ways that the counter value for instantaneous faults can be read off depending on how often the diagnostic has been run.
Lower graph	Validating diagnostic trouble codes (DTCs). The diagnostic trouble code (DTC) is stored when the counter for instantaneous faults has reached its maximum value.

COUNTERS, DESCRIPTION

Counter
A useful fault-tracing tool is the Diagnostic Trouble Code (DTC) counter. The control module stores 6 different counters for each Diagnostic Trouble Code (DTC), which describes the occurrence. The counters can be used to determine when and how often a fault has been detected. Using the counters for the Diagnostic Trouble Code (DTC) it is possible to, see if the fault has only been registered during the current operating cycle or whether it has been detected previously. If a fault is intermittent it is possible to determine how intermittent the fault is by studying the values of

the different counters.
Example:

- Counter 1 = 15 Counts the number of operating cycles since the fault was last validated.
- Counter 3 = 69 Counts the number of operating cycles since the fault was first validated.
- Counter 4 = 1 Counts how many times the fault has occurred since the first time the fault was first validated.
- Counter 5 = 91764 The counter adds the time in seconds for which the control module has been operating since the fault was first validated and the diagnostic trouble code (DTC) was stored.
- Counter 6 = 0 The counter adds the time in seconds for which the test, the diagnostic, has run since the fault was first validated and the diagnostic trouble code (DTC) was stored.
- Counter 7 = 0 The counter adds the time in seconds for which the fault has been validated since the fault was first validated and the diagnostic trouble code (DTC) was stored.

In the examples given above, counter 1 gives the number of operating cycles where the diagnostic was run without a fault being detected. Counting takes place from when the fault was last detected. Counter 3 is the total number of operating cycles regardless of whether the diagnostic was run or not. Counter 4 shows the number of operating cycles where the diagnostic detected a fault. Counters 3 and 4 start to count from the first operating cycle after the operating cycle when the fault was first detected.
In the example, counter 4 = 1, which means that the fault was detected twice. One can, see that no fault was detected during the relevant operating cycle. Depending on the number of operating cycles and the customer's driving pattern, it can assist in ruling out this control module from the customer's current problems. The counters can help us understand how intermittent the fault can be. If the counters 1 = 0, 3 = 0 and 4 = 0 it indicates that there have not been any operating cycles since the fault was detected and that the fault was probably generated in the workshop.
For an operating cycle to be recognized certain requirements may be necessary, for example, increasing the engine coolant temperature. In certain cases ignition on, ignition off and ignition on again are counted as an operating cycle.
Counter 5 can be useful if the fault was detected in this operating cycle. The time can be used to determine more exactly when the fault occurred.

NOTE:
Not all counters need be implemented in a control module, this varies from system to system. The possible counters are described below.

Counter	Function
A (see the graph) Counter 1	The graph illustrates the time at which a fault occurs. In the illustration the control module has detected a fault in the second cycle. This fault has then occurred a total of 5 times. The counter can be read off for each diagnostic trouble code (DTC) in the control module in which this is implemented. Operating cycles are marked with vertical lines. An operating cycle usually begins at ignition on and finishes when the ignition is switched off.

C#1 (see the graph) Counter 2	Counts the number of operating cycles since the fault was *last* validated. This information can be used to determine whether the fault is active during the current operating cycle or not. The fault is present now if the value is zero. This counter is also used for most systems to give "Permanent fault" and " Intermittent fault" text messages in VIDA when reading off a diagnostic trouble code (DTC).
C#3 (see the graph) Counter 3	Counts the number of operating cycles since the fault was *first* validated. When a fault has been validated, the counter will count up by 1 for each subsequent operating cycle. The same as counter C#1 but monitors the number of cycles since the first fault occurred.
C#4 (see the graph) Counter 4	Counts the number of operating cycles in which the fault was validated since it was first validated. Counts the number of times the fault has occurred since the first time.
C#5 Counter 5	The counter assesses the number of seconds the control module has been operating since the fault was first validated and the diagnostic trouble code (DTC) was stored. The time the control module has been operating is only counted when it is active, not in "sleep mode".
C#6 Counter 6	The counter assesses the number of seconds the test (the diagnosis) has been operating since the fault was first validated and the diagnostic trouble code (DTC) was stored.
C#7 Counter 7	The counter assesses the number of seconds the fault has been valid since it was first validated and the diagnostic trouble code (DTC) was stored.

VEHICLE COMMUNICATION INFORMATION, CD MODULE (MP2) (2003-06)

DESCRIPTION OF VEHICLE COMMUNICATION INFORMATION

CONTENTS

Select type of description.

- see **DESCRIPTION OF FROZEN VALUES**
- see **DESCRIPTION OF PARAMETERS**
- see **DESCRIPTION OF ACTIVATIONS**

DESCRIPTION OF FROZEN VALUES

EXPLANATION

Not all the parameters described need to be implemented in the control module. This varies from system to system.

Frozen values are parameter values that are stored when a diagnostic trouble code (DTC) is stored.

BATTERY VOLTAGE, VALUE

Measurement range: 0-12 V.

Normal value when the generator (GEN) is charging: 13.0-14.5 V.

The value indicates the voltage to the CD player.

DISTANCE, VALUE

Measurement range: 0-1048575 km.

The value indicates the total mileage of the car at the time the diagnostic trouble code (DTC) was stored.

PASSENGER COMPARTMENT TEMPERATURE, VALUE

Measurement range: -60 - 195°C.

The value indicates the passenger compartment temperature at the time the diagnostic trouble code was stored.

OUTSIDE TEMPERATURE, VALUE

Measurement range: -128 - 127.75°C.

The value indicates the outside temperature at the time the diagnostic trouble code was stored.

ENGINE RUNNING, STATUS

The status displays whether the engine was running when the diagnostic trouble code was stored.

No = the engine was not running

Yes = the engine was running

TIME, VALUE

The value displays the time that has passed since the diagnostic trouble code was stored.

DESCRIPTION OF ACTIVATIONS

The following activations are available:

PLAY

Play the disc in the player

STOP

Stop the disc currently playing.

PAUSE

Set the player to pause mode.

UNLOAD

Remove the disc from the player

SEARCH FORWARDS

Search forwards with sound.

SEARCH BACKWARDS

Search backwards with sound.

FAST FORWARD

Search forwards without sound.

FAST BACKWARD

Search backwards without sound.

1-6

Selecting the disc in the CD changer.

VEHICLE COMMUNICATION INFORMATION, INFOTAINMENT CONTROL MODULE

DESCRIPTION OF ACTIVATIONS

BUTTONS ON THE LEFT-HAND KEYPAD

Activate the buttons on the left-hand keypad.

- CD button
- AM/FM button
- Forward button
- Back button
- 1 button
- 2 button
- 3 button
- 4 button
- 5 button

- 6 button
- 7 button
- 8 button
- 9 button
- 0 button
- * button
- # button
- button

BUTTONS ON THE RIGHT-HAND KEYPAD

Activate the buttons on the right-hand keypad.

- button
- button
- button
- button
- button
- Up button
- Down button
- Eject button.

DESCRIPTION OF PARAMETERS

30 SUPPLY, VALUE

Measurement range: 0 - 50 V

Normal range: 12 - 14 V

The value indicates the power supply to the infotainment control module (ICM).

5 V SUPPLY, VALUE

Measurement range: 0 - 10 V

Normal range: 4.5 - 5.5 V

The value indicates the internal power supply in the infotainment control module (ICM).

POWER CONSUMPTION INFOTAINMENT, VALUE

Measurement range: 0 - 50 A

The value indicates the power consumption for the infotainment control module (ICM).

POWER CONSUMPTION INFOTAINMENT CONTROL MODULE (ICM), VALUE

Measurement range: 0 - 50 A

The value indicates the power consumption for the infotainment control module (ICM).

INPUT SIGNAL FROM THE BUTTON CIRCUIT, VALUE

Measurement range: 0 - 1023 V

Normal range: ~ 4.1 V (when no buttons in the relevant circuit are affected)

The value indicates the voltage in the button circuit.

- Normal range: ~(3.6 V, 3.1 V, 2.4 V, 1.4 V)
- Left button circuit 1 (>>|, AM/FM, |<<, CD)
- Left button circuit 2 (*, 7, 4, 1)
- Left button circuit 3 (0, 8; 5, 2)
- Left button circuit 4
- Right button circuit 1
- Normal range: ~ (3.1 V, 2.4 V, 1.4 V)
- Right button circuit 2 (Up, Down, CD eject)
- Normal range: ~
- Right button circuit 5
- Button circuit.

NUMBER OF CONTROL MODULES IN THE MOST NETWORK, VALUE

The value indicates the number of control modules in the present MOST network. The number can be between 4-8.

BUTTONS IN THE KEYPAD, STATUS

The status displays if the selected button is activated or not

MOST-LOCKED, STATUS

The status indicates whether the MOST network is closed and communication possible.

- No
- Yes

RING BREAK DIAGNOSTIC, STATUS

NOTE: This parameter is only changed after a ring break diagnostic has been run.

After the ring break diagnosis has been carried out the status indicates if there is an open-circuit and if so the location of the open-circuit.

- OK
- Pos1 - Pos8

HINT: The number of possible positions varies depending on the number of control modules in the vehicle.

NETWORK ACTIVITY, STATUS

Status indicates if there is communication in the MOST network.

- No
- Yes

DESCRIPTION OF READING OFF OF EXTENDED DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

see **DESCRIPTION OF FROZEN VALUES**

see **STATUS IDENTIFIER, DESCRIPTION**

see **COUNTERS, DESCRIPTION**

DESCRIPTION OF FROZEN VALUES

EXPLANATION

Not all the parameters described need to be implemented in the control module. This varies from system to system.

Frozen values are parameter values that are stored when a diagnostic trouble code (DTC) is stored.

HINT: Frozen values are stored the first time a diagnostic trouble code (DTC) is generated. Because of this, intermittent open-circuits on the MOST network may be hard to diagnose.

BATTERY VOLTAGE, VALUE

Measurement range: 0 - 30 V.

Normal value when the generator (GEN) is charging: 13.0-14.5 V.

The voltage value at the Central Electronic Module (CEM).

DISTANCE, VALUE

Measurement range: 0-1048575 km.

The value indicates the total mileage of the car at the time the diagnostic trouble code (DTC) was stored.

PASSENGER COMPARTMENT TEMPERATURE, VALUE

Measurement range -60 - 195°C.

The driver information module (DIM) obtains the value via CAN.

OUTSIDE TEMPERATURE, VALUE

Measurement range -128 - 127.75°C.

The driver information module (DIM) obtains the value via CAN.

ENGINE RUNNING, STATUS

The status displays whether the engine was running when the diagnostic trouble code (DTC) was stored.

No = the engine was not running

Yes = the engine was running

TIME, VALUE

The value displays the time that has passed since the diagnostic trouble code (DTC) was stored.

CAN COMMUNICATION, STATUS

The status indicates the control modules in the Control area network (CAN) which were communicating when the diagnostic trouble code (DTC) was stored.

30 SUPPLY, VALUE

Measurement range: 0 - 50 V

The value indicates the power supply to the Infotainment control module (ICM) when the diagnostic trouble code was stored.

5 V SUPPLY, VALUE

Measurement range: 0 - 10 V

Normal range: 4.5 - 5.5 V

The value indicates the internal power supply in the Infotainment control module (ICM) when the diagnostic

trouble code was stored.

RING BREAK DIAGNOSTIC, STATUS

The status indicates the MOST network status when the Diagnostic Trouble Code (DTC) was stored.

The status is stored in the first event of a Diagnostic Trouble Code (DTC) being stored. If the fault is intermittent, the Diagnostic Trouble Code (DTC) can be stored on several occasions but the value freezes only on the first occasion. Intermittent open-circuit on the MOST network can be difficult to diagnose due to this.

Ok = MOST network ok.

Open-circuit location = Indicates the location of the open-circuit in the MOST network.

MOST LOCKED, STATUS

The status indicates whether the MOST network was closed when the diagnostic trouble code (DTC) was stored.

No = The MOST network was not closed and communication was not possible.

Yes = The MOST network was closed and communication was possible.

INPUT SIGNAL FROM THE BUTTON CIRCUIT, VALUE

Measurement range: 0 - 1023 V

The value indicates the voltage in the button circuit when the diagnostic trouble code (DTC) was stored.

- Left button circuit 1 (AM/FM, CD, |<<, >>|)
- Left button circuit 2
- Left button circuit 3
- Left button circuit 4
- Right button circuit 1
- Right button circuit 2
- Right button circuit 5
- Button circuit for.

VOLUME AND SELECTOR SWITCHES, STATUS

The status indicates the position of the switches in the controls and.

- Open
- Closed

STATUS IDENTIFIER, DESCRIPTION

Status identifier
There are different status identifiers that can be read off for each diagnostic trouble code (DTC). The control module tests each terminal almost continuously. By reading off the diagnostic trouble code (DTC) and the associated status identifier (which detects the fault and stores the DTC), information about the test is obtained. Not all status identifiers need to be implemented in one control module. This varies from system to system. All status identifiers are reset and start counting again each time the control module is powered up and when erasing diagnostic trouble codes (DTCs). The possible status identifiers are described below.

Status identifier	**Explanation**
Upper graph	When the signal value is above or below a maximum or minimum value that is considered to be a fault by the control module, an instantaneous fault is registered (i. e. a fault is active). The value may vary depending on the specific diagnostic trouble code (DTC). Examples of this are U > 11.5 V, U < 2 V or f < 10 Hz.
SI#01 (see the graph)	The test is active. The control module can only detect faults and store diagnostic trouble codes (DTC) when the test is running.
SI#02 (see the graph)	The test has been active. Indicates whether the control module was able to detect faults and store diagnostic trouble codes (DTC).
SI#03 (see the graph)	The control module detects an instantaneous fault. This information is used by the control module to determine if or when a diagnostic trouble code (DTC) should be stored. As soon as a signal exceeds the permitted value (compare with the upper graph), there is an instantaneous fault.
SI#04 (see the graph)	The control module has detected an instantaneous fault. An instantaneous fault has been detected at some stage.
SI#05	Lamp lighting / Text message. Information about whether the diagnostic trouble code (DTC) activates a warning lamp or text message in the combined instrument panel.
SI#06	The test is disabled because another fault has occurred. The diagnostic trouble code (DTC) is stored at the point of the base fault. If this leads to further faults, related diagnostic trouble codes (DTCs) are not stored.
SI#08 (see the graph)	Counter for instantaneous faults. When an instantaneous fault is detected by the control module, a counter counts up for as long as the fault exists. When the fault is no longer present, the counter counts down again. The diagnostic trouble code (DTC) is stored in the car if the counter reaches a certain maximum value. VEHICLE COMMUNICATION INFORMATION, INFOTAINMENT CONTROL MODULE (ICM) (2003-06)

DESCRIPTION OF VEHICLE COMMUNICATION INFORMATION

CONTENTS

Select type of description.

- see **DESCRIPTION OF FROZEN VALUES**
- see **DESCRIPTION OF EXTENDED DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION**
- see **DESCRIPTION OF PARAMETERS**
- see **DESCRIPTION OF ACTIVATIONS**

DESCRIPTION OF FROZEN VALUES

EXPLANATION

Not all the parameters described need to be implemented in the control module. This varies from system to system.

Frozen values are parameter values that are stored when a diagnostic trouble code (DTC) is stored.

HINT: Frozen values are stored the first time a diagnostic trouble code (DTC) is generated. Because of this, intermittent open-circuits on the MOST network may be hard to diagnose.

BATTERY VOLTAGE, VALUE

Measurement range: 0-30 V.

Normal value when the generator (GEN) is charging: 13.0-14.5 V.

The value indicates the voltage at the central electronic module (CEM).

DISTANCE, VALUE

Measurement range: 0-1048575 km.

The value indicates the total mileage of the car at the time the diagnostic trouble code (DTC) was stored.

PASSENGER COMPARTMENT TEMPERATURE, VALUE

Measurement range: -60-195°C.

The combined instrument panel obtains the value via the control area network (CAN).

OUTSIDE TEMPERATURE, VALUE

Measurement range: -128-127.75°C.

The combined instrument panel obtains the value via the control area network (CAN).

ENGINE RUNNING, STATUS

The status displays whether the engine was running when the diagnostic trouble code (DTC) was stored.

No = the engine was not running

Yes = the engine was running

TIME, VALUE

The value displays the time that has passed since the diagnostic trouble code (DTC) was stored.

CAN COMMUNICATION, STATUS

The status indicates the control modules in the Control area network (CAN) which were communicating when the diagnostic trouble code (DTC) was stored.

30 SUPPLY, VALUE

Measurement range: 0-50 V

The value indicates the power supply to the infotainment control module (ICM) when the diagnostic trouble code (DTC) was stored.

5 V SUPPLY, VALUE

Measurement range: 0-10 V

Normal range: 4.5-5.5 V

The value indicates the internal power supply in the infotainment control module (ICM) when the diagnostic trouble code (DTC) was stored.

