
Fig. 196: Identifying Transmission Control Module Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

AW55-50 (and AW50AWD) is a 5-speed electronically controlled automatic transmission with a lock-up function for the three highest gears. The transmission control module (TCM) adapts the gear changes to ensure that the correct gear is selected for the driving mode, engine load, driver requirements, speed etc. This gives good fuel economy combined with increased comfort by ensuring smoother gear changes and lower noise levels.

The transmission control module (TCM) receives information about the desired gear position and driving mode from the driver. In conjunction with the signals from a number of sensors in the transmission and the engine control system, unlike with a purely hydraulically controlled transmission, this allows the control module to calculate the optimal shifting points and engagement of lock-up. The control module allows for small changes in the operating conditions and adapts the various transmission functions to ensure that the correct gear is always selected in relation to the driving mode selected by the driver.

This adaptability guarantees smooth and consistent gear shift quality throughout the operational life of the transmission.

In order to precisely determine the gear shift and lock-up engagement points based on the driving mode selected, the control module receives and processes information about the following:

- Selected gear position - from the gear-shift position sensor
- Selected driving mode economy/sport - reactive function programmed in the control module which is controlled by the speed at which the accelerator pedal (AP) is depressed. Quick "pedal movement" = sport mode. Winter (W) mode is activated using a switch on the gear selector assembly
- Vehicle speed - from the brake control system via the Controller area network (CAN)
- Transmission input shaft rpm - from the transmission speed sensor
- The transmission output shaft rpm - from the transmission output speed sensor
- The engine speed (RPM) and torque and throttle opening - from the engine management system via the Controller area network (CAN)
- If the brake pedal is depressed and to what extent - from the brake control system via the Controller area network (CAN)
- If the accelerator pedal (AP) is depressed and to what extent - from the engine management system via the Controller area network (CAN)
- Transmission fluid temperature - from the temperature sensor in the transmission
- Engine coolant temperature - from the engine control module (ECM) via the Control area network (CAN).

COMPONENTS

Fig. 197: Identifying Transmission Control Components
Courtesy of VOLVO CARS CORPORATION

The following components are included in the control system for automatic transmissions:

- Transmission control module (TCM) - Controls activation and deactivation of the solenoids by processing the signals from components such as the transmission input and output speed sensors and the temperature sensor. Also stores adaptive data as well as diagnostic trouble codes (DTCs) and frozen values for diagnostics
- Shift solenoid, S1 - Controls shifting in the transmission
- Shift solenoid, S2 - Controls shifting in the transmission
- Shift solenoid, S3 - Controls shifting in the transmission
- Shift solenoid, S4 - Controls shifting in the transmission
- Shift solenoid, S5 - Controls shifting in the transmission
- Lock-up solenoid, SLU - Controls the lock-up function and is also used for certain shifts
- Line pressure solenoid, SLT - Controls the transmission line pressure and neutral control
- Line pressure solenoid, SLS - Controls the transmission shifting pressure and is activated for certain gears
- Transmission input speed sensor (input shaft speed) (1) - Provides the transmission control module (TCM) with information about the input shaft speed from the engine
- Speed sensor (output shaft speed) (2) - Provides the transmission control module (TCM) with information about the output shaft speed from the transmission
- Oil temperature sensor (3) - Provides the transmission control module (TCM) with information about the oil temperature of the transmission
- Gear-shift position sensor (4) - Provides the transmission control module (TCM) with information about the selected gear position
- Gear selector module (GSM) - Provides the transmission control module (TCM) with information about the Geartronic mode and winter mode (W) amongst others.

SIGNALS

The table below summarizes the input signals to and output signals from the transmission control module (TCM). The signal types are divided into directly connected signals, serial communication and Controller area network (CAN) communication. The following illustration displays the same information with the Volvo component designations.

Input signals	Output signals
Directly connected: **Speed sensor, input shaft** (7/61). Provides information about the transmission input speed. Use to calculate the shifting process and to run diagnostics for the hydraulic/mechanical functions in the transmission. **Speed sensor, output shaft** (7/62). Provides information about the transmission output speed. Use to calculate the vehicle speed and to run diagnostics for the hydraulic/mechanical functions	**Directly connected:** (power supply unless otherwise stated) **Shift solenoids, S1-S5** (8/38-39, 8/72-74). The transmission control module (TCM) checks which gear is active by activating the solenoids in different patterns. **Lock-up solenoid, SLU** (8/40). Adjusts the line pressure to a lock-up pressure. Also used for certain shifts. **Line pressure solenoid, SLS** (8/41). Adjusts the line pressure to a shift pressure and is activated for

in the transmission. **Oil temperature sensor** (7/74). Provides information about the transmission oil temperature. **Gear-shift position sensor** (3/71). Provides the transmission control module (TCM) with information about the selected gear position of the transmission. Enables starting only in position P and N. Four trailing contacts are grounded in a unique pattern for each gear.	certain gears. **Line pressure solenoid, SLT** (8/71). Adjusts the linear line pressure when shifting.
Via serial communication: **Gear selector module (GSM)** (3/156). Provides data about the status of the winter (W) mode button and the control signal during geartronic shifting.	**Via serial communication:** **Gear selector module (GSM)** (3/156). Controls the solenoid for the shift-lock function, 8/36. Activated by a signal from the central electronic module (CEM).
Via Controller Area Network (CAN): **Electronic throttle module (ETM)** (4/50) /**Electronic throttle unit** (6/120) via the engine control module (ECM) (4/46): • Throttle opening, used to calculate gear changes. Sport mode and kick-down • Accelerator pedal (AP) position, used to calculate gear-shift timing. **Steering wheel module (SWM)** (3/130), via the central electronic module (CEM) (4/56). Cruise control, used to calculate acceleration depending on the position of the Resume and Set buttons. **Brake control module (BCM) / ABS control module** (4/16). Provides information about the vehicle speed and also the difference in speed between the left and right-hand wheels. Prevents upshifting if the difference in speed is above 40 km/h to protect the differential in the transmission. **Engine control module (ECM)** (4/46): • Stop lamp switch ON/OFF, used during torque converter lock-up • Engine coolant temperature (ECT), used for diagnostics for the transmission temperature sensor and for catalytic converter start-up (Cat-start) • Engine speed (RPM) >400 rpm = engine running. Used to start the transmission oil pressure and diagnostic functions	**Via Controller Area Network (CAN):** **Brake control module (BCM) / ABS control module** (4/16): • Current gear, used to transmit a signal not to regulate when shifting • Vehicle speed, used as back-up. **Engine control module (ECM)** (4/46): • Transmission temperature, used to compensate increased load at low oil temperatures • Selected gear, used by the engine so that the engine can compensate for different loads • Lock-up, used by the engine so that the engine can compensate for different loads • Next gear planned by the transmission control module (TCM), used by the engine so that the engine can compensate for different loads • The request about reduced engine torque when shifting, the engine reduces the engine torque when shifting • Torque limiting request, the engine limits the engine torque, depending on the current gear and if winter mode (W) is selected • Current gear selector lever position. Used to show the lever position in the driver information module (DIM) • Lights the malfunction indicator lamp (MIL)

• Engine speed (RPM), used to check the slipping rate of the torque converter and the pressure build up, affecting the shifting comfort • Kick-down. If the accelerator pedal (AP) is depressed and the throttle is wide open the engine control module (ECM) transmits a signal to the transmission control module (TCM) about kick-down • Current engine torque, used to check the line pressure.	in the driver information module (DIM). Checking the malfunction indicator lamp (MIL), lamp lights in the event of emission related faults. **Driver information module (DIM)** (5/1): • Current gear selector lever position. Used to show the lever position in the driver information module (DIM) • Via the central electronic module (CEM), checking the warning lamps. The warning lamp lights orange in the event of a fault • Via the central electronic module (CEM), text message in the driver information module (DIM). The driver can receive up to five error messages from the transmission control module (TCM). **Rear electrical module (REM)** (4/58). The transmission control module (TCM) transmits signals via the central electronic module (CEM) to light the back-up (reversing) lamp.

TRANSMISSION CONTROL MODULE (TCM) DIAGNOSTIC FUNCTIONS

GENERAL

Fig. 199: Identifying Transmission Control Module
Courtesy of VOLVO CARS CORPORATION

The control module has a built-in diagnostic system, the Volvo on-board diagnostic (OBD) system. This system continuously monitors its own system and the input and output signals.

DIAGNOSTIC TROUBLE CODES (DTCS)

The control module will store a diagnostic trouble code (DTC) if it detects a fault. If a fault disappears for any reason after the diagnostic trouble code (DTC) has been permanently stored in the control module, information about the fault remains stored in the control module.

READING AND ERASING DIAGNOSTIC TROUBLE CODES (DTCS)

Stored diagnostic trouble codes (DTCs) can be read off and erased using this function.

Diagnostic trouble codes (DTCs) can only be erased when all diagnostic trouble codes (DTCs) have been read at least once.

READING OFF INPUT AND OUTPUT SIGNALS

Using this function, the status of the control module input and output signals can be continuously read off.

For further information about parameters, see **DESCRIPTION OF PARAMETERS** .

ACTIVATING COMPONENTS

This function allows components to be activated so that their functions can be checked.

For further information about activations, see **DESCRIPTION OF ACTIVATIONS** .

READING OFF THE CONTROL MODULE IDENTIFICATION

VIDA identifies the control modules by reading off a number of codes from the control module memory.

The codes contain the following information about the control module:

- the hardware P/N (control modules without software)
- the hardware serial number (control modules without software)
- the software P/N
- the diagnostic software P/N

TRANSMISSION CONTROL MODULE (TCM) (TF-80SC; 2007-2012)

DESIGN

CONTROL MODULE

Fig. 200: Identifying Control Module
Courtesy of VOLVO CARS CORPORATION

The Transmission Control Module (TCM) is integrated with the gear position indicator as one unit. The unit is fitted in the top side of the transmission housing, on the gear selector shaft. The control module's connector is directly connected to the transmission.

GEAR POSITION INDICATOR

The gear position indicator is integrated with the Transmission Control Module as one unit.

The gear position indicator informs the Transmission Control Module on the gear selected, and whether reverse gear is engaged to light the reversing lamp. The gear position indicator contains a permanent magnet and a linear Hall sensor. The gear position indicator creates a signal voltage of between 0 and 5 V which equates to current gear selector lever position.

The gear position indicator can be diagnosed.

Voltage level for the different gear positions

SOLENOID AND

Fig. 201: Identifying S1 & S2 Solenoids In Transmission Control System
Courtesy of VOLVO CARS CORPORATION

The solenoids and S are located in the transmission control system, which is fitted on the front edge of the transmission. The solenoids are the on/off type and consist of an electrical coil that controls a hydraulic valve. The solenoids are supplied 12 V via the transmission control module (TCM) and are grounded in the control system. The solenoids control shifting and the transmission control module (TCM) activates the solenoids with engine braking for 1st gear.

The solenoids can be diagnosed.

LOCK-UP SOLENOID,

Fig. 202: Identifying SLU Solenoid In Transmission Control System
Courtesy of VOLVO CARS CORPORATION

The lock-up solenoid is located on the transmission control system, which is fitted on the front edge of the transmission. The lock-up solenoid consists of an electrical coil that controls a hydraulic valve. The solenoid is controlled with a pulse width modulated voltage and is grounded via the transmission control module. The control module regulates the lock-up engagement of the torque converter. During lock-up, the solenoid is pulsed in, which makes lock-up engagement gentle. The solenoid allows the torque converter to work in one of three modes: "open", "controlled slippage" and "locked". The solenoid has a linear hydraulic function.

The solenoid can be diagnosed.

LINEAR PRESSURE SOLENOID,

Fig. 203: Identifying SLT Solenoid In Transmission Control System
Courtesy of VOLVO CARS CORPORATION

The linear pressure solenoid,, is located in the transmission control system, which is fitted on the front edge of the transmission. The linear pressure solenoid,, consists of an electrical coil that controls a hydraulic valve. The solenoid is controlled with a pulse width modulated (PWM) voltage and is grounded via the transmission control module. The solenoid has a linear hydraulic function. The hydraulic valve is controlled by the varying current resulting from the current pulse ratio. With a high pulse ratio, i. e. high current strength, the system pressure is low. With a low pulse ratio, i. e. low current strength, the system pressure is high. In the event of an open circuit the system pressure is at a maximum, resulting in hard shifting. The hydraulic valve is then fully open.

The solenoid can be diagnosed.

LINEAR PRESSURE SOLENOID AND

Fig. 204: Identifying Linear Pressure Solenoids In Transmission Control System
Courtesy of VOLVO CARS CORPORATION

The linear pressure solenoids and are located in the transmission control system, which is fitted on the front edge of the transmission. The designation of the solenoid is linked to the component (clutch/brake band) that the solenoid controls. The linear pressure solenoids consist of an electrical coil that controls a hydraulic valve. The solenoids are controlled with a pulse width modulated (PWM) voltage and are grounded via the transmission control module (TCM). The solenoids have a linear hydraulic function. The hydraulic valves are controlled by the varying current resulting from the current pulse ratio. With a high pulse ratio, i. e. high current strength (approx. 1 A), the system pressure is low. With a low pulse ratio, i. e. low current strength, the system pressure is high. In the event of an open circuit the system pressure is at a maximum, resulting in hard shifting. Here, the hydraulic valve is fully open.

The solenoids can be diagnosed.

SPEED SENSOR, INPUT SHAFT

Fig. 205: Identifying Input Shaft Speed Sensor
Courtesy of VOLVO CARS CORPORATION

The speed sensor for the input shaft is located inside the gearbox. The sensor is a so-called "active sensor" (Hall sensor) and is supplied with 12 V power. When the pulse wheel on clutch C2 rotates the sensor generates a pulsed current (square wave), where the strength of the current depends on the position of the pulse wheel. The signals from the coil in the sensor are then acted on by magnetic-sensitive resistance, which means that the

output signal is a current which fluctuates between 7 mA and 14 mA, and whose frequency increases with speed. The Transmission Control Module (TCM) calculates transmission speed using the signal from the sensor.

The Transmission Control Module (TCM) uses information on input shaft speed for:

- calculating how much torque reduction shall be requested from the Engine Control Module (ECM) with gearshifting
- comparing engine speed with input shaft speed to calculate the slipping speed of the torque converter
- calculating gearshift timing
- calculating engagement and disengagement of the lock-up function
- comparing the signal with the signal from the transmission speed sensor for the output shaft, for calculating the current gear ratio. This is performed to identify whether the value corresponds with the expected gear ratio.

The speed sensor for the input shaft can be diagnosed.

SPEED SENSOR, OUTPUT SHAFT

Fig. 206: Identifying Input Shaft Speed Sensor
Courtesy of VOLVO CARS CORPORATION

The speed sensor for the output shaft is located inside the gearbox. The sensor provides a signal to the Transmission Control Module (TCM) on vehicle speed. The sensor is a so-called "active sensor" (Hall sensor) and is supplied with 12 V power. When the pulse wheel rotates (the wheel for shiftlock), the sensor generates a pulsed current (square wave), where the strength of the current depends on the position of the pulse wheel. The signals from the coil in the sensor are then acted on by magnetic-sensitive resistance, which means that the output signal is a current which fluctuates between 7 mA and 14 mA, and whose frequency increases with speed. The Transmission Control Module (TCM) uses information on output shaft speed for:

- calculating how much torque reduction shall be requested from the Engine Control Module (ECM) with gearshifting
- comparing engine speed with output shaft speed to calculate the slipping speed of the torque converter
- calculating gearshift timing
- calculating engagement and disengagement of the lock-up function

- comparing the signal with the signal from the transmission speed sensor for the input shaft, for calculating the current gear ratio. This is performed to identify whether the value corresponds with the expected gear ratio.

The speed sensor for the output shaft can be diagnosed.

OIL TEMPERATURE SENSOR

Fig. 207: Identifying Oil Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

The temperature sensor is the NTC type. The temperature sensor is located on the transmission control system inside the side cover and measures the temperature of the transmission oil in the sump. The temperature sensor is an integrated part of the cable harness. The temperature sensor is supplied with 5 V and is grounded via the Transmission Control Module (TCM). By measuring the voltage drop over the sensor's NTC resistor the control module can determine the temperature of the transmission oil. The Transmission Control Module (TCM) uses the information on transmission oil temperature for:

- calculating transmission gearshift timing
- calculating engagement and disengagement of the lock-up function.

The Transmission Control Module (TCM) stores the time for which the temperature has been within a certain temperature range and if a certain temperature and time has been exceeded, then a diagnostic trouble codes (DTC) is generated to indicated that an oil change is necessary.

The temperature sensor can be diagnosed.

GEAR SELECTOR MODULE (GSM)

Fig. 208: Identifying Gear Selector Module (GSM)
Courtesy of VOLVO CARS CORPORATION

The gear selector assembly is located in the tunnel console and is mechanically connected to the transmission by a cable which moves the shuttle valve in the transmission control system. The Gear Selector Module (GSM) is located on the top panel of the gear selector assembly. The Gear Selector Module (GSM) is supplied with power from the Central Electronic Module (CEM). The Gear Selector Module (GSM) communicates with the Transmission Control Module (TCM) via serial communication, to light up gear position indication amongst other things. Gear position indication consists of a row of LEDs in the top panel of the gear selector assembly.

The Central Electronic module (CEM) has a cable which is directly connected to the Gear Selector Module (GSM) to control the shiftlock solenoid. The supply of power and ground for the solenoid are directly connected to the Gear Selector Module (GSM).

The switch for winter program (W) is located on the top panel of the gear selector assembly. Upon activation the switch sends a request to activate the winter program (Winter mode) to the Transmission Control Module. The Transmission Control Module then determines whether or not the winter program is possible.

The Gear Selector Module can be diagnosed. In the event of a fault a signal on fault status is sent to the Transmission Control Module which then stores any diagnostic trouble codes.

SHIFTLOCK

Fig. 209: Identifying Shiftlock
Courtesy of VOLVO CARS CORPORATION

To prevent the gear selector from being unintentionally shifted out of, the vehicle is equipped with an electronic shiftlock. This blocks the gear selector lever's retaining pin in the lock segment, holding the gear selector in the position. The gear selector can only be moved from to another gear position when the ignition is on and the brake pedal is depressed. The central electronic module detects the brake pedal position via a direct connection to the brake pedal sensor. It then sends a signal to the gear selector module to deactivate the electromagnetic solenoid in the gear selector assembly. The solenoid lock pin is pulled in and it is possible to depress the catch in the gear selector lever to select another gear. If the ignition key is in "0", the solenoid is deactivated. In this position, the gear selector is manually locked via the keylock function.

KEYLOCK

Fig. 210: Identifying Keylock & Mechanical Link
Courtesy of VOLVO CARS CORPORATION

A lock and safety function is mechanically linked to the ignition switch by a cable. The keylock is controlled by the lock piston position in the ignition switch and by the gear selector lever position. This means that the ignition key can only be removed from the ignition switch if the gear selector lever is in. This also means that the gear selector lever can only be moved from if the ignition key has been turned to position I. The keylock is only available in combination with shiftlock. In order to prevent the gear selector from moving, the central electronic module electrically locks the shiftlock solenoid between key positions I and II since the transmission control module is not supplied power until key position II.

GEAR SELECTOR ASSEMBLY

Gear selector assembly with Geartronic function

Fig. 211: Identifying Gear Selector With Geartronic Function
Courtesy of VOLVO CARS CORPORATION

The gear selector assembly of Geartronic has a unique design and function. In addition to the lever positions it also has a mode for "manual" shifting.

The gear selector lever for Geartronic has the following functions:

- : Park.
- : Reverse.
- : Neutral
- : Automatic shifting between all gears.
- : Manual shifting. Three Hall sensors are fitted on the gear selector module. A permanent magnet on the gear selector lever acts on the sensor output signals to the gear selector module

DIAGNOSTIC FUNCTIONS

GENERAL

The control modules have a built-in diagnostic system, Volvo Diagnostics, which continuously monitors its own system as well as the input and output signals.

DIAGNOSTIC TROUBLE CODES

If the control module detects a fault then it stores a diagnostic trouble code. If a fault disappears for any reason after a diagnostic trouble code has been permanently stored in the control module then the information on the diagnostic trouble code remains in the control module.

READING AND ERASING DIAGNOSTIC TROUBLE CODES

Stored diagnostic trouble codes can be read off and erased using this function.

Diagnostic trouble codes can only be erased once all the diagnostic trouble codes have been read off at least once.

READING OFF INPUT AND OUTPUT SIGNALS

The status for the control module input and output signals can be continuously read off using this function.

ACTIVATING COMPONENTS

Components can be activated for function checking using this function.

READING OFF THE CONTROL MODULE IDENTIFICATION

The control module can be identified by means of reading off a number of codes.

- hardware P/N
- hardware serial number
- software P/N
- diagnostic software P/N

RESETTING THE ADAPTATION VALUES

There are three functions in the software for the Transmission Control Module for adaptation which can be activated:

- Resetting adaptation. Must be performed after replacing an internal component or the whole transmission.
- Resetting the gauge for oil degradation.
- Adaptation of gear selector lever in neutral position.

CALIBRATING THE GEAR POSITION INDICATOR

When checking or replacing the control module the gear position indicator must be calibrated so that the gear position indicator adopts the correct gear position.

DOWNLOADING SOFTWARE AND REPLACING THE CONTROL MODULE

New software can be downloaded into the Transmission Control Module. When software is ordered the software and hardware of the vehicle are compared with Volvo's central database. If the comparison corresponds then the software is downloaded into the control module.

If the comparison between the car and Volvo's central database does not correspond, then the database is updated with the vehicle's configuration. When this is complete the software is downloaded.

FUNCTION

REGULATING THE SOLENOIDS WHEN GEARSHIFTING

Shifting is regulated by the transmission control module activating the solenoids in a specific pattern. The solenoids and control which gear is engaged. The solenois also control how engagement occurs by adapting hydraulic pressure. The basic parameters for the various shift points are accelerator pedal position and vehicle speed while shift quality is determined by torque control.

The pressurizing of clutches and brakes can be adapted by means of reading off the changes in the rotation speed of the transmission input shaft during the gearshift processes and comparing them with the calculated values in the Transmission Control Module.

Two different shift patterns are available: normal mode and winter mode.

In normal conditions the gearshifts take place at relatively low speeds in order to reduce fuel consumption. With rapid accelerator pedal movements the Transmission Control Module automatically changes over to sport mode.

GEARSHIFT PATTERNS

Gear	Activated solenoid					
	OFF	OFF	*ON*	*ON*	*ON*	*ON*
	OFF	OFF	*ON*	*ON*	OFF	*ON*
	OFF	OFF	*ON*	*ON*	*ON*	*ON*

*)	*ON*	*ON*	OFF	*ON*	*ON*	*ON*
	OFF	OFF	OFF	*ON*	*ON*	OFF
	OFF	OFF	OFF	*ON*	OFF	*ON*
	OFF	OFF	OFF	OFF	*ON*	*ON*
	OFF	OFF	*ON*	OFF	OFF	*ON*
	OFF	OFF	*ON*	OFF	*ON*	OFF

*) with engine braking

REGULATING THE LOCK-UP FUNCTION

Regulating the lock-up function takes place by means of the Transmission Control Module activating the lock-up solenoid. The engagement takes place by means of the Transmission Control Module controlling the lock-up solenoid linearly and adapting the hydraulic pressure. The basic parameters for engagement are the engine speed, accelerator pedal position and the rotation speed of the transmission input and output shafts. The pressurizing of the lock-up function can be adapted by means of reading off the changes in the rotation speed of the transmission input shaft during the gearshift processes and comparing them with the calculated values in the Transmission Control Module.

Two different lock-up functions are integrated: locked lock-up and slipping lock-up.

Locked lock-up

In normal conditions lock-up takes place at relatively low speeds in order to reduce fuel consumption.

Slipping lock-up

Is a function which provides gentler engagement with dampened vibration and lower noise when using the lock-up gear. When this function is activated, lock-up is active but not fully applied.

The requirements for the function to be activated include the following:

- gear selector in or
- gear 2, 3, 4, 5 or 6
- transmission input speed is 1000 rpm
- transmission oil temperature is 20 - 120 °C.

Due to the slipping of the torque converter, between 50-200 rpm, the friction properties of the transmission oil are very important. The transmission oil's properties therefore differ from conventional ATF oil properties. Always use transmission oil specified for this transmission, otherwise the function of the transmission can be impaired.

GEARSHIFT PROGRAM

Normal program

When driving with normal accelerator pedal application the Transmission Control Module uses a preset gearshift program, optimized to shift for economical driving. This gearshift program is designed for "normal" driving which combined provides early upshifting and lock-up. The gearshift program automatically adapts to different driving cases such as driving uphill with a trailer or driving at high altitude. In addition, transmission oil pressure is adapted to provide gentle engagement of the gears.

Winter program

Winter mode is selected with the button on the top panel of the gear selector assembly. Winter mode makes it possible to start in a high gear to prevent wheel spin on a slippery surface. The program is also suitable for other difficult situations where the driver wishes to limit gear selection. When the gear position is the vehicle starts in 3rd gear. Automatic shifting takes place between 3rd, 4th, 5th and 6th gear.

When the winter program is selected a W is lit in the combined instrument panel.

If kickdown is activated in winter mode then the transmission uses all gears for optimum performance.

Sport mode - Only S60R and V70R

On R-models, the function is replaced by. Sport mode is activated with button on the top panel of the gear selector assembly. The program adapts shift points to provide the best possible performance. Downshifting occurs quicker at lower throttle application.

The function can also be activated automatically if the button on the dashboard is pressed.

OTHER PROGRAMS

Adaptation

The Transmission Control Module (TCM) monitors each gearshift to achieve consistent and gentle gearshifting in all driving conditions. This is achieved by means of the control module either lowering or raising the hydraulic system pressure which is used during the gearshift itself. The changes in pressure level are stored in the control module memory when the vehicle is shut down, and are retrieved when starting. This provides improved gearshift comfort and improved service life for the transmission.

Complete adaptation applies when the following conditions have been fulfilled:

- the position of the accelerator pedal is constant
- oil temperature between 65 °C and 110 °C.

Driving uphill

The Transmission Control Module (TCM) can change the gearshift pattern slightly when driving uphill. This is to avoid close gearshifts.

Neutral control (only available on certain models)

This function is activated when the driver stops the car and the car is stationary, at traffic lights for example. The transmission control module (TCM) then disengages the C1 clutch which releases the forward drive of the transmission and reduces the load on the engine. The function improves fuel consumption and reduces vibrations at idle speed. When the driver releases the brake, the C1 clutch engages and drive is resumed.

The following conditions must be met in order for the neutral function to activate:

- gear selector in position D
- oil temperature above + 10 °C
- throttle position less than 3 %
- brake pedal depressed
- speed 0 km/h
- engine speed less than 1500 RPM.

GEARSHIFTING WITH GEARTRONIC

Fig. 212: Locating Geartronic Gearshift Indicator
Courtesy of VOLVO CARS CORPORATION

When the gear selector is moved to Geartronic mode, the automatic transmission is still hydraulically in. If the gear selector is moved up (+), the gear selector module sends a signal to the transmission control module (TCM) to upshift. If the gear selector is moved down (-), a signal is sent to the transmission control module to downshift. When the gear selector is in mode, the driver information moduel will change its symbol from to the currently engaged gear, such as 3. A signal is also sent to the gear selector moduel to light the LED for and deactivate other LEDs. The transmission control moduel (TCM) determines whether the shift is possible. The driver information module (DIM) indicates the current gear. If shifting is permitted, the various solenoids are activated in the pattern specific to the relevant gear.

In certain situations however the Transmission Control Module (TCM) takes over the gearshift decisions. Amongst other things, the following applies:

- When stationary, only gears 1, 2 and 3 can be selected. Gear 4 can be selected at speeds above 40 km/h and gear 5 at speeds above 55 km/h, and gear 6 at speeds above 70 km/h.
- Automatic downshifting takes place on all gears when below a certain speed. Example: Gear 2 is selected. Automatic downshifting then takes place from gear 2 to gear 1 at 2 km/h if the speed before this exceeded 25 km/h. Otherwise gear 2 remains engaged. However, situations can arise where gear 3 remains engaged despite the vehicle stopping.
- A manual upshift is required after an automatic downshift. Kickdown is not available in Geartronic mode.
- Permitted speeds for the manual downshifts equate to those for kickdown upshifts, i. e. an engine speed of approx. 6000 rpm.
- If transmission temperature becomes too high then the Transmission Control Module takes over the gearshift decisions. The purpose of this is to engage a gear where lock-up is possible at the current speed.
- Lock-up is possible for gears 2, 3, 4, 5 and 6.

Other

- In mode, a signal on gear selector lever position is generated for the gear selector module (GSM) as follows: a Hall sensor is fitted on the printed circuit board for the gear selector module (GSM) for each one of the three gear selector lever positions. A permanent magnet on the gear selector lever acts on the sensor output signals to the control module. The control module can read off the position of the gear

selector lever by means of the differences in signal character.

ADAPTATION DATA

The Transmission Control Module (TCM) software includes a service for resetting adaptations that can be activated:

- Resetting adaptation - should be performed after replacing an internal component or the whole transmission.

Resetting adaptation is activated via the vehicle communication input.

GAUGE FOR TRANSMISSION OIL DATA

Fig. 213: Identifying Gauge For Transmission Oil Data
Courtesy of VOLVO CARS CORPORATION

There is a gauge for transmission oil quality integrated into the software for the Transmission Control Module (TCM). This gauge calculates the time for which the oil exceeds a certain temperature during a certain period. When the gauge reaches the maximum value a diagnostic trouble code (DTC) for oil change is generated in the control module. When replacing transmission oil the gauge must be reset to zero to avoid generating a diagnostic trouble code (DTC) during incorrect conditions. This applies to changing transmission oil and when changing the oil with a repair.

The resetting function is activated via the vehicle communication input.

EMERGENCY MODE IN THE EVENT OF A FAULT

When a fault has arisen in the transmission (permanent fault) and is registered by the Transmission Control Module (TCM), a help program for dealing with the fault is activated. The Transmission Control Module (TCM) then performs certain actions to protect the transmission while maintaining as much driveability as possible. Minor faults do not activate any help programs. There are different programs depending on the type of fault.

- Emergency/limp-home mode
- Failsafe action (temporary action)

Failsafe action is activated upon first detection of the fault, if the fault disappears then the system returns to normal function. Emergency mode is activated with less serious faults and Limp-home mode is activated with the most serious faults. If the fault disappears (intermittent fault) then the control module returns to normal function as soon as the ignition is next switched on.

The warning lamp in the combined instrument panel comes on, and a text message is displayed in the text window in the combined instrument panel if emergency/limp-home mode has arisen. No text is displayed when the ignition is switched on until the fault has been detected.

SYSTEM OVERVIEW

GENERAL

Fig. 214: Identifying Transmission Control Module (TCM)
Courtesy of VOLVO CARS CORPORATION

TF-80SC (TF-80SC AWD) is 6-speed electronically controlled automatic transmission with lock-up function on the five highest gears. The Transmission Control Module (TCM) adapts gearshifts so that the correct gear is always selected with respect to driving style, engine load, driver requirements, speed etc. This provides good fuel economy and increased comfort through gentler gearshifts and lower noise level.

The Transmission Control Module (TCM) receives information on required gear position and required driving style (driving program) from the driver. Together with signals from a number of sensors in the transmission and the engine management system, this enables the calculation of optimum gearshift timing and lock-up engagement, in contrast to a gearbox with only a hydraulic control system. The control module takes consideration of small changes in operating conditions and adapts the different transmission functions so that the correct gear is always selected in accordance with the driving program selected by the driver.

The Transmission Control Module (TCM) has an adaptive capacity intended to ensure even gearshift quality during the whole service life of the transmission.

In order to be able to determine gearshift timing and lock-up engagement precisely, based on the selected

driving program, the control module receives information on the following:

- Selected gear position - from the gear position indicator.
- Speed of transmission input shaft - from transmission speed sensor, input shaft.
- Speed of transmission output shaft - from transmission speed sensor, output shaft.
- Transmission oil temperature - from temperature sensor in the transmission.
- Engine speed and torque, and throttle opening - from Engine Control Module (ECM) via the Controller Area Network (CAN).
- Whether and how much the accelerator pedal is depressed - from Engine Control Module (ECM) via the Controller Area Network (CAN).
- Engine temperature - from Engine Control Module (ECM) via the Controller Area Network (CAN).
- Vehicle speed - from Brake Control Module (BCM) via the Controller Area Network.
- Whether and how much the brake pedal is depressed - from Brake Control Module via the Controller Area Network.

COMPONENTS

Fig. 215: Identifying Linear Pressure Solenoids In Transmission Control System
Courtesy of VOLVO CARS CORPORATION

The following components are included in the automatic transmission control system:

- Transmission Control Module - Controls activation/deactivation of the solenoids by means of processing the input signals from the transmission speed and temperature sensors. Also stores adaptive data and diagnostic trouble codes and frozen values for diagnostics.
- Gear position indicator, integrated with Transmission Control Module - Provides Transmission Control Module information on selected gear position.
- Solenoid - Controls engine braking on 1st gear.
- Solenoid - Controls engine braking on 1st gear.
- Lock-up solenoid - Controls the lock-up function and also used with certain shiftings.
- Linear pressure solenoid - Controls transmission system pressure.
- Linear pressure solenoid - Controls transmission shift pressure and also used with certain shiftings.

- Linear pressure solenoid - Controls transmission shift pressure and also used with certain shiftings.
- Linear pressure solenoid - Controls transmission shift pressure and also used with certain shiftings.
- Linear pressure solenoid - Controls transmission shift pressure and also used with certain shiftings.
- Speed sensor, input shaft (1) - Provides Transmission Control Module (TCM) information on input shaft speed from the engine.
- Speed sensor, output shaft (2) - Provides Transmission Control Module (TCM) information on output shaft speed from the transmission.
- Oil temperature sensor (3) - Provides Transmission Control Module (TCM) information on transmission oil temperature.
- Gear Selector Module (GSM) - Provides Transmission Control Module (TCM) information on Geartronic position and winter mode (W) etc.

SIGNALS

The table below summarizes the input and output signals to and from the Transmission Control Module (TCM). The signal types are divided into directly connected signals, serial communication and Controller Area Network (CAN) communication. The illustration below displays the same information with the Volvo component designations.

Input signals	Output signals
Directly connected: **Speed sensor, input shaft** (7/61): • Provides information on transmission input speed. Amongst other things, used to calculate the gearshift process, to check lock-up and to diagnose the hydraulic/mechanical function in the transmission. **Speed sensor, output shaft** (7/62): • Provides information on transmission output speed. Amongst other things, used to calculate vehicle speed, and to diagnose the hydraulic/mechanical function in the transmission. **Oil temperature sensor** : • Provides information on transmission oil temperature. The information is used to adjust gearshift timing and oil pressure.	**Directly connected:** (power supply unless otherwise stated) **Solenoids** (8/38-39): • Transmission Control Module activates the solenoids with engine braking on 1st gear. **Lock-up solenoid,** : • Adapts system pressure to a lock-up pressure. Also used with certain gearshifts. **Linear pressure solenoid,** : • Adapts linear system pressure during gearshifts. **Linear pressure solenoid,** : • Adapts system pressure to a gearshift pressure to clutch C1 and is activated with certain gearshifts.

Gear position indicator : • Provides information on selected gear position to the transmission control module. Enables starting only in and. Consists of a permanent magnet that is moved across a number of Hall elements, creating a specific voltage for each gear position.	**Linear pressure solenoid,** : • Adapts system pressure to a gearshift pressure to clutch C2 and is activated with certain gearshifts. **Linear pressure solenoid,** : • Adapts system pressure to a gearshift pressure to clutch C3 and is activated with certain gearshifts. **Linear pressure solenoid,** (8/142): • Adapts system pressure to a gearshift pressure to brake band B1 and is activated with certain gearshifts. **Gear Selector Module (GSM)** (3/156): • Controls shift-lock solenoid for the shift-lock function in the gear selector assembly. **Engine Control Module (ECM)** (4/46): • Start inhibiting. Provides the Engine Control Module (ECM) with a signal on whether or not the engine may be started.
Via serial communication: **Gear Selector Module (GSM)** : • Provides in formation on whether the gear selector is locked in postition plus information on the status of the winter mode (W) button (status of the sport mode button for). • Also provides a control signal with Geartronic shifting, and information on fault status in the Gear Selector Module (GSM) to generate diagnostic trouble codes (DTC) for faults in the Gear Selector Module (GSM).	**Via serial communication:** **Gear Selector Module (GSM)** (3/156): • The Transmission Control Module (TCM) provides the Gear Selector Module (GSM) with signals on which diodes shall be lit on the gear selector assembly panel, depending on gear position selected.
Via Controller Area Network (CAN)	**Via Controller Area Network (CAN)**

communication:
Steering Wheel Module (SWM) (3/254), via Central Electronic Module (CEM) (4/56):

- Cruise control, used when calculating acceleration, depending on Resume and Set button position.

Brake Control Module (BCM) (4/16):

- Provides information on vehicle speed and difference in speed between right and left-hand wheels. Prevents upshifting if the difference in speed is above 40 km/h, in order to protect the differential in the transmission.

Engine Control Module (ECM) (4/46):

- Stop lamp switch OFF/ON, used with torque converter lock-up.
- Engine temperature, used to diagnose the transmission temperature sensor and with the catalytic converter start function (Cat-start).
- Engine speed, more than 400 rpm = engine running. Used to start transmission oil pressure and diagnostic function.
- Engine speed. Used to check torque converter slipping speed and pressure build-up, which increases gearshift comfort.
- Kickdown, if the accelerator pedal is depressed and the throttle is fully open then the Engine Control Module (ECM) sends a signal to the Transmission Control Module (TCM) on kickdown.
- Current engine torque, used to check transmission system pressure.
- Throttle opening, used to calculate gearshifts. Sport mode and kickdown.
- Accelerator pedal position, used to calculate gearshift timing.

Suspension module (SUM) (4/84) (only applies to S60R/V70R):

communication:
Brake Control Module (BCM) (4/16):

- Current gear, used to provide the signal for no control when gearshifting.
- Vehicle speed, used as back-up.

Engine Control Module (ECM) (4/46):

- Transmission temperature, used to compensate increased load at low oil temperatures.
- Selected gear, used by the engine so that the engine can compensate for different loads.
- Lock-up, used by the engine so that the engine can compensate for different loads.
- Next gear planned by Transmission Control Module (TCM), used by the engine so that the engine can compensate for different loads.
- Request for reduction in engine torque when gearshifting, the engine reduces the engine torque when gearshifting.
- Request for torque limitation, the engine limits the engine torque, depending on current gear and whether winter mode (W) is selected.

Driver Information Module (DIM) (5/1):

- Current gear selector lever position. Used to indicate lever position in the Driver Information Module (DIM).
- Via Central Electronic Module (CEM), checking of warning lamps. Lights the general warning lamp in the event of a fault.
- Via Central Electronic Module (CEM), text message in Driver Information Module (DIM). The driver can obtain different fault messages from the Transmission Control Module (TCM).
- The Transmission Control Module (TCM) transmits a signal via the Controller Area Network (CAN) to the Engine Control

• Selected driving mode (Advanced)	Module (ECM) to light the malfunction indicator lamp (MIL) in the Driver Information Module (DIM) in the event of an emission related fault. **Central Electronic Module (CEM)** (4/56): • The Transmission Control Module (TCM) transmits a signal via the Central Electronic Module (CEM) to light the reversing lamp.

TRANSMISSION CONTROL MODULE (TCM) (TF-80SC AWD; 2005-2012)

DESIGN

see **DESIGN**

DIAGNOSTIC FUNCTIONS

see **DIAGNOSTIC FUNCTIONS**

DOWNLOADING SOFTWARE AND REPLACING THE CONTROL MODULE

see **DOWNLOADING SOFTWARE AND REPLACING THE CONTROL MODULE**

FUNCTION

see **FUNCTION**

SYSTEM OVERVIEW

see **SYSTEM OVERVIEW**

UPPER ELECTRONIC MODULE (2003-2004)

DESIGN

SIREN

Fig. 217: Locating Siren Control Module
Courtesy of VOLVO CARS CORPORATION

Data from the siren (Siren Control Module) to the upper electronic module contains configuration and status

information. This data is carried via serial communication.

When the alarm is activated the siren sends continuous status signals to the upper electronic module.

The siren is equipped with a battery and a built-in battery charger so that it is independent of the vehicle power supply. The battery charger maintains battery voltage in the integrated battery. When the alarm is activated the power supply is monitored for the siren and serial communication between the siren and the upper electronic module. The siren sounds if the car's power supply to the siren is broken or if communication between the upper electronic module and the siren is interrupted. The battery and the battery charger in the siren cannot be changed separately. The entire siren must be replaced if it is faulty.

The siren is located in a protected position under the fender liner in the front right-hand wheel arch. The siren must be configured after replacement. Configuration is carried out using VIDA (Volvo scan tool).

The siren can be diagnosed.

SUN ROOF

Fig. 218: Identifying Sun Roof Module
Courtesy of VOLVO CARS CORPORATION

The Sun Roof Module is operated by one switch. The switch is located in the same unit in the roof as the front reading lamps and the courtesy lighting. The sun roof can be opened, closed and tilted.

The sun roof is powered by a motor in the roof in front of the sun roof. The position of the sun roof is determined by two optical sensors.

There are diagnostics for the sun roof.

MOVEMENT SENSOR

Fig. 219: Locating Mass Movement Sensor
Courtesy of VOLVO CARS CORPORATION

The Mass Movement Sensor detects movement in the passenger compartment using radio waves at 2.450 GHz. The Doppler effect principle is used to determine if the frequency of the received microwave has been modified in comparison to the transmitted microwave. Any change in frequency is interpreted as a movement in the car. When movement is detected, a trigger signal is sent to the upper electronic module which activates the alarm.

The movement sensor is located in the headlining in the center of the car. This allows the sensor to cover as large an area as possible.

There are diagnostics for the movement sensor.

RAIN SENSOR

Fig. 220: Locating Rain Sensor Module
Courtesy of VOLVO CARS CORPORATION

The rain sensor module optically senses water on the windshield. An infra red beam of specific intensity lights a section of the windshield. The intensity of the reflected beam is measured and compared to the intensity of the transmitted beam. If there is water on the surface of the windshield, the beam distorts, reducing the intensity of the beam. If the beam is not reflected completely it is interpreted as rain on the windshield and the windshield wipers are started.

The signals from the upper electronic module are carried via serial communication. The rain sensor transmits the signals to the upper electronic module. These signals request a particular windshield wiper speed (depending on the amount of rain falling on the windshield), indicate that a sudden large splash has hit the windshield and register the light conditions outdoors.

The rain sensor is located in front of the rear view mirror on the inner side of the windshield. A special windshield is used on cars with rain sensors.

There are diagnostics for the rain sensor.

INTERIOR ROOF LIGHTING

Fig. 221: Identifying Interior Roof Lighting
Courtesy of VOLVO CARS CORPORATION

There are a number of lamps inside the passenger compartment. The lamps include four reading lamps and a general courtesy lamp.

The front left and front right reading lamps and the courtesy light are located in the same unit in the roof, just above the rear view mirror. The two rear reading lamps are located in the roof above the rear seat.

The five lamps transmit control signals to the control module. These signals allow the control module to determine the status of the lamps and switches This allows faults such as broken bulbs, open circuits or jammed switches to be detected.

The five control signals are distributed as input signals at the four inputs in the upper electronic module. The control signal for the courtesy lighting shares the same inputs as control signals for the front reading lamps. The rear reading lamps each have their own input.

Two different lighting times can be programmed using VIDA depending on the requirements of the customer.

- Short lighting time which is the time from when the door is unlocked or closed or from when the engine is switched off until the interior lighting goes out. The time can be set between 5 and 255 seconds. Normal setting is 30 seconds
- Long lighting time, which is the time from when a door is left open or from when a light is lit using a

button to when the interior lighting goes out. The time can be set between 0 and 255 minutes. Normal setting is 10 minutes.

There are diagnostics for all lamps in the inner roof lighting.

REMOTE CONTROL

Fig. 222: Identifying Remote Control
Courtesy of VOLVO CARS CORPORATION

The remote control can be used to lock and unlock the doors, unlock the tailgate (V70 and V70XC), open the trunk lid (S80 and S60), to activate the approach lighting, and to activate the panic alarm (certain markets).

The receiver for the remote control is located in the rear view mirror and transmits signals to the upper electronic module. These signals determine:

- which function should be activated
- at which frequency the receiver receives the signal from the remote control
- which of the remote controls transmitted the signal
- the signal strength received from the remote control.

Up to six remote controls can be stored in the upper electronic module. The control module stores the identity and PIN for each remote control.

The remote control identity and PIN are also stored in the central Volvo database When replacing the upper electronic module, this data is transmitted to the car. This means that the remote controls do not need to be replaced and can be used with the new upper electronic module.

There are two different types of remote control, depending on whether the car is a late or an early model. The two variants are programmed into the control module in different ways. The early variant has an 8 digit PIN. The late variant has one 8 digit and one 16 digit PIN.

The early version and late version differ by chassis number.

	Chassis number

Model	**Early version**	**Later version**
S80	-161195	161196-
V70	-045075 (1) -047529 (2)	045076- (1) 047530- (2)
V70 XC	-003972	003973-
S60	-	All

- (1); applies to cars manufactured in production plant 1
- (2); applies to cars manufactured in production plant 2.

Information regarding at which production plant a car was manufactured can be found in the VIN number. The 7th character from the right in the VIN indicates the production plant.

If the seat and power door mirrors in the car have a memory function, these functions are affected by the remote controls which are stored in positions 1, 2 or 3. The memory functions store the seat and power door mirror settings at the time the car was locked using one of these remote controls. Next time the car is unlocked using the same remote control, the seat and the power door mirrors move to the same settings.

The remote control battery can be replaced.

REAR VIEW MIRROR

Fig. 223: Identifying Rear View Mirror
Courtesy of VOLVO CARS CORPORATION

The rear view mirror has an automatic anti-dazzle function for when light from behind the car is too bright in the mirror (option in certain markets).

One photo sensor on the front of the rear view mirror, and one on the rear side compare light intensity. When the intensities differ by a specified amount the anti-dazzle function compensates to the required degree. The upper electronic module receives and manages the signals from the two photo sensors.

The anti-dazzle function can be set to the customer requirements. The selectable values are Light, Normal and Dark. Initial setting is Normal.

LEDs for the seat belt reminder are located in the rear view mirror, above the mirror lens.

CAUTION: The rear view mirror with automatic anti-dazzle can only be installed in the factory. Upgrading to, or removing an anti-dazzle rear view mirror cannot be carried out after market due to software limitations.

There are diagnostics for the functions in the rear view mirror.

DIAGNOSTIC FUNCTIONS

GENERAL

The upper electronic module (UEM) has a built-in diagnostic system, the Volvo on-board diagnostic (OBD) system, which continuously monitors itself and the input and output signals.

DIAGNOSTIC TROUBLE CODES (DTCS)

A diagnostic trouble code (DTC) is stored if the control module detects a fault. The control module can store up to 15 diagnostic trouble codes (DTCs).

If a fault disappears for any reason after the diagnostic trouble code (DTC) has been permanently stored in the control module, information about the fault remains in the control module.

READING AND ERASING DIAGNOSTIC TROUBLE CODES (DTCS)

Stored diagnostic trouble codes (DTCs) can be read off and erased using this function.

Diagnostic trouble codes (DTCs) can only be erased once all the diagnostic trouble codes (DTCs) have been read off at least once.

NOTE: Certain functions cannot be carried out before diagnostic trouble codes (DTCs) have been erased.

READING OFF INPUT AND OUTPUT SIGNALS

This function can be used to continuously read off the values and status of the control module's input and output signals.

The following parameters can be read off:

- The number of remote controls
  - **Alarm status 1: Not activated and not deployed, connected sensors.**
  - **Alarm status 2: Activated and not deployed, connected sensors.**
  - **Alarm status 3: Activated and not deployed, disconnected sensors.**
  - **Alarm status 4: Activated and deployed, connected sensors.**
  - **Alarm status 5: Activated and deployed, disconnected sensors.**

- **Alarm status 6: Not activated and not deployed, disconnected sensors.**

- The number of the remote control

NOTE: One of the remote control buttons must be activated when reading off.

- **Alarm status 1: Not activated and not deployed, connected sensors.**
- **Alarm status 2: Activated and not deployed, connected sensors.**
- **Alarm status 3: Activated and not deployed, disconnected sensors.**
- **Alarm status 4: Activated and deployed, connected sensors.**
- **Alarm status 5: Activated and deployed, disconnected sensors.**
- **Alarm status 6: Not activated and not deployed, disconnected sensors.**

- The activated buttons on the remote control

NOTE: One of the remote control buttons must be activated when reading off.

- **Alarm status 1: Not activated and not deployed, connected sensors.**
- **Alarm status 2: Activated and not deployed, connected sensors.**
- **Alarm status 3: Activated and not deployed, disconnected sensors.**
- **Alarm status 4: Activated and deployed, connected sensors.**
- **Alarm status 5: Activated and deployed, disconnected sensors.**
- **Alarm status 6: Not activated and not deployed, disconnected sensors.**

- Voltage to mass movement sensor module (MMS), alternatively movement sensor module (IMS), status

NOTE: Listed as On or Off. The mass movement sensor module (MMS), or movement sensor module (IMS), is supplied with voltage (On) when the alarm is activated and the sensors are connected.

- **Alarm status 1: Not activated and not deployed, connected sensors.**
- **Alarm status 2: Activated and not deployed, connected sensors.**
- **Alarm status 3: Activated and not deployed, disconnected sensors.**
- **Alarm status 4: Activated and deployed, connected sensors.**
- **Alarm status 5: Activated and deployed, disconnected sensors.**
- **Alarm status 6: Not activated and not deployed, disconnected sensors.**

- Alarm status

NOTE: Indicates the alarm setting and alarm sensor setting. Six states can occur:

- **Alarm status 1: Not activated and not deployed, connected sensors.**
- **Alarm status 2: Activated and not deployed, connected sensors.**
- **Alarm status 3: Activated and not deployed, disconnected sensors.**

  - **Alarm status 4: Activated and deployed, connected sensors.**
  - **Alarm status 5: Activated and deployed, disconnected sensors.**
  - **Alarm status 6: Not activated and not deployed, disconnected sensors.**
- Front left reading lamp, status
- The switch for the front left reading lamp
- Front right reading lamp, status
- Switch for the front right reading lamp
- Rear left reading lamp, status
- The switch for the rear left reading lamp
- Rear right reading lamp, status
- The switch for the rear right reading lamp
- Third row reading lamp, status (XC90 only)
- Switch, third row reading lamps (XC90 only)
- The switch for the general lighting
- Extended X-supply, status

NOTE: **X-supply supplies power to the sunroof, mirror lamps and rain sensor module (RSM). X-supply is active when the controller area network (CAN) is active, and for a short time after the controller area network (CAN) is no longer active. This time varies and depends on a number of parameters.**

- Local lighting, status
- Cargo compartment lighting, status

NOTE: **Only applies to V70.**

- The degree of anti-dazzle for the rear view mirror

NOTE: **The parameter can only be read off when the engine is running and back-up (reverse) gear is not selected.**

100 % means that the rear view mirror is fully dimmed.

0 % means that the rear view mirror is not dimmed.

- Supply voltage, sun roof

NOTE: **The following parameters for the sun roof are read off from a separate vehicle communication input for the upper electronic module (UEM).**

-

- Button activation, forward
- Button activation, backward
- Button activation, tilt
- Button activation, auto
- Motor, forward
- Motor, backward.

NOTE: The following parameters for tyre pressure monitoring can only be read off on vehicles with TPMS.

-
- Last received sensor ID
- Last stored tyre pressure

ACTIVATING COMPONENTS AND FUNCTIONS

NOTE: A short delay can occur before a component is activated.

Remote control activations can only be carried out if the key is not in the ignition. Lock activations can only be carried out if the doors are shut.

With this function the components and functions associated with the upper electronic module (UEM) can be activated.

The following components / parameters can be activated in alternative ways:

- General lighting, directly to the lamp
- Front left reading lamp, directly to the lamp
- Front right reading lamp, directly to the lamp
- Rear left reading lamp, directly to the lamp
- Rear right reading lamp, directly to the lamp
- Third row reading lamps, direct to the lamps (XC90 only)
- Extended X-supply
- Voltage to mass movement sensor module (MMS), alternatively movement sensor module (IMS)
- Seat belt reminder
- Indicates that the passenger airbag (PAD) is disconnected (from 2005-)
- Remote control, activate the button
- Local lighting
- Cargo compartment lighting (applies only to the V70 and XC70)

NOTE: The following activations for the sun roof are performed in separate

vehicle communication input for the upper electronic module (UEM).

-
- Button activation, forward
- Button activation, backward
- Motor, forward
- Motor, backward.

READING OFF AND PROGRAMMING DATA

With this option it is possible to read programmed data and to program in data.

NOTE: **If possible, all data must be read out from the control module before replacement. After replacement the relevant data must be programmed into the new control module. The following customer parameters must be read off before the control module is replaced. This is so that the same information can be programmed in the new control module.**

With auto mode:

The general lighting lights and remains lit for 30 seconds when:

The door has been unlocked from outside using a key or remote control.

The engine has been stopped and the ignition key turned to position 0.

The default period is 30 seconds. This can be changed to between 5 seconds and 255 seconds.

The general lighting lights and remains lit for under 10 minutes when:

One of the doors is opened after unlocking.

When the lamp is lit using a button.

The default period can be reprogrammed from 0 to 255 minutes at 10 minute intervals.

The strength of the interior rear view mirror anti-dazzle. There are three positions; a normal position, one with stronger anti-dazzle and one with weaker anti-dazzle.

READING OFF THE CONTROL MODULE IDENTIFICATION

VIDA identifies control modules by reading off a number of codes from the control module memory.

The codes contain information about the control module:

- hardware P/N (control module without software)

- hardware serial number (control module without software)
- software P/N
- diagnostic software P/N.

PROGRAMMING REMOTE CONTROLS

Add remote control

This function is used when the customer wishes to order extra remote controls in addition to those supplied on delivery. The PIN-code for a new remote control must be programmed into the control module memory before the remote control can be used.

The control module memory has room for six remote controls.

Removing remote controls

This function is used when the customer wishes to erase one or more remote controls from the control module memory, so that the remote control cannot be used any longer. All the available remote controls should be at hand when erasing is being carried out.

TIRE PRESSURE MONITORING SYSTEM (TPMS)

The Upper electronic module (UEM) may store diagnostic trouble codes (DTCs) in the event of an error in the actual receiver or in a sensor. In order to carry out a correct evaluation of the function, the vehicle must have traveled faster than 40 km/h (25 mph) for longer than 570 seconds (approximately 9.5 minutes). This time is accumulated time, i. e. the counted time is interrupted if the vehicle travels slower than 40 km/h (25 mph), if for example, stopping at traffic lights. Counting continues as soon as the vehicle exceeds 40 km/h (25 mph). The Upper electronic module (UEM) can store two diagnostic trouble codes (DTCs) per sensor. A diagnostic trouble code (DTC) for lost communication and a diagnostic trouble code (DTC) for low battery voltage. When a diagnostic trouble code (DTC) is stored the ID number is also stored on the sensor which the diagnostic trouble code (DTC) applies to. When a diagnostic trouble code (DTC) is stored a message is shown in the Driver information module (DIM).

QUICK CHECK OF TPMS

Fig. 224: Checking TPMS
Courtesy of VOLVO CARS CORPORATION

NOTE: Some car/model years require that you are more accurate when aiming the diagnostic tool at the sensor for an activation to succeed. If an activation fails, realign the diagnostic tool and perform the activation again. First after three (3) failed activation attempts can a sensor be regarded as defective.

The system can be checked, using the diagnostic tool, by activating a read off at the same time as activating the sensors using a special tool. The special tool is positioned against the tire where the sensor is located at the same time as the button on the special tool is depressed. The special tool then transmits a signal that activates the sensor so that it starts to send signals to the Upper electronic module (UEM). The activated sensor ID number and tyre pressure is then shown in the display of the diagnostic tool. Note the sensor's id-number and its position.

After activating a sensor, press the "Show data" button for the relevant wheel. Then repeat the activation procedure for all wheels. Different ID numbers should appear. If the same ID number as the previous wheel appears, the activation has failed. Perform the activation again for the relevant wheel and press the "Show data" button again.

DOWNLOADING SOFTWARE AND REPLACING THE CONTROL MODULE

New software can be downloaded into the upper electrical module. When ordering software, the hardware and the software in the car is compared to the Volvo central database. If the comparison is OK the software is downloaded to the control module. The PINs for the existing remote controls are downloaded at the same time.

If the comparison between the car and Volvo central database is not OK, the database is updated with the relevant configuration. When this is complete the software and PINs are downloaded.

When installing a completely new upper electronic module in the car the PINs for the existing remote controls are downloaded to the control module. New remote controls do not need to be ordered after a software download or after the control module is replaced.

The control module is integrated in the rear view mirror. If the control module is replaced, the rear view mirror assembly must also be replaced.

The upper electronic module must be unlocked using a unique PIN to download software or to add remote controls to the upper electronic module. VIDA carries out the unlocking automatically. The PIN is obtained from the Volvo central database and is sent with the software package when ordered, when remote controls are to be added or erased, or when a new upper electronic module is installed in the car and loaded with software.

Because of the unique PIN, the upper electronic modules cannot be moved between cars.

Three customer parameters can be programmed into the upper electronic module. These customer parameters are stored in the control module but not in the Volvo central database. This means that the customer parameters must be reprogrammed when the hardware is replaced.

Two different times for internal lighting can be programmed depending on the requirements of the customer. These times are parameters that are adjusted directly using the diagnostic tool:

- Short lighting time which is the time from when the door is unlocked or closed or from when the engine is switched off until the interior lighting goes out. The time can be set between 5 and 255 seconds. Normal setting is 30 seconds
- Long lighting time, which is the time from when a door is left open or from when a light is lit using a button to when the interior lighting goes out. The time can be set between 0 and 255 minutes. Normal setting is 10 minutes.

In addition the degree of anti-dazzle of rear view mirrors with automatic anti-dazzle function can be set to the customer requirements. The selectable values are Light, Normal and Dark. This programming is carried out by ordering and carrying out software downloads, especially for setting anti-dazzle.

FUNCTION

SUNROOF OPERATION

Fig. 225: Identifying Sunroof Operation Overview
Courtesy of VOLVO CARS CORPORATION

The sun roof communicates with the upper electronic module (4/70) via serial communication. The sun roof has an internal control module (4/33) which manages this communication.

Data about the sun roof position and data used for diagnostics is sent from the sun roof to the upper electronic module. Data about the position is sent on to other control modules, including the climate control module via the central electronic module (4/56).

The communication between the upper electronic module and the sun roof consists of diagnostic information.

RAIN SENSOR

Fig. 226: Identifying Rain Sensor Operation Overview
Courtesy of VOLVO CARS CORPORATION

The rain sensor (7/149) determines that there is water on the windshield. The sensor assesses the volume of water on the windshield and the prevailing exterior light conditions. This data is then sent, via the upper electronic module (4/70), to other control modules in the car on the Control area network (CAN). These control modules in turn ensure that the windshield wipers are set to the correct speed. The rain sensor senses if the windshield is dirty or covered with traffic film and automatically compensates accordingly. The rain sensor also senses heavier splashes on the windshield. The windshield wipers are then operated at top speed.

The rain sensor communicates with the upper electronic module via serial communication. The power supply is from the upper electronic module via the power supply signal EXT. X, when the ignition key is in positions I or II. The rain sensor is active for 10 minutes after the ignition has been switched off.

The steering wheel module (3/130) sends signals via the control area network (CAN) to the central electronic module (4/56) and upper electronic module about the position of the wiper stalk. If the stalk is moved to the

intermittent wiping/rain sensor position, the upper electronic module transmits this data to the rain sensor which is then activated.

The rain sensor transmits data via the upper electronic module to the central electronic module, which then controls the wiper motor. The sensitivity can be adjusted using the collar on the wiper stalk.

The upper electronic module transmits a fault message to the central electronic module if there is a fault in the rain sensor. If there is a fault message when the rain sensor is active, the central electronic module selects top speed for the windshield wipers until the windshield wiper stalk is moved from the intermittent/rain sensor position. If the fault recurs, intermittent wiping will be activated when the wiper stalk is next moved to the intermittent/rain sensor position, although at a fixed interval.

INTERIOR ROOF LIGHTING

Fig. 227: Identifying Interior Roof Lighting Operation Overview
Courtesy of VOLVO CARS CORPORATION

The interior roof lighting and reading lamps, front (3/117) and rear (10/150), five lamps in total, are controlled via the upper electronic module (4/70) in that they are supplied with voltage directly from the control module when each switch is activated. The courtesy lighting is also activated when the doors are opened or when local lighting is activated.

Data is sent to the upper electronic module from the central electronic module (4/56) via the Control area network (CAN). This data indicates which doors or tailgate/trunk lid are opened or closed.

The request for keyhole lighting, courtesy lighting and cargo compartment lighting is sent from the upper electronic module to the central electronic module (4/56) and rear electrical module (4/58) via the Control area network (CAN).

Cargo compartment lighting in the V70 and the V70XC (10/25) is also supplied with voltage by the upper electronic module. The lamp is activated when the central electronic module indicates to the upper electronic module that the tailgate is open.

Sun visor lighting (10/114-115) is supplied with voltage by the upper electronic module using the voltage supply signal EXT. X. The lamp is activated when the flap covering the mirror in the sun visor is opened.

AUTOMATIC REAR VIEW MIRROR ANTI-DAZZLE

The upper electronic module receives data from two photo sensors, one on the front and one on the reverse of the rear view mirror. If the upper electronic module determines that the anti-dazzle function is required, a signal is sent to the electro-chromatic mirror which diffuses to the level required.

The signal transfer occurs internally in the rear view mirror, and is carried out directly between the upper electronic module and the anti-dazzle function.

CAUTION: The rear view mirror with automatic anti-dazzle can only be installed in the factory. Upgrading to, or removing an anti-dazzle rear view mirror cannot be carried out after market due to software limitations.

SEAT BELT REMINDER

Fig. 228: Identifying Seat Belt Reminder Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The seat belt reminder is activated when the upper electronic module (4/70) receives a signal from the central electronic module (4/56), via the Control area network (CAN), which indicates that the seat belt is not engaged despite someone sitting in the front seat. Data is also transmitted to the driver information module (5/1) which indicates to the driver that the seat belt is not being used in one of the front seats.

SYSTEM OVERVIEW

CONTROL MODULE

Fig. 229: Identifying Rear View Mirror
Courtesy of VOLVO CARS CORPORATION

The most important task of the upper electronic module is to manage the following functions:

- Siren
- Sun roof
- Movement sensor
- Rain sensor
- Interior roof lighting
- Cargo compartment lighting (V70 and V70XC)
- Sun visor lighting
- Remote control
- Automatic rear view mirror anti-dazzle
- Seat belt reminder.

The control module is integrated in the rear view mirror. If the control module is replaced, the rear view mirror assembly must also be replaced.

The upper electronic module communicates partly with components which are directly connected and partly with other control modules and components via serial communication and the Control area network (CAN).

The control module checks activations and input and output signals through an integrated diagnostic system A diagnostic trouble code (DTC) is stored if the control module detects an error. In certain cases the upper electronic module replaces the faulty signal with a substitute signal.

Diagnostic trouble codes (DTC) are stored in the control module memory. The data can be read off using the VIDA (Volvo scan tool).

A simple way to check that the upper electronic module is supplied with power is to activate the seat belt reminder function Activate the seat belt reminder by sitting in the driver's seat. Switch on the ignition, do not fasten the seat belt. If the seat belt reminder lights, the upper electronic module is supplied with voltage. Another way of checking that the upper electronic module is supplied with voltage is to switch on the rear reading lamps.

SIGNALS

The table below summarizes input and output signals to and from the upper electronic module. The signal types are divided into directly connected signals, serial communication and Control area network (CAN) communication. The illustration below displays the same information and the Volvo part numbers.

Input signals	Output signals
Directly connected:	**Directly connected:** (power supply unless otherwise stated)
Control signal reading lamps (x 4)	Movement sensor (optional extra)

Remote control (data) Remote control (frequency) Remote control (signal strength) Photo sensor rear view mirror (x 2)	Reading lamps (x 4) Roof lighting Cargo compartment lighting Voltage supply signal EXT. X Remote control receiver Anti-dazzle for the rear view mirror (optional extra) Diodes in the rear view mirror
Via serial communication: Siren (optional extra) Sun roof (optional extra) Movement sensor (optional extra) Rain sensor (optional extra)	**Via serial communication:** Siren (optional extra) Sun roof (optional extra) Movement sensor (optional extra) Rain sensor (optional extra)
Via Control area network (CAN) communication: Central electronic module Driver's door module Engine control module (ECM) Carphone module (optional extra) Steering wheel module	**Via Control area network (CAN) communication:** Accessory electronic module (optional extra) Central electronic module Driver's door module Passenger door module Carphone module (optional extra) Rear electronic module

Fig. 230: Identifying Upper Electronic Module (UEM) Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

UPPER ELECTRONIC MODULE (UEM) (2005-2012)

DESIGN

SIREN (SCM) (APPLIES UP TO AND INCLUDING STRUCTURE WEEK 201127)

Fig. 231: Locating Siren Control Module
Courtesy of VOLVO CARS CORPORATION

Information transmitted by the siren control module (SCM) to the upper electronic module (UEM) contains configuration and status information. This data is carried via serial communication.

When the alarm is activated the siren sends continuous status signals to the upper electronic module (UEM).

The siren has a battery and a built in battery charger so that it is independent of the power supply in the car. The battery charger maintains battery voltage in the integrated battery. When the alarm is activated, the power supply for the siren and the serial communication between the siren and the upper electronic module (UEM) are monitored. The siren sounds if the car's power supply to the siren is broken or if communication between the upper electronic module (UEM) and the siren is interrupted. The battery and battery charger in the siren cannot be replaced separately. The entire siren must be replaced in the event of a fault.

The siren is in a protected location under the fender liner in the front right-hand wheel arch. The siren must be configured after replacement. Configuration is carried out using VIDA (Volvo scan tool).

There are diagnostics for the siren.

From and including structure week 201128, SCM is replaced by BBS, which is instead then connected to the Rear electronic module (REM).

SUN ROOF

Fig. 232: Identifying Sun Roof Module
Courtesy of VOLVO CARS CORPORATION

The sun roof module (SRM) is operated by one switch. The switch is located in the same unit in the roof as the front reading lamps and the courtesy lighting. The sun roof can be opened and closed as well as angled up slightly at the rear edge.

The sun roof is driven by a motor which is in the roof, in front of the sun roof. The position of the sun roof is determined by two optical sensors. The sun roof has a sun roof module (SRM) which manages communication.

There are diagnostics for the sun roof.

MASS MOVEMENT SENSOR MODULE (MMS)

Fig. 233: Locating Mass Movement Sensor Module (MMS)
Courtesy of VOLVO CARS CORPORATION

NOTE: For XC90 MY 2012- the Mass movement sensor module (MMS) is replaced with ultrasonic sensor module (IMS).

The mass movement sensor module (MMS) detects movements inside the passenger compartment using high frequency radio waves. The Doppler effect principle is used to determine whether the frequency of the received microwave is different from the transmitted microwave. If the frequency has changed, this is interpreted as a

movement in the vehicle. If a movement is detected, a trigger signal is transmitted to the upper electronic module (UEM) which activates the alarm.

Mass movement sensors (MMS) are located in the ceiling, in the center of the vehicle, to optimally cover as much as possible of the vehicle's volume. In XC90 there are two mass movement sensors (MMS), one front and one rear. These are connected in parallel to the central electronic module (CEM) and share wiring for voltage supply and communication.

The mass movement sensor module (MMS) is powered from the upper electronic module (UEM) and earthed in the body.

There are diagnostics for the mass movement sensor module (MMS).

ULTRASONIC SENSOR MODULE (IMS) (XC90 MY 2012-).

Fig. 234: Identifying Ultrasonic Sensor Module (IMS)
Courtesy of VOLVO CARS CORPORATION

NOTE: Only in XC90 MY 2012-.

The ultrasonic sensor module (IMS) is located in a cover on the ceiling. The ultrasound sensor (IMS) is used to detect movement inside the passenger compartment when the alarm is activated. The aim is to detect, for example, anybody attempting to reach into the vehicle to steal a bag or similar. When the sensor is activated it performs an internal self-test and reports the result to the CEM, if the test failed the CEM sets a DTC. The sensors communicate serially and are powered via the Upper electronic module (UEM). When the sensor is activated, it emits ultrasound in the passenger compartment. The sound waves are reflected back to the sensor and if the sensor detects changes in reflectivity or movements inside the passenger compartment, the alarm is triggered.

NOTE: The sensor performance is affected by air turbulence and therefore all windows and any roof hatches must be closed for the sensor to operate most effectively.

RAIN SENSOR MODULE (RSM)

Fig. 235: Locating Rain Sensor Module
Courtesy of VOLVO CARS CORPORATION

The rain sensor module (RSM) uses optical measurement to detect water on the windshield. An infrared beam of a fixed intensity lights part of the windshield. The intensity of the reflected beam is measured and compared to the intensity of the transmitted beam. If there is water on the surface of the windshield, the beam will be distorted and some of its intensity lost. If the beam is not fully reflected, this is interpreted as water on the windshield and the windshield wipers start.

The signals from the rain sensor module (RSM) to the upper electronic module (UEM) are carried via serial communication. The rain sensor module (RSM) transmits the signals to the upper electronic module (UEM). These signals request a particular windshield wiper speed (depending on the amount of rain falling on the windshield), indicate that a sudden large splash has hit the windshield and register the light conditions outdoors.

The rain sensor module (RSM) is in front of the rear view mirror on the inside of the windshield. Cars with rain sensor modules (RSM) have a special windshield.

The rain sensor module (RSM) is powered by the upper electronic module (UEM).

There are diagnostics for the rain sensor module (RSM).

INTERIOR ROOF LIGHTING

Fig. 236: Identifying Interior Roof Lighting

Courtesy of VOLVO CARS CORPORATION

There are a number of lamps inside the passenger compartment. The lamps include four reading lamps and a general courtesy lamp.

In XC90 models with three rows of seats there are 6 reading lamps.

The front left and front right reading lamps and the courtesy light are located in the same unit in the roof, just above the rear view mirror. The other reading lamps are in the roof above the rear seat(s).

These lamps transmit control signals to the control module. These signals allow the control module to determine the status of the lamps and switches. This allows any faults to be detected. For example:

- a blown bulb
- an open-circuit in a cable
- that the switch has jammed in the pressed in position.

The control signals are divided up as input signals at a number of inputs in the upper electronic module (UEM). The control signal for the courtesy lighting shares the same inputs as control signals for the front reading lamps. The rear control signals for the reading lamps each have their own input. If there is a third row of seats, there is a separate input for the control signals for this row.

Two different lighting times can be programmed using VIDA depending on the requirements of the customer. For further information, see: **DOWNLOADING SOFTWARE AND REPLACING THE CONTROL MODULE**

There are diagnostics for all lamps in the inner roof lighting.

REMOTE CONTROL

Fig. 237: Identifying Ignition Key
Courtesy of VOLVO CARS CORPORATION

The remote control can be used to:

- lock and unlock the doors
- unlock the tailgate (V70, XC70 and XC90)
- open the trunk lid (S80 and S60)
- activate the approach lighting
- activate the panic alarm (certain markets).

The receiver is in the rear view mirror and transmits signals to the upper electronic module (UEM). These signals determine:

- which function should be activated
- at which frequency the receiver receives the signal from the remote control
- which of the remote controls transmitted the signal
- the signal strength received from the remote control.

Up to six remote controls can be stored in the upper electronic module (UEM). The control module stores the identity and PIN for each remote control.

The remote control identity and PIN are also stored in the Volvo central database When replacing the upper electronic module (UEM), this data is transmitted to the vehicle. This means that the remote controls do not need to be replaced and can be used with the new control module.

The remote control has two PIN codes, one with 16 characters and one with 8.

If the vehicle has seats and door mirrors with memory, these functions are affected by the remote controls stored in positions 1, 2 and 3. When the car is unlocked using one of these remote controls and the driver's door is opened the information about which remote control unlocked the car is stored. The setting for the driver's seat and the door mirrors is stored in that remote control at the same time that the car is put to "sleep mode". (Sleep mode means that the car continues in stand-by mode with low energy consumption, which occurs when the ignition key is removed and no function is activated for approximately 5 minutes). The next time that the car is unlocked using that particular remote control the driving seat and the door mirrors will be set to the same positions that they were in when the car stored the information.

The remote control battery can be replaced.

REAR VIEW MIRROR

Fig. 238: Identifying Rear View Mirror
Courtesy of VOLVO CARS CORPORATION

The rear view mirror has an automatic anti-dazzle function for when light from behind the car is too bright in the mirror (option in certain markets).

There is one photo sensor on the reverse of the rear view mirror and another on the front. Both sensors compare the intensity of the light through the windshield and from the rear of the vehicle. If the difference exceeds a certain value, the anti-dazzle function is activated to the required degree. The upper electronic module (UEM) receives and processes the signals from the two photo sensors.

The anti-dazzle function can be set to the customer requirements. For further information, see:
DOWNLOADING SOFTWARE AND REPLACING THE CONTROL MODULE

There are diodes in the rear view mirror above the mirror glass. These are for the seat belt reminder and for the PAD (passenger airbag deactivated) lamp.

NOTE: The rear view mirror with automatic anti-dazzle can only be installed in the factory. Upgrading to, or removing an anti-dazzle rear view mirror cannot be carried out after market due to software limitations.

There are diagnostics for the functions in the rear view mirror.

TIRE PRESSURE MONITORING SYSTEM (TPMS)

Fig. 239: Locating Tire Pressure Monitoring System (TPMS) Components
Courtesy of VOLVO CARS CORPORATION

The purpose of the tire pressure monitoring system, TPMS, is to enable the driver to have an optimum tire pressure by giving a warning when the pressure in any of the tires becomes too low. Correct tire pressure is important for:

- achieving good fuel economy
- achieving optimum comfort and good driving characteristics
- preventing flat tires due to too low tire pressure.

The function is integrated in the Upper electronic module (UEM). Sensors are installed together with the air valve on each wheel to measure the air pressure in the tires.

NOTE: **The system must be regarded as a driver aid to maintain the correct tire pressure. The system must NOT be regarded as a warning system that indicates that there is a serious problem with the vehicle. No tire is completely sealed - there is always slight leakage as the tire can never be completely sealed to the rim. When inflating the tire with air, you must, as much as possible, ensure that the tires are at same temperature as the outside temperature. Furthermore, "Comfort pressure" should not be applied as this gives a tire pressure that is too close to the parameter for the monitoring system, which means that even small changes in temperature or load can cause the pressure in the tires to be too low for the system to consider acceptable. When inflating with air, the tires must be filled to the pressure stated on the decal located on the car body. The pressure is calculated with regard to fuel economy, comfort and safety. Therefore, these pressures MUST be followed. If the decal is missing or damaged, a new one must be ordered and applied. This is especially important on vehicles with TPMS.**

TIRE PRESSURE SENSOR

Fig. 240: Identifying Special Tool
Courtesy of VOLVO CARS CORPORATION

The tire pressure sensors are installed together with the air valve on the rim. The sensor consists of a pressure sensor, a communication circuit, an acceleration sensor and a battery.

NOTE: Special procedures are required for removing the tyre from the rim depending on vehicle model and tyre type. This is to prevent damaging the sensor.

SEAT BELT REMINDER

Fig. 241: Identifying Seat Belt Reminder
Courtesy of VOLVO CARS CORPORATION

There is a lamp in the upper electronic module (UEM) for the front seat belt reminder. The sensors for the seat belt reminder are in the seat belt buckles. The upper electronic module (UEM) receives information from the supplemental restraint system module (SRS). This information indicates where the seat belt buckle is engaged and whether there is someone in the seat. If someone is in one of the front seats and the seat belt buckle is engaged, the seat belt reminder lamp goes out.

WARNING LAMP FOR PASSENGER AIRBAG DISCONNECTED (PAD)

Fig. 242: Identifying Passenger Airbag Warning Light
Courtesy of VOLVO CARS CORPORATION

There is a PAD (passenger airbag deactivated) warning lamp in the upper electronic module (UEM). This function varies depending on the market. If the passenger airbag is deactivated or a fault has occurred which will prevent activation of the passenger airbag, this lamp will light up.

COMPASS

Fig. 243: Identifying Integrated Compass
Courtesy of VOLVO CARS CORPORATION

The compass is integrated in the rear view mirror. The compass display is integrated in the mirror glass. The display is a vacuum-fluorescent type. The display luminance is regulated via the internal light sensor in the rear view mirror. When the vehicle is started, all the segments light up in the display. All the segments then go out after a couple of seconds. The display then functions normally. The compass has a button (1) which is used to:

- set the magnetic zone in which the car is being driven
- calibrate the compass.

Magnetic zones

Fig. 244: Identifying Magnetic Zones
Courtesy of VOLVO CARS CORPORATION

In many places, magnetic north is different from true north. In order to compensate for this difference, the compass uses a method that divides the globe into 15 different zones. If the compass is not set for the zone in which the vehicle is being driven, it may display the wrong direction. If the vehicle is transported between different zones, the magnetic zone setting must be altered manually.

Fig. 245: Identifying Compass Zone Selection
Courtesy of VOLVO CARS CORPORATION

The correct zone must be selected for the compass to work correctly.

1. Ignition position II.
2. Hold the button on the reverse of the rear view mirror in for approximately 3 seconds until ZONE is displayed (use, for example, a straightened paperclip) The number for the actual area is displayed.
3. Press the button repeatedly until the number for the relevant geographical area is displayed.

The display reverts to the compass direction after a few seconds, this means that the zone change is complete.

Calibration

Calibration of the compass is necessary for it to display the correct direction. During calibration, the compass

detects the magnetic field from the vehicle, which must be taken into consideration when calculating the compass direction. If strong magnetic fields affect the compass, such as for example, an antenna close to the mirror, or if changes in direction occur too quickly, the compass shows the last measured direction until a new measurement is successful. The direction will not be updated if the vehicle is stationary.

The compass must be calibrated when:

- the display does not show a compass direction within a couple of seconds. This may be due to a highly magnetic object, such as an antenna, being placed in the vicinity of the compass.
- the compass does not display the correct direction, even though the correct magnetic zone has been set.

The compass may need calibrating to display correctly. For best results, switch off all large power consumers such as interior lighting, blower fan, rear demist etc. and avoid having metal objects and magnetic objects near the mirror.

1. Stop the vehicle in a large open area with the engine running.
2. Hold the button on the reverse of the rear view mirror in until is displayed.
3. Drive slowly in a circle at no more than 8 km/h until disappears from the display. Calibration is complete.

Alternative calibration step: set off as normal, disappears from the display when calibration is complete.

DIAGNOSTIC FUNCTIONS

see **DIAGNOSTIC FUNCTIONS**

DOWNLOADING SOFTWARE AND REPLACING THE CONTROL MODULE

New software can be downloaded into the upper electronic module (UEM). When ordering software, the hardware and the software in the car is compared to the information in the Volvo central database. If the comparison is OK the software is downloaded to the control module. The PINs for the existing remote controls are downloaded at the same time.

If the comparison between the vehicle and Volvo central database is not OK, the database is updated with the relevant configuration. When this is complete the software and PINs are downloaded.

When installing a completely new upper electronic module (UEM) in the car, the PINs for the existing remote controls are downloaded to the control module. New remote controls do not need to be ordered after a software download or after the control module is replaced.

The control module is integrated in the rear view mirror. If the control module is replaced, the rear view mirror assembly must also be replaced.

The upper electronic module (UEM) must be unlocked using a unique PIN to download software or to add remote controls. VIDA automatically unlocks the control module. The PIN is obtained from the Volvo central database. It is sent with the software package if:

- reload software is ordered

- remote controls are being added or erased
- a new control module is installed in the vehicle and loaded with software.

Because of the unique PIN code, the control module cannot be moved between vehicles.

Three customer parameters can be programmed into the upper electronic module (UEM). These customer parameters are stored in the control module but not in the Volvo central database. This means that the customer parameters must be reprogrammed when hardware is replaced.

Two different times for internal lighting can be programmed depending on the requirements of the customer. These times are parameters that are adjusted directly using VIDA:

- **Short lighting time** . This is the time from when the door is unlocked or closed or from when the engine is switched off until the interior lighting goes out. The time can be set between 5 and 255 seconds. Normal setting is 30 seconds
- **Long lighting time** . This is the time from when a door is left open or from when a light is lit using a button to when the interior lighting goes out. The time can be set between 0 and 255 minutes. Normal setting is 10 minutes.

In addition the degree of anti-dazzle of rear view mirrors with automatic anti-dazzle function can be set to customer requirements. The selectable values are Light, Normal and Dark. This programming is carried out by ordering and carrying out software downloads, especially for setting anti-dazzle.

FUNCTION

SUNROOF OPERATION

Fig. 246: Identifying Sunroof Communication Links & Components
Courtesy of VOLVO CARS CORPORATION

The sun roof module (SRM) (4/33) communicates with the upper electronic module (UEM) (4/70) using serial communication.

Information about the sun roof position and information to be used for diagnosis is sent from the sun roof module (SRM) to the upper electronic module (UEM). The information about the position is transmitted on to other control modules, such as the climate control module (CCM) (3/112) via the central electronic module (CEM) (4/56).

The communication between the upper electronic module (UEM) and the sun roof module (SRM) mainly consists of diagnostic information.

RAIN SENSOR MODULE (RSM)

Fig. 247: Identifying Rain sensor module (RSM) Communication Links & Components
Courtesy of VOLVO CARS CORPORATION

The rain sensor module (RSM) (7/149) determines whether there is water on the windshield. The sensor assesses the volume of water on the windshield and the prevailing exterior light conditions. This information is then sent, via the upper electronic module (4/70), to other control modules in the car on the controller area network (CAN). These control modules in turn ensure that the windshield wipers are set to the correct speed. The rain sensor senses if the windshield is dirty or covered with traffic film and automatically compensates accordingly. The rain sensor also senses heavier splashes on the windshield. The windshield wipers are then operated at top speed.

The rain sensor module (RSM) communicate with the upper electronic module (UEM) using serial communication. Power is supplied from the upper electronic module (UEM) via the power supply signal EXT. X, when the ignition key is in positions I or II. The rain sensor is active for 10 minutes after the ignition has been switched off.

The steering wheel module (SWM) (3/254) transmits a signal about the position of the windshield wiper stalk via LIN-communication to the central electronic module (CEM) (4/56). The central electronic module (CEM) sends this information onwards on the controller area network (CAN) to the upper electronic module (UEM). If the stalk is moved to the intermittent wiping/rain sensor position, the upper electronic module (UEM) transmits this data to the rain sensor module (RSM) which is then activated.

The rain sensor module (RSM) sends information via the upper electronic module (UEM) to the central electronic module (CEM) which then deploys the wiper motor. The sensitivity can be adjusted using the collar

on the wiper stalk.

If a fault occurs in the rain sensor module (RSM), the upper electronic module (UEM) transmits an error message to the central electronic module (CEM). If there is a fault message when the rain sensor is active, the central electronic module (CEM) selects top speed for the windshield wipers until the windshield wiper stalk is moved from the intermittent/rain sensor position. If the fault recurs, intermittent wiping will be activated when the wiper stalk is next moved to the intermittent/rain sensor position, although only at a fixed interval.

INTERIOR ROOF LIGHTING

Fig. 248: Identifying Interior Roof Lighting Communication Links & Components
Courtesy of VOLVO CARS CORPORATION

The interior roof lighting and reading lamps, front (3/117) and rear (10/150) are controlled via the upper electronic module (UEM) (4/70) in that they are supplied with voltage directly from the control module when each switch is activated. The courtesy lighting is also activated when the doors are opened or when approach lighting is activated.

Data is sent to the upper electronic module (UEM) from the rear electronic module (REM) (4/58) via the controller area network (CAN). This data indicates which doors or tailgate/trunk lid are opened or closed.

The request for keyhole lighting, courtesy lighting and cargo compartment lighting is sent from the upper electronic module (UEM) to the central electronic module (CEM) (4/56) and rear electrical module (REM) via the controller area network (CAN).

The cargo compartment lighting in the V70 and XC70 (10/25) is powered by the upper electronic module (UEM). The lamp is activated if the upper electronic module (UEM) receives information from the rear electronic module (REM) indicating that the tailgate is open.

The sun visor lighting (10/114-115) is powered by the upper electronic module (UEM) using the voltage supply signal EXT. X. The lamp is activated when the flap covering the mirror in the sun visor is opened.

AUTOMATIC REAR VIEW MIRROR ANTI-DAZZLE

The upper electronic module (UEM) receives data from two photo sensors, one on the front and one on the reverse of the rear view mirror. If the upper electronic module (UEM) determines that the anti-dazzle function is required, a signal is sent to the electro-chromatic mirror which diffuses to the level requested.

The signal transfer occurs internally in the rear view mirror, and is carried out directly between the upper electronic module (UEM) and the anti-dazzle function.

NOTE: The rear view mirror with automatic anti-dazzle can only be installed in the factory. Upgrading to, or removing an anti-dazzle rear view mirror cannot be carried out after market due to software limitations.

SEAT BELT REMINDER

Fig. 249: Identifying Seat Belt Reminder Communication Links & Components
Courtesy of VOLVO CARS CORPORATION

The seat belt reminder is activated when the upper electronic module (UEM) (4/70) receives a signal from the supplemental restraint system module (SRS) (4/9), via the controller area network (CAN), which indicates that the seat belt is not engaged despite someone sitting in the front seat.

TIRE PRESSURE MONITORING SYSTEM (TPMS)

Fig. 250: Identifying Tire Pressure Monitoring System (TPMS) Information Display
Courtesy of VOLVO CARS CORPORATION

The system covers the upper electronic module (UEM) (4/70) and the sensors in the wheels. The sensors in the wheels are activated when the vehicle exceeds 40 km/h (25 mph). The sensors then start to transmit data messages approximately once per minute, which are received by the remote control receiver in the Upper electronic module (UEM). These messages contain the sensor's ID number and air pressure in the tire where the sensor is mounted.

The frequency that the sensors transmit on is the same for all sensors. The control module can also receive signals from other vehicles with the same system installed. However, the ID number in each sensor is unique. The sensors that are mounted on the actual vehicle are determined by an elimination procedure in the Upper electronic module (UEM). When the ignition is switched on, the Upper electronic module starts to listen for messages from the sensors. The control module registers the ID number found in the received messages that the sensors transmit, from the actual vehicle and other vehicles. The Upper electronic module stores all ID numbers that are received in a list in its internal memory. For each ID number that is received, the number of times that that ID number is received is also saved. As the number of ID numbers received increases, the ID numbers received the most times are evaluated. The four ID numbers that have been received the most times receive the highest "calculation" and are considered to belong to the actual vehicle. In this way, any ID numbers that have been received from other vehicles can be differentiated. For example, ID numbers that are in another lane next to the actual vehicle. This evaluation takes approximately 5 minutes if the Upper electronic module has no data.

If the evaluation has been carried out, the sensors that are assumed to belong to the actual vehicle are stored in the control module. The information remains between each driving cycle. In this case, it is sufficient for the control module to receive a message from each sensor with corresponding ID number to complete evaluation.

In Upper Electronic Module there are tables programmed with which air pressure is recommended for this specific vehicle model. This information about air pressure in the tires included in the messages sent from the sensors is compared to the programmed values in Upper Electronic Module.

If the pressure reported from a sensor differs more than 22% from the recommended value, a warning message will be shown in the Driver information module.

There are two warning levels that generate different warning messages, one warning for low pressure and one warning for no pressure. A message will also be shown is a sensor should stop transmitting or should receive too low battery voltage.

To reset a warning it is easiest to stop the vehicle and fill air in the tire where the air pressure is low. In order for the warning to reset air has to be filled so that the air pressure reaches a level that corresponds to at least 95% of the recommended air pressure, and then drive the vehicle faster than 40 km/h for more than 10 minutes, accumulated time.

If the customer has come to the workshop, the warning can also be reset by filling air in the tire where the air pressure is low and then the sensor is activated with the special tool for activating the tire pressure sensor.

When air is filled and the pressure changes, the sensor immediately sends a signal to Upper Electronic Module. If the ignition is on, the warning is reset immediately.

NOTE: Only applies to USA/CDN. A warning lamp also lights in the Driver information module at the same time as the warning message.

COMPASS

Fig. 251: Identifying Integrated Compass
Courtesy of VOLVO CARS CORPORATION

The compass detects the magnetic pull of the North and South Poles. Using this, the compass calculates the direction in which the front of the vehicle is pointing.

The display in the top right-hand corner of the rear view mirror shows the compass direction. Eight different directions can be displayed, using the abbreviations and.

- North
- North East
- East
- South East
- South

- South West
- West
- North West

SYSTEM OVERVIEW

CONTROL MODULE

Fig. 252: Identifying Rear View Mirror
Courtesy of VOLVO CARS CORPORATION

The primary task of the upper electronic module (UEM) is to manage the functions of the:

- Siren (SCM) (XC90, applies up to and including structure week 201127)
- Sun roof
- Mass movement sensor module (MMS) (does not apply to the XC90 MY 2012-)
- Ultrasonic sensor module (IMS) (only applies to the XC90 MY 2012-)
- Rain sensor module (RSM)
- Interior roof lighting
- Cargo compartment lighting (V70 and XC70)
- Sun visor lighting
- Remote control
- Automatic rear view mirror anti-dazzle
- Seat belt reminder
- Tire pressure warning
- Indication of disconnected passenger airbag (PAD- Passenger Airbag Deactivated)
- Compass

The control module is integrated in the rear view mirror. If the control module is replaced, the rear view mirror assembly must also be replaced.

The upper electronic module (UEM) communicates with directly connected components and with other control modules and components via serial communication and the controller area network (CAN).

The control module checks activations and input and output signals via an integrated diagnostic system. A diagnostic trouble code (DTC) is stored if the control module detects an error. In certain cases the upper electronic module (UEM) replaces the faulty signal with a substitute value.

Any diagnostic trouble codes (DTCs) are stored in the control module memory. The data can be read off using VIDA (Volvo scan tool).

A simple way to check that the upper electronic module (UEM) is supplied with power is to activate the seat belt reminder function. Activate the seat belt reminder by sitting in the driver's seat. Switch on the ignition, do not fasten the seat belt. If the seat belt reminder lights, the upper electronic module (UEM) is supplied with voltage. Another way of checking that the control module is supplied with voltage is to switch on one of the rear reading lamps.

SIGNALS

The table below summarizes the input signals to and output signals from the upper electronic module (UEM). The signal types are divided into directly connected signals, serial communication and controller area network (CAN) communication. The illustration below displays the same information with the Volvo component designations.

Input signals	Output signals
Directly connected: • Control signal reading lamps (x 4 XC90 x 5) • Remote control (data) • Remote control (frequency) • Remote control (signal strength) • Photo sensor rear view mirror (x 2).	**Directly connected:** (power supply unless otherwise stated) • Mass movement sensor module (MMS) (7/122) (optional extra) and (7/158), or ultrasonic sensor module (IMS) (7/199) (optional extra). (XC90 has MMS (2 x) for MY -2011 which is replaced by IMS (1 x) for MY 2012-) • Reading lamps (x 4, XC90 x 6) • Roof lighting • Cargo compartment lighting • Voltage supply signal EXT. X • Remote control receiver • Anti-dazzle in the rear view mirror (optional extra) • Diodes in the rear view mirror.
Via serial communication: • Siren (SCM) (16/35) (extra equipment) (withdrawn on XC90 from and including structure week 201128)	**Via serial communication:** • Siren (SCM) (16/35) (extra equipment) (withdrawn on XC90 from and including structure week 201128)

• Sun roof module (SRM) (4/33) (optional extra) • Mass movement sensor module (MMS) (7/122) (optional extra) and (7/158) (for XC90 MY -2011), or ultrasonic sensor module (IMS) (7/199) (for XC90 MY 2012-) • Rain sensor module (RSM) (7/149) (optional extra).	• Sun roof module (SRM) (4/33) (optional extra) • Mass movement sensor module (MMS) (7/122) (optional extra) and (7/158) (for XC90 MY -2011), or ultrasonic sensor module (IMS) (7/199) (for XC90 MY 2012-) • Rain sensor module (RSM) (7/149) (optional extra).
Via Controller Area Network (CAN) communication: • Central electronic module (CEM) (4/56) • Driver door module (DDM) (3/126) • Engine control module (ECM) (4/46) • Phone module (PHM) (16/60) (optional equipment). • Supplemental restraint system module (SRS) (4/9).	**Via Controller Area Network (CAN) communication:** • Accessory electronic module (AEM) (4/78) (optional equipment) • Central electronic module (CEM) (4/56) • Driver door module (DDM) (3/126) • Passenger door module (PDM) (3/127) • Phone module (PHM) (16/60) (optional equipment). • Rear electronic module (REM) (4/58).

WINDOWS (2003-2012)

WINDOWS

Fig. 254: Identifying Tinted Glass
Courtesy of VOLVO CARS CORPORATION

Windows, general

The windows are tinted and relatively thick to reduce the sound levels in the car.

- Standard 4 mm
- Laminated 5 mm.

The side windows on the XC90 are also laminated (anti smash and grab windows) to provide greater protection against break-ins. This option is market dependent.

Power windows are standard.

PUR bonded windows

The windshield, rear side windows and rear windshield are PUR bonded.

PUR bonded windows must be replaced using the method described in VIDA (Volvo scan tool).

Different versions

- There are four different versions of the windshield. Standard, with rain sensor, with IR glass and with IR glass/rain sensor
- There are two versions of the front door window. Standard and Laminated
- There are three different versions of the two windows in the rear door. Standard, Laminated and dark tint
- There are two different versions available for the rear windshield and the rear side window. Standard and dark tint.

Component	Option			
Windshield	Std	Rain sensor	IR glass	IR glass/rain sensor
Door window front	Std	Laminated (5 mm)		
Door window rear	Std	Dark tint	Laminated (5 mm)	
Door window rear fixed	Std	Dark tint	Laminated (5 mm)	
Rear side window	Std	Dark tint		
Rear windshield	Std	Dark tint		

PUR bonded windows give the body torsional rigidity, which has a positive impact on:

- Handling and collision safety
- Driving comfort
- Reducing rattles and squeaks
- It also reduces the risk of resonance from the driveline and suspension when cornering.

NOTE: **When replacing the rear windshield, ensure that that the PUR adhesive or primer does not come into contact with the electrical loops for the heated rear windshield.**

Cover panel

The cover panel for the antenna module (ATM) is at the rear edge of the roof.

The cover panel is made of plastic.

The cover panel is bonded to the roof using PUR adhesive.

ACCESSORIES AND BODY, CAB

Miscellaneous - Design and Function

CLIMATE CONTROL MODULE (2003-2004)

DESIGN

CLIMATE CONTROL UNIT

Fig. 1: Climate Control Unit Components
Courtesy of VOLVO CARS CORPORATION

The climate control unit consists of the following components:

1. Heater element
2. Damper motor, temperature, left
3. Blower fan
4. Damper motor, fresh air / recirculation
5. Power unit for blower fan motor
6. Particle filter
7. Damper motor, ventilation and floor (also defroster for MCC/STD)

8. Damper motor, temperature, right
9. Damper motor defroster (ECC).

Engine coolant constantly flows through the heater element. There is no valve to regulate the flow. The selected temperature is achieved using dampers for the right and left-hand sides of the car installed upstream and downstream of the heater element. These control the amount of air to be warmed. There are also dampers downstream of the heater element that guide the airflow to the correct air vent.

The climate control module provides infinitely variable electronic blower fan control. When AUTO mode (only electronic climate control) is engaged the climate control module (CCM) adapts the blower fan speed to the setting of the controls and the vehicle speed. The blower fan can be set to run-on in order to reduce residual moisture in the evaporator.

A timer located in the central electronic module (CEM) controls the run-on time. 50 minutes after the engine has been switched off and the ignition has been turned to position 0 or I the central electronic module (CEM) supplies power to the climate control module (CCM) and the blower fan is activated at full speed for 7 minutes. This run-on dries the evaporator and prevents bad odors.

This function is programmed at the factory, but can be deactivated in the event of customer complaints via programming of customer parameters. Programming is carried out via VIDA (Volvo scan tool).

The function is only available to cars of structure week 199850 and later.

All damper motors are of the stepper type. Their position and speed is controlled electronically.

Manual climate control and standard climate control have four stepper motors controlling the following dampers:

- Ventilation / floor / defroster via a link system
- Recirculation and fresh air via a link system
- Temperature left
- Temperature right.

For electronic climate control (ECC) there is an extra stepper motor which controls the defroster. The wiring between the damper motors and the climate control module (CCM) consists of four cables for supply voltage and directional control and a separate cable for each motor which controls the motor to be activated. Each motor has four coils. The corresponding coils in each motor are supplied with power at the same time. The motors are only supplied with power if they are grounded at the same time. When a new position is selected for the damper motor, the climate control module (CCM) calculates how many steps are required to complete the movement. The climate control module (CCM) then activates the damper motor with the necessary number of steps. When the motor is instructed to move to an end position, the motor is activated until it stops. This end position is then used as a limit position. This means that the damper motors are self-adjusting, but only after the limit positions have been reached. When replacing the damper motors, ensure that the self-adjustment is carried out. Otherwise the customer may experience defective climate control.

There are diagnostics for the blower fan and damper motors.

AIR CONDITIONING (ECC AND MCC ONLY)

Fig. 2: Identifying A/C Compressor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) controls the A/C compressor. When the A/C switch on the dashboard environment panel is activated, a request to activate the compressor is transmitted via Control area network (CAN) to the engine control module (ECM). The engine control module (ECM) determines when the compressor must operate.

If any of the following conditions are met the compressor is disconnected:

- High engine coolant temperature (ECT)
- Wide open throttle (WOT)
- The engine has just been started
- Overpressure in the air conditioning (A/C) system.

When the engine is started the engine control module (ECM) activates the air conditioning compressor for a short period even if the climate control module (CCM) has not transmitted a request about this. This is carried out for diagnosis. This check is carried out at all temperatures exceeding -6 °C.

The advantage in allowing the engine control module (ECM) to control the air conditioning compressor is that it can delay compressor activation somewhat, if the idling speed must be compensated for the extra load for

example.

SUN SENSOR (ELECTRONIC CLIMATE CONTROL ONLY)

Fig. 3: Locating Sun Sensor
Courtesy of VOLVO CARS CORPORATION

The sun sensor transmits information about sun intensity to the climate control module (CCM).

The sun sensor consists of a photo diode which is supplied with power from the control module. The conductivity of the diode depends on the amount of light to which it is exposed. The diode is located under a diffusing lens which reduces the sensitivity of the photo diode to the angle of the light hitting it. Increased sun intensity reduces the voltage over the photo diode. The control module measures the voltage over the photo diode and compensates for high sun intensity by lowering the ventilation air temperature, changing the distribution of air and increasing the speed of the blower fan.

The climate control module (CCM) starts to compensate the blower fan speed at a sun intensity of 400 W/m^2 and reaches maximum compensation at a sun intensity of 1000 W/m^2 .

The sun sensor is located in the middle of the dashboard by the windshield.

There are diagnostics for the sun sensor.

AIR QUALITY SENSOR (ELECTRONIC CLIMATE CONTROL ONLY, OPTION)

Fig. 4: Air Quality Sensor
Courtesy of VOLVO CARS CORPORATION

The air quality sensor is available as an option for the electronic climate control from model year 2000. Its function is to transmit a signal to the climate control module (CCM) if it detects increased concentrations of pollutants in the outside air.

The air quality sensor measures the CO_x and NO_x content.

The air quality sensor compares current values with previous ones and can calculate changes in pollutant concentrations.

The signal from the air quality sensor to the climate control module (CCM) is a pulse width modulation (PWM) signal and has four stages, 0-3:

- signal 0= no increase in or reduced pollutant level
- signal 1=gradual increase in pollutant level
- signal 2=moderate increase in pollutant level
- signal 3=rapid increase in pollutant level.

The control module uses the signal to control the recirculation damper motor.

The air quality sensor is located on the right-hand side of the fresh air intake under the cowl.

There are diagnostics for the air quality sensor.

SWITCHES, DASHBOARD ENVIRONMENT PANEL, (LOWER SECTION)

Fig. 5: Identifying Climate Control Module (CCM)
Courtesy of VOLVO CARS CORPORATION

Across the lower section of the dashboard environment panel there is a 12V socket and space for a maximum of seven switches.

Each switch has its own identity. This is unique for the relevant function. The switches can therefore be positioned in any location on the dashboard environment panel, as long as they are installed in the off position. They do not have to be in any particular order. However, the identity of the installed switches must correspond with the car configuration file so that they can be activated.

There are diagnostics for the switches.

REAR A/C (ONLY XC90 WITH THREE ROWS OF SEATS)

Fig. 6: Identifying Rear A/C
Courtesy of VOLVO CARS CORPORATION

XC90 with three rows of seats is equipped with a rear A/C system. This consists of:

- power unit
- fan
- expansion valve
- blower fan switch.

The rear A/C system is controlled by a switch in the lower section of the dashboard environment panel. When the switch is activated the climate control unit (CCM) transmits a signal to the rear electronic module (REM) via the Control area network (CAN). The rear electronic module (REM) supplies the power unit and the blower fan switch with voltage via a relay. The blower fan switch sends control voltage to the power unit based on the position of the control. The power unit converts the control voltage to supply voltage for the blower fan motor.

The rear A/C is directly connected to the front air conditioning via the high and low pressure pipes and hoses. The only way to control the cooling in the third row of seats is to control the fan speed using the rear fan switch.

The rear electronic module (REM) diagnoses the relay supply, otherwise the rear A/C cannot be diagnosed.

DIAGNOSTIC FUNCTIONS

CLIMATE CONTROL MODULE (CCM)

The climate control module (CCM) has a built-in diagnostic system which continuously monitors internal functions and input and output signals.

DIAGNOSTIC TROUBLE CODES (DTCS)

Diagnostic trouble codes (DTCs) are stored in the control module if the climate control module (CCM) detects a fault. Every diagnostic trouble code (DTC) has a counter which records the number of cycles which have been "fault-free" since the diagnostic trouble code (DTC) was stored. A fault which is detected in each operating cycle is defined as permanent. A fault which is detected in one or more operating cycles (although not the present one) is defined as intermittent.

An operating cycle is the period from when the ignition was switched on, remained on for at least 10 seconds and was finally switched off for at least 10 seconds.

READING AND ERASING DIAGNOSTIC TROUBLE CODES (DTCS)

Stored diagnostic trouble codes (DTCs) can be read off and erased using this function.

READING OFF INPUT AND OUTPUT SIGNALS

Using this function, the status or value of parameters can be read off. The presentation of the status or value can be obtained graphically or digitally.

For further information about the different parameters, see **DESCRIPTION OF PARAMETERS** .

READING OFF EXTENDED FAULT-TRACING INFORMATION

This function can be used to read parameters, status identifiers and counters stored at the same time as a diagnostic trouble code (DTC). These are called frozen values.

For further information, see **FROZEN VALUES CLIMATE CONTROL MODULE, DESCRIPTION**.

DESCRIPTION OF PROGRAMMABLE PARAMETERS, CUSTOMER ADAPTATION

Certain parameters for the climate control module (CCM) can be read off and programmed using this function. The purpose of this programming is to:

- read the programmed parameters before replacing the control module. This is so the same parameters can be entered into the new control module
- to adapt the function of the control module for the equipment levels of the car (passenger compartment ventilation filter, parking heater)
- to adapt the function of the control module to the requirements of the driver.

Passenger compartment ventilation filter compensation, status

Indicates the status for the activation of passenger compartment ventilation filter compensation.

OFF = Compensation not active

ON = Compensation active (preset)

Blower fan run-on, status

Provides the status for activation of the blower fan run-on. The run-on dries the evaporator and prevents bad odors which may otherwise result from residual moisture in the system.

OFF = Run-on inactive

ON = Run-on active (preset)

Blower fan speed, value

Allows the speed to be modified for the blower fan when the climate control system is in AUTO mode. Modifying the parameters means that the climate control system either blows more or less air than the preprogrammed value, to correspond to the request of the driver.

Gives the voltage value for adaptation of the blower fan speed.

-1.0 - +1.0 V (0 V preset)

Setting for air distribution for the floor / defroster residual heat, value

Indicates the setting of the air distribution between the floor and defroster.

10/90 - 90/10% (70/30% preset)

Setting for air distribution for the floor / defroster parking heater, value

Indicates the setting of the air distribution between the floor and defroster.

10/90 - 90/10% (70/30% preset)

Passenger compartment temperature, value

The passenger compartment temperature in relation to the passenger compartment temperature switch position can be adjusted by programming a compensation value.

The passenger compartment temperature can be raised or lowered by a maximum of ±2 °C (±4 °F) from the normal value. This allows the temperature to be adjusted in accordance with the driver's wishes.

0 = -1.0 °C/-2.0 °F

1 = -0.5 °C/-1.0 °F

2 = 0.0 °C / 0.0 °F (default value)

3 = +0.5 °C/+1.0 °F

4 = +1.0 °C/+2.0 °F

DESCRIPTION OF COMPONENTS/FUNCTIONS ACTIVATION

Self-adjustment of damper motors

This function can be used to carry out self adjustment of the limit positions for all the damper motors. Self

adjustment must be carried out if, after checks, one or more of the damper motors do not reach their limit positions or the climate control module (CCM) is replaced. There are a number of possible reasons for a damper motor not reaching its end position. For example, the motor or the damper has been turned manually, the voltage supply may have been cut, or a component has been replaced.

FROZEN VALUES CLIMATE CONTROL MODULE, DESCRIPTION

EXPLANATION

Not all the parameters described need to be implemented in the control module. This varies from system to system.

Parameters can also vary depending on which type of climate control module the car is equipped with.

Frozen values are parameter values that are stored when a diagnostic trouble code (DTC) is stored.

BATTERY VOLTAGE, VALUE

Measurement range: 0-18 V

Normal value when the generator (GEN) is charging: 13.0-14.5 V

The value indicates the voltage at the climate control module. Delayed X supply means that voltage supply is retained for 1 minute after the ignition is switched off. Activation of functions such as blower fan run-on and damper motor self-adjustment must be possible during this time.

DISTANCE, VALUE

Indicates the total mileage of the vehicle. The value is given in km.

TIME, VALUE

The value displays the time that has passed since the diagnostic trouble code (DTC) was stored.

FAN CURRENT, VALUE

Measurement range: 0-10 mA

The climate control module calculates the value based on the signal from the control knob for the blower fan. With electronic climate control, the value is also affected by automatic climate control (AUTO position).

The value is used to control the power supply from the power unit to the blower fan motor.

FAN SWITCH, VALUE

Measurement range: 0-100 %

The value indicates the control signal from the climate control module to the blower fan motor.

BLOWER FAN DIAGNOSTIC SIGNAL, VALUE

Measurement range: 0-5 V

The climate control module generates an analog signal. This is converted to a current which the power unit converts back to an analog signal. The diagnostic signal is an extremely intense signal that cannot be used when checking the blower fan.

PASSENGER COMPARTMENT TEMPERATURE, VALUE

Measurement range: -40 to +85 °C

The climate control module calculates the temperature based on the signal from the passenger compartment temperature sensor.

The value is used to control the passenger compartment temperature and as the input signal to the central electronic module (CEM).

FAN LEVEL, VALUE

Measurement range: 0-7 step

The value indicates the position of the blower fan switch and is used by the climate control module to calculate the control signal to the blower fan motor.

VOLTAGE FAN, VALUE

Measurement range: 1-5 V

The value indicates the position of the blower fan switch and is used by the climate control module to calculate the control signal to the blower fan motor.

LEFT TEMPERATURE DAMPER MOTOR, STATUS

The status displays if the damper motor is activated or not.

Off = not activated

On = activated

RIGHT TEMPERATURE DAMPER MOTOR, STATUS

The status displays if the damper motor is activated or not.

Off = not activated

On = activated

RECIRCULATION DAMPER MOTOR, STATUS

The status displays if the damper motor is activated or not.

Off = not activated

On = activated

DAMPER MOTOR FLOOR / VENTILATION STATUS

The status displays if the damper motor is activated or not.

Off = not activated

On = activated

DAMPER MOTOR, DEFROSTER, STATUS

The status displays if the damper motor is activated or not.

Off = not activated

On = activated

ENGINE RUNNING, STATUS

The status displays if the engine was running when the diagnostic trouble code (DTC) was stored.

No = engine not running

Yes = engine running

PULSES FROM THE TEMPERATURE SENSOR FOR THE FAN MOTOR, VALUE

Measurement range: 0-15 pulses/65 ms

The value indicates the speed of the fan for the passenger compartment temperature sensor. The standard number of pulses is 12-13/65 ms.

TEMPERATURE, VALUE

Measurement range: -60 to +195 °C

The value indicates the engine coolant temperature (ECT). The climate control module uses the value to control the blower fan during cold start when AUTO is selected.

OUTSIDE TEMPERATURE, VALUE

Measurement range: -40 to +80 °C

The climate control module obtains the value via the control area network (CAN) from the passenger door module.

The value is used to control the passenger compartment temperature.

EVAPORATOR TEMPERATURE SENSOR, VALUE

Measurement range: 0-5 V

The climate control module uses the value from the evaporator temperature sensor to calculate the temperature.

The value is used to control the air conditioning (A/C) compressor. The compressor is switched off when there is a risk of freezing.

AIR CONDITIONING (A/C), STATUS, COMPRESSOR STATUS

The status displays if the compressor was running when the diagnostic trouble code (DTC) was stored.

Off = compressor off

On = compressor on

LINEAR PRESSURE, VALUE

Measurement range 0-3100 kPa

The value indicates the pressure in the compressor.

VOLTAGE, PASSENGER COMPARTMENT TEMPERATURE SENSOR, VALUE

Measurement range: 0-5 V

The climate control module uses the value from the passenger compartment temperature sensor to calculate the passenger compartment temperature. The value is used as a compensation parameter to control the passenger compartment temperature.

SUN SENSOR, SENSOR SIGNAL, VALUE

Measurement range: 0-5 V

The climate control module uses the value from the sun sensor to calculate the sun intensity. The value is used as a compensation parameter to control the passenger compartment temperature.

TWILIGHT SENSOR, SENSOR SIGNAL, VALUE

Measurement range: 0-5 V

The climate control module uses the value from the twilight sensor to calculate the degree of darkness. The value is used to control the strength of the lighting of the button LEDs.

TEMPERATURE DAMPER MOTOR, LEFT POSITION, VALUE

Measurement range: 0-100 %

The value indicates how much the damper is open.

The climate control module calculates the value based on the stage movement of the damper motor.

DAMPER MOTOR, TEMPERATURE RIGHT POSITION, VALUE

Measurement range: 0-100 %

The value indicates how much the damper is open.

The climate control module calculates the value based on the stage movement of the damper motor.

RECIRCULATION DAMPER MOTOR POSITION, VALUE

Measurement range: 0-100 %

The value indicates how much the damper is open.

The climate control module calculates the value based on the stage movement of the damper motor.

FLOOR / VENTILATION DAMPER MOTOR POSITION, VALUE

Measurement range: 0-100 %

The value indicates how much the damper is open.

The climate control module calculates the value based on the stage movement of the damper motor.

DAMPER MOTOR DEFROSTER POSITION, VALUE

Measurement range: 0-100%

The value indicates how much the damper is open.

The climate control module calculates the value based on the stage movement of the damper motor.

AUTOMATIC BREAKER, ACTIVATED, STATUS

The status displays if the signal from the air distribution selector to the climate control module was activated when the diagnostic trouble code (DTC) was stored.

Yes = activated

No = not activated

FLOOR, ACTIVATED, STATUS

The status displays if the signal from the air distribution selector to the climate control module was activated when the diagnostic trouble code (DTC) was stored.

Yes = activated

No = not activated

DEFROSTER, ACTIVATED, STATUS

The status displays if the signal from the air distribution selector to the climate control module was activated when the diagnostic trouble code (DTC) was stored.

Yes = activated

No = not activated

MAX DEFROSTER, ACTIVATED, STATUS

The status displays if the signal from the air distribution selector to the climate control module was activated when the diagnostic trouble code (DTC) was stored.

Yes = activated

No = not activated

AIR CONDITIONING (A/C) ON, ACTIVATED, STATUS

The status displays if the signal from the air distribution selector to the climate control module was activated when the diagnostic trouble code (DTC) was stored.

Yes = activated

No = not activated

AIR CONDITIONING (A/C) OFF, ACTIVATED, STATUS

The status displays if the signal from the air distribution selector to the climate control module was activated when the diagnostic trouble code (DTC) was stored.

Yes = activated

No = not activated

RECIRCULATION ACTIVATED, STATUS

The status displays if the signal from the air distribution selector to the climate control module was activated when the diagnostic trouble code (DTC) was stored.

Yes = activated

No = not activated

VENTILATION, ACTIVATED, STATUS

The status displays if the signal from the air distribution selector to the climate control module was activated when the diagnostic trouble code (DTC) was stored.

Yes = activated

No = not activated

SEAT HEATER LEFT FRONT ACTIVATED, STATUS

The status displays if the signal from the seat heater to the climate control module was activated when the diagnostic trouble code (DTC) was stored.

Yes = activated

No = not activated

SEAT HEATER RIGHT FRONT ACTIVATED, STATUS

The status displays if the signal from the seat heater to the climate control module was activated when the diagnostic trouble code (DTC) was stored.

Yes = activated

No = not activated

DEFROSTER / HEATED REAR WINDSHIELD, ACTIVATED, STATUS

The status displays if the signal from the defroster / heated rear windshield to the climate control module was activated when the diagnostic trouble code (DTC) was stored.

Yes = activated

No = not activated

SENSOR SIGNAL, AIR QUALITY SENSOR (AQS), STATUS

The climate control module interprets the pulse width of the air quality sensor and presents it as different levels.

Off

Level 1

Level 2

Level 3

AIR QUALITY SENSOR PULSE WIDTH, VALUE

Measurement range 0-100 %

The climate control unit calculates the air quality using the signal from the air quality sensor. The value is used to control the position of the recirculation motor.

GENERAL INFORMATION ABOUT READING OFF THE STATUS OF THE BUTTONS ON THE DASHBOARD ENVIRONMENT PANEL

The result from reading off the status for buttons on the dashboard environment panel in order from left to right.

DASHBOARD ENVIRONMENT PANEL, BUTTON IDENTITY, STATUS

The status indicates the function of the button.

The following alternatives are available:

- Empty position

  Adjustable head restraints

  Folding door mirrors

  Private locking

  STC

  DSTC

  Auxiliary lamps

  Reduced alarm

  Bi-fuel

  Child-proof lock.

DASHBOARD ENVIRONMENT PANEL, BUTTON ACTIVATED, STATUS

The status displays if the button was activated when the diagnostic trouble code (DTC) was stored.

Yes = activated

No = not activated

DASHBOARD ENVIRONMENT PANEL, BUTTON STATUS

The status displays if the function for the button corresponds to the configuration for the central electronic module (CEM).

Unknown = the status could not be determined

Not permitted = the button function does not correspond to the configuration of the central electronic module

Permitted = the button function corresponds to the configuration of the central electronic module

CARCONFIGSTATUS, ADJUSTABLE HEAD RESTRAINT, STATUS

The status displays whether the identity of a certain switch is permissible or missing compared with the permitted switch identities in the Car Configuration File.

Not defined = comparison failed

Not permitted = identity not permitted

OK = identity permitted

Button missing = button missing on the dashboard environment panel in comparison to the information in the Car Config File

CARCONFIGSTATUS, FOLDING DOOR MIRRORS, STATUS

The status displays whether the identity of a certain switch is permissible or missing compared with the permitted switch identities in the Car Configuration File.

Not defined = comparison failed

Not permitted = identity not permitted

OK = identity permitted

Button missing = button missing on the dashboard environment panel in comparison to the information in the Car Config File

CARCONFIGSTATUS, BIFUEL, STATUS

The status displays whether the identity of a certain switch is permissible or missing compared with the

permitted switch identities in the Car Configuration File.

Not defined = comparison failed

Not permitted = identity not permitted

OK = identity permitted

Button missing = button missing on the dashboard environment panel in comparison to the information in the Car Config File

CARCONFIGSTATUS, PRIVATE LOCKING, STATUS

The status displays whether the identity of a certain switch is permissible or missing compared with the permitted switch identities in the Car Configuration File.

Not defined = comparison failed

Not permitted = identity not permitted

OK = identity permitted

Button missing = button missing on the dashboard environment panel in comparison to the information in the Car Config File

CARCONFIGSTATUS, STC (STABILITY AND TRACTION CONTROL), STATUS

The status displays whether the identity of a certain switch is permissible or missing compared with the permitted switch identities in the Car Configuration File.

Not defined = comparison failed

Not permitted = identity not permitted

OK = identity permitted

Button missing = button missing on the dashboard environment panel in comparison to the information in the Car Config File

CARCONFIGSTATUS, DSTC (DYNAMIC STABILITY AND TRACTION CONTROL), STATUS

The status displays whether the identity of a certain switch is permissible or missing compared with the permitted switch identities in the Car Configuration File.

Not defined = comparison failed

Not permitted = identity not permitted

OK = identity permitted

Button missing = button missing on the dashboard environment panel in comparison to the information in the Car Config File

CARCONFIGSTATUS, AUXILIARY LAMPS, STATUS

The status displays whether the identity of a certain switch is permissible or missing compared with the permitted switch identities in the Car Configuration File.

Not defined = comparison failed

Not permitted = identity not permitted

OK = identity permitted

Button missing = button missing on the dashboard environment panel in comparison to the information in the Car Config File

CARCONFIGSTATUS, REDUCED ALARM, STATUS

The status displays whether the identity of a certain switch is permissible or missing compared with the permitted switch identities in the Car Configuration File.

Not defined = comparison failed

Not permitted = identity not permitted

OK = identity permitted

Button missing = button missing on the dashboard environment panel in comparison to the information in the Car Config File

CARCONFIGSTATUS, CHILD-PROOF LOCK, STATUS

The status displays whether the identity of a certain switch is permissible or missing compared with the permitted switch identities in the Car Configuration File.

Not defined = comparison failed

Not permitted = identity not permitted

OK = identity permitted

Button missing = button missing on the dashboard environment panel in comparison to the information in the Car Config File

DOWNLOADING SOFTWARE AND REPLACING THE CONTROL MODULE

New software can be downloaded into the climate control module. When ordering software, the hardware and the software in the car is compared to the Volvo central database. If the comparison is OK the software is downloaded to the control module.

If the comparison between the car and Volvo central database is not OK, the database is updated with the car configuration. When this is complete the software is downloaded.

The entire climate control module must be replaced as one unit. The exceptions are the fan for the passenger compartment temperature sensor and the switches on the lower section of the dashboard environment panel.

Five customer parameters can be programmed into the climate control module. These customer parameters are stored in the control module but not in the Volvo central database. This means that the customer parameters must be reprogrammed when the hardware is replaced.

FUNCTION

CONTROLLING THE CLIMATE IN THE PASSENGER COMPARTMENT

Fig. 7: Climate Control Module Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The way in which the climate in the passenger compartment is regulated depends on the type of climate control module (CCM) in the car.

Electronic climate control

Electronic climate control means that either manual settings or the AUTO function can be used. In the latter case the control module automatically regulates heat, air conditioning, recirculation and air distribution until the selected temperature is achieved.

Manual climate control

Manual climate control means that heat, air conditioning, recirculation and air distribution must be selected manually.

STD

STD means that heat, recirculation and air distribution must be selected manually.

The climate control module (CCM) (3/112) regulates the following:

- Activation of the air conditioning (A/C) compressor (8/3) with a request via the Controller area network (CAN) to the engine control module (ECM) (4/46)
- Controlling the damper motors. For electronic climate control (6/48), (6/95), (6/96), (6/102) and (6/103). For manual climate control; (6/48), (6/69), (6/95) and (6/96)
- Blower fan speed (6/28).

The climate control module (CCM) regulates the climate in the passenger compartment based on the following input signals:

- The passenger compartment temperature, signal from the internal passenger compartment temperature sensor
- The outside temperature, signal from the outside temperature sensor (7/11)
- The evaporator temperature, signal from the evaporator temperature sensor (7/41)
- Sun roof status. Signal from the sun roof control module (4/33) via the upper electronic module (UEM) (4/70) over the Controller area network (CAN)
- Side window status. Signals from the driver door module (DDM) (3/126) and passenger door module (PDM) (3/127) via the Controller area network (CAN)
- Door status. Signal from the central electronic module (CEM) (4/56) via the Controller area network (CAN)
- Sun intensity. Signal from the sun sensor (7/12)
- Speed. Signal from the brake control module (BCM) (4/16) (previously ABS), via the Controller area network (CAN)
- Windshield wiper status. Signal from the steering wheel module (SWM) (3/130) via the Controller area network (CAN).

The climate control module (CCM) (for electronic climate control) uses information about the status of the sun roof, side windows and doors to determine how it should compensate for changes in the passenger compartment temperature. If side windows, doors or the sun roof are opened, the climate control module (CCM) will not compensate for a change in passenger compartment temperature. Instead it maintains the same level of climate control for the compressor and blower fan as before.

The climate control module (CCM) (for electronic climate control) uses the signal from the steering wheel module (SWM) to establish whether the windshield wipers are switched on. This is to regulate the blower fan and the damper motor to remove any mist from the inside of the windshield when it rains.

The climate control module (CCM) (for electronic climate control) uses the signal from the sun sensor to compensate for high sun intensity by decreasing the temperature of ventilation air, changing air distribution and increasing the speed of the blower fan.

The climate control module (CCM) (for electronic climate control and manual climate control) uses the signal from the evaporator temperature sensor to control the activation of the air conditioning (A/C) compressor. If the signal from the evaporator temperature sensor indicates an evaporator temperature below 6 °C, the compressor cannot be activated because of the risk of freezing.

To maintain a constant flow of air in the passenger compartment the climate control module (CCM) (for electronic climate control) uses the speed signal from the brake control module (BCM) to regulate the speed of the blower fan. Generally, as the speed of the car increases the speed of the blower fan decreases.

At higher speeds the flow of air into the fresh air damper is adjusted.

SEAT HEATERS

Fig. 8: Seat Heaters Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The seat heaters are activated by pressing the switches on the climate control module (CCM) (3/112). The climate control module (CCM) transmits information via the Controller area network (CAN) about the status selected for each seat to the central electronic module (CEM) (4/56). The central electronic module (CEM) then transmits the information to the relevant control module for seat heating (4/201, 4/202). The control modules for the seat heaters then control the current to the heater pad for the left-hand seat (9/16, 9/18) and right-hand seat (9/17, 9/19).

The central electronic module (CEM) also transmits information to the climate control module (CCM) about whether the seat heaters are activated or not. The climate control module (CCM) uses this information to light / turn off the LEDs on the buttons.

RECIRCULATION CONTROL (ELECTRONIC CLIMATE CONTROL ONLY)

Fig. 9: Recirculation Control Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The climate control module (CCM) (3/112) controls the recirculation during the following conditions for electronic climate control:

- The recirculation switch is on (the LED lights orange)
- The system is in AUTO position and there is a large difference between the desired and current temperature
- The car is equipped with an air quality sensor, and the recirculation switch is on (the LED light green).

The air quality sensor transmits a signal to the climate control module (CCM) if it detects high concentrations of pollutants in the outside air. When this occurs the climate control module (CCM) transmits a signal to the damper motor for recirculation (6/48) to close the fresh air damper and to use recirculated air. The level of recirculation is controlled by the signal from the air quality sensor:

- signal 1 provides partial recirculation for speeds below 85 km/h, no recirculation for speeds exceeding 85 km/h
- signals 2 and 3 provide 100% recirculation.

If the high level of pollutants remains the system stays in recirculation for a certain time, maximum of 10 minutes. The time that the system is recirculating is determined by the outside temperature, if the air conditioning (A/C) is on and if the windshield wipers are activated. The system returns to fresh air for a short time before recirculation is resumed. The particle filter absorbs most of the pollutants entering the passenger compartment during this time. The maximum time prevents misting and musty air.

The air quality transmits information about the content of pollutants to the climate control module (CCM). This information is graded into four levels, and the information used for diagnosis.