3.3 V SUPPLY, VALUE

Measurement range: 0-5 V

Normal range: 2.9-3.5 V

The value indicates the internal power supply in the infotainment control module (ICM) when the diagnostic trouble code (DTC) was stored.

DISPLAY VOLTAGE, VALUE

Measurement range: 0-600 V

Normal range: 40-80 V

The value indicates the power supply to the display in the infotainment control module (ICM) when the diagnostic trouble code (DTC) was stored.

RING BREAK DIAGNOSTIC, STATUS

The status indicates the status of the MOST network when the diagnostic trouble code (DTC) was stored.

Status is stored the first time a diagnostic trouble code (DTC) is generated. If the fault is intermittent, the diagnostic trouble code may be generated several times, but the frozen value is only stored the first time. Because of this, intermittent open-circuits on the MOST network may be hard to diagnose.

Ok = MOST network ok.

Open-circuit location = Indicates the location of the open-circuit in the MOST network.

MOST LOCKED, STATUS

The status indicates whether the MOST network was closed when the diagnostic trouble code (DTC) was stored.

No = The MOST network was not closed and communication was not possible.

Yes = The MOST network was closed and communication was possible.

BUTTONS LEFT KEYPAD, STATUS

The status indicates which button on the left-hand keypad was activated when the diagnostic trouble code (DTC) was stored.

Activated = The button was activated

Not activated = The button was not activated.

BUTTONS RIGHT KEYPAD, STATUS

The status indicates which button on the right-hand keypad was activated when the diagnostic trouble code (DTC) was stored.

Activated = The button was activated

Not activated = The button was not activated.

INPUT SIGNAL FROM THE BUTTON CIRCUIT, VALUE

Measurement range: 0-1023 V

The value indicates the voltage in the button circuit when the diagnostic trouble code was stored.

- Left button circuit 1
- Left button circuit 2
- Left button circuit 3
- Left button circuit 4
- Right button circuit 1
- Right button circuit 2
- Right button circuit 5
- Button circuit for.

VOLUME AND SELECTOR SWITCHES, STATUS

The status indicates the position of the switches in the and controls

Open

Closed

VOLUME AND SELECTOR KNOB MOVEMENT, VALUE

Measurement range: 0-FF

The value indicates whether the or controls have been activated and how many steps they had been moved when the diagnostic trouble code (DTC) was stored.

DESCRIPTION OF PARAMETERS

30 SUPPLY, VALUE

Measurement range: 0 - 50 V

Normal range: 12 - 14 V

The value indicates the power supply to the infotainment control module (ICM).

5 V SUPPLY, VALUE

Measurement range: 0 - 10 V

Normal range: 4.5 - 5.5 V

The value indicates the internal power supply in the infotainment control module (ICM).

3.3 V SUPPLY, VALUE

Measurement range: 0 - 5 V

Normal range: 2.9 - 3.5 V

The value indicates the internal power supply in the infotainment control module (ICM).

DISPLAY VOLTAGE, VALUE

Measurement range: 0 - 600 V

Normal range: 40 - 80 V

The value indicates the voltage to the display in the infotainment control module (ICM).

POWER CONSUMPTION INFOTAINMENT, VALUE

Measurement range: 0 - 50 A

The value gives the power consumption of the infotainment system.

POWER CONSUMPTION INFOTAINMENT CONTROL MODULE (ICM), VALUE

Measurement range: 0 - 50 A

The value gives the power consumption of the Infotainment Control Module (ICM).

INPUT SIGNAL FROM THE BUTTON CIRCUIT, VALUE

Measurement range: 0 - 1023 V

Normal range: ~4.1 V (when no buttons in the relevant circuit are affected.)

The value indicates the voltage in the button circuit.

- Normal range: ~(3.6V, 3.1V, 2.4V, 1.4V)
- Left button circuit 1 (>>|, AM/FM, |<<, CD)
- Left button circuit 2 (*, 7, 4, 1)
- Left button circuit 3 (0, 8; 5, 2)
- Left button circuit 4 (#, 9, 6, 3)
- Right button circuit 1
- Normal range: ~(3.1V, 2.4V, 1.4V)
- Right button circuit 2 (Up, Down, CD eject)
- Normal range: ~(1.4V)
- Right button circuit 5

NUMBER OF CONTROL MODULES IN THE MOST NETWORK, VALUE

The value indicates the number of control modules in the present MOST network. The number can be between 4-8.

BUTTONS IN THE KEYPAD, STATUS

The status displays if the selected button is activated or not

DISPLAY TEST, STATUS

Status displays the position for display test.

- Normal
- All pixels on
- All pixels off
- Predetermined pattern 1
- Predetermined pattern 2
- Predetermined pattern 3
- Predetermined pattern 4
- Undefined.

DISPLAY TYPE, STATUS

Status indicates what display type for the present unit.

- Standard
- Graphic
- Undefined.

MOST-LOCKED, STATUS

The status indicates whether the MOST network is closed and communication possible.

No

Yes

RING BREAK DIAGNOSTIC, STATUS

NOTE: This parameter is only changed after a ring break diagnostic has been run.

After the ring break diagnosis has been carried out the status indicates if there is an open-circuit and if so the location of the open-circuit.

Ok

Pos1 - Pos8

HINT: The number of possible positions varies depending on the number of control modules in the car.

NETWORK ACTIVITY, STATUS

Status indicates if there is communication in the MOST network.

No

Yes

3 DB SWITCH, STATUS

Status displays if the 3 dB switch is on or off.

DESCRIPTION OF ACTIVATIONS

BUTTONS ON THE LEFT-HAND KEYPAD

Activate the buttons on the left-hand keypad.

- CD button
- Back button

- AM/FM button
- Forward button
- 1 button
- 4 button
- 7 button
- * button
- 2 button
- 5 button

VEHICLE COMMUNICATION INFORMATION, INTEGRATED AUDIO MODULE (IAM) (2007-12)

DESCRIPTION OF COMPONENT/FUNCTION ACTIVATION

FREQUENCY BAND AM/FM FM

Selecting the frequency band FM.

The radio must be selected as sound source.

FREQUENCY BAND AM/FM AM

Selecting the frequency band AM.

The radio must be selected as sound source.

ANTENNA SELECTION, MAIN ANTENNA

Selecting the Main antenna.

The radio must be selected as the sound source and FM selected as the frequency band.

ANTENNA SELECTION, SUBANTENNA

Selecting the Subantenna.

The radio must be selected as the sound source and FM selected as the frequency band.

MEDIA PLAYER STATUS, STOP

Stops the media player.

The media player must be selected as sound source.

MEDIA PLAYER STATUS, EJECT

Ejects the disc from the media player.

The media player must be selected as sound source.

ACTIVE DISC, DISC 1-6

Selects disc in the CD changer.

The media player must be selected as sound source.

DESCRIPTION OF PARAMETERS

PARAMETERS, STATUS

MEDIA PLAYER STATUS

Displays current status of the media player:

- Play
- Stop
- Pause
- Load
- Eject
- Search forward (sound on)
- Search backward (sound on)
- Fast backward by time (mute)
- Fast forward by time (mute)
- Retract
- Empty

The parameter can be read when the media player is selected as the source.

ACTIVE DISC

Displays which disc is selected in the CD changer.

The parameter can be read when the vehicle is equipped with CD changer and this is selected as the source.

FREQUENCY BAND AM/FM

Displays which frequency band, AM or FM, is selected.

The parameter can be read when the radio is selected as the source.

ANTENNA SELECTION

Displays which antenna, main antenna or subantenna, is in use.

The parameter can be read when the radio is selected as the source.

REGION

Displays the region for which the antenna is configured.

EU=Europe

USA=USA

AUS=Australia

JPN=Japan

PARAMETERS, VALUE

TRACK

Displays the current track on the CD disc.

The parameter can be read when the media player is selected as the source.

FREQUENCY

Displays which frequency is set.

The parameter can be read when the radio is selected as the source.

SIGNAL STRENGTH

Obtaining radio signal strength readings.

The value read applies to the active antenna. The signal strength is presented as a figure between 0 and 255. The figure 0 means that no signal has been registered. The figure 255 means that the highest possible signal strength has been registered.

The parameter can be read when the radio is selected as the source.

NOISE LEVEL

Reading the radio signal noise level.

The value read applies to the active antenna. The noise level is presented as a figure between 0 and 15. The figure 0 means that no noise has been registered. The figure 15 means that the highest noise level that can be registered has been reached.

The parameter can be read when the radio FM band is selected as the source.

DESCRIPTION OF READING EXTENDED DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

CONTENTS

Select type of description:

- see **DESCRIPTION OF FROZEN VALUES**
- see **STATUS IDENTIFIER, DESCRIPTION**
- see **COUNTERS, DESCRIPTION**

DESCRIPTION OF FROZEN VALUES

EXPLANATION

All parameters described do not need to be implemented in the Integrated Audio Module (IAM), this varies from system to system.

Frozen values are parameter values stored when a Diagnostic Trouble Code (DTC) is generated.

BATTERY VOLTAGE, CENTRAL ELECTRONIC MODULE (CEM)

Measurement range: 5-30 V.

The normal value when the alternator is charging: 13.0-14.5 V.

The value indicates the voltage to the Central Electronic Module (CEM).

DISTANCE, VALUE

Measurement range: 0-1048575 km.

The value indicates the vehicle's total mileage when the Diagnostic Trouble Code (DTC) was generated.

PASSENGER COMPARTMENT TEMPERATURE, VALUE

Measurement range: -60 to +195°C.

The value indicates passenger compartment temperature when the Diagnostic Trouble Code (DTC) was generated.

OUTSIDE TEMPERATURE, VALUE

Measurement range: -128 to +127.75°C.

The value indicates outside temperature when the Diagnostic Trouble Code (DTC) was generated.

ENGINE RUNNING, STATUS

The status indicates whether the engine was running when the Diagnostic Trouble Code (DTC) was generated.

No = the engine was not running

Yes = the engine was running

STATUS IDENTIFIER, DESCRIPTION

Status identifier
There are different status identifiers that can be read off for each diagnostic trouble code (DTC). The control module tests each terminal almost continuously. By reading off the diagnostic trouble code (DTC) and the associated status identifier (which detects the fault and stores the DTC), information about the test is obtained. Not all status identifiers need to be implemented in one control module. This varies from system to system. All status identifiers are reset and start counting again each time the control module is powered up and when erasing diagnostic trouble codes (DTCs). The possible status identifiers are described below.

Status identifier	**Explanation**
Upper graph	When the signal value is above or below a maximum or minimum value that is considered to be a fault by the control module, an instantaneous fault is registered (i. e. a fault is active). The value may vary depending on the specific diagnostic trouble code (DTC). Examples of this are U > 11.5 V, U < 2 V or f < 10 Hz.
SI#01 (see the graph)	The test is active. The control module can only detect faults and store diagnostic trouble codes (DTC) when the test is running.
SI#02 (see the graph)	The test has been active. Indicates whether the control module was able to detect faults and store diagnostic trouble codes (DTC).
SI#03 (see the graph)	The control module detects an instantaneous fault. This information is used by the control module to determine if or when a diagnostic trouble code (DTC) should be stored. As soon as a signal exceeds the permitted value (compare with the upper graph), there is an instantaneous fault.
SI#04 (see the graph)	The control module has detected an instantaneous fault. An instantaneous fault has been detected at some stage.
SI#05	Lamp lighting / Text message. Information about whether the diagnostic trouble code (DTC) activates a warning lamp or text message in the combined instrument panel.
SI#06	The test is disabled because another fault has occurred. The diagnostic trouble code (DTC) is stored at the point of the base fault. If this leads to further faults, related diagnostic trouble codes (DTCs) are not stored.
SI#08 (see the graph)	Counter for instantaneous faults. When an instantaneous fault is detected by the control module, a counter counts up for as long as the fault exists. When the fault is no longer present, the counter counts down again. The diagnostic trouble code (DTC) is stored in the car if the counter reaches a certain maximum value. The maximum value varies between different diagnostic trouble codes (DTCs). The speed of the count depends on how long the fault can persist before it results in customer symptoms.
SI#09 (see the graph)	Maximum value of counter SI#08. There are a variety of ways that the counter value for instantaneous faults can be read off depending on how often the diagnostic has been run.
Lower graph	Validating diagnostic trouble codes (DTCs). The diagnostic trouble code (DTC) is stored when the counter for instantaneous faults has reached its maximum value.

Fig. 5: Status Identifier Graph

COUNTERS, DESCRIPTION

Counter
A useful fault-tracing tool is the Diagnostic Trouble Code (DTC) counter. The control module stores 6 different counters for each Diagnostic Trouble Code (DTC), which describes the occurrence. The counters can be used to determine when and how often a fault has been detected. Using the counters for the Diagnostic Trouble Code (DTC) it is possible to, see if the fault has only been registered during the current operating cycle or whether it has been detected previously. If a fault is intermittent it is possible to determine how intermittent the fault is by studying the values of

the different counters.
Example:

- Counter 1 = 15 Counts the number of operating cycles since the fault was last validated.
- Counter 3 = 69 Counts the number of operating cycles since the fault was first validated.
- Counter 4 = 1 Counts how many times the fault has occurred since the first time the fault was first validated.
- Counter 5 = 91764 The counter adds the time in seconds for which the control module has been operating since the fault was first validated and the diagnostic trouble code (DTC) was stored.
- Counter 6 = 0 The counter adds the time in seconds for which the test, the diagnostic, has run since the fault was first validated and the diagnostic trouble code (DTC) was stored.
- Counter 7 = 0 The counter adds the time in seconds for which the fault has been validated since the fault was first validated and the diagnostic trouble code (DTC) was stored.

In the examples given above, counter 1 gives the number of operating cycles where the diagnostic was run without a fault being detected. Counting takes place from when the fault was last detected. Counter 3 is the total number of operating cycles regardless of whether the diagnostic was run or not. Counter 4 shows the number of operating cycles where the diagnostic detected a fault. Counters 3 and 4 start to count from the first operating cycle after the operating cycle when the fault was first detected.
In the example, counter 4 = 1, which means that the fault was detected twice. One can, see that no fault was detected during the relevant operating cycle. Depending on the number of operating cycles and the customer's driving pattern, it can assist in ruling out this control module from the customer's current problems. The counters can help us understand how intermittent the fault can be. If the counters 1 = 0, 3 = 0 and 4 = 0 it indicates that there have not been any operating cycles since the fault was detected and that the fault was probably generated in the workshop.
For an operating cycle to be recognized certain requirements may be necessary, for example, increasing the engine coolant temperature. In certain cases ignition on, ignition off and ignition on again are counted as an operating cycle.
Counter 5 can be useful if the fault was detected in this operating cycle. The time can be used to determine more exactly when the fault occurred.

NOTE:
Not all counters need be implemented in a control module, this varies from system to system. The possible counters are described below.

Counter	Function
A (see the graph) Counter 1	The graph illustrates the time at which a fault occurs. In the illustration the control module has detected a fault in the second cycle. This fault has then occurred a total of 5 times. The counter can be read off for each diagnostic trouble code (DTC) in the control module in which this is implemented. Operating cycles are marked with vertical lines. An operating cycle usually begins at ignition on and finishes when the ignition is switched off.

C#1 (see the graph) Counter 2	Counts the number of operating cycles since the fault was *last* validated. This information can be used to determine whether the fault is active during the current operating cycle or not. The fault is present now if the value is zero. This counter is also used for most systems to give "Permanent fault" and " Intermittent fault" text messages in VIDA when reading off a diagnostic trouble code (DTC).
C#3 (see the graph) Counter 3	Counts the number of operating cycles since the fault was *first* validated. When a fault has been validated, the counter will count up by 1 for each subsequent operating cycle. The same as counter C#1 but monitors the number of cycles since the first fault occurred.
C#4 (see the graph) Counter 4	Counts the number of operating cycles in which the fault was validated since it was first validated. Counts the number of times the fault has occurred since the first time.
C#5 Counter 5	The counter assesses the number of seconds the control module has been operating since the fault was first validated and the diagnostic trouble code (DTC) was stored. The time the control module has been operating is only counted when it is active, not in "sleep mode".
C#6 Counter 6	The counter assesses the number of seconds the test (the diagnosis) has been operating since the fault was first validated and the diagnostic trouble code (DTC) was stored.
C#7 Counter 7	The counter assesses the number of seconds the fault has been valid since it was first validated and the diagnostic trouble code (DTC) was stored.

VEHICLE COMMUNICATION INFORMATION, MD MODULE (MP1) (2003-06)

DESCRIPTION OF VEHICLE COMMUNICATION INFORMATION

CONTENTS

Select type of description.

- see **DESCRIPTION OF FROZEN VALUES**
- see DESCRIPTION OF PARAMETERS
- see **DESCRIPTION OF ACTIVATIONS**

DESCRIPTION OF FROZEN VALUES

EXPLANATION

Not all the parameters described need to be implemented in the control module. This varies from system to system.

Frozen values are parameter values that are stored when a diagnostic trouble code (DTC) is stored.