Recirculation is never permitted if the defroster is selected. The climate control module (CCM) requests the compressor when the evaporator temperature exceeds 3 °C.

HEATED REAR WINDSHIELD AND DOOR MIRRORS

Fig. 10: Heated Rear Windshield And Door Mirrors Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The heated rear windshield and door mirrors are activated by pressing the switch on the climate control module (CCM) (3/112). The climate control module (CCM) transmits information to the central electronic module (CEM) (4/56) about the selected heating status. The central electronic module (CEM) transmits a signal to the driver's door module (3/126) and passenger door module (PDM) (3/127) for the heated door mirrors and to the rear electronic module (REM) (4/58) for the heated rear windshield.

The central electronic module (CEM) also transmits information to the climate control module (CCM) about whether the seat heaters are activated or not. The climate control module (CCM) uses this information to light / turn off the LED on the button.

SWITCH FUNCTIONS, DASHBOARD ENVIRONMENT PANEL, (LOWER SECTION)

The following functions can be activated using the switches on the dashboard environment panel:

- Folding head restraint, rear seat (S60/S80)
- Folding door mirrors (market dependent)
- Bi-fuel, on / off (market dependent)
- Valet lock, on/off
- Child lock, on / off (market dependent)
- STC, off / on (option)
- DSTC, off / on (option)
- Auxiliary lamps, off / on (option)

- Reduced alarm, on / off (option).

In order for certain functions to be activated the engine must be switched on and/or the master key must be in position II.

Folding head restraints, rear seat

When the switch for the folding head restraints is activated, information is transmitted by the climate control module (CCM) (3/112) to the rear electrical module (4/58) via the Controller area network (CAN).

Folding door mirrors

When the switch for the folding door mirrors is activated, information is transmitted by the climate control module (CCM) to the driver's door module (3/126) and the passenger door module (PDM) (3/127) via the Controller area network (CAN).

Bi-fuel

When the bi-fuel switch is activated, a signal is transmitted from the climate control module (CCM) to the engine control module (ECM) (4/46) on the Controller area network (CAN) via the central electronic module (CEM). The engine control module (ECM) transmits a signal to the climate control module (CCM) about the type of fuel being used. The climate control module (CCM) uses this signal to light / turn off the LED on the switch.

Valet lock / child-proof lock

When activating the valet lock switch or the child lock switch information is transmitted to the rear electronic module (REM) via the Controller area network (CAN).

STC or DSTC

When the STC or DSTC switch is activated, a signal is transmitted from the climate control module (CCM) to the brake control module (BCM) (previously ABS) (4/16) via the Controller area network (CAN). The brake control module (BCM) transmits a signal to the climate control module (CCM) about whether the STC or DSTC functions are operating. The climate control module (CCM) uses this signal to light / turn off the LED on the switch.

Auxiliary lamps

When the auxiliary lamps switch is activated, information is transmitted from the climate control module (CCM) to the central electronic module (CEM). The central electronic module (CEM) transmits a signal to the climate control module (CCM) about whether the auxiliary lamps are on or not. The climate control module (CCM) uses this information to light / turn off the LED on the switch

Reduced alarm

When activating the reduced alarm switch information is transmitted via the Controller area network (CAN) to

the upper electronic module (UEM) and rear electronic module (REM).

Rear A/C

When activating the switch for rear A/C information is transmitted via the Controller area network (CAN) to the rear electronic module (REM). From this signal and the signal from the engine control module (ECM) indicating whether the engine is running or not, the rear electronic module (REM) will activate/deactivate the relay supply to the rear A/C system. The rear electronic module (REM) transmits a signal indicating whether the rear A/C is on or not to the climate control module (CCM) via the control area network (CAN). The climate control module (CCM) uses this information to light / turn off the LED in the switch.

SYSTEM OVERVIEW

CONTROL MODULE

Fig. 11: Climate Control Module
Courtesy of VOLVO CARS CORPORATION

The climate control module controls the climate control system and the buttons in the dashboard environment panel.

The climate control module is located in the center console. There are three versions of control module (market dependent). These are:

- Electronic Climate Control. This fully automatic climate control system has air conditioning and the option of manual settings
- Manual Climate Control. A manual climate control system with air conditioning
- Standard Heater. A manual climate control system without air conditioning.

The climate control module (for the electronic climate control and manual climate control) obtains the current passenger compartment temperature from a sensor integrated into the control module.

The intensity of the dashboard lighting is regulated based on a signal from the twilight sensor. The twilight sensor is located at the front of the dashboard environment panel under the button for air distribution to the floor.

The climate control module communicates with components which are directly connected and with other control modules and also with components via serial communication and Control area network (CAN).

The control module checks input and output signals and carried out activations via an integrated diagnostic system. A diagnostic trouble code (DTC) is stored if the control module detects an error. In certain cases the control module replaces the faulty signal with a substitute value.

Diagnostic trouble codes (DTC) are stored in the control module memory. This information can be read off using the diagnostic tool via the data link connector (DLC) in the car.

A simple method for checking that the climate control module has a power supply and is grounded is to increase or decrease the blower fan speed. Another method is to activate one of the functions controlled by the buttons on the dashboard environment panel.

SIGNALS

The table below summarizes input and output signals to and from the climate control module. The signal types are divided into directly connected signals, serial communication and Controller area network (CAN) communication. The illustration below displays the same information with the Volvo component designations.

Input signals	Output signals
Directly connected:	**Directly connected:**
Sun sensor (7/12), (ECC)	Blower fan motor (6/28), control signal
Blower fan motor (6/28), diagnostic signal	Damper motors for electronic climate control (6/48, 6/95-96, 6/102-103), control signal
Evaporator temperature sensor (7/41), control signal	Damper motors for manual climate control (6/48, 6/69, 6/95-96), control signal
Air quality sensor (7/159), (ECC, option)	Sun sensor (7/12), (ECC)
Via Controller Area Network (CAN):	**Via Controller Area Network (CAN):**
The central electronic module (CEM) (4/56)	The central electronic module (CEM) (4/56)
The engine control module (ECM) (4/46)	Driver's door module (DDM) (3/126)

CLIMATE CONTROL MODULE (CCM) (2005-2012)

DESIGN

CLIMATE CONTROL UNIT

Fig. 13: Climate Control Unit
Courtesy of VOLVO CARS CORPORATION

The climate control unit consists of the following components:

1. Heater element
2. Damper motor module (DMM), temperature left
3. Blower fan
4. Damper motor module (DMM), fresh air/recirculation
5. Power unit for blower fan motor
6. Particle filter
7. Damper motor module, ventilation and floor (also defroster for MCC)
8. Damper motor module (DMM), temperature right
9. Damper motor module (DMM), defroster (ECC).

Engine coolant constantly flows through the heater element. There is no valve to regulate the flow. The selected temperature is achieved using dampers for the right and left-hand sides of the car installed upstream and downstream of the heater element. These control the amount of air to be warmed. There are also dampers downstream of the heater element that guide the airflow to the correct air vent.

The climate control module provides infinitely variable electronic blower fan control. When AUTO mode (ECC only) is engaged the climate control module (CCM) adapts the blower fan speed to the setting of the controls and the vehicle speed. The blower fan can be set to run-on in order to reduce residual moisture in the evaporator (the function is not available for vehicle's with engine B8444S).

A timer located in the central electronic module (CEM) controls the run-on time. 50 minutes after the engine has been switched off and the ignition has been turned to position 0 or I, the central electronic module (CEM) supplies power to the climate control module (CCM) and the blower fan is activated at full speed for 7 minutes. This run-on dries the evaporator and prevents bad odors.

This function is programmed at the factory, but can be deactivated in the event of customer complaints via programming of customer parameters. Programming is carried out via VIDA (Volvo scan tool).

DAMPER MOTOR MODULE (DMM)

Fig. 14: Damper Motor Module
Courtesy of VOLVO CARS CORPORATION

The damper motor module (DMM) consists of a control unit and a stepper motor. The different versions of the climate control system have up to 5 damper motor modules (DMM). These are for the different functions such as defroster and recirculation. The climate control module (CCM) communicates with the other damper motor modules (DMM) via two LIN buses, LIN bus 1 and LIN bus 2.

When regulating the different dampers, the climate control module (CCM) transmits a request for a new damper position to the each damper motor module (DMM). The damper motor module (DMM) calculates and then regulates the required direction and number of steps required to obtain the requested position. The damper motor module (DMM) then transmits information to the climate control module (CCM) indicating the actual damper position and status.

When replacing the damper motor module (DMM), the new damper motor must be identified by the climate control module (CCM). This is carried out via VIDA (Volvo scan tool). When replacing the damper motors,

ensure that identification is carried out.

Each damper motor module (DMM) is powered via a relay in the central electronic module (CEM).

There are diagnostics for the damper motor module (DMM).

COOLING SYSTEM (NOT B8444S)

Fig. 15: Identifying A/C Compressor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) controls the A/C compressor. When the air conditioning (A/C) compressor on the dashboard environment panel is activated, a request is transmitted via the control area network (CAN) to the engine control module (ECM) about the activation of the compressor. The engine control module (ECM) determines when the compressor must operate. If any of the following conditions are met the compressor is disconnected:

- high engine coolant temperature (ECT)
- wide open throttle (WOT)
- the engine has just been started
- overpressure in the air conditioning (A/C) system.

When the engine is started the engine control module (ECM) activates the air conditioning compressor for a

short period even if the climate control module (CCM) has not transmitted a request for this. This is carried out for diagnosis. This check is carried out at all temperatures exceeding -6 °C.

The advantage in allowing the engine control module (ECM) to control the air conditioning compressor is that it can delay compressor activation somewhat, if the idling speed must be compensated for the extra load for example.

COOLING SYSTEM (B8444S ONLY)

Fig. 16: Identifying A/C Compressor (B8444S Only)
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) controls the variable A/C compressor. When the A/C switch on the dashboard environment panel is activated, a request is transmitted via the control area network (CAN) to the engine control module (ECM) about the activation of the compressor. The engine control module (ECM) calculates the current to open the valve to control the variable A/C compressor. If any of the following conditions are met, the valve that activates the compressor is not opened:

- high engine coolant temperature (ECT)
- wide open throttle (WOT)
- the engine has just been started
- overpressure in the air conditioning (A/C) system.

When the engine is started the engine control module (ECM) activates the air conditioning compressor for a short period even if the climate control module (CCM) has not transmitted a request for this.

This is carried out for diagnosis and maintenance at all temperatures exceeding 0 °C.

SUN SENSOR (ELECTRONIC CLIMATE CONTROL ONLY)

Fig. 17: Locating Sun Sensor
Courtesy of VOLVO CARS CORPORATION

TWILIGHT SENSOR

Fig. 18: Locating Sun Sensor
Courtesy of VOLVO CARS CORPORATION

EVAPORATOR TEMPERATURE SENSOR

Fig. 19: Identifying Evaporator Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

The evaporator temperature sensor is installed on the heater. Its role is to inform the climate control module (CCM) of the temperature of the refrigerant. The climate control module (CCM) controls the request from the evaporator temperature sensor to activate the air conditioning compressor. The evaporator temperature sensor is directly connected to the climate control module (CCM).

There are diagnostics for the evaporator temperature sensor.

AIR QUALITY SENSOR (AQS) (ECC ONLY, OPTION)

Fig. 20: Air Quality Sensor
Courtesy of VOLVO CARS CORPORATION

The air quality sensor (AQS) is available as an option for ECC. The air quality sensor (AQS) is, together with a particle filter, part of a system which has the role of ensuring that the air in the passenger compartment is free of pollutants. The role of the air quality sensor (AQS) is to transmit a signal to the climate control module (CCM) if it detects increased concentrations of pollutants in the outside air.

The air quality sensor (AQS) measures concentrations of COx and NOx.

The air quality sensor (AQS) compares the present values with previous ones and can calculate changes in pollutant concentrations.

The air quality sensor (AQS) communicates with the climate control module (CCM) via a LIN bus.

The signal from the air quality sensor (AQS) to the climate control module (CCM) has four steps, 0-3:

- off = no increase or reduction in pollutant level
- signal 1 = gradual increase in pollutant level
- signal 2 = medium increase in pollutant level
- signal 3 = rapid increase in pollutant level.

The climate control module (CCM) uses the signal to control the recirculation damper motor.

There are diagnostics for the air quality sensor (AQS).

SEAT HEATERS

Fig. 21: Identifying Left Seat Heating Module (SHM)
Courtesy of VOLVO CARS CORPORATION

The system for the seat heaters consists of three different parts:

- a seat heating module (SHM) which controls the function for communicating with the climate control module (CCM)
- two heater pads
- a temperature sensor.

The seat heating module (SHM) is under the left and right-hand front seat. The heater pads are in the seat and backrest. The temperature sensor is in the seat.

The seat heating module (SHM) is directly connected to the heater pad and temperature sensor. The seat heating module (SHM) communicates with the climate control module (CCM) via a LIN bus.

There are diagnostics for the seat heating module (SHM).

SWITCHES, DASHBOARD ENVIRONMENT PANEL, (LOWER SECTION)

Fig. 22: Dashboard Environment Panel

Courtesy of VOLVO CARS CORPORATION

Across the lower section of the dashboard environment panel there is a 12V socket and space for a maximum of seven switches.

Each switch has its own identity. This is unique for the relevant function. The switches can therefore be positioned in any location on the dashboard environment panel, as long as they are installed in the off position. They do not have to be in any particular order. However, the identity of the installed switches must correspond with the car configuration file so that they can be activated.

There are diagnostics for the switches.

REAR A/C (ONLY XC90 WITH THREE ROWS OF SEATS)

Fig. 23: Identifying Rear A/C
Courtesy of VOLVO CARS CORPORATION

XC90 with three rows of seats is equipped with a rear A/C system. This consists of:

- power unit
- fan
- expansion valve
- blower fan switch.

The rear A/C system is controlled by a switch in the lower section of the dashboard environment panel. When the switch is activated, the climate control unit (CCM) transmits a signal to the rear electronic module (REM) via the controller area network (CAN). The rear electronic module (REM) supplies the power unit and the blower fan switch with voltage via a relay. The blower fan switch sends control voltage to the power unit based on the position of the control. The power unit converts the control voltage to supply voltage for the blower fan motor.

The rear A/C is directly connected to the front air conditioning via the high and low pressure pipes and hoses. The only way to control the cooling in the third row of seats is to control the fan speed using the rear fan switch.

The rear electronic module (REM) diagnoses the relay supply, otherwise the rear A/C cannot be diagnosed.

DIAGNOSTIC FUNCTIONS

CLIMATE CONTROL MODULE (CCM)

The climate control module (CCM) has a built-in diagnostic system which continuously monitors internal functions and input and output signals.

DIAGNOSTIC TROUBLE CODES (DTCS)

Diagnostic trouble codes (DTCs) are stored in the control module if the climate control module (CCM) detects a fault. Each diagnostic trouble code (DTC) has a counter which records the number of operating cycles which have been fault-free since the diagnostic trouble code (DTC) was last stored. A fault which is detected in the present operating cycle is defined as permanent. A fault which is detected in one or more operating cycles (although not the present one) is defined as intermittent.

An operating cycle is the period from when the ignition has been off, then on for at least 10 seconds and finally off for at least 10 seconds.

READING AND ERASING DIAGNOSTIC TROUBLE CODES (DTCS)

Stored diagnostic trouble codes (DTCs) can be read off and erased using this function.

READING OFF INPUT AND OUTPUT SIGNALS

Using this function, the status or value of parameters can be read off. The presentation of the status or value can be graphic or digital.

For further information about the different parameters, see: **DESCRIPTION OF PARAMETERS**

READING OFF EXTENDED FAULT-TRACING INFORMATION

This function can be used to read parameters, status identifiers and counters stored at the same time as a diagnostic trouble code (DTC). These are called frozen values.

For further information, see: **DESCRIPTION OF FROZEN VALUES**

PROGRAMMING THE CLIMATE CONTROL MODULE (CCM), CUSTOMER ADAPTATION

Certain parameters for the climate control module (CCM) can be read off and programmed using this function. The purpose of this programming is to:

- read the programmed parameters before replacing the control module. This is so the same parameters can be entered into the new control module
- adapt the function of the control module to the requirements of the driver (customer adaptation)
- adapt the function of the control module for the equipment levels of the vehicle (passenger compartment ventilation filter, parking heater).

Blower fan run-on, status

Provides the status for activation of the blower fan run-on. The run-on dries the evaporator and prevents bad odors which may otherwise result from residual moisture in the system.

OFF = Run-on inactive

ON = Run-on active (preset)

Air distribution floor/defroster when residual heater is active (NOTE Accessory)

Parameter programming controls the desired setting of air distribution between the floor and defroster when the residual heater is active.

The function means that the coolant can circulate for around 20 minutes after the engine has been switched off. In this way, the passenger compartment can be heated for up to 20 minutes without the engine having to be running. The function is started via the control stalk.

The function can be activated for a further 20 minutes, however, the temperature of the coolant will have cooled considerably and the residual heat will therefore be lower.

Possible settings (70/30% preset):

- 90/10 (90% floor, 10% defroster)
- 80/20 (80% floor, 20% defroster)
- 70/30 (70% floor, 30% defroster)
- 60/40 (60% floor, 40% defroster)
- 50/50 (50% floor, 50% defroster)
- 30/70 (30% floor, 70% defroster)
- 10/90 (10% floor, 90% defroster).

Programming the seat temperature

Enter the setting for the high and low temperature levels for heating the front seat.

IDENTIFYING THE DAMPER MOTORS

This function is used to identify the damper motor module (DMM) after a replacement. When replacing the damper motor module (DMM), the new unit will have a general identity on the LIN bus. The damper motor module (DMM) must then be run to its limit positions. The number of steps the motor can be run between the limit positions is unique for each damper. This determines the functionality of the new damper motor module (DMM) for the climate control module (CCM).

CALIBRATION OF CLIMATE CONTROL MODULE (CCM)

This function is used to check the components communicating with the climate control module (CCM) via LIN bus 1 and LIN bus 2. A diagnostic trouble code (DTC) between CCM-0070 and CCM-0072 will be stored, depending on the fault, if there is a fault in one of the LIN buses. These diagnostic trouble codes (DTCs) can

only be stored for this diagnostic function.

DOWNLOADING SOFTWARE AND REPLACING THE CONTROL MODULE

New software can be downloaded into the climate control module (CCM). When ordering software, the hardware and the software in the car is compared to the information in the Volvo central database. If the comparison is OK the software is downloaded to the control module.

If the comparison between the car and Volvo central database is not OK, the database is updated with the car configuration. When this is complete the software is downloaded.

The entire climate control module (CCM) must be replaced as one unit.

Different customer parameters can be programmed into the climate control module (CCM). These customer parameters are stored in the control module but not in the Volvo central database. This means that the customer parameters must be reprogrammed when hardware is replaced.

For further information about programmable customer parameters, see: **DIAGNOSTIC FUNCTIONS**

FUNCTION

CONTROLLING THE CLIMATE IN THE PASSENGER COMPARTMENT

Fig. 24: Identifying Climate Control System & Components
Courtesy of VOLVO CARS CORPORATION

The way in which the climate in the passenger compartment is regulated depends on the type of climate control module (CCM) in the car.

Electronic climate control (ECC)

Electronic climate control means that either manual settings or the AUTO function can be used. In the latter case the control module automatically regulates heat, air conditioning, recirculation and air distribution until the selected temperature is achieved.

Manual climate control (MCC)

Manual climate control means that heat, air conditioning, recirculation and air distribution must be selected manually.

Climate control module (CCM) (3/112) regulates the following:

- Activation of the air conditioning (A/C) compressor (8/3) using a request via the controller area network (CAN) to the engine control module (ECM) (4/46)
- Controlling the damper motors. For ECC (6/48), (6/95), (6/96), (6/102) and (6/103). For MCC (6/48), (6/69), (6/95) and (6/96)
- Blower fan speed (6/28).

The climate control module (CCM) regulates the climate in the passenger compartment based on the following input signals:

- The passenger compartment temperature, signal from the internal passenger compartment temperature sensor
- Outside temperature, signal from the outside temperature sensor (7/11) via the passenger door module (PDM) (3/127) on the controller area network (CAN)
- The evaporator temperature, signal from the evaporator temperature sensor (7/41)
- Sun roof status. Signal from the sun roof control module (4/33) via the upper electronic module (UEM) (4/70) over the controller area network (CAN)
- Status of the side window, signals from the driver door module (DDM) (3/126) and passenger door module (PDM) (3/127) via the controller area network (CAN)
- Status of the doors, signal from the central electronic module (CEM) via the controller area network (CAN)
- Sun intensity, signal from the sun sensor (7/12) via the central electronic module (CEM)
- Speed, signal from the brake control module (BCM) (4/16) via the controller area network (CAN)
- Status of the windshield wipers, signal from the steering wheel module (SWM) (3/254) via the controller area network (CAN).

The climate control module (CCM) (for ECC) uses information about the status of the sun roof, side windows and doors to determine how it should compensate for changes in the passenger compartment temperature. If any side windows, doors or the sun roof are opened, the climate control module (CCM) will not compensate for a change in the passenger compartment temperature. Instead it maintains the same level of climate control for the compressor and blower fan as before.

The climate control module (CCM) (for ECC) uses the signal from the steering wheel module (SWM) indicating that the windshield wipers are on. This is to regulate the blower fan and the damper motor to remove any mist from the inside of the windshield when it rains.

The climate control module (CCM) (for ECC) uses the signal from the sun sensor to compensate for high sun intensity. This is done by lowering the temperature of the ventilation air, altering air distribution and increasing the speed of the blower fan.

The climate control module (CCM) uses the signal from the evaporator temperature sensor to control a request for:

- activation of the A/C compressor (not B8444S)
- control of the A/C compressor (B8444S only)

If the signal from the evaporator temperature sensor displays an evaporator temperature of below 4.5 °C, the compressor is not permitted to run due to the risk of ice formation.

To maintain a constant flow of air in the passenger compartment, the climate control module (CCM) (for ECC) uses the speed signal from the brake control module (BCM) to regulate the speed of the blower fan. Generally, as the speed of the car increases the speed of the blower fan decreases.

At higher speeds the flow of air into the fresh air damper is adjusted.

REGULATING SEAT HEAT

Fig. 25: Identifying Seat Heat Regulation System & Components
Courtesy of VOLVO CARS CORPORATION

The seat heaters are activated using the switches on the climate control module (CCM) (3/112). The function is normally switched off. When activating the seat heaters, the first position is high temperature. If the button is pressed again, the temperature will be low. The status of the indication is displayed via LEDs. The climate control module (CCM) transmits information about the selected temperature to the relevant seat heating module (SHM) on the relevant LIN bus. The seat heating module (SHM) then controls the current to the heater pads.

Each seat heating module (SHM) then transmits its present status to the climate control module (CCM).

Communication between the climate control module (CCM) and each seat heating module (SHM) takes place in the following way:

- seat heating module (SHM), driver's side (9/12) on LIN bus 1
- seat heating module (SHM), passenger side (9/13) on LIN bus 2.

The climate control module (CCM) receives information from the central electronic module (CEM) (4/56) about the type of seat and upholstery via the controller area network (CAN). The levels for high and low temperature are adapted for the relevant seat and upholstery by the climate control module (CCM). To a certain extent, the levels for high and low temperature can be adapted to the wishes of the customer using VIDA (Volvo scan tool).

RECIRCULATION CONTROL (ELECTRONIC CLIMATE CONTROL ONLY)

Fig. 26: Identifying Air Recirculation Control System & Components
Courtesy of VOLVO CARS CORPORATION

For ECC, the climate control module (CCM) (3/112) controls the recirculation during the following conditions:

- the recirculation switch is on (the LED lights orange)
- the system is in AUTO mode and there is a large difference between the desired and current temperature
- the car is equipped with an air quality sensor (AQS), and the recirculation switch is on (the LED lights green).

The air quality sensor (AQS) (7/159) transmits a signal to the climate control module (CCM) if it detects raised concentrations of pollutants in the outside air. When this occurs, the climate control module (CCM) transmits a signal to the damper motor for recirculation (6/48) to close the fresh air damper and to use recirculated air.

The degree of recirculation is controlled by the signal from the air quality sensor (AQS):

- signal 1 provides partial recirculation for speeds below 85 km/h, no recirculation for speeds exceeding 85 km/h
- signals 2 and 3 provide 100% recirculation.

If the high level of pollutants remains, the system stays in recirculation for a certain time, maximum of 10 minutes. The time that the system is recirculating is determined by the outside temperature, whether the air conditioning (A/C) is on or if the windshield wipers are activated. The system returns to fresh air for a short

time before recirculation is resumed. The particle filter absorbs most of the pollutants entering the passenger compartment during this time. The maximum time prevents misting and musty air.

The air quality sensor (AQS) transmits information about the content of pollutants to the climate control module (CCM). This information is graded into four levels, and the information used for diagnosis.

Recirculation is never permitted if the defroster is selected. The climate control module (CCM) also requests compressor activation when the evaporator temperature exceeds 3 °C.

HEATED REAR WINDSHIELD AND DOOR MIRRORS

Fig. 27: Identifying Heated Rear Windshield & Door Mirror System Components
Courtesy of VOLVO CARS CORPORATION

The heated rear windshield and door mirrors are activated by pressing the switch on the climate control module (CCM) (3/112). The climate control module (CCM) transmits information via the controller area network (CAN) indicating the status of the electrical heating to the following:

- rear electronic module (REM) (4/58)
- driver door module (DDM) (3/126)
- passenger door module (PDM) (3/127).

SWITCH FUNCTIONS, DASHBOARD ENVIRONMENT PANEL, (LOWER SECTION)

The following functions can be activated using the switches on the dashboard environment panel:

- Folding head restraint, rear seat (S60/S80)
- Folding door mirrors (market dependent)
- Bi-fuel, on / off (market dependent)
- Valet lock, on/off
- Child-proof lock, on/off (market dependent)
- Rear air conditioning (A/C) (XC90, option)
- STC, off / on (option)
- DSTC, off / on (option)
- BLIS, off / on (option)
- Auxiliary lamps, off / on (option)
- Parking assistance (option)
- Reduced alarm, on / off (option)
- Four-C (Continuously Controlled Chassis Concept), (option).

In order for certain functions to be activated the engine must be switched on and/or the master key must be in position II.

Folding head restraints, rear seat

When the switch for the folding head restraints is activated, information is transmitted by the climate control module (CCM) (3/112) to the rear electrical module (4/58) via the control area network (CAN).

Folding door mirrors

When the switch for the folding door mirrors is activated, information is transmitted by the climate control module (CCM) to the driver door module (3/126) and the passenger door module (PDM) (3/127) via the control area network (CAN).

Bi-fuel

When the bi-fuel switch is activated, a signal is transmitted from the climate control module (CCM) to the engine control module (ECM) (4/46) on the control area network (CAN) via the central electronic module (CEM) (4/56). The engine control module (ECM) transmits a signal to the climate control module (CCM) about the type of fuel being used. The climate control module (CCM) uses this information to light and turn off the LED in the switch.

Valet lock / child-proof lock

When activating the valet lock switch or the child lock switch information is transmitted to the rear electronic module (REM) via the control area network (CAN).

Rear A/C

When activating the switch for rear A/C information is transmitted via the Controller area network (CAN) to the rear electronic module (REM). From this signal and the signal from the engine control module (ECM) indicating whether the engine is running or not, the rear electronic module (REM) will activate/deactivate the relay supply to the rear A/C system. The rear electronic module (REM) transmits a signal indicating whether the rear A/C is on or not to the climate control module (CCM) via the control area network (CAN). The climate control module (CCM) uses this information to light and turn off the LED in the switch.

STC or DSTC (applies to model year -2006)

When the STC or DSTC switch is activated, a signal is transmitted from the climate control module (CCM) to the brake control module (BCM) (4/16) via the controller area network (CAN). The brake control module (BCM) then transmits a signal to the climate control module (CCM) indicating that the STC or DSTC function is on or off. The climate control module (CCM) uses this information to light and turn off the LED in the switch.

BLIS (applies to model year 2007-)

When activating the switch for Blind Spot Information System, the information is transmitted via the CAN network to the Driver door module (DDM) / Passenger door module (PDM). The Driver door module (DDM) / Passenger door module (PDM) transmit the signal to the Climate control module (CCM) about whether the BLIS function is on or off.

The Climate control module (CCM) uses the signal to switch the LED on or off the switch

Auxiliary lamps

When the auxiliary lamps switch is activated, information is transmitted from the climate control module (CCM) to the central electronic module (CEM). The central electronic module (CEM) transmits a signal to the climate control module (CCM) about whether the auxiliary lamps are on or not. The climate control module (CCM) uses this information to light and turn off the LED in the switch.

Back-up warning

When activating the switch for parking assistance, information is transmitted via the Controller area network (CAN) to the rear electronic module (REM).

Reduced alarm

When activating the switch for reduced alarm, information is transmitted via the Controller area network (CAN) to the rear electronic module (REM).

Four-C (Continuously Controlled Chassis Concept)

When activating the switch for Four-C, information is transmitted via the Controller area network (CAN) to the suspension module (SUM).

SYSTEM OVERVIEW

CONTROL MODULE

Fig. 28: Identifying Climate Control Module (CCM)
Courtesy of VOLVO CARS CORPORATION

The climate control module (CCM) controls the climate control system and the buttons in the dashboard environment panel.

The climate control module (CCM) is located in the center console. There are two versions of control module (market dependent). These are:

- Electronic climate control (ECC)
- Manual climate control (MCC).

ECC is a fully automatic climate control system with air conditioning. It also allows manual settings.

MCC is a manual climate control system with air conditioning.

The climate control module (CCM) communicates with components which are directly connected and also with other control modules and components via LIN and CAN communication.

The climate control module (CCM) communicates with the damper motors, air quality sensor (AQS) and the seat heaters via two separate LIN buses. The number of components on the LIN buses varies, depending on the equipment level of the car (ECC/MCC and any accessories).

The following components communicate on LIN bus 1:

- the damper motor module (DMM) for air distribution
- the damper motor module (DMM) for temperature left
- the left-hand seat heater.

The following components communicate on LIN bus 2:

- the damper motor module (DMM) for the defroster (ECC only)

- the damper motor module (DMM) for temperature right
- the damper motor module (DMM) for recirculation
- the air quality sensor (AQS)
- the right-hand seat heater.

The control module checks input and output signals and carries out activations via an integrated diagnostic system. A diagnostic trouble code (DTC) is stored if the control module detects an error. In certain cases the control module replaces the faulty signal with a substitute value.

Any diagnostic trouble codes (DTCs) are stored in the control module memory. This information can be read off using VIDA via the data link connector (DLC) in the vehicle.

A simple method for checking that the climate control module (CCM) has a power supply and is grounded is to increase or decrease the blower fan speed. Another method is to activate one of the functions controlled by the buttons on the dashboard environment panel.

SIGNALS

The table below summarizes the input signals to and output signals from the climate control module (CCM). The signal types are divided into directly connected signals, LIN and CAN communication. The illustration below displays the same information with the Volvo component designations.

Input signals	Output signals
Directly connected: • Blower fan motor (6/28), diagnostic signal • Evaporator temperature sensor (7/41), control signal.	**Directly connected:** • Blower fan motor (6/28), control signal.
Via LIN communication: • Damper motor module (DMM) for ECC (6/48, 6/95-96, 6/102-103) • Damper motor module (DMM) for MCC (6/48, 6/69, 6/95-96) • Air quality sensor (AQS) (7/159) • Seat heating module (SHM), passenger side (9/13) • Seat heating module (SHM), driver's side (9/12).	**Via LIN communication:** • Damper motor module (DMM) for ECC (6/48, 6/95-96, 6/102-103) • Damper motor module (DMM) for MCC (6/48, 6/69, 6/95-96) • Air quality sensor (AQS) (7/159) • Seat heating module (SHM), passenger side (9/13) • Seat heating module (SHM), driver's side (9/12).
Via Controller Area Network (CAN) communication: • Central electronic module (CEM) (4/56) • Engine control module (ECM) (4/46) • Rear electronic module (REM) (4/58) • Brake control module (BCM) (4/16)	**Via Controller Area Network (CAN) communication:** • Central electronic module (CEM) (4/56) • Driver door module (DDM) (3/126) • Passenger door module (PDM) (3/127) • Brake control module (BCM) (4/16)

• Driver door module (DDM) (3/126) • Passenger door module (PDM) (3/127) • Upper electronic module (UEM) (4/70) • Steering wheel module (SWM) (3/254).	• Rear electronic module (REM) (4/58) • Engine control module (ECM) (4/46).

COMBUSTION PREHEATER MODULE (CPM) (2005-2012)

INFORMATION

GENERAL

Combustion preheater module (CPM) is not a CAN-node, it is a slave node for Central electronic module (CEM), that communicates via serial communication (LIN).

CONTROL MODULE FOR THE STEERING WHEEL ANGLE SENSOR (2003-2004)

DESIGN

CONTROL MODULE FOR THE STEERING WHEEL ANGLE SENSOR

Fig. 30: Control Module For Steering Wheel Angle Sensor
Courtesy of VOLVO CARS CORPORATION

After initiation, with the ignition key in position II and when the steering wheel is turned 4.5 degrees in any

direction, the control module for the steering wheel angle sensor continuously transmits information about the steering wheel angle position to the brake control unit to calculate the driving style of the driver. The brake control module was called ABS-control module up to and including model year 2001.

Communication between the Steering wheel angle sensor control module and the brake control module occurs on the high speed side of the Controller area network (CAN). The control module for the steering wheel angle sensor is positioned on a bracket inside the central electronic module.

The control module for the steering wheel angle sensor is supplied with power from the overload relay.

STEERING WHEEL ANGLE SENSOR

Fig. 31: Identifying Steering Wheel Angle Sensor
Courtesy of VOLVO CARS CORPORATION

The steering wheel angle sensor is incorporated with the SRS contact reel, which in turn is installed on the steering wheel module. The steering wheel angle sensor is equipped with a disc with two code paths. Two circuits with light diodes read off a code path each. One circuit measures the steering angle up to 360 degrees and the other records how many complete turns the steering wheel has turned. Both circuits measure within +/- 700 degrees with a precision of 4.5 degrees. This information is transmitted to the control module for the Steering wheel angle sensor as digital signals.

Due to the reliance of the DSTC (Dynamic stability and traction control) on information from the steering angle sensor it is extremely important that the contact reel has been centered correctly and that only an original Volvo

steering wheel is used.

SRS

SAS DIAGNOSTIC FUNCTIONS

Fig. 32: Control Module For Steering Wheel Angle Sensor
Courtesy of VOLVO CARS CORPORATION

General

The control unit has built-in diagnostics, Volvo Diagnostics, which continually monitor the unit and the input and output signals.

Diagnostic trouble codes

If the control unit detects a fault, it stores a diagnostic trouble code. If, for any reason, a fault disappears after the diagnostic trouble code has been permanently stored in the control unit, information about the trouble code still remains in the control unit.

Reading and erasing diagnostic trouble codes

Stored diagnostic trouble codes can be read from the control unit using this facility.

Diagnostic trouble codes may be erased but only after they have been read at least once.

Reading input and output signals

Status of control unit input and output signals can be continually read using this facility.

For more information about parameters, see **DESCRIPTION OF PARAMETERS (STEERING ANGLE SENSOR)**.

Reading the control unit identity

VIDA identifies control units by reading the number of codes from the control unit memory. The codes contain information on the control unit as follows:

- hardware component number (control units without software)
- software component number (control units without software)
- software component number
- diagnostic software component number

DESCRIPTION OF PARAMETERS (STEERING ANGLE SENSOR)

INTRODUCTION / STATUS

INTRODUCTION

The steering angle sensor is integrated with the contact roller for the SRS-system and is installed on the steering wheel lever module. The function of the sensor is to sense the driver's steering wheel movements. The steering angle sensor consists of a steel disc with two hole-patterned grooves illuminated by several installed pairs of light-emitting diodes and phototransistors. The disc is mounted so that it follows the steering column's movements and then the phototransistors can sense the disc's movement. One pair of light-emitting diodes (IY, IX) reads an index groove with a unique groove pattern. The other pair (A, B) reads a groove with a repeated pattern around the disc (dark, light, dark, light, etc. The grooves' resolution is 1.5 degrees. Since the steering wheel can be turned several revolutions an additional two groups of light-emitting diodes must be used (R1, R2, R3, R4) to read off which steering wheel revolution one is at (normal <3). During the movement the SAS control module (Steering Angle Sensor) processes all information about the steering wheel's absolute position. In connection with start of the vehicle one has to turn the steering wheel a small angle, approx. 5 degrees in any direction to enable the control module to determine the steering wheel's position. This means that the wheel's angle and direction can be determined in relation to the driving direction. The information is used in the DSTC-system (together with other information about the vehicle's driving situation) to decide if the vehicle is driven stable and safe or is in a skid situation.

STEERING WHEEL ANGLE

The value displays the steering wheel angle in degrees.

0° = Steering wheel in the straight forward position

1° to 720° = Angle of the steering wheel when turning to the left

-1° to -720° = Angle of the steering wheel when turning to the right

LED IY STATUS

The value displays the status of LED IY.

ON = LED IY active

OFF = LED IY not active

LED IX STATUS

The value displays the IX status.

ON = LED IX active

OFF = LED IX not active

LED A STATUS

The value displays the A status.

ON = LED A active

OFF = LED A not active

LED B STATUS

The value displays the B status.

ON = LED B active

OFF = LED B not active

LED R1 STATUS

The value displays the R1 status.

ON = LED R1 active

OFF = LED R1 not active

LED R2 STATUS

The value displays the R2 status.

ON = LED R2 active

OFF = LED R2 not active

LED R3 STATUS

The value displays the R3 status.

ON = LED R3 active

OFF = LED R3 not active

LED R4 STATUS

The value displays the R4 status.

ON = LED R4 active

OFF = LED R4 not active

POWER SUPPLY, STEERING WHEEL ANGLE SENSOR MODULE (SAS)

The value indicates battery voltage at the steering wheel angle sensor module (SAS).

Measurement range: 5 to 15 V

POWER SUPPLY, CENTRAL ELECTRONIC MODULE (CEM)

The value indicates battery voltage at the Central electronic module (CEM).

Measurement range: 5 to 15 V

LED CIRCUIT 1 STATUS

The value displays the status of LED circuit 1

ON = LED circuit 1 is active

OFF = LED circuit 1 is not activate

LED CIRCUIT 2 STATUS

The value displays the status of LED circuit 1

ON = LED circuit 2 is active

OFF = LED circuit 2 is not activate

SIGNAL VOLTAGE, SIGNAL A

The value indicates the signal voltage for signal A.

Measurement range: 0 to 16 V

SIGNAL VOLTAGE, SIGNAL B

The value indicates the signal voltage for signal B.

Measurement range: 0 to 16 V

LED CIRCUIT 1 CURRENT

The value displays the current through LED circuit 1.

Measurement range: 0 to 50 mA

LED CIRCUIT 2 CURRENT

The value displays the current through LED circuit 2.

Measurement range: 0 to 50 mA

SOFTWARE DOWNLOADING

New software can be downloaded into the control module for the Steering wheel angle sensor. When ordering software, the hardware and the software in the car is compared to the Volvo central database. If the comparison is OK the software is downloaded to the control module. If the comparison between the car and Volvo central database is not OK, the database is updated with the car configuration. When this is complete the software is downloaded.

SYSTEM OVERVIEW

CONTROL MODULE

Fig. 33: Control Module For Steering Wheel Angle Sensor
Courtesy of VOLVO CARS CORPORATION

1. Control module for the steering wheel angle sensor
2. Steering wheel angle sensor
3. Reference groove
4. Encoder for steering movements.

Only cars equipped with DSTC (dynamic stability and traction control) have a steering wheel angle sensor control module. The easiest way to determine if a car is equipped with DSTC (Dynamic stability and traction control) is to search for a switch, marked DSTC, positioned in the panel on the climate control module.

The Steering wheel Angle Sensor Module is positioned on the side of the central electronic module. The only function of the steering wheel angle sensor is to process the signals from the steering wheel angle sensor. The signals used by the DSTC system. The steering wheel angle sensor is mounted on the steering wheel module and is directly connected to the steering angle sensor via a connector on the steering wheel module. The Steering wheel angle sensor control module transmits signal information via the high-speed side of the Controller area network (CAN) to the brake control module, model year 2002-or the ABS control module, model year 1999-2001.

If a fault occurs the control module for the steering angle sensor detects this and a diagnostic trouble code (DTC) is stored at the same time as the DSTC function is switched off.

Diagnostic trouble codes (DTCs) stored in the control module for the steering wheel angle sensor. This information can be read off using the diagnostic tool via the data link connector (DLC) in the car.

SIGNALS FOR THE CONTROL MODULE FOR THE STEERING WHEEL ANGLE SENSOR

The table below summarizes input and output signals to and from the Steering wheel angle sensor control module. The signal types are divided into directly connected signals, serial communication and Controller area

network (CAN) communication.

Input signals	Output signals
Via Controller Area Network (CAN): -	**Via Controller Area Network (CAN):** **The brake control module (or ABS-control module)** (4/16). Transmits relevant information about the steering wheel angle from the straight ahead position, the speed of the steering wheel movements and about which direction the steering wheel is turned.
Directly connected: **The steering wheel angle sensor** (7/91). Provides the control module with relevant information about the steering wheel angle from the straight ahead position, the speed of the steering wheel movements and about which direction the steering wheel is turned.	**Directly connected:** -

DIAGNOSIS (2003-2012)

BACKGROUND

GENERAL

Factors that have improved safety, increased comfort, added functions and increased environmental friendliness, have made modern vehicles more and more complicated.

The more complicated the vehicle is, the more important is the diagnostics system in the vehicle with the diagnostics tool when it comes to ensuring fast, safe and economic test, service and repair.

To reduce emissions from the vehicle, the diagnostic systems shall also, according to legislation, detect emission-influencing problems as well as defects that may cause follow-up damage on emission-related components.

LEGAL REQUIREMENTS EMISSIONS

OBD I - On Board Diagnostic I

On Board Diagnostic I (diagnostic system in the vehicle) was 1988 a requirement from CARB (California Air Resource Board) which is an air quality board. The purpose of these regulations was to ensure that component or function defects that affected exhaust emissions are detected by the control module's diagnostic functions.

OBD I included diagnosis of control module, emission-related components connected to the control module as well as exhaust gas recirculation.

Using the diagnostic socket in the engine compartment, the information about the system was accessible to all, both brand-name workshops and independent workshops.

In case of a detected emission-related problem, a warning light is activated in the driver information module (MIL= Malfunction Indicator Light), when the problem is confirmed as a real malfunction. Thus, the light is not activated immediately upon detection, only first when the malfunction is confirmed, which may be, e. g., following a few driving cycles.

OBD II - On Board Diagnostic II

Fig. 34: Locating OBD II - On Board Diagnostic II
Courtesy of VOLVO CARS CORPORATION

On Board Diagnostic II was another requirement from CARB that applied from 1996. CARB demanded additional and refined diagnosis for emission-related component and systems in the drivetrain (engine and transmission).

Also, a standardized communication method was required for reading out of diagnosis (Standard SAE J1979 and J2190, where J2190 is voluntary and includes Enhanced Diagnostics - the vehicle manufacturer's own diagnosis in addition to legal requirements).

It should be possible to read out diagnostic trouble codes and their format, information connected to diagnostic trouble codes as well as parameters*, according to this standard. OBD II's diagnostic trouble codes are five-digit and begin with the letter P followed by four digits.

This standardized communication method means that anyone shall be able to manufacture and sell an instrument for reading out, a so-called Generic Scan Tool. Thus, the vehicle owner is not dependent on using a brand-name workshop.

The standard OBD II requires a standardized diagnostic socket in the passenger compartment near the driver's seat, where this instrument is to be plugged in. This means that the diagnostic socket (connector) is the same on all vehicles regardless of manufacturer or model.

However, there is a difference between manufacturers regarding which pins are used in the connector. This depends on the OBD II standard supports four types of communication protocols.

A protocol may be said to be the "language" that is to be used for communication with the control module.

Fig. 35: Identifying Standardized Pins On OBD II-Connector
Courtesy of VOLVO CARS CORPORATION

Standardized pins on OBD II-connector:

- Pin 2 SAE J-1850 bus +
- Pin 4 Chassis ground
- Pin 5 Signal ground
- Pin 6 SAE J-2284, CAN-bus (CAN-H)
- Pin 7 SAE J1979, ISO 9141-2 / ISO14230-4, K-line
- Pin 10 SAE J-1850 bus -
- Pin 14 SAE J.2284, CAN-bus (CAN-L)
- Pin 15 ISO 9141-2 / ISO14230-4, L-line
- Pin 16 Voltage feed

Other pins in the connector are permitted for the vehicle manufacturer's own specific use. On pin 7 (K-line), two-way communication is permitted, on pin 15 (L-line) only one-way communication is permitted to the control module. Therefore, the L-line is missing in many vehicles.

ISO14230-4 = Protocol KWP2000.

OBD II was first introduced for Volvo on engine management system Motronic 4.3, Motronic 4.4, and automatic transmission AW 50 42, AW 30 40/43 in model 850/960 for market USA/CDN.

With time, OBD II-communication with control modules via CAN is introduced.

The legal requirement also includes the function Readiness Monitoring.

* Parameter refers to, e. g., rpm, engine temperature, battery voltage, etc., with associated value 800 rpm, 87 °C as well as 14, 2 V, etc.

DIAGNOSTIC VERSIONS AND COMMUNICATION METHODS

GENERAL

Since the end of the 1980s, the control module's diagnosis has developed from detecting simple problems and storing a small amount of information to including more complicated tests and checks.

Today a large amount of information can be read out both about the detected problem as well as parameters from the control module's input and output signals.

VOLVO DIAGNOSTICS II - FIRST VERSION

Fig. 36: Locating OBD II - On Board Diagnostic II
Courtesy of VOLVO CARS CORPORATION

Volvo Diagnostics II - first version was a new Volvo standard introduced in *1996* . This meant that control modules communicated serially in the same way, and that diagnostic functions in the different systems were designed in a similar manner.

The communication cable in the vehicle used for this communication is common to all control modules in question. The control modules are connected to the same connection in the diagnostic socket (pin 7).

The diagnostic socket is located in the passenger compartment and for certain markets it is common with the diagnostics system OBD II.

Volvo Diagnostics II, first version, was introduced in 1996 on, among others:

- Engine management system Motronic 4.4
- Automatic transmission AW 50 42/AW 30 40/43
- Control module Airbag SRS6.2
- Immobilizer

- Control module Brakes ABS 850
- Combined instrument panel 850
- Power seat 850/960
- and was gradually introduced for additional systems and car models.

For certain models, the diagnostics tool for this diagnosis is still Volvo System Tester (car models from and incl. model year 1998 as well as certain systems for model year 1999).

The diagnostics tool VIDA, now replacing VADIS, is used for car models of model year 1999 and later.

VOLVO DIAGNOSTICS II - SECOND VERSION

Fig. 37: Communication Via CAN-Communication
Courtesy of VOLVO CARS CORPORATION

Volvo Diagnostics II - second version was introduced in *1999* and is a development of the first version. The major difference is that communication between the diagnostics tool and the control modules takes place via CAN-communication instead of on a communication cable.

The control modules also communicate with each other to exchange information on the CAN-net instead of via separate cables between the control modules.

This version introduced the possibility to download software to the control modules.

With the introduction of this version, the rate in the low-speed network was (LS CAN) 125 kbit/s and the rate in the low-speed network was (HS CAN) 250 kbit/s. Depending on model and model year, the speed of the network has increased with time.

The diagnostics tool VIDA, now replacing VADIS, is used for car models of model year 1999 and later.

GENERIC GLOBAL DIAGNOSTICS (GGD)

Fig. 38: Engine Block
Courtesy of VOLVO CARS CORPORATION

Generic Global Diagnostics (GGD) is a mutually developed diagnostics concept within the Ford company.

Communication and services are similar to Volvo Diagnostics II - first version. Communication between the diagnostics tool and control modules takes place via CAN-communication. The services that can be performed are similar.

Designation of trouble codes adheres to standard ISO/DIS 15031-6.4 and consist of a letter and six characters.

The control modules also communicate on the CAN-net with each other to exchange information.

It is also possible to download other software to the control modules.

Volvo Diagnostics, fifth version, was introduced in model XC90 model year *2005* with engine B8444S (only high-speed network) and then in model S80 (07-).

The diagnostics tool VIDA, now replacing VADIS, is used for car models of model year 2005 and later.

DIAGNOSTICS AND SERVICES

GENERAL

Fig. 39: Control Module And Diagnostics Tool
Courtesy of VOLVO CARS CORPORATION

The control module's diagnostics can perform and present the following using a connected diagnostics tool:

- Store malfunction indicator (diagnostic trouble codes) and in certain cases activate warning light or show text message.
  - Counter that indicates how frequent the malfunction is
  - Status indicators for the diagnostic trouble code test.
  - Frozen values that were generated when malfunction was detected for the first time.
- Store information about the nature of the malfunction:
  - Counter that indicates how frequent the malfunction is
  - Status indicators for the diagnostic trouble code test.
  - Frozen values that were generated when malfunction was detected for the first time.
- Erase information about malfunction and its information.
- Present values (parameters) for different connected input signals and output signals from, e. g., components as well as other calculated values.
- Present part number, version number, component number, etc. for both software and hardware.
- Present and change certain special customer settings and configurations.
- Trigger/control (activate) the connected output signals.
- Start special built-in check programs/tester such as, e. g., calibrations of gear position sensor, quick-test of tank system.
- Access check to limit access to certain parameters and functions. Accessible first after unlocking with, e. g., PIN-code.

Exactly what each control module's diagnostics can perform depends both on model year and system.

DIAGNOSTIC TROUBLE CODES (MALFUNCTION INDICATOR)

- see **READINESS MONITOR (CERTAIN MARKETS ONLY)**

PARAMETERS

Parameters or values are data that are read out from the control module's memory positions to, e. g., check the signal from a sensor or identify the control module's software version.

In principle, parameters can be divided into two parts:

- one for **dynamic values** continuously updated in the control module
- one for **static values** not changed by the control module and always stored.

Parameters, dynamic

Fig. 40: Dynamic Parameters
Courtesy of VOLVO CARS CORPORATION

The *dynamic values* are stored in the control module's RAM-memory, which means that the values disappear when the memory's power supply is turned off (control module is turned off). As soon as the control module's power is turned on (ignition on), values are stored again.

Example of values are:

- Outside temperature
- Engine speed

- Load
- Coolant temperature
- Vehicle speed
- Battery voltage

Values are updated continuously after a pre-determined time interval. This means that certain values are updated with very short time interval, while other values are updated more seldom. Update rate is determined by how important the value is to the control module.

By reading off the value from, e. g., a sensor or switch, it can be decided if the signal is correct or not.

NOTE: **When a malfunction is detected and a diagnostic trouble code is stored, it may well be that the displayed value is a replacement value and not the real value. If the value does not change, e. g., if the sensor is disconnected, it may be the replacement value that is shown.**

Parameters, static

Fig. 41: Identifying Static Parameters
Courtesy of VOLVO CARS CORPORATION

The *static values* are stored in the control module's EEPROM, which means that these values are always stored regardless of if the control module is on or off. These values are normally not updated by the control module, instead they are only changed using, e. g., the diagnostics tool at vehicle manufacture in the factory or reprogramming during a workshop visit.

Example of values are:

- Hardware P/N (control module without software).
- Hardware serial number (control module without software).
- Software P/N.
- Diagnostic software P/N.
- Customer-programmed values, e. g., passenger compartment temperature, alarm on and off.

- The vehicle's configuration, that is, the vehicle's content and equipment that can be used to compare the vehicle's equipment physically with how the vehicle is configured. The configuration may be affected/changed, e. g., when downloading software.

ACTIVATIONS

Fig. 42: Control Module Activation Of Components
Courtesy of VOLVO CARS CORPORATION

Wit this service it is possible to trigger (activate) the components that are connected to the control module. Examples of components are:

- Relays
- Solenoids
- Lock motors
- Damper motors
- Signals to other control modules.

NOTE: If a malfunction is detected, diagnostic trouble code is stored and emergency functions or modes, etc. are activated to "protect" the system, the control module can prevent activation.

Depending on the system, the control module or diagnostics tool can perform activations in different ways, for some the component is activated according to a certain pattern, e. g., OFF, ON, OFF, ON, OF, ON, etc. in a sequence.

For other systems, the component is activated, e. g., ON, and remain on until the activation is stopped.

QUICK-TESTS, CALIBRATIONS

Quick-tests or calibrations are functions or checks that are integrated in the control module's software and are started by the control module using commands from the diagnostics tool.

Wit this service it is possible to start certain pre-defined checks or teach-ins. Examples of these are:

- Quick-test of fuel tank system
- Quick-test of camshaft control
- Resetting of adaptions and counter for oil
- Calibration of gear position sensor
- Calibration of components for Brake control module (BCM)

NOTE: To enable start and running of these services, it is often that certain start conditions must be fulfilled.

SOFTWARE DOWNLOADING

New software can be downloaded to the control modules. When ordering software the vehicle software and hardware are compared to Volvo's central database. If the comparison corresponds the new software is downloaded to the control module.

If the comparison between the car and Volvo's central database does not correspond, then the database is updated with the vehicle's configuration. When this is complete the software is downloaded.

ERASING DIAGNOSTIC TROUBLE CODES

Stored diagnostic trouble codes (DTCs) can be read off and erased using this function. Diagnostic trouble codes (DTCs) can only be erased once all the diagnostic trouble codes (DTCs) have been read off at least once.

When erasing diagnostic trouble codes, the diagnostic trouble code's counter, status identifier as well as frozen values are also erased.

For certain systems, stored adaptions may also be reset when erasing.

DRIVING CYCLE/OPERATION CYCLE

Fig. 43: Driving Cycle/Operation Cycle
Courtesy of VOLVO CARS CORPORATION

All control modules' diagnostics require that some form of driving cycle or operation cycle is run for

diagnostics to be considered as complete. The terms driving cycle or operation cycle appear, these mean the same, they are only different designations.

Example

The illustration above shows an example of a driving cycle or operation cycle. The vehicle is started and driven *(Start)* , is stopped sometime and the ignition is turned off *(Stop)* . When the ignition is turned on again *(Start)* a new driving cycle starts.

A new driving cycle or operation cycle usually starts every time the ignition is turned on, which means that you should turn on the ignition, turn off the ignition, and then turn on the ignition again.

However, the condition varies from control module to control module, there are also, e. g., speed and temperature conditions, before a driving cycle or operation cycle is considered to be complete.

When a malfunction is detected and then is confirmed as a real malfunction and is stored, various counters are also stored, indicating how frequent the malfunction is. These counters use driving cycles or operation cycles as basis for updating the counters' values.

READINESS MONITOR (CERTAIN MARKETS ONLY)

This is a function in Engine control module (ECM) that controls the control module's emission-related sub-system. With the function you can read out if the control module has run all diagnostics for the following sub-systems:

- Misfiring
- Fuel system
- Catalytic converter
- Evaporative emission (EVAP) system
- Heated oxygen sensors (HO2S)
- Other related components

Thus, Readiness refers only to if the diagnostics (tests) have been run or not, not if a malfunction was found or not. If a malfunction is found during the test, a diagnostic trouble code is stored and the malfunction light (MIL-light) is lit.

If the tests are run in the driving cycle without detecting a malfunction, then "Readiness" is immediately generated to OK.

However, if a malfunction is found in the driving cycle, then Readiness is generated to Not Ok, and another driving cycle is required where the test is run to generate Readiness to Ok.

The following alternatives are possible:

- Readiness is run (Ok), no malfunction detected, which means that the vehicle can be approved in a check.
- Readiness is run (Ok), with malfunction detected, which means that the vehicle cannot be approved in a

check.
- Readiness is not run (Not ok), which means that the vehicle cannot be approved in a check.

Readiness was originally a requirement from the American authority, United States Environmental Protection Agency (EPA), and is used there for Inspection and maintenance test (IM-test) (corresponds to annual inspection). Depending on legal requirements, the function may also be found on other markets.

EMERGENCY MODE, BACK-UP MODE "LIMP-HOME"

When a malfunction has occurred in the system that is confirmed (permanent malfunction) and is registered by the control module, modes are activated for certain systems and functions to handle the malfunction.

The purpose of these actions is to "protect" the control system and at the same time retain as much functionality or driving function as possible.

The minor malfunctions do not activate any back-up modes, there are different programs depending on type of malfunction and which control system to which it applies. All control systems do not have emergency modes or back-up modes.

Sometimes emergency modes must be activated immediately when a malfunction is detected, even if there has been no time to confirm and store any diagnostic trouble code. This is to maintain certain function, e. g., in case of malfunction of the mass air floe sensor for the engine management system, when the emergency program tries to prevent the engine from stopping.

HINT: Limp-home, emergency mode or back-up mode that may appear in case of malfunction is described in diagnostic trouble code information under replacement values.

For, e. g., automatic transmission TF-80SC AWD (XC90, B8444S) there are two back-up modes:

- Failsafe action (temporary action)
- Emergency/limp-home mode

Failsafe action is activated at the first detection of the malfunction, if the malfunction disappears the system returns to normal function.

Emergency mode is activated in case of less serious malfunctions Limp-home mode is activated for the most serious malfunctions.

The warning light in the driver information module lights up, and a text message is shown in the text window in the driver information module that emergency/limp-home mode has been activated. When the ignition is turned off and on again, no text is shown until the malfunction is detected again.

NOTE: If the malfunction disappears (intermittent malfunction) the control module returns to normal function first when the ignition is turned on the next time.

For automatic transmission's emergency mode, the following may take place, e. g.:

- Adaption function is blocked.
- Lock-up function is blocked.
- Function slipping lock-up is blocked.
- Function neutral check is blocked.
- The transmission only shifts to 3rd gear and reverse gear. All other shifting is blocked.

The above actions will be noticed by the driver since only one gear can be sued. Some may also notice that lock-up is not engaged. Then the vehicle comes to the workshop with a *symptom* for some form of lost driving function, probably also with the warning light on.

This symptom shall not be confused with the malfunction itself, instead it is a symptom of the back-up mode. The symptom that the malfunction itself causes (it it causes any) may be noticed briefly or not at all.

NOTE: If the malfunction is confirmed (permanent) it may be that the control module resumes normal function at ignition off and on again (symptom does not exist any longer). First when the malfunction is detected again (diagnostic trouble code test started and conditions fulfilled), the back-up mode is activated. The malfunction may then first be interpreted as if it was intermittent (non-existent or not active).

FROZEN VALUES

For every diagnostic trouble code, pre-defined parameters are frozen and stored in the control module. The frozen values are stored immediately after the malfunction has been detected and gives a "picture" of the conditions when the malfunction was stored.

NOTE: Status identifier, Counter and Frozen values are the most important factors to deciding the malfunction's nature, that is, to decide:

- when the malfunction was detected (frozen values, counters)
- what the driving conditions were at the time (frozen values)
- status for the test (self-diagnosis) (status identifier)
- how frequent the malfunction is (counter).

In newer car models, frozen values consist of a number of global (common) general parameters as well as a number of control model-unique parameters. Global may be:

- Road distance
- Battery voltage
- Passenger compartment temperature
- Outside temperature
- Engine running

In addition to these, the diagnostic trouble code-unique parameters are stored which are especially selected

parameters for the diagnostic trouble code.

Most parameters in the frozen values are the same for all malfunctions and indicate a general condition when a malfunction was detected, for example:

- Road distance
- Outside temperature
- Engine speed
- Load
- Coolant temperature
- Vehicle speed
- Battery voltage
- etc.

Some of them have been selected to give a better understanding of the specific malfunction.

NOTE: When erasing diagnostic trouble codes, stored frozen values are also erased.

HINT: Reading out and interpreting these frozen values make it easier to understand when in time the malfunction occurred, as well as under what driving and environment conditions the malfunction was detected, related to when and how the customer experienced the symptom.

IDENTIFYING MALFUNCTION

Fig. 44: Identifying Detected Malfunction
Courtesy of VOLVO CARS CORPORATION

A malfunction that is detected is assessed by the control module's self-diagnosis. First after, e. g., a certain time, a certain number of driving cycles, certain driving/operation or other conditions, the control module decides if it is a real malfunction or not.

When self-diagnosis has determined that a real malfunction exists, you can say that the *malfunction is confirmed* and the malfunction is stored in the control module's trouble code memory in the form of diagnostic

trouble codes.

If a malfunction disappears, the diagnostic trouble code will remain for a tome in the diagnostic trouble code memory, but the status of the diagnostic trouble code changes. How long the diagnostic trouble code is stored in the diagnostic trouble code memory is different from control module to control module, as well as between different vehicle models (generation of vehicle model).

In some systems the diagnostic trouble code will be stored until it is erased with the diagnostics tool. In other systems the diagnostic trouble code is erased automatically by the control module after, e. g., a certain number of malfunction-free driving cycles. A new driving cycle (operation cycle) is usually started every time the ignition is turned on.

Information about the nature of the malfunction is stored for every diagnostic trouble code:

- when the malfunction was detected (frozen values, counters)
- what the driving conditions were at the time (frozen values)
- status for the test (diagnosis) (status identifier)
- how frequent the malfunction is (counter).

Exactly what is stored is different from control module to control module,, as well as between different vehicle models (generation of vehicle model).

If the system is provided with warning light, it is lit when the ignition key is turned to position II. The warning light will go off after a certain number of seconds when no malfunction is detected on the control system.

The warning light will be on in case of a malfunction of the control system. The warning light will be lit first after the malfunction is confirmed as a real malfunction.

DESIGNATION OF TROUBLE CODES

The diagnostics tool VIDA shows the diagnostic trouble code in plain text according to the following example:

TCM-001F Speed sensor Signal missing Permanent malfunction

This diagnostic trouble code consists of the following parts:

- Prefix for control system in question (**TCM**) to show what system the diagnostic trouble code belongs to. *
    - If the qualifier is, e. g., "Too high signal", the control module interprets that the signal from the sensor is too high. This may mean that, e. g., the voltage is too high, current is too high, frequency is too high, or the pulse ratio (% duty) is too high, all depending on which type of signal it is. Malfunction causes may be, e. g., open circuit or short-circuiting to voltage.
    - If the qualifier is "Too low signal", the control module interprets that the signal from the sensor is too low. Malfunction causes may be, e. g., open circuit, short-circuiting to ground, contact resistance in connections.

NOTE: **Information about which type of signal that the control module detects and what conditions are required to detect that a malfunction is found again in the diagnostic trouble code information.**

- Diagnostic trouble code number (**001F**) to decide which diagnostic trouble code is stored. Number of digits in the diagnostic trouble code number may vary. *, **
  - If the qualifier is, e. g., "Too high signal", the control module interprets that the signal from the sensor is too high. This may mean that, e. g., the voltage is too high, current is too high, frequency is too high, or the pulse ratio (% duty) is too high, all depending on which type of signal it is. Malfunction causes may be, e. g., open circuit or short-circuiting to voltage.
  - If the qualifier is "Too low signal", the control module interprets that the signal from the sensor is too low. Malfunction causes may be, e. g., open circuit, short-circuiting to ground, contact resistance in connections.

NOTE: **Information about which type of signal that the control module detects and what conditions are required to detect that a malfunction is found again in the diagnostic trouble code information.**

- Title (**Speed sensor**) is a text that shows to which component/function the diagnostic trouble code refers. *
  - If the qualifier is, e. g., "Too high signal", the control module interprets that the signal from the sensor is too high. This may mean that, e. g., the voltage is too high, current is too high, frequency is too high, or the pulse ratio (% duty) is too high, all depending on which type of signal it is. Malfunction causes may be, e. g., open circuit or short-circuiting to voltage.
  - If the qualifier is "Too low signal", the control module interprets that the signal from the sensor is too low. Malfunction causes may be, e. g., open circuit, short-circuiting to ground, contact resistance in connections.

NOTE: **Information about which type of signal that the control module detects and what conditions are required to detect that a malfunction is found again in the diagnostic trouble code information.**

- Qualifier (**Signal missing**) is used to show *how the control module has perceived the signal from, e. g., the sensor, or how it detected the monitored function.* In this case, the control module has perceived that the signal is missing. There a re a number of other qualifiers for, e. g., too high signal, incorrect signal, too high flow, too low flow, etc. *, **.
  - If the qualifier is, e. g., "Too high signal", the control module interprets that the signal from the sensor is too high. This may mean that, e. g., the voltage is too high, current is too high, frequency is too high, or the pulse ratio (% duty) is too high, all depending on which type of signal it is. Malfunction causes may be, e. g., open circuit or short-circuiting to voltage.
  - If the qualifier is "Too low signal", the control module interprets that the signal from the sensor is

too low. Malfunction causes may be, e. g., open circuit, short-circuiting to ground, contact resistance in connections.

NOTE: Information about which type of signal that the control module detects and what conditions are required to detect that a malfunction is found again in the diagnostic trouble code information.

-
- Status (**Permanent malfunction**) to show the malfunction's status, that is, if the malfunction has been detected in the present driving cycle or not. There are two different status texts, permanent or intermittent. When the control module's diagnosis cannot decide the malfunction's status, the diagnostic trouble code is shown without status text. *

* When reading out diagnostic trouble codes using diagnostic socket with light-emitting diode, you get a three-digit flash code. Then this code is translated to a diagnostic trouble code text using the service information.

For example, if the control module flashes the code 1-2-3 from Engine control module (ECM), it can be translated to, e. g., diagnostic trouble code 1-2-3 Engine temperature sensor. Volvo Diagnostic Key and Volvo System Tester translate these flash codes directly to plain text (add a title). In these diagnostic systems it is not possible to show qualifier or status.

** For systems with diagnostic version called Generic Global Diagnostics (GGD) (adheres to standard ISO/DIS 15031-6.4) the diagnostic trouble code number consists of a letter and six characters. The letter alternatives are B, C, P and N, which means Body, Chassis, Powertrain and Network and indicate to which "function" in the vehicle the diagnostic trouble code belongs. The six following characters may consist of both letters (A-F) and digits (0-9) and indicate the component to which the malfunction refers as well as what type of malfunction. See following example.

BCM-C006A16 Multi-axial acceleration sensor. General electric malfunction. Too low voltage

CLASSIFICATION OF DIAGNOSTIC TROUBLE CODES

In principle, malfunctions can be classified in two categories, intermittent or permanent.

Permanent malfunctions.

The easiest malfunctions to identify and confirm as a malfunction are the permanent malfunctions. A permanent malfunction is a malfunction when something has "broken" and remains like that until it is repaired.

Intermittent malfunctions.

The intermittent malfunctions are, as opposed to the permanent malfunctions, are both difficult to identify and confirm. The malfunction exists but is neither active nor present all the time. The malfunction comes and goes briefly under very rare conditions.

For the intermittent malfunctions, the degree of intermittence can also be determined, that is, how intermittent the malfunction is (how often/seldom the malfunction appears).

HINT: For assessment of intermittence, stored counters are used together with the diagnostic trouble code.

Common permanent malfunction causes are:

- Open circuits or short-circuits on cables or in connectors caused by mechanical damage, vibrations, corrosion, oxidation, moisture, etc.

Common intermittent malfunction causes are:

- Loose connections or contact resistance caused by vibrations, corrosion, oxidation, moisture, etc.
- Brief short-circuits to both ground and voltage caused by damage to cables, moisture in connectors, etc.
- Electro-magnetic interference.

Malfunction causes may be both electrical, mechanical or related to software.

Intermittent malfunctions (or malfunctions that occur under unknown conditions) may also be malfunctions that only occur during certain operation or ambient conditions.

E. g., that the window or seat for some reason jams in its end-position when using automatic function, or that the climate control unit supplies poor heat in a certain position when it rains outside.

CONDITIONS FOR DIAGNOSIS TO FIND A MALFUNCTION

For the control module's self-diagnosis of a component or function to start and run (one or several times) special conditions must be fulfilled. Conditions for diagnosis varies depending on which component or function is to be monitored. When the diagnosis has started and is run, the signal, value or function must go above or below the limit value for the control module to detect a malfunction.

Example of conditions for the control module to start the diagnosis/test:

- Engine speed higher than 500 rpm.
- Ignition position II.
- Speed above 40 km/h.
- 4th gear selected.

Example of limit values for detecting malfunction:

- Direct voltage from outside temperature sensor lower than 0.495 V for a time longer than 1 second.
- After the engine has run for approx. 10 minutes, the control module receives an unchanged signal from the oil temperature sensor even though the signal should have changed according to a set pattern.
- Malfunction shall be active (permanent) for at least 2 driving cycles.

Example

Fig. 45: Example Of Limit Values For Detecting Malfunction (1 Of 2)
Courtesy of VOLVO CARS CORPORATION

The illustration shows an imagined scenario when a malfunction occurs in a circuit for a signal.

First the signal varies normally during driving. The diagnostic trouble code test starts after some time (5), is then run cyclically in a pre-defined pattern and monitors the signal. Limit values for monitoring to consider the signal as incorrect is a voltage lower than 0.50 V (2) or higher than 4.85 V (1). An open circuit occurs in the circuit and the signal becomes 0 V (4). Monitoring detects this, waits so that the malfunction is confirmed and then stores a diagnostic trouble code (6).

Fig. 46: Example Of Limit Values For Detecting Malfunction (2 Of 2)
Courtesy of VOLVO CARS CORPORATION

If the diagnostic trouble code test (5) starts after the malfunction (4) occurs, then monitoring will detect the malfunction fist when the test starts. Then monitoring waits so that the malfunction is confirmed and then stores a diagnostic trouble code (6). If you want the control module to detect a malfunction in the vehicle, you have to make sure that the control module's diagnostic trouble code test starts or is started.

HINT: If a malfunction occurs which has not yet been detected by the control module's monitoring, since the diagnostic trouble code test has not started, the vehicle may still exhibit a symptom.

NOTE: Conditions for diagnosis are described in the diagnostic trouble code

information for every diagnostic trouble code.

Most diagnosis (at least non-emission-related diagnosis) are repeated periodically during the driving cycle, and every time they are repeated, a test is run that either results in a malfunction being detected or no malfunction being detected.

To enable the emission-related diagnosis to be completed and the diagnostic trouble code to be confirmed (with MIL-light activated as a result), several driving cycles in a row must be completed with a detected malfunction.

To enable the non-emission-related diagnosis to be completed (at least once), in principle the start conditions must be fulfilled for a certain time (from fractions of a second to a number of seconds).

Certain diagnoses require a completed driving cycle (e. g., ignition on, ignition off, and ignition on again) for the diagnosis to be considered as complete. Other diagnoses requires several other conditions to be fulfilled, e. g., with regards to:

- vehicle speed
- engine coolant temperature (ECT)
- time since start
- different load and engine speed relationships in the same trip
- a certain event (for example, that the component operates).

HINT: To assess if a test/diagnosis for the diagnostic trouble code is started or completed, status identifiers can be used. Turning off the ignition and then turning it on again often results in start of a new driving cycle/operation cycle, which results in update of status identifiers.

When, e. g., the engine control module (ECM) has run all diagnostics, the control module has completed a "trip". An extensive driving schedule in various conditions is required to complete a trip. The engine may also need to be shut off for a certain amount of time and then switched on again to complete a trip.

Emissions related diagnostic functions

Control modules that have and control emission-related components or functions, e. g., Engine control module (ECM) and Transmission control module (TCM), check that emission-related systems work. These systems are checked by running a diagnostic function. The diagnostic function checks the included components and that the function itself works in the system.

Lighting the malfunction indicator lamp (MIL)

In the event of emissions related diagnostic trouble codes (DTCs), a counter counts down to determine when to light the malfunction indicator lamp (MIL). The conditions for lighting the malfunction indicator lamp (MIL) vary depending on which diagnostic trouble code (DTC) is stored.

NOTE: **If a malfunction becomes intermittent or the malfunction disappears, then the MIL-light turns off first after 3 driving cycles in a row are completed with malfunction detection.**

Self-erasing of emission-related diagnostic trouble codes

After 40 driving cycles without detected malfunction with start of cool engine, where the engine temperature (coolant temperature) increases more than 5 °C (approx. 9 °F) and the final temperature is above approx. +71 ° C (159.8 °F), then the diagnostic trouble code is erased. Diagnoses (diagnostic trouble code tests) for misfire and fuel adaptions require 80 driving cycles. These driving cycles are defined as a "warm-up cycle".

COUNTER

GENERAL

For every diagnostic trouble code, the control modules stores a number of counters. These counters count the number of driving cycles that have been performed in the control module with or without malfunctions, if the malfunction is detected or not. In control systems older than model year 1999, there may be control systems, depending on control system, without counters or with few counters. From model year 1999, there are systems with several counters. The following counters may appear:

- Counter 1
- Counter 2 *
- Counter 3
- Counter 4
- Counter 5**
- Counter 6
- Counter 7
- Counter 8

The text uses the term driving cycle, which may also be called Operation cycle.

* In principle, only systems with the diagnostic concept Generic Global Diagnostic (GGD).

** Only for emission-related systems.

When erasing diagnostic trouble codes, the diagnostic trouble code's counter is erased.

NOTE: Status identifier, Counter and Frozen values are the most important factors to deciding the malfunction's nature, that is, to decide:

- when the malfunction was detected (frozen values, counters)
- what the driving conditions were at the time (frozen values)
- status for the test (self-diagnosis) (status identifier)
- how frequent the malfunction is (counter).

COUNTER VOLVO DIAGNOSTICS II

Fig. 47: Counter Volvo Diagnostics II Graph
Courtesy of VOLVO CARS CORPORATION

Graph A illustrates when in time that the malfunction occurs. In the illustration, the control module has detected a malfunction in the second driving cycle (graph's x-axis) and this malfunction then appears 4 more times, a total of 5 times. Counters can be read out for every diagnostic trouble code in the control module which have this introduced. Driving cycles are marked with vertical lines. A driving cycle often begins with ignition on and ends with ignition off.

Counter 1 (C#1). Counts number of cycles performed since the malfunction was confirmed *last* . As soon as a malfunction is detected and confirmed, the value is reset.

When the malfunction is both detected and disappears in the second driving cycle (graph A), counter 1 will count up to 1 first in the following driving cycle (driving cycle 3), that is, a driving cycle has been run through since the last time the malfunction was confirmed.

In driving cycle 4, the counter is updated again, now to value 2. Just after that, the malfunction is detected (graph A), the malfunction is confirmed and the counter's value is reset. This sequence is repeated once again in driving cycle 5.

With other words, one can say that if the value is zero, the malfunction exists now or has existed earlier in the current driving cycle. If the vehicle is restarted so that a new driving cycle is initiated (often requires ignition off and on again) in this position and the counter's value still is 0, then you probably have a permanent malfunction.

Values near zero indicate that the malfunction has been detected recently. It may also be that the malfunction exists but the diagnostic trouble code test has not started in these driving cycles, which means that the counter has not been reset. A high counter value indicates that the malfunction was last detected a number of driving cycles ago.

Counter 3 (C#3) (see graph). Counts the number of driving cycles performed since the malfunction was confirmed the *first* time. When a malfunction is confirmed the first time, the counter will count up by 1 for every subsequent driving cycle, regardless of if the malfunction is detected or not. Thus, the counter tracks the number of driving cycles since the malfunction was detected the first time. See graph where the counter increases by 1 for every subsequent driving cycle and the value of the counter is finally 6.

A low value indicates that the malfunction was detected for the first time relatively recently. However, a high value indicates that a first detection was performed some time ago.

Counter 4 (C#4) (see graph). Counts the number of driving cycles in which the malfunction has been confirmed since it was confirmed the first time. The graph shows that after the malfunction was detected the first time, the malfunction has been detected in 3 driving cycles. Thus, after the malfunction was detected the first time, another 6 driving cycles (counter 3), have passed and in these the malfunction has been detected 3 times (counter 3). Simplified, one can say that in this example, the malfunction has occurred/been detected in every other driving cycle, and the malfunction can be assessed as relatively frequent.

A certain indication of a malfunction's intensity can be obtained if you compare the value for counter 4 with counter 3. The closer the value for counter 4 the value is to the value of counter 3, the more frequent the malfunction.

If counters 3 and 4 have the same value, the malfunction has been detected in every driving cycle, which means that the malfunction is frequent.

Counter 5 (C#5). The counter sums up the time in seconds that *the control module has been operating* since the malfunction first was confirmed and the diagnostic trouble code was stored. The time that the control module has been operating is only counted when it is active, not in "sleep mode". The counter is not shown in the illustration.

Counter 6 (C#6). The counter sums up the time in seconds that *the diagnostic trouble code test has been in progress* since the malfunction first was confirmed and the diagnostic trouble code was stored. The counter is not shown in the illustration.

Counter 7 (C#7). The counter sums up the time in seconds that *malfunction has been confirmed* since it first was confirmed and the diagnostic trouble code was stored. The counter is not shown in the illustration.

COUNTER GENERIC GLOBAL DIAGNOSTICS (GGD)

Fig. 48: Counter Generic Global Diagnostics (GGD) Graph
Courtesy of VOLVO CARS CORPORATION

Graph A. Diagnostic trouble code test active

Shows if the control module's diagnostic trouble code test is active or not. The blue surface indicates when the test is active. Not included as a status identifier.

Graph B. Malfunction active

Shows if the malfunction in the vehicle is active or not. The red surface indicates when the malfunction is present (active). Not included as a status identifier.

In the illustration, the control module has detected a malfunction in the second driving cycle, and this malfunction occurs a total of 4 times. Counters can be read out for every diagnostic trouble code in the control module which has this implemented. Driving cycles are indicated with vertical lines. A driving cycle often begins with ignition on and ends with ignition off.

Counter 1 (C#1). Counts number of driving cycles performed since the malfunction was confirmed *last* . As soon as a malfunction is detected and confirmed, the value is reset. When the malfunction is both detected and disappears in the second driving cycle (graph A), counter 1 will count up to 1 first in the following driving cycle (driving cycle 3), that is, a driving cycle has been run through since the last time the malfunction was confirmed.

In driving cycle 4, the counter is updated again, now to value 2. Just after that, the malfunction is detected (graph A), the malfunction is confirmed and the counter's value is reset. This sequence is repeated once again in driving cycle 5.

With other words, one can say that if the value is zero, the malfunction exists now or has existed earlier in the current driving cycle. If the vehicle is restarted (often requires ignition off and on again) in this position and the counter's value still is 0, then you probably have a permanent malfunction.

Values near zero indicate that the malfunction has been detected recently. It may also be that the malfunction exists but the diagnostic trouble code test has not started in these driving cycles, which means that the counter has not been reset. A high counter value indicates that the malfunction was last detected a number of driving cycles ago.

Counter 2 (C#2). Counts the number of driving cycles since the last confirmation of the malfunction and where the diagnostic trouble code was performed *without* detecting malfunction and confirmation of malfunction. Thus, when diagnostic trouble code is performed and no malfunction is detected, the counter will count up by 1 for every driving cycle. As soon as a malfunction is detected and confirmed, the value is reset.

When the malfunction is detected and disappears in the second driving cycle (graph A), counter 2 will count up to 1 first in the following driving cycle (run cycle 3). In driving cycle 4 the counter is updated again (diagnostic trouble code test has been run without detecting malfunction), now to value 2. Immediately after that the malfunction is detected (graph A), the malfunction is confirmed and the counter's value is reset. This sequence is repeated once again in driving cycle 5.

During driving cycle 6 and 7, the diagnostic trouble code test was run without detecting malfunction and the counter receives the value 2. In driving cycle 8, the diagnostic trouble code test is not run and thus the counter is not updated.

Counter 3 (C#3) . Counts the number of driving cycles performed since the malfunction was confirmed the *first* time. When a malfunction is confirmed the first time, the counter will count up by 1 for every subsequent driving cycle, regardless of if the malfunction is detected or not. Thus, the counter tracks the number of driving cycles since the malfunction was detected the first time. See graph where the counter increases by 1 for every subsequent driving cycle and the value of the counter is finally 6.

A low value indicates that the malfunction was detected for the first time relatively recently. However, a high value indicates that a first detection was performed some time ago.

Counter 4 (C#4). Counts the number of driving cycles in which the counter's value has been updated first when the malfunction was detected in the driving cycle. The counter has a final value of 3.

A certain indication of a malfunction's intensity can be obtained if you compare the value for counter 4 with counter 3. The closer the value for counter 4 the value is to the value of counter 3, the more frequent the malfunction.

Counter 5 warm-up (C#5). Counts the number of warm-up cycles that have been run since the malfunction light (MIL) has gone off. The counter is not shown in the illustration. Note: Only applies to emission-related systems.

Counter 6 malfunction detection (C#6). The counter counts the number of internal detections of the malfunction that have been run for the diagnostic trouble code. When this counter reaches value +127, the control modules decides that the malfunction is active right now.

When the counter is at value -128, the malfunction is not active. The value is reset for every new driving cycle.

If the value increases towards +127, the control module has detected a malfunction, and for every internal test the value is counted up. When the malfunction no longer exists, the control module counts down to minimum -128.

The value on the control module can only be changed when it has started the test for the diagnostic trouble code. How big each step is that the control module counts up or down the value by to reach the limits +127 or -128 may vary between control modules. Limits +127 and -128 are pre-defined limits in the control module.

In the graph, the counter first counts down to -128 when the diagnostic trouble code test starts. When a malfunction occurs (graph B) and the diagnostic trouble code test detects the malfunction, first the counter's value is reset to 0, then it scrolls up to +127. Only then the malfunction is considered to exist. If the malfunction disappears and the diagnostic trouble code test is active, the counter counts down to -128.

Counter 7 malfunction detection - max. current (C#7). Shows maximal value that counter 6 has in the present driving cycle.

The counter is not shown in the illustration.

Counter 8 malfunction detection - max. earlier (C#8). Shows maximal value that counter 6 has in the present and/or has had in earlier driving cycle.

The counter is not shown in the illustration.

STATUS IDENTIFIER

GENERAL

There are status indicator (status identifiers) that can be read out for every diagnostic trouble code. The control module tests every connection (signal) or function more or less periodically, depending on the self-diagnosis' conditions for start.

By reading out the diagnostic trouble code with associated status identifier, then you obtain *status for the diagnostic trouble code test that detects the malfunction, as well as if the malfunction exists now or not.*

NOTE: Status identifier, Counter and Frozen values are the most important factors to deciding the malfunction's nature, that is, to decide:

- when the malfunction was detected (frozen values, counters)
- what the driving conditions were at the time (frozen values)
- status for the test (self-diagnosis) (status identifier)
- how frequent the malfunction is (counter).

All status identifiers (or malfunction detection counters) do not have to be introduced in one control module, this varies from system too system. All status identifiers restarts the count every time a new driving cycle/operation cycle starts or when erasing diagnostic trouble codes. Status identifiers should be read off continuously as the different identifiers can be updated later on.

The following describes possible status identifiers.

NOTE: Status identifiers for systems with diagnostics Volvo Diagnoses II is slightly different from status identifiers for diagnostic version Generic Global Diagnostics (GGD).

When erasing diagnostic trouble codes, the diagnostic trouble code's status identifier is erased.

STATUS IDENTIFIER VOLVO DIAGNOSTICS II

The following identifiers are available (showed values apply until updated with a new read-out):

- SB 01 Diagnostic trouble code test run in progress.
- SB 02 Diagnostic trouble code test run at least once during current driving cycle.
- SB 03 Sporadic/single malfunctions found the last time diagnostic trouble code test was run during current driving cycle/operation cycle.
- SB 04 Sporadic/single malfunctions found at least once during current driving cycle.
- SB 05 Request light warning light/text message due to detected malfunction.
- SB 06 Diagnostic trouble code test blocked due to malfunction found by another diagnostic trouble code test.
- SB 08 Malfunction detection counter, current value.
- SB 09 Malfunction detection counter, maximum value reached some time during current operation cycle.

Abbreviation SB is from the English 'Status Bit'.

Fig. 49: Identifying Status Identifier Volvo Diagnostics II Graph
Courtesy of VOLVO CARS CORPORATION

The upper graph shows a varying signal value. If the signal value exceeds a max. value, which is considered a malfunction by the control module, then a sporadic malfunction is registered, that is, a malfunction is about to occur. Then the grey-marked surface indicates the signal considered to be incorrect.

The text below uses the term Driving cycle, which may also be called Operation cycle.

NOTE: If the diagnostic trouble codes are erased, the status identifiers are also erased

SB01 Diagnostic trouble code test run in progress (second paragraph from top).

Shows if the diagnostic trouble code test runs or not right now (in current driving cycle). It is only when the test runs that the control module can detect malfunctions and generate diagnostic trouble codes.

Grey-marked surface means that the test runs and can detect a malfunction if it occurs. The surface is "dashed", showing that when the diagnostic trouble codes runs, it runs in a cyclic, pre-determined pattern.

Status identifier 03 and 04 shows if a malfunction is detected or not. In this case, a malfunction is detected 3 times.

Status alternative when reading out is Yes (test runs now) or No (test is not run now).

SB02 Diagnostic trouble code test run at least once during current driving cycle (third graph from the top).

Shows if the diagnostic trouble code test has been run or not during the current driving cycle. If it has been possible for the control module to detect malfunctions and generate diagnostic trouble code any time during the current driving cycle.

Grey-marked surface means that the diagnostic trouble code test has been run at some time. If the diagnostic trouble code test has been run at some time in this driving cycle, status will always be Yes and remain so until the ignition is turned on off and a new driving cycle starts. When a new driving cycle starts, status identifiers are "reset" and is initially No.

Status identifier 03 and 04 shows if a malfunction is detected or not.

Status alternative when reading out is Yes (test completed) or No (test not completed).

SB03 Sporadic/single malfunctions found the last time diagnostic trouble code test was run during current driving cycle (fourth graph from the top).

A sporadic malfunction (intermittent malfunction) has been detected 3 times *the last* time the diagnostic trouble code test was run during current driving cycle. During the diagnostic trouble code test run the last time (status identifier 01) a malfunction has been detected 3 times.

Status alternative when reading out is Yes (sporadic malfunction found) or No (no sporadic malfunction found).

NOTE: **When the control module detects the malfunction for the first time(status identifier 03 and 04), a diagnostic trouble code has not yet been stored. It is first when the malfunction detection counter 08 reaches a certain value that the control module considers that a real malfunction exists (a confirmed malfunction) and the diagnostic trouble code is stored.**

SB 04 Sporadic/single malfunctions found at least once during current driving cycle (fifth graph from the top).

A sporadic malfunction (intermittent malfunction) has been detected at some time during current driving cycle. Grey. marked surface means that a malfunction has been detected at some time.

If the diagnostic trouble code test has been run at some time in this driving cycle, status will always be Yes and remain so until the ignition is turned on off and a new driving cycle starts. When a new driving cycle starts, status identifiers are "reset" and is initially No. Status identifier 03 and 04 shows if a malfunction is detected or not.

Status alternative when reading out is Yes (test has been run earlier) or No (test has not been run).

SB 05 Request light warning light/text message due to detected malfunction (sixth paragraph from the top).

Information that diagnostic trouble code activates a warning light or text message in driver information module. In this case, lighting of warning light is requested when the diagnostic trouble code has been confirmed and stored.

Status alternative when reading out is Yes (request performed) or No (no request).

SB06 Diagnostic trouble code test blocked (seventh graph from top).

Information that diagnostic trouble code test is turned off as a result of another malfunction and diagnostic trouble code is generated where the root cause is detected. If this in turn results in subsequent malfunctions, it prevents generation of subsequent diagnostic trouble codes. In this case, the diagnostic trouble code test is not blocked.

Status alternative when reading out is Yes (diagnostic trouble code test blocked) or No (diagnostic trouble code test not blocked).

SB08 Malfunction detection counter, current value (eight graph from top).

When a sporadic malfunction is detected by the control module the malfunction detection counter counts up as long as the malfunction exists.

When the malfunction no longer exists the counter counts down again. This is the basis for the control module's decision to store the diagnostic trouble code and the diagnostic trouble code is stored in the vehicle first when the counter reaches a certain max. value. This max. value varies between different diagnostic trouble codes.

Count rate of the counter is controlled as long as the malfunction exists before it causes customer symptom. The counter is used to decide if it is a real malfunction that has occurred and that has existed for some time. It is the control module's way of confirming the diagnostic trouble code, that is, confirming that a real malfunction exists.

SB09 Malfunction detection counter, max. value during current operation cycle

Shows max. value that status identifier 08 has reached during current driving cycle. When a new driving cycle starts, the counter is "reset".

STATUS IDENTIFIER GENERIC GLOBAL DIAGNOSTICS (GGD)

The following identifiers are available (showed values apply until updated with a new read-out):

- SB 00 Malfunction found the last time that the diagnostic trouble code test was run during current driving cycle
- SB 01 Malfunction found at least once during the current driving cycle
- SB 02 Malfunction found at least once during the current and previous driving cycles
- SB 03 Malfunction found recently since erasing of diagnostic trouble codes
- SB 04 Diagnostic trouble code test run at least once since erasing of diagnostic trouble codes
- SB 05 Malfunction found at least once since erasing of diagnostic trouble codes
- SB 06 Diagnostic trouble code test run at least once during current operation cycle.
- SB 07 Request light warning light/text message due to detected malfunction.

Fig. 50: Identifying Status Identifier Generic Global Diagnostics (GGD) Graph
Courtesy of VOLVO CARS CORPORATION

The upper graph shows a varying signal value. If the signal value exceeds a max. value, which is considered a malfunction by the control module, then a sporadic malfunction is registered, that is, a malfunction is about to occur. Then the grey-marked surface indicates the signal considered to be incorrect.

The text below uses the term Driving cycle, which may also be called Operation cycle. The order of status identifiers in illustration and in the list below are presented as they belong to each other, not in numerical order.

NOTE: If the diagnostic trouble codes are restored, the status identifiers are also restored

Graph A Diagnostic trouble code test active

Shows if the control module's diagnostic trouble code test is active or not. The blue surface indicates when the test is active. The surface is "dashed", which shows when the diagnostic trouble code test runs it runs in a cyclically pre-determined pattern. Not included as a status identifier.

Graph B Malfunction active

Shows if the malfunction in the vehicle is active or not. The red surface indicates when the malfunction is present (active). Not included as a status identifier.

Graph C Counter 6 malfunction detection (C#6)

The counter counts the number of internal detections of the malfunction that have been performed for the diagnostic trouble code. Not included as a status identifier. When this counter reaches value +127 the control module considers the malfunction to be active right now.

When the counter is at value -128, the malfunction is not active. The value is reset for every new driving cycle.

If the value increases towards +127, the control module has detected a malfunction and for every internal test the value is counted up. When the malfunction no longer exists, the control module counts down to minimum -128.

The value on the control module can only be changed when it has started the test for the diagnostic trouble code. How big each step is that the control module counts up or down the value by to reach the limits +127 or -128 may vary between control modules. Limits +127 and -128 are pre-defined limits in the control module.

In the graph, the counter first counts down to -128 when the diagnostic trouble code test starts (graph A). When a malfunction occurs (graph B) and the diagnostic trouble code test detects the malfunction, first the counter's value is reset to 0, then it scrolls up to +127. Only then the malfunction is considered to exist. If the malfunction disappears and the diagnostic trouble code test is active, the counter counts down to -128.

SB **06 Diagnostic trouble code test run at least once during current operation cycle**

Shows if the control module has performed diagnostic trouble code test for this diagnostic trouble code in *current* driving cycle. When the diagnostic trouble code test starts and counter 6 (malfunction detection) counts down to -128 (no malfunction found) or up to +127 (malfunction found), the control module considers that diagnostic trouble code test has been run.

Yellow-marked surface means that diagnostic trouble code test *is not yet* run.

Status alternative when reading out is Run or Not run.

SB **00 Malfunction found the last time that the diagnostic trouble code test was run during current driving cycle**

Shows if the control module detects the malfunction right now. It is only when the test runs that the control module can detect malfunctions and generate diagnostic trouble codes. A malfunction has been detected 2 times during the current driving cycle. Note that only when counter 6 (malfunction detection) reaches the value +127 is it considered to be a malfunction. When the value gas dropped from +127 to 0, it is considered that there is no longer a malfunction.

Status alternative when reading out is Yes (malfunction detected right now) or No (no malfunction detected right now).

SB **01 Malfunction found at least once during the current driving cycle**

Shows if the control module has detected the malfunction *anytime during the current driving cycle.* It is only when the test runs that the control module can detect malfunctions and generate diagnostic trouble codes. The diagnostic trouble code test has started and a malfunction has been detected at least 1 time during the current driving cycle.

Status alternative when reading out is Yes (malfunction found) or No (malfunction not found).

This status identifier is generated at the same time as status identifier SB00 and will remain in status Yes for the rest of the current driving cycle. At start of a new driving cycle, it has changed to status No until a malfunction is detected again.

SB **05 Malfunction found at least once since erasing of diagnostic trouble codes**

Shows if the control module has detected the malfunction during *earlier* driving cycle. A malfunction has been detected at least 1 time since the diagnostic trouble code was erased the last time.

Status alternative when reading out is Yes (malfunction found) or No (malfunction not found).

This status identifier is generated at the same time as status identifier SB 00 and will remain in status Yes until diagnostic trouble codes are erased once again.

SB **04 Diagnostic trouble code test run at least once since erasing of diagnostic trouble codes**

Shows if the control module has performed diagnostic trouble code test for this diagnostic trouble code in

current and/or earlier driving cycle since the diagnostic trouble code was erased the last time. This means that if diagnostic trouble code test has been run after erasing of diagnostic trouble codes, it will remain in Run until diagnostic trouble codes are erased once again.

Yellow-marked surface means that diagnostic trouble code test *has been* run.

Status alternative when reading out is Run or Not run.

This status identifier is generated at the same time as status identifier SB 06.

SB **07 Request for lit warning light/text message**

Information about the diagnostic trouble code activates a warning light or text message. In this case, lighting of the warning light is requested when a diagnostic trouble code is stored.

Status alternative when reading out is Yes (request performed) or No (no request).

SB **02 Malfunction found at least once during the current and previous driving cycles**

Pending not yet confirmed diagnostic trouble code.

Status alternative when reading out is Yes (malfunction found but not confirmed) or No (no malfunction found).

This status identifier is generated at the same time as status identifier SB 00 is generated for the first time and will remain in status Yes until certain driving cycle conditions are fulfilled and no malfunctions are detected. After a certain number of driving cycles without detected malfunction, it returns to status No. Number of driving cycles required depends on the system.

SB **03 Malfunction found recently since erasing of diagnostic trouble codes**

Confirmed diagnostic trouble code.

Status alternative when reading out is Yes (malfunction found and confirmed) or No (no malfunction found).

This status identifier is generated at the same time as status identifier SB 00 is generated for the first time and will remain in status Yes until certain driving cycle conditions are fulfilled and no malfunctions are detected. After a certain number of driving cycles without detected malfunction, it returns to status No. That is, if a malfunction becomes intermittent and no longer is detected, the status will change to No. Number of driving cycles required depends on the system.

NOTE: **For emission-related control system, this status identifier is generated to status Yes (Malfunction found and confirmed), first after status identifier SB02 has had status Yes (Malfunction found but not confirmed) for 2 driving cycles in a row with malfunction detected.**

INTRODUCTION

Volvo has developed a wide range of tools and information for easier and faster troubleshooting of the vehicle and its different systems. The range includes service and troubleshooting information, integrated self-diagnostics in control modules, measuring instrument for exhaust analysis, diagnostic tools, etc.

Troubleshooting or diagnostics are performed by the mechanic using two different concepts; Off Board Diagnostics (diagnostics outside the vehicle) or On Board Diagnostics (diagnostics system in the vehicle).

Off Board Diagnostics (diagnostics outside the vehicle) is done *without* help from the control module's self-diagnosis. Examples of these are:

- Breakout box and multimeter to measure signals.
- Mechanic's troubleshooting using hearing, touch, and vision as well as experience.
- Diagnostic tools that are connected in parallel between control module and connector.
- Cylinder leak tester.

On Board Diagnostics (diagnostic systems in the vehicle) *is done using the control module's self-diagnosis* and is read out and presented using a diagnostics tool.

	Off Board Diagnostics	On Board Diagnostics
Advantages	• A few tools to develop compared to functionality/software in all control modules. • Can probably be used for several models.	• Store information about the nature of the malfunction (malfunction frequency, test status, driving conditions), making it possible to troubleshoot intermittent malfunctions. • Require a diagnostic tool to convey information to the mechanic.
Disadvantages	• If the malfunction has disappeared (intermittent), the malfunction will probably not be found.	• Software and its functionality must be in every control module (great quantity). • If a malfunction in the software is detected, many units must be updated.

Fig. 51: Identifying Vehicle Diagnostics
Courtesy of VOLVO CARS CORPORATION

The term **Diagnostics** refers to true recognition and designation of an illness. The term comes from the Greek **dia** = through, and **gnosis** = knowledge. The purpose of a diagnosis is to give a summarized term for the different symptoms that the "sick" describes, and thus be able to give a specific treatment.

The control module in the vehicle includes software to manage intended function (e. g., control all functions of an engine), to monitor the system's components and functions. Monitoring (self-diagnosis) detects any malfunctions, stores these, activates protective actions (back-up modes) and, in some cases, warns the driver.

Monitoring (diagnosis) is always activated when the system is on but tests are started and run according to different pre-defined conditions. A malfunction that is detected is first assessed by monitoring, after, e. g., a certain time, a certain number of driving cycles, certain driving/operation cases or other conditions, the control module decides if it is a real malfunction or not. When monitoring determines that a real malfunction exists, it can be said that the malfunction is confirmed and the malfunction is stored.

The basic goal of self-diagnosis in control modules is to detect and report malfunctions in a control module or its connected components and cables. Part of the goal (found in legal requirements) is also to detect malfunctions that affect emissions as well as malfunctions that may cause subsequent damage to emission-related components.

Self-diagnosis shall also warn for malfunctions that mean a safety risk for drivers, passengers, and vehicles that otherwise would not cause a symptom and thus not be detected. This applies to, e. g., brake system and SRS-system.

Self-diagnosis shall be used by workshops as one of the tools for taking care of the symptom (property/malfunction) that the customer experiences. After the malfunction cause is found (via troubleshooting) and taken care of (via repair), self-diagnosis can also be used to verify that the malfunction cause has been fixed and that the customer's symptom does not exist any longer.

NOTE: **The control module's self-diagnosis (diagnostic trouble code tests) cannot detect all malfunctions that may occur in a vehicle. This primarily applies to mechanical malfunctions but also some electrical malfunctions, e. g., poor connection to battery, or relay spools for a relay are monitored but the**

function/circuit that the relay controls is not monitored.

Unfortunately, sometimes the control module's self-diagnosis can *miss to generate* a diagnostic trouble code for a malfunction where the customer experiences a symptom (malfunction), and sometimes it may generate a diagnostic trouble code despite the customer *not* experiencing any symptom (malfunction). This is because customers have different sensitivity to malfunctions (how easily the symptom is detected) and because it is not always to optimize self-diagnosis for all conditions that may occur during the vehicle's life. That is why you should *not entirely rely* on the vehicle's diagnostic trouble codes.

Diagnostic trouble codes should only be regarded as *indicators* of probably malfunction sources. *If the customer experiences a symptom (malfunction) but diagnostic trouble codes are not stored, this does not mean that the vehicle is trouble-free.*

Worth keeping in mind when troubleshooting:

- When there is so much electronic equipment in the vehicles, it is easy to blame the "complex" electronics and forget the normal basics for, e. g., an engine's function. But the basics are the same today as when we had carburetor engines.
- A common mistake in troubleshooting is to quickly restricting yourself to a certain area without having checked basic functions, e. g., that the ignition system and engine are in good mechanical condition, the battery is fully charged, fuses are intact.
- Troubleshooting information gives very good guidance when troubleshooting and is almost impossible to do without. By using the customer's symptom, developed troubleshooting methods with, e. g., diagnostic trouble code information, you are quickly guided to being able to pin-point the malfunction.

NOTE: The electronic components in the control systems are very reliable and seldom cause any malfunctions.

This document describes the following:

- Background to why self-diagnosis is found in the vehicle.
- Diagnostic services, what they do.
- Using the self-diagnosis.
- Diagnostic versions and its communication method.
- Tools for reading out diagnosis.
- Where I find the information.

PRACTICAL USE OF DIAGNOSTICS

GENERAL

There are several ways to decide if the malfunction is active right now or not as well as when the malfunction occurred:

- **Read off the diagnostic trouble code's counter, status identifier and frozen values.** By interpreting these you can find out when the malfunction was stored, how often the malfunction has occurred (intermittence) and what the driving conditions were when the malfunction was stored.
- **Read off a parameter** for component/system and decide if the value is correct or not. By, e. g., manually affecting the sensor or the switch, you can decide immediately if the parameter (signal) with its circuit is correct.
- **Trigger a component** (activate) and decide if the component/function is affected or not. By triggering, e. g., the relay and listening for its clicking sound or the function which is to be affected, it is possible to decide immediately if the component is correct.
- **Decide if the vehicle shows any symptom (malfunction).** If the vehicle no longer shows the symptom, one may suspect that the malfunction no longer is active.

The following accounts in detail for some of the above.

TO DECIDE THE INTENSITY OF A MALFUNCTION

NOTE: Examples 1-5 (below) are based on counters for diagnostic concept Generic Global Diagnostic (GGD).

When a malfunction is intermittent or has unknown status, the diagnostic trouble code's counter is very useful to decide:

- How many driving cycles that have passed since the malfunction was detected the first time as well as since the malfunction was detected.
- During how many driving cycles that the control module has detected the malfunction during a certain period, as well as how many driving cycles that the control module has not detected the malfunction. That the control module has not detected the malfunction may be due to the control module not having started the test for the malfunction, conditions to detect the malfunction are not fulfilled, or that the malfunction no longer exists.

The purpose of interpreting the counters is that it is possible to understand the malfunction's intensity, that is, show "how much" intermittent the malfunction is, as well as help in assessing if the chances to repeat the malfunction and customer symptom, and then succeed with troubleshooting.

If you read out the diagnostic trouble code information and it shows that the diagnostic trouble code test runs at least once every driving cycle (e. g., when driving), the counters' value may be very important when assessing the diagnostic trouble code's status and actions. However, if start of diagnostic trouble code test and its conditions are difficult to achieve, the counters' values should be considered to be of less importance.

Counters 1 and 3 show driving cycles. Counters 2 and 4 also show driving cycles, but then really a "share" of counters 1 and 3, respectively. In principle, counter 4 shows how many times that the customer should have detected symptoms.

NOTE: ***For systems with diagnostic concept Generic Global Diagnostics (GGD).*** **If many diagnostic trouble codes are stored at the same time, then certain diagnostic trouble codes (the oldest) will have these frozen values/counters erased, this to save memory in the control module. These diagnostic trouble codes will then only have counter 2 left. Note also that counter 2 will also be erased when the memory is full, but often later than when other counters are erased.**

NOTE: ***For system with diagnostic concept Volvo Diagnostics II.*** **If many diagnostic trouble codes are stored at the same time, the control module keeps at least half of the oldest and half of the newest diagnostic trouble codes in the trouble code memory.**

NOTE: **For diagnostic trouble codes where the malfunction is not detected for many driving cycles and where the malfunction is detected again, then frozen values and counter values are written over with new values, that is, the diagnostic trouble code is considered "new".**

Example 1, Intermittent malfunction

Fig. 52: Identifying Intermittent Malfunction Example 1
Courtesy of VOLVO CARS CORPORATION

1. Counter 1 = 5
2. Counter 2 = 2
3. Counter 3 = 25
4. Counter 4 = 10
5. Driving cycles

After the malfunction has been detected for the first time (driving cycle 0) the malfunction has been detected again in 9 of the first 20 driving cycles. Using this, the conclusion can be drawn that in 11 driving cycles the test has not been run or the malfunction has not been found, or a combination of these. After the last time that the malfunction was detected, 5 driving cycles have passed, where the test was run in 2 driving cycles without

detecting a malfunction.

Conclusion: Intermittent malfunction

Assessment: Good possibility to repeat the malfunction and customer symptom, and thus succeed with troubleshooting, as the malfunction has been found quite recently in several driving cycles.

Example 2, Permanent malfunction

Fig. 53: Identifying Permanent Malfunction Example 2
Courtesy of VOLVO CARS CORPORATION

1. Counter 1 = 0
2. Counter 2 = 0
3. Counter 3 = 25
4. Counter 4 = 26
5. Driving cycles

After the malfunction has been detected for the first time the malfunction has been detected again in all following driving cycles.

Conclusion: Permanent malfunction

Assessment: Very good possibility to repeat the customer symptom and thus succeed with troubleshooting, as the malfunction has been found in every driving cycle. Since the malfunction has been detected during the present driving cycle it does not really matter for troubleshooting if the malfunction has been detected in all previous driving cycles or not.

The counter show more how "sure" the malfunction is as well as that it can confirm if the customer experienced the malfunction as the counter indicates.

Example 3, Intermittent malfunction

Fig. 54: Identifying Intermittent Malfunction Example 3
Courtesy of VOLVO CARS CORPORATION

1. Counter 1 = 122
2. Counter 2 = 122
3. Counter 3 = 125
4. Counter 4 = 4
5. Driving cycles

After the malfunction has been detected for the first time the malfunction has been detected again in the 3 following driving cycles. After the last time that the malfunction was detected, 122 driving cycles have passed, where the test has been run in 122 driving cycles without detecting a malfunction.

Conclusion: Intermittent malfunction

Assessment: Not very good chance to repeat the malfunction and the customer symptom and thus succeed with troubleshooting, as the malfunction has only been detected in a few driving cycles a very long time ago.

The less driving cycles a malfunction has been detected in and the greater the number of driving cycles since the malfunction was detected the last time, the more difficult it is expected to be to repeat the malfunction and the customer symptom and thus succeed with troubleshooting.

This can be read off by the lower value is on counter 4 and the higher the value is on counter 1 and 2, as well as the lower the difference is between the value on counter 3 and counter 2, the more difficult it is expected to be to repeat the malfunction and the customer symptom and thus succeed with troubleshooting.

Example 4, Intermittent malfunction

Fig. 55: Identifying Intermittent Malfunction Example 4
Courtesy of VOLVO CARS CORPORATION

1. Counter 1 = 25
2. Counter 2 = 25
3. Counter 3 = 25
4. Counter 4 = 1
5. Driving cycles

After the malfunction has been detected for the first time, the malfunction has never been detected again. After the last time that the malfunction was detected, 25 driving cycles have passed, where the test has run in 25 driving cycles without detecting a malfunction.

Conclusion: Intermittent malfunction

Assessment: Not very good chance to repeat the malfunction and the customer symptom and thus succeed with troubleshooting, as the malfunction has only been detected in one driving cycle quite a long time ago.

Example 5 Unknown status

Fig. 56: Identifying Unknown Status Example 5
Courtesy of VOLVO CARS CORPORATION

1. Counter 1 = 25
2. Counter 2 = 0
3. Counter 3 = 25
4. Counter 4 = 1
5. Driving cycles

After the malfunction has been detected for the first time, the malfunction has never been tested and/or detected. After the last time that the malfunction was detected, 25 driving cycles have passed where the test has not been started. Since the diagnostic trouble code test has not started anymore, it cannot be decided if the malfunction exists or not.

Conclusion: Unknown status

Assessment: Read diagnostic trouble code information and try to achieve condition so that the diagnostic trouble code test is started and run, which makes it possible to detect the malfunction. If the malfunction is detected, chances are very good to repeat the customer symptom, and thus succeed with troubleshooting when the malfunction has been found in the current driving cycle.

If the malfunction was not detected even though conditions are fulfilled, then chances are less good to repeat the customer symptom, and thus succeed with troubleshooting as the malfunction has not been found in the current driving cycle.

TO DECIDE DIAGNOSTIC TROUBLE CODE TEST'S STATUS

By reading out the diagnostic trouble code with associated status identifier, then *status for the diagnostic trouble code test that detects the malfunction and generates the diagnostic trouble code, is obtained.*

Example 1, Permanent malfunction

Status identifier:

	Malfunction found the last time that the diagnostic trouble code test was run during current driving cycle	=	Yes
	Malfunction found at least once during the current driving cycle	=	Yes
	Malfunction found at least once during the current and previous driving cycles	=	Yes
	Malfunction found recently since erasing of diagnostic trouble codes	=	Yes
	Diagnostic trouble code test run at least once since erasing of diagnostic trouble codes	=	Test run
	Malfunction found at least once since erasing of diagnostic trouble codes	=	Yes
	Diagnostic trouble code test run at least once during the current driving cycle	=	Test run

	Request for lit warning light/text message	=	Yes

The diagnostic trouble code test has been run in both current driving cycle and in earlier driving cycles. Malfunction has been detected both in current driving cycle and in previous driving cycle, which indicates that the malfunction is active right now. The control module has requested lighting of the warning light.

Conclusion: Permanent malfunction.

Assessment: Very good chance to repeat the customer symptom and thus succeed with troubleshooting, as the malfunction has been found in current and in previous driving cycle. Since the malfunction has been detected during the present run cycle, it does not really matter for troubleshooting if the malfunction has been detected in all previous driving cycles or not. If this information is supplemented with the counters' values you can decide how "permanent" the malfunction is.

If the vehicle is stationary, e. g., with the ignition on, this means that the test runs directly when the ignition is turned on. This makes it easier to both fins the malfunction and to verify that the malfunction cause has been take care of.

Example 2, Unknown status

Status identifier:

	Malfunction found the last time that the diagnostic trouble code test was run during current driving cycle	=	No
	Malfunction found at least once during the current driving cycle	=	No
	Malfunction found at least once during the current and previous driving cycles	=	Yes
	Malfunction found recently since erasing of diagnostic trouble codes	=	Yes
	Diagnostic trouble code test run at least once since erasing of diagnostic trouble codes	=	Test run
	Malfunction found at least once since erasing of diagnostic trouble codes	=	Yes
	Diagnostic trouble code test run at least once during the current driving cycle	=	Test not run
	Request for lit warning light/text message	=	No

The diagnostic trouble code test has been run in previous run cycles but not in current driving cycle. Malfunction has been detected in previous run cycle, but not in current driving cycle since the test has not started. Warning light is on.

Conclusion: Unknown status

Assessment: Since the test has not started in the current driving cycle it is not possible to decide if the malfunction is "active" right now. First read the diagnostic trouble code information and try to obtain conditions

so that the test is started and run, which enables detection of the malfunction. If the malfunction is detected, chances are very good to repeat the customer symptom, and thus succeed with troubleshooting as the malfunction has been found in the current driving cycle.

If the malfunction was not detected even though conditions are fulfilled, then chances are less good to repeat the customer symptom, and thus succeed with troubleshooting as the malfunction has not been found in the current driving cycle.

TO DECIDE OPERATION CONDITIONS WHEN THE MALFUNCTION WAS DETECTED

Malfunctions in a system may be intermittent. It is important to remember this when troubleshooting a possible malfunction cause. If the malfunction is not in the vehicle when it is in the workshop you can miss a malfunction cause since the values may be correct when troubleshooting takes place. A good indication of when the malfunction first occurred for the first time are the frozen values that can be read out for every diagnostic trouble code.

The frozen values are stored immediately after a malfunction has been detected. Most parameters in the frozen values are the same for all malfunctions and indicate a general condition when a malfunction has been detected, e. g., engine rpm, load, coolant temperature, vehicle speed and battery voltage. Some of them have been selected to give a better understanding of the specific malfunction.

Diagnostic trouble code *ECM-903F Electronic throttle unit, internal malfunction* cam be used as an example of how frozen values can be used.

The first possible source indicated in VIDA is the voltage feed to the electronic throttle unit and then continues by suggesting that you check the battery and charging system. However, the battery's condition when the vehicle is in the workshop does not necessarily show the battery voltage when the malfunction was detected.

Instead, the best information is found in the frozen values, that is, voltage that the Engine control module (ECM) detects when Electronic throttle module (ETM) indicated the malfunction.

However, you should remember that this is not an indication of voltage feed to Electronic throttle module (ETM), it is voltage feed to Engine control module (ECM). If Engine control module (ECM) according to frozen values has had good voltage the battery was okay. Therefore, voltage feed to Electronic throttle module (ETM) should be checked separately.

Frozen values for ECM 903F:

- Condition, heated oxygen sensor control bank 1 = LR: Closed circuit with two sensors
- Condition, heated oxygen sensor control bank 2 = LR: Closed circuit with two sensors
- Calculated load = 4.71%
- Engine temperature = 87 °C
- Fuel adaption, quick adjustment, bank 1 = 15.63%
- Fuel adaption, slow adjustment, bank 1 = -0.78%
- Fuel adaption, quick adjustment, bank 2 = 23.44%
- Fuel adaption, slow adjustment, bank 2 = -0.78%

- Engine speed = 760 rpm
- Vehicle speed = 0 km/h
- Boost pressure = 30%
- Battery voltage = 12.50 V
- Throttle angle, desired value = 14.84%
- Air mass = 23.8 kg/h
- Outside temperature = 33 °C

In this case we assume that the vehicle had low battery voltage in the workshop. However, as can be seen in the frozen values, battery voltage was okay when the malfunction occurred, so this was probably not the cause.

This is an example of how frozen values can be used to increase efficiency of troubleshooting and avoid using too much time for incorrect troubleshooting. This prevents troubleshooting and fixing a malfunction that was not the real cause of the problem that was to be solved.

The odometer reading (km) is sometimes included in frozen values in Engine control module (ECM). This enables a quick comparison with the odometer so that you can assess if the malfunction occurred as part of the troubleshooting and can be ignored. For example, CAN-network-related diagnostic trouble codes are saved when the battery voltage drops during work on the vehicle since passenger compartment lighting and other loads drain the battery.

The frozen values indicate odometer reading in km. If you multiply this value by factor 0.62 you obtain driving distance in miles. Current driving distance in both miles and km can be read out with VIDA (Volvo scan tool).

Keep the following in mind when using frozen values for troubleshooting.

The frozen values to be used with care are those stored for the CAN-net and are related to diagnostic trouble codes for Electronic throttle module (ETM).

If Electronic throttle module (ETM) detects that communication to Engine control module (ECM) is interrupted, then malfunction flags will be generated in Electronic throttle module (ETM). These malfunction flags will be sent to Engine control module (ECM) first when communication on the CAN-net works again.

This means that Engine control module (ECM) will store the diagnostic trouble codes first when Electronic throttle module (ETM) delivers them, which in turn means that it is at this point in time that the frozen values are saved. For Electronic throttle module (ETM) this means that the frozen values will be from a point in time after the malfunction first occurred.

DIFFERENTIAL ELECTRONIC MODULE (DEM) (4T65 AWD; 2005-2006)

DESIGN

see **DESIGN**

DIAGNOSTIC FUNCTIONS

GENERAL

The control module has a built-in diagnostic system, Volvo Diagnostic, which continuously monitors internal functions as well as input and output signals.

DIAGNOSTIC TROUBLE CODES (DTCS)

A diagnostic trouble code (DTC) is stored if the control module detects a fault. Should a fault disappear for any reason after being permanently stored in the control module as a diagnostic trouble code (DTC), the information remains stored in the control module.

READING AND ERASING DIAGNOSTIC TROUBLE CODES (DTCS)

Stored diagnostic trouble codes (DTCs) can be read off and erased using this function.

Diagnostic trouble codes (DTCs) can only be erased once all the diagnostic trouble codes (DTCs) have been read off at least once.

READING OFF INPUT AND OUTPUT SIGNALS

This function can be used to continuously read off the status of the control module's input and output signals.

For further information about parameters, see **DESCRIPTION OF PARAMETERS**

READING OFF THE CONTROL MODULE IDENTIFICATION

VIDA identifies control modules by reading off a number of codes from the control module memory.

The codes contain information about the control module:

- hardware P/N (control module without software)
- hardware serial number (control module without software)
- software P/N
- diagnostic software P/N.

DIFFERENTIAL ELECTRONIC MODULE (DEM) (TF-80SC AWD; 2005-2008)

DESIGN

CONTROL MODULE

Fig. 57: Identifying Differential Electronic Module (DEM)
Courtesy of VOLVO CARS CORPORATION

Differential Electronic Module (DEM) is directly secured onto the clutch unit housing and together with the axial solenoid constitutes one unit. The axial solenoid controls the control valve.

The Differential Electronic Module (DEM) receives signals via the Controller Area Network (CAN)

from:

- Engine Control Module (ECM)
- Central Electronic Module (CEM)
- Brake Control Module (BCM)
- Driver Information Module (DIM).

Conducted by these signals, the Differential Electronic Module (DEM) determines how high the oil pressure to the clutch unit should be. The oil pressure to the clutch driven plates is decisive for how much torque can be transferred to the rear wheels.

Four-wheel drive does not function in the event of a fault in the Differential Electronic Module (DEM).

OIL PRESSURE AND TEMPERATURE SENSOR

Fig. 58: Identifying Oil Pressure And Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

The oil pressure and temperature sensor is fitted close to the axial solenoid in the Differential Electronic Module (DEM) housing. The sensor is flushed with hydraulic oil. The sensor measures the temperature and pressure (measurement range 0 - 4 MPa) of the hydraulic oil. The sensor sends a signal on temperature and pressure to the control module. The control module uses the signal to adapt the function of the system when the temperature of the oil and its subsequent viscosity is changed.

If the temperature of the oil exceeds 105 °C then the clutch is depressurized and four-wheel drive is disconnected. When the temperature falls below 101 °C the clutch is pressurized again. The pressure of the oil is limited to max. 10.3 MPa by the safety valve.

Four-wheel drive does not function in the event of any fault in the temperature sensor, and the function is significantly reduced in the event of a fault in the pressure sensor.

The oil pressure and temperature sensor can be diagnosed.

CONTROL VALVE/AXIAL SOLENOID

Fig. 59: Identifying Control Valve / Axial Solenoid
Courtesy of VOLVO CARS CORPORATION

The control valve/axial solenoid is located in the Differential Electronic Module (DEM) housing.

The control module supplies a variable pulse width modulated (PWM) signal to the axial solenoid. The solenoid changes the position of the control valve in accordance with the control signal. The pressure to the working piston of the clutch driven plates is controlled in this way.

Four-wheel drive does not function in the event of a fault in the control valve/axial solenoid.

The control valve/axial solenoid can be diagnosed.

ELECTRICAL FEED PUMP

Fig. 60: Identifying Electrical Feed Pump
Courtesy of VOLVO CARS CORPORATION

The electrical feed pump is fitted on the clutch unit and is supplied with voltage from the Differential Electronic Module (DEM). When the engine is started and reaches an engine speed of over 400 rpm the electrical feed pump is supplied with voltage from the control module.

The feed pump pumps oil to the axial pistons whose rollers are applied to the cam disc. At the same time oil flows to the working piston so that the play in the disc package is eliminated and the clutch's capacity for rapid

reaction and control is prepared.

Four-wheel drive does not function in the event of a fault in the feed pump.

The feed pump can be diagnosed.

DIAGNOSTIC FUNCTIONS

GENERAL

The control module has an integrated diagnostic system, which continuously monitors its own system as well as the input and output signals.

DIAGNOSTIC TROUBLE CODES (DTC)

If the control module detects a fault then it stores a diagnostic trouble code (DTC). If a fault disappears for any reason after a diagnostic trouble code (DTC) has been permanently stored in the control module then the information on the diagnostic trouble code (DTC) remains in the control module.

READING AND ERASING DIAGNOSTIC TROUBLE CODES (DTC)

Stored diagnostic trouble codes (DTC) can be read off and erased using this function.

NOTE: Diagnostic trouble codes (DTC) can be erased even if all diagnostic trouble codes (DTC) have not been read off at least once.

READING OFF INPUT AND OUTPUT SIGNALS

The status for the control module input and output signals can be continuously read off using this function.

For more information on parameters, see: **DESCRIPTION OF PARAMETERS**

READING OFF THE CONTROL MODULE IDENTIFICATION

The control module can be identified by means of reading off a number of codes.

The codes contain information about the control module:

- hardware P/N (control module without software)
- hardware serial number (control module without software)
- software P/N
- diagnostic software P/N

DOWNLOADING SOFTWARE AND REPLACING THE CONTROL MODULE

New software can be downloaded into the Differential Electronic Module (DEM). When software is ordered the software and hardware of the vehicle are compared with Volvo's central database. If the comparison

corresponds then the software is downloaded into the control module.

If the comparison between the car and Volvo's central database does not correspond, then the database is updated with the vehicle's configuration. When this is complete the software is downloaded.

The control module is fitted on the clutch unit and can be replaced. Control module replacement also involves replacing the control valve/axial solenoid, this is because the control module and control valve/axial solenoid are fitted and calibrated in the factory as one unit.

FUNCTION

ELECTRONIC FUNCTION

Fig. 61: Active On Demand Coupling Electronic Function
Courtesy of VOLVO CARS CORPORATION

1. Oil pressure and temperature sensor
2. Differential Electronic Module (DEM)
3. Control valve/axial solenoid
4. Electrical feed pump

The Differential Electronic Module (DEM) is directly secured onto the clutch unit and together with the axial solenoid and control valve constitutes one unit. Amongst other things the Differential Electronic Module

(DEM) communicates with the Engine Control Module (ECM) and the Brake Control Module (BCM) via the Controller Area Network (CAN). Conducted by the sensor signals, the Differential Electronic Module (DEM) controls the oil pressure to the clutch driven plates by adjusting the axial solenoid. The axial solenoid has variable control over the control valve by means of a pulse width modulated (PWM) signal. The basic pressure in the system is built up by the electrical feed pump. The oil pressure to the clutch driven plates is decisive for how much torque can be transferred to the rear wheels.

NOTE: If the car has dynamic stability and traction control (DSTC), the required stability control is applied before four wheel drive.

Active On demand Coupling (AOC) is equipped with an oil pressure and temperature sensor, which measures the prevailing temperature and pressure in the hydraulic oil. The oil pressure and temperature sensor informs the Differential Electronic Module (DEM) on the temperature and the pressure. If the temperature is too high, above 105 °C, then the four-wheel drive is disconnected to protect the clutch unit from damage. When the temperature falls below 101 °C the clutch unit is reconnected with full functionality.

To protect driveshafts and joints, the Differential Electronic Module (DEM) has functions that reduce the torque that is transferred to the rear wheels in certain situations.

"Trailer detection" is an example of one of these functions. This function is based means that if a trailer is coupled to the vehicle and the driving conditions are such that the front wheels slip on the surface, the Differential Electronic Module (DEM) will transfer less torque to the rear wheels than it would have done without a trailer.

This results in most of the torque remaining on the front wheels, which protects the rear wheel driveshafts and drive joints from extreme loads.

MECHANICAL FUNCTION, OVERVIEW

Fig. 62: Active On Demand Coupling Mechanical Function Overview

6. Input shaft
7. Cam disc
8. Housing for outer clutch driven plates
9. Outer clutch driven plates
10. Inner clutch driven plates
11. Compression springs
12. Output shaft

The engine torque is transferred to the propeller shaft via the transmission. The input shaft is separated from the output shaft. The disc package must be applied to transfer torque to the rear axle. Inner and outer wet clutch plates are the power transmission points between the input and output shafts.

The cam disc, which is sine shaped, rotates at the same speed as the propeller shaft. The axial piston rollers run

on the cam disc's roller coaster and press the axial piston in and out, which creates an oil pressure which acts on the working piston, which in turn applies the disc package.

HYDRAULIC FUNCTION, OVERVIEW

10. Oil strainer
11. Electrical feed pump
12. Oil filter
13. Suction valves

14. Piston pump
15. Working piston
16. Wet disc package
17. Bearings
18. Compression springs

Active On demand Coupling (AOC) can be explained as a hydraulic pump.

The basic pressure in the system is built up by the electrical feed pump. This way the axial pistons are pressurized with oil so that they are pressed against the cam disc via the rollers. The axial piston builds up a working pressure which is conducted to the working piston via the pressure valves. This pressure creates a fixed connection between the input and output shafts. The maximum pressure is limited by the pressure limiting valve. The difference in speed between the input and output shafts is proportional in accordance with the oil pressure to the axial pistons. A large difference in speed between the input and output shafts provides high oil pressure to the axial pistons. The same speed on the input and output shafts provides lower oil pressure to the axial pistons. The oil pressure on the clutch driven plates is controlled by the control valve. The axial solenoid controls the control valve. A closed control valve provides maximum pressure to the clutch driven plates, which provides maximum power transmission. An open control valve provides minimum pressure to the clutch driven plates, which provides a limited power transmission.

The accumulator maintains the basic pressure in the system. The oil filter keeps the oil free from dirt and small particles which can damage the system.