BATTERY VOLTAGE, MP1, VALUE

Measurement range: 0-12 V.

Normal value when the generator (GEN) is charging: 13.0-14.5 V.

The value indicates the voltage to the MD player.

DISTANCE, VALUE

Measurement range: 0-1048575 km.

The value indicates the total mileage of the car at the time the diagnostic trouble code (DTC) was stored.

PASSENGER COMPARTMENT TEMPERATURE, VALUE

Measurement range: -60 - 195°C.

The value indicates the passenger compartment temperature at the time the diagnostic trouble code (DTC) was stored.

OUTSIDE TEMPERATURE, VALUE

Measurement range: -128 - 127.75°C.

The value indicates the outside temperature at the time the diagnostic trouble code (DTC) was stored.

ENGINE RUNNING, STATUS

The status displays whether the engine was running when the diagnostic trouble code (DTC) was stored.

No = the engine was not running

Yes = the engine was running

TIME, VALUE

The value displays the time that has passed since the diagnostic trouble code (DTC) was stored.

DESCRIPTION OF PARAMETERS

MD PLAYER STATUS

The MD player can have the following status:

- Play
- Stop
- Pause

- Load
- Unload
- Search forwards
- Search backwards
- Fast forward
- Fast backward
- Retract
- Empty

TRACK

The value indicates which disc track is playing at the moment.

PLAYED TIME

The value indicates the time the current track has been playing.

DESCRIPTION OF ACTIVATIONS

The following activations are available:

PLAY

Play the disc in the player

STOP

Stop the disc that is playing.

PAUSE

Set the player to pause mode.

UNLOAD

Remove the disc from the player

SEARCH FORWARDS

Search forwards with sound.

SEARCH BACKWARDS

Search backwards with sound.

FAST FORWARD

Fast forward without sound.

FAST BACKWARD

Fast rewind without sound.

VEHICLE COMMUNICATION INFORMATION, MULTIMEDIA MODULE (MMM) (2003-12)

DESCRIPTION OF VEHICLE COMMUNICATION INFORMATION

CONTENTS

Select type of description.

- see **COUNTERS, DESCRIPTION**

DESCRIPTION OF FROZEN VALUES

EXPLANATION

Not all the parameters described need to be implemented in the control module. This varies from system to system.

Frozen values are parameter values that are stored when a diagnostic trouble code (DTC) is stored.

BATTERY VOLTAGE, VALUE

Measurement range: 8-16 V.

Normal value when the generator (GEN) is charging: 13.0-14.5 V.

DISTANCE, VALUE

Measurement range: 0-1048575 km.

The value indicates the total mileage of the car at the time the diagnostic trouble code (DTC) was stored.

PASSENGER COMPARTMENT TEMPERATURE, VALUE

Measurement range: -60 to 195°C.

OUTSIDE TEMPERATURE, VALUE

Measurement range: -128 to 127.75°C.

ENGINE RUNNING, STATUS

The status displays whether the engine was running when the diagnostic trouble code (DTC) was stored.

No = the engine was not running

Yes = the engine was running

-3 DB SWITCH, STATUS

The status indicates whether the -3 db switch was activated or not.

on = activated

off = not activated

TIME, VALUE

The value displays the time that has passed since the diagnostic trouble code (DTC) was stored.

VEHICLE COMMUNICATION, REMOTE DIGITAL AUDIO RECEIVER (RDAR) (2007-12)

DESCRIPTION OF PARAMETERS

PARAMETERS, STATUS

SIGNAL SOURCE

The Remote Digital Audio Receiver (RDAR) can receive and decode a signal from either satellites, ground antennas or both. The control module selects the source whose signal is the strongest.

The following variations of detected sources are possible:

No signal = No signal detected.

SAT1 = Signal from satellite 1 detected.

SAT2 = Signal from satellite 2 detected.

ground transmission = Signal from ground antennas detected.

SAT1 & SAT2 = Signals from satellite 1 and 2 detected.

SAT1 & ground transmission = Signals from satellite 1 and ground antennas detected.

SAT2 & ground transmission = Signals from satellite 2 and ground antennas detected.

all = Signals from all sources detected.

DESCRIPTION OF READING OFF OF EXTENDED DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Contents

Select type of description:

- see **DESCRIPTION OF FROZEN VALUES**
- see **STATUS IDENTIFIER, DESCRIPTION**
- see **COUNTERS, DESCRIPTION**

DESCRIPTION OF FROZEN VALUES

EXPLANATION

Not all the parameters that are described need to be implemented in the control module. These varies from system to system.

Frozen values are parameter values that are stored when a diagnostic trouble code (DTC) is stored.

BATTERY VOLTAGE, VALUE

Measurement range: 5-24 V.

Normal value when the generator (GEN) is charging: 13.0-14.5 V.

DISTANCE, VALUE

Measurement range: 0-1, 000, 000 km.

The value indicates the vehicle's total mileage when the Diagnostic Trouble Code (DTC) was generated.

PASSENGER COMPARTMENT TEMPERATURE, VALUE

Measurement range: -40 to +80°C.

OUTSIDE TEMPERATURE, VALUE

Measurement range: -40 to +80°C.

ENGINE RUNNING, STATUS

The status displays whether the engine was running when the diagnostic trouble code (DTC) was stored.

No = engine was not running.

Yes = engine was running.

TIME, VALUE

The value displays the time that has passed since the diagnostic trouble code (DTC) was stored.

VEHICLE COMMUNICATION INFORMATION (2006-12)

DESCRIPTION OF PARAMETERS

PARAMETERS, STATUS

STATUS, ALARM (VOLVO ON CALL)

This parameter indicates how the phone module (PHM) sees the status of the alarm.

This parameter is used by phone modules (PHM) with Volvo On Call functionality. If the car alarm is triggered, for example during a theft attempt, information about the status of the alarm from the upper electronic module (UEM) to the phone module (PHM) via the central electronic module (CEM). The phone module (PHM) then transmits vehicle data to the Volvo On Call Service Center which contacts the owner and informs him what has happened.

Alarm status 1 = the alarm has been disarmed with sensors

Alarm status 2 = the alarm has been armed with sensors

Alarm status 3 = the alarm is armed without sensors (reduced alarm)

Alarm status 4 = triggered alarm with sensors

Alarm status 5 = triggered alarm without sensors

Alarm status 6 = the alarm has been disarmed without sensors

STATUS, LOCK (VOLVO ON CALL)

This parameter indicates how the phone module (PHM) sees the status of the lock.

This parameter is used by phone modules (PHM) with Volvo On Call functionality.

Unlocked = the vehicle is unlocked

Locked from the inside = the vehicle is unlocked from the inside

Locked from the outside = the vehicle is unlocked from the outside

ANTENNA SIGNAL (VOLVO ON CALL)

The parameter indicates whether the phone module (PHM) is using the external or internal antenna.

This internal antenna is a spare antenna and is only available for phone modules (PHM) with Volvo On Call functionality.

The reserve antenna is only used when a Volvo On Call service is activated and when the normal antenna is not functioning.

Internal antenna = the internal spare antenna is used

External antenna = the external antenna is used

PARAMETERS, VALUE

GSM IMEI NUMBER (MARKETS WITH GSM ONLY)

This parameter displays the IMEI (International Mobile Equipment Identification) of the phone module (PHM).

The parameter will not be a valid value for non GSM phone modules (PHM).

HINT: GSM market phone modules (PHM) have a SIM card holder installed in the glove compartment.

The IMEI number can also be read off from the text window for the driver information module (DIM). To do this, enter *#06# on the keypad for the climate control module (CCM).

CAPACITY OF THE EMERGENCY BATTERY (VOLVO ON CALL)

This parameter indicates the remaining capacity of the internal emergency battery. The emergency battery is only used in phone modules (PHM) with Volvo On Call functionality.

The emergency battery is only used when activating the Volvo On Call service and if there is no power supply.

The remaining capacity is calculated by the phone module (PHM).

Measurement range 0-100%.

100% is full capacity.

The carphone module (PHM) stores a diagnostic trouble code (DTC) when the capacity drops to 30%.

- 0% corresponds to 0 minutes call time
- 10% corresponds to approximately 5 minutes call time
- 20% corresponds to approximately 10 minutes call time
- 30% corresponds to approximately 15 minutes call time
- 40-50% corresponds to approximately 20 minutes call time
- 60% corresponds to approximately 30 minutes call time

- 70-100% corresponds to more than 30 minutes call time.

VIN (VOLVO ON CALL)

This parameter displays the VIN (Vehicle Identification Number) programmed in the phone module (PHM).

This parameter is used by phone modules (PHM) with Volvo On Call functionality.

If an incorrect VIN is programmed in the phone module (PHM), the activation and deactivation code for the Volvo On Call subscription will not work.

GPS RECEIVED POSITION, LATITUDE (VOLVO ON CALL)

This parameter is used by phone modules (PHM) with Volvo On Call functionality. The phone module (PHM) receives the signal from the global positioning system module (GPS).

This parameter displays the latitude of the last received position of the vehicle.

The phone module (PHM) transmits the signal together with other vehicle data when a Volvo On Call service is activated.

GPS RECEIVED POSITION, LONGITUDE (VOLVO ON CALL)

This parameter is used by phone modules (PHM) with Volvo On Call functionality. The phone module (PHM) receives the signal from the global positioning system module (GPS).

This parameter displays the longitude of the last received position of the vehicle.

The phone module (PHM) transmits the signal together with other vehicle data when a Volvo On Call service is activated.

GSM SIGNAL STRENGTH (MARKETS WITH GSM ONLY)

This parameter indicates the signal strength for GSM phone modules (PHM).

Measurement range 0 - 31.

The value of the signal strength depends on the coverage and geographical location of the vehicle.

The value for normal coverage/reception should be approximately 20-25.

POWER SUPPLY

The parameter indicates the power supply to the phone module (PHM). The phone module (PHM) has a +30-supply.

Measurement range 0-66 V.

The normal value at ignition and with the engine running should be approximately 12 V (battery voltage).

TEMPERATURE UNIT

The parameter indicates the internal temperature in the phone module (PHM).

Measurement range -127 - 127°C.

The normal temperature is approximately 70°C but may vary depending on whether the air conditioning (A/C) or heater is in use.

DESCRIPTION OF READING DETAILED DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

SELECT DESCRIPTION

see **DESCRIPTION OF FROZEN VALUES**

see **STATUS IDENTIFIER, DESCRIPTION**

see **COUNTERS, DESCRIPTION**

DESCRIPTION OF FROZEN VALUES

EXPLANATION

Not all the parameters that are described need to be implemented in the control module. These varies from system to system.

The number of parameters can also vary between diagnostic trouble codes (DTCs).

Frozen values are parameter values that are stored when a diagnostic trouble code (DTC) is stored.

ENGINE RUNNING, STATUS

The status displays whether the engine was running when the diagnostic trouble code (DTC) was stored.

The phone module (PHM) obtains the value via the control area network (CAN).

No = the engine was not running

Yes = the engine was running

PASSENGER COMPARTMENT TEMPERATURE, VALUE

Measurement range -60 - 195°C.

The value indicates the passenger compartment temperature at the time the diagnostic trouble code (DTC) was stored.

The phone module (PHM) obtains the value via the control area network (CAN).

OUTSIDE TEMPERATURE, VALUE

Measurement range -128 - 127.75°C.

The value indicates the outside temperature at the time the diagnostic trouble code (DTC) was stored.

The phone module (PHM) obtains the value via the control area network (CAN).

BATTERY VOLTAGE, CENTRAL ELECTRONIC MODULE (CEM), VALUE

Measurement range 5-30 V.

The normal value when the alternator is charging: 13.0-14.5 V.

The parameter indicates the supply voltage to the central electronic module (CEM) when the diagnostic trouble code (DTC) was stored.

The phone module (PHM) obtains the value via the control area network (CAN).

DISTANCE, VALUE

Measurement range 0-1, 000, 000 km.

The parameter indicates the mileage when the diagnostic trouble code (DTC) was stored.

The phone module (PHM) obtains the value via the control area network (CAN).

POWER SUPPLY, VALUE

Measurement range 5 - 66 V.

The value indicates the power supply to the phone module (PHM) when the diagnostic trouble code (DTC) was stored.

TEMPERATURE UNIT, VALUE

Measurement range -127 - 127°C.

The value indicates the internal temperature in the phone module (PHM) when the diagnostic trouble code (DTC) was stored.

The normal temperature is approximately 70°C but this may vary depending on whether the air conditioning (A/C) or heater is in use.

SIGNAL STRENGTH GSM, VALUE

Measurement range 0 -31.

The value indicates the signal strength for GSM phone modules (PHM).

The value of the signal strength depends on the coverage and geographical location of the vehicle. The value for normal coverage/reception should be approximately 20-25.

VEHICLE COMMUNICATION INFORMATION, ANTENNA MODULE (ATM) (2003-06)

DESCRIPTION OF VEHICLE COMMUNICATION INFORMATION

CONTENTS

Select type of description.

- see **DESCRIPTION OF PARAMETERS**
- see **DESCRIPTION OF READOUTS, FM**
- see **DESCRIPTION OF ACTIVATIONS AND READOUTS, FM**
- see **DESCRIPTION OF READOUTS, AM**

DESCRIPTION OF READOUTS, FM

FREQUENCY BAND AM/FM

Click on the button **AM/FM** to change frequency band between AM and FM.

Readout value indicates frequency band in question or if the control module is off.

AM = frequency band AM.

FM = frequency band FM.

Off = control module off.

FREQUENCY

Clicking on the button >>| starts an automatic search for radio stations in the frequency band.

Radio stations with a signal strength of approx. 110 or higher are found automatically.

Readout value indicates frequency in question in MHz.

MAIN ANTENNA

Readout value indicates if the main antenna is activated or deactivated.

On = main antenna activated.

Off = main antenna deactivated.

SUB-ANTENNA

Readout value indicates if the sub-antenna is activated or deactivated.

On = sub-antenna activated.

Off = sub-antenna deactivated.

SIGNAL STRENGTH

The readout value applies to the active antenna.

Signal strength is presented as a number between 0 and 255. 0 means that no signal has been registered, and 255 means that highest possible signal strength has been registered.

NOISE LEVEL

The readout value applies to the active antenna.

Noise level is presented as a number between 0 and 15. 0 means that no noise has been registered, and 15 means that highest possible noise level has been registered.

DESCRIPTION OF ACTIVATIONS AND READOUTS, FM

FREQUENCY BAND AM/FM

Click on the button **AM/FM** to change frequency band between AM and FM.

Readout value indicates frequency band in question or if the control module is off.

AM = frequency band AM.

FM = frequency band FM.

Off = control module off.

FREQUENCY

Clicking on the button>>| starts an automatic search for radio stations in the frequency band.

Radio stations with a signal strength of approx. 110 or higher are found automatically.

Readout value indicates frequency in question in MHz.

MAIN ANTENNA

By clicking on the button **Start readout 1** , the main antenna is activated. When the antenna has been activated, a readout is performed of the activation as well as the values for signal strength and noise level.

Readout value indicates if the main antenna is activated or deactivated.

On = main antenna activated.

Off = main antenna deactivated.

SUB-ANTENNA

By clicking on the button **Start readout 2** , the sub-antenna is activated. When the antenna has been activated, a readout is performed of the activation as well as the values for signal strength and noise level.

Readout value indicates if the sub-antenna is activated or deactivated.

On = sub-antenna activated.

Off = sub-antenna deactivated.

SIGNAL STRENGTH

The readout value applies to the active antenna.

Signal strength is presented as a number between 0 and 255. 0 means that no signal has been registered, and 255 means that highest possible signal strength has been reached.

NOISE LEVEL

The readout value applies to the active antenna.

Noise level is presented as a number between 0 and 15. 0 means that no noise has been registered, and 15 means that highest possible noise level has been registered.

DESCRIPTION OF READOUTS, AM

FREQUENCY BAND AM/FM

Click on the button **AM/FM** to change frequency band between AM and FM.

Readout value indicates frequency band in question or if the control module is off.

AM = frequency band AM.

FM = frequency band FM.

Off = control module off.

FREQUENCY

Clicking on the button>>| starts an automatic search for radio stations in the frequency band.

Radio stations with a signal strength of approx. 75 or higher are found automatically.

Readout value indicates frequency in question in kHz.

SIGNAL STRENGTH

Signal strength is presented as a number between 0 and 255. 0 means that no signal has been registered, and 255 means that highest possible signal strength has been registered.

VEHICLE COMMUNICATION INFORMATION, SUBWOOFER MODULE (SUB) (2003-08)

DESCRIPTION OF VEHICLE COMMUNICATION INFORMATION

CONTENTS

Select type of description.

- see **DESCRIPTION OF FROZEN VALUES**
- see **STATUS IDENTIFIER, DESCRIPTION**
- see **COUNTERS, DESCRIPTION**

DESCRIPTION OF FROZEN VALUES

EXPLANATION

Not all the parameters described need to be implemented in the control module. This varies from system to system.

Frozen values are parameter values that are stored when a diagnostic trouble code (DTC) is stored.

BATTERY VOLTAGE, VALUE

Measurement range: 5-24 V.

Normal value when the generator (GEN) is charging: 13.0-14.5 V.

DISTANCE, VALUE

Measurement range: 0-1, 000, 000 km.

The value indicates the total mileage of the car at the time the diagnostic trouble code (DTC) was stored.

PASSENGER COMPARTMENT TEMPERATURE, VALUE

Measurement range: -40 to +80°C.

OUTSIDE TEMPERATURE, VALUE

Measurement range: -40 to +80°C.

ENGINE RUNNING, STATUS

The status displays whether the engine was running when the diagnostic trouble code (DTC) was stored.

No = the engine was not running

Yes = the engine was running

SOUND VOLUME, VALUE

Measurement range: 0 to -127 dB.

TIME, VALUE

The value displays the time that has passed since the diagnostic trouble code (DTC) was stored.

VEHICLE COMMUNICATION INFORMATION, GLOBAL POSITIONING SYSTEM MODULE (GPS) (2007-12)

DESCRIPTION OF PARAMETERS

GPS RECEIVED POSITION, LONGITUDE

Indicates the vehicle's longitudinal position.

GPS RECEIVED POSITION, LATITUDE

Indicates the vehicle's latitudinal position.

GPS SATELLITES ACCESSIBLE

Indicates how many satellites the global positioning system module (GPS) is in contact with.

- Not available - no contact with any satellites
- No fix - contact with a satellite but unable to fix a position
- 2D Fix- contact with a satellite, two-dimensional position fixing
- 3D Fix - contact with satellites, three-dimensional position fixing
- Circuit fault - Open-circuit/short-circuit in the cable harness between the global positioning system module (GPS) and the GPS antenna.

DESCRIPTION OF READING OFF OF EXTENDED DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

see **DESCRIPTION OF FROZEN VALUES**

see **STATUS IDENTIFIER, DESCRIPTION**

see **COUNTERS, DESCRIPTION**

DESCRIPTION OF FROZEN VALUES

EXPLANATION

Not all the parameters described need to be implemented in the global positioning system module (GPS). This varies from system to system.

Frozen values are parameter values that are stored when a diagnostic trouble code (DTC) is stored.

BATTERY VOLTAGE, VALUE

Measurement range: 5-24 V.

Normal value when the generator (GEN) is charging: 13.0-14.5 V.

DISTANCE, VALUE

Measurement range: 0-1, 000, 000 km.

The value indicates the vehicle's total mileage when the Diagnostic Trouble Code (DTC) was generated.

PASSENGER COMPARTMENT TEMPERATURE, VALUE

Measurement range: -40 to 80°C.

The value indicates the vehicle's passenger compartment temperature when the Diagnostic Trouble Code (DTC) was generated.

OUTSIDE TEMPERATURE, VALUE

Measurement range: -40 to 80°C.

The value indicates the outside temperature at the time the diagnostic trouble code (DTC) was stored.

ENGINE RUNNING, STATUS

The status displays whether the engine was running when the diagnostic trouble code (DTC) was stored.

No = the engine was not running

Yes = the engine was running

TIME, VALUE

The value displays the time that has passed since the diagnostic trouble code (DTC) was stored.

CHECKING THE SYSTEM, DIGITAL VERSATILE DISC PLAYER AND SCREENS. REAR SEAT ENTERTAINMENT, GENERATION 4.1 (2006-2007)

CHECKING THE SYSTEM, DIGITAL VERSATILE DISC PLAYER AND SCREENS

FAULT-TRACING INFORMATION

If the system cannot be turned on and no screen is lit up and the malfunction cannot be connected to a special function, e. g., that the AUX-input is used, the cause of the malfunction may be:

- Contact resistance or oxidation in the terminals.
- One or both screens not connected.
- Open-circuit in leads between screen and rear seat entertainment module (RSE).
- Voltage supply to the screen or Rear Seat Entertainment Module (RSE).
- Damaged screen.

If the DVD player does not work but other audio/picture sources work, the problem may be due to:

- Damaged dvd-disc.

If none or only one of the screens work, and this is not associated to a certain function in the system, the probable cause may be:

- Contact resistance or oxidation in the terminals.
- Open circuit on signal cable.
- Power supply missing
- Damaged screen.
- Open-circuit or short-circuit in the cable for the control area network (CAN).

Fig. 1: Identifying Entertainment System Components & Communication
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

- **Continue**

  Refer to **FAULT-TRACING INFORMATION**

CHECKING THE POWER SUPPLY AND GROUND TERMINALS

If lighting in the buttons does not come on at all, this indicates malfunction of the voltage feed or ground for the rear seat entertainment module (RSE) / DVD-Player.

Check the lead for voltage feed to rear seat entertainment module (RSE)/DVD-player's #A4, #A6 and #A7 for short-circuiting to voltage, short-circuiting to ground and open circuit. The voltage should be approx. the same as the battery voltage.

HINT: Power supply (15 feed) is common with power supply to rear 12 V socket.

Check the lead for ground connection to rear seat entertainment module (RSE), connector #A8, for open circuit and short-circuit to voltage. Also check the ground terminal. Check for contact resistance and oxidation.

Check the connector for rear seat entertainment module (RSE) / DVD-Player contact resistance and oxidation.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.1**
- see **CHECKING WIRING AND TERMINALS**

Fig. 2: Identifying Rear Seat Entertainment Module (RSE)
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

- **Continue**

  Refer to **VERIFICATION**

FAULT-TRACING INFORMATION

When the ignition is on, the rear seat entertainment module (RSE) performs a simple internal system-check and starts the start-up procedure with the screens.

- Ignition on. Lighting in the DVD-player's buttons is activated.
- When start-up is performed the lighting in the DVD-player's buttons goes off, does not apply to POWER-button.

Check how illumination of the function buttons behaves during start-up and then select the alternative described below. The specified times are to be considered guidelines, not exact times.

1. Lighting in the DVD-player's buttons is not activated at all with ignition on.
2. DVD player button illumination comes on. Goes out in all buttons except the POWER button after 4-10 seconds.
3. DVD player button illumination comes on. Goes out in all buttons except the POWER button after 15-35 seconds.
4. DVD player button illumination comes on. Goes out in all buttons only in brief intervals every 10 seconds.

HINT: That the lighting in the function buttons goes out after approx. 10 seconds, means that the screens are supplied with voltage and grounded as well as that Rear seat entertainment module (RSE) (DVD-player) has established contact with both screens on the internal CAN-net. This also means that the circuit boards behind the screens in both head restraints work as intended.

Fig. 3: Identifying Entertainment System Components & Communication
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Select alternative according to above.

- **1**

  Refer to **CHECKING THE POWER SUPPLY AND GROUND TERMINALS**

- **2**

  Refer to **CHECKING THE POWER SUPPLY TO THE CONTROL MODULE**

- **3**

  Refer to **CHECKING VOLTAGE FEED AND GROUND FOR SCREENS**

- **4**

  Refer to **CHECKING WAKE-UP SIGNAL**

CHECKING THE POWER SUPPLY TO THE CONTROL MODULE

- Turn on the system with the main switch on the DVD-player.
- Lighting in all of the DVD-player's buttons shall now be activated and remain on.

HINT: If lighting in all of the DVD-player's buttons is activated, and then goes off after approx. 5-10 seconds, this indicates lost 15-feed to rear seat entertainment module (RSE) / DVD-Player.

Fig. 4: Identifying Rear Seat Entertainment Module (RSE)
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Does lighting stay on?

- **YES**

  Refer to **CHECKING THE DISPLAY SCREENS**

- **NO**

  Refer to **CHECKING THE WIRING AND TERMINALS**

CHECKING VOLTAGE FEED AND GROUND FOR SCREENS

Rear seat entertainment module (RSE) (DVD-player) has not established contact with one or both screens. Whatever the case is, can be indicated by how long time the start has taken.

NOTE: **If one of the screens does not respond but the other does, start-up takes about 15-25 seconds. If none of the screens respond, then start-up takes approx. 30-35 seconds.**

The specified times are to be considered guidelines, not exact times.

HINT: Turn on the system with the main switch on the DVD-player. The screen that does not have contact with the control module (DVD-player) will not light up. If the power supply and ground to the screen are working properly but the screen has no contact with the rear seat entertainment module (RSE)/DVD player via the CAN network, the screen will come on in LOCAL mode at start-up. Then neither sound will be heard nor picture shown at playback from DVD-player to this screen. This indicates a malfunction of either the wake-up signal or CAN-communication.

Take measurements for the screen that is not communicating.

Check the voltage feed from rear seat entertainment module (RSE) / DVD-Player to screens, #E1 (left screen) and #E13 (right screen), for short-circuiting to ground and open circuit. The voltage must be approximately battery voltage when the ignition is on.

Check the ground connection from rear seat entertainment module (RSE) / DVD-Player to screens, #E12 (left screen) and #E24 (right screen), for short-circuiting to voltage and open circuit.

Check the connector for rear seat entertainment module (RSE) / DVD-Player as well as screens for loose contact, contact resistance and oxidation.

HINT: If a screen is not working, try switching places between the screens/head restraints. If the malfunction remains, this indicates a malfunction either in the leads between the screen's circuit board and the display itself or in the display itself.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.1**
- see **CHECKING WIRING AND TERMINALS**

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING WAKE-UP SIGNAL**

CHECKING THE WIRING AND TERMINALS

Check the lead for voltage feed (15-feed) to rear seat entertainment module (RSE)/DVD-player's #A6 and #A7 for short-circuiting to voltage, short-circuiting to ground and open circuit.

HINT: Power supply (15 feed) is common with power supply to rear 12 V socket.

NOTE: When this feed is lost, the system will only work for another approx. 10 minutes. The system cannot be restarted until the power supply is OK. If no cable or fuse defects are found and there still is no power supply, the problem probably lies in the vehicle electrical system.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.1**
- see **CHECKING WIRING AND TERMINALS**

Fig. 5: Identifying Rear Seat Entertainment Module (RSE)
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

- Ignition off.
- Restore components and connectors.
- Switch on the ignition. Lighting in the DVD-player's buttons is activated.
- When start-up is performed the lighting in the DVD-player's buttons goes off, does not apply to POWER-button.

NOTE: A long start-up time indicates a fault in communication with the screens.

- Start the system using the POWER button on the DVD player or the remote control. Use the buttons, on both DVD-player and remote control, to operate the system.

Check that:

- The screens show a picture.
- DVD-disc can be played.
- Sound is heard in wireless headphones.
- Sound can be heard in the vehicle's speakers.
- Menus can be accessed with the remote control in both screens.
- If possible, connect an external source to the AV input and test the function.

Fig. 6: Identifying Entertainment System Components & Communication
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Is the function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

CHECKING THE DISPLAY SCREENS

- Turn on the system with the main switch on the DVD-player.
- Lighting in all of the DVD-player's buttons shall now be activated and remain on.
- Now the screens shall be activated.

Fig. 7: Identifying Seat Headrest Video Screen
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Do the screens come on?

- **YES**

  Refer to **CHECKING THE REMOTE CONTROL**

- **NO**

  Refer to **CHECKING THE COMPONENTS AND WIRING**

CHECKING THE COMPONENTS AND WIRING

Checking the components and wiring

HINT: If only one of the screens lights up, try installing the screen that is not working in the head restraint where the working screen was installed. Then restart the system by turning it off, switching off the ignition and then switching the ignition on again. Turn on the system with the main switch on the DVD-player. If the malfunction remains, this indicates a malfunction either in the leads between the screen's circuit board and the display itself or in the display itself.

If necessary, test with a new circuit card or a new display.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.1**
- see **CHECKING WIRING AND TERMINALS**

Fig. 8: Identifying Seat Headrest Video Screen
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

- **Continue**

  Refer to **VERIFICATION**

CHECKING THE REMOTE CONTROL

Make sure the remote control batteries are fully charged.

- Turn off the system with the main switch on the DVD player.
- Wait until the system has shut down.
- Turn on the system with the remote control aimed at the left screen.

Then repeat with the right screen.

Fig. 9: Identifying Entertainment System Components & Communication
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Do the screens come on?

- **YES**

  Refer to **CHECKING THE DVD PLAYER**

- **NO**

  Refer to **CHECKING THE REMOTE CONTROL SIGNAL**

CHECKING THE REMOTE CONTROL SIGNAL

HINT: If none of the screens come on in the previous test, the probable cause is a damaged remote control or discharged batteries.

HINT: If only one screen does not come on in the previous test, it indicates that the cable for infrared (IR) signals is probably damaged.

HINT: Activation of the infrared IR-receivers in the head restraints can be checked by the IR-lights in the screen's lower edge being on dimly after the system has been turned on.

Checking IR-signal, left screen

Check the lead for the infrared (IR) signal between the screen and rear seat entertainment module (RSE) for open circuit.

To check the voltage level on the signal cable for IR-signal, proceed as follows:

- Connect all cables and connectors.
- Measure the voltage between the signal cable for the Infra Red (IR) signal to the left-hand display screen

and ground. The measured voltage is reference value.

NOTE: Do not press any of the buttons on the remote control during this measurement.

- Measure from the rear side of a suitable connector. Do not damage the terminals in the connector.
- Aim the remote control at the left screen and press in a button on the remote control. The voltage on the signal cable must fall slightly for as long as the button on the remote control is pressed in.

NOTE: Important in this measurement are not the absolute voltage levels, instead you get a voltage difference downward.

Checking IR-signal, right screen

Compare the latest reading as above with the signal for the infra red (IR) signal from the right-hand infra red (IR) receiver for the display screen.

Conclusion

- If the result of the above checks is that no malfunction was found, this means that the receivers in both screens work and that the remote control is OK.
- If voltages on the cables are OK but a lower voltage cannot be measured when a button on the remote control is pressed down, try with replacing the remote control.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.1**
- see **CHECKING WIRING AND TERMINALS**
- **Continue**

  Refer to **VERIFICATION**

CHECKING THE DVD PLAYER

Check that the DVD is not damaged and that it is clean. Try using another DVD if necessary.

Check that nothing has jammed in the DVD player. Check that there are no mechanical grinding noises coming from the DVD player when it is in operation.

Check that the disc can be inserted and ejected without problems.

NOTE: Only one disc at a time may be loaded in the DVD-player.

Check that the transport protection disc, which is supplied with system at delivery, is not in the DVD-player.

Fig. 10: Identifying Rear Seat Entertainment Module (RSE)
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING THE FUNCTION**

CHECKING THE FUNCTION

- Select the dvd-player as source for one of the screens and press on the remote control's PLAY button.

  Check that picture is shown and sound is heard at playback.

  NOTE: If there is a picture but no audio in one or both of the headphones, see other fault tracing.

  If picture and sound are shown, start-up of the system, DVD-player, and screens is ok.

Is there a picture?

- **YES**

  FAULT NOT FOUND: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE CABLE AND COMPONENT**

CHECKING THE CABLE AND COMPONENT

Check the leads for video signals between the TV-receiver and rear seat entertainment module (RSE) for short-circuiting to voltage, short-circuiting to ground, and open circuit. There are two video leads for each screen. Regards the cables from rear seat entertainment module (RSE), terminals #E10 and #E11 for left screen as well as terminals #E22 and #E23 for right screen.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.1**
- see **CHECKING WIRING AND TERMINALS**

- **Continue**

  Refer to **VERIFICATION**

CHECKING CAN CABLES

HINT: If the power supply and ground to the screen are working properly but the screen has no contact with the rear seat entertainment module (RSE)/DVD player via the CAN network, the screen will come on in LOCAL mode at start-up. Then neither sound will be heard nor picture shown at playback from DVD-player to this screen. Menus available locally in the screen can be accessed.

Check if the screens are activated in LOCAL-mode, which means that there is malfunction on the CAN-leads.

Check the leads for CAN-communication between rear seat entertainment module (RSE) / DVD-Player and screens, #E3 and #E4 (left screen) and #E15 and #E16 (right screen, for short-circuiting to voltage, short-circuiting to ground, and open circuit.

In connector D, on rear seat entertainment module (RSE) / DVD-Player, there is a bridging of the CAN-net for the right screen. Bridging is in place to enable future expansion of the system with additional control modules. If connector B has been damaged or is disconnected or if for some reason there is no contact between the two ends of the CAN cable jumper, it will not be possible to establish communication with the right screen.

HINT: If a screen is not working, try switching places between the screens/head restraints. If the malfunction remains, this indicates a malfunction either in the leads between the screen's circuit board and the display itself or in the display itself.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.1**
- see **CHECKING WIRING AND TERMINALS**

- **Continue**

Refer to **VERIFICATION**

CHECKING WAKE-UP SIGNAL

The control module makes three attempts to activate a screen by transmitting a high signal on the cable as a wake-up signal to the screen in question. This takes place according to the following pattern, on the condition that the screen does not reply. Normally only one wake-up signal is sent for the screen to wake up.

If the pattern below appears, the screen is not responding.