PRETENSIONING

The function of the four-wheel drive system is based in there being a difference in speed between front and rear wheels. This difference in speed can affect traction performance in certain driving situations. The role of the pretensioning function is to improve traction performance, primarily in starting off from being stationary, without affecting other properties of the system to achieve this.

The pretensioning function is obtained by means of the feed pump building up a basic pressure. A pretensioning of the clutch unit is generated by means of this increase in pressure, and the engine torque can be transferred to both rear and front wheels. The pretensioning functionality is controlled by software so that activation only takes place when necessary.

SYSTEM OVERVIEW

ACTIVE ON DEMAND COUPLING (AOC)

Fig. 64: Active On Demand Coupling (AOC)
Courtesy of VOLVO CARS CORPORATION

The most important function of Active On demand Coupling (AOC) and its Differential Electronic Module (DEM) is to control the four-wheel drive function, i. e. power distribution between front and rear axles. The system consists of a clutch assembly with a mechanical, hydraulic and electronic section. The clutch unit is located on the rear axle, between the final drive and the propeller shaft. The mechanical section is driven by the propeller shaft. The hydraulic section is driven by the difference in speed arising between propeller shaft rotation and rear axle rotation.

Active On demand Coupling (AOC) enables the following characteristics:

- Permanent four-wheel drive with electronic control of transferred torque.
- A driving character equivalent to front-wheel drive.
- Rapid reactions.
- No opposing forces when maneuvering or parking.
- The system is not so sensitive to differences between the tires, e. g. when driving with the spare wheel.
- Not sensitive to towing with an axle lifted.
- Not sensitive to brake testing on a chassis dynamometer.

CLUTCH UNIT AND CONTROL MODULE

Fig. 65: Coupling Unit And Control Module
Courtesy of VOLVO CARS CORPORATION

The hydraulic section consists of 1-5, the mechanical consists of 6-10 and the electronic section consists of 11-13:

1. Pressure valves
2. Accumulator
3. Oil filter
4. Ring pistons
5. Control valve/axial solenoid
6. Input shaft
7. Inner and outer wet clutch plates
8. Inner clutch hub with sine shape cam disc
9. Rollers with ring pistons
10. Output shaft
11. Electrical feed pump

12. Differential Electronic Module (DEM)
13. Oil pressure and temperature sensor

The Differential Electronic Module (DEM) is fitted on the clutch unit housing.

The Differential Electronic Module (DEM) communicates with other control modules via Controller Area Network (CAN) communication:

The control module has an integrated diagnostic system.

SIGNALS

The table below summarizes input and output signals to and from the Differential Electronic Module (DEM). The illustration below displays the same information with the Volvo component designations.

Input signals	Output signals
Directly connected: • **Oil pressure and temperature sensor**	**Directly connected:** (supply voltage unless otherwise specified) • **Electrical feed pump** • **Axial solenoid** - pulse width modulated (PWM) signal
Via Controller Area Network (CAN) communication: • **Central Electronic Module (CEM)** (4/56), informs on the position of the ignition key and reverse gear status amongst other things. • **Brake Control Module (BCM)** (4/16), informs on the speed of the wheels from the wheel speed sensors and ABS modulation status amongst other things. • **Driver Information Module (DIM)** (5/1), informs on parking brake switch status. • **Engine Control Module (ECM)** (4/46), informs on engine speed, driver engine torque request, calculated engine torque, accelerator pedal position, stop lamp switch status and clutch pedal switch status, amongst other things.	**Via Controller Area Network (CAN) communication:** • **Brake Control Module (BCM)** (4/16), receives information on clutch unit status and torque transferred to the rear axle. • **Central Electronic Module (CEM)** (4/56), receives information on the diagnostic status of the Differential Electronic Module (DEM).

Fig. 66: Differential Electronic Module (DEM) Network
Courtesy of VOLVO CARS CORPORATION

DIFFERENTIAL ELECTRONIC MODULE (DEM) (TF-80SC AWD; 2009-2012)

DESIGN

CONTROL MODULE

Fig. 67: Differential Electronic Module (DEM)
Courtesy of VOLVO CARS CORPORATION

The differential electronic module (DEM) is secured directly to the coupling unit's housing and makes up unit with the pressure reducing valve. The control module and the pressure reducing valve are calibrated together at the factory and can therefore only be replaced together.

Via the controller area network (CAN), the differential electronic module (DEM) receives signals from:

- engine control module (ECM).
- central electronic module (CEM)
- brake system control module (BCM)
- driver information module (DIM).

Conducted by these signals, the Differential Electronic Module (DEM) determines how high the oil pressure to the clutch unit should be. The oil pressure to the clutch driven plates is decisive for how much torque can be transferred to the rear wheels.

In case of Differential electronic module (DEM) failure, four-wheel drive may be reduced or lost completely.

PRESSURE REDUCING VALVE

Fig. 68: View of Pressure Reducing Valve
Courtesy of VOLVO CARS CORPORATION

The pressure reducing valve is located in the Differential electronic module (DEM).

The pressure reducing valve receives a constant pulse width modulated (PWM) signal from the control module. The control signal from the control module changes the position of the pressure reducing valve. This regulates the pressure to the discs' operating piston.

In case of diagnostics failure of the pressure reducing valve, four-wheel drive is lost.

The pressure reducing valve can be diagnosed.

ELECTRICAL FEED PUMP.

Fig. 69: View of Electrical Feed Pump
Courtesy of VOLVO CARS CORPORATION

The electric feed pump is located on the clutch unit and is supplied with voltage from the Differential electronic module (DEM).

The pump starts at ignition on and then works up a max. oil pressure of 35 bar. This is to always enable request for full torque. Then the pump is shut off until the pressure has dropped to 50%, then it starts again. If the pump does not reach max. pressure within 15 seconds, it is shut off and is then started again. This is calculated via a current measuring algorithm in the Differential electronic module (DEM). The pump works in intervals so that it is not damaged in case of a malfunction, e. g., leakage, in the system. The time interval that the pump works between depends on the temperature. At normal room temperature the pump runs at approx. 20-30 second intervals.

Four-wheel drive does not function in the event of a fault in the feed pump.

The feed pump can be diagnosed.

OIL FILTER WITH NON-RETURN VALVE

Fig. 70: View of Oil Filter With Non-Return Valve
Courtesy of VOLVO CARS CORPORATION

The hydraulic oil is pumped to the accumulator tank via an oil filter. The oil filter keeps the oil free from dirt

and small particles that can damage the system. There is a non-return valve installed in the oil filter.

In case of oil filter malfunction, a trouble code may be generated.

The oil filter can be diagnosed

DIAGNOSTIC FUNCTIONS

GENERAL

The control module has an integrated diagnostic system, which continuously monitors its own system as well as the input and output signals.

DIAGNOSTIC TROUBLE CODES (DTCS)

If the control module detects a fault then it stores a diagnostic trouble code. If a fault disappears for any reason after a diagnostic trouble code has been permanently stored in the control module then the information on the diagnostic trouble code remains in the control module in a number of driving cycles that can be calibrated.

READING AND ERASING DIAGNOSTIC TROUBLE CODES (DTCS)

Stored diagnostic trouble codes (DTCs) can be read off and erased using this function.

NOTE: Diagnostic trouble codes (DTCs) can be erased without having been read off.

READING OFF INPUT AND OUTPUT SIGNALS

This function can be used to continuously read off the status of the control module's input and output signals.

READING OFF THE CONTROL MODULE IDENTIFICATION

The control module can be identified by means of reading off a number of codes.

The codes contain information about the control module:

- hardware P/N (control module without software)
- hardware serial number (control module without software)
- software P/N
- diagnostic software P/N.

DOWNLOADING SOFTWARE AND REPLACING THE CONTROL MODULE

New software can be downloaded into the Differential Electronic Module (DEM). When software is ordered the software and hardware of the vehicle are compared with Volvo's central database. If the comparison corresponds then the software is downloaded into the control module.

If the comparison between the car and Volvo's central database does not correspond, then the database is

updated with the vehicle's configuration. When this is complete the software is downloaded.

The control module is fitted on the clutch unit and can be replaced. Control module replacement also involves replacing the pressure reducing valve, this is because the control module and pressure reducing valve are installed and calibrated in the factory as one unit.

FUNCTION

ELECTRONIC HYDRAULIC FUNCTION

Fig. 71: Electronic Hydraulic Schematic
Courtesy of VOLVO CARS CORPORATION

1. Differential electronic module (DEM)
2. Electrical feed pump.
3. Oil filter with non-return valve
4. Pressure reducing valve (installed on Differential electronic module (DEM))
5. Disc pack
6. Accumulator tank

Differential electronic module (DEM) is mounted directly on the clutch unit and makes up a unit together with the pressure reducing valve.

Differential electronic module (DEM) communicates with, among others, Engine control module (ECM) and Brake control module (BCM) via the CAN-net. With guidance of the sensor signals, Differential Electronic Module (DEM) controls the oil pressure to the discs through the pressure reducing valve.

The pressure reducing valve is controlled endlessly by a pulse-width modulated (PWM)-signal.

The electric feed pump starts at ignition on and immediately works up a maximal hydraulic pressure in the accumulator. When max. pressure has been reached, the feed pump shuts off until the pressure has dropped below 50% again. Then the feed pump starts again and builds up the max. pressure.

This procedure is calculated by Differential electronic module (DEM) using various parameters. In the accumulator the pressurized oil is routed to the clutch via the pressure reducing valve. Differential electronic module (DEM) controls the valve so that correct working pressure is obtained, 0-27.5 bar. The oil pressure to the discs is decisive to how much torque can be transmitted to the rear wheels.

MECHANICAL FUNCTION, OVERVIEW

Fig. 72: Cutaway View
Courtesy of VOLVO CARS CORPORATION

1. Output shaft.
2. Input shaft
3. Inner and outer wet clutch plates

4. Operating piston

The transmission and bevel gear transfers engine torque to the propeller shaft. The input shaft is joined to the clutch's output shaft via the multi-plate clutch pack. The multi-plate clutch in the coupling must be engaged to transfer torque to the rear axle. The inner and outer wet multi-plate clutch are the transfer point between the input and output shafts.

The feed pump builds up an oil pressure which then Differential electronic module (DEM) controls via the pressure reducing valve, so that correct pressure is obtained. Then the working piston is applied against the disc pack so that the clearance is eliminated and the clutch is prepared to enable quick reaction and control. At 27.5 bar deployed pressure from the pressure reducing valve max. torque is reached, 1, 500 Nm, through the clutch to the rear wheels already at start.

SYSTEM OVERVIEW

POWER TRANSMISSION

Fig. 73: Power Transmission Overview
Courtesy of VOLVO CARS CORPORATION

1. **Bevel gear:** Transmits torque from transmission to propeller shaft. Always rotates at the same rate as the front wheel pair.
2. **Propeller shaft:** Transmits torque from front axle (bevel gear) to rear axle. Always rotates at the same

rate as the front wheel pair.

3. **Active On demand Coupling (AOC):** At four-wheel drive, the AOC transmits torque from the propeller shaft to the rear wheel pair. Rotates at four-wheel drive.
4. **Differential gear:** Transmits the force to the rear wheel pairs. Rotates at the same rate as the front wheels at four-wheel drive.

ACTIVE ON DEMAND COUPLING (AOC)

Fig. 74: View of Active On Demand Coupling (AOC)
Courtesy of VOLVO CARS CORPORATION

Active On demand Coupling (AOC) and its Differential electronic module (DEM), has as its most important function to control the function for four-wheel drive, that is, power distribution between front and rear axle.

The system consists of an integrated clutch with a mechanical, a hydraulic, and an electronic part.

The clutch unit is located on the rear axle, between the final drive and the propeller shaft. The mechanical part is driven by the propeller shaft. The hydraulic part is driven by an electric pump.

Active On demand Coupling (AOC) generation 4 enables the following characteristics:

- Continuous control of four wheel drive, with electronic control of torque transfer.
- Rapid reactions
- No opposing forces when maneuvering or parking.
- Improved stability.
- Reduction of oversteering/understeering.
- Permanent capacity for four-wheel drive.

CLUTCH UNIT AND CONTROL MODULE

Fig. 75: Cutaway View of Clutch Unit And Control Module
Courtesy of VOLVO CARS CORPORATION

1. Accumulator
2. Oil filter
3. Pressure reducing valve
4. Inner and outer wet clutch plates
5. Inner connection hub with splines for output shaft. The hub has a sinusoidal cam curve
6. Input shaft
7. Electrical feed pump.
8. Differential electronic module (DEM)
9. Non-return valve
10. Annular piston

The Differential Electronic Module (DEM) is fitted on the clutch unit housing.

The Differential Electronic Module (DEM) communicates with other control modules via Controller Area Network (CAN) communication:

The control module has integrated diagnostics for its own components and functions.

SIGNALS

The table below summarizes input and output signals to and from the Differential Electronic Module (DEM). The illustration below displays the same information with the Volvo component designations.

Input signals	Output signals
Directly connected: -	**Directly connected:** (power supply unless otherwise stated) • **Electric feed pump** (internal in AOC) - pulse-width modulated (PWM) signal • **Pressure reducing valve** (internal in AOC) - pulse-width modulated (PWM) signal
Via Controller Area Network (CAN) communication: • **central electronic module (CEM)** (4/56), provides the status of, among other things, the ignition position and the back-up (reverse) gear. • **Brake Control Module (BCM)** (4/16), informs on the speed of the wheels from the wheel speed sensors and ABS modulation status amongst other things. • **Driver Information Module (DIM)** (5/1), informs on parking brake switch status. • **Engine Control Module (ECM)** (4/46), informs on engine speed, driver engine torque request, calculated engine torque, accelerator pedal position, stop lamp switch status and clutch pedal switch status, amongst other things. • **Trailer module (TRM)** (4/110), provides information about whether a trailer is connected to the vehicle or not.	**Via Controller Area Network (CAN) communication:** • **Brake control module (BCM)** (4/16), receives information about the status of the coupling unit and current torque capacity for the rear axle. • **Central Electronic Module (CEM)** (4/56), receives information on the diagnostic status of the Differential Electronic Module (DEM). • **Driver information module (DIM)** (5/1), via Central electronic module (CEM) receives information about malfunction messages from Differential electronic module (DEM). These are shown to the driver as text messages and warning symbols.

Fig. 76: Network Diagram

DRIVER DOOR MODULE (DDM) AND PASSENGER DOOR MODULE (PDM) (2003-2012)

DESIGN

THE DOOR LOCK

The passenger door module (PDM) and driver door module (DDM) have diagnostics for the front door locks.

THE POWER WINDOW MECHANISM

Fig. 77: Identifying Power Window Mechanism
Courtesy of VOLVO CARS CORPORATION

The window lift mechanism on the driver's side is operated via the driver door module (DDM). The window lift mechanism on the passenger side is operated either via the passenger door module (PDM) or via the driver door module (DDM).

The window lift mechanisms in both rear doors can be operated via the driver door module (DDM). The window lift mechanisms in the front and rear doors can be operated when the ignition key is in position I or II. The power windows can be operated from when the ignition is switched off until one of the front doors is opened.

The driver door module (DDM) has four spring loaded switches which operate the individual front and rear windows.

The passenger door module (PDM) has a spring loaded switch which operates the window in the front passenger door. The switches in the driver door module (DDM) which control the rear windows can only be activated up or down. The rear windows move up or down for as long as the switch is activated.

The switches for the front windows have five positions which control the position of the window:

0) Normal position where the function is passive.

1) step 1 upwards, raises the window for as long as the button is activated.

2) step 2 upwards, automatically fully closes the window (AUTO-UP).

-1) step 1 downwards, lowers the window for as long as the button is activated.

-2) step 2 downwards, fully opens the window automatically (AUTO-DOWN).

The rear windows are powered via the central electronic module (CEM). However they can be disabled using a child lock switch on the driver door module (DDM). When the child lock is activated, the rear windows cannot be operated from the rear seats. They can still be operated however from the driver door module (DDM).

The front window lift mechanisms have a Hall sensor which measures the rotation speed of each lift mechanism, allowing them to determine the position of the window. If a Hall sensor is not functioning in one of the window lift mechanisms, the AUTO-UP or AUTO-DOWN function for that window is not available. The power window lift mechanism, power window lift motor and Hall sensor form one unit and cannot be replaced separately.

The window lift mechanisms in the front doors have an inbuilt function to prevent trapping. When AUTO-UP is activated, the window lift mechanism detects whether there is any resistance, i. e. whether too much force is required to close the window. If so, the window stops and then lowers slightly. The anti-trapping system is active during AUTO-UP if the window is open more than 3 mm.

A diagnostic trouble code (DTC) is stored if for any reason the power window mechanism is unable to determine the window position. If this should happen, the power window mechanism must be re-initialized. This is carried out via a diagnostic function in VIDA (Volvo scan tool).

The passenger door module (PDM) and driver door module (DDM) have diagnostics for the window lift mechanisms and Hall sensors in the front doors.

DOOR MIRROR

Fig. 78: Door Mirror
Courtesy of VOLVO CARS CORPORATION

Motors

The motors for the door mirrors are operated via the driver door module (DDM).

The mirrors can be adjusted in the X and Y axes via the two motors for each mirror. Two buttons on the driver door module (DDM), marked L and R, are used to select either the right or left-hand mirror for adjustment. An LED lights in the button that is activated. Only one button can be activated at any one time (left or right). X and Y axis adjustment is made using a control which maneuvers the mirror in the selected direction for as long as the button is pressed (or until the mirror reaches a limit position). To deactivate the adjustment control, press the

left or right-hand button again so that the LEDs are off. The mirrors can be adjusted when the ignition key is in position I or II.

Power seats with memories for the door mirrors are optional equipment. This function requires that the position of the mirrors is saved when the car is locked. Two sensors in each mirror register the mirror position in the X and Y axes. This function has been available as an option since structure week 199950.

The door windows can be equipped as an option with a motor that allows the mirror housing to be folded in. The driver door module (DDM) and passenger door module (PDM) have diagnostics for the motor for folding in the door mirrors. However the activation signal is transmitted by the climate control module (CCM).

The motors and sensors used to set the position of the door mirrors form one unit and cannot be replaced separately.

Heating

The door mirrors contain a heating loop to defrost the glass. The heating loop is on the reverse of the mirror glass. In the event of a fault, the entire mirror glass must be replaced. The heating loops are supplied with power and ground by the driver door module (DDM) and passenger door module (PDM), which also have diagnostics for the loops. However the function is activated by the climate control module (CCM).

Lights in the door mirrors

As an option, the door mirrors can be equipped with lights. The lights are mounted on the underneath of the mirror housing. The driver door module (DDM) and passenger door module (PDM) have diagnostics for the outputs for the lights. However the function is activated by the upper electronic module (UEM) and the remote control.

Outside temperature

In the right-hand mirror there is a temperature sensor which measures the outside temperature. This temperature data is used by the combined instrument panel.

NOTE: This temperature sensor must not be confused with the temperature sensor in the left-hand mirror housing which is used by the engine control module (ECM).

The temperature sensor in the right-hand mirror housing can be replaced separately. The passenger door module (PDM) has diagnostics for the temperature sensor.

DOOR OPEN WARNING LAMP

Fig. 79: Door Open Warning Lamp
Courtesy of VOLVO CARS CORPORATION

There is a door open warning lamp in each front door which lights when the door is opened. The lamps are supplied with power via the driver door module (DDM) and passenger door module (PDM).

Since structure week 199950 door open warning lamps are no longer installed.

The driver door module (DDM) and passenger door module (PDM) have diagnostics for the door open warning lamps.

DIAGNOSTIC FUNCTIONS

DRIVER'S DOOR MODULE

See **DIAGNOSTIC FUNCTIONS, DRIVER'S DOOR MODULE (DDM)**.

PASSENGER DOOR MODULE (PDM)

See **DIAGNOSTIC FUNCTIONS, PASSENGER DOOR MODULE (PDM)**.

DIAGNOSTIC FUNCTIONS, PASSENGER DOOR MODULE (PDM)

GENERAL

The control module has a built-in diagnostic system, Volvo Diagnostic, which continuously monitors internal functions as well as input and output signals.

DIAGNOSTIC TROUBLE CODES (DTCS)

A diagnostic trouble code (DTC) is stored if the control module detects a fault. The passenger door module can store up to 10 diagnostic trouble codes (DTCs).

Should a fault disappear for any reason after being permanently stored in the control module as a diagnostic trouble code (DTC), the information remains stored in the control module.

READING AND ERASING DIAGNOSTIC TROUBLE CODES (DTCS)

Diagnostic trouble codes (DTCs) can only be erased once all the diagnostic trouble codes (DTCs) have been read off at least once.

READING OFF INPUT AND OUTPUT SIGNALS

This function can be used to continuously read off the values and status of the control module's input and output signals.

The key must not be in the ignition when reading off the status of the door mirror lamp.

Lock cable M1, status, is active while locking the central locking

Lock cable M2, status, is active while unlocking the central locking and / or deadlocks

Lock cable M3, status, is active while locking the deadlocks

The following parameters can be read off:

- The status of the front passenger window up-control
- The status of the front passenger window down-control
- The status of the front passenger window auto-control
- The status of the up-motor for the power window
- The status of the down-motor for the power window
- Lock cable M1, status
- Lock cable M2, status
- Lock cable M3, status
- The status of the door open warning lamp (does not apply to all cars)
- The status of the control for the door mirror
- Defroster, status
- Door mirror lamp, status
- Outside temperature, value

NOTE: The outside temperature can only be read off from the control module on the right-hand side of the car.

- Power supply, value
- Signal supply, value
- Door mirror position X axis, value (does not apply to all cars)
- Door mirror position Y axis, value (does not apply to all cars).

ACTIVATING COMPONENTS AND FUNCTIONS

Use this option to activate components / functions in the passenger door module.

The following components / parameters can be activated in alternative ways:

- The up / down control for the front passenger window
- Power window motor, up / down
- Lock cable M1
- Lock cable M2
- Door mirror motor
- Defroster
- Door mirror lamp
- Door open warning lamp (does not apply to all cars).

READING OFF AND PROGRAMMING DATA

With this option it is possible to read programmed data and to program in data.

NOTE: If the control module has been replaced, the position of the windows must be initiated using a diagnostic function. A window must be in its uppermost position before it can be initiated.

No customer related programming is available in the control module.

READING OFF THE CONTROL MODULE IDENTIFICATION

The diagnostic tool identifies control modules by reading off a number of codes from the control module memory.

The codes contain information about the control module:

- hardware P/N (control module without software)
- hardware serial number (control module without software)
- software P/N
- diagnostic software P/N.

DIAGNOSTIC FUNCTIONS, DRIVER'S DOOR MODULE (DDM)

GENERAL

The control module has a built-in diagnostic system, Volvo Diagnostic, which continuously monitors internal functions as well as input and output signals.

DIAGNOSTIC TROUBLE CODES (DTCS)

The control module will store a diagnostic trouble code (DTC) if it detects a fault. The driver's door module can

store up to 10 diagnostic trouble codes (DTCs).

Should a fault disappear for any reason after being permanently stored in the control module as a diagnostic trouble code (DTC), the information remains stored in the control module.

READING AND ERASING DIAGNOSTIC TROUBLE CODES (DTCS)

Diagnostic trouble codes (DTCs) can only be erased once all the diagnostic trouble codes (DTCs) have been read off at least once.

READING OFF INPUT AND OUTPUT SIGNALS

This function can be used to continuously read off the values and status of the control module's input and output signals.

The key must not be in the ignition when reading off the status of the door mirror lamp.

Lock cable M1, status, is active while locking the central locking

Lock cable M2, status, is active while unlocking the central locking and / or deadlocks

Lock cable M3, status, is active while locking the deadlocks

The following parameters can be read off:

- The status of the front left window up-control
- The status of the front left window down-control
- The status of the front left window auto-control
- The status of the front right window up-control
- The status of the front right window down-control
- The status of the front right window auto-control
- The status of the rear left window up-control
- The status of the rear left window down-control
- The status of the rear right window up-control
- The status of the rear right window down-control
- The status of the child safety button

NOTE: A diagnostic trouble code (DTC) is stored if the child safety button is activated for 10 seconds.

- The status of the selection of control for the left door mirror
- The status of the selection of control for the right door mirror
- The status of the upward control for the door mirror
- The status of the downward control for the door mirror

- The status of the control for the left door mirror
- The status of the control for the right door mirror
- The status of the up-motor for the power window
- The status of the down-motor for the power window
- Lock cable M1, status
- Lock cable M2, status
- Lock cable M3, status
- The status of the door open warning lamp (does not apply to all cars)
- Defroster, status
- Door mirror lamp, status
- Outside temperature, value

NOTE: The outside temperature can only be read off from the control module on the right-hand side of the car.

- Power supply, value
- Signal supply, value
- Door mirror position X axis, value (does not apply to all cars)
- Door mirror position Y axis, value (does not apply to all cars).

ACTIVATING COMPONENTS AND FUNCTIONS

Use this option to activate components / functions in the driver's door module.

The following components / parameters can be activated in alternative ways:

- The up / down control for the front left window
- The up / down control for the front right window
- The up / down control for the rear windows
- The selection of the left or right door mirror control
- Upwards / downwards / left / right door mirror control
- Power window motor, up / down
- Lock cable M1
- Lock cable M2
- Door mirror motor
- Defroster
- Door mirror lamp
- Door open warning lamp (does not apply to all cars).

READING OFF AND PROGRAMMING DATA

With this option it is possible to read programmed data and to program in data.

NOTE: **If the control module has been replaced, the position of the windows must be initiated using a diagnostic function. A window must be in its uppermost position before it can be initiated.**

No customer related programming is available in the control module.

READING OFF THE CONTROL MODULE IDENTIFICATION

The diagnostic tool identifies control modules by reading off a number of codes from the control module memory.

The codes contain information about the control module:

- hardware P/N (control module without software)
- hardware serial number (control module without software)
- software P/N
- diagnostic software P/N.

DOWNLOADING SOFTWARE AND REPLACING THE CONTROL MODULE

New software can be downloaded into the driver door module (DDM) and passenger door module (PDM). When ordering software, the hardware and the software in the car is compared to the data in the Volvo central database. If the comparison is OK the software is downloaded to the control module.

If the comparison between the car and Volvo central database is not OK, the database is updated with the car configuration. When this is complete the software is downloaded.

The window positions must be re-initialized after the driver door module (DDM) or passenger door module (PDM) is replaced. This is so that the new control module stores the closed position of the window. Initialization is carried out using VIDA (Volvo scan tool).

If the car has power seats with memory for the door mirrors, this function can be switched off. This means that the personal settings for the door mirrors, based on the remote control used to unlock the door, can be deactivated. Deactivation is carried out using VIDA (Volvo scan tool). This function can be switched off on cars from model year 2003. This setting will be stored in the control module after deactivation, but not in the Volvo Central Database. This means that the deactivation must be repeated when hardware is replaced.

FUNCTION

OPERATING WINDOWS

Fig. 80: Identifying Window Control Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

Window control is activated via switches on the driver door module (DDM) (3/126) and passenger door module (PDM) (3/127). The motor for the power window on the driver's side (6/58) is controlled directly from the driver door module (DDM). The motor for the power window on the passenger side (6/60) is controlled via CAN communication from the driver door module (DDM) to the passenger door module (PDM). The signals for operating the rear windows are transmitted from the driver door module (DDM) via the controller area network (CAN) to the central electronic module (CEM) (4/56), which manages the rear window functions.

The passenger door module (PDM) only operates the front window on the passenger side. The signal for operating the front passenger window is transmitted from the passenger door module (PDM) to the window lift mechanism motor on the passenger side (6/60).

If the child lock is activated from the driver door module (DDM), the rear windows cannot be operated from the rear seat. When the child lock switch is activated, a signal is transmitted from the driver door module (DDM) on the controller area network (CAN) to the central electronic module (CEM) which disables rear window operation.

FUNCTIONS IN THE DOOR MIRRORS

The functions in the door mirrors (6/62 left) (6/63 right) which are controlled from the driver door module (DDM) (3/126) or passenger door module (PDM) (3/127) are: mirror position adjustment, folding in the mirrors, mirror heating, local lighting/guide lighting, and temperature measurement.

Adjusting the mirror position

Fig. 81: Identifying Mirror Position Adjusting Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The position of the mirror is controlled using buttons on the driver door module (DDM) (3/126). The driver door module (DDM) transmits a signal directly to the mirror on the driver's side (6/62). When adjusting the mirror on the passenger side (6/63), a signal is transmitted from the driver door module (DDM) to the passenger door module (PDM) (3/127) on the Controller area network (CAN).

If the car has power seats with memory for the door mirrors, the position of the mirrors is stored by two potentiometers. The signal indicating the position in the X and Y axes is received by the driver door module (DDM) and passenger door module (PDM). When one of the buttons on the control unit for the power seat is activated, a signal is transmitted from the power seat module (PSM) (4/52) to the driver door module (DDM) and passenger door module (PDM). This adjusts the door mirrors to the stored position. The stored position can also be set according to which remote control is used to unlock the car.

Folding in the door mirrors

Fig. 82: Door Mirrors Folding Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

Mirror folding is activated via the switch for folding door mirrors (3/171), which is on the climate control module (CCM) (3/112). A signal is transmitted via the Controller area network (CAN) to the driver door module (DDM) (3/126) and passenger door module (PDM) (3/127). These in turn send the signal on to each door mirror (6/62 and 6/63), which fold each mirror in or out. There is a delay between the button being pressed and the door mirrors folding in or out.

Heating the mirrors

Fig. 83: Identifying Mirrors Input Heating And Output Signals
Courtesy of VOLVO CARS CORPORATION

Mirror heating is activated at the same time as the rear windshield defroster. When the switch for rear demist/mirror demist (3/8) is pressed, the climate control module (CCM) (3/112) transmits a signal to the central electronic module (CEM) (4/56). The central electronic module (CEM) activates the rear demist and transmits a signal to the driver door module (DDM) (3/126) and passenger door module (PDM) (3/127) to activate mirror heating. When the driver door module (DDM) and passenger door module (PDM) receive the signal, the outputs for each door mirror are powered (6/62 and 6/63). The function is switch off at the same time as the rear demist. This can happen in three different ways:

- If the switch for rear demist/mirror demist is pressed again after activation the function is switched off, using a signal from the central electronic module (CEM)
- The heating switches off automatically 12 minutes after activation. The driver door module (DDM) and passenger door module (PDM) then receive a signal from the central electronic module (CEM) requesting that the function be deactivated
- The heating is also switched off if the ignition is switched off.

Local lighting/Guide lighting

Fig. 84: Identifying Local Lighting / Guide Lighting Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The local lighting is activated using the remote control for the car. The function can only be activated when the ignition is off. When the yellow button on the remote control is pressed, the upper electronic module (UEM) (4/70) receives an activation signal which is sent onwards on the Controller area network (CAN). The driver door module (DDM) (3/126) and passenger door module (PDM) (3/127) receive the signal and switch on the lighting for the left door mirror (10/148) and the lighting for the right door mirror (10/149). The function is deactivated by pressing the button on the remote control again. A signal is then sent from the upper electronic module (UEM) to the driver door module (DDM) and passenger door module (PDM) requesting that the function is switched off. The function is also switched off when the ignition is switched on.

The guide lighting is activated using the left-hand control stalk (the key must be removed from the ignition switch). The steering wheel module (SWM) (3/130) then transmits a signal via the controller area network (CAN) to the central electronic module (CEM) (4/56). When the car is then locked, the central electronic module (CEM) sends a signal onwards via the controller area network to the driver door module (DDM) (3/126) and passenger door module (PDM) (3/127), which turn on the lights in the door mirrors (10/148 and 10/149). The lights are part of the guide lighting function and remain on for a set time (30, 60 or 90 seconds).

Measuring the outside temperature

Fig. 85: Identifying Outside Temperature Measuring Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The outside temperature is continuously measured (in ignition positions I and II) by the outside temperature sensor (7/11), which is always in the right-hand door mirror. The analog signal is received by the passenger door module. The signal is converted to a digital signal. This signal is then transmitted on the controller area network (CAN) and used by the central electronic module (CEM) (4/56), which sends the signal on to the driver information module (DIM) (5/1).

DOOR OPEN WARNING LAMP

Fig. 86: Door Open Warning Lamp Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The door open warning lamp function is on cars from between structure weeks 199820 and 199950. The function utilizes the signal transmitted by the central electronic module (CEM) (4/56) on the controller area network (CAN) when a door is opened. The signal is received by the driver door module (DDM) and passenger door module (PDM). The door open warning lamp is then lit in the left (10/60) and right-hand (10/61) front doors. When the door is closed, the central electronic module (CEM) transmits a new signal on the controller area network (CAN). The signal is received by the driver door module (DDM) and passenger door module (PDM) which turns off the relevant door open warning lamp.

SYSTEM OVERVIEW

CONTROL MODULE

Fig. 87: Driver Door Module And Passenger Door Module Control Modules
Courtesy of VOLVO CARS CORPORATION

The driver door module (DDM) and the passenger door module (PDM) are broadly similar in terms of functionality. The information in this document is common to both the driver door module (DDM) and the passenger door module (PDM) unless otherwise indicated. The main task of both control modules is to manage:

- The power window mechanism
- The door lock
- Door mirror adjustment
- Door mirror folding
- Door mirror heating
- Outside temperature measurement
- Local lighting
- Door open warning lamp.

The control modules are in their respective doors. The driver door module (DDM) is on the driver's side and the passenger door module (PDM) is on the passenger side. The switches for the power windows are mounted directly on top of the control modules. The appearance and physical versions of the two control modules is different.

The driver door module (DDM) and passenger door module (PDM) communicate with directly connected components and with other control modules and components connected via Controller area network (CAN) communication.

Both control modules check activations and input and output signals via an integrated diagnostic system. A diagnostic trouble code (DTC) is stored if either of the control module detects a fault.

Any diagnostic trouble codes (DTCs) are stored in the relevant control module memory. The data can be read off using VIDA (Volvo scan tool).

A simple way to ensure that the control modules are powered and grounded is to activate one of the functions

that are operated via the switches on the driver door module (DDM) or passenger door module (PDM). The control module is powered and grounded if any of the functions are working.

SIGNALS

The following table summarizes the input signals to and output signals from the driver door module (DDM) and the passenger door module (PDM). The signal types are divided into directly connected signals and Controller area network (CAN) communication. The following illustration displays the same information with the Volvo component designations.

Input signals	Output signals
Directly connected: • Door lock (3/74, 3/75) • Sensors used to set the position of the door mirror (2 per mirror) • Outside temperature sensor (7/11).	**Directly connected:** (power supply unless otherwise stated) • Window lift mechanisms (Front doors) (6/58, 6/60) • Door locks (Front doors) (3/74, 3/75) • Door mirror motors (3 per mirror) (6/62, 6/63) • Heating, door mirror (9/33, 9/34) • Lights in the door mirrors (10/148, 10/149) (optional equipment) • Door open warning lamps (10/60, 10/61).
Via Controller Area Network (CAN) communication: • Climate control module (CCM) (3/112) • Central electronic module (CEM) (4/56) • Driver door module (DDM) (3/126) (Applies only to the passenger door module (PDM)) • Power seat module (PSM) (4/52) • Upper electronic module (UEM) (4/70).	**Via Controller Area Network (CAN) communication:** • Climate control module (CCM) (3/112) • Central electronic module (CEM) (4/56) • Passenger door module (PDM) (3/127) (Applies only to the driver door module (DDM)) • Phone module (PHM) (16/60) (optional equipment) • Upper electronic module (UEM) (4/70) (Applies only to the driver door module (DDM)).

Fig. 88: Driver Door Module And Passenger Door Module Input And Output Signals

DRIVER INFORMATION MODULE (DIM). (2003-2012)

DESIGN

ILLUMINATION IN DRIVER INFORMATION MODULE (DIM)

Up to and including model year 2003, filament bulbs were used for illuminating the Driver Information Module (DIM). These bulbs can be changed separately.

LEDs have been used for illumination purposes as from model year 2004. If any of the LEDs blow, the entire Driver Information Module (DIM) will have to be changed.

DIAGNOSTIC FUNCTIONS

DESCRIPTION OF THE SCROLLING VALUES (LAMPS)

Warning lamp seat belts, value

Indicates whether the lamp is on or off according to the control module.

SRS warning lamp, value

Indicates whether the lamp is on or off according to the control module.

Brake system warning lamp, value

The ABS control module lights or extinguishes the lamp via the control area network. The lamp may assume the value on or off.

Lamp parking brake warning, value

Indicates whether the lamp is on or off according to the control module.

Lamp low oil pressure, value

The oil pressure signal can be read off. The signal comes from the engine control module (ECM). One can read off whether the low oil pressure lamp should be on or off.

Charge lamp, value

Indicates whether the lamp is on or off according to the control module.

Indicator lamp fog lamp rear, value

Indicates whether the lamp is on or off according to the control module.

Malfunction indicator lamp (MIL), value

Indicates whether the lamp is on or off according to the control module.

ABS warning lamp, value

Indicates whether the lamp is on or off according to the control module.

Traction control warning lamp, value

The Brake Control Module (BCM) transmits the lamp signal to the driver information module (DIM) via the Control area network (CAN). Indicates whether the lamp is on or off according to the Driver Information Module (DIM).

Trailer warning lamp, value

Indicates whether the lamp is on or off according to the control module.

General orange warning lamp, value

Indicates whether the lamp is on or off according to the control module.

General red warning lamp, value

Indicates whether the lamp is on or off according to the control module.

High beam, value

Indicates whether the lamp is on or off according to the control module.

Lamp low fuel level, value

Indicates whether the lamp is on or off according to the control module.

DESCRIPTION OF THE SCROLLING VALUES (OTHER SIGNALS)

Fuel level, value

Signal from the two fuel level sensors in the rear electronic module (REM). The value displays between 0 and 80 liters depending on the amount of fuel in the tank.

Engine coolant temperature, value

An engine coolant temperature (ECT) display. The signal comes from the engine control module (ECM) and the temperature is displayed in Celsius.

Engine speed (RPM), value

An engine speed (RPM) display. The signal is between 0 and 8000 rpm and comes from the engine control module (ECM).

Vehicle speed, value

The vehicle speed can be read off. The signal comes from the Brake Control Module (BCM) or the transmission control module (TCM) via the Control area network (CAN).

Brake fluid level, value

The sensor is directly connected to the driver information module (DIM). Indicates whether the control module interprets the signal as low or high level.

Parking brake, value

The sensor is directly connected to the driver information module (DIM). Indicates whether the control module interprets the signal as activated or not activated. With the parking brake applied the sensor is activated.

The SRS indicator lamp status, value

The Driver Information Module (DIM) informs the Supplemental Restraint System Module (SRS) if the indicator lamp is working or is defective.

Cruise control, value

Indicates whether the cruise control status is on or off.

DESCRIPTION OF THE CUSTOMER PARAMETERS IN THE DRIVER INFORMATION MODULE (DIM)

Total mileage, value

Measurement range 0-999999 km, 0-999999 miles. The parameter can only be programmed once before the read off mileage exceeds 500 km or 310 miles. Programmed by the Central Electronic Module (CEM) after the control module has been replaced.

Distance conditions for service, value

Indicates the mileage required to display the service indicator message. The available values for metric calibrated instruments are 5000, 7500, 10000, 12000, 15000 or 20000 km. The available values for imperial calibrated instruments are 2500, 5000, 6000, 7500, 10000 or 12500 miles.

Time conditions for service, value

Indicates the time required to display the service indication message. The values set are 6, 12, 18 or 24 months.

Engine run time conditions for service, value

Indicates the time the engine must have been running before the service indication message will be displayed. The value set is 500, 750 or 1000 hours.

Displaying zeroes, value

Setting the instrument panel to display or not display the zeroes.

Temperature unit, value

The temperature unit of measurement can be selected. The temperature display can be selected between Celsius or Fahrenheit.

Unit trip computer, value

Setting the trip computer (applies only to cars with trip computer). It is possible to select liters, Imperial gallons or US gallons.

Clock position, value

12- or 24- hour display.

Mileage at service, value

Reading off the mileage at service. The parameter can be programmed between 0-999999 km or miles. When resetting the service reminder indicator (SRI) the parameter is reprogrammed by copying the mileage.

CAUTION: Mileage at service should be used with total mileage to determine whether a service is due

Time at service, value

Reading off global time at service. The parameter can be between 0 -163 months (13.6 years). When resetting the service reminder message, the parameter is reprogrammed by copying the global time in the central electronic module (CEM) to the driver information module (DIM).

CAUTION: Time at service and global time should be used with time conditions to determine whether a service is due.

Engine hours since service, value

Parameter read off. Indicates how many hours the engine has run since the last service. The parameter can be between 0 -65536 hours. Resets when service reminder message is reset.

CAUTION: Engine time since service should be used with engine hours to service to determine whether a service is due

Global time, value

Reading off the clock in the central electronic module (CEM). The parameter can be between 0 -163 months (13.6 years).

CAUTION: Time at service and global time should be used with time conditions to determine whether a service is due.

Parking brake warning

Setting the sound signal for the parking brake warning. Parking brake warning can be on or off. The default position is on.

DESCRIPTION OF COMPONENT / FUNCTION ACTIVATION

Lamps and displays

The combined instrument panel lamps flash and the gauges sweep from minimum to maximum for 4 seconds.

Warning lamp seat belts, value

Activating the instrument lamp.

SRS warning lamp, value

Activating the instrument lamp.

Brake system warning lamp, value

Activating the instrument lamp.

Lamp parking brake warning, value

Activating the instrument lamp.

Lamp low oil pressure, value

Activating the instrument lamp.

Charge lamp, value

Activating the instrument lamp.

Indicator lamp fog lamp rear, value

Activating the instrument lamp.

Malfunction indicator lamp (MIL), value

Activating the instrument lamp.

ABS warning lamp, value

Activating the instrument lamp.

Traction control warning lamp, value

Activating the instrument lamp.

Trailer warning lamp, value

Activating the instrument lamp.

General orange warning lamp, value

The orange triangular warning lamp in the center of the instrument panel is activated.

General red warning lamp, value

The red triangular warning lamp in the center of the instrument panel is activated.

High beam indicator lamp, value 1

Activating the instrument lamp.

Lamp low fuel level, value

Activating the instrument lamp.

DOWNLOADING SOFTWARE AND REPLACING THE CONTROL MODULE

New software can be downloaded into the driver information module. When ordering software, the hardware and the software in the car is compared to the Volvo central database. If the comparison is OK the software is downloaded to the control module.

If the comparison between the car and Volvo central database does not correspond, the database is updated with the configuration of the car. The software download then begins.

The driver information module is integrated in the combined instrument panel. When replacing the control module the entire combined instrument panel must also be replaced.

The language in the combined instrument panel can be changed. This is done by ordering new software for the driver information module from the replacement parts catalogue. In the replacement parts catalogue there is software for reloading the driver information module (reloading driver information module) and software for changing to 15 different languages. Reloading reloads the same software that was installed before the control module was replaced.

There are other functions for the combined control module which can be ordered. However, these are not downloaded into the driver information module but into the central electronic module. There are functions such as the trip computer.

A number of customer parameters can be programmed into the driver information module.

The following data can be programmed into the driver information module. Programming:

- Conditions for the service reminder indicator (SRI) to light, mileage, time and engine hours
- If the instrument panel should display zeroes for the mileage
- Unit for temperature. Fahrenheit or Celsius
- Unit in the trip computer (only applies to cars with trip computers). Fuel consumption can be displayed in liters per 100 km, miles per GB Gallon, miles per US Gallon and kilometers per liter
- 12 or 24 hour clock display.

These customer parameters are stored in the control module but not in the Volvo central database. This means that the customer parameters must be reprogrammed when the hardware is replaced.

FUNCTION

TEXT MESSAGES

Fig. 89: Identifying Text Messages Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

In the lower left section of the combined instrument panel (driver information module) (5/1) there is a small window where text messages are displayed. This gives the driver supplementary information for the different warning symbols in order to reduce the number of different symbols in the combined instrument panel. Other types of messages are also displayed, such as the functions of the trip odometer. There is an order of priority where warning signals are displayed first.

Depending on the circumstances, a request for these messages may come from the central electronic module (4/56) or the steering wheel module (3/130). The signals are transmitted via the Control Area Network (CAN).

OUTSIDE TEMPERATURE

Fig. 90: Identifying Outside Temperature Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The outside temperature gauge is integrated in the tachometer. Its function is to display the outside temperature and to warn the driver when the conditions are icy by displaying a symbol of a snowflake. The snowflake is displayed at a range of -5 to +2 °C.

A sensor which detects the outside temperature is mounted in the right-hand door mirror. The temperature signal is then read off by either the passenger door module (3/127). The value is transmitted via the Control area network (CAN) to the central electronic module (4/56) which then forwards the message to the driver's information module (5/1). The temperature is displayed in Celsius or Fahrenheit, depending on the market, in increments of one degree. The temperature unit can be changed when reprogramming.

CLOCK

Fig. 91: Clock Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The only function of the clock is to display the time in hours and minutes.

The data is transmitted via the control area network (CAN) from the central electronic module (4/56) to the driver information module (5/1).

The customer can adjust the time using a knob on the clock display. The driver information module then transmits the new time to the central electronic module which registers the new data and updates its clock accordingly. The customer can select whether the time will be displayed using the 12 or 24 hour clock. If the 12 hour clock is selected AM or PM is automatically displayed.

SEAT BELT REMINDER

Fig. 92: Identifying Seat Belt Reminder Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The seat belt reminder reminds the driver to put on the seat belt. There are two versions of the seat belt reminder - European and American. They are slightly different, which is outlined below. The signals which indicate the variant in the car (European or American) are transmitted by the central electronic module (4/56) via the Control Area Network (CAN). Two small symbols light in the upper electronic module (4/70) and indicate when a seat belt is not fastened. The driver information module (5/1) emits an audible signal to warn the driver that no seat belt is fastened. From model year 2002 inclusive, there is also a display on the combined instrument

panel (5/1) which warns the driver if their belt is not fastened.

European version

If the seat belt is not fastened when the ignition is switched on, the symbols in the upper electronic module will light and there will be an audible signal from the driver information module. This continues for 6 seconds until either the seat belt is fastened or reverse gear is selected. If the car travels at 10 km/h or more, the audible signal reactivates if the driver has not fastened his/her seat belt.

American version

When the ignition is switched on, the symbols in the upper electronic module will light continuously for 6 seconds, or until the driver's seat belt is fastened. At the same time there will be a ringing sound from the driver information module for the same period of time. If the driver releases the belt after fastening it, the audible signal will not resume if more than 6 seconds have passed since the ignition was switched on.

TRIP ODOMETER / ODOMETER

Fig. 93: Brake Warning Lamp Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The function of the trip odometers and the odometer is to display the three available odometer modes. The two settings are the total mileage of the car and the mileage since the two trip odometers were last set to zero. These two can be reset individually. The odometer and one of the two trip odometers are always displayed. The central electronic module (4/56) receives a speed signal from the brake control module (ABS) (4/16) which is transmitted on the high speed section of the Control Area Network (CAN). The central electronic module then transmits the signal on to the driver information module (5/1) via the low speed section of the Control Area Network (CAN). The distance traveled is saved every fourth kilometre and the value is stored in the central electronic module (4/56). Press the button briefly to switch between the two trip odometers. Hold the button in longer to reset the trip odometer. There must be a power supply to the driver information module (5/1) before the odometer can be reset.

SERVICE REMINDER INDICATOR (SRI)

Fig. 94: Clock Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The service reminder indicator (SRI) lights the first time the ignition is switched on after the service interval has been reached. The service reminder indicator (SRI) will continue to light and remain lit for 2 minutes, every time the ignition is switched on until it is reset. The service indicator has changed from model year 2002. The need for a service is indicated partly by a lamp and partly by a text message - "time for service". Previously only the lamp indicated "Service". The service reminder indicator (SRI) can be programmed in three different ways: distance traveled, time since last service and engine hours since last service. The service reminder indicator (SRI) can be reset using VIDA or as follows:

Hold down the reset button for the trip odometer and turn the key to position II. Continue holding the button down until the service reminder indicator (SRI) begins to flash. Release the button.

ENGINE COOLANT TEMPERATURE (ECT) GAUGE

Fig. 95: Engine Coolant Temperature Gauge Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM), (4/46) processes the value from the coolant temperature sensor (7/16). The processed value is then transmitted to the central electronic module (4/56) on the high speed section of the Control Area Network (CAN). The central electronic module receives the signal and generates a corresponding signal on the low speed section of the Control Area Network (CAN). The driver information module (5/1) reads the signal from the low speed section of the Control Area Network (CAN). The driver receives information about the temperature from the engine coolant temperature gauge in the combined instrument panel. If the value is too high a red lamp lights and a text message is displayed outlining the fault.

HANDBRAKE

Fig. 96: Hand Brake Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

A switch is connected to the combined instrument panel (driver information module) (5/1) which detects the incoming signal indicating whether the handbrake is applied or not. The switch is activated and the lamp is lit when the handbrake is applied. This signal is directly connected.

SRS LAMP

Fig. 97: Identifying SRS Lamp Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The supplementary restraint system (SRS) (4/9) contacts the driver information module (5/1) if there is a problem in the system. A signal is transmitted via the Control area network (CAN) and the driver information module lights a lamp and displays a text message. The combined instrument panel also informs the supplementary restraint system (SRS) whether the lamp is working or not.

BRAKE WARNING LAMP

Fig. 98: Brake Warning Lamp Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The brake control module (4/16) (called ABS module on model years up to and including 2001) informs the driver information module (5/1) via the Control area network (CAN) if there is a fault in the brake system. The

driver information module indicates this to the driver by lighting the red general warning lamp and displaying a text message.

The brake fluid level sensor detects the level of the brake fluid in the reservoir. When the level is low, a switch in the sensor closes and the warning lamp lights. This function is directly connected to the driver information module.

FUEL GAUGE

Fig. 99: Fuel Gauge Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

There are two sensors in the fuel tank which transmit signals about the fuel level to the rear electronic module (REM). The rear electronic module (4/58) sends the values on to the driver information module (5/1), which receives the signals, interprets them and displays the fuel level on the fuel gauge. When the fuel level is low a yellow lamp lights to inform the driver.

The fuel gauge is not sensitive to rapid change. This is to prevent incorrect values being displayed when cornering or driving on slopes for example.

SPEEDOMETER

Fig. 100: Identifying Speedometer Input And Output Signals

Courtesy of VOLVO CARS CORPORATION

The speedometer displays the actual speed the car is traveling at.

Information about the vehicle speed comes from the speed sensor which is connected to the brake control module (BCM) (called the ABS module on cars up to and including model year 2001) and the gearbox control module (TCM) (4/28). The brake control module (BCM) (4/16) and the gearbox control module (TCM) calculate an average speed based on the signals sent from the two front wheels by the speed sensors. The calculated speed signal is then transmitted to the central electronic module (CEM) (4/56) from the brake control module and the gearbox control module on the high speed section of the Control Area Network (CAN). Depending on the quality of the signal, the central electronic module uses the signal from the brake control module or the gearbox control module (TCM). The central electronic module then transmits this data on to the driver information module (DIM) (5/1) where it is displayed.

Only cars with automatic gearbox have a gearbox control module (TCM). In cars with manual transmissions, the speed signal is transmitted to the central electronic module by only the brake control module on the high speed section of the Control Area Network (CAN).

TACHOMETER

Fig. 101: Engine Coolant Temperature Gauge Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

A flywheel sensor (7/25) is connected to the engine control module (ECM) (4/46). The engine control module (ECM) transmits the engine speed signal onwards via the high speed section of the Control Area Network (CAN). The central electronic module (CEM) (4/56) receives the signal and generates a corresponding signal on the low speed section of the Control Area Network (CAN). The driver information module (DIM) (5/1) reads the signal from the low speed section of the Control Area Network (CAN). The driver information module

receives the value and presents the actual engine speed for the driver.

LAMP FOR LOW OIL PRESSURE (ONLY APPLIES TO VERSIONS WITH OIL PRESSURE SENSOR)

Fig. 102: Identifying Lamp For Low Oil Pressure Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The oil pressure sensor (7/6) is connected to the engine control module (ECM) (4/46). The engine control module transmits the oil pressure signal onwards via the high speed section of the Control Area Network (CAN). The central electronic module (4/56) receives the signal, and generates a corresponding signal on the low speed section of the Control Area Network (CAN). If the oil pressure is low, the driver information module (DIM) (5/1) reads the signal from the low speed section of the Control Area Network (CAN). The driver information module indicates this to the driver by lighting a red warning lamp and displaying a text string with explanatory information.

HINT: In vehicles with an oil level sensor, the general warning lamp comes on and a text message appears when the oil level is too low.

GENERAL WARNING LAMP

The function is to display different "faults" in the car. When a lamp lights this is followed by a text message which presents the driver with additional information about why the lamp has lit. From model year 2002 inclusive the color of the lamp has changed from orange to yellow / red. The lamp lights red in the event of serious faults, or yellow for less serious faults.

MALFUNCTION INDICATOR LAMP (MIL)

The malfunction indicator lamp (MIL) only lights in the combined instrument panel (driver information module) (5/1), if certain emissions related diagnostic trouble codes (DTCs) are stored in the engine control module (ECM) (4/46) or gearbox control module (TCM) (4/28). The signal between the driver information module and engine control module (ECM) is directly connected.

SYSTEM OVERVIEW

CONTROL MODULE

Fig. 103: Driver Information Module
Courtesy of VOLVO CARS CORPORATION

The most important role of the Driver Information Module is to display the status of the systems in the car for the driver. This covers functions such as:

- Vehicle speed
- Engine speed
- Fuel level
- Engine coolant temperature (ECT)
- Various warning signals.

The control module is integrated in the combined instrument panel. When replacing the driver information module, the entire combined instrument panel must also be replaced.

The driver information module mostly communicates with other control modules and components via CAN communication. However some functions are connected directly.

The control module checks input and output signals through an integrated diagnostic system. A diagnostic trouble code (DTC) is stored if the control module detects an error. In certain cases the driver information module replaces the faulty signal with a substitute signal.

Diagnostic trouble codes (DTC) are stored in the control module memory. The data can be read off using the diagnostic tool.

An easy way of checking that the driver information module is both powered and grounded is to check whether the following warning lamps light when the ignition is switched on: Parking brake, Malfunction indicator lamp

and Brake fluid level.

SIGNALS

The table below summarizes input and output signals to and from the driver information module. The signal types are divided into directly connected signals, serial communication and Control area network (CAN) communication. The illustration below displays the same information with the Volvo part numbers.

Input signals	Output signals
Directly connected: Parking brake switch, 3/47 Malfunction indicator lamp (MIL) Brake fluid level sensor, 7/4	**Directly connected:**
Via Control Area Network (CAN): Brake control module (ABS), 4/16 Central electronic module, 4/56 ECM, 4/46 Phone module, 16/60 SRS, 4/9 TCM (4/28) Rear electrical module, 4/58 Steering wheel module, 3/130	**Via Control Area Network (CAN):** Brake control module (ABS), 4/16 Central electronic module, 4/56 Phone module, 16/60 SRS, 4/9 RTI, 16/45 Climate control module, 3/112

Fig. 104: Driver Information Module Input And Output Signals

ENGINE (B6324S; 2007-2010)

DESIGN AND FUNCTION

ENGINE BLOCK

Fig. 105: Expanded View of Engine Components
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Oil separator	5	Cylinder block
2	Camshaft cover	6	Intermediate section
3	Cylinder head	7	Oil pan
4	Gear housing		

CYLINDER HEAD, CAMSHAFT BEARING HOUSING

Fig. 106: View of Cylinder Head, Camshaft Bearing Housing
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Camshaft cover	3	Induction camshaft
2	Exhaust camshaft	4	Cylinder head

The cylinder head is of the cross-flow type, (Cross-flow = in from one side and out from the other side).

The two camshafts are supported by seven bearing caps each, directly in the cylinder head and camshaft cover. The camshaft cover works like a combined valve cover and camshaft bearing cap. The camshaft cover has cast oil ducts on the underneath which ensure good oil supply to the camshafts and the valve lifters.

The maintenance-free valve lifters, valve springs and valves are in the cylinder head.

CYLINDER HEAD GASKET

Fig. 107: Identifying Cylinder Head Gasket
Courtesy of VOLVO CARS CORPORATION

The seal between the cylinder head and cylinder block is a conventional cylinder head gasket. The seal between the other gasket faces is a liquid gasket.

The cylinder head gasket is made of steel and has multiple layers.

For exact adaptation to the relevant piston height there are different thicknesses available. This is to absorb the differences between pistons, connecting rods etc and thereby obtain the correct compression.

CYLINDER BLOCK

Fig. 108: View Of Cylinder Block
Courtesy of VOLVO CARS CORPORATION

The cylinder block consists of 3 sections.

- Cylinder block
- Intermediate section
- Gear housing

All three sections are made of die cast aluminum, molded under high pressure.

The mating flange between the cylinder block and intermediate section is in the center line of the crankshaft. The gear housing for the camshaft drive is secured on top of the cylinder block.

The cylinder block houses six cast iron cylinder sleeves. These cylinder sleeves cannot be replaced. The stroke length of the cylinders is greater than the cylinder diameter. This produces good torque and competitive power.

The intermediate section's seven main bearing caps have cast iron reinforcements.

On the top of the intermediate section there are cast oil channels which distribute the oil to the main bearings and on via the crankshaft to the big ends.

OIL PAN

Fig. 109: Identifying Engine Oil Pan
Courtesy of VOLVO CARS CORPORATION

The oil pan is made of die cast aluminum with baffles. This is so that the oil does not splash excessively. Liquid gasket creates a seal between the cylinder block and the oil sump.

The oil pan is designed to reduce mechanical noise from the engine, at the same time as providing a reliable supply of oil at different angles. A composite oil scraper keeps the larger section of the oil volume away from the rotating crankshaft. It minimizes power loss, improves fuel economy and prevents the oil from foaming.

The oil suction line, which runs from the oil pan, is made of plastic. The oil pan is equipped with an oil level sensor.

The oil pan contributes to the rigid design and operates as an extra reinforcement of the cylinder block.

PISTON

Fig. 110: Identifying Piston Cooling Nozzle
Courtesy of VOLVO CARS CORPORATION

1. Piston cooling nozzle

The pistons are die cast in aluminum and the connecting rods are forged in steel.

The heat received by the pistons from combustion, is cooled, partly via the coolant jacket in the block but also by the oil from the six piston cooling nozzles.

CRANK SYSTEM

Fig. 111: Identifying Crankshaft System
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Vibration damper	4	Gear wheel
2	Crankshaft	5	Oil cooler pipe
3	Carrier plate		

The crankshaft is made from forged steel with induction hardened bearing surfaces.

The sprocket is crimped on the crankshaft's rearmost shank.

The crankshaft is supported by seven main bearings. The main bearings are replaceable main bearing shells. The sixth main bearing is a thrust bearing that holds the crankshaft in a determined position along the length of

the axle.

An internal vibration damper is on the front end of the crankshaft. Inside the enclosed vibration damper, a circular flywheel works on a silicone fluid, which dampens the crankshaft torsion oscillations. The vibration damper gives longer service life for the crankshaft and smoother engine operation.

The energy that is generated in the vibration damper, is converted to heat, therefore, the unit is cooled with oil via the oil cooler pipe.

INTERMEDIATE SHAFT

Fig. 112: Identifying Intermediate Shaft
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Camshaft transmission sprocket	5	Intermediate wheel
2	Drive wheel for the auxiliary unit	6	Crankshaft sprocket
3	Intermediate shaft	7	Oil pump
4	Freewheel clutch		

The intermediate shaft is located in the gear housing on the cylinder block. The intermediate shaft drives the

camshafts and the auxiliary unit.

There is a sprocket on the rear section of the crankshaft, which drives the intermediate shaft via an intermediate wheel. The intermediate wheel drives the intermediate shaft via the intermediate shaft's centrally mounted gear. The intermediate shaft has a further two gear wheels of different sizes.

The intermediate shaft's front gear wheel has a freewheel clutch that drives the alternator at 2.7 times the engine speed. A free wheel clutch drives in one direction and slips/freewheels in the other direction.

The rear gear wheel drives the overhead camshafts.

CAMSHAFT TRANSMISSION

Fig. 113: Identifying Camshaft Transmission
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Camshaft chain	3	Intermediate shaft
2	Auxiliary unit sprocket		

Both camshafts are driven by a camshaft chain, which in turn, is driven by the crankshaft via the intermediate shaft. The camshaft chain has inverted teeth, so called, "silent chain".

The chain drive is maintenance free.

The exhaust side's camshaft has a vibration damper, which guarantees optimum balance in the gear and chain sprockets.

Timing cover

Fig. 114: Identifying Timing Chain Cover
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Chain guide	5	Coolant pump outlet
2	Induction camshaft	6	Hydraulic chain tensioner
3	Exhaust camshaft	7	Intermediate shaft
4	Coolant pump shell		

The timing cover is cast in aluminum.

The coolant pump shell is integrated in the timing cover. This saves weight. The coolant pump is still driven by the auxiliary unit's transmission.

The chain us tensioned by a hydraulic chain tensioner, which is located in the timing cover. Oil injection pipes supply the chain with oil.

VARIABLE CAMSHAFT PROFILE (CPS), ONLY APPLIES TO B6324S

Fig. 115: Identifying Variable Camshaft
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Camshaft phase setting	3	High lift
2	Shift lobe	4	Low lift

The ideal engine should have low valve lift for low engine RPMs and loads, and high valve lift at high RPMs and loads.

To achieve this, an engine with two completely different camshaft profiles is required.

This engine has a patented system for camshaft profile switching. The system uses two completely different cam profiles designed on the same camshaft.

The inlet camshaft is provided with three cams for each valve, one centrally located with small lift height, 3.6 mm, and two equally sized outer cams with big lift height, 10.0 mm. With a small lift height at low load and at engine speeds up to approx. 3000 rpm, the primary benefit is lower fuel consumption.

In principle, during the time that the lift height is small, the air damper is completely open. Control of the incoming air volume to the cylinders takes place through control of the camshaft's opening times. Hereby the

pump losses are reduced, which in turn gives lower fuel consumption.

Low lift

At small lift height (4), only the centrally placed cam acts on the valve, which takes place through the inner valve depressor. The outer cams act on the outer valve depressors, which follow the cams' movement. Since the centrally located valve depressor and the outer depressor are not connected, the outer depressor moves without affecting the valve. Thus, lift height becomes small.