- High voltage (approx. 11.5 V) for approx. one second.
- Low voltage (approx. 0 V) for approx. one second.
- High voltage (approx. 11.5 V) for approx. one second.
- Low voltage (approx. 0 V) for approx. 10 seconds.
- Constant high voltage.

Measurement of wake-up signal.

When the ignition is on, the rear seat entertainment module (RSE) performs a simple internal system-check and starts the start-up procedure with the screens.

- Measure wake-up signal at the screen. Measure from the rear side of a suitable connector. Do not damage the terminals in the connector. Measure signal that goes to the screen that does not answer the wake-up calls.
- Switch on the ignition. Lighting in the DVD-player's buttons is activated.
- Note voltage of the wake-up signal.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.1**
- see **CHECKING WIRING AND TERMINALS**

Fig. 11: Identifying Seat Headrest Video Screen
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Fig. 12: Identifying Rear Seat Entertainment Module (RSE)
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Is there any wake-up signal?

- **YES**

  Refer to **CHECKING CAN CABLES**

- **NO**

  Refer to **CHECKING THE CABLE AND COMPONENT**

CHECKING THE CABLE AND COMPONENT

Take measurements for the screen that is not communicating.

Check the lead for the wake-up signal from rear seat entertainment module (RSE) / DVD-Player to screens, #E2 (left screen) and #E14 (right screen), for short-circuiting to ground and open circuit.

Check the connector for rear seat entertainment module (RSE) / DVD-Player as well as screens for loose contact, contact resistance and oxidation.

HINT: If a screen is not working, try switching places between the screens/head restraints. If the malfunction remains, this indicates a malfunction either in the leads between the screen's circuit board and the display itself or in the display itself.

Remedy as necessary.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.1**

- see **CHECKING WIRING AND TERMINALS**
- **Continue**

  Refer to **VERIFICATION**

CHECKING WAKE-UP SIGNAL

Rear seat entertainment module (RSE) (DVD-player) has not established contact with one or both screens. Follow the procedure below to check which screen has not responded.

NOTE: Switch off the system before connecting/disconnecting a connector.

- Turn off the ignition.
- Connect a voltmeter between the cable for the wake-up signal to right screen and ground. Measure wake-up signal at the screen. Measure from the rear side of a suitable connector. Do not damage the terminals in the connector.
- Switch on the ignition. Wait approximately 10 seconds.

Check the voltage of the wake-up signal. Note voltage of the wake-up signal.

- Then measure the wake-up signal of the left screen. Note voltage of the wake-up signal.

Left screen	Right screen	Options	
Voltage is continually high (approx. 11.5 V).	Voltage is continually high (approx. 11.5 V).	Communication established with both screens.	
Voltage is high (approx. 11.5 V) but goes down to approx. 0 V every 10 seconds.	Voltage is approx. 0 V.	No communication established with left screen.	1.
Voltage is continually high (approx. 11.5 V).	Voltage is high (approx. 11.5 V) but goes down to approx. 0 V every 10 seconds.	No communication established with right screen.	1.
Voltage is continually high (approx. 11.5 V).	Voltage is approx. 0 V.	Probable open circuit on wake-up signal for right screen.	2.
Voltage is approx. 0 V.	Voltage is approx. 0 V.	Probable open circuit on wake-up signal for left screen.	2.
Voltage is high (approx. 11.5 V) but goes down to approx. 0 V every 10 seconds.	Voltage is high (approx. 11.5 V) but goes down to approx. 0 V every 10 seconds.	Probable fault in CAN communication with screens.	3.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CHECKING THE SYSTEM, DIGITAL VERSATILE DISC PLAYER AND SCREENS. REAR SEAT ENTERTAINMENT, GENERATION 4.2 (2007-2008)

CHECKING THE SYSTEM, DIGITAL VERSATILE DISC PLAYER AND SCREENS

FAULT-TRACING INFORMATION

If the system cannot be turned on and no screen is lit up and the malfunction cannot be connected to a special function, e. g., that the AUX-input is used, the cause of the malfunction may be:

- Contact resistance or oxidation in the terminals.
- One or both screens not connected.
- Open-circuit in leads between screen and rear seat entertainment module (RSE).
- Voltage supply to the screen or Rear Seat Entertainment Module (RSE).
- Damaged screen.

If the DVD player does not work but other audio/picture sources work, the problem may be due to:

- Damaged dvd-disc.

If none or only one of the screens work, and this is not associated to a certain function in the system, the probable cause may be:

- Contact resistance or oxidation in the terminals.
- Open circuit on signal cable.
- Power supply missing
- Damaged screen.
- Open-circuit or short-circuit in the cable for the control area network (CAN).

FAULT-TRACING INFORMATION

When the ignition is on, the rear seat entertainment module performs a simple internal system-check and starts the start-up procedure with the screens.

- Ignition on. Lighting in the DVD-player's buttons is activated.
- When start-up is performed the lighting in the DVD-player's buttons goes off, does not apply to POWER-button.
- Check how illumination of the function buttons behaves during start-up and then select the alternative described below. The specified times are to be considered guidelines, not exact times.

NOTE: Times for system start-up vary depending on the software. It is not necessary to identify software version to perform this fault tracing. Current software can be read using SERVICE MENU.

Later software. Software, version. Select an option:

1. Lighting in the DVD-player's buttons is not activated at all with ignition on.
2. Lighting in all of the DVD-player's buttons is activated and all buttons except the POWER-button go off after approx. 10 seconds.
3. Lighting in all of the DVD-player's buttons is activated and all buttons except the POWER-button go off after approx. 85-95 seconds.

Older software. Select an option:

1. Lighting in the DVD-player's buttons is not activated at all with ignition on. Refer to **CHECKING THE POWER SUPPLY AND GROUND TERMINALS**
2. DVD player button illumination comes on. Goes out in all buttons except the POWER button after 4-10 seconds. Refer to **CHECKING THE POWER SUPPLY TO THE CONTROL MODULE**
3. DVD player button illumination comes on. Goes out in all buttons except the POWER button after 15-35 seconds. Refer to **CHECKING VOLTAGE FEED AND GROUND FOR SCREENS**
4. DVD player button illumination comes on. Goes out in all buttons only in brief intervals every 10 seconds. Refer to **CHECKING WAKE-UP SIGNAL**

HINT: That the lighting in the function buttons goes out after approx. 10 seconds, means that the screens are supplied with voltage and grounded as well as that Rear seat entertainment module (RSE) (DVD-player) has established contact with both screens on the internal CAN-net. This also means that the circuit boards behind the screens in both head restraints work as intended.

Fig. 20: Identifying Entertainment System Components & Communication
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

CHECKING THE POWER SUPPLY TO THE CONTROL MODULE

- Turn on the system with the main switch on the DVD-player.
- Lighting in all of the DVD-player's buttons shall now be activated and remain on.

HINT: If lighting in all of the DVD-player's buttons is activated, and then goes off after approx. 5-10 seconds, this indicates lost 15-feed to rear seat entertainment module (RSE) / DVD-Player.

Fig. 21: Identifying Rear Seat Entertainment Module (RSE)
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Does lighting stay on?

- **YES**

  Refer to **CHECKING THE DISPLAY SCREENS**

- **NO**

  Refer to **CHECKING THE WIRING AND TERMINALS**

CHECKING VOLTAGE FEED AND GROUND FOR SCREENS

Rear seat entertainment module (RSE) has not established contact with one or both screens. Whatever the case is, can be indicated by how long time the start has taken.

NOTE: **Later software. Software, version. If one of the screens does not respond but the other does, start-up takes about 85 seconds. If none of the screens respond, start-up takes approx. 95 seconds.**

NOTE: **Older software. If one of the screens does not respond but the other does, start-up takes about 15-25 seconds. If none of the screens respond, then start-up takes approx. 30-35 seconds.**

The specified times are to be considered guidelines, not exact times.

HINT: Turn on the system with the main switch on the DVD-player. The screen that does not have contact with the control module (DVD-player) will not light up. If the power supply and ground to the screen are working properly but the screen has no contact with the rear seat entertainment module (RSE)/DVD player via the CAN network, the screen will come on in LOCAL mode at start-up. Then neither sound will be heard nor picture shown at playback from DVD-player to this screen. This

indicates a malfunction of either the wake-up signal or CAN-communication.

Take measurements for the screen that is not communicating.

Check the voltage feed from rear seat entertainment module (RSE) / DVD-Player to screens, #E1 (left screen) and #E13 (right screen), for short-circuiting to ground and open circuit. The voltage must be approximately battery voltage when the ignition is on.

Check the ground connection from rear seat entertainment module (RSE) / DVD-Player to screens, #E12 (left screen) and #E24 (right screen), for short-circuiting to voltage and open circuit.

Check the connector for rear seat entertainment module (RSE) / DVD-Player as well as screens for loose contact, contact resistance and oxidation.

HINT: If a screen is not working, try switching places between the screens/head restraints. If the malfunction remains, this indicates a malfunction either in the leads between the screen's circuit board and the display itself or in the display itself.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.2**
- see **CHECKING WIRING AND TERMINALS**

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING WAKE-UP SIGNAL**

CHECKING THE WIRING AND TERMINALS

Check the lead for voltage feed (15-feed) to rear seat entertainment module (RSE)/DVD-player's #A6 and #A7 for short-circuiting to voltage, short-circuiting to ground and open circuit.

HINT: Power supply (15 feed) is common with power supply to rear 12 V socket.

NOTE: When this feed is lost, the system will only work for another approx. 10 minutes. The system cannot be restarted until the power supply is OK. If no cable or fuse defects are found and there still is no power supply, the problem probably lies in the vehicle electrical system.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.2**
- see **CHECKING WIRING AND TERMINALS**

Fig. 22: Identifying Rear Seat Entertainment Module (RSE)
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

- Ignition off.
- Restore components and connectors.
- Switch on the ignition. Lighting in the DVD-player's buttons is activated.
- When start-up is performed the lighting in the DVD-player's buttons goes off, does not apply to POWER-button.

NOTE: A long start-up time indicates a fault in communication with the screens.

- Start the system using the POWER button on the DVD player or the remote control. Use the buttons, on both DVD-player and remote control, to operate the system.

Check that:

- The screens show a picture.
- DVD-disc can be played.
- Sound is heard in wireless headphones.

- Sound can be heard in the vehicle's speakers.
- Menus can be accessed with the remote control in both screens.
- If possible, connect an external source to the AV input and test the function.

Fig. 23: Identifying Entertainment System Components & Communication
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Is the function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

CHECKING THE DISPLAY SCREENS

- Turn on the system with the main switch on the DVD-player.
- Lighting in all of the DVD-player's buttons shall now be activated and remain on.
- Now the screens shall be activated.

Fig. 24: Identifying Seat Headrest Video Screen
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Do the screens come on?

- **YES**

  Refer to **CHECKING THE REMOTE CONTROL**

- **NO**

  Refer to **CHECKING THE COMPONENTS AND WIRING**

CHECKING THE COMPONENTS AND WIRING

Checking the components and wiring

HINT: If only one of the screens lights up, try installing the screen that is not working in the head restraint where the working screen was installed. Then restart the system by turning it off, switching off the ignition and then switching the ignition on again. Turn on the system with the main switch on the DVD-player. If the malfunction remains, this indicates a malfunction either in the leads between the screen's circuit board and the display itself or in the display itself.

If necessary, test with a new circuit card or a new display.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.2**
- see **CHECKING WIRING AND TERMINALS**

Fig. 25: Identifying Seat Headrest Video Screen
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

- **Continue**

  Refer to **VERIFICATION**

CHECKING THE REMOTE CONTROL

Make sure the remote control batteries are fully charged.

- Turn off the system with the main switch on the DVD player.
- Wait until the system has shut down.

- Turn on the system with the remote control aimed at the left screen.

Then repeat with the right screen.

Fig. 26: Identifying Entertainment System Components & Communication
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Do the screens come on?

- **YES**

  Refer to **CHECKING THE DVD PLAYER**

- **NO**

  Refer to **CHECKING THE REMOTE CONTROL SIGNAL**

CHECKING THE REMOTE CONTROL SIGNAL

HINT: If none of the screens come on in the previous test, the probable cause is a damaged remote control or discharged batteries.

HINT: If only one screen does not come on in the previous test, it indicates that the cable for infrared (IR) signals is probably damaged.

HINT: Activation of the infrared IR-receivers in the head restraints can be checked by the IR-lights in the screen's lower edge being on dimly after the system has been turned on.

Checking IR-signal, left screen

Check the lead for the infrared (IR) signal between the screen and rear seat entertainment module (RSE) for open circuit.

To check the voltage level on the signal cable for IR-signal, proceed as follows:

- Connect all cables and connectors.
- Measure the voltage between the signal cable for the Infra Red (IR) signal to the left-hand display screen and ground. The measured voltage is reference value.

NOTE: Do not press any of the buttons on the remote control during this measurement.

- Measure from the rear side of a suitable connector. Do not damage the terminals in the connector.
- Aim the remote control at the left screen and press in a button on the remote control. The voltage on the signal cable must fall slightly for as long as the button on the remote control is pressed in.

NOTE: Important in this measurement are not the absolute voltage levels, instead you get a voltage difference downward.

Checking IR-signal, right screen

Compare the latest reading as above with the signal for the infra red (IR) signal from the right-hand infra red (IR) receiver for the display screen.

Conclusion

- If the result of the above checks is that no malfunction was found, this means that the receivers in both screens work and that the remote control is OK.
- If voltages on the cables are OK but a lower voltage cannot be measured when a button on the remote control is pressed down, try with replacing the remote control.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.2**
- see **CHECKING WIRING AND TERMINALS**

- **Continue**

  Refer to **VERIFICATION**

CHECKING THE DVD PLAYER

Check that the DVD is not damaged and that it is clean. Try using another DVD if necessary.

Check that nothing has jammed in the DVD player. Check that there are no mechanical grinding noises coming from the DVD player when it is in operation.

Check that the disc can be inserted and ejected without problems.

NOTE: Only one disc at a time may be loaded in the DVD-player.

Check that the transport protection disc, which is supplied with system at delivery, is not in the DVD-player.

Fig. 27: Identifying Rear Seat Entertainment Module (RSE)
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING THE FUNCTION**

CHECKING THE FUNCTION

- Select the dvd-player as source for one of the screens and press on the remote control's PLAY button.

  Check that picture is shown and sound is heard at playback.

  NOTE: If there is a picture but no audio in one or both of the headphones, see other fault tracing.

  If picture and sound are shown, start-up of the system, DVD-player, and screens is ok.

Is there a picture?

- **YES**

FAULT NOT FOUND: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE CABLE AND COMPONENT**

CHECKING THE CABLE AND COMPONENT

Check the leads for video signals between the TV-receiver and rear seat entertainment module (RSE) for short-circuiting to voltage, short-circuiting to ground, and open circuit. There are two video leads for each screen. Regards the cables from rear seat entertainment module (RSE), terminals #E10 and #E11 for left screen as well as terminals #E22 and #E23 for right screen.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.2**
- see **CHECKING WIRING AND TERMINALS**

- **Continue**

  Refer to **VERIFICATION**

CHECKING CAN CABLES

HINT: If the power supply and ground to the screen are working properly but the screen has no contact with the rear seat entertainment module (RSE)/DVD player via the CAN network, the screen will come on in LOCAL mode at start-up. Then neither sound will be heard nor picture shown at playback from DVD-player to this screen. Menus available locally in the screen can be accessed.

Check if the screens are activated in LOCAL-mode, which means that there is malfunction on the CAN-leads.

Check the leads for CAN-communication between rear seat entertainment module (RSE) / DVD-Player and screens, #E3 and #E4 (left screen) and #E15 and #E16 (right screen, for short-circuiting to voltage, short-circuiting to ground, and open circuit.

In connector D, on rear seat entertainment module (RSE) / DVD-Player, there is a bridging of the CAN-net for the right screen. Bridging is in place to enable future expansion of the system with additional control modules. If connector B has been damaged or is disconnected or if for some reason there is no contact between the two ends of the CAN cable jumper, it will not be possible to establish communication with the right screen.

HINT: If a screen is not working, try switching places between the screens/head restraints. If the malfunction remains, this indicates a malfunction either in the leads between the screen's circuit board and the display itself or in the display itself.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE, GENERATION 4.2**
- see **CHECKING WIRING AND TERMINALS**
- **Continue**

  Refer to **VERIFICATION**

CHECKING WAKE-UP SIGNAL

The control module makes three attempts to activate a screen by transmitting a high signal on the cable as a wake-up signal to the screen in question. This takes place according to the following pattern, on the condition that the screen does not reply. Normally only one wake-up signal is sent for the screen to wake up.

If the pattern below appears, the screen is not responding.

Later software. Software, version.

- High voltage (approx. 11.5 V) for approx. one second.
- Low voltage (approx. 0 V) for approx. three seconds.
- High voltage (approx. 11.5 V) for approx. one second.
- Low voltage (approx. 0 V) for approx. three seconds.
- Constant high voltage.

Older software.

- High voltage (approx. 11.5 V) for approx. one second.
- Low voltage (approx. 0 V) for approx. one second.
- High voltage (approx. 11.5 V) for approx. one second.
- Low voltage (approx. 0 V) for approx. 10 seconds.
- Constant high voltage.

Measurement of wake-up signal.

When the ignition is on, the rear seat entertainment module (RSE) performs a simple internal system-check and starts the start-up procedure with the screens.

- Measure wake-up signal at the screen. Measure from the rear side of a suitable connector. Do not damage the terminals in the connector. Measure signal that goes to the screen that does not answer the wake-up calls.
- Switch on the ignition. Lighting in the DVD-player's buttons is activated.
- Note voltage of the wake-up signal.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.2**
- see **CHECKING WIRING AND TERMINALS**

Fig. 28: Identifying Seat Headrest Video Screen
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Fig. 29: Identifying Rear Seat Entertainment Module (RSE)
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Is there any wake-up signal?

- **YES**

  Refer to **CHECKING CAN CABLES**

- **NO**

  Refer to **CHECKING THE CABLE AND COMPONENT**

CHECKING THE CABLE AND COMPONENT

Take measurements for the screen that is not communicating.

Check the lead for the wake-up signal from rear seat entertainment module (RSE) / DVD-Player to screens, #E2 (left screen) and #E14 (right screen), for short-circuiting to ground and open circuit.

Check the connector for rear seat entertainment module (RSE) / DVD-Player as well as screens for loose contact, contact resistance and oxidation.

HINT: If a screen is not working, try switching places between the screens/head restraints. If the malfunction remains, this indicates a malfunction either in the leads between the screen's circuit board and the display itself or in the display itself.

Remedy as necessary.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.2**
- see **CHECKING WIRING AND TERMINALS**
- **Continue**

  Refer to **VERIFICATION**

CHECKING WAKE-UP SIGNAL

Rear seat entertainment module (RSE) (DVD-player) has not established contact with one or both screens. Follow the procedure below to check which screen has not responded.

NOTE: Switch off the system before connecting/disconnecting a connector.

- Turn off the ignition.
- Connect a voltmeter between the cable for the wake-up signal to right screen and ground. Measure wake-up signal at the screen. Measure from the rear side of a suitable connector. Do not damage the terminals in the connector.
- Switch on the ignition. Wait approximately 10 seconds.

Check the voltage of the wake-up signal. Note voltage of the wake-up signal.

- Then measure the wake-up signal of the left screen. Note voltage of the wake-up signal.

Left screen	Right screen		Options
Voltage is continually high (approx. 11.5 V).	Voltage is continually high (approx. 11.5 V).	Communication established with both screens.	
Voltage is high (approx. 11.5 V) but goes down to approx. 0 V every 10 seconds.	Voltage is approx. 0 V.	No communication established with left screen.	1.
Voltage is continually high (approx. 11.5 V).	Voltage is high (approx. 11.5 V) but goes down to approx. 0 V every 10 seconds.	No communication established with right screen.	1.

Voltage is continually high (approx. 11.5 V).	Voltage is approx. 0 V.	Probable open circuit on wake-up signal for right screen.	2.
Voltage is approx. 0 V.	Voltage is approx. 0 V.	Probable open circuit on wake-up signal for left screen.	2.
Voltage is high (approx. 11.5 V) but goes down to approx. 0 V every 10 seconds.	Voltage is high (approx. 11.5 V) but goes down to approx. 0 V every 10 seconds.	Probable fault in CAN communication with screens.	3.

  Refer to **VERIFICATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CHECKING THE SYSTEM, DIGITAL VERSATILE DISC PLAYER AND SCREENS

FAULT-TRACING INFORMATION

If the system cannot be turned on and no screen is lit up and the malfunction cannot be connected to a special function, e. g., that the AUX-input is used, the cause of the malfunction may be:

- Contact resistance or oxidation in the terminals.
- One or both screens not connected.
- Open-circuit in leads between screen and rear seat entertainment module (RSE).
- Voltage supply to the screen or Rear Seat Entertainment Module (RSE).
- Damaged screen.

If the DVD player does not work but other audio/picture sources work, the problem may be due to:

- Damaged dvd-disc.

If none or only one of the screens work, and this is not associated to a certain function in the system, the probable cause may be:

- Contact resistance or oxidation in the terminals.
- Open circuit on signal cable.
- Power supply missing
- Damaged screen.
- Open-circuit or short-circuit in the cable for the control area network (CAN).

Fig. 35: Identifying Entertainment System Components & Communication
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

- **Continue**

  see **FAULT-TRACING INFORMATION**

CHECKING THE POWER SUPPLY AND GROUND TERMINALS

If lighting in the buttons does not come on at all, this indicates malfunction of the voltage feed or ground for the rear seat entertainment module (RSE) / DVD-Player.

Check the lead for voltage feed to rear seat entertainment module (RSE)/DVD-player's #A4, #A6 and #A7 for short-circuiting to voltage, short-circuiting to ground and open circuit. The voltage should be approx. the same as the battery voltage.

HINT: Power supply (15 feed) is common with power supply to rear 12 V socket.

Check the lead for ground connection to rear seat entertainment module (RSE), connector #A8, for open circuit

and short-circuit to voltage. Also check the ground terminal. Check for contact resistance and oxidation.

Check the connector for rear seat entertainment module (RSE) / DVD-Player contact resistance and oxidation.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.2**
- see **CHECKING WIRING AND TERMINALS**

Fig. 36: Identifying Rear Seat Entertainment Module (RSE)

  see **VERIFICATION**

FAULT-TRACING INFORMATION

- FAULT TRACING FAILED

  FAULT TRACING FAILED: The fault should have been detected and remedied. As this is not the case fault-tracing has failed. Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

- NEW TRY

  see **FAULT-TRACING INFORMATION**

FAULT-TRACING INFORMATION

When the ignition is on, the rear seat entertainment module performs a simple internal system-check and starts the start-up procedure with the screens.

- Ignition on. Lighting in the DVD-player's buttons is activated.
- When start-up is performed the lighting in the DVD-player's buttons goes off, does not apply to POWER-button.
- Check how illumination of the function buttons behaves during start-up and then select the alternative described below. The specified times are to be considered guidelines, not exact times.

NOTE: Times for system start-up vary depending on the software. It is not necessary to identify software version to perform this fault tracing.

Later software. Software, version. Select an option:

1. Lighting in the DVD-player's buttons is not activated at all with ignition on.
2. Lighting in all of the DVD-player's buttons is activated and all buttons except the POWER-button go off after approx. 10 seconds.
3. Lighting in all of the DVD-player's buttons is activated and all buttons except the POWER-button go off after approx. 85-95 seconds.

Older software. Select an option:

1. Lighting in the DVD-player's buttons is not activated at all with ignition on. See **CHECKING THE POWER SUPPLY AND GROUND TERMINALS**
2. DVD player button illumination comes on. Goes out in all buttons except the POWER button after 4-10 seconds. See **CHECKING THE POWER SUPPLY TO THE CONTROL MODULE**
3. DVD player button illumination comes on. Goes out in all buttons except the POWER button after 15-35 seconds. See **CHECKING VOLTAGE FEED AND GROUND FOR SCREENS**
4. DVD player button illumination comes on. Goes out in all buttons only in brief intervals every 10 seconds. See **CHECKING WAKE-UP SIGNAL**

HINT: That the lighting in the function buttons goes out after approx. 10 seconds, means that the screens are supplied with voltage and grounded as well as that Rear seat entertainment module (RSE) (DVD-player) has established contact with both screens on the internal CAN-net. This also means that the circuit boards behind the screens in both head restraints work as intended.

Fig. 37: Identifying Entertainment System Components & Communication
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

CHECKING THE POWER SUPPLY TO THE CONTROL MODULE

- Turn on the system with the main switch on the DVD-player.
- Lighting in all of the DVD-player's buttons shall now be activated and remain on.

HINT: If lighting in all of the DVD-player's buttons is activated, and then goes off after approx. 5-10 seconds, this indicates lost 15-feed to rear seat entertainment module (RSE) / DVD-Player.

Fig. 38: Identifying Rear Seat Entertainment Module (RSE)
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Does lighting stay on?

- **YES**

  see **CHECKING THE DISPLAY SCREENS**

- **NO**

  see **CHECKING THE WIRING AND TERMINALS**

CHECKING VOLTAGE FEED AND GROUND FOR SCREENS

Rear seat entertainment module (RSE) has not established contact with one or both screens. Whatever the case is, can be indicated by how long time the start has taken.

NOTE: **Later software. Software, version. If one of the screens does not respond but the other does, start-up takes about 85 seconds. If none of the screens respond, start-up takes approx. 95 seconds.**

NOTE: **Older software. If one of the screens does not respond but the other does, start-up takes about 15-25 seconds. If none of the screens respond, then start-up takes approx. 30-35 seconds.**

The specified times are to be considered guidelines, not exact times.

HINT: Turn on the system with the main switch on the DVD-player. The screen that does not have contact with the control module (DVD-player) will not light up. If the power supply and ground to the screen are working properly but the screen has no contact with the rear seat entertainment module (RSE)/DVD player via the CAN network, the screen will come on in LOCAL mode at start-up. Then neither sound will be heard nor picture shown at playback from DVD-player to this screen. This indicates a malfunction of either the wake-up signal or CAN-communication.

Take measurements for the screen that is not communicating.

Check the voltage feed from rear seat entertainment module (RSE) / DVD-Player to screens, #E1 (left screen) and #E13 (right screen), for short-circuiting to ground and open circuit. The voltage must be approximately battery voltage when the ignition is on.

Check the ground connection from rear seat entertainment module (RSE) / DVD-Player to screens, #E12 (left screen) and #E24 (right screen), for short-circuiting to voltage and open circuit.

Check the connector for rear seat entertainment module (RSE) / DVD-Player as well as screens for loose contact, contact resistance and oxidation.

HINT: If a screen is not working, try switching places between the screens/head restraints. If the malfunction remains, this indicates a malfunction either in the leads between the screen's circuit board and the display itself or in the display itself.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.2**

- see **CHECKING WIRING AND TERMINALS**

Was a fault detected?

- **YES**

  see **VERIFICATION**

- **NO**

  see **CHECKING WAKE-UP SIGNAL**

CHECKING THE WIRING AND TERMINALS

Check the lead for voltage feed (15-feed) to rear seat entertainment module (RSE)/DVD-player's #A6 and #A7 for short-circuiting to voltage, short-circuiting to ground and open circuit.

HINT: Power supply (15 feed) is common with power supply to rear 12 V socket.

NOTE: When this feed is lost, the system will only work for another approx. 10 minutes. The system cannot be restarted until the power supply is OK. If no cable or fuse defects are found and there still is no power supply, the problem probably lies in the vehicle electrical system.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.2**
- see **CHECKING WIRING AND TERMINALS**

Fig. 39: Identifying Rear Seat Entertainment Module (RSE)

  see **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

- Ignition off.
- Restore components and connectors.
- Switch on the ignition. Lighting in the DVD-player's buttons is activated.
- When start-up is performed the lighting in the DVD-player's buttons goes off, does not apply to POWER-button.

NOTE: A long start-up time indicates a fault in communication with the screens.

- Start the system using the POWER button on the DVD player or the remote control. Use the buttons, on both DVD-player and remote control, to operate the system.

Check that:

- The screens show a picture.
- DVD-disc can be played.
- Sound is heard in wireless headphones.
- Sound can be heard in the vehicle's speakers.
- Menus can be accessed with the remote control in both screens.
- If possible, connect an external source to the AV input and test the function.

Fig. 40: Identifying Entertainment System Components & Communication
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Is the function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **FAULT-TRACING INFORMATION**

CHECKING THE DISPLAY SCREENS

- Turn on the system with the main switch on the DVD-player.
- Lighting in all of the DVD-player's buttons shall now be activated and remain on.
- Now the screens shall be activated.

Fig. 41: Identifying Seat Headrest Video Screen
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Do the screens come on?

- **YES**

  see **CHECKING THE REMOTE CONTROL**

- **NO**

  see **CHECKING THE COMPONENTS AND WIRING**

CHECKING THE COMPONENTS AND WIRING

Checking the components and wiring

HINT: If only one of the screens lights up, try installing the screen that is not working in the head restraint where the working screen was installed. Then restart the system by turning it off, switching off the ignition and then switching the ignition on again. Turn on the system with the main switch on the DVD-player. If the malfunction remains, this indicates a malfunction either in the leads between the screen's circuit board and the display itself or in the display itself.

If necessary, test with a new circuit card or a new display.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.2**
- see **CHECKING WIRING AND TERMINALS**

Fig. 42: Identifying Seat Headrest Video Screen
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

- **Continue**

  see **VERIFICATION**

CHECKING THE REMOTE CONTROL

Make sure the remote control batteries are fully charged.

- Turn off the system with the main switch on the DVD player.
- Wait until the system has shut down.
- Turn on the system with the remote control aimed at the left screen.

Then repeat with the right screen.

Fig. 43: Identifying Entertainment System Components & Communication
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Do the screens come on?

- **YES**

  see **CHECKING THE DVD PLAYER**

- **NO**

  see **CHECKING THE REMOTE CONTROL SIGNAL**

CHECKING THE REMOTE CONTROL SIGNAL

HINT: If none of the screens come on in the previous test, the probable cause is a damaged remote control or discharged batteries.

HINT: If only one screen does not come on in the previous test, it indicates that the cable for infrared (IR) signals is probably damaged.

HINT: Activation of the infrared IR-receivers in the head restraints can be checked by the IR-lights in the screen's lower edge being on dimly after the system has been turned on.

Checking IR-signal, left screen

Check the lead for the infrared (IR) signal between the screen and rear seat entertainment module (RSE) for open circuit.

To check the voltage level on the signal cable for IR-signal, proceed as follows:

- Connect all cables and connectors.
- Measure the voltage between the signal cable for the Infra Red (IR) signal to the left-hand display screen and ground. The measured voltage is reference value.

NOTE: Do not press any of the buttons on the remote control during this measurement.

- Measure from the rear side of a suitable connector. Do not damage the terminals in the connector.
- Aim the remote control at the left screen and press in a button on the remote control. The voltage on the signal cable must fall slightly for as long as the button on the remote control is pressed in.

NOTE: Important in this measurement are not the absolute voltage levels, instead you get a voltage difference downward.

Checking IR-signal, right screen

Compare the latest reading as above with the signal for the infra red (IR) signal from the right-hand infra red (IR) receiver for the display screen.

Conclusion

- If the result of the above checks is that no malfunction was found, this means that the receivers in both screens work and that the remote control is OK.
- If voltages on the cables are OK but a lower voltage cannot be measured when a button on the remote control is pressed down, try with replacing the remote control.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.2**
- see **CHECKING WIRING AND TERMINALS**
- **Continue**

  see **VERIFICATION**

CHECKING THE DVD PLAYER

Check that the DVD is not damaged and that it is clean. Try using another DVD if necessary.

Check that nothing has jammed in the DVD player. Check that there are no mechanical grinding noises coming from the DVD player when it is in operation.

Check that the disc can be inserted and ejected without problems.

NOTE: Only one disc at a time may be loaded in the DVD-player.

Check that the transport protection disc, which is supplied with system at delivery, is not in the DVD-player.

Fig. 44: Identifying Rear Seat Entertainment Module (RSE)
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Was a fault detected?

- **YES**

  see **VERIFICATION**

- **NO**

  see **CHECKING THE FUNCTION**

CHECKING THE FUNCTION

- Select the dvd-player as source for one of the screens and press on the remote control's PLAY button.

  Check that picture is shown and sound is heard at playback.

  NOTE: If there is a picture but no audio in one or both of the headphones, see other fault tracing.

  If picture and sound are shown, start-up of the system, DVD-player, and screens is ok.

Is there a picture?

- **YES**

  FAULT NOT FOUND: Troubleshooting has been completed.

- **NO**

  see **CHECKING THE CABLE AND COMPONENT**

CHECKING THE CABLE AND COMPONENT

Check the leads for video signals between the TV-receiver and rear seat entertainment module (RSE) for short-circuiting to voltage, short-circuiting to ground, and open circuit. There are two video leads for each screen. Regards the cables from rear seat entertainment module (RSE), terminals #E10 and #E11 for left screen as well as terminals #E22 and #E23 for right screen.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.2**
- see **CHECKING WIRING AND TERMINALS**

- **Continue**

  see **VERIFICATION**

CHECKING CAN CABLES

HINT: If the power supply and ground to the screen are working properly but the screen has no contact with the rear seat entertainment module (RSE)/DVD player via the CAN network, the screen will come on in LOCAL mode at start-up. Then neither sound will be heard nor picture shown at playback from DVD-player to this screen. Menus available locally in the screen can be accessed.

Check if the screens are activated in LOCAL-mode, which means that there is malfunction on the CAN-leads.