High lift

At high lift height (3), the inner valve depressor is connected with the outer valve depressor with lock pins. The outer camshaft cams' movement is transmitted through the outer valve depressor, on through the lock pins and the inner valve depressor to the valve. Thus, lift height becomes big.

The position of the lock pins is controlled hydraulically with two electro-hydraulic valves. One electro-hydraulic valve controls the valves for cylinders 1, 2 and 4, while the other controls the valve for cylinders 3, 5 and 6. Thus, the electro-hydraulic valves control 6 valves each (as the engine has 2 inlet valves and 2 exhaust valves per cylinder).

The position, on/off, of the electro-hydraulic valves is controlled by the Engine control module (ECM).

The inner valve depressor works like a hydraulic valve depressor, which compensates any wear. Thus the valve clearance is "0".

The exhaust camshaft is conventional and has a lift height of 10.0 mm. The valve depressors are mechanical, that is, they "have" valve clearance.

LUBRICATION SYSTEM

Fig. 116: Identifying Lubrication System
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Oil pan	5	Oil dipstick
2	Oil pump	6	Housing for the oil filter
3	Oil pressure line	7	Supply to the vibration damper's cooling nozzle.
4	Oil cooler	8	Oil suction line

The task of the lubrication system is to build-up a protective film of oil between the moving parts of the engine. The lubrication system must also transport dirt particles away from the moving parts and cool hot engine parts.

This is carried out by the oil pump supplying oil to the oil filter through an oil pressure line of treated steel.

Clean oil is supplied to the oil cooler from the oil filter to the oil cooler. From there the oil is further distributed, through a duct system, out to the various engine functions.

A pressure sensitive valve controls the oil flow to the vibration damper's oil cooler pipe if necessary.

Oil pump

Fig. 117: Identifying Oil Pump
Courtesy of VOLVO CARS CORPORATION

The oil pump is in the oil pan, mounted underneath the intermediate section. The oil pump has an integrated relief valve. The pump is directly driven by the sprocket on the rear end of the crankshaft.

The oil pump draws oil from a centrally located nozzle in the sump.

The pump increases the pressure of the oil for lubrication, cooling and hydraulic functions.

Oil filter module

Fig. 118: Identifying Oil Filter Module
Courtesy of VOLVO CARS CORPORATION

The oil filter module consists of an oil filter reservoir and an oil cooler. It is mounted on the intermediate section. The oil filter module is element based and can be taken apart.

The oil cooler is connected to the coolant system. Coolant is led through the oil cooler.

COOLING SYSTEM

Fig. 119: Identifying Cooling System
Courtesy of VOLVO CARS CORPORATION

The coolant pump shell is integrated in the timing cover. The pump wheel is still driven by the auxiliary unit's transmission.

The coolant pump pumps coolant through the cylinder block, and also cools the cylinder head, cylinder sleeves, spark plug wells, intake ducts and fuel injection nozzles.

The coolant flows in at the coolant pump and passes through a number of channels before it collects and then flows out to the thermostat housing. If the thermostat housing is closed, the coolant passes via the by-pass channel directly to the coolant pump to then circulate through the cylinder block again.

For the turbocharged engine, the task of the cooling system is to supply the turbocharger with coolant.

CRANKCASE VENTILATION

Fig. 120: Identifying Crankcase Ventilation System
Courtesy of VOLVO CARS CORPORATION

The crankcase ventilation is maintained internally in the engine.

An oil separator is on top of the engine's camshaft cover. It separates the oil drops from the air in the crankcase. The drops are collected in a separator and flow back inside the engine to the oil pan. This prevents extra weight and space for external pipes.

AUXILIARY UNIT TRANSMISSION

Fig. 121: Auxiliary Unit Drive
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Servo pump	4	Intermediate shaft
2	Guide pulley	5	Belt tensioner
3	Air conditioning (A/C) compressor	6	Coolant pump

The auxiliary units are located at the upper edge of the cylinder block, above the transmission. They are driven by two systems, a Poly-V-belt driven system and a clutch system. These two systems are driven by the intermediate shaft transmission.

The belt system consists of a 6-ribbed Poly-V belt, an automatic belt tensioner and a guide pulley. This system drives the servo pump and AC compressor. The coolant pump is driven by the servo pump via the clutch system.

TURBOCHARGER (TC)

NOTE: Only applies to turbocharged engines.

Fig. 122: View of Turbocharger System
Courtesy of VOLVO CARS CORPORATION

The exhaust gases enter via the manifold (1) down to the turbine housing (8) and out to the exhaust system via a downpipe and catalytic converter.

The turbine expels the exhaust gases and rotates the compressor wheel (3). The compressor wheel creates a certain amount of suction using the intake air. This intake air enters the compressor via the air filter and uses a rotational movement to speed up the air, creating the boost pressure. The air then continues into the intake system via the charge air pipe and charge air cooler.

The electronically controlled By-pass valve (4) then controls the boost pressure in the turbocharger by determining the amount of exhaust gases which must pass the turbine. The turbine transfers drive to the compressor. The wastegate valve (2) is a membrane which equalizes the pressure of the intake and exhaust air to eliminate noise.

The turbocharger is lubricated by the engine's oil system (7). The oil system also acts as a supplement to the coolant system (5 and 6).

OVERVIEW

Fig. 123: ENGINE (B6324S; 2007-2010)
Courtesy of VOLVO CARS CORPORATION

The engine has been developed by Volvo.

It is a 6 cylinder transverse in-line engine with a cylinder capacity of 3.2 L for naturally aspirated engines and 3.0 L for turbocharged engines.

The engine is extremely compact. When it was introduced it was the shortest 6-cylinder engine of 3.2 L on the market. Conventional straight 6-cylinder engines are too long to fit between the collision members in the engine compartment. The special design of this engine solves the problem.

The engine has an extremely short drive train, its length is only 625 mm from the front edge of the engine block to the rear edge of the carrier plate.

Great attention has been paid to creating a very rigid engine. Middle part, cylinder block and cylinder head have been structurally optimized to combine low weight with high rigidity.

Even the camshaft cover is structurally optimized.

The engine has double overhead camshafts and 24 valves.

Camshafts, servo pump, AC-compressor, coolant pump and alternator are driven by an auxiliary unit drive, mounted on the back of the engine.

This placement of the auxiliary unit drive gives completely new possibilities of creating a good collision-protective structure around the straight 6-cylinder drive unit.

The entire engine block and the cylinder head is made from aluminum.

The engine has a compact "pent-roof" designed combustion chamber and V-arranged valves. This gives optimal and fast filling and direct flushing via the inlet manifold followed by the combustion chamber (cross-flow) and the exhaust channel.

The squish surfaces together with the centrally positioned spark plug provide optimal combustion of the air/fuel mixture, low knock sensitivity and low, stable exhaust emissions.

The engine's firing order is 1 - 5 - 3 - 6 - 2 - 4. The firings occur every 120 degrees that the crankshaft rotates.

ENGINE (B6324S5; 2011-2012)

DESIGN AND FUNCTION

ENGINE BLOCK

Fig. 124: Expanded View of Engine Components
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Oil separator	5	Cylinder block
2	Camshaft cover	6	Intermediate section
3	Cylinder head	7	Oil pan
4	Gear housing		

CYLINDER HEAD, CAMSHAFT BEARING HOUSING

Fig. 125: View of Cylinder Head, Camshaft Bearing Housing
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Camshaft cover	3	Induction camshaft
2	Exhaust camshaft	4	Cylinder head

The cylinder head is of the cross-flow type, (Cross-flow = in from one side and out from the other side).

The two camshafts are supported by seven bearing caps each, directly in the cylinder head and camshaft cover. The camshaft cover works like a combined valve cover and camshaft bearing cap. The camshaft cover has cast oil ducts on the underneath which ensure good oil supply to the camshafts and the valve lifters.

The maintenance-free valve lifters, valve springs and valves are in the cylinder head.

CYLINDER HEAD GASKET

Fig. 126: Identifying Cylinder Head Gasket
Courtesy of VOLVO CARS CORPORATION

The seal between the cylinder head and cylinder block is a conventional cylinder head gasket. The seal between the other gasket faces is a liquid gasket.

The cylinder head gasket is made of steel and has multiple layers.

CYLINDER BLOCK

Fig. 127: View Of Cylinder Block
Courtesy of VOLVO CARS CORPORATION

The cylinder block consists of 3 sections.

- Cylinder block
- Intermediate section
- Gear housing

All three sections are made of die cast aluminum, molded under high pressure.

The mating flange between the cylinder block and intermediate section is in the center line of the crankshaft. The gear housing for the camshaft drive is secured on top of the cylinder block.

The cylinder block houses six cast iron cylinder sleeves. These cylinder sleeves cannot be replaced. The stroke length of the cylinders is greater than the cylinder diameter. This produces good torque and competitive power.

The intermediate section's seven main bearing caps have cast iron reinforcements.

On the top of the intermediate section there are cast oil channels which distribute the oil to the main bearings and on via the crankshaft to the big ends.

OIL SUMP AND OIL VOLUME

Fig. 128: View of Oil Sump and Dipstick
Courtesy of VOLVO CARS CORPORATION

The oil sump is made of die-cast aluminum with baffles (splash walls). This is so that the oil stays in the sump during active driving (heavy braking/acceleration, sharp turns, etc). Liquid gasket ensures the seal between the cylinder block and the oil sump.

The oil pan is designed to reduce mechanical noise from the engine, at the same time as providing a reliable supply of oil at different angles. A composite oil scraper keeps the larger section of the oil volume away from the rotating crankshaft. It minimizes power loss, improves fuel economy and prevents the oil from foaming.

The oil suction line, which runs from the oil pan, is made of plastic. The oil pan is equipped with an oil level sensor.

The oil pan contributes to the rigid design and operates as an extra reinforcement of the cylinder block.

The oil volume for engines B6324S4/S5 and B6304T4 have been reduced by 0.6 litres. Reasons for reducing the oil volume are, among others, lower service costs (cost of ownership), lower friction, and increased power. Lower friction and higher power are attained by facilitating the engine's internal 'breathing' with a lower oil surface, that is, easier evacuation of gases under the pistons.

The change of the oil volume is partly connected to a changed oil scraper plate, which means that the oil system also works with a reduced oil volume, as well as cooling for **IVD** (**I** nternal **V** iscous **D** amper), which is removed since 09w11. Since the volume reduction is partly connected to IVD-cooling it is not possible to

reduce the oil volume on an older engine with IVD-cooling, even if the new oil scraper plate is retrofitted. Due to the volume reduction, a new oil dipstick is introduced with adapted markings.

OIL SCRAPER PLATE

Fig. 129: Identifying Oil Scraper Plate
Courtesy of VOLVO CARS CORPORATION

Under the crankshaft there is an oil scraper plate that is to prevent the oil from following along with the crankshaft in the crank movement. The plate is updated and is now located closer to the crankshaft and has integrated drain pipes. With these changes it has been possible to reduce the oil volume.

PISTON

Fig. 130: Identifying Piston Cooling Nozzle
Courtesy of VOLVO CARS CORPORATION

1. Piston cooling nozzle

The pistons are die cast in aluminum and the connecting rods are forged in steel.

The heat received by the pistons from combustion, is cooled, partly via the coolant jacket in the block but also by the oil from the six piston cooling nozzles.

SPARKPLUGS

Fig. 131: View of SIP-spark plug
Courtesy of VOLVO CARS CORPORATION

To further improve the engine's features, a new type of spark plug is used, from Denso. The designation is "**SIP** " which means **S** uper **I** gnition spark **P** lug.

An SIP-spark plug has a special design which improves a number of features with a more stable spark. By using a special alloy for both the centre and side electrode, these can have a smaller diameter than normally. The smaller diameter of the electrodes minimizes heat losses during the flame build process, concentrates the electric field, and gives a stronger spark. The stronger spark gives higher engine power, improved fuel economy, better cold-cranking performance, and longer service life. It is the same spark plug for all versions of engine B63x4x, and can also be used for older versions. Electrode gap is 1.0 mm.

CRANK SYSTEM

Fig. 132: Identifying Crankshaft System
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Vibration damper	4	Gear wheel
2	Crankshaft	5	Oil cooler pipe
3	Carrier plate		

The crankshaft is made from forged steel with induction hardened bearing surfaces.

The sprocket is crimped on the crankshaft's rearmost shank.

The crankshaft is supported by seven main bearings. The main bearings are replaceable main bearing shells. The sixth main bearing is a thrust bearing that holds the crankshaft in a determined position along the length of the axle.

An internal vibration damper is on the front end of the crankshaft. Inside the enclosed vibration damper, a circular flywheel works on a silicone fluid, which dampens the crankshaft torsion oscillations. The vibration damper gives longer service life for the crankshaft and smoother engine operation.

Engine versions without turbo were changed 10w20 with a modified crankshaft. The goal is to reduce the crankshaft's torsion vibrations at high engine speeds (4, 500 rpm and up) and to save weight. The reduced torsion vibration means reduced noise level at high RPMs at the same time as it reduces the load (torque) on the

geartrain that drives the camshafts and auxiliary unit drive. It is the crankshaft's forged blank that is changed, reworking is unchanged.

To reduce vibrations material has been added between crank pin and main pin for the rear cylinders, which gives increased stiffness. At the crankshaft's front end, material has been removed instead, to reduce the crankshaft's oscillating mass. A new strategy has been used to design the crankshaft's balance weights to reduce weight. This can be seen by some balance weights having become small while others have become bigger. The changes have reduced the crankshaft's weight by a total of 1 kg. The change does not apply to turbo engines, but can be used on earlier versions of aspiration engines.

Main bearing

Fig. 133: Identifying Main Bearings
Courtesy of VOLVO CARS CORPORATION

To improve the cold-cranking capacity, all main bearings have a changed appearance. In the middle of the bearing the thickness is unchanged but toward the end of the bearing the thickness is approx. 10µm thinner. The new type of bearing is possible to use on all versions of engine B63x4x, also those built earlier than 10w20.

INTERMEDIATE SHAFT

Fig. 134: Identifying Intermediate Shaft
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Camshaft transmission sprocket	5	Intermediate wheel
2	Drive wheel for the auxiliary unit	6	Crankshaft sprocket
3	Intermediate shaft	7	Oil pump
4	Freewheel clutch		

The intermediate shaft is located in the gear housing on the cylinder block. The intermediate shaft drives the camshafts and the auxiliary unit.

There is a sprocket on the rear section of the crankshaft, which drives the intermediate shaft via an intermediate wheel. The intermediate wheel drives the intermediate shaft via the intermediate shaft's centrally mounted gear. The intermediate shaft has a further two gear wheels of different sizes.

The intermediate shaft's front gear wheel has a freewheel clutch that drives the alternator at 2.7 times the engine speed. A free wheel clutch drives in one direction and slips/freewheels in the other direction.

The rear gear wheel drives the overhead camshafts.

CAMSHAFT TRANSMISSION

Fig. 135: Identifying Camshaft Transmission
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Camshaft chain	3	Intermediate shaft
2	Auxiliary unit sprocket		

Both camshafts are driven by a camshaft chain, which in turn is driven by the crankshaft via the intermediate shaft. The camshaft chain has inverted teeth, so called, "silent chain".

The chain drive is maintenance free.

The exhaust side's camshaft has a vibration damper, which guarantees optimum balance in the gear and chain sprockets.

Timing cover

Fig. 136: Identifying Timing Chain Cover
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Chain guide	5	Coolant pump outlet
2	Induction camshaft	6	Hydraulic chain tensioner
3	Exhaust camshaft	7	Intermediate shaft
4	Coolant pump shell		

The timing cover is cast in aluminum.

The coolant pump shell is integrated in the timing cover. This saves weight. The coolant pump is still driven by the auxiliary unit's transmission.

The chain us tensioned by a hydraulic chain tensioner, which is located in the timing cover. Oil injection pipes supply the chain with oil.

VARIABLE CAMSHAFT PROFILE (CPS), ONLY APPLIES TO B6324S5

Fig. 137: Identifying Variable Camshaft
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Camshaft phase setting	3	High lift
2	Shift lobe	4	Low lift

The ideal engine should have low valve lift for low engine RPMs and loads, and high valve lift at high RPMs and loads.

To achieve this, an engine with two completely different camshaft profiles is required.

This engine has a patented system for camshaft profile switching. The system uses two completely different cam profiles designed on the same camshaft.

The inlet camshaft is provided with three cams for each valve, one centrally located with small lift height, 3.6 mm, and two equally sized outer cams with big lift height, 10.0 mm. With a small lift height at low load and at engine speeds up to approx. 3000 rpm, the primary benefit is lower fuel consumption.

In principle, during the time that the lift height is small, the air damper is completely open. Control of the incoming air volume to the cylinders takes place through control of the camshaft's opening times. Hereby the pump losses are reduced, which in turn gives lower fuel consumption.

Low lift

At small lift height (4), only the centrally placed cam acts on the valve, which takes place trough the inner valve depressor. The outer cams act on the outer valve depressors, which follow the cams' movement. Since the centrally located valve depressor and the outer depressor are not connected, the outer depressor moves without affecting the valve. Thus, lift height becomes small.

High lift

At high lift height (3), the inner valve depressor is connected with the outer valve depressor with lock pins. The outer camshaft cams' movement is transmitted through the outer valve depressor, on through the lock pins and the inner valve depressor to the valve. Thus, lift height becomes big.

The position of the lock pins is controlled hydraulically with two electro-hydraulic valves. One electro-hydraulic valve controls the valves for cylinders 1, 2 and 4, while the other controls the valve for cylinders 3, 5 and 6. Thus, the electro-hydraulic valves control 6 valves each (as the engine has 2 inlet valves and 2 exhaust valves per cylinder).

The position, on/off, of the electro-hydraulic valves is controlled by the Engine control module (ECM).

The inner valve depressor works like a hydraulic valve depressor, which compensates any wear. Thus, the valve clearance is "0".

The exhaust camshaft is conventional and has a lift height of 10.0 mm. The valve depressors are mechanical, that is, they "have" valve clearance.

VALVE DEPRESSOR

Fig. 138: Identifying Valve Depressors
Courtesy of VOLVO CARS CORPORATION

Valve depressors without **CPS** -functionality (**C** amshaft **P** rofile **S** hifting) have a coating of **DLC** (**D** iamond **L** ike **C** arbon).

It is the tops of the valve depressors that are coated with DLC. The layer with diamond-like carbon structure has a depth of 2µm, is very hard and has self-lubricating properties. The surface reduces the friction against the camshaft lobes and thus gives lower fuel consumption and longer service life.

Thanks to very good adhesion and toughness the DLC-coating can handle very high loads. The change applies to valve depressors without CPS-functionality.

This means that it concerns depressors in position:

- Engine B6304T4 (Ulev2) Exhaust, inlet
- Engine B6324S4 (Pzev) Exhaust, inlet
- Engine B6324S5 (Ulev) Exhaust

If needed the DLC-coated depressors can also be used on older engines.

LUBRICATION SYSTEM

Fig. 139: View Of Lubrication System
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Oil pan	5	Oil dipstick
2	Oil pump	6	Housing for the oil filter
3	Oil pressure line	7	Oil suction line
4	Oil cooler		

The task of the lubrication system is to build-up a protective film of oil between the moving parts of the engine. The lubrication system must also transport dirt particles away from the moving parts and cool hot engine parts.

This is carried out by the oil pump supplying oil to the oil filter through an oil pressure line of treated steel.

Clean oil is supplied from the oil filter to the oil cooler. From there the oil is further distributed, through a duct system, out to the various engine functions.

A pressure sensitive valve controls the oil flow to the vibration damper's oil cooler pipe if necessary.

Oil pump

Fig. 140: Identifying Oil Pump
Courtesy of VOLVO CARS CORPORATION

The oil pump is in the oil pan, mounted underneath the intermediate section. The oil pump has an integrated relief valve. The pump is directly driven by the sprocket on the rear end of the crankshaft.

The oil pump draws oil from a centrally located nozzle in the sump.

The pump increases the pressure of the oil for lubrication, cooling and hydraulic functions.

Oil filter module

Fig. 141: Identifying Oil Filter Module
Courtesy of VOLVO CARS CORPORATION

The oil filter module consists of an oil filter reservoir and an oil cooler. It is mounted on the intermediate section. The oil filter module is element based and can be taken apart.

The oil cooler is connected to the coolant system. Coolant is led through the oil cooler.

COOLING SYSTEM

Fig. 142: Identifying Cooling System
Courtesy of VOLVO CARS CORPORATION

The coolant pump shell is integrated in the timing cover. The pump wheel is still driven by the auxiliary unit's transmission.

The coolant pump pumps coolant through the cylinder block, and also cools the cylinder head, cylinder sleeves, spark plug wells, intake ducts and fuel injection nozzles.

The coolant flows in at the coolant pump and passes through a number of channels before it collects and then flows out to the thermostat housing. If the thermostat housing is closed, the coolant passes via the by-pass channel directly to the coolant pump to then circulate through the cylinder block again.

For the turbocharged engine, the task of the cooling system is to supply the turbocharger with coolant.

Coolant pump and drive gear

Fig. 143: Identifying Coolant Pump And Pulley
Courtesy of VOLVO CARS CORPORATION

Alternator/clutch

Fig. 144: View of Alternator and Freewheel
Courtesy of VOLVO CARS CORPORATION

The belt pulleys on alternator and intermediate shaft have improved surface treatment.

On the alternator shaft between alternator and intermediate shaft there is a clutch with a freewheel (one-way clutch) at each end. The function is to filter the engine's different irregular shape and thus avoid gear rattle/noise in the geartrain.

In connection with introduction of **EHPAS** (electric servo pump), the belt-driven servo pump with its heavy steel belt pulley is discontinued as well as the clutch for the coolant pump. The reduced rotating moment of inertia means more freewheeling, primarily when idling.

To reduce/avoid wear, the drive gears' outer ring (against the one-way clutch's friction band), are treated with nitride.

AC bracket

Fig. 145: Identifying A/C Compressor Bracket
Courtesy of VOLVO CARS CORPORATION

The AC compressor's fastening bracket is simplified. Earlier solution with a main bracket and three separate stays, is replaced by a modified bracket which has the front reinforcement stay integrated and a new fastening point in the transmission. The change means, except that the fastener assembly has 9 fewer bolts, that the installation method becomes easier and there is no longer a need for any special tools when assembling.

CRANKCASE VENTILATION

Fig. 146: Identifying Crankcase Ventilation System
Courtesy of VOLVO CARS CORPORATION

The crankcase ventilation is maintained internally in the engine.

An oil separator is on top of the engine's camshaft cover. It separates the oil drops from the air in the crankcase. The drops are collected in a separator and flow back inside the engine to the oil pan. This prevents extra weight and space for external pipes.

AUXILIARY UNIT TRANSMISSION

Fig. 147: Auxiliary Unit Drive
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Servo pump (only XC90)	4	Intermediate shaft
2	Guide pulley	5	Belt tensioner
3	Air conditioning (A/C) compressor	6	Coolant Pump

The auxiliary units are located at the upper edge of the cylinder block, above the transmission. They are driven by two systems, a Poly-V-belt driven system and a clutch system. These two systems are driven by the intermediate shaft transmission.

The belt system consists of a 6-ribbed Poly-V belt, an automatic belt tensioner and a guide pulley. This system drives the servo pump and AC compressor. The coolant pump is driven by the servo pump via the clutch system.

TURBOCHARGER (TC)

NOTE: Only applies to turbocharged engines.

Fig. 148: View of Turbocharger System
Courtesy of VOLVO CARS CORPORATION

The exhaust gases enter via the manifold (1) down to the turbine housing (8) and out to the exhaust system via a downpipe and catalytic converter.

The turbine expels the exhaust gases and rotates the compressor wheel (3). The compressor wheel creates a certain amount of suction using the intake air. This intake air enters the compressor via the air filter and uses a rotational movement to speed up the air, creating the boost pressure. The air then continues into the intake system via the charge air pipe and charge air cooler.

The electronically controlled By-pass valve (4) then controls the boost pressure in the turbocharger by determining the amount of exhaust gases which must pass the turbine. The turbine transfers drive to the compressor. The wastegate valve (2) is a membrane which equalizes the pressure of the intake and exhaust air to eliminate noise.

The turbocharger is lubricated by the engine's oil system (7). The oil system also acts as a supplement to the coolant system (5 and 6).

EXHAUST MANIFOLD / CATALYTIC CONVERTER

Fig. 149: Identifying Manifold With Catalytic Converter
Courtesy of VOLVO CARS CORPORATION

Exhaust manifold/**CCC** (**C** lose **C** oupled **C** atalyst) and front exhaust pipe/catalytic converter for engine are improved with regards to weight and efficiency. Heat shield plates are modified.

Manifold with catalytic converter

The catalytic converter's cross-section is changed from oval to round, which means better contact pattern of the exhaust flow against the catalytic converter's substrate. This means that the amount of precious metals in the coating on the catalytic converter can be reduced at the same time as the emission standards are fulfilled. In addition to a great cost-saving, reducing the need for precious metals also results in less environmental impact.

The outlet flange is changed from a thickness of 8 mm with threaded holes (x4) to a 4 mm thick plate with press bolts (x4). This gives weight and cost-savings. Gaskets are changed to 1.2 mm flat gaskets.

Downpipe/Catalytic converter

The catalytic converter's inlet flange is also changed from 8 mm to 4 mm thick, which gives a weight and cost-saving. The bellows is more flexible which gives less noise from resonance and vibrations as well as longer service life. Also, the rear catalytic converters have a reduced amount of precious metals in the substrate's coating at the same time as the emission standards still are fulfilled, which gives another big cost-saving.

OVERVIEW

Fig. 150: ENGINE (B6324S5; 2011-2012)
Courtesy of VOLVO CARS CORPORATION

The engine has been developed by Volvo.

It is a 6 cylinder transverse in-line engine with a cylinder capacity of 3.2 L for naturally aspirated engines and 3.0 L for turbocharged engines.

After having been relatively unchanged since the introduction 0620, this engine family has been updated on several points. Most modifications have their basis in an effort to achieve lower fuel consumption and thus less environmental impact.

Engine power has increased, at the same time as fuel consumption has decreased.

- B6304T4: (ULEV2 Ultra Low Emission Vehicle): 300(US)/ 304 hp / 440 Nm
- B6324S4 (PZEV - Partial Zero Emission Vehicle): 230(US) 233 hp (torque unchanged 300 Nm)
- B6324S5 (ULEV - Ultra Low Emission Vehicle): 240(US) /243 hp (torque unchanged 320 Nm)

All of these engines meet the emission standards for Euro5.

The engines' idle speed 650 rpm.

The engine is extremely compact. When it was introduced it was the shortest 6-cylinder engine of 3.2 L on the

market. Conventional straight 6-cylinder engines are too long to fit between the collision members in the engine compartment. The special design of this engine solves the problem.

The engine has an extremely short drive train, its length is only 625 mm from the front edge of the engine block to the rear edge of the carrier plate.

Great attention has been paid to creating a very rigid engine. Middle part, cylinder block and cylinder head have been structurally optimized to combine low weight with high rigidity.

Even the camshaft cover is structurally optimized.

The engine has double overhead camshafts and 24 valves.

Camshafts, AC-compressor, coolant pump and alternator are driven by an auxiliary unit drive, mounted on the back of the engine.

This placement of the auxiliary unit drive enables new possibilities for creating a good collision-protecting structure around the straight 6-cylinder drive unit. In the latest update of the engine family the servo pump has been replaced by an electrically driven pump (EHPAS).

The entire engine block and the cylinder head is made from aluminum.

The engine has a compact "pent-roof" designed combustion chamber and V-arranged valves. This gives optimal and fast filling and direct flushing via the inlet manifold followed by the combustion chamber (cross-flow) and the exhaust channel.

The squish surfaces together with the centrally positioned spark plug provide optimal combustion of the air/fuel mixture, low knock sensitivity and low, stable exhaust emissions.

The engine's firing order is 1 - 5 - 3 - 6 - 2 - 4. The firings occur every 120 degrees that the crankshaft rotates.

ENGINE (B8444S; 2005-2011)

DESIGN

ENGINE BLOCK

Fig. 151: Engine (B8444S; 2005-2011)
Courtesy of VOLVO CARS CORPORATION

The cylinder heads and valve covers are made of aluminum.

The seal between the cylinder head and cylinder block occurs using two cylinder head gaskets, one for each cylinder head. The cylinder head gasket is made up of three layers of stainless steel. Two outer and a center which act as a seal around the cylinders. The outer surfaces of the gasket are covered by a rubber layer which functions as a seal. The seal between the other planes is made using liquid gasket.

Fig. 152: Identifying Cylinder Bank Offset
Courtesy of VOLVO CARS CORPORATION

The engine has two cylinder banks. The left cylinder bank is slightly offset compared to the right. This allows the use of the vehicle's existing member system and crumple zones.

The engine has double pairs of overhead camshafts - one intake camshaft and one exhaust camshaft in each cylinder head. The camshafts are chain-driven.

Fig. 153: Identifying Cylinder Number
Courtesy of VOLVO CARS CORPORATION

The cylinders are numbered in the order in which they are installed on the crankshaft when seen from the front (from the camshaft's timing gear).

Fig. 154: View of Four Valves Per Cylinder
Courtesy of VOLVO CARS CORPORATION

The engine has four valves per cylinder. The valves are angled at 19 degrees. The valve diameter of the intake valves is 35 mm and the exhaust valve's is 30 mm. The valves are stellite coated. The valve stem diameter for both inlet and exhaust is 5.5 mm.

The combustion chamber is the "Pent roof" type. Together with the V arranged valves this gives optimal and fast filling and direct flushing via the intake channel followed by the combustion chamber (cross-flow) and exhaust channel.

The squish surfaces together with the centrally positioned spark plug provide optimal combustion of the air/fuel mixture, low knock sensitivity and low, stable exhaust emissions.

CYLINDER HEAD

Fig. 155: Identifying Cylinder Head
Courtesy of VOLVO CARS CORPORATION

The engine's two cylinder heads are in principle mirror images of each other. The cast oil galleries in the cylinder head ensures good oil supply to the camshafts and the mechanical valve lifters.

CYLINDER BLOCK

Fig. 156: Identifying Cylinder Block
Courtesy of VOLVO CARS CORPORATION

The cylinder block is made of cast aluminum. It has a stiff rib structure for better rigidity and thereby better sound and vibration properties.

The cylinder block has eight cast-iron cylinder liners molded into the cylinder block. They cannot be replaced.

The coolant jacket goes halfway down the cylinders to ensure quicker heating and thereby reduce hydrocarbon emissions. Certain sections of the coolant jacket are deeper to reduce the risk of the cylinder deformation.

INTERMEDIATE SECTION

Fig. 157: Identifying Intermediate Section
Courtesy of VOLVO CARS CORPORATION

The intermediate section is made of aluminum. The crankshaft bearing caps are integrated in the intermediate section. The bearing caps are made of cast iron. The caps are fixed with four screws per cap.

OIL SUMP

Fig. 158: Identifying Oil Pan
Courtesy of VOLVO CARS CORPORATION

The oil pan is made of pressed aluminum. It has baffles to prevent the oil moving too much. Because of the exterior dimensions of the engine, the oil pan has a unique shape in order to hold the necessary oil volume. The oil pan is made in two parts for manufacturing reasons.

An electric oil level sensor is located in the pan. There is also a normal oil dipstick for manual checks of the oil volume.

PISTONS AND CONNECTING RODS

Fig. 159: Identifying Piston And Connecting Rod
Courtesy of VOLVO CARS CORPORATION

The pistons are cast and are made of a light metal alloy. The piston mantle is coated with graphite. The first groove is hard anodized to minimize wear.

The piston is equipped with two compression rings and a three piece oil ring.

The connecting rods are forged. The contact surface between the bearing cap and the connecting rod is treated. Guide pins contribute to good alignment. The connecting rod bearings are aluminum bearings. The bearings are lead free.

The piston transfers the compressive force of the ignited fuel/air mixture to the crankshaft via the connecting rod. The piston rings form a seal so that the fuel/air mixture does not force its way down past the piston. The top ring ensures a seal between the piston and the cylinder. The second ring also seals and scrapes away any oil during the downward movement of the piston. The third ring makes sure the oil drains via the drain hole.

The pistons are oil-cooled. This is necessitated by the short distance between the piston head and the top piston ring.

CRANKSHAFT AND BALANCER SHAFT

Fig. 160: Identifying Crank and Balancer Shafts
Courtesy of VOLVO CARS CORPORATION

1. Balancer shaft
2. Crankshaft

The crankshaft is made of carbon steel with a nitride hardened surface. The crankshaft bearings have separate caps, the intermediate section of the cylinder block makes up the lower half of the bearing. The crankshaft has five main bearings where the third also acts as an axial bearing. The main bearings are aluminum bearings.

The crankshaft has offset pins. Two connecting rods are mounted on each crankshaft pin with an internal offset of 30°.

Big-end bearings and axial bearings are lead-free.

Two splined joints are located at the front end of the crankshaft, the inner one drives the oil pump. The timing chain gear is located on the outer joint.

The crankshaft has a three part vibration damper consisting of a hub and two active masses. The hub is located between the inner and outer masses. The crankshaft vibration damper drives the auxiliary belt.

The 60 degree angle between the two cylinder banks means that the engine is equipped with a balancer shaft.

This is to give the vibration characteristic which corresponds to a 90 degree V8. The balancer shaft is located in the center of the engine, above the crankshaft. The balancer shaft rotates in the opposite direction to the crankshaft. It is driven by the crankshaft using the same chain that drives the intake camshafts. The balancer shaft rotates at the same speed as the crankshaft.

The balancer shaft is made of spherolitic cast iron (nodular iron).

CAMSHAFTS AND VALVE SYSTEM

Fig. 161: Identifying Camshafts
Courtesy of VOLVO CARS CORPORATION

The engine has double pairs of overhead camshafts, one intake camshaft and one exhaust camshaft in each cylinder bank. The intake camshafts are located in the middle of the engine while the exhaust camshafts are placed on the outside.

The camshafts are made of cast iron. They are hollow to keep the weight down. Each camshaft pair is mounted in its respective cylinder head with five loose bearing caps per camshaft.

The camshafts work directly on the valve stem via the valve lifters. There is a certain amount of play (valve play) between the valve depressors and the cam lobes. Valve play is adjusted to make up for the longitudinal differences between the valve and cylinder head that occur upon warm-up. The valve depressors are solid and made of steel.

Each camshaft has a CVVT unit. The reset angle is 40.5 crankshaft degrees for the intake camshafts and 42.5 crankshaft degrees for exhaust camshafts.

- Intake camshafts open -8° to 32, 5° before top dead center (BTDC) and close 60° to 19.5° after the bottom dead center.
- Exhaust camshafts open 62° to 19.5° before bottom dead center and close -10° to 32.5° after the top dead center (TDC).

CAMSHAFT CHAIN DRIVE

Fig. 162: Identifying Camshaft Chain Drive
Courtesy of VOLVO CARS CORPORATION

The crankshaft drives the intake camshafts and the balancer shaft using a camshaft chain (1). The camshaft is tensioned by a hydraulic chain tensioner. The tensioner is supplied with oil from the normal lubrication system. The camshaft chain is lubricated with oil via a separate nozzle (2).

The intake camshafts in turn drive the respective exhaust camshafts via their chain (3). This intermediate drive means that the outer exhaust camshafts can have smaller pulley wheels which reduces the size of the engine. The intermediate drive chains each have their own hydraulic tensioner. The tensioner is supplied with oil from the normal lubrication system.

A cover seals the area for the camshaft chain drive.

The system requires no maintenance during the entire life of the engine. Both the chain guide and the chain tensioner have plastic inserts on the treads for quiet operation.

LUBRICATION SYSTEM

Fig. 163: View of Lubrication System
Courtesy of VOLVO CARS CORPORATION

The lubrication system has a large supply line with a strainer which prevents large contaminants from reaching the oil pump.

The oil pump (1) is driven by the crankshaft. The oil pump is a rotor pump with integrated pressure control valve. The valve opens at approximately 5.0 bar and prevents excessively high pressure which could damage the oil cooler.

The oil cooler is a flat oil cooler. The space for oil and coolant is divided alternately between the plates.

The oil filter (2) is a loose filter element placed in a housing. The overflow valve for a blocked filter is in the cover.

FUEL SYSTEM

Fig. 164: Identifying Fuel Injection System
Courtesy of VOLVO CARS CORPORATION

A specially designed fuel system is used to reduce the height of the engine.

The fuel system is made of stainless steel to ensure reliability. The fuel hose is made of nylon to reduce the weight of the engine.

INTAKE SYSTEM

Fig. 165: View of Two Mode Induction System
Courtesy of VOLVO CARS CORPORATION

An induction system with two modes is used to increase torque at low engine speed. Both the intake manifold and the equalizer tank are made of aluminum.

A moveable damper is located in the common area of the intake pipe. The damper separates the area lengthways into two chambers. The damper is controlled from completely closed to completely open, with no intermediate position. Up to an engine speed of 3200 rpm the damper is closed and the damper is open at higher engine speeds.

By dividing the area into two separate chambers, the area functions as two secondary intake pipes. The primary pipes are the cast pipes which lead to the inlet valves of the respective cylinder's intake valves from the collection volume. A closed damper provides secondary pipes while an open damper gives short secondary pipes.

Engine speeds up to 3200 rpm

The combined length and volume of the pipes is tuned to the piston movement and the valve opening times. The result is that the air pulses in time with the valve opening times. this means that the air is pumped into the cylinders when the inlet valves are open. The system gives a high a volumetric efficiency, that is, fills the cylinders and therefore produces a high torque.

In order not to disturb the pulse frequency the left chamber supplies 1, 4, 6 and 7 while the right chamber

supplies cylinders 8, 3, 5 and 2, this is to interact with the firing order 1-8-4-3-6-5-7-2.

Engine speed (RPM) greater than 3200 rpm

At engine speeds greater than 3200 rpm the throttle opens. At these speeds the character of the pulses change character at the same time as a greater volume is required to supply the cylinders with air. The whole area/volume now supplies all cylinders. The common volume and the shape of the pipes is designed to exploit the pulses which occur in this engine speed (rpm) range.

If the damper does not open at 3200 rpm there is marked deterioration in performance from 3200 rpm up to 5000 rpm.

THROTTLE BODY

Fig. 166: Identifying Throttle Body
Courtesy of VOLVO CARS CORPORATION

The throttle body is made of cast aluminum. The position sensor, which is located under the plastic cover, reads the position of the throttle disc and two engine connections that turn the throttle disc. The throttle disc position is determined by how much the driver depresses the accelerator pedal. The throttle body is warmed via engine coolant.

COOLING SYSTEM

Fig. 167: Schematic of Cooling System

2. Right cylinder head
3. Electric coolant pump
4. Heat exchanger (passenger compartment)
5. Preheating crankcase ventilation
6. Throttle body
7. Upper cooling hose
8. Bypass pipe
9. To cylinder head
10. Radiator
11. Oil cooler
12. Lower cooling hose
13. Thermostat housing
14. Coolant pump
15. Left cylinder head
16. Expansion tank with level sensor
17. Air bleed circuit

The engine is cooled used reversed cooling, that is, the cylinder head is cooled first. The system gives fast heating and contributes to reducing emissions.

The radiator is made of aluminum to withstand thermal fatigue as the radiator is alternately cooled with cold air and heated with hot coolant. The cooling system is regulated by a mechanical thermostat, which is located in the thermostat housing. The thermostat housing, in turn, is located on the inlet side of the coolant pump, between the radiator and the coolant pump.

The heart of the thermostat is a wax body which expands when energy, in the form of heat, is applied. A jiggle pin is located in the thermostat. Any air in the cooling system can be evacuated from the system using the jiggle pin.

Cold air is sucked through the cooler using an electric engine cooling fan installed on the fan shroud behind the radiator. The engine cooling fan is brushless and has six fixed stages. It is controlled by the engine control module (ECM).

Oil cooler

The oil cooler is round and has an inlet and outlet for oil as well as for coolant. The oil cooler is structured in layers, with alternating layers of coolant and oil flow. Because the oil cooler has very small slits, there is a large pressure drop here.

AUXILIARIES BELT

Fig. 168: Auxiliaries Belt Routing
Courtesy of VOLVO CARS CORPORATION

1. Generator (GEN)
2. Belt tensioner
3. Servo pump
4. Water pump
5. air conditioning (A/C) compressor.

All auxiliary units, the alternator, servo pump and A/C compressor are directly mounted in the engine block. They are driven by the vibration damper via an auxiliaries belt. This solution gives a compact design.

The coolant pump is also driven by the auxiliaries belt.

The auxiliaries belt has a mechanical belt tensioner.

EXHAUST SYSTEM

Fig. 169: Identifying Exhaust System
Courtesy of VOLVO CARS CORPORATION

HINT: The illustration displays the exhaust system for the XC90.

The exhaust system is made of double-layer sheeting to keep the temperature down. The inner sheet is 1.0 mm thick while the outer is 1.5 mm thick. There is 4-8 mm of space between the sheets.

An exhaust system extends from each cylinder bank. Each side consists of a manifold with close-coupled catalytic converter, pipes, bellows and a rear catalytic converter. Both sides join to form a common pipe after the rear catalytic converter.

The pipes are designed in such a way that the gas flow from the cylinders is not disruptive and there is good flow distribution to the catalytic converters. Bellows in front of the two rear catalytic converters absorb engine movements and compensate for manufacturing and assembly tolerances.

A catalytic converter consists of perforated stones of ceramic or metal (known as substrate). These are coated with a surface enlarger (washcoat) on which the precious metals platinum, palladium and rhodium, the catalysts, are applied.

The catalytic converter has an extra heat shield toward the radiator fan to reduce the temperature.

Four oxygen sensors are used to regulate the engine and monitor the catalytic converter. There is an oxygen sensor upstream and downstream of each close-coupled catalytic converter.

The two banks are almost exactly the same length to ensure good sound. The exhaust system provides the engine's characteristic V8 sound.

FUNCTION

CRANKSHAFT MOVEMENT

Fig. 170: View Of Crankshaft Relationships
Courtesy of VOLVO CARS CORPORATION

To achieve an even running and characteristic V8 sound, the ignition impulse interval is 90 crankshaft degrees. To reach this in an engine with a 60 degree angle between the cylinder banks, the crankshaft pins for the opposing cylinder pairs are offset by 30 degrees.

Fig. 171: Identifying Crankshaft Pins Offset By 30 Degrees.
Courtesy of VOLVO CARS CORPORATION

When the left hand piston is at the top, the right hand piston is halfway between the upper and lower turn points. This is because the crankshaft pins are internally offset by 30 degrees.

Fig. 172: Crankshaft Rotated 90 Degrees
Courtesy of VOLVO CARS CORPORATION

When the crankshaft has rotated 90 degrees the right hand piston is at the top and the left hand piston is halfway between the upper and lower turning points.

Fig. 173: Ignition Impulses Occur Every 90° Crankshaft Rotation
Courtesy of VOLVO CARS CORPORATION

When the crankshaft has rotated a further 270 degrees the left hand piston is at the top and the right hand piston is halfway between the upper and lower turning points.

By offsetting the crankshaft pins by 30 degrees in this way the ignition impulses will occur every 90th crankshaft degree.

Fig. 174: Identifying Ignition Impulses
Courtesy of VOLVO CARS CORPORATION

The Example shows the principle for cylinder 1 and 2. With the firing order 1-8-4-3-6-5-7-2 the following occurs:

- Cylinder 1 fires.
- The crankshaft then rotates 360°+270°=630° until cylinder 2 fires.
- The next ignition impulse, now again for cylinder 1, occurs when the crankshaft has rotated a further 90 degrees.

LUBRICATION SYSTEM

Fig. 175: Identifying Lubrication System
Courtesy of VOLVO CARS CORPORATION

1. Cylinder head
2. Cylinder block
3. Intermediate section
4. Oil sump
5. Crankshaft
6. Oil filter
7. Camshafts

Oil is led from the oil sump via a suction nozzle to the oil pump, which is located on the crankshaft. The oil pump suction function is facilitated by a purge valve that eliminates any air from the system.

The oil is pumped on to the oil cooler system and then on to the oil filter. The oil is led from the filter through a cast oil duct in the intermediate section to the main bearings. The oil is distributed to the big-end bearings via drilled channels in the crankshaft.

The camshafts receive their oil supply via drilled channels in the cylinder block. The channels continue up through the cylinder heads where they open out on the underside of the lower half of the cylinder head. There is a cross channel in the channels to the cylinder heads which leads oil to the pistons. From here the oil is moved further via the oil channels to the intake camshaft bearings and valve lifters.

The exhaust camshaft bearings are supplied via two cast cross channels at the front of the upper halves. The oil is led via drains in the block from the cylinder heads and from the crankshaft bearings back to the oil pan.

CRANKCASE VENTILATION

Fig. 176: Identifying Crankcase Ventilation
Courtesy of VOLVO CARS CORPORATION

The system is pressure controlled and completely enclosed.

Crankcase gases flow up to both the valve covers. There is a hose connecting the valve covers. A labyrinth system of plates is installed in the valve covers. The oil in the gases condenses on the plates and drains back to the oil pan.

The ventilation is pressure controlled to retain stable pressure in the crankcase. A pressure regulator is installed on the rear edge of the right valve cover. The gases which are evacuated are led from the regulator through a hose to a connection on the inlet pipe. Coolant is circulated around the connection to prevent freezing.

The pressure in the crankcase is approximately - 0.03 bar.

COOLING SYSTEM

Fig. 177: Diagram Of Cooling System
Courtesy of VOLVO CARS CORPORATION

The combustion of fuel in the vehicle engine produces both mechanical motion and excess energy. The excess energy takes the form of heat that is led away from the engine via:

- exhaust gases
- convection to the air in the engine compartment
- transfer to the coolant in the cooling system
- the engine oil.

The thermostat (1) regulates the amount of coolant to the engine. The wax body in the thermostat expands when subjected to heat.

The coolant is pumped by the coolant pump (2) to the inlets (6) for the cylinder heads (3). The coolant flows forward through the relevant cylinder head and on through the cylinder banks back to the common outlet (4). After passing the engine the coolant flows by:

- Closed thermostat through the bypass pipe (5) back to the coolant pump without cooling off.
- Open thermostat through the radiator (7) to the coolant pump. The coolant also flows through the bypass pipe back to the coolant pump.

EXHAUST SYSTEM

Fig. 178: Identifying Exhaust System
Courtesy of VOLVO CARS CORPORATION

HINT: The illustration displays the exhaust system for the XC90.

The three-way catalytic converters clean by oxidizing carbon monoxide (CO) and hydrocarbons (HC) to water and carbon dioxide (CO_2). Nitrous oxides (NO_x) are reduced to nitrogen and water. The catalytic converter transforms over 98 percent of these substances during normal operation. Lead contaminates in the fuel can damage the catalytic converter, quickly rendering it inoperable.

OVERVIEW

Fig. 179: ENGINE (B8444S; 2005-2011)
Courtesy of VOLVO CARS CORPORATION

The engine is an 8 cylinder V-engine with 60 degrees angle between the two cylinder banks. A specially adapted exhaust system together with the offset crankshaft pins gives the characteristic V8 sound. The engine is transverse and is only available in combination with AWD.

The engine is mounted vertically on the subframe.

Displacement is 4.4 dm^3 . Each cylinder has four valves.

The engine has a variable intake system which gives high torque at low engine speeds (rpm) and high performance at high engine speeds (rpm).

The ignition system has directly installed ignition coils.

The engine has mechanical valve lifters and electronic throttle. The throttle body is heated by coolant which means that pre-heating of intake air is not required.

The engine has double pairs of overhead camshafts, driven by three maintenance-free chains.

The engine has a counter rotating balancer shaft which gives vibration free running.

The cylinder block is made of a light metal alloy.

The direction of cooling system flow allows the coolant to first cool the cylinder heads and then the engine block.

All auxiliary units, the alternator, servo pump and A/C compressor are directly mounted on the engine block.

95 RON fuel can be used for normal operation. 98 RON is recommend for maximum performance and lowest possible fuel consumption. When driving in climates hotter than +38 °C, fuel with the highest possible octane rating is recommended to ensure the best possible performance and fuel consumption.

The engine is regulated by the Engine Control Module (ECM).

ENGINE CONTROL MODULE (ECM) (B6324S; 2007-2010)

DESIGN

IGNITION SWITCH

Fig. 180: Identifying Ignition Switch
Courtesy of VOLVO CARS CORPORATION

The Engine Control Module (ECM) uses the signal from the ignition switch to detect when the ignition key has been turned to position II or III. When the key is in the ignition position (position II) or starting position (position III) a high signal (U_{bat}) is transmitted from the ignition switch to the engine control module (ECM).
The engine management system prepares for start-up (for example, temporarily activates the fuel pump (FP) relay). When the flywheel in the engine rotates, the engine speed (RPM) sensor signal is used to keep the fuel pump (FP) relay activated.

The fuse in the fusebox in the passenger compartment supplies current to the ignition switch.

The central electronic module (CEM) has diagnostics for the ignition switch.

TRANSMISSION CONTROL MODULE (TCM)

The engine control module (ECM) uses a directly connected signal from the transmission control module (TCM) in the start function (activating the starter motor).

ENGINE SPEED (RPM) SENSOR

Fig. 181: Identifying Engine Speed (RPM) Sensor
Courtesy of VOLVO CARS CORPORATION

The engine speed (RPM) sensor provides the engine control module (ECM) with information about the speed and position of the crankshaft. The engine control module (ECM) is able to use the signal from the engine speed (RPM) sensor to determine when a piston is approaching top dead center (TDC).

The signal from the engine speed (RPM) sensor is also used to check the engine for misfires. For further information, see: **MISFIRE DIAGNOSTIC**

The impulse sensor is located on the engine's flywheel side, pointing forward. The sensor is inductive with permanent magnet. When the flywheel/drive flange plate passes the impulse sensor, an alternating voltage is induced in the sensor. The generated voltage and frequency increase when the engine speed increases.

The signal varies between 0.1-100 V depending on the engine speed (RPM).

The Engine Control Module (ECM) is able to determine the engine speed (RPM) by counting the number of holes per time unit. When the reference position passes the engine speed (RPM) sensor, the voltage and frequency drop momentarily to zero, even though the engine is still running. This allows the engine control module (ECM) to determine the position of the crankshaft.

If the signal from the engine speed (RPM) sensor is incorrect or missing, the control module will use signals from the camshaft position (CMP) sensor.

The engine speed sensor can be diagnosed by the engine control module (ECM) and the sensor signal (engine speed) can be read out.

CAMSHAFT POSITION (CMP) SENSOR

Fig. 182: Identifying Camshaft Position (CMP) Sensor
Courtesy of VOLVO CARS CORPORATION

The function of the camshaft position (CMP) sensor is to detect the flanks of the camshaft rotor. The signal from the sensor is used by the engine control module (ECM) to determine the angle of the camshaft.

Each camshaft is divided into a number of flanks (segments) per camshaft revolution. A pulse wheel on the camshaft consisting of teeth (the teeth are positioned by each flank) is used by the camshaft position sensor (CMP) to detect the flanks and the position of the camshaft.

In the event of misfire or engine knock, the control module is able to determine which cylinder is misfiring or knocking using the camshaft position (CMP) sensor's signal.

Data about the camshaft position is used during camshaft control (CVVT). See: **CAMSHAFT CONTROL (CVVT)**

The sensor, which is a magnetic resistor with a permanent magnet, is grounded in the control module and supplied with 5 V from the control module. When one of the teeth on the camshaft pulse wheel passes the camshaft position (CMP) sensor, a signal is transmitted to the control module from the camshaft position (CMP) sensor. The signal varies between 0 and 5 V and is high when a tooth is in contact with the camshaft position (CMP) sensor and low when the tooth leaves the camshaft position (CMP) sensor.

There is camshaft position (CMP) sensor for each camshaft.

The camshaft sensors are located by the camshafts on the engine's left side, closest to the flywheel.

The engine control module (ECM) can diagnose the camshaft position (CMP) sensors.

KNOCK SENSOR (KS)

Fig. 183: Identifying Knock Sensor (Ks)
Courtesy of VOLVO CARS CORPORATION

The function of the knock sensor (KS) is to monitor combustion knocking from the engine. Knocking may damage the engine and reduces the efficiency of engine combustion.

If the engine control module (ECM) registers knocking from any of the cylinders, the ignition will be retarded for that cylinder at the next combustion stage. If repeated ignition retardation does not prevent knocking, the injection period will be increased. This has a cooling effect.

The sensor is made up of a piezo electrical crystal. If there is engine knock, vibrations (sound waves) spread through the cylinder block to the knock sensor (KS). The resultant mechanical stress in the piezo electrical material in the knock sensors generates a voltage. This signal is transmitted to the Engine Control Module (ECM). The signal corresponds to the frequency and amplitude of the sound waves. This allows the Engine Control Module (ECM) to determine if the engine is knocking. The camshaft position (CMP) sensor and engine speed (RPM) sensor are used to determine the operating cycle of the engine (which cylinder is igniting) and thereby which cylinder is knocking.

The knock sensors (KS) are located on the cylinder block under the intake manifold.

The engine control module (ECM) can diagnose the knock sensors (KS).

ENGINE COOLANT TEMPERATURE (ECT) SENSOR

Fig. 184: Identifying Engine Coolant Temperature (ECT) Sensor
Courtesy of VOLVO CARS CORPORATION

The engine coolant temperature (ECT) sensor checks the temperature of the engine coolant. The temperature of the engine coolant is required so that the engine control module (ECM) can regulate:

- the injection period
- the idle speed
- the engine cooling fan (FC)
- the ignition advance
- engagement and disengagement of the A/C compressor
- diagnostic functions.

The sensor is a negative temperature coefficient (NTC) type which is supplied with power from the control module (signal) and is grounded in the control module.

The resistance in the sensor changes depending on the temperature of the coolant. Depending on the resistance in the sensor, voltage (signal) is transmitted to the engine control module (ECM). The lower the temperature the higher the voltage (high resistance). A high temperature results in low voltage (low resistance).

The engine temperature sensor is located by the thermostat under the intake manifold.

The engine temperature sensor can be diagnosed by the engine control module (ECM) and the sensor value can be read out.

MASS AIR FLOW (MAF) SENSOR/INTAKE AIR TEMPERATURE (IAT) SENSOR

Fig. 185: Identifying Mass Air Flow (MAF) Sensor/Intake Air Temperature (IAT) Sensor
Courtesy of VOLVO CARS CORPORATION

Overview

The mass air flow (MAF) sensor is a combined sensor and contains two sensors in the same component:

- Mass air flow (MAF) sensor
- intake air temperature (IAT) sensor.

The mass air flow sensor is located by the air filter housing.

Mass air flow (MAF) sensor

The mass air flow (MAF) sensor gauges the air mass sucked into the engine. It continuously transmits signals to the engine control module (ECM) about the mass of the intake air. This data is used by the engine control module (ECM) to calculate:

- the injection period
- the fuel pressure
- the ignition timing
- the engine load.

The gearbox control module (TCM) also uses this data for its gear shift calculations. This data is transmitted to the gearbox control module (TCM) from the engine control module (ECM) via the high speed side of the Controller area network (CAN).

The mass air flow (MAF) sensor is a hot wire type. Unlike other hot wire types, the mass air flow sensor in the Denso system uses a hot wire which has a ceramic casing. This eliminates the need for a clean burn function.

The mass air flow (MAF) sensor is supplied with battery voltage by the system relay and is grounded in the engine control module (ECM). The signal from the sensor is analog and varies between approximately between 0.5 - 4.5 V. Low air flow (low mass) results in low voltage, high air flow (high mass) gives high voltage.

The mass air flow (MAF) sensor can be diagnosed by the engine control module (ECM) and the sensor signal can be read off.

Intake air temperature (IAT) sensor

The temperature sensor checks the temperature of the intake air in the intake manifold. This data is used by the engine control module (ECM) to calculate injection period. The control module also controls certain diagnostic functions using the signal from the temperature sensor.

The sensor, which is an NTC resistor, is grounded in the control module and supplied with power (signal) from the control module.

The resistance in the sensor changes according to the intake air temperature. This provides the control module with a signal of between 0.5 - 5 V. The lower the temperature the higher the voltage (high resistance). A high temperature results in low voltage (low resistance).

The temperature sensor can be diagnosed by the engine control module (ECM) and the sensor signal can be read off.

HEATED OXYGEN SENSORS (HO2S)

Front heated oxygen sensor (HO2S)

Fig. 186: Identifying Heated Oxygen Sensors (HO2S)
Courtesy of VOLVO CARS CORPORATION

CAUTION: The air lines for the heated oxygen sensors (HO2S) must not be trapped or damaged in any way. The connectors for the heated oxygen sensors (HO2S) must not be greased under any circumstances. The oil in the grease would disrupt the reference air and the function of the heated oxygen sensors (HO2S).

Front heated oxygen sensor (HO2S) is used to provide the engine control module (ECM) with information about the remaining oxygen content of the exhaust gases before the three-way catalytic converter (TWC). This is so that the engine control module (ECM) can continually check the combustion so that lambda=1 is achieved. lambda=1 is the ideal fuel-air ratio, with 14.7 kg air per 1 kg fuel.

The heated oxygen sensor uses current regulation and its signal characteristic is linear. With a linear signal characteristic, the amplitude of the signal curve is low when changing the oxygen content in the exhaust gases. The probe consists of a preheating element and the actual lambda sensor. The lambda sensor is an oxygen sensitive ceramic body consisting of zirconium oxide. The control module supplies power to the ceramic body, which reacts to the oxygen content of the exhaust gases. This in turn affects the signal to the engine control module (ECM). In order to determine the oxygen content in the exhaust pipe, the heated oxygen sensor needs reference air from the surrounding air. This reference air reaches the heated oxygen sensor via the air lines.

There are two front heated oxygen sensors; one for bank 1 and one for bank 2.

The heated oxygen sensors (HO2S) are diagnosed by the engine control module (ECM) and the signals from them can be read off. For further information, see: **HEATED OXYGEN SENSOR (HO2S) DIAGNOSTIC**

The control module can be used to read off the calculated lambda value from the heated oxygen sensor (HO2S) signal.

Rear heated oxygen sensor (HO2S)

Fig. 187: Identifying Heated Oxygen Sensors (HO2S)
Courtesy of VOLVO CARS CORPORATION

CAUTION: The air lines for the heated oxygen sensors (HO2S) must not be trapped or damaged in any way. The connectors for the heated oxygen sensors (HO2S) must not be greased under any circumstances. The oil in the grease would disrupt the reference air and the function of the heated oxygen sensors (HO2S).

The rear heated oxygen sensor (HO2S) is used to provide the Engine Control Module (ECM) with information about the remaining oxygen content of the exhaust gases behind the three-way catalytic converter (TWC). This information is used by the Engine Control Module (ECM) to check the function of the three-way catalytic converter (TWC). This check is carried out when the conditions for the Rear heated oxygen sensors (HO2S) are used to provide the Engine Control Module (ECM) with information about the remaining oxygen content of the exhaust gases behind the three-way catalytic converter (TWC). This information is used by the Engine Control Module (ECM) to check the function of the three-way catalytic converter (TWC). This check is carried out when the conditions for the catalytic converter diagnostics have been met. Rear heated oxygen sensors (HO2S) have no direct effect on regulation of the fuel/air mixture. However the Engine Control Module (ECM) uses the signal to optimize the signal from front heated oxygen sensors (HO2S). For further information, see: **THREE-WAY CATALYTIC CONVERTER (TWC) DIAGNOSTICS**

The heated oxygen sensor (HO2S) uses voltage control. The signal characteristic is binary. With a binary signal characteristic, the amplitude of the signal curve changes considerably when changing the oxygen content in the exhaust gases. Otherwise its components and function are the same as the front heated oxygen sensor (HO2S).

There are two rear heated oxygen sensors; one for bank 1 and one for bank 2.

The heated oxygen sensors (HO2S) can be diagnosed by the engine control module (ECM), and signals from them can be read off

Preheating of the heated oxygen sensors (HO2S)

The heated oxygen sensor (HO2S) only functions above a certain temperature, approximately 300 °C. The normal operating temperature is between 300-900 °C. The heated oxygen sensors (HO2S) are electrically pre-heated so that operating temperature is rapidly reached. They are also pre-heated to ensure that the heated

oxygen sensors (HO2S) maintain a normal operating temperature and to prevent condensation which could damage the heated oxygen sensor (HO2S).

The sensor's heating coil consists of a PTC-resistor. The heating coil is supplied with voltage from the system relay and is grounded internally in the Engine control module (ECM).

When the control module grounds the connection, a current will pass through the PTC-resistor. When the heated oxygen sensor is cold, the resistance in the PTC-resistor is low and a high current will pass through the circuit. To avoid condensation damage to the heated oxygen sensor the current is pulsed from the Engine control module (ECM) in the beginning. Depending on the temperature, consideration is given to dew point and, as the temperature increases in the PTC-resistor, the resistance increases in the resistor, the current is reduced and transfers gradually to non-pulsing current.

The heating period for the front heated oxygen sensor is short, approx. 20 seconds.

The heater element heats the heated oxygen sensors (HO2S) to approximately 350 °C. The probes maintain this as a minimum temperature.

The engine control module (ECM) can diagnose the heater element.

BRAKE LIGHT SWITCH

Fig. 188: Identifying Brake Light Switch
Courtesy of VOLVO CARS CORPORATION

The purpose of the brake light switch is to provide the engine control module (ECM) with information indicating whether the brake pedal is depressed.

When the brake pedal is pressed down, a signal is sent to the Engine control module (ECM), which turns off the cruise control (if it is activated). The brake pedal position sensor also handles the function for switching off cruise control.

The brake light switch is supplied with power from the ignition switch (terminal 30). When the brake pedal is depressed the switch closes and a high signal (12 V) is transmitted to the engine control module (ECM).

The stop lamp switch can be diagnosed by the engine control module (ECM) and its status (depressed or not)

can be read off.

The brake light switch is on the pedal box by the brake pedal.

A/C PRESSURE SENSOR

Fig. 189: Identifying A/C Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

The air conditioning (A/C) pressure sensor detects the pressure in the high-pressure side of the air conditioning (A/C) system. See: **REGULATING THE AIR CONDITIONING (A/C) COMPRESSOR**

The sensor is linear. It is grounded in the control module and supplied with a 5 Volt current from the control module. A linear signal (between 0-5 V depending on the pressure in the air conditioning (A/C)) is transmitted to the control module. Low pressure produces low voltage, high pressure produces high voltage. The air conditioning (A/C) pressure sensor is affected by the pressure in the high-pressure pipe of the air conditioning (A/C) system (narrow pipe).

The engine control module (ECM) can diagnose the air conditioning (A/C) pressure sensor. The sensor value can be read off using the diagnostic tool.

ACCELERATOR PEDAL (AP) POSITION SENSOR

Fig. 190: Identifying Accelerator Pedal (AP) Position Sensor

Courtesy of VOLVO CARS CORPORATION

The function of the accelerator pedal position sensor is to provide the engine control module (ECM) and central electronic module (CEM) information on the position of the accelerator pedal. The engine control module (ECM) uses this data to deploy the shutter in the throttle unit to the correct angle.

The accelerator pedal position sensor consists of a plastic housing with two potentiometers, and an Analog/Digital converter. The potentiometers are connected to a common shaft which is affected by the position of the accelerator pedal.

The accelerator pedal (AP) position sensor transmits an analog and a pulse width modulated (PWM-signal to the engine control module (ECM). These signals indicate the position of the accelerator pedal (AP). The digital signal is generated by the sensors Analog/Digital converter.

The analog and digital signals are used at the same time by the engine control module (ECM) to regulate the throttle shutter angle.

The power supply to the two potentiometers is different. The analog potentiometer is supplied with 5 V via the engine control module (ECM). The digital potentiometer is supplied with 12 V via the system relay and is grounded in the car body.

The digital signal is used together with the analog signal for diagnostics of the accelerator pedal position sensor.

Accelerator pedal (AP) position sensor's signals can be read off.

A diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects a difference between the analog and digital signals. The engine control module (ECM) then uses a minimal value to ensure the function (limp home).

The accelerator pedal (AP) position sensor is located on the accelerator pedal bracket.

OUTSIDE TEMPERATURE SENSOR

Fig. 191: Locating Outside Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

The outside temperature sensor detects the temperature in the surrounding air. The signal is used by the engine control module (ECM) as a substitute value in the event of a fault in certain components or functions and to control certain diagnostic functions.

The sensor is a negative temperature coefficient (NTC) type which is supplied with power from the control module (signal). The resistance in the sensor changes with the outside temperature. This alters the signal to the engine control module (ECM). The lower the temperature the higher the voltage (high resistance). A high temperature results in low voltage (low resistance).

The outside temperature sensor is positioned in the left door mirror.

The outside temperature sensor can be diagnosed by the engine control module (ECM) and the sensor value can be read off.

ENGINE COOLANT LEVEL SENSOR

Fig. 192: Identifying Engine Coolant Level Sensor
Courtesy of VOLVO CARS CORPORATION

The function of the engine coolant level sensor is to alert the driver if the engine coolant level in the expansion tank is too low.

The sensor is a magnetic reed switch, which is enclosed in a pipe on the bottom of the expansion tank. Around the pipe, on the inside of the expansion tank is a float. This float contains a magnet. When the engine coolant level is above minimum, the float is too high in the tank to affect the switch. However if the engine coolant level falls below the minimum level, the magnetic field acts on the switch.

The sensor is supplied with voltage (signal) from the engine control module (ECM) and grounded in the body. When the engine coolant level in the expansion tank is over a certain level the circuit closes, which produces a low signal. When the engine coolant level is below a certain level the circuit is opened by the engine coolant level sensor, which produces a high signal. When the engine control module (ECM) detects a high signal the information about low engine coolant level is transmitted via the Controller area network (CAN) to the driver information module (DIM), which warns the driver.

NOTE: There are no functions controlled by the engine which are directly connected to

the low coolant level warning lamp. The Engine Control Module (ECM) only transfers the signal which is used by the Driver Information Module (DIM).

The engine control module (ECM) cannot diagnose the engine coolant level sensor.

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR, INTAKE

Fig. 193: Identifying Manifold Absolute Pressure (Map) Sensor
Courtesy of VOLVO CARS CORPORATION

The manifold absolute pressure (MAP) sensor detects quick pressure changes in the intake manifold after the throttle. The signal from the sensor is used by the engine control module (ECM) to supplement the mass air flow (MAF) sensor when calculating injection period.

Manifold absolute pressure (MAP) sensor, intake is located on the lower part of the intake manifold at the electronic throttle module.

The semi-conductor sensor is grounded in the control module and is supplied with power from the control module.

The resistance in the intake manifold moves the silicone membrane in the sensor, giving a signal of 0.5 - 4.5 V to the control module. Low pressure results in low voltage, high pressure gives high voltage.

The pressure sensor can be diagnosed by the engine control module (ECM) and the sensor signal can be read off.

FUEL PRESSURE SENSOR / FUEL TEMPERATURE SENSOR

Fig. 194: Identifying Fuel Pressure Sensor / Fuel Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

Overview

The fuel pressure, fuel temperature sensor is combined and consists of both the fuel pressure sensor and the fuel temperature sensor. The sensor detects the fuel pressure (the absolute pressure) and the temperature of the fuel in the fuel rail.

The fuel pressure sensor is located on the fuel rail's end.

The fuel pressure-/fuel temperature sensor can be diagnosed by the engine control module (ECM) and its signals (pressure and temperature) can be read off.

Fuel pressure sensor

The pressure sensor is a Piezo resistive type resistor, the resistance of which changes with the pressure. Depending on the pressure in the fuel rail, an analog signal of 0 - 5 V is transmitted to the engine control module (ECM). Low pressure results in low voltage, high pressure gives high voltage.

The engine control module (ECM) then uses this signal to adjust the pressure in the fuel rail using the fuel pump control module. See also: **FUEL PRESSURE REGULATION**

The pressure sensor is supplied with 5 V and grounded in the engine control module (ECM). The pressure sensor transmits a signal indicating the fuel pressure to the engine control module (ECM) on a separate cable.

NOTE: The absolute pressure is displayed when using parameter read outs to read off the fuel pressure. If there is no pressure at the fuel rail, the atmospheric pressure will be displayed.

HINT: The relative pressure (absolute pressure minus atmospheric pressure) is displayed when reading off the fuel pressure via a manometer connected to the fuel rail.

Fuel temperature sensor

The temperature sensor is an NTC sensor. The sensor is supplied with voltage (signal) from and grounded in the engine control module (ECM).

The resistance in the sensor changes according to the temperature of the fuel. This provides the engine control module (ECM) with a signal of between 0 - 5 V. Low temperature results in high voltage (high resistance). High temperature results in low voltage (low resistance).

The engine control module (ECM) uses the signal to calculate the volume of the fuel.

OIL LEVEL SENSOR

Fig. 195: Identifying Oil Level Sensor
Courtesy of VOLVO CARS CORPORATION

The function of the oil level sensor is to provide the engine control module (ECM) with information regarding the level of engine oil in the oil sump.

The sensor consists of:

- a terminal with three pins
- integrated electronics
- 2 capacitive gauge elements
- a PTC resistor.

The oil level sensor is supplied with 5 V by the engine control module (ECM). The oil level sensor generates a pulse width modulated (PWM) signal for the engine control module (ECM).

The oil level sensor can be diagnosed by the engine control module (ECM).

The pulse-width modulated (PWM) signal from the oil level sensor can be read using parameter readout.

MAIN RELAY (SYSTEM RELAY)

Fig. 196: Identifying Main Relay
Courtesy of VOLVO CARS CORPORATION

The function of the main relay (system relay) is to supply certain components with voltage.

The relay is mechanical and has a closing and opening function. In the rest position the circuit in the relay is open.

The main relay terminals (#30 and #86) are supplied with voltage by the battery. When the ignition key has been turned and the engine control module (ECM) is powered, the terminal (#85) on the main relay is grounded by the engine control module (ECM).

When the terminal (#85) is grounded, the relay is activated and a number of components are powered via the relay terminal (#87).

The main relay is in the integrated relay/fuse box in the engine compartment and is diagnosed by the engine control module (ECM).

INJECTORS

Fig. 197: Identifying Fuel Injector
Courtesy of VOLVO CARS CORPORATION

The function of the injectors is to spray fuel into the cylinders in the correct spray patterns. This happens

sequentially.

The injectors are located along the intake pipe.

The engine control module (ECM) controls the injectors by grounding the valves in pulses.

The injectors can be diagnosed by the engine control module (ECM) and can be activated.

IGNITION COILS

Fig. 198: Identifying Ignition Coil
Courtesy of VOLVO CARS CORPORATION

The ignition coils supply the spark plugs with high voltage to produce sparks. The engine control module (ECM) controls the ignition coils so that sparks are generated at the correct time. The signal reconnects to the engine control module (ECM) so that diagnostics can be carried out.

Each ignition coil has an integrated power stage.

The ignition coils are in the sparkplug wells above each spark plug.

The control module checks the ignition coils' function using one separate diagnostic lead.

CAMSHAFT RESET VALVE (CVVT)

Fig. 199: Identifying Camshaft Reset Valve
Courtesy of VOLVO CARS CORPORATION

The camshaft reset valve controls the oil flow to the CVVT unit (camshaft pulley).

The valve consists of an electro-magnetic valve with a spring-loaded piston. There are slits in the piston which channel the engine lubricating oil to the CVVT unit by moving the piston in the reset valve. The continuous variable valve timing (CVVT) unit turns the camshaft (the camshaft timing changes). The direction in which the camshaft turns depends on the chamber in the CVVT unit which is supplied with oil (pressure). See also: **CAMSHAFT CONTROL (CVVT)**

An oil filter is mounted at the intake channel for the valves to prevent oil contaminants from affecting the function of the reset valves.

The system relay supplies the reset valve with voltage via a fuse. The valve is grounded (control stage) internally in the engine control module (ECM). When the valve is grounded using a pulse width modulation (PWM) signal, the oil flow in the valve can be regulated to the different chambers in the continuous variable valve timing (CVVT) unit at variable rates. This allows the angle position to be changed precisely and steplessly.

The engine control module (ECM) can diagnose the camshaft reset valve.

The valve is located on the cylinder head above the camshaft. There is a valve for intake camshaft.

There is no valve for the exhaust camshaft.

EVAPORATIVE EMISSION SYSTEM (EVAP) VALVE

Fig. 200: Identifying Evaporative Emission System (EVAP) Valve
Courtesy of VOLVO CARS CORPORATION

The evaporative emission system (EVAP) valve is used to open and close the connection between the EVAP canister and the intake manifold. The valve controls the flow of hydro-carbons (fuel vapor) from the EVAP canister to the engine intake manifold using the vacuum in the intake manifold. This ensures that hydro-carbons stored in the EVAP canister are used in the engine combustion process.

The valve is an electromagnetic valve and is powered from the system relay. When the valve needs to be opened, it is grounded internally in the engine control module (ECM). The evaporative emission system (EVAP) valve is closed when in the standby position (open-circuit).

When the control module requests that the EVAP canister should be drained (the hydrocarbons stored in the canister should be released into the engine), the control module deploys the evaporative emission system (EVAP) valve by grounding it. A pulse width modulation (PWM) signal is used to ground the valve and to control the degree to which the valve will open. In this way, the drainage of the EVAP canister is matched to the volumetric efficiency of the EVAP canister, the engine speed (RPM) and the engine load.

The evaporative emission system (EVAP) valve can be diagnosed by the engine control module (ECM) and can be activated.

The EVAP-valve is located by the intake manifold (by the electronic throttle module) on the front of the engine.

LEAK DIAGNOSTIC UNIT

Fig. 201: View of Leak Diagnostic Unit
Courtesy of VOLVO CARS CORPORATION

The function of the leak diagnostic unit is to pressurize the fuel tank system during leak diagnostics and to open the fuel tank system to the surrounding air during evaporative emissions control.

The leak diagnostic unit consists of a plastic housing with:

1. electrical air pump
2. a valve / solenoid which governs the air flow in the unit
3. a heater element (PTC resistor) which warms up the pump.

The electrical pump, valve and heater element in the unit are supplied with voltage by the system relay. The pump, valve and heater element are grounded (control) in the engine control module (ECM).

During leak diagnostics the pump in the leak diagnostic unit starts. The valve in the unit is operated by the engine control module (ECM) by grounding the different circuits internally in the engine control module (ECM). Operation depends on whether the diagnostic phase is checking for leakage or checking the function of the diagnostic system. The engine control module (ECM) gauges the power consumption of the pump during pressurization. The power consumption corresponds to a certain pressure in the fuel tank system. See also:**LEAK DIAGNOSTIC UNIT**

The engine control module (ECM) can diagnose the leak diagnostic unit.

The valve in the leak diagnostic unit can be activated and the power consumption of the pump can be read off.

The leak diagnostic unit is at the upper front edge of the fuel tank.

AIR CONDITIONING (A/C) COMPRESSOR.

Fig. 202: Identifying (A/C) Compressor
Courtesy of VOLVO CARS CORPORATION

The air conditioning (A/C) compressor transports refrigerant, which is necessary for air conditioning (A/C) operation. It is an axial piston compressor with variable displacement. I. E. The compressor has adjustable cylinder displacement which is controlled by a check valve (solenoid). The valve, which is underneath the compressor, can be replaced.

The A/C compressor is mounted on the cylinder block and is driven by the engine's crankshaft via the auxiliaries belt.

AIR CONDITIONING (A/C) RELAY

Fig. 203: Identifying (A/C) relay
Courtesy of VOLVO CARS CORPORATION

The air conditioning (A/C) relay supplies the A/C compressor with voltage. The relay is controlled by the engine control module (ECM) based on information from different signals:

- the climate control module (CCM) (via the control area network (CAN))
- the engine coolant temperature
- the position of the accelerator pedal (AP)
- the pressure in the system.

The engine control module (ECM) can temporarily disengage the A/C compressor during wide open throttle (WOT) acceleration.

The relay is mechanical. It has a closing / opening function and is supplied with power from the system relay.

In the rest position the circuit in the relay is open.

The system relay supplies the coil and the relay with power. The relay activates when the coil is grounded in the engine control module (ECM), the circuit closes and the A/C compressor is supplied with power via the relay voltage output.

The relay coil is grounded (signal) when the engine control module (ECM) receives a signal via the CAN network from the climate control module (CCM) to activate the relay and start the compressor.

STARTER MOTOR RELAY

Fig. 204: Identifying Main Relay
Courtesy of VOLVO CARS CORPORATION

The function of the starter motor relay is to supply power to the starter motor. See also: **START**

The starter motor relay is in the relay/fusebox in the engine compartment.

ENGINE COOLING FAN (FC) / ENGINE COOLING FAN (FC) CONTROL MODULE

Fig. 205: Identifying Engine Cooling Fans (FC) and Control Modules
Courtesy of VOLVO CARS CORPORATION

NOTE: The engine cooling fan may have a post-run of up to approx. 6 minutes after the engine has been turned off. The time for the fan's post-run depends on engine temperature, temperature in the engine compartment and pressure level in the AC-system.

WARNING: Be careful since the engine cooling fan may have a post-run after the engine has been turned off.

The engine cooling fan (FC) consists of two fans and two control modules. The control modules are controlled by the same signal from the engine control module (ECM).

HINT: For different reasons, there are variants where the engine cooling fan consists of two fans and one control module.

The engine cooling fan (FC) has two functions. One is to cool the engine compartment, the other is to cool the condenser when the air conditioning (A/C) compressor is working.

The engine control module (ECM) transmits a pulse width modulated (PWM) signal to the engine cooling fan (FC) control modules. The control modules then activate the fans at different speeds. The speed is determined by the engine control module (ECM), depending on the coolant temperature and the vehicle speed.

The temperature conditions for engagement of the different engine cooling fan (FC) stages may vary slightly, depending on the engine variant and the equipment level. The temperature conditions apply when:

- the A/C is off
- no faults are detected by the engine control module (ECM).

The engine cooling fan (FC) is located behind the radiator and its control module is grounded and powered with battery voltage via a fuse.

There are diagnostics for the engine cooling fan (FC). The engine cooling fan (FC) transmits a diagnostic signal

to the engine control module (ECM).

FUEL PUMP (ONLY US)

Fig. 206: Identifying Fuel Pump Module
Courtesy of VOLVO CARS CORPORATION

The function of the fuel pump is to ensure that the pressure is correct at the delivery lines for the injectors when requested by the fuel pump control module.

The fuel pump consists of:

1. An electrical pump with an integrated safety valve
2. A pressure equalization valve. This valve equalizes rapid pressure peaks which occur, for example, when the injectors close during engine braking. It also contains a non-return valve which ensures that the pressure in the system does not drop when the engine is switched off
3. Fuel level sensor
4. Fuel filter, cannot be replaced separately
5. Relief valve, releases fuel into the pump housing
6. Ejector pump, continuously fills the pump housing with fuel. The fuel always flows from the fuel pump through the ejector and back to the pump housing.

The fuel pump is supplied with battery voltage by the fuel pump control module and is grounded in the car body via the fuel pump control module.

The engine control module (ECM) has diagnostics for the fuel pump function to ensure that the pressure is correct. See also: **FUEL PRESSURE REGULATION, DIAGNOSTICS**

The fuel pump can be activated and its status can be read off.

The pressure in the fuel rail can be measured by connecting a manometer to a nipple. This nipple is on the right-hand end of the fuel rail.

FUEL PUMP CONTROL MODULE

Fig. 207: Identifying Fuel Pump
Courtesy of VOLVO CARS CORPORATION

The fuel pump control module is called PEM (Pump Electronic Module). It powers the fuel pump and regulates the output of the pump. The fuel pressure changes with the output of the pump.

The fuel pump control module is supplied with battery voltage by the fuel pump (FP) relay and is grounded in the car body. The fuel pump (FP) relay is controlled by the central electronic module (CEM) when requested by the engine control module (ECM).

The engine cannot be started if the power supply to the fuel pump control module is faulty because the fuel pump will not then be powered.

The fuel pump control module is controlled by the engine control module (ECM) via serial communication. The fuel pump control module then controls the fuel pump by transmitting pulse width modulated (PWM) voltage on the ground lead for the fuel pump. This means that the voltage drop across the pump changes, and with it the output of the fuel pump. See also: **FUEL PRESSURE REGULATION**

There are no diagnostics for the fuel pump control module. The engine control module (ECM) has diagnostics for fuel pressure regulation and the associated components. See also: **FUEL PRESSURE REGULATION, DIAGNOSTICS**

The pulse width modulated (PWM) signal from the engine control module (ECM) to the fuel pump control module can be read off using the diagnostic tool.

The fuel pump control module is on the outside on the right-hand side of the fuel tank.

ACTUATOR VARIABLE INTAKE MANIFOLD

Fig. 208: Identifying Actuators, Variable, Intake Manifold
Courtesy of VOLVO CARS CORPORATION

1. Primary actuator with throttle (upper)
2. Secondary actuator with throttle (lower)

The function of the actuators is to vary the length of the intake manifold, via throttles installed in the intake manifold.

The actuators are supplied with voltage from the system relay via fuse and ground (control) internally in the engine control module (ECM).

see **VARIABLE INTAKE SYSTEM**

The actuators for variable intake can be diagnosed by the engine control module (ECM).

The actuators are bolted directly to the intake manifold.

CAM PROFILE SOLENOID (CPS)

Fig. 209: Identifying Cam Profile Solenoid (CPS)
Courtesy of VOLVO CARS CORPORATION

The function of the solenoid is to control (trigger) oil pressure to the hydraulic valve depressors.

The solenoid is supplied with voltage from the system relay via fuse and ground (control) internally in the engine control module (ECM).

The system has two solenoids that each supplies a number of cylinders.

The solenoids are located on each side of the engine between the camshafts.

The solenoids can be diagnosed by the Engine control module (ECM).

see **VARIABLE CAMSHAFT PROFILE (CPS)**

EMISSIONS WARNING LAMP

Fig. 210: Identifying Malfunction Indicator Lamp
Courtesy of VOLVO CARS CORPORATION

The emissions warning lamp in the Driver Information Module (DIM) has a warning symbol. This warning symbol varies depending on the market. The warning symbols are:

- "Engine symbol" (not USA)
- "CHECK ENGINE" (MIL - Malfunction Indicator Lamp, USA only).

The warning lamp lights when the ignition key is turned to position II. The warning lamp will go out after approximately 15 seconds or if the engine is started when no fault is found in the engine management system.

If Readiness is not complete (certain diagnostic functions not completed), the warning lamp will flash instead of going out when the ignition key is in position II.

The warning lamp will light if there is a fault in one of the parameters in the engine management system. The warning lamp will also light in response to a request transmitted via the control area network (CAN) if there is a fault in the transmission control module (TCM) which affects emissions.

ELECTRONIC THROTTLE UNIT

Fig. 211: Identifying Electronic Throttle Unit
Courtesy of VOLVO CARS CORPORATION

The electronic throttle unit, using the PWM control signal from the engine control module (ECM), regulates the amount of air for engine combustion. This is done using an electronically controlled shutter.

The aluminum electronic throttle unit consists of a round throttle disc on a spindle. The spindle is driven by a DC motor (damper motor), gear wheel and two springs; one for opening and one for return.

By changing the polarity of the power supply, the DC motor can be run in both directions. At one of the limit positions the throttle disc is closed so that minimal air can pass the throttle unit. In the other limit position, the throttle disc is parallel to the air flow. This provides maximum airflow through the electronic throttle unit.

Two permanent magnets in the gear sector on the throttle spindle are used to check the position of the throttle disc. The permanent magnets affect two throttle position (TP) Hall sensors in the cover. The analog signals from the two sensors are transmitted to the engine control module (ECM). The signals are offset. The engine control module (ECM) compares these signals with the stored desired values to check if they are plausible.

The electronic throttle unit is located on the engine intake manifold. In the event of a fault, the throttle unit must be replaced as a single unit.

The engine control module (ECM) can diagnose the electronic throttle unit.

THROTTLE POSITION (TP) SENSOR

Electronic throttle unit.

LEAK DIAGNOSTICS (CERTAIN MARKETS ONLY)

Fig. 212: Fuel Tank System Leak Overview
Courtesy of VOLVO CARS CORPORATION

All gases that evaporate from fuel in the fuel tank must be led to and stored in the evaporative emission system (EVAP) canister so that they can be directed into the engine for combustion. In order to detect leakages which cause evaporation of gases into the air, the fuel tank system is diagnosed for leakage. The fuel tank system consists of:

- fuel tank
- Canister purge (CP) valve (1)
- EVAP canister (2)
- leak diagnostic unit (3)
- air cleaner (ACL) (4)
- Roll-over valve (5)
- Float Limit Vent Valve (6)
- fuel filler pipe (7)
- all lines between the above components.

The fuel tank system has a leak diagnostic unit to diagnose any leakage. The leak diagnostic unit pressurizes the fuel tank system when the ignition is off, if the conditions for diagnosis have been met. The control module can detect faults in the function of the leak diagnostic unit and leakage that is 0.5 mm or greater. Minor leak; leakage greater than 0.5 mm but less than 1.0 mm. Major leak; leakage greater than 1.0 mm.

The leak diagnostic unit consists of a pump and a valve that controls the air flow in the unit. The fuel tank system tests for leaks by measuring the power consumption of the pump. The power consumption of the pump corresponds to a certain pressure in the fuel tank system. During diagnosis, the rate at which the pressure can build up is checked, taking into account the quantity of fuel in the tank. The quicker the pressurization the better the fuel tank system is sealed.

Conditions for diagnosis

The diagnosis begins when all the following conditions are met:

- There must be no diagnostic trouble code (DTC) stored for the following components or functions:
  - the power stage for the pump in the leak diagnostic unit
  - the power stage for the valve in the leak diagnostic unit
  - the power stage for the EVAP canister purge valve
  - the EVAP canister purge valve.
  - the engine coolant temperature (ECT) sensor
  - atmospheric pressure sensor
  - outside temperature sensor.
- The engine is switched off until the engine coolant temperature (ECT) has fallen to a few degrees above the outside temperature, then engine running for at least 10 minutes.
- Ignition off
- Vehicle speed 0 km/h
- Engine coolant temperature (ECT) -5 °C or higher.
- Maximum altitude of 2500 meters above sea level
- Outside temperature between -5 and +35 °C.
- Fuel volume in the tank less than 85%. The engine control module (ECM) ignores these parameters if a diagnostic trouble code (DTC) is stored for the fuel level sensor and the fuel volume cannot be determined.
- Battery voltage between 11.0-15.0 V. The voltage must be stable.
- EVAP canister purge valve closed
- Low volume in the canister.
- Fuel tank filler cap locked. Tip. Locking occurs when the vehicle speed exceeds approximately 20 km/h.

Diagnostic phases

The diagnostic is divided into the following phases and is carried out in sequence when all conditions for the diagnostic have been met.

- reference phase
- function test
- Leak diagnostic

Fig. 213: Identifying Fault Free Fuel Tank System Diagram Phase 1
Courtesy of VOLVO CARS CORPORATION

Reference phase (1-2)

The illustration is a diagram of a fault free fuel tank system.

Before the leak diagnostic begins, the control module runs reference phase for leakage. Reference phase (1-2) for leakage that is 0.5 mm is carried out by the pump in the leak diagnostic unit pumping ambient air through a 0.5 mm hole and back out to the ambient air. At the same time, the power consumption (A) of the pump is measured and stored in the control module. The stored value (A) for the power consumption of the pump corresponds to a leakage of 0.5 mm. This value is then compared by the engine control module (ECM) to determine the leak status of the fuel tank system.

Function test (1-3)

If the value for the power consumption of the pump is too high or low during reference phase (1-2), or if the value for pump power consumption varies too much during reference phase (1-2), the diagnostic is cancelled and starts again the next time the conditions for the diagnostic are met. A diagnostic trouble code (DTC) is stored if the diagnostic is cancelled because the power consumption of the pump is varying excessively.

After reference phase the valve (2) in the leak diagnostic unit is activated and controls the air flow to the fuel tank to pressurize the fuel tank system. This change of air flow will cause the power consumption of the pump to fall briefly before the pressure builds up in the fuel tank system (3). A diagnostic trouble code is stored if the value for the power consumption of the pump drops too quickly, slowly or not at all.

Fig. 214: Identifying Leak Diagnostic, Major Leak Diagram
Courtesy of VOLVO CARS CORPORATION

Leak diagnostic, major leak (leakage greater than 1.0 mm)

The diagnostic for "major leaks" is carried out each time when the conditions for the diagnostic are met. The leak diagnostic unit pressurizes the fuel tank system, measures the power consumption of the pump (4) and compares this with a calculated desired value (B). A diagnostic trouble code (DTC) for a major leak is stored if the measured value does not reach the calculated desired value within a certain time (the time is determined by the fuel level in the tank).

Leak diagnostic, minor leak (leakage greater than 0.5 mm but less than 1.0 mm)

The diagnostic for minor leaks is run every other time that the conditions for the diagnostic are met. The diagnostic for major leaks is always run before the diagnostic for minor leaks. The leak diagnostic unit continues to pressurize the fuel tank system (5-6). After a certain amount of time (the time varies depending on the fuel level in the tank), the engine control module (ECM) checks the fuel tank system for leaks. This is determined from calculations based on:

- time
- the measured reference current consumption of the pump (A)
- the measured power consumption of the pump when the assessment is made
- the shape and character of the current curve during pressurization.

A diagnostic trouble code (DTC) is stored if a minor leak is detected.

DIAGNOSTIC FUNCTIONS

LEAK DIAGNOSTICS, ORIGINAL VERSION (CERTAIN MARKETS ONLY)

LEAK DIAGNOSTICS, ORIGINAL VERSION

Fig. 215: Fuel Tank System Leak Overview
Courtesy of VOLVO CARS CORPORATION

To minimize false detection of leakage, new software has been released for the Engine control module (ECM). The software has been released afterwards, in order of priority, started at the end of 2006.

The improved software version makes diagnostics more robust and durable against aging and wear of the leak diagnostic unit. It affects strategies, behavior and to a degree also read off parameters.

All gases that evaporate from fuel in the fuel tank must be led to and stored in the evaporative emission system (EVAP) canister so that they can be directed into the engine for combustion. In order to detect leakages which cause evaporation of gases into the air, the fuel tank system is diagnosed for leakage. The fuel tank system consists of:

- fuel tank
- Canister purge (CP) valve (1)
- EVAP canister (2)
- leak diagnostic unit (3)
- air cleaner (ACL) (4)
- Roll-over valve (5)
- Float Limit Vent Valve (6)
- fuel filler pipe (7)

- all lines between the above components.

The fuel tank system has a leak diagnostic unit to diagnose any leakage. The leak diagnostic unit pressurizes the fuel tank system when the ignition is off, if the conditions for diagnosis have been met. The control module can detect faults in the function of the leak diagnostic unit and leakage that is 0.5 mm or greater. Minor leak; leakage greater than 0.5 mm but less than 1.0 mm. Major leak; leakage greater than 1.0 mm.

The leak diagnostic unit consists of a pump and a valve that controls the air flow in the unit. The fuel tank system tests for leaks by measuring the power consumption of the pump. The power consumption of the pump corresponds to a certain pressure in the fuel tank system. During diagnosis, the rate at which the pressure can build up is checked, taking into account the quantity of fuel in the tank. The quicker the pressurization the better the fuel tank system is sealed.

Conditions for diagnosis

The diagnosis begins when all the following conditions are met:

- There must be no diagnostic trouble code (DTC) stored for the following components or functions:
  - the power stage for the pump in the leak diagnostic unit
  - the power stage for the valve in the leak diagnostic unit
  - the power stage for the EVAP canister purge valve
  - the EVAP canister purge valve.
  - the engine coolant temperature (ECT) sensor
  - atmospheric pressure sensor
  - outside temperature sensor.
- The engine is switched off until the engine coolant temperature (ECT) has fallen to a few degrees above the outside temperature, then engine running for at least 10 minutes.
- Ignition off
- Vehicle speed 0 km/h
- Engine coolant temperature (ECT) -5°C or higher.
- Maximum altitude of 2500 meters above sea level.
- Outside temperature between -5 and +35°C.
- Fuel volume in the tank less than 85%. The engine control module (ECM) ignores these parameters if a diagnostic trouble code (DTC) is stored for the fuel level sensor and the fuel volume cannot be determined.
- Battery voltage between 11.0-15.0 V. The voltage must be stable.
- EVAP canister purge valve closed
- Low volume in the canister.
- Fuel tank filler cap locked. Tip. Locking occurs when the vehicle speed exceeds approximately 20 km/h.

Diagnostic phases

The diagnostic is divided into the following phases and is carried out in sequence when all conditions for the

diagnostic have been met.

- reference phase
- function test
- leak diagnostic

Fig. 216: Identifying Fault Free Fuel Tank System Diagram Phase 1
Courtesy of VOLVO CARS CORPORATION

Reference phase (1-2)

The illustration is a diagram of a fault free fuel tank system.

Before the leak diagnostic begins, the control module runs a reference phase for leakage. During the reference phase (1-2) for leakage that is 0.5 mm, the pump in the leak diagnostic unit pumps ambient air through a 0.5 mm hole and back out to the ambient air. At the same time, the power consumption (A) of the pump is measured and stored in the control module. The stored value (A) for the power consumption of the pump corresponds to a leakage of 0.5 mm. This value is then used by the engine control module (ECM) to determine the leak status of the fuel tank system.

Function test (1-3)

If the value for the power consumption of the pump is too high or low during reference phase (1-2), or if the value for pump power consumption varies too much during reference phase (1-2), the diagnostic is cancelled and starts again the next time the conditions for the diagnostic are met. A diagnostic trouble code (DTC) is stored if the diagnostic is cancelled because the power consumption of the pump is varying excessively.

After the reference phase, the valve (2) in the leak diagnostic unit is activated and controls the air flow to the fuel tank to pressurize the fuel tank system. This change of air flow will cause the power consumption of the pump to fall briefly before the pressure builds up in the fuel tank system (3). A diagnostic trouble code is stored if the value for the power consumption of the pump drops too quickly, slowly or not at all.

Fig. 217: Identifying Leak Diagnostic, Major Leak Diagram
Courtesy of VOLVO CARS CORPORATION

Leak diagnostic, major leak (leakage greater than 1.0 mm)

The diagnostic for "major leaks" is carried out each time when the conditions for the diagnostic are met. The leak diagnostic unit pressurizes the fuel tank system, measures the power consumption of the pump (4) and compares this with a calculated desired value (B). A diagnostic trouble code (DTC) for a major leak is stored if the measured value does not reach the calculated desired value within a certain time (the time is determined by atmospheric pressure and the fuel level in the tank).

Leak diagnostic, minor leak (leakage greater than 0.5 mm but less than 1.0 mm)

The diagnostic for minor leaks is run every other time that the conditions for the diagnostic are met. The diagnostic for major leaks is always run before the diagnostic for minor leaks. The leak diagnostic unit continues to pressurize the fuel tank system (5-6). After a certain amount of time (the time varies depending on the fuel level in the tank), the engine control module (ECM) checks that the fuel tank system for leaks. This is determined based on:

- time
- the measured reference current consumption of the pump (A)
- the measured power consumption of the pump when the assessment is made
- the shape and character of the current curve during pressurization.

A diagnostic trouble code (DTC) is stored if a minor leak is detected.

OVERVIEW

OVERVIEW

General

The engine control module (ECM) diagnoses both internal signals and functions as well as signals and functions

from connected components.

Conditions for diagnosis

For the diagnosis of a component or function to start, certain specific conditions must be met. The conditions for diagnostics vary depending on the component or function being diagnosed.

Conditions must be met during the diagnostic in order for the diagnostic to be completed. The time and conditions for the diagnostic vary depending on the component or function being diagnosed. Certain diagnostics only require the ignition to be switched on and off for a diagnostic to be run. Other diagnostics require that several different conditions are met. For example:

- vehicle speed
- engine coolant temperature (ECT)
- time since start
- different load and engine speed relationships in the same trip
- a certain event (for example the evaporative emission system (EVAP) valve is operating).

When the engine control module (ECM) has run all the implemented diagnostics, the control module has completed a "trip". An extensive driving schedule in various conditions is required to complete a trip. The engine may also need to be shut off for a certain amount of time and then switched on again to complete a trip.

Emissions related diagnostic functions

The engine control module (ECM) checks that the emissions related systems are working. These systems are checked by running a diagnostic function. The diagnostic function checks the components and that the system is functioning.

Diagnostic trouble code (DTC) memory

When the engine control module (ECM) detects a fault, the diagnostic trouble code and status are stored in the diagnostic trouble code memory and are visible during normal diagnostic trouble code readout. If the diagnostic trouble code (DTC) lights the malfunction indicator lamp (MIL), this occurs at the same time. If an existing fault disappears and does not recur, the engine control module changes the status of the diagnostic trouble code after a certain number of fault-free operating cycles (depending on the nature of the diagnostic trouble code). This means that it can no longer be read during normal diagnostic trouble code readout. In this status, the diagnostic trouble code remains until the engine control module (ECM) erases diagnostic trouble codes or is disconnected from power.

Substitute value

For certain types of diagnostic trouble codes (DTCs), the missing signal is replaced with a substitute value so that the system can continue functioning.

LEAK DIAGNOSIS, IMPROVED VERSION (CERTAIN MARKETS ONLY)

LEAK DIAGNOSTICS, IMPROVED VERSION

Fig. 218: Fuel Tank System Leak Overview
Courtesy of VOLVO CARS CORPORATION

All gases that evaporate from fuel in the fuel tank must be led to and stored in the evaporative emission system (EVAP) canister so that they can be directed into the engine for combustion. In order to detect leakages which cause evaporation of gases into the air, the fuel tank system is diagnosed for leakage. The fuel tank system consists of:

- fuel tank
- Canister purge (CP) valve (1)
- EVAP canister (2)
- leak diagnostic unit (3)
- air cleaner (ACL) (4)
- Roll-over valve (5)
- Float Limit Vent Valve (6)
- fuel filler pipe (7)
- all lines between the above components.

The fuel tank system has a leak diagnostic unit to diagnose any leakage. The leak diagnostic unit pressurizes the fuel tank system when the conditions for diagnosis have been met. The control module can detect faults in the function of the leak diagnostic unit and leakage that is 0.5 mm or greater. Minor leak; leakage greater than 0.5 mm but less than 1.0 mm. Major leak; leakage greater than 1.0 mm.

The leakage diagnostic consists of a pump and a valve that control the flow in the unit. Engine control module (ECM) checks sealing in the tank system by measuring the relationship between obtained pressure and flow from the leakage diagnostic pump when pressurized.

If a certain pressure is not obtained with a pre-determined (with known mass) the Engine control module (ECM) interprets it as a leakage from the fuel tank system.

Leakage diagnostics start in normal operation when specific conditions have been fulfilled, see below. Diagnostics can also be started by command using VIDA when you disregard some of these conditions.

Conditions for diagnosis

The diagnosis begins when all the following conditions are met:

NOTE: Slightly different conditions apply when diagnostics are started by command using VIDA (Volvo scan tool).

- No diagnostic trouble codes for EVAP-valve or atmospheric pressure sensor may be stored.
- The engine is switched off until the engine coolant temperature (ECT) has fallen to a few degrees above the outside temperature, then engine running for at least 10 minutes.
- Ignition off
- Vehicle speed 0 km/h
- Engine temperature 4-35 °C.
- Maximum altitude of 2500 meters above sea level.
- Outdoor temperature between 4-35 °C.
- Fuel volume in the tank between 0-85%. The engine control module (ECM) ignores these parameters if a diagnostic trouble code (DTC) is stored for the fuel level sensor and the fuel volume cannot be determined.
- Battery voltage between 11-15 V. The voltage must be stable.
- EVAP canister purge valve closed
- Low volume in the canister.
- Tank hatch locked.

NOTE: Locking occurs when the vehicle speed exceeds 20 km/h.

Diagnostic phases

The diagnostic is divided into the following phases and is carried out in sequence when all conditions for the diagnostic have been met.

- reference phase
- function test
- checking tank system.

Reference phase

Before leakage diagnosis itself can be started, the control module performs a reference phase for leakage. Reference phase for leakage which is 0.5 mm is performed by the leakage diagnostic unit's pump pumping ambient air through a hole which is 0.5 mm and back out to the ambient air. During that time, the pump is monitored n the leakage diagnostic unit and reference values are stored away for later use in assessing the tank system's sealing.

If any reference value for the pump is unreasonably high or low, or varies too much, then diagnosis is interrupted and a diagnostic trouble code is generated.

Function test

After the reference phase, the leakage diagnostic unit's valve is activated and the air flow is controlled to the tank system to pressurize the tank system. This shift in air flow means that the pump load drops briefly before the pressure builds up in the tank system. If the load does not change within reasonable limits within reasonable time, then diagnosis is interrupted and a diagnostic trouble code is generated.

Checking tank system, major leakage (leakage bigger than 1.0 mm)

Diagnosis are performed every time conditions for diagnosis are fulfilled.

The leakage diagnostic unit pressurizes the tank system and checks sealing by monitoring the pressure in the tank system. The pressure is a calculated pressure, calculated using measured power consumption on the pump. If the pressure stabilizes and/or does not go above 1500 Pa within 450 seconds, this is interpreted as a leakage from the fuel tank system. Diagnosis is interrupted and a diagnostic trouble code for major leakage is generated.

Checking tank system, minor leakage (leakage bigger than 0.5 mm but smaller than 1.0 mm)

Diagnosis for minor leakage is performed every other time conditions for diagnosis are fulfilled. Otherwise, diagnosis finishes after checking for major leakage.

The leakage diagnosis unit continues pressurizing the tank system. Engine control module (ECM) checks sealing in the tank system by measuring the relationship between reached pressure and flow from the leakage diagnosis pump when pressurizing. In a sealed system the relationship between these shall be linear. Any deviations from the linear relationship is calculated and used to assess the tank system's sealing.

If the assessment, performed within 15 minutes, is that a minor leakage has been detected in the tank system, a diagnostic trouble code for minor leakage is generated.

DOWNLOADING SOFTWARE AND REPLACING THE CONTROL MODULE

New software can be downloaded into the engine control module (ECM). When ordering software, the hardware and the software in the car is compared to the information in the Volvo central database. If the comparison is OK the software is downloaded to the control module. If the comparison between the car and Volvo central database is not OK, the database is updated with the car configuration. When this is complete the software is downloaded.

The Engine control module (ECM) is located on the air filter box, under a plastic cover.

The engine control module (ECM) contains a unique code for each car for the immobilizer. The central electronic module (CEM) checks this code at engine start up. The engine will not start if the central electronic module (CEM) detects an incorrect code for the immobilizer. This means that the engine control module (ECM) cannot be switched from vehicle to vehicle.

The engine control module (ECM) must first be "unlocked" using a unique PIN for each car before it can be programmed with a code for the immobilizer. When the PIN has been approved by the engine control module (ECM), the code for the immobilizer can be programmed.

The PIN and the code for the immobilizer are obtained from the Volvo central database and sent out with the software package when software for downloading has been ordered.

All new engine control modules (ECM) have the same PIN which is preprogrammed by the control module supplier. When the engine control module (ECM) has been programmed successfully the original PIN for the car will be programmed in the engine control module (ECM) memory and will replace the preprogrammed PIN code.

FUNCTION

START

Fig. 219: Identifying Starting System

Courtesy of VOLVO CARS CORPORATION

The starter motor (6/25) is supplied with power via the starter motor relay (2/35), the starter motor relay is controlled by the engine control module (ECM) (4/46).

The start process is as follows:

1. The ignition key is turned to start position (position III)
2. A high signal (U_{bat}) from the ignition switch (3/1) is transmitted to the engine control module (ECM) via the central electronic module (CEM) (4/56). The engine control module (ECM) interprets this high signal as a request to activate the starter motor.
3. The engine control module (ECM) activates the starter motor solenoid by grounding and powering the coil for the starter motor relay.
4. The relay closes the circuit between the starter motor solenoid and the fuse in the relay/fuse box in the engine compartment, activating the starter motor.
5. The engine control module (ECM) activates the starter motor until the engine starts (the engine speed (rpm) exceeds a certain value)

Auto start

If the ignition key returns to ignition position (position II) before the engine is started, the starter motor continues to run. The starter motor runs until the engine is started or until a certain time has elapsed. The engine temperature dictates the running time of the starter motor:

- 0 °C or higher, approximately 3 seconds
- less than 0 °C, up to approximately 5 seconds.

If the engine does not turn or if the engine speed is extremely low when the start relay is activated, the engine control module (ECM) interrupts start relay activation.

Activation of the starter motor is not permitted or is interrupted if:

- the engine is running (the engine speed (RPM) above a certain value)
- the immobilizer function does not allow a start.
- the gear selector is not in position "P" or "N" (automatic transmissions). The engine control module (ECM) receives a signal indicating the position of the gear selector from the transmission control module (TCM) (4/28) via both the controller area network (CAN) and from a directly connected cable between the engine control module (ECM) and transmission control module (TCM).

CAMSHAFT CONTROL (CVVT)

Fig. 220: Identifying Camshaft Control (CVVT) System
Courtesy of VOLVO CARS CORPORATION

Only the intake camshaft can be controlled by the Engine control module (ECM) via a reset valve.

The intake camshaft is located in the engine's leading edge (in the travel direction) and the exhaust camshaft in the trailing edge (towards the passenger compartment).

The camshafts are driven by the crankshaft via a gear housing located on the engine's top side.

When each camshaft is adjusted in the factory, its position is aligned with the crankshaft's position. The camshaft's position at alignment against the crankshaft is called the **camshaft's 0-position** (basic setting).

At camshaft control (CVVT), the camshaft's 0-position is displaced so that the camshaft's angle position is changed. Thus, opening and closing of the exhaust and inlet valves changes relative to the crankshaft.

By controlling the camshaft's angle position, the engine's performance can be increased, idle quality can be improved, and emissions can be reduced.

The engine control module (ECM) detects the position of the camshafts by comparing the signals from the engine speed (RPM) sensor (1) (crankshaft position) and the camshaft position (CMP) sensors (2) (camshaft positions). The engine control module (ECM) then controls the angle of the camshaft by controlling the oil flow to the CVVT unit using the reset valve camshaft (3).

There are diagnostics for this function. See also: **CAMSHAFT DIAGNOSTICS (CVVT)**

Controlling, reset valve camshaft

Fig. 221: Diagram of Camshaft Reset Valve
Courtesy of VOLVO CARS CORPORATION

1. Oil filter reset valve camshaft.
2. Oil channel (pressure, inlet).
3. Channel connected with CVVT-unit's chamber (triggering).
4. Channel connected with CVVT-unit's chamber (re-triggering).

The camshaft reset valve controls the oil flow to the continuous variable valve timing (CVVT) unit. The engine control module (ECM) uses a pulse width modulation (PWM) signal to control the valve. See also: **CAMSHAFT RESET VALVE (CVVT)**

The continuous variable valve timing (CVVT) unit allows the position of the camshaft to be adjusted relative to the crankshaft.

The camshaft is secured to the CVVT-unit's rotor. The rotor (and thus, the camshaft) can rotate in relation to the timing belt pulley by the oil pressure building up on one or the other side of the rotor's vanes in the CVVT-unit.

Control occurs according to the following during deployment/return of the camshaft.

Fig. 222: Action of Camshaft Reset Valve
Courtesy of VOLVO CARS CORPORATION

A: Inlet camshaft

- Oil pressure from the lubrication system (1) of the engine.
- The oil passes the filter for the camshaft reset valve (2) and then on to the reset valve (3).
- The engine control module (ECM) controls the oil flow to one of the CVVT unit chambers (4) depending on whether it is to be deployed/returned by the camshaft.

The reset valve is controlled by the engine control module (ECM) by high frequency, switching for deployment and return. This results in rapid and precise control. The inlet camshaft can be triggered up to approx. 40 crankshaft degrees.

CONTROLLING THE GENERATOR

Fig. 223: Controlling The Generator
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) (4/46) regulates the charge voltage of the alternator (GEN) (6/26) (via LIN communication) when requested by the central electronic module (CEM) (4/56) (via CAN communication).

The engine control module (ECM) can change the requested charging voltage from the central electronic module (CEM) in order to adapt it to certain operating conditions such as starting, idling or high engine loads.

The value of requested charge voltage from the engine control module (ECM) and the charge current of the generator can be read off.

The alternator control module (ACM) (6/26) transmits information to the engine control module (ECM) regarding any faults). The diagnostic trouble codes (DTCs) are stored in the engine control module (ECM) in the event of a fault. In the event of certain faults, information about these faults is also transmitted to the central electronic module (CEM).

VARIABLE INTAKE SYSTEM

Fig. 224: Controlling The Variable Intake System
Courtesy of VOLVO CARS CORPORATION

General

Today's modern car engines often utilize systems with variable length of the intake manifolds.

In older engines with fixed lengths, the length had to be adapted to a certain specific engine speed range.

Today's system gives greater flexibility as well as additional torque without any costs in the form of, e. g., fuel consumption or emissions.

In the variable intake system, there are two actuators with associated throttles to change the length of the intake manifolds. These are:

- Actuator variable intake manifold, upper (6/139)
- Actuator variable intake manifold, lower (6/140)

The primary throttle is activated at engine speed over approx. 4800 rpm and the secondary throttle is activated between approx. 3800 rpm and 4800 rpm (applies at + 20 °C).

Different throttle combinations:

- **Position 1:** Both throttles are closed at engine speeds lower than approx. 3800 rpm.
- **Position 2:** The secondary throttle opens at approx. 3800 rpm and this shortens the length some more.
- **Position 3:** Both throttles are fully open to minimize the length at higher engine speeds (over 4800 rpm).

The valve for variable intake is controlled by the engine control module (ECM) (4/46).

The actuators for variable intake function can be activated and the function for variable intake can be diagnosed by the engine control module (ECM).

VARIABLE CAMSHAFT PROFILE (CPS)

Fig. 225: Viewing Variable Camshaft Profile (CPS)
Courtesy of VOLVO CARS CORPORATION

1. High lift
2. Low lift

To maintain low fuel consumption at different loads and engine speeds, there is a system for variable camshaft profile (CPS, Cam Profile Shifting) that can vary the duration and lift height of the valves on the intake camshaft.

Duration = part of the rotating camshaft's revolution that the camshaft acts on the valve.

The system is made up of hydraulic valve depressors where the Engine control module (ECM), via oil channels, can set the valve depressors in two positions, one low position and one high position.

At start and at low temperatures (oil temperature below +40 °C, the system is pressureless and thus in its low position (spring loaded).

To minimize stresses the Engine control module (ECM) pressurizes the depressors that are not loaded at the moment. For this, two cam profile solenoids are needed.

Cam profile solenoid 1 (CPS1) supplies cylinder 1, 2, and 4, and cam profile solenoid 2 (CPS2) supplies cylinder 3, 5, and 6 with pressurized oil.

OIL MONITORING

Fig. 226: Monitoring Oil Level
Courtesy of VOLVO CARS CORPORATION

General

The following components are used for oil monitoring:

- oil level sensor (7/35)
- engine control module (ECM) (4/46)
- driver information module (DIM) (5/1).

The oil level sensor, via the driver information module (DIM), is used to inform the driver if oil filling is required.

Detecting the oil level

The integrated electronics of the sensor calculates the oil level using the measured value for the oil temperature.

For the correct oil level to be calculated, temporary oil level changes in the oil trough must also be included in the calculation, which can occur when driving on hills, around bends or similar for example. The engine control module (ECM) makes these calculations using the oil level sensor signal and a number of other parameters, for example, vehicle speed signal and load signal.

CONTROLLING THE CRUISE CONTROL

Fig. 227: Identifying Cruise Control Components
Courtesy of VOLVO CARS CORPORATION

The following components are used when controlling the cruise control:

- engine control module (ECM) (4/46)
- steering wheel module (SWM) (3/254)
- control unit cruise control (3/4)
- central electronic module (CEM) (4/56)
- brake control module (BCM) (4/16) (brake pedal position, speed signal)
- driver information module (DIM) (5/1) (cruise control light)
- transmission control module (TCM) (4/28)
- electronic throttle unit (6/120)

- brake light switch (3/9).

To activate cruise control, the function must be switched on using the "CRUISE" button. Then a light is activated in the driver information module (DIM).

The driver activates the function by pressing the SET+ or SET- button. A message is then transmitted via the low speed side of the CAN network to the central electronic module (CEM) which then transmits the message on via the high speed side of the CAN network to the engine control module (ECM).

The engine control module (ECM) controls the throttle angle so that a constant speed is maintained using the vehicle speed signal from the Brake Control Module (BCM). The transmission control module (TCM) also receives a message indicating that cruise control is active via the Controller area network (CAN), so that the transmission follows certain shifting patterns when the cruise control is active.

If the accelerator pedal (AP) is depressed the vehicle speed increases as normal and then resumes the stored value when the driver releases the accelerator pedal (AP) again.

The engine control module (ECM) continually stores the speed. If the cruise control is disengaged, for example, if the driver depresses the brake pedal, the previous speed can be resumed by pressing the "RESUME" button.

The cruise control cannot be activated below a certain speed.

Cruise control is switched off:

- when the driver depresses the brake pedal
- when the driver presses the "CRUISE" button on the steering wheel
- when the driver depresses the "0" button on the steering wheel
- if "P" or "N" position is transmitted on the controller area network (CAN)
- if the speed deviates too much from the set value
- when the control system detects a fault that prevents activation.

FUEL TRIM

Fig. 228: Graphic of Exhaust Emissions
Courtesy of VOLVO CARS CORPORATION

Overview

Fuel trim reduces exhaust emissions. Fuel trim reduces nitrous oxides (NO_x), carbon monoxide (CO) and hydrocarbon (HC) emissions.

Theoretically, if the correct amount of oxygen is added during combustion, fuel can be converted to water (H_2O) and carbon dioxide (CO_2). Emissions would then be completely safe.

In practice considerable amounts of hydro-carbons (HC) and varying amounts of carbon monoxide (CO) and carbon dioxide (CO_2) remain.

Fig. 229: Identifying Nitrous Oxides
Courtesy of VOLVO CARS CORPORATION

Due to the high temperature and pressure, nitrous oxides such as NO and NO_2 are also formed. The common designation for these gases is nitrous oxides NO_x .

Fig. 230: Graphic of Exhaust Emissions
Courtesy of VOLVO CARS CORPORATION

By speeding up the reaction between the remaining reactive components using a catalytic converter, these can be converted to water (H_2 O), carbon dioxide (CO_2) and nitrogen (N_2).

However this can only happen if the balance of hydro-carbons (HC), carbon monoxide (CO), oxygen (O_2) and nitrous oxides (NO_x) is exactly right in the exhaust. This happens when the fuel air mixture before combustion is 14.7 kg of air per kg of fuel. The Lambda value is then said to be one, (lambda=1).

Fig. 231: Diagram of Engine Control Components
Courtesy of VOLVO CARS CORPORATION

A base program in the engine control module (ECM) calculates the injection period based on data about load, i.

e. the measured air mass and engine speed (rpm). The calculated injection time (from the base program) is then modified by a circuit (short-term fuel trim). The signal from the heated oxygen sensor (HO2S) is used to finely adjust the injection period so that lambda=1 is reached. The short-term fuel trim is a circuit that finely adjusts the injection period so that the fuel/air mixture is optimized (lambda=1). The control module also used the signals from the front and rear heated oxygen sensors (HO2S) to correct the front heated oxygen sensor (HO2S) (offset adjustment) and thereby the injection period. This gives a higher degree of accuracy during fuel trim. Fuel trim is a rapid process which may take place several times a second. Adjustment of the injection period calculated in the base program is limited.

The short-term fuel trim can be read off.

Adaptive functions

Fig. 232: Graphed View Of Adaptive Function
Courtesy of VOLVO CARS CORPORATION

Certain factors, for example, tolerance deviations on certain components such as mass air flow (MAF) sensor and injectors, air leakage on the intake side, fuel pressure etc. affect the fuel / air mix. In order to compensate for this, the engine control module (ECM) has adaptive (self learning) functions. When the engine is new the short term fuel trim varies cyclically around a nominal central line (A) 1.00, with, for example, a ±5% change of injection time when fuel trim is in operation.

If there is air leakage for example, the short-term fuel trim will quickly be offset to a new position (B) and will then work for example between 1.10 (+10%) and 1.20 (+20%), although still at an amplitude of 5%, but with an

offset in relation to the original center line (A). The injection period has then been increased to compensate the increase in the amount of air.

The adaptive functions will correct the change, so that the short-term fuel trim will work around the new center line (B) where it will again have its full range of control available.

Put simply, fuel trim is a measurement of the difference (C) between the original short-term fuel trim center line (A) and the new center line (B).

The adaptive functions are split into various operational ranges based on the load and speed of the engine.

The different adaption ranges can be read off.

The adaptive adjustments of injection time are continuously stored in the engine control module (ECM). This means that, at different operating ratios, the correct mixture ratio is achieved before the heated oxygen sensor (HO2S) reaches operating temperature.

The diagnostic trouble code (DTC) is stored in the engine control module (ECM) if any adaption value is too high or too low.

INDIVIDUAL CYLINDER FUEL TRIM (-2009)

General

The Engine control module (ECM) controls the fuel according to the description in Fuel trim above, but has another refined system for improving exhaust values, namely individual cylinder fuel trim.

In short, this means that the Engine control module (ECM) can detect the fuel/air mixture composition for each individual (6 cylinders).

To achieve this requires, among others, refined heated oxygen sensors that are very sensitive to the oxygen content in the exhausts.

Should problems occur, which would mean that the sensors, "lose" their extra sensitivity, the Engine control module (ECM) will return to traditional fuel trim.

This will not force the vehicle outside any limit values for exhausts, since this is more than enough to give "clean" exhausts.

FUEL PRESSURE REGULATION

Fig. 233: Identifying Fuel Pressure Control Components
Courtesy of VOLVO CARS CORPORATION

General

Fuel pressure regulation for demand controlled fuel pumps (DECOS - DEmand COntrolled fuel Supply) means that the fuel pressure is controlled steplessly by varying the output of the fuel pump. The design of the system allows a greater maximum pressure (approximately 650kPa) in the fuel pump. This pressure is used in extreme situations, such as heavy engine load for example

The following components are used for fuel pressure regulation:

- engine control module (ECM) (4/46) with integrated atmospheric pressure sensor
- fuel pump control module (4/83)
- fuel pressure sensor with fuel temperature sensor (7/156)
- fuel pump with by-pass valve (6/33).

The time taken for the engine start procedure can be reduced by rapidly increasing the pressure in the fuel rail when the engine control module (ECM) receives a signal about the position of the ignition switch from the central electronic module (CEM).

The engine control module (ECM) is better able to calculate the injection period using the signal from the atmospheric pressure sensor and fuel pressure sensor. This particularly improves the cold starting characteristics of the engine.

The advantages of varying the output of the fuel pump so that it is not always at full power are:

- the total power consumption of the fuel pump (FP) is reduced, reducing the load on the power supply system
- the service life of the fuel pump (FP) is increased

- fuel pump noise is reduced.

Control

The engine control module (ECM) calculates the desired fuel pressure. A signal is then transmitted to the fuel pump control module indicating the desired fuel pressure. Serial communication between the engine control module (ECM) and the fuel pump control module is used to carry the signal. The fuel pump control module then operates the fuel pump unit to obtain the desired pressure using a pulse width modulation voltage on the ground lead. The fuel pump (FP) can be controlled steplessly by changing the pulse width modulation (PWM) signal. Only that pressure which is required at that specific time will then be released to the fuel rail/injectors. The value of the pulse width modulation (PWM) signal is a measurement of the operational load of the fuel pump (FP) (% duty, 100% = maximum pressure).

The engine control module (ECM) continuously monitors the fuel pressure using the signal from the fuel pressure sensor. This allows the desired fuel pressure to be reached, and if necessary a signal is transmitted to the fuel pump control module requesting that the fuel pressure is adjusted.

The engine control module (ECM) attempts too obtain a constant fuel pressure (approximately 380kPa relative to atmospheric pressure with the engine running).

By-pass valve

When the injectors close when the pressure is too great (during engine braking for example) there is a pressure peak. The by-pass valve in the fuel pump (FP) is used to even out the pressure peak. The opening pressure of the valve is approximately 650 kPa.

The by-pass valve also functions as a non-return valve, ensuring that the fuel pressure in the system is maintained when the engine is switched off.

There is high pressure before the engine is started. This high pressure means that the valve in the by-pass valve opens and the system is "flushed".

Passive safety

For safety reasons, the engine control module (ECM) shuts off the fuel pump (FP) if the supplemental restraint system module (SRS) detects a collision.

KNOCK CONTROL

Fig. 234: Identifying Knock Sensors
Courtesy of VOLVO CARS CORPORATION

Knock occurs in the combustion chamber when the fuel and air mixture self ignites. This can occur either before or after the spark plug has produced an ignition spark. In both cases the gas in two or more places ignites in the combustion chamber.

This results in an extremely fast combustion process with flames from several directions. When these flames collide, the pressure in the cylinder increases rapidly and there is a mechanical knocking sound.

If any cylinder knocks, then certain types of vibrations in the engine block. These vibrations are transmitted to the knock sensors (7/23-24), which are bolted in the engine block.

One knock sensor detects knock on cylinders 1, 2, 3. The other knock sensor detects knock on cylinders 4, 5, and 6.

The mechanical stress generated in the knock sensors' piezo-electric materials result in generation of a voltage. The Engine control module (ECM) (4/46) can then, using the camshaft sensors (7/172-173) and the impulse sensor (7/25), decide which cylinder is knocking.

The knock sensors (KS) also interpret a proportion of normal engine sound. The control module is able to recognize the vibrations which correspond to knocking by filtering, amplifying and using software to evaluate the signal.

If the knock sensors (KS) detect knocking in the engine above a certain threshold value, the ignition timing is first retarded and then the fuel/air mixture is enriched to eliminate knocking.

IGNITION CONTROL

Fig. 235: Identifying Ignition Control Components
Courtesy of VOLVO CARS CORPORATION

The following components are used for ignition control:

- engine speed (RPM) sensor (7/25)
- Camshaft sensor (7/172-173)
- mass air flow (MAF) sensor (7/17)
- engine coolant temperature (ECT) sensor (7/16)
- throttle position (TP) sensor on the electronic throttle unit (6/120)
- knock sensor (KS) (7/23-24)
- transmission control module (TCM) (4/28)
- spark plugs with ignition coils (20/3-8).

The engine control module (ECM) calculates the optimum ignition advance based on the software and information from the sensors. The engine control module (ECM) cuts the current to the ignition coil mounted on the cylinder to be ignited and produces a spark.

During the starting phase the engine control module (ECM) produces a fixed ignition setting. When the engine has started and the vehicle is being driven, the engine control module (ECM) calculates the optimum ignition setting, taking factors such as the following into account:

- engine speed (RPM)
- load
- temperature.

The engine control module (ECM) analyses the signal from the knock sensors (KS) when the engine reaches operating temperature. If any of the cylinders knock, the ignition is retarded for that specific cylinder until the knocking ceases.

The ignition then advanced to the normal position or until the knock recurs.

Before the Transmission control module (TCM) is going to shift, sometimes it sends a request for torque limitation to the Engine control module (ECM). Which then lowers the ignition momentarily to reduce the torque and thus give smoother shifting and reduced load on the transmission.

Lowering of ignition can be done in several levels, where the levels depend on the signals from the Transmission control module (TCM). The return signal from the Engine control module (ECM) to the Transmission control module (TCM) confirms that the signal reached the Engine control module (ECM).

For further information, also see: **MISFIRE DIAGNOSTIC**

The engine misfires if the fuel does not ignite correctly. For further information, also see: **MISFIRE DIAGNOSTIC**

REGULATING THE AIR CONDITIONING (A/C) COMPRESSOR

Fig. 236: (A/C) Compressor Regulating System
Courtesy of VOLVO CARS CORPORATION

The air conditioning (A/C) compressor is controlled by the engine control module (ECM) (4/46) on request from the climate control module (CCM) (4/6) via the controller area network (CAN). When the engine control module (ECM) receives a signal from the climate control module (CCM) to activate the air conditioning (A/C) compressor, the engine control module (ECM) grounds the circuit for the relay coil for the A/C compressor. See also: **AIR CONDITIONING (A/C) RELAY**

The relay (2/22) closes the circuit between the integrated relay/fusebox in the engine compartment and the clutch for the air conditioning (A/C) compressor (8/3). The air conditioning (A/C) compressor which has a variable cylinder displacement is always running during normal driving. Displacement in the compressor is regulated by a solenoid which is controlled by the engine control module (ECM).