Check the leads for CAN-communication between rear seat entertainment module (RSE) / DVD-Player and screens, #E3 and #E4 (left screen) and #E15 and #E16 (right screen, for short-circuiting to voltage, short-circuiting to ground, and open circuit.

In connector D, on rear seat entertainment module (RSE) / DVD-Player, there is a bridging of the CAN-net for the right screen. Bridging is in place to enable future expansion of the system with additional control modules. If connector B has been damaged or is disconnected or if for some reason there is no contact between the two ends of the CAN cable jumper, it will not be possible to establish communication with the right screen.

HINT: If a screen is not working, try switching places between the screens/head restraints. If the malfunction remains, this indicates a malfunction either in the leads between the screen's circuit board and the display itself or in the display itself.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE, GENERATION 4.2**
- see **CHECKING WIRING AND TERMINALS**
- **Continue**

  see **VERIFICATION**

CHECKING WAKE-UP SIGNAL

The control module makes three attempts to activate a screen by transmitting a high signal on the cable as a wake-up signal to the screen in question. This takes place according to the following pattern, on the condition that the screen does not reply. Normally only one wake-up signal is sent for the screen to wake up.

If the pattern below appears, the screen is not responding.

Later software. Software, version.

- High voltage (approx. 11.5 V) for approx. one second.
- Low voltage (approx. 0 V) for approx. three seconds.
- High voltage (approx. 11.5 V) for approx. one second.
- Low voltage (approx. 0 V) for approx. three seconds.
- Constant high voltage.

Older software.

- High voltage (approx. 11.5 V) for approx. one second.
- Low voltage (approx. 0 V) for approx. one second.
- High voltage (approx. 11.5 V) for approx. one second.
- Low voltage (approx. 0 V) for approx. 10 seconds.
- Constant high voltage.

Measurement of wake-up signal.

When the ignition is on, the rear seat entertainment module (RSE) performs a simple internal system-check and starts the start-up procedure with the screens.

- Measure wake-up signal at the screen. Measure from the rear side of a suitable connector. Do not damage the terminals in the connector. Measure signal that goes to the screen that does not answer the wake-up calls.
- Switch on the ignition. Lighting in the DVD-player's buttons is activated.
- Note voltage of the wake-up signal.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.2**
- see **CHECKING WIRING AND TERMINALS**

Fig. 45: Identifying Seat Headrest Video Screen
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Fig. 46: Identifying Rear Seat Entertainment Module (RSE)
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Is there any wake-up signal?

- **YES**

  see **CHECKING CAN CABLES**

- **NO**

  see **CHECKING THE CABLE AND COMPONENT**

CHECKING THE CABLE AND COMPONENT

Take measurements for the screen that is not communicating.

Check the lead for the wake-up signal from rear seat entertainment module (RSE) / DVD-Player to screens, #E2 (left screen) and #E14 (right screen), for short-circuiting to ground and open circuit.

Check the connector for rear seat entertainment module (RSE) / DVD-Player as well as screens for loose contact, contact resistance and oxidation.

HINT: If a screen is not working, try switching places between the screens/head restraints. If the malfunction remains, this indicates a malfunction either in the leads between the screen's circuit board and the display itself or in the display itself.

Remedy as necessary.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.2**

- see **CHECKING WIRING AND TERMINALS**
- **Continue**

  see **VERIFICATION**

CHECKING WAKE-UP SIGNAL

Rear seat entertainment module (RSE) (DVD-player) has not established contact with one or both screens. Follow the procedure below to check which screen has not responded.

NOTE: Switch off the system before connecting/disconnecting a connector.

- Turn off the ignition.
- Connect a voltmeter between the cable for the wake-up signal to right screen and ground. Measure wake-up signal at the screen. Measure from the rear side of a suitable connector. Do not damage the terminals in the connector.
- Switch on the ignition. Wait approximately 10 seconds.

Check the voltage of the wake-up signal. Note voltage of the wake-up signal.

- Then measure the wake-up signal of the left screen. Note voltage of the wake-up signal.

Left screen	Right screen		Options
Voltage is continually high (approx. 11.5 V).	Voltage is continually high (approx. 11.5 V).	Communication established with both screens.	
Voltage is high (approx. 11.5 V) but goes down to approx. 0 V every 10 seconds.	Voltage is approx. 0 V.	No communication established with left screen.	1.
Voltage is continually high (approx. 11.5 V).	Voltage is high (approx. 11.5 V) but goes down to approx. 0 V every 10 seconds.	No communication established with right screen.	1.
Voltage is continually high (approx. 11.5 V).	Voltage is approx. 0 V.	Probable open circuit on wake-up signal for right screen.	2.
Voltage is approx. 0 V.	Voltage is approx. 0 V.	Probable open circuit on wake-up signal for left screen.	2.
Voltage is high (approx. 11.5 V) but goes down to approx. 0 V every 10 seconds.	Voltage is high (approx. 11.5 V) but goes down to approx. 0 V every 10 seconds.	Probable fault in CAN communication with screens.	3.

Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Select an alternative as set out in the table above.

- **1**

  see **CHECKING THE POWER SUPPLY AND GROUND TERMINAL**

- **2**

  see **CHECKING THE CABLE AND COMPONENT**

- **3**

  see **CHECKING CAN CABLES**

CHECKING THE POWER SUPPLY AND GROUND TERMINAL

Take measurements for the screen that is not communicating.

Check the voltage feed from rear seat entertainment module (RSE) / DVD-Player to screens, #E1 (left screen) and #E13 (right screen), for short-circuiting to ground and open circuit. The voltage must be approximately battery voltage when the ignition is on.

Check the ground connection from rear seat entertainment module (RSE) / DVD-Player to screens, #E12 (left screen) and #E24 (right screen), for short-circuiting to voltage and open circuit.

Check the connector for rear seat entertainment module (RSE) / DVD-Player as well as screens for loose contact, contact resistance and oxidation.

HINT: If a screen is not working, try switching places between the screens/head restraints. If the malfunction remains, this indicates a malfunction either in the leads between the screen's circuit board and the display itself or in the display itself.

Remedy as necessary.

  see **VERIFICATION**

CHECKING THE SYSTEM, DIGITAL VERSATILE DISC PLAYER AND SCREENS. REAR SEAT ENTERTAINMENT, GENERATION 4.3 (2009-2011)

CHECKING THE SYSTEM, DIGITAL VERSATILE DISC PLAYER AND SCREENS

FAULT-TRACING INFORMATION

If the system cannot be turned on and no screen is lit up and the malfunction cannot be connected to a special function, e. g., that the AUX-input is used, the cause of the malfunction may be:

- Contact resistance or oxidation in the terminals.
- One or both screens not connected.
- Open-circuit in leads between screen and rear seat entertainment module (RSE).
- Voltage supply to the screen or Rear Seat Entertainment Module (RSE).
- Damaged screen.

If the DVD player does not work but other audio/picture sources work, the problem may be due to:

- Damaged dvd-disc.

If none or only one of the screens work, and this is not associated to a certain function in the system, the probable cause may be:

- Contact resistance or oxidation in the terminals.
- Open circuit on signal cable.
- Power supply missing
- Damaged screen.
- Open-circuit or short-circuit in the cable for the control area network (CAN).

Fig. 52: Identifying Entertainment System Components & Communication
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

- **Continue**

  Refer to **FAULT-TRACING INFORMATION**

CHECKING THE POWER SUPPLY AND GROUND TERMINALS

If lighting in the buttons does not come on at all, this indicates malfunction of the voltage feed or ground for the rear seat entertainment module (RSE) / DVD-Player.

Check the lead for voltage feed to rear seat entertainment module (RSE)/DVD-player's #A4, #A6 and #A7 for short-circuiting to voltage, short-circuiting to ground and open circuit. The voltage should be approx. the same as the battery voltage.

HINT: Power supply (15 feed) is common with power supply to rear 12 V socket.

Check the lead for ground connection to rear seat entertainment module (RSE), connector #A8, for open circuit and short-circuit to voltage. Also check the ground terminal. Check for contact resistance and oxidation.

Check the connector for rear seat entertainment module (RSE) / DVD-Player contact resistance and oxidation.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.3**
- see **CHECKING WIRING AND TERMINALS**

Fig. 53: Identifying Rear Seat Entertainment Module (RSE)
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

- **Continue**

  Refer to **VERIFICATION**

FAULT-TRACING INFORMATION

When the ignition is on, the rear seat entertainment module (RSE) performs a simple internal system-check and starts the start-up procedure with the screens.

- Ignition on. Lighting in the DVD-player's buttons is activated.
- When start-up is performed the lighting in the DVD-player's buttons goes off, does not apply to POWER-button.

Check how illumination of the function buttons behaves during start-up and then select the alternative described below.

1. Lighting in the DVD-player's buttons is not activated at all with ignition on. Refer to **CHECKING THE POWER SUPPLY AND GROUND TERMINALS**
2. Lighting in all of the DVD-player's buttons is activated and all buttons except the POWER-button go off after approx. 10 seconds. Refer to **CHECKING THE POWER SUPPLY TO THE CONTROL MODULE**
3. Lighting in all of the DVD-player's buttons is activated and all buttons except the POWER-button go off after approx. 85-95 seconds. Refer to **CHECKING VOLTAGE FEED AND GROUND FOR SCREENS**

The specified times are to be considered guidelines, not exact times.

HINT: That the lighting in the function buttons goes out after approx. 10 seconds, means that the screens are supplied with voltage and grounded as well as that Rear seat entertainment module (RSE) (DVD-player) has established contact with both screens on the internal CAN-net. This also means that the

circuit boards behind the screens in both head restraints work as intended.

Fig. 54: Identifying Entertainment System Components & Communication
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

CHECKING THE POWER SUPPLY TO THE CONTROL MODULE

- Turn on the system with the main switch on the DVD-player.
- Lighting in all of the DVD-player's buttons shall now be activated and remain on.

HINT: If lighting in all of the DVD-player's buttons is activated, and then goes off after approx. 5-10 seconds, this indicates lost 15-feed to rear seat entertainment module (RSE) / DVD-Player.

Fig. 55: Identifying Rear Seat Entertainment Module (RSE)
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Does lighting stay on?

- **YES**

Refer to **CHECKING THE DISPLAY SCREENS**

- **NO**

  Refer to **CHECKING THE WIRING AND TERMINALS**

CHECKING VOLTAGE FEED AND GROUND FOR SCREENS

NOTE: **Rear seat entertainment module (RSE) (DVD-player) has not established contact with one or both screens. Whatever the case is, can be indicated by how long time the start has taken. If one of the screens does not respond but the other does, start-up takes about 85 seconds. If none of the screens respond, start-up takes approx. 95 seconds. The specified times are to be considered guidelines, not exact times.**

HINT: Turn on the system with the main switch on the DVD-player. The screen that does not have contact with the control module (DVD-player) will not light up. If the power supply and ground to the screen are working properly but the screen has no contact with the rear seat entertainment module (RSE)/DVD player via the CAN network, the screen will come on in LOCAL mode at start-up. Then neither sound will be heard nor picture shown at playback from DVD-player to this screen. This indicates a malfunction of either the wake-up signal or CAN-communication.

Take measurements for the screen that is not communicating.

Check the voltage feed from rear seat entertainment module (RSE) / DVD-Player to screens, #E1 (left screen) and #E13 (right screen), for short-circuiting to ground and open circuit. The voltage must be approximately battery voltage when the ignition is on.

Check the ground connection from rear seat entertainment module (RSE) / DVD-Player to screens, #E12 (left screen) and #E24 (right screen), for short-circuiting to voltage and open circuit.

Check the connector for rear seat entertainment module (RSE) / DVD-Player as well as screens for loose contact, contact resistance and oxidation.

HINT: If a screen is not working, try switching places between the screens/head restraints. If the malfunction remains, this indicates a malfunction either in the leads between the screen's circuit board and the display itself or in the display itself.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.3**
- see **CHECKING WIRING AND TERMINALS**

Was a fault detected?

- **YES**

Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING WAKE-UP SIGNAL**

CHECKING THE WIRING AND TERMINALS

Check the lead for voltage feed (15-feed) to rear seat entertainment module (RSE)/DVD-player's #A6 and #A7 for short-circuiting to voltage, short-circuiting to ground and open circuit.

HINT: Power supply (15 feed) is common with power supply to rear 12 V socket.

NOTE: When this feed is lost, the system will only work for another approx. 10 minutes. The system cannot be restarted until the power supply is OK. If no cable or fuse defects are found and there still is no power supply, the problem probably lies in the vehicle electrical system.

Other information

1. see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.3**
2. see **CHECKING WIRING AND TERMINALS**

Fig. 56: Identifying Rear Seat Entertainment Module (RSE)
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

- Ignition off.
- Restore components and connectors.
- Switch on the ignition. Lighting in the DVD-player's buttons is activated. If the TV receiver is installed, the receiver's LED lights up.
- When start-up is performed the lighting in the DVD-player's buttons goes off, does not apply to POWER-button. If the TV receiver is installed, the receiver's LED goes out.

NOTE: A long start-up time indicates a fault in communication with the screens.

- Start the system using the POWER button on the DVD player or the remote control. Use the buttons, on both DVD-player and remote control, to operate the system.

Check that:

- The screens show a picture.
- DVD-disc can be played.
- Sound is heard in wireless headphones.
- Sound can be heard in the vehicle's speakers.
- Menus can be accessed with the remote control in both screens.
- TV picture appears (if TV receiver is installed) and it is possible to change channels.
- If possible, connect an external source to the AV input and test the function.

Fig. 57: Identifying Entertainment System Components & Communication
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Is the function OK?

- **YES**

OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

CHECKING THE DISPLAY SCREENS

- Turn on the system with the main switch on the DVD-player.
- Lighting in all of the DVD-player's buttons shall now be activated and remain on.
- Now the screens shall be activated.

Fig. 58: View Of Display Screens
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Do the screens come on?

- **YES**

  Refer to **CHECKING THE REMOTE CONTROL**

- **NO**

  Refer to **CHECKING THE COMPONENTS AND WIRING**

CHECKING THE COMPONENTS AND WIRING

Too high or too low temperature in the screen.

The screen has a built-in temperature sensor that registers the temperature inside the screen. The temperature signal is sent to the rear seat entertainment module (RSE)/DVD player and is used to prevent the use of the screen at too high or low a temperature. Temperature is not monitored for the first 5 minutes after the ignition is switched on.

The following happens:

- At +72 °C and -19 °C, a warning appears on the screen. The warning message is removed if the temperature changes to +70 °C or -17 °C.
- If the temperature changes to +77 °C or -24 °C, the system shuts off.

Check if the screen's temperature is within approved range.

Checking the components and wiring

HINT: If only one of the screens lights up, try installing the screen that is not working in the head restraint where the working screen was installed. Then restart the system by turning it off, switching off the ignition and then switching the ignition on again. Turn on the system with the main switch on the DVD-player. If the malfunction remains, this indicates a malfunction either in the leads between the screen's circuit board and the display itself or in the display itself.

Try a new screen if necessary.

  Refer to **VERIFICATION**

CHECKING THE REMOTE CONTROL

Make sure the remote control batteries are fully charged.

- Turn off the system with the main switch on the DVD player.
- Wait until the system has shut down.
- Turn on the system with the remote control aimed at the left screen.

Then repeat with the right screen.

Do the screens come on?

- **YES**

  Refer to **CHECKING THE DVD PLAYER**

- **NO**

  Refer to **CHECKING THE REMOTE CONTROL SIGNAL**

CHECKING THE REMOTE CONTROL SIGNAL

HINT: If none of the screens come on in the previous test, the probable cause is a damaged remote control or discharged batteries.

HINT: If only one screen does not come on in the previous test, it indicates that the cable for infrared (IR) signals is probably damaged.

HINT: Activation of the infrared IR-receivers in the head restraints can be checked by the IR-lights in the screen's lower edge being on dimly after the system has been turned on.

Checking IR-signal, left screen

Check the lead for the infrared (IR) signal between the screen and rear seat entertainment module (RSE) for open circuit.

To check the voltage level on the signal cable for IR-signal, proceed as follows:

- Connect all cables and connectors.
- Measure the voltage between the signal cable for the Infra Red (IR) signal to the left-hand display screen and ground. The measured voltage is reference value.

  NOTE: Do not press any of the buttons on the remote control during this measurement.

- Measure from the rear side of a suitable connector. Do not damage the terminals in the connector.
- Aim the remote control at the left screen and press in a button on the remote control. The voltage on the signal cable must fall slightly for as long as the button on the remote control is pressed in.

NOTE: Important in this measurement are not the absolute voltage levels, instead you get a voltage difference downward.

Checking IR-signal, right screen

Compare the latest reading as above with the signal for the infra red (IR) signal from the right-hand infra red (IR) receiver for the display screen.

Conclusion

- If the result of the above checks is that no malfunction was found, this means that the receivers in both screens work and that the remote control is OK.
- If voltages on the cables are OK but a lower voltage cannot be measured when a button on the remote control is pressed down, try with replacing the remote control.

CHECKING THE DVD PLAYER

Check that the DVD is not damaged and that it is clean. Try using another DVD if necessary.

Check that nothing has jammed in the DVD player. Check that there are no mechanical grinding noises coming from the DVD player when it is in operation.

Check that the disc can be inserted and ejected without problems.

NOTE: Only one disc at a time may be loaded in the DVD-player.

Check that the transport protection disc, which is supplied with system at delivery, is not in the DVD-player.

Fig. 60: Identifying Rear Seat Entertainment Module (RSE)
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING THE FUNCTION**

CHECKING THE FUNCTION

- Select the dvd-player as source for one of the screens and press on the remote control's PLAY button.

  Check that picture is shown and sound is heard at playback.

  NOTE: If there is a picture but no audio in one or both of the headphones, see other fault tracing.

  If picture and sound are shown, start-up of the system, DVD-player, and screens is ok.

Is there a picture?

- **YES**

  FAULT NOT FOUND: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE CABLE AND COMPONENT**

CHECKING THE CABLE AND COMPONENT

Check the leads for video signals between the TV-receiver and rear seat entertainment module (RSE) for short-circuiting to voltage, short-circuiting to ground, and open circuit. There are two video leads for each screen. Regards the cables from rear seat entertainment module (RSE), terminals #E10 and #E11 for left screen as well as terminals #E22 and #E23 for right screen.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.3**
- see **CHECKING WIRING AND TERMINALS**

- **Continue**

  Refer to **VERIFICATION**

CHECKING CAN CABLES

HINT: If the power supply and ground to the screen are working properly but the screen has no contact with the rear seat entertainment module (RSE)/DVD player via the CAN network, the screen will come on in LOCAL mode at start-up. Then neither sound will be heard nor picture shown at playback from DVD-player to this screen. Menus available locally in the screen can be accessed.

Check if the screens are activated in LOCAL-mode, which means that there is malfunction on the CAN-leads.

Check the leads for CAN-communication between rear seat entertainment module (RSE) / DVD-Player and screens, #E3 and #E4 (left screen) and #E15 and #E16 (right screen, for short-circuiting to voltage, short-circuiting to ground, and open circuit.

In connector D, on rear seat entertainment module (RSE) / DVD-Player, there is a bridging of the CAN-net for the right screen. Bridging is in place to enable future expansion of the system with additional control modules. If connector B has been damaged or is disconnected or if for some reason there is no contact between the two ends of the CAN cable jumper, it will not be possible to establish communication with the right screen.

HINT: If a screen is not working, try switching places between the screens/head restraints. If the malfunction remains, this indicates a malfunction either in the leads between the screen's circuit board and the display itself or in the display itself.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.3**
- see **CHECKING WIRING AND TERMINALS**

- **Continue**

Refer to **VERIFICATION**

CHECKING WAKE-UP SIGNAL

The control module makes three attempts to activate a screen by transmitting a high signal on the cable as a wake-up signal to the screen in question. This takes place according to the following pattern, on the condition that the screen does not reply. Normally only one wake-up signal is sent for the screen to wake up.

If the pattern below appears, the screen is not responding.

- High voltage (approx. 11.5 V) for approx. one second.
- Low voltage (approx. 0 V) for approx. three seconds.
- High voltage (approx. 11.5 V) for approx. one second.
- Low voltage (approx. 0 V) for approx. three seconds.
- Constant high voltage.

Measurement of wake-up signal.

When the ignition is on, the rear seat entertainment module (RSE) performs a simple internal system-check and starts the start-up procedure with the screens.

- Measure wake-up signal at the screen. Measure from the rear side of a suitable connector. Do not damage the terminals in the connector. Measure signal that goes to the screen that does not answer the wake-up calls.
- Switch on the ignition. Lighting in the DVD-player's buttons is activated.
- Note voltage of the wake-up signal.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.3**
- see **CHECKING WIRING AND TERMINALS**

Is there any wake-up signal?

- **YES**

  Refer to **CHECKING CAN CABLES**

- **NO**

  Refer to **CHECKING THE CABLE AND COMPONENT**

CHECKING THE CABLE AND COMPONENT

Take measurements for the screen that is not communicating.

Check the lead for the wake-up signal from rear seat entertainment module (RSE) / DVD-Player to screens, #E2 (left screen) and #E14 (right screen), for short-circuiting to ground and open circuit.

Check the connector for rear seat entertainment module (RSE) / DVD-Player as well as screens for loose contact, contact resistance and oxidation.

HINT: If a screen is not working, try switching places between the screens/head restraints. If the malfunction remains, this indicates a malfunction either in the leads between the screen's circuit board and the display itself or in the display itself.

Remedy as necessary.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CHECKING TMC MESSAGES (2008-2010)

CHECKING TMC MESSAGES

FAULT-TRACING INFORMATION

When a warning message about an exit is received via TMC, it is possible that the warning is not displayed on the current exit road, but on the main road. Even if the exit is closed, RTI will guide the driver along the closed road.

Fault-tracing

NOTE: Replacing components does not solve the problem.

Order the latest service disc for your region as follows, to program the unit with new software.

Service discs are divided into the following regions:

- Europe/Russia
- Middle East/South Africa
- Australia/New Zealand
- USA/Mexico

Fault symptom

- Navigation/Other navigation problems
- Navigation/Does not work
- Navigation/Navigation system gives incorrect directions

Fig. 61: Identifying TMC Receiver

CHECKING TV RECEPTION AND TV RECEIVER. REAR SEAT ENTERTAINMENT, GENERATION 4.3 (2009-2011)

CHECKING TV RECEPTION AND TV RECEIVER

FAULT-TRACING INFORMATION

Digital TV-receiver (DVB-T) is an extra option that receives the digital TV-channels, converts them and transmits them on to rear seat entertainment module (RSE). For the TV-receiver to be able to receive transmitted channels, two antennas are connected to the receiver. The TV receiver is operated by the remote control via the rear seat entertainment module (RSE).

No TV-picture is shown or no TV-sound is heard.

- No power supply or ground to TV receiver.
- Damaged TV receiver fuse.
- Damaged cables for audio and video signals between the rear seat entertainment module (RSE) and the

TV receiver.
- Damaged wake-up signal cables between the rear seat entertainment module (RSE) and TV receiver.
- The rear seat entertainment module (RSE) is not programmed for a TV receiver.

TV picture appears, but quality is poor.

- Weak or distorted antenna signal.
- Damaged cables between the TV receiver and the antennas.
- Damaged antennas.

Not possible to change channels with the remote control.

- Damaged cables for remote control's IR signals between the rear seat entertainment module (RSE) and the TV receiver.

TV channels deleted.

- Switch on the TV receiver is in the wrong position.

Message about software update is shown.

- Switch on the TV receiver is in the wrong position.

NOTE: **In order for TV-channels to be shown in the system for rear seat entertainment, the system for rear seat entertainment must be on and in other respects work trouble-free.**

Fig. 62: View Of Checking TV Reception And TV Receiver
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

- **Continue**

Refer to **SYMPTOM SELECTION**

CHECKING THE WIRING AND COMPONENT

Check that the TV-receiver's extra fuse is trouble-free.

HINT: Check that the TV-receiver's indicator diode is turned on when the ignition is turned on. If the LED indicators come on, the power supply, ground connection and wake-up signal are OK. The indicator diode is only on during start-up of the system as well as when the system is on.

Check the lead for voltage feed to the TV-receiver's 26-pin connector #26 for short-circuiting to voltage, short-circuiting to ground and open circuit. The voltage should be approx. the same as the battery voltage.

Check the lead for ground connection to the TV-receiver's 26-pin connector #13 for open circuit and short-circuiting to voltage. Also check the ground terminal. Check for contact resistance and oxidation.

Check the lead for the wake-up signal to the TV-receiver's 26-pin connector #25 for short-circuiting to voltage, short-circuiting to ground and open circuit. When rear seat entertainment module (RSE) sends wake-up signal the voltage shall be approx. 9 V.

Check that rear seat entertainment module (RSE) is programmed for TV-receiver. If the vehicle is vehicle is equipped with TV receiver and the control unit has been replaced, the control unit setting must be changed.

If there is a picture but no audio

Check the leads for sound between TV-receiver and rear seat entertainment module (RSE) for short-circuiting to voltage, short-circuiting to ground and open circuit. Refers to leads to rear seat entertainment module (RSE), connections #C3, #C4, and #C5.

If there is a picture but no audio

Check the leads for video signals between the TV-receiver and rear seat entertainment module (RSE) for short-circuiting to voltage, short-circuiting to ground, and open circuit. Refers to leads to rear seat entertainment module (RSE), connections #C1 and #C2.

Other information

- see **SIGNAL SPECIFICATION, REAR SEAT ENTERTAINMENT MODULE (RSE), GENERATION 4.3**
- see **CHECKING WIRING AND TERMINALS**

Fig. 63: View Of Checking TV Reception And TV Receiver
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

- **Continue**

  Refer to **VERIFICATION**

SYMPTOM SELECTION

Select one of the following options

1. No TV-picture is shown or no TV-sound is heard.

   Refer to **CHECKING THE WIRING AND COMPONENT**

2. TV picture appears, but quality is poor.

   Refer to **CHECKING SIGNAL FOR TV-PICTURE**

3. Not possible to change channels with the remote control.

   Refer to **CHECKING CONTROL OF TV-RECEIVER WITH REMOTE CONTROL**

4. TV channels deleted. Message about software update is shown.

   Refer to **CHECKING SETTING OF SWITCH TV-RECEIVER**

Fig. 64: View Of Checking TV Reception And TV Receiver
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

CHECKING SIGNAL FOR TV-PICTURE

The antenna's direction and the current receiver conditions are decisive to the picture's quality. If the picture deteriorates or disappears, if the audio is choppy or some of the channels disappear, it is likely due to a weak antenna signal. The signal is affected by factors such as terrain formations, weather conditions and vehicle position in relation to the TV transmitter. The problem could show up in conjunction with transfers, seasonal changes and types of weather.

Check that the antenna's leads are correctly connected to the TV-receiver and that the leads to the antennas are trouble-free.

HINT: The antenna gets voltage feed and ground from the TV-receiver. Supplied 5 V via the antenna cable's intermediate conductor and grounded via the cable screening. Under the casing of each antenna, there is an indicator LED that lights when the digital TV receiver is on and the antenna is OK. If the system is ON and the LED does not light, the fault lies in the antenna, its cables or the power supply/ground from the TV receiver.

Fig. 65: Identifying TV Receiver Antenna
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

- **Continue**

  Refer to **VERIFICATION**

CHECKING CONTROL OF TV-RECEIVER WITH REMOTE CONTROL

NOTE: **If the remote control does not work with the rest of the system, stop this fault tracing.**

The TV receiver is operated by the remote control via the rear seat entertainment module (RSE).

Check the leads for the infrared signals between the TV-receiver's 6-pin connector, #1 and #3, and rear seat entertainment module (RSE), #D15 and #D25, for short-circuiting to voltage, short-circuiting to ground, and open circuit.

Fig. 66: View Of Checking TV Reception And TV Receiver

Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

- **Continue**

  Refer to **VERIFICATION**

CHECKING SETTING OF SWITCH TV-RECEIVER

The TV receiver has two small switches located next to the program card slot.

The following settings are possible:

1. Normal position.
2. Mode for software update.
3. Mode for erasing programmed TV-channels.
4. Mode for changing signal standard between PAL and NTSC.

If a customer comes in with his/her vehicle and complains of any of the following, the positions of the TV receiver switches should be checked.

- A menu about software update is always shown in the screens at TV-display.
- The stored TV-channels are always erased and a message is shown.

Under normal conditions, the switches must always be in the Normal position.

Fig. 67: View Of Switches In Normal Position
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

- Ignition off.
- Restore components and connectors.
- Switch on the ignition. Lighting in the DVD-player's buttons is activated. If the TV receiver is installed, the receiver's LED lights up.
- When start-up is performed the lighting in the DVD-player's buttons goes off, does not apply to POWER-button. If the TV receiver is installed, the receiver's LED goes out.

NOTE: A long start-up time indicates a fault in communication with the screens.

- Start the system using the POWER button on the DVD player or the remote control. Use the buttons, on both DVD-player and remote control, to operate the system.

Check that:

- The screens show a picture.
- DVD-disc can be played.
- Sound is heard in wireless headphones.
- Sound can be heard in the vehicle's speakers.
- Menus can be accessed with the remote control in both screens.
- TV picture appears (if TV receiver is installed) and it is possible to change channels.
- If possible, connect an external source to the AV input and test the function.

Fig. 68: View Of Checking TV Reception And TV Receiver
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Is the function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CHECKING USB CONNECTION (2009-2011)

CHECKING USB CONNECTION

READING OFF DIAGNOSTIC TROUBLE CODES (DTCS)

Connect a USB memory to the USB connection.

Click the VCT2000 symbol to read out the USB memory ID.

If the USB memory ID can be read out, the USB connection is working.

If the USB memory ID cannot be read out, the USB connection is not working. This may be due to an open-circuit in one of the cables between the Integrated Audio Module (IAM) and USB-connection.

Checking for the fault

If possible, check if the customer's symptom remains.

Checking the wiring

Check the cables for short-circuit to voltage, short-circuit to ground and open circuit.

If no faults are found, replace the USB connection.

Other information

- see **SIGNAL SPECIFICATION**
- see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION IAM-5001**

Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CHECKING WIRELESS HEADPHONES. REAR SEAT ENTERTAINMENT,

GENERATION 4.1 (2006-2007)

CHECKING WIRELESS HEADPHONES

FAULT-TRACING INFORMATION

The wireless headsets can be used for both display screens. The sound to the headsets is transferred from the display screens, via infrared signals (IR), to the headsets in two channel stereo format. If the headsets do not function the fault could be due to:

- The headsets (Infra-red receiver in the headsets)
- Headset batteries discharged.
- Blocked path for infrared signals to the headsets.
- Damaged IR-transmitter/head rest.
- Leads between Rear seat entertainment module (RSE) and screens are damaged.

NOTE: In order for sound from the system for rear seat entertainment to be heard in the headsets, the system for rear seat entertainment must be on and work faultlessly.

Fig. 71: Identifying Seat Headrest Video Screen
Courtesy of VOLKSWAGEN GROUP OF AMERICA, INC.

- **Continue**

  Refer to **CHECKING THE HEADSETS**

CHECKING THE HEADSETS

HINT: To obtain a certain audio source - insert a CD in the DVD-player, press the Play button, and select DVD as source on the screen where troubleshooting is to be performed.

Checking the settings

Check that the volume has not been turned down via VOLUME on the remote control or that the volume on the relevant headset has not been turned down.

Check that the sound source for the selected headset channel and the headsets are on. Sound that is sent from left screen is always channel A in the headphones, and sound that is sent from right screen is always channel B in the headphones.

Checking the infra-red transmitter/head restraint and infra-red receiver/headsets

Check that the infra-red transmitter/head restraint is not obstructed. In certain cases moisture can impair infra-red signal reception.

Also check that the receiver in the headsets is not obstructed.

Check that the IR-diodes at the bottom on the screen light up dimly when the system is on and that there is a sound source. If the IR-diodes are not lit up, the system will play some form of media, the circuit board in the head restraint is probably damaged.

Checking the headsets

Check the headset batteries.

Check to, see if the other headset functions. If this is the case the headsets are defective.

Checking audio leads for screen

Check if the malfunction only is at one screen or if the malfunction is present at both screens. If the problem only occurs at one screen - change place between both headrests and, see if the problem comes along.

Check that it is only the wireless headphones that do not work. If there is no sound from the vehicle's ordinary loudspeakers, the fault may be in the rear seat entertainment module (RSE). Before replacing the control module, ensure that all other relevant symptom tests have been carried out.

Check that the connector between Rear seat entertainment module (RSE) and both screens is installed correctly and that it is not damaged.

Check the leads for audio signals from Rear seat entertainment module (RSE) to respective screen. There are three audio leads for each screen, one for left audio channel, one for right audio channel and a ground connection which is common for both audio channels. Regards the cables from rear seat entertainment module (RSE), terminals #E6, #E7 and #E8 for left display screen as well as terminals #E18, #E19 and #E20 for right display screen.

Conclusion

- If no problem can be found on the cables to the screens and it is only from one screen that sound cannot

be played, but sound from Rear seat entertainment module (RSE) can be listened to from other places - try changing circuit board in the head restraint where the sound does not work.

- If no malfunction can be found on the leads to the screens, none of the screens can give sound to the headphones but sound from Rear seat entertainment module (RSE) can be heard from other places - try replacing Rear seat entertainment module (RSE). Before replacing the control module, ensure that all other relevant symptom tests have been carried out.
- If sound does not reach any receiver (neither AUX-panel, wired headphones, rear speakers nor wireless headphones) - replace Rear seat entertainment module (RSE). If sound is not heard from the front audio system or in the wireless headsets, there may be a fault in the Rear Seat Entertainment Module (RSE). Before replacing the control module, ensure that all other relevant symptom tests have been carried out.

Remedy as necessary.