The engine control module (ECM) controls the solenoid (displacement) from the driver's and vehicle's various driving characteristics. On Startup of the engine, pulling off and at acceleration etc, displacement is controlled so that the A/C compressor has the least possible effect on the engine torque. The climate control module (CCM) controls all functions in the climate control system that are related to the vehicle's interface for driver and passenger. I. E. the climate control system buttons on the dashboard environment panel.

The climate control module (CCM) transmits information to the engine control module (ECM), which determines what must be prioritized. For example, the air conditioning (A/C) compressor in certain extreme cases is switched off completely, regardless of the climate control module (CCM) request. This is to prevent negative engine performance and to protect the air conditioning (A/C) system. As well as the information from

the climate control module (CCM), the engine control module (ECM) controls the air conditioning (A/C) compressor based on the information from:

- Air conditioning (A/C) pressure sensor (high pressure side) (7/8)
- the throttle position (TP) sensor (6/120)
- the engine coolant temperature (ECT) sensor (7/16).

THROTTLE CONTROL

Fig. 237: Identifying Throttle Control
Courtesy of VOLVO CARS CORPORATION

To ensure that the correct throttle angle is reached, the engine control module (ECM) (4/46) controls the throttle shutter in the throttle unit (6/120), mainly using the signal from:

- Accelerator pedal (AP) position sensor (7/51)
- the throttle position (TP) sensor on the electronic throttle unit.

Additional signals and parameters are used to ensure optimum throttle control. By example by compensating for:

- the load from the air conditioning (A/C) compressor
- the load from the transmission depending on the selected gear mode

- engine coolant temperature (ECT)
- mass air flow through the intake manifold
- manifold absolute pressure (MAP) in the intake manifold.

The position of the throttle is measured by two potentiometers, in the throttle position (TP) sensor, which are on the throttle unit. These are connected, so that potentiometer 1 produces a higher voltage as the throttle angle increases, while potentiometer 2 does the opposite.

In a combustion engine, the difference between the minimum and maximum airflow is considerable. The smaller air flows need more thorough regulation, so the potentiometer signal from potentiometer 1 is amplified approximately 4 times in the engine control module (ECM) before it reaches the AC/DC converter in the engine control module (ECM). This means that there are three, two real and one fictitious, input signals available to the engine control module (ECM). These signals are used to determine the position of the throttle and to deploy the damper motor to the correct position. In general the amplified signal is primarily used for small throttle angles (small air flows), which are desirable when a high degree of accuracy is required, for idle air trim for example.

Because the signal is amplified, it reaches its maximum value as early as approximately a quarter of maximum deployment.

The engine control module (ECM) primarily uses the signal from potentiometer 1 as a measurement of throttle opening. The signal from potentiometer 2 is mainly to check that potentiometer 1 is working. The engine control module (ECM) then uses the signal to calculate a throttle angle (actual value). This is the actual throttle angle. The value for the actual throttle angle is used by those functions in the engine control module (ECM) which depend on this information so that the throttle can be correctly regulated.

There is an adaptation (learning) in the engine control module (ECM) so that the control module can calculate how the damper motor needs to be controlled. See "Adaptation of the throttle unit" below.

The throttle angle is regulated so that the actual angle (actual value) is the same as the angle calculated by the engine control module (ECM) (desired value). The engine control module (ECM) also uses the values that were stored during adaptation of the throttle angle, and the actual signals from the potentiometers.

The damper motor is deployed by the integrated power stage in the engine control module (ECM) using a pulse width modulation (PWM) signal. The torsion from the opening and return springs in the electronic throttle unit is also used. If there is a fault in the engine control module (ECM) so that the throttle unit cannot be operated or powered, the springs in the throttle unit will turn the throttle disc to the limp home position (return position). This return position gives a throttle angle large enough to allow the car to be driven to a workshop, although with considerably reduced driveability.

Throttle angle

The throttle angle is usually gauged by potentiometer 1. For small angles the amplified signal is used to obtain a clearer signal. The engine control module (ECM) also monitors the throttle unit signals from the potentiometers to check that they are plausible, that they are within the minimum and maximum limits and that the signals correspond to the same throttle angle. If there is a difference in the signals, a fictitious throttle signal is calculated from the load signal, the engine speed (rpm) and the prevailing conditions, particularly pressure and temperature.

The potentiometer whose signal is closest to the calculated throttle angle will then be assumed to be correct. The other potentiometer is then classified as not functioning and a diagnostic trouble code (DTC) is generated. The system then constantly monitors the throttle angle of the remaining potentiometer in comparison to the calculated throttle angle. If there is a difference between these values, the engine control module (ECM) will not rely on any of the throttle unit potentiometers. The power stage in the throttle unit is then disengaged, and the throttle switches to limp home mode.

Adaptation of the throttle unit

In ignition position II, the engine control module (ECM) carries out adaptation of the electronic throttle unit. Adaptation is carried out by the throttle disc being mechanically controlled to the closed position and the current throttle position being read off. If previous adaptation values are missing in the engine control module (ECM), for example, if the control module has not been powered, the current throttle angle is stored as the adaptation value. If, in addition, there is a previously stored value, the average value of the previous one and the current throttle angle is stored as the new adaptation value.

HINT: When replacing the electronic throttle unit, the engine control module (ECM) must therefore always be switched off.

SYSTEM OVERVIEW

CONTROL MODULE

Fig. 238: Identifying Engine Control Module (ECM)
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) controls, amongst others, the following functions:

- injectors
- ignition
- camshafts (CVVT)
- Evaporative emission system (EVAP) valve
- throttle angle
- engine cooling fan (FC)

- air conditioning (A/C) compressor.
- fuel pump
- Variable intake system
- variable camshaft profile.

The engine control module (ECM) is supplied with battery voltage (U_{bat}) via fuses in the central electronic module (CEM) and in the integrated relay/fusebox in the engine compartment.

To prevent certain stored date from being erased from the engine control module (ECM) when the ignition is switched off, the control module also has a 30-supply. This supply is from the integrated relay/fusebox in the engine compartment.

The control module is grounded via the wiring which is connected at the right-hand suspension turret.

The engine control module (ECM) contains a voltage regulator which maintains a low voltage (5 V) in internal components in the control module such as:

- Analog/Digital converter
- Digital/Analog converter
- Micro-processor.

Functions which require battery power (U_{bat}) and high output are controlled by external or internal power stages. For example ignition coils have external power stages (integrated into the ignition coils) while the power stages for the injectors are integrated in the engine control module (ECM).

The micro-processor in the engine control module (ECM) receives signals from the different sensors and control modules in the vehicle. The micro-processor uses a program which interprets the signals from the different sensors and how the components and functions should be controlled.

The engine control module (ECM) has several self-learning (adaptive) functions. It continually adapts ongoing calculations to changing circumstances (such as wear, air leaks, differences between different fuels).

Emissions are kept low through efficient management of the injection period, ignition, evaporative emission system (EVAP) valve and camshafts etc. Faults which affect emissions can be detected by running diagnostics for functions and components.

The Engine control module (ECM) is located on the air filter box, under a plastic cover.

The engine control module (ECM) communicates with other control modules using controller area network (CAN) communication or LIN communication.

The engine control module (ECM) checks activations, input and output signals and functions using an integrated diagnostic system. A diagnostic trouble code (DTC) is stored if, after validation, the control module detects a fault. In certain cases the faulty signal is also replaced with a substitute value or certain functions are limited.

For example, substitute values can be set for:

- engine coolant temperature (ECT) sensor
- Mass air flow (MAF) sensor
- throttle position (TP) sensor
- air pressure
- fuel pressure.

Mathematical calculations and signals from certain components are used to calculate the substitute values. Other substitute values are fixed, predefined values in the engine control module (ECM).

The substitute value allows the vehicle to be driven and for the emissions to be kept at a reasonable level even though vital functions or components are malfunctioning.

Functions which may be limited are for example:

- camshaft control (CVVT)
- fuel trim
- throttle angle
- fuel pressure regulation.

The substitute values are used and functions restricted so that the system is still able to work while protecting components that are required for safety reasons (for example the throttle angle).

Any diagnostic trouble codes (DTCs) are stored in the internal memory of the engine control module (ECM). The information can be read off via the data link connector (DLC) in the vehicle.

SIGNALS

The table below summarizes the input signals to and output signals from the Engine Control Module (ECM). The signal types are divided into directly connected signals, LIN and CAN communication. The illustration below gives the same information as the Volvo component designations.

Input signals	Output signals
Directly connected: • Ignition switch (3/1) • Air conditioning (A/C) pressure sensor (7/8) • Brake light switch (from the central electronic module (CEM)) (3/9) • Accelerator pedal (AP) position sensor (7/51) • Electronic throttle unit (6/120)	**Directly connected:** • Air conditioning (A/C) relay (2/22) • Air conditioning (A/C) compressor (8/3) • Electronic throttle unit (6/120) • Engine cooling fan (FC) control module (4/71) • Evaporative emission system (EVAP) valve (8/18) • Injectors (8/6-11)

• Camshaft position sensor, intake (7/172) • Camshaft position sensor, exhaust (7/173) • Engine coolant temperature (ECT) sensor (7/16) • Engine speed (RPM) sensor (7/25) • Fuel pressure sensor / fuel temperature sensor (7/156) • Knock sensor (KS) (7/23-24) • Mass air flow (MAF) sensor/air temperature sensor (7/17) • Manifold absolute pressure (MAP) sensor (7/81) • Front oxygen sensor, bank 1 (7/15) • Front oxygen sensor, bank 2 (7/82) • Rear oxygen sensor, bank 1 (7/103) • Rear oxygen sensor, bank 2 (7/104) • Oil level sensor (7/35) • Outside temperature sensor (6/62) • Ignition coils (20/3-8) • Engine cooling fan (FC) control module (4/71) • Leak diagnostic unit (6/67), (certain markets only). • Gear position status (P/N engaged/disengaged) (from the transmission control module (TCM) (4/28)) • Engine coolant level sensor (7/73)	• Fuel pump (FP) control module (4/83) • Ignition coils (20/3-8) • Leak diagnostic unit (6/67), (certain markets only). • Front oxygen sensor, bank 1 preheating (7/15) • Front oxygen sensor, bank 2 preheating (7/82) • Rear oxygen sensor, bank 1 preheating (7/103) • Rear oxygen sensor, bank 2 preheating (7/104) • Main relay (system relay) (2/32) • Starter motor relay (2/35) • Camshaft reset valve (CVVT), intake (8/19) • Emissions warning lamp (5/1) • Actuator variable intake manifold, upper (6/139) • Actuator variable intake manifold, lower (6/140) • Cam profile solenoid 1 (CPS1) (8/125) • Cam profile solenoid 2 (CPS2) (8/126)

ENGINE CONTROL MODULE (ECM) (B8444S; 2005-2011)

DESIGN

IGNITION SWITCH

Fig. 241: Identifying Ignition Switch And Connector Terminals
Courtesy of VOLVO CARS CORPORATION

The Engine Control Module (ECM) uses the signal from the ignition switch to detect when the ignition key has been turned to position II or III. When the key is in the ignition position (position II) or starting position (position III) a high signal (U_{bat}) is transmitted from the ignition switch to the engine control module (ECM).

The engine management system prepares for start-up (for example, temporarily activates the fuel pump (FP) relay). When the flywheel in the engine rotates, the engine speed (RPM) sensor signal is used to keep the fuel pump (FP) relay activated.

The fuse in the fuse box in the passenger compartment supplies current to the ignition switch.

The central electronic module (CEM) has diagnostics for the ignition switch.

ENGINE SPEED (RPM) SENSOR

Fig. 242: Identifying Engine Speed (RPM) Sensor
Courtesy of VOLVO CARS CORPORATION

The engine speed (RPM) sensor provides the engine control module (ECM) with information about the speed and position of the crankshaft. The engine control module (ECM) is able to use the signal from the engine speed (RPM) sensor to determine when a piston is approaching top dead center (TDC).

The signal from the engine speed (RPM) sensor is also used to check the engine for misfires. For further information, see: **MISFIRE DIAGNOSTIC**

The engine speed (RPM) sensor is at the rear of the engine above the flywheel.

The sensor is inductive with a permanent magnet. An alternating current is induced in the sensor when the flywheel/carrier plate passes the engine speed (RPM) sensor. The generated voltage and frequency increases with the engine speed (rpm).

The signal varies between 0.1-100 V depending on the engine speed (RPM).

The Engine Control Module (ECM) is able to determine the engine speed (RPM) by counting the number of holes per time unit. When the reference position passes the engine speed (RPM) sensor, the voltage and frequency drop momentarily to zero, even though the engine is still running. This allows the engine control module (ECM) to determine the position of the crankshaft.

If the signal from the engine speed (RPM) sensor is incorrect or missing, the control module will use signals from the camshaft position (CMP) sensor.

The engine speed (RPM) sensor can be diagnosed by the engine control module (ECM) and the sensor signal (engine speed (RPM)) can be read off.

CAMSHAFT POSITION (CMP) SENSOR

Fig. 243: Camshaft Position Sensor
Courtesy of VOLVO CARS CORPORATION

The function of the camshaft position (CMP) sensor is to detect the flanks of the camshaft rotor. The signal from the sensor is used by the engine control module (ECM) to determine the angle of the camshaft.

Each camshaft is divided into a number of flanks (segments) per camshaft revolution. A pulse wheel on the camshaft consisting of teeth (the teeth are positioned by each flank) is used by the camshaft position sensor (CMP) to detect the flanks and the position of the camshaft.

In the event of misfire or engine knock, the control module is able to determine which cylinder is misfiring or knocking using the camshaft position (CMP) sensor signal. Also, see **KNOCK SENSOR (KS)** and **ENGINE SPEED (RPM) SENSOR**.

Data about the camshaft position is used during camshaft control (CVVT). See: **CAMSHAFT CONTROL (CVVT)**

The sensor, which is a magnetic resistor with a permanent magnet, is grounded in the control module and supplied with 5 V from the control module. When one of the teeth on the camshaft pulse wheel passes the camshaft position (CMP) sensor, a signal is transmitted to the control module from the camshaft position (CMP) sensor. The signal varies between 0 - 5 V and is high when a tooth is close to the camshaft position (CMP) sensor and low when the tooth leaves the camshaft position (CMP) sensor.

There is camshaft position (CMP) sensor for each camshaft.

The camshaft position (CMP) sensors are located by the camshafts on the rear edge of the engine (left-hand side of the vehicle, closest to the flywheel).

The engine control module (ECM) can diagnose the camshaft position (CMP) sensors.

KNOCK SENSOR (KS)

Fig. 244: Identifying Knock Sensor
Courtesy of VOLVO CARS CORPORATION

The function of the knock sensor (KS) is to monitor combustion knocking from the engine. Knocking may damage the engine and reduces the efficiency of engine combustion.

If the engine control module (ECM) registers knocking from any of the cylinders, the ignition will be retarded for that cylinder at the next combustion stage. If repeated ignition retardation does not prevent knocking, the injection period will be increased. This has a cooling effect.

The sensor is made up of Piezo electrical crystals. If there is engine knock, vibrations (sound waves) spread through the cylinder block to the knock sensor (KS). The resultant mechanical stress in the Piezo electrical material in the knock sensors generates a voltage. This signal is transmitted to the engine control module (ECM). The signal corresponds to the frequency and amplitude of the sound waves. This allows the Engine Control Module (ECM) to determine if the engine is knocking. The camshaft position (CMP) sensor and engine speed (RPM) sensor are used to determine the operating cycle of the engine (which cylinder is igniting) and therefore which cylinder is knocking.

The knock sensors are located on the engine block between the cylinder rows.

Knock sensor 1 detects knock on cylinders 5, 6, 7 and 8. Knock sensor 2 detects knock on cylinders 1, 2, 3 and 4.

The engine control module (ECM) can diagnose the knock sensors (KS).

ENGINE COOLANT TEMPERATURE (ECT) SENSOR

Fig. 245: View of Engine Coolant Temperature (ECT) Sensor
Courtesy of VOLVO CARS CORPORATION

The engine coolant temperature (ECT) sensor checks the temperature of the engine coolant. The temperature of the engine coolant is required so that the engine control module (ECM) can regulate:

- the injection period
- the idle speed
- the engine cooling fan (FC)
- the ignition advance
- engagement and disengagement of the A/C compressor
- diagnostic functions.

The sensor is a negative temperature coefficient (NTC) type which is supplied with power from the control module (signal) and is grounded in the control module.

The resistance in the sensor changes depending on the temperature of the coolant. Depending on the resistance in the sensor, voltage (signal) is transmitted to the engine control module (ECM). The lower the temperature the higher the voltage (high resistance). A high temperature results in low voltage (low resistance).

The engine coolant temperature (ECT) sensor is located beside the thermostat.

The engine coolant temperature (ECT) can be diagnosed by the engine control module (ECM) and the value of the sensor can be read off.

MASS AIR FLOW (MAF) SENSOR/INTAKE AIR TEMPERATURE (IAT) SENSOR

Fig. 246: Identifying Mass Air Flow Sensor
Courtesy of VOLVO CARS CORPORATION

Overview

The mass air flow (MAF) sensor is a combined sensor and contains two sensors in the same component:

- mass air flow (MAF) sensor
- intake air temperature (IAT) sensor.

The mass air flow (MAF) sensor is positioned between the air cleaner (ACL) housing and the intake manifold.

Mass air flow (MAF) sensor

The mass air flow (MAF) sensor gauges the air mass sucked into the engine. It continuously transmits signals to the engine control module (ECM) about the mass of the intake air. This data is used by the engine control module (ECM) to calculate:

- the injection period
- the fuel pressure
- the ignition timing
- the engine load.

The transmission control module (TCM) also uses this data for its gear shift calculations. This data is transmitted to the transmission control module (TCM) from the engine control module (ECM) via the high speed side of the Controller area network (CAN).

The mass air flow (MAF) sensor is a hot wire type. Unlike other hot wire types, the mass air flow sensor in the Denso system uses a hot wire which has a ceramic casing. This eliminates the need for a clean burn function.

The mass air flow (MAF) sensor is supplied with battery voltage by the system relay and is grounded in the engine control module (ECM). The signal from the sensor is analog and varies between approximately between 0.5 - 4.5 V. Low air flow (low mass) results in low voltage, high air flow (high mass) gives high voltage.

The mass air flow (MAF) sensor can be diagnosed by the engine control module (ECM) and the sensor signal can be read off.

Intake air temperature (IAT) sensor

The temperature sensor checks the temperature of the intake air in the intake manifold. This data is used by the engine control module (ECM) to calculate injection period. The control module also controls certain diagnostic functions using the signal from the temperature sensor.

The sensor, which is an NTC resistor, is grounded in the control module and supplied with power (signal) from the control module.

The resistance in the sensor changes according to the intake air temperature. This provides the control module with a signal of between 0.5 - 5 V. The lower the temperature the higher the voltage (high resistance). A high temperature results in low voltage (low resistance).

The temperature sensor can be diagnosed by the engine control module (ECM) and the sensor signal can be read off.

HEATED OXYGEN SENSORS (HO2S)

Front heated oxygen sensor (HO2S)

Fig. 247: View of Heated Oxygen Sensor (HO2S)
Courtesy of VOLVO CARS CORPORATION

CAUTION: The air lines for the heated oxygen sensors (HO2S) must not be trapped or damaged in any way. The connectors for the heated oxygen sensors (HO2S) must not be greased under any circumstances. The oil in the grease would disrupt the reference air and the function of the heated oxygen sensors (HO2S).

Front heated oxygen sensor (HO2S) is used to provide the engine control module (ECM) with information about the remaining oxygen content of the exhaust gases before the three-way catalytic converter (TWC). This is so that the engine control module (ECM) can continually check the combustion so that lambda=1 is achieved.

lambda=1 is the ideal fuel-air ratio, with 14.7 kg air per 1 kg fuel.

The heated oxygen sensor (HO2S) uses current control and its signal characteristic is linear. With a linear signal characteristic, the amplitude of the signal curve is low when changing the oxygen content in the exhaust gases. The probe consists of a preheating element and the actual lambda sensor. The lambda sensor is an oxygen sensitive ceramic body consisting of zirconium oxide. The control module supplies power to the ceramic body, which reacts to the oxygen content of the exhaust gases. This in turn affects the signal to the engine control module (ECM). In order to determine the oxygen content in the exhaust pipe, the heated oxygen sensor (HO2S) needs reference air from the surrounding air. This reference air reaches the heated oxygen sensor (HO2S) via the air lines.

CAUTION: The air lines for the heated oxygen sensors (HO2S) must not be trapped or damaged in any way. The connectors for the heated oxygen sensors (HO2S) must not be greased under any circumstances. The oil in the grease would disrupt the reference air and the function of the heated oxygen sensors (HO2S).

There are two front heated oxygen sensors; one for bank 1 and one for bank 2.

Bank 1 (front cylinder row); cylinders 1, 3, 5 and 7.

Bank 2 (rear cylinder row, closest to the passenger compartment); cylinders 2, 4, 6 and 8.

The heated oxygen sensors (HO2S) can be diagnosed by the engine control module (ECM), and signals from them can be read off. For further information: **HEATED OXYGEN SENSOR (HO2S) DIAGNOSTIC**

The control module can be used to read off the calculated lambda value from the heated oxygen sensor (HO2S) signal.

Rear heated oxygen sensor (HO2S)

Fig. 248: View of Heated Oxygen Sensor (HO2S)
Courtesy of VOLVO CARS CORPORATION

CAUTION: The air lines for the heated oxygen sensors (HO2S) must not be trapped or

damaged in any way. The connectors for the heated oxygen sensors (HO2S) must not be greased under any circumstances. The oil in the grease would disrupt the reference air and the function of the heated oxygen sensors (HO2S).

The rear heated oxygen sensor (HO2S) is used to provide the engine control module (ECM) with information about the remaining oxygen content of the exhaust gases beyond the three-way catalytic converter (TWC). This information is used by the Engine Control Module (ECM) to check the function of the three-way catalytic converter (TWC). This check is carried out when the conditions for the catalytic converter diagnostics have been met. The rear heated oxygen sensor (HO2S) has no direct effect on regulation of the fuel/air mixture. However the engine control module (ECM) uses the signal to optimize the signal from the front heated oxygen sensor (HO2S). For further information, see: **THREE-WAY CATALYTIC CONVERTER (TWC) DIAGNOSTICS**

The heated oxygen sensor (HO2S) uses voltage control. The signal characteristic is binary. With a binary signal characteristic, the amplitude of the signal curve changes considerably when changing the oxygen content in the exhaust gases. Otherwise its components and function are the same as the front heated oxygen sensor (HO2S).

CAUTION: The air lines for the heated oxygen sensors (HO2S) must not be trapped or damaged in any way. The connectors for the heated oxygen sensors (HO2S) must not be greased under any circumstances. The oil in the grease would disrupt the reference air and the function of the heated oxygen sensors (HO2S).

There are two rear heated oxygen sensors; one for bank 1 and one for bank 2.

Bank 1 (front cylinder row); cylinders 1, 3, 5 and 7.

Bank 2 (rear cylinder row, closest to the passenger compartment); cylinders 2, 4, 6 and 8.

The heated oxygen sensors (HO2S) can be diagnosed by the engine control module (ECM), and signals from them can be read off

Preheating of the heated oxygen sensors (HO2S)

The heated oxygen sensor (HO2S) only functions above a certain temperature, approximately 300 °C. The normal operating temperature is between 300-900 °C. The heated oxygen sensors (HO2S) are electrically pre-heated so that operating temperature is rapidly reached. They are also pre-heated to ensure that the heated oxygen sensors (HO2S) maintain a normal operating temperature and to prevent condensation which could damage the heated oxygen sensor (HO2S).

The heater element in the probe consists of a positive temperature coefficient (PTC) resistor. The system relay supplies the heater element with voltage. The element is grounded in the engine control module (ECM). When the control module grounds the connection a current flows through the PTC resistor. When the heated oxygen sensor (HO2S) is cold, the resistance in the PTC resistor is low and a large current will flow through the circuit. The current from the engine control module (ECM) is pulsed at first to prevent condensation damage to the heated oxygen sensor (HO2S). Depending on the temperature, allowances are made for factors such as the dew

point. As the temperature in the PTC resistor rises, the resistance rises, the current falls and switches in stages to a constant current. The pre-heating time for front heated oxygen sensor (HO2S) is short, approximately 20 seconds.

The heater element heats the heated oxygen sensors (HO2S) to approximately 350 °C. The probes maintain this as a minimum temperature.

The engine control module (ECM) can diagnose the heater element.

STOP LAMP SWITCH

Fig. 249: Brake Light Switch
Courtesy of VOLVO CARS CORPORATION

The purpose of the stop lamp switch is to provide the engine control module (ECM) with information indicating whether the brake pedal is depressed or not.

A signal is transmitted to the engine control module (ECM) when the brake pedal is pressed. The engine control module (ECM) disengages the cruise control (if activated). The brake pedal sensor also disengages cruise control.

The stop lamp switch is supplied with power from the ignition switch (terminal 30). When the brake pedal is depressed the switch closes and a high signal (12 V) is transmitted to the engine control module (ECM).

The stop lamp switch can be diagnosed by the engine control module (ECM) and its status (depressed or not) can be read off.

The stop lamp switch is on the pedal box by the brake pedal.

A/C PRESSURE SENSOR

Fig. 250: A/C Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

The air conditioning (A/C) pressure sensor detects the pressure in the high-pressure side of the air conditioning (A/C) system.

The sensor is linear. It is grounded in the control module and supplied with 5 V from the control module. A linear signal (which depends on the pressure in the air conditioning (A/C) system) is transmitted to the engine control module (ECM). Low pressure produces low voltage, high pressure produces high voltage.

The air conditioning (A/C) pressure sensor can be diagnosed by the engine control module (ECM) and the sensor value can be read off.

The air conditioning (A/C) pressure sensor is directly mounted on the air conditioning receiver drier.

TRANSMISSION CONTROL MODULE (TCM)

The engine control module (ECM) uses a directly connected signal from the transmission control module (TCM) in the start function (activating the starter motor).

ACCELERATOR PEDAL (AP) POSITION SENSOR

Fig. 251: Identifying Accelerator Pedal (AP) Position Sensor
Courtesy of VOLVO CARS CORPORATION

The function of the accelerator pedal (AP) position sensor is to provide the engine control module (ECM) and central electronic module (CEM) with information about the position of the accelerator pedal. This data is used by the engine control module (ECM) to deploy the shutter in the throttle unit to the correct angle.

The accelerator pedal (AP) position sensor consists of a plastic housing with two potentiometers, and an Analog/Digital converter. The potentiometers are connected to a common shaft which is affected by the position of the accelerator pedal (AP).

The accelerator pedal (AP) position sensor transmits an analog and a pulse width modulated (PWM signal to the engine control module (ECM). These signals indicate the position of the accelerator pedal (AP). The digital signal is generated by the sensors Analog/Digital converter.

The analog and digital signals are used at the same time by the engine control module (ECM) to regulate the throttle shutter angle.

The power supply to the two potentiometers is different. The analog potentiometer is supplied with 5 V via the engine control module (ECM). The digital potentiometer is supplied with 12 V via the system relay and is grounded in the car body.

The digital signal is also used in conjunction with the analog signal for accelerator pedal (AP) position sensor diagnostics.

Accelerator pedal (AP) position sensor signals can be read off.

A diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects a difference between the analog and digital signals. The engine control module (ECM) then uses a minimal value to ensure the function (limp home).

The accelerator pedal (AP) position sensor is located on the accelerator pedal bracket.

OUTSIDE TEMPERATURE SENSOR

Fig. 252: Identifying Outside Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

The outside temperature sensor detects the temperature in the surrounding air. The signal is used by the engine

control module (ECM) as a substitute value in the event of a fault in certain components or functions and to control certain diagnostic functions.

The sensor is a negative temperature coefficient (NTC) type which is supplied with power from the control module (signal). The resistance in the sensor changes with the outside temperature. This alters the signal to the engine control module (ECM). The lower the temperature the higher the voltage (high resistance). A high temperature results in low voltage (low resistance).

The outside temperature sensor is positioned in the left door mirror.

The outside temperature sensor can be diagnosed by the engine control module (ECM) and the sensor value can be read off.

ENGINE COOLANT LEVEL SENSOR

Fig. 253: Engine Coolant Level Sensor
Courtesy of VOLVO CARS CORPORATION

The function of the engine coolant level sensor is to alert the driver if the engine coolant level in the expansion tank is too low.

The sensor is a magnetic reed switch, which is enclosed in a pipe on the bottom of the expansion tank. Around the pipe, on the inside of the expansion tank is a float. This float contains a magnet. When the engine coolant level is above minimum, the float is too high in the tank to affect the switch. However if the engine coolant level falls below the minimum level, the magnetic field acts on the switch.

The sensor is supplied with voltage (signal) from the engine control module (ECM) and grounded in the body. When the engine coolant level in the expansion tank is over a certain level the circuit closes, which produces a low signal. When the engine coolant level is below a certain level the circuit is opened by the engine coolant level sensor, which produces a high signal. When the engine control module (ECM) detects a high signal the information about low engine coolant level is transmitted via the Controller area network (CAN) to the driver information module (DIM), which warns the driver.

NOTE: There are no functions controlled by the engine which are directly connected to the low coolant level warning lamp. The Engine Control Module (ECM) only

transfers the signal which is used by the Driver Information Module (DIM).

The engine control module (ECM) cannot diagnose the engine coolant level sensor.

OIL PRESSURE SWITCH

Fig. 254: Identifying Oil Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

The function of the oil pressure switch is to warn the driver about low oil pressure via the driver information module (DIM).

The oil pressure switch has a pressure sensing switch which is powered (signal) by the engine control module (ECM) and grounded in the cylinder block. The oil pressure switch is affected by the oil pressure of the engine.

When the oil pressure exceeds a certain value, the switch in the oil pressure switch will open. A high signal is then sent to the engine control module (ECM).

If the oil pressure is below a certain value, the switch in the oil pressure switch will close and a low signal will be sent to the engine control module (ECM). The engine control module (ECM) then transmits a CAN signal to the driver information module (DIM) to light the indicator lamp for low oil pressure.

The oil pressure sensor is on the cylinder block.

The engine control module (ECM) cannot diagnose the oil pressure switch.

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR, INTAKE

Fig. 255: Identifying Manifold Absolute Pressure (MAP) Sensor
Courtesy of VOLVO CARS CORPORATION

The manifold absolute pressure (MAP) sensor detects quick pressure changes in the intake manifold after the throttle. The signal from the sensor is used by the engine control module (ECM) to supplement the mass air flow (MAF) sensor when calculating injection period.

The manifold absolute pressure (MAP) sensor intake is located on the upper rear edge of the engine (passenger compartment side).

The semi-conductor sensor is grounded in the control module and is supplied with power from the control module.

The resistance in the intake manifold moves the silicone membrane in the sensor, giving a signal of 0.5 - 4.5 V to the control module. Low pressure results in low voltage, high pressure gives high voltage.

The pressure sensor can be diagnosed by the engine control module (ECM) and the sensor signal can be read off.

FUEL PRESSURE SENSOR / FUEL TEMPERATURE SENSOR

Fig. 256: Fuel Pressure Sensor And Fuel Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

Overview

The fuel pressure and fuel temperature sensors are combined.

The sensor detects the fuel pressure (absolute pressure) and the temperature of the fuel in the fuel rail.

The fuel pressure sensor is on the right-hand end of the fuel rail.

The fuel pressure-/fuel temperature sensor can be diagnosed by the engine control module (ECM) and its signals (pressure and temperature) can be read off.

Fuel pressure sensor

The pressure sensor is a Piezo resistive type resistor, the resistance of which changes with the pressure. Depending on the pressure in the fuel rail, an analog signal of 0 - 5 V is transmitted to the engine control module (ECM). Low pressure results in low voltage, high pressure gives high voltage.

The engine control module (ECM) then uses this signal to adjust the pressure in the fuel rail using the fuel pump control module. See also: **FUEL PRESSURE REGULATION**

The pressure sensor is supplied with 5 V and grounded in the engine control module (ECM). The pressure sensor transmits a signal indicating the fuel pressure to the engine control module (ECM) on a separate cable.

NOTE: The absolute pressure is displayed when using parameter read outs to read off the fuel pressure. If there is no pressure at the fuel rail, the atmospheric pressure will be displayed.

HINT: The relative pressure (absolute pressure minus atmospheric pressure) is displayed when reading off the fuel pressure via a manometer connected to the fuel rail.

Fuel temperature sensor

The temperature sensor is an NTC sensor. The sensor is supplied with voltage (signal) from and grounded in the engine control module (ECM).

The resistance in the sensor changes according to the temperature of the fuel. This provides the engine control module (ECM) with a signal of between 0 - 5 V. Low temperature results in high voltage (high resistance). High temperature results in low voltage (low resistance).

The engine control module (ECM) uses the signal to calculate the volume of the fuel.

OIL LEVEL SENSOR

Fig. 257: Identifying Oil Level Sensor
Courtesy of VOLVO CARS CORPORATION

The function of the oil level sensor is to provide the engine control module (ECM) with information regarding the level of engine oil in the oil sump.

The sensor consists of:

- a terminal with three pins
- integrated electronics
- 2 capacitive gauge elements
- a PTC resistor.

The oil level sensor is supplied with 5 V by the engine control module (ECM). The oil level sensor generates a pulse width modulated (PWM) signal for the engine control module (ECM).

The oil level sensor can be diagnosed by the engine control module (ECM).

The pulse-width modulated (PWM) signal from the oil level sensor can be read using parameter readout.

MAIN RELAY (SYSTEM RELAY)

Fig. 258: Identifying Main Relay

Courtesy of VOLVO CARS CORPORATION

The function of the main relay (system relay) is to supply certain components with voltage.

The relay is mechanical and has a closing and opening function. In the rest position the circuit in the relay is open.

The main relay terminals (#30 and #86) are supplied with voltage by the battery. When the ignition key has been turned and the engine control module (ECM) is powered, the terminal (#85) on the main relay is grounded by the engine control module (ECM).

When the terminal (#85) is grounded, the relay is activated and a number of components are powered via the relay terminal (#87).

The main relay is in the integrated relay/fuse box in the engine compartment and is diagnosed by the engine control module (ECM).

INJECTORS

Fig. 259: Identifying Fuel Injector
Courtesy of VOLVO CARS CORPORATION

The function of the injectors is to spray fuel into the cylinders in the correct spray patterns. This happens sequentially.

The injectors are located under the intake manifold.

The engine control module (ECM) controls the injectors by grounding the valves in pulses.

The injectors can be diagnosed by the engine control module (ECM) and can be activated.

IGNITION COILS

Fig. 260: Identifying Ignition Coil
Courtesy of VOLVO CARS CORPORATION

The ignition coils supply the spark plugs with high voltage to produce sparks. The engine control module (ECM) controls the ignition coils so that sparks are generated at the correct time. The signal reconnects to the engine control module (ECM) so that diagnostics can be carried out.

Each ignition coil has an integrated power stage.

The ignition coils are in the sparkplug wells above each spark plug.

The engine control module (ECM) can diagnose the ignition coils.

CAMSHAFT RESET VALVE (CONTINUOUS VARIABLE VALVE TIMING (CVVT))

Fig. 261: Identifying Camshaft Reset Valve
Courtesy of VOLVO CARS CORPORATION

The camshaft reset valve controls the oil flow to the CVVT unit (camshaft pulley).

The valve consists of an electro-magnetic valve with a spring-loaded piston. There are slits in the piston which channel the engine lubricating oil to the CVVT unit by moving the piston in the reset valve. The continuous variable valve timing (CVVT) unit turns the camshaft (the camshaft timing changes). The direction in which the camshaft turns depends on the chamber in the CVVT unit which is supplied with oil (pressure). See also:

CAMSHAFT CONTROL (CVVT)

An oil filter is mounted at the intake channel for the valves to prevent oil contaminants from affecting the function of the reset valves.

The system relay supplies the reset valve with voltage via a fuse. The valve is grounded (control) in the engine control module (ECM). When the valve is grounded using a pulse width modulation (PWM) signal, the oil flow in the valve can be regulated to the different chambers in the continuous variable valve timing (CVVT) unit at variable rates. This allows the cam timing to be changed precisely and steplessly.

It is important not to mix up the pipes for the valves when removing/installing the reset valve camshaft.

The engine control module (ECM) can diagnose the camshaft reset valve.

The valves are on the cylinder head above the camshafts. There are four reset valves, two for the inlet camshaft and two for the exhaust camshaft.

EVAPORATIVE EMISSION SYSTEM (EVAP) VALVE

Fig. 262: Evaporative Emission System Valve
Courtesy of VOLVO CARS CORPORATION

The evaporative emission system (EVAP) valve is used to open and close the connection between the EVAP canister and the intake manifold. The valve controls the flow of hydro-carbons (fuel vapor) from the EVAP canister to the engine intake manifold using the vacuum in the intake manifold. This ensures that hydro-carbons stored in the EVAP canister are used in the engine combustion process.

The valve is an electromagnetic valve and is powered from the system relay. When the valve needs to be opened, it is grounded internally in the engine control module (ECM). The evaporative emission system (EVAP) valve is closed when in the standby position (open-circuit).

When the control module requests that the EVAP canister should be drained (the hydrocarbons stored in the canister should be released into the engine), the control module deploys the evaporative emission system (EVAP) valve by grounding it. A pulse width modulation (PWM) signal is used to ground the valve and to control the degree to which the valve will open. In this way, the drainage of the EVAP canister is matched to the volumetric efficiency of the EVAP canister, the engine speed (RPM) and the engine load.

The evaporative emission system (EVAP) valve can be diagnosed by the engine control module (ECM) and can be activated.

The evaporative emission system (EVAP) valve is on the rear edge of the engine (passenger compartment side).

LEAK DIAGNOSTIC UNIT (CERTAIN MARKETS ONLY)

Fig. 263: Identifying Leak Diagnostic Unit
Courtesy of VOLVO CARS CORPORATION

The function of the leak diagnostic unit is to pressurize the fuel tank system during leak diagnostics.

The leak diagnostic unit consists of a plastic housing with:

1. electrical air pump
2. a valve / solenoid which governs the air flow in the unit
3. a heater element (PTC resistor) which warms up the pump.

The electrical pump, valve and heater element in the unit are supplied with voltage by the system relay. The pump, valve and heater element are grounded (control) in the engine control module (ECM).

When leak diagnostics are not active, the valve is held open to ambient air for EVAP control to be carried out.

During leak diagnostics the pump in the leak diagnostic unit starts. The valve in the unit is operated by the engine control module (ECM) by grounding the different circuits internally in the engine control module (ECM).

The Engine control module (ECM) checks the fuel tanks system for leaks by pressurizing the system and at the same time monitoring a number of relevant parameters. Also see: **LEAK DIAGNOSTICS (CERTAIN MARKETS ONLY)**

The engine control module (ECM) can diagnose the leak diagnostic unit.

The valve in the leak diagnostic unit can be activated.

The leak diagnostic unit is at the upper front edge of the fuel tank.

AIR CONDITIONING (A/C) COMPRESSOR (CHECK VALVE AIR CONDITIONING (A/C) COMPRESSOR)

Fig. 264: Identifying A/C Compressor (B8444S Only)
Courtesy of VOLVO CARS CORPORATION

The air conditioning (A/C) compressor transports refrigerant, which is necessary for air conditioning (A/C) operation. It is an axial piston compressor with variable displacement. I. E. The compressor has adjustable cylinder displacement which is controlled by a check valve (solenoid). The valve, which is underneath the compressor, can be replaced.

The air conditioning (A/C) compressor is directly mounted on the engine block and is powered by the engine crankshaft via the auxiliaries belt.

AIR CONDITIONING (A/C) RELAY

Fig. 265: Air Conditioning Relay
Courtesy of VOLVO CARS CORPORATION

The air conditioning (A/C) relay supplies the A/C compressor with voltage. The relay is controlled by the engine control module (ECM) based on information from different signals:

- the climate control module (CCM) (via the control area network (CAN))

- the engine coolant temperature
- the position of the accelerator pedal (AP)
- the pressure in the system.

The engine control module (ECM) can temporarily disengage the A/C compressor during wide open throttle (WOT) acceleration.

The relay is mechanical. It has a closing / opening function and is supplied with power from the system relay.

In the rest position the circuit in the relay is open.

The system relay supplies the coil and the relay with power. The relay activates when the coil is grounded in the engine control module (ECM), the circuit closes and the A/C compressor is supplied with power via the relay voltage output.

The relay coil is grounded (signal) when the engine control module (ECM) receives a signal via the Controller area network (CAN) from the climate control module (CCM) to activate the relay and start the compressor.

STARTER MOTOR RELAY

Fig. 266: Identifying Main Relay
Courtesy of VOLVO CARS CORPORATION

The function of the starter motor relay is to supply power to the starter motor. See also: **START**

The starter motor relay is in the relay/fuse box in the engine compartment.

ENGINE COOLING FAN (FC) / ENGINE COOLING FAN (FC) CONTROL MODULE

Fig. 267: Identifying Engine Cooling Fans (FC) and Control Modules
Courtesy of VOLVO CARS CORPORATION

NOTE: The engine cooling fan may have a post-run of up to approx. 6 minutes after the engine has been turned off. The time for the fan's post-run depends on engine temperature, temperature in the engine compartment and pressure level in the AC-system.

WARNING: Be careful since the engine cooling fan may have a post-run after the engine has been turned off.

The engine cooling fan (FC) cools the coolant, engine compartment and the condenser when the air conditioning (A/C) compressor is running.

The engine control module (ECM) transmits a pulse width modulated (PWM) signal to the engine cooling fan (FC) control module. The control module then activates the fan at different speeds. The speed of the engine cooling fan (FC) is determined by the engine control module (ECM), depending on the coolant temperature (based on the signal from the engine coolant temperature (ECT) sensor) and the vehicle speed.

The temperature conditions for engagement of the different engine cooling fan (FC) stages may vary slightly, depending on the engine variant and the equipment level. The temperature conditions apply when:

- the A/C is off
- no faults are detected by the Engine Control Module (ECM).

There is an internal diagnostic function in the engine cooling fan (FC). This function transmits a signal to the engine control module (ECM) if the fan is partially or fully blocked. To do this, the engine cooling fan (FC) control module grounds the pulse width modulation (PWM) signal based on a predetermined pattern.

The engine cooling fan (FC) and its control module are behind the radiator.

The engine cooling fan (FC) can be diagnosed by the engine control module (ECM) and can be activated.

FUEL PUMP

Fig. 268: Fuel Pump
Courtesy of VOLVO CARS CORPORATION

The function of the fuel pump is to ensure that the pressure is correct at the delivery lines for the injectors when requested by the fuel pump control module.

The fuel pump consists of:

1. An electrical pump with an integrated safety valve
2. A pressure equalization valve. This valve equalizes rapid pressure peaks which occur, for example, when the injectors close during engine braking. It also contains a non-return valve which ensures that the pressure in the system does not drop when the engine is switched off
3. Fuel level sensor
4. Fuel filter, cannot be replaced separately
5. Relief valve, releases fuel into the pump housing
6. Ejector pump, continuously fills the pump housing with fuel. The fuel always flows from the fuel pump through the ejector and back to the pump housing.

The fuel pump is supplied with battery voltage by the fuel pump control module and is grounded in the car body via the fuel pump control module.

The engine control module (ECM) has diagnostics for the fuel pump function to ensure that the pressure is correct. See also: **FUEL PRESSURE REGULATION, DIAGNOSTICS**

The fuel pump can be activated and its status can be read off.

The pressure in the fuel rail can be measured by connecting a manometer to a nipple. This nipple is on the right-hand end of the fuel rail.

FUEL PUMP (FP) CONTROL MODULE

Fig. 269: Fuel Pump Control Module
Courtesy of VOLVO CARS CORPORATION

The fuel pump control module powers the fuel pump and regulates the output of the pump. The fuel pressure changes with the output of the pump.

The fuel pump (FP) control module is supplied with battery voltage by the fuel pump relay and grounded in the car body. The fuel pump relay is controlled by the central electronic module (CEM) at the request of the engine control module (ECM).

The engine cannot be started if the power supply to the fuel pump control module is faulty because the fuel pump will not then be powered.

The fuel pump control module is controlled by the engine control module (ECM) via serial communication. The fuel pump control module then controls the fuel pump by transmitting pulse width modulated (PWM) voltage on the ground lead for the fuel pump. This means that the voltage drop across the pump changes, and with it the output of the fuel pump. See also: **FUEL PRESSURE REGULATION**

There are no diagnostics for the fuel pump control module. The engine control module (ECM) has diagnostics for fuel pressure regulation and the associated components. See also: **FUEL PRESSURE REGULATION, DIAGNOSTICS**

The pulse width modulated (PWM) signal from the engine control module (ECM) to the fuel pump control module can be read off.

The fuel pump control module is on the outside on the right-hand side of the fuel tank.

VALVE VARIABLE INTAKE

Fig. 270: Identifying Variable Intake Control Valve
Courtesy of VOLVO CARS CORPORATION

The valve for variable intake controls the vacuum motor for the damper in the variable intake manifold.

The valve consists of an electro-magnetic valve which controls the air flow between the vacuum tank and the vacuum valve for the damper in the variable intake manifold.

The valve is supplied with voltage from the system relay via fuse and ground (control) internally in the engine control module (ECM). Also see: **VARIABLE INTAKE SYSTEM**

The valve for variable intake can be diagnosed by the engine control module (ECM).

The valve for variable intake is on the right-hand side of the engine beside the intake manifold.

EMISSIONS WARNING LAMP

Fig. 271: Emissions Warning Lamp
Courtesy of VOLVO CARS CORPORATION

The emissions warning lamp in the Driver Information Module (DIM) has a warning symbol. This warning symbol varies depending on the market. The warning symbols are:

- "Engine symbol" (not USA)

- "CHECK ENGINE" (MIL - Malfunction Indicator Lamp, USA only).

The warning lamp lights when the ignition key is turned to position II. The warning lamp will go out after approximately 15 seconds or if the engine is started when no fault is found in the engine management system.

If Readiness is not complete (certain diagnostic functions not completed), the warning lamp will flash instead of going out when the ignition key is in position II.

The warning lamp will light if there is a fault in one of the parameters in the engine management system. The warning lamp will also light in response to a request transmitted via the control area network (CAN) if there is a fault in the transmission control module (TCM) which affects emissions.

ELECTRONIC THROTTLE UNIT

Fig. 272: Electronic Throttle Unit
Courtesy of VOLVO CARS CORPORATION

The electronic throttle unit, using the PWM control signal from the engine control module (ECM), regulates the amount of air for engine combustion. This is done using an electronically controlled shutter.

The aluminum electronic throttle unit consists of a round throttle disc on a spindle. The spindle is driven by a DC motor (damper motor), gear wheel and two springs; one for opening and one for return.

By changing the polarity of the power supply, the DC motor can be run in both directions. At one of the limit positions the throttle disc is closed so that minimal air can pass the throttle unit. In the other limit position, the throttle disc is parallel to the air flow. This provides maximum airflow through the electronic throttle unit.

Two permanent magnets in the gear sector on the throttle spindle are used to check the position of the throttle disc. The permanent magnets affect two throttle position (TP) Hall sensors in the cover. The analog signals from the two sensors are transmitted to the engine control module (ECM). The signals are offset. The engine control module (ECM) compares these signals with the stored desired values to check if they are plausible.

The electronic throttle unit is located on the engine intake manifold. In the event of a fault, the throttle unit must be replaced as a single unit.

The engine control module (ECM) can diagnose the electronic throttle unit.

THROTTLE POSITION (TP) SENSOR

Electronic throttle unit.

FUEL PRESSURE REGULATION, DIAGNOSTICS

See: **FUEL PRESSURE REGULATION, DIAGNOSTICS**

OVERVIEW

GENERAL

The engine control module (ECM) diagnoses both internal signals and functions as well as signals and functions from connected components.

CONDITIONS FOR DIAGNOSIS

For the diagnosis of a component or function to start, certain specific conditions must be met. The conditions for diagnostics vary depending on the component or function being diagnosed.

Conditions must be met during the diagnostic in order for the diagnostic to be completed. The time and conditions for the diagnostic vary depending on the component or function being diagnosed. Certain diagnostics only require the ignition to be switched on and off for a diagnostic to be run. Other diagnostics require that several different conditions are met. For example:

- vehicle speed
- engine coolant temperature (ECT)
- time since start
- different load and engine speed relationships in the same trip
- a certain event (for example the evaporative emission system (EVAP) valve is operating).

When the engine control module (ECM) has run all the implemented diagnostics, the control module has completed a "trip". An extensive driving schedule in various conditions is required to complete a trip. The engine may also need to be shut off for a certain amount of time and then switched on again to complete a trip.

EMISSION-RELATED DIAGNOSTIC FUNCTIONS

The engine control module (ECM) checks that the emission-related systems are working. These systems are checked by running a diagnostic function. The diagnostic function checks the components and that the system is functioning.

DIAGNOSTIC TROUBLE CODE MEMORY

When the engine control module (ECM) detects a fault, the diagnostic trouble code (DTC) and status are stored in the diagnostic trouble code (DTC) memory and are now visible at normal diagnostic trouble code (DTC) read out. If the diagnostic trouble code (DTC) lights the malfunction indicator lamp (MIL) this occurs at the same time. If an existing fault disappears and does not recur, the engine control module, after a certain number of fault-free operating cycles and depending on the DTC, changes the status of the diagnostic trouble code (DTC). This means that it can no longer be read off at normal DTC read out. In this status, the diagnostic trouble code (DTC) remains until the engine control module (ECM) erases diagnostic trouble code (DTC) or is disconnected from power.

SUBSTITUTE VALUE

For certain types of diagnostic trouble codes (DTCs), the missing signal is replaced with a substitute value so that the system can continue functioning.

DOWNLOADING SOFTWARE AND REPLACING THE CONTROL MODULE

New software can be downloaded into the engine control module (ECM). When ordering software, the hardware and the software in the car is compared to the information in the Volvo central database. If the comparison is OK the software is downloaded to the control module. If the comparison between the car and Volvo central database is not OK, the database is updated with the car configuration. When this is complete the software is downloaded.

The engine control module (ECM) is located on the air cleaner (ACL) box in the engine compartment.

The engine control module (ECM) contains a unique code for each car for the immobilizer. The central electronic module (CEM) checks this code at engine start up. The engine will not start if the central electronic module (CEM) detects an incorrect code for the immobilizer. This means that the engine control module (ECM) cannot be switched from vehicle to vehicle.

The engine control module (ECM) must first be "unlocked" using a unique PIN for each car before it can be programmed with a code for the immobilizer. When the PIN has been approved by the engine control module (ECM), the code for the immobilizer can be programmed.

The PIN and the code for the immobilizer are obtained from the Volvo central database and sent out with the software package when software for downloading has been ordered.

All new engine control modules (ECM) have the same PIN which is preprogrammed by the control module supplier. When the engine control module (ECM) has been programmed successfully the original PIN for the car will be programmed in the engine control module (ECM) memory and will replace the preprogrammed PIN code.

FUNCTION

STARTING MOTOR

Fig. 273: Identifying Starter Motor System
Courtesy of VOLVO CARS CORPORATION

The starter motor (6/25) is supplied with power via the starter motor relay (2/35), the starter motor relay is controlled by the engine control module (ECM) (4/46).

The start process is as follows:

1. The ignition key is turned to start position (position III)
2. A high signal (U_{bat}) from the ignition switch (3/1) is transmitted to the engine control module (ECM) via the central electronic module (CEM). The engine control module (ECM) interprets this high signal as a request to activate the starter motor.
3. The engine control module (ECM) activates the starter motor solenoid by grounding and powering the coil for the starter motor relay.
4. The relay closes the circuit between the starter motor solenoid and the fuse in the relay/fuse box in the engine compartment, activating the starter motor.
5. The engine control module (ECM) activates the starter motor until the engine starts (the engine speed (rpm) exceeds a certain value)

Auto start

If the ignition key returns to ignition position (position II) before the engine is started, the starter motor continues to run. The starter motor runs until the engine is started or until a certain time has elapsed. The engine temperature dictates the running time of the starter motor:

- 0 °C or higher, approximately 3 seconds
- less than 0 °C, up to approximately 5 seconds.

If the engine does not turn or if the engine speed is extremely low when the start relay is activated, the engine control module (ECM) interrupts start relay activation.

Activation of the starter motor is not permitted or is interrupted if:

- the engine is running (the engine speed (RPM) above a certain value)
- the immobilizer function does not allow a start.
- the gear selector is not in position "P" or "N" (automatic transmissions). The engine control module (ECM) receives a signal indicating the position of the gear selector from the transmission control module (TCM) (4/28) via both the controller area network (CAN) and from a directly connected cable between the engine control module (ECM) and transmission control module (TCM).

CAMSHAFT CONTROL (CVVT)

Fig. 274: Identifying Camshaft Control (CVVT System)
Courtesy of VOLVO CARS CORPORATION

Both intake camshafts and exhaust camshafts are regulated by the Engine Control Module (ECM). The intake camshafts are located in the middle of the engine, while the exhaust camshafts are located furthest out. The camshafts are divided into two banks.

Bank 1 (front cylinder row); cylinders 1, 3, 5 and 7.

Bank 2 (rear cylinder row, closest to the passenger compartment); cylinders 2, 4, 6 and 8.

The inlet camshafts are driven primarily by the crankshaft and chain, while the exhaust camshafts are driven by a chain from the inlet camshafts.

When each camshaft is set at the factory, it is aligned with the position of the crankshaft. The position of the camshaft in relation to the crankshaft is designated **the camshaft 0 position** (default setting). During camshaft control (CVVT) the camshaft 0-position is offset so that the cam timing changes. The opening and closing of the intake and exhaust valves can be changed to match the camshaft. Engine performance can be increased, idle quality increased and emissions reduced by regulating the camshaft timing changes.

The engine control module (ECM) detects the position of the camshafts by comparing the signals from the engine speed (RPM) sensor (1) (crankshaft position) and the camshaft position (CMP) sensors (2) (camshaft positions). The engine control module (ECM) then controls the angle of the camshaft by controlling the oil flow to the CVVT unit using the reset valve camshaft (3).

There are diagnostics for this function. See also: **CAMSHAFT DIAGNOSTICS (CVVT)**

Controlling, reset valve camshaft

Fig. 275: Diagram of Camshaft Reset Valve
Courtesy of VOLVO CARS CORPORATION

1: Oil filter reset valve camshaft.

2: Oil duct (pressure, inlet).

3: Duct leading to CVVT unit chamber (deployment).

4: Duct leading to CVVT unit chamber (deployment).

The camshaft reset valve controls the oil flow to the continuous variable valve timing (CVVT) unit. The engine control module (ECM) uses a pulse width modulation (PWM) signal to control the valve. See also: **CAMSHAFT RESET VALVE (CONTINUOUS VARIABLE VALVE TIMING (CVVT))**

Controlling, CVVT units

Fig. 276: Diagram Of The Continuous Variable Valve Timing CVVT Units
Courtesy of VOLVO CARS CORPORATION

The CVVT units are the "Vane" type which means that the CVVT unit rotors are turned by oil pressure on one, or the other, side of the rotor wings.

A: CVVT unit exhaust

B: CVVT unit inlet

1: Timing belt pulley inlet camshaft (primary, inlet camshaft driven by the crankshaft).

2: Timing belt pulley inlet -/exhaust camshaft (secondary, exhaust camshaft driven by inlet camshaft).

3: Oil duct reset valve camshaft (pressure).

4: Oil duct for controlling CVVT unit.

5: Oil duct for return CVVT unit.

6: Spring (CVVT unit exhaust camshaft only).

The continuous variable valve timing (CVVT) unit allows the position of the camshaft to be adjusted relative to the crankshaft.

The camshaft is secured to the CVVT unit rotor. The rotor (and with it the camshaft) rotates in relation to the timing belt pulley (1) by the oil pressure building up on one or both sides of the rotor vanes in the CVVT unit.

The difference in function between the exhaust camshaft (A) and inlet camshaft (B) CVVT unit is that the exhaust camshaft CVVT unit is equipped with a spring. The force of the spring makes the CVVT unit deploy the camshaft. The function causes faster deployment of the exhaust camshaft at engine start-up, before the oil pressure build in the engine.

Control occurs according to the following during deployment/return of the camshaft.

Fig. 277: Diagram Of The Continuous Variable Valve Timing CVVT System
Courtesy of VOLVO CARS CORPORATION

A: Exhaust camshaft

B: Inlet camshaft

- Oil pressure from the lubrication system (1) of the engine.
- The oil passes the filter for the camshaft reset valve (2) and then on to the reset valve (3).
- The engine control module (ECM) controls the oil flow to one of the CVVT unit chambers (4) depending on whether it is to be deployed/returned by the camshaft.

The reset valve is controlled by the engine control module (ECM) by high frequency, switching for deployment and return. This results in rapid and precise control. Both camshafts can be controlled up to 40 crankshaft degrees.

CONTROLLING THE GENERATOR

Fig. 278: Identifying ACM, ECM & CEM Communication Link
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) (4/46) regulates the charge voltage of the generator (GEN) (6/26) (via LIN communication) when requested by the central electronic module (CEM) (4/46) (via CAN communication).

The engine control module (ECM) can change the charge voltage requested by the central electronic module (CEM). to suit certain operating conditions such as engine start, idle speed or high engine load.

The value of requested charge voltage from the engine control module (ECM) and the charge current of the generator can be read off.

The alternator control module (ACM) (6/26) transmits information to the engine control module (ECM) regarding any faults). The diagnostic trouble codes (DTCs) are stored in the engine control module (ECM) in the event of a fault. In the event of certain faults, information about these faults is also transmitted to the central electronic module (CEM).

VARIABLE INTAKE SYSTEM

Fig. 279: View of Variable Intake System Components

Courtesy of VOLVO CARS CORPORATION

The variable intake system components consist mainly of:

1. Vacuum tank
2. Valve for variable intake
3. Vacuum motor
4. Throttle discs

In order to maintain a high volume of intake air at different engine speeds (RPM) and engine loads, B8444S is equipped with the Variable Intake System. The Variable Intake System divides drawn in air into two volumes. The engine control module (ECM) then regulates the air flow between these volumes using dampers in order to achieve the optimum air flow at specific operating temperatures.

The vacuum from the engine is stored in a vacuum tank (1). The vacuum is then guided to the vacuum motor (3) using the variable intake valves (2). The vacuum motor affects the damper in the intake system.

The variable intake valve is controlled by the engine control module (ECM) (4/46).

The variable intake valve can be activated and the variable intake function can be diagnosed by the engine control module (ECM).

OIL MONITORING

Fig. 280: Identifying oil monitoring components
Courtesy of VOLVO CARS CORPORATION

General

The following components are used for oil monitoring:

- oil level sensor (7/35)
- engine control module (ECM) (4/46)
- driver information module (DIM) (5/1).

The oil level sensor, via the driver information module (DIM), is used to inform the driver if oil filling is required.

Detecting the oil level

The integrated electronics of the sensor calculates the oil level using the measured value for the oil temperature.

In order for the correct oil level to be calculated, temporary oil level changes in the oil sump must be added to the calculation, for example when driving on an incline, during cornering and the like. These calculations are performed by the engine control module (ECM) using the oil level sensor signal and a number of other parameters such as the vehicle speed signal and load signal.

REGULATING THE CRUISE CONTROL

Fig. 281: Components Regulating Cruise Control
Courtesy of VOLVO CARS CORPORATION

The cruise control function is an example of distributed functionality.

The following components are used when regulating the cruise control:

- engine control module (ECM) (4/46)
- steering wheel module (SWM) (3/254)
- cruise control, control unit (3/4)
- central electronic module (CEM) (4/56)
- brake control module (BCM) (4/16) (brake pedal position, speed signal)

- driver information module (DIM) (5/1) (cruise control lamp)
- transmission control module (TCM) (4/28)
- electronic throttle unit (6/120)
- stop lamp switch (3/9).

To activate cruise control the function must be switched on using the "CRUISE" button. A lamp lights up in the driver information module (DIM).

The driver activates the function by pressing the SET+ or SET- button. A message is then transmitted via the low speed side of the Controller area network (CAN) to the central electronic module (CEM) which then transmits the message on via the high speed side of the Controller area network (CAN) to the engine control module (ECM).

The engine control module (ECM) controls the throttle angle so that a constant speed is maintained using the vehicle speed signal from the Brake Control Module (BCM). The transmission control module (TCM) also receives a message indicating that cruise control is active via the Controller area network (CAN), so that the transmission follows certain shifting patterns when the cruise control is active.

If the accelerator pedal (AP) is depressed the speed increases as normal and then resumes to the stored value when the driver releases the accelerator pedal (AP) again.

The engine control module (ECM) continually stores the speed. If the cruise control is disengaged, if for example the driver depresses the brake pedal, the previous speed can be resumed by pressing the "RESUME" button.

The cruise control cannot be activated below a certain speed.

Cruise control is disengaged:

- when the driver depresses the brake pedal
- when the driver presses the "CRUISE" button on the steering wheel
- when the driver depresses the "0" button on the steering wheel
- if "P" or "N" position is transmitted on the controller area network (CAN)
- if the speed deviates too much from the set value
- when the control system detects a fault that prevents activation.

FUEL TRIM

Fig. 282: Fuel Trim
Courtesy of VOLVO CARS CORPORATION

Overview

Fuel trim reduces exhaust emissions. Fuel trim reduces nitrous oxides (NO_x), carbon monoxide (CO) and hydrocarbon (HC) emissions.

Theoretically, if the correct amount of oxygen is added during combustion, fuel can be converted to water (H_2O) and carbon dioxide (CO_2). Emissions would then be completely safe.

In practice considerable amounts of hydro-carbons (HC) and varying amounts of carbon monoxide (CO) and carbon dioxide (CO_2) remain.

Fig. 283: Fuel Trim
Courtesy of VOLVO CARS CORPORATION

Due to the high temperature and pressure, nitrous oxides such as NO and NO_2 are also formed. The common designation for these gases is nitrous oxides NO_x .

Fig. 284: Converting Exhaust To H2O And CO2
Courtesy of VOLVO CARS CORPORATION

By speeding up the reaction between the remaining reactive components using a catalytic converter, these can be converted to water (H_2 O), carbon dioxide (CO_2) and nitrogen (N_2).

However this can only happen if the balance of hydro-carbons (HC), carbon monoxide (CO), oxygen (O_2) and nitrous oxides (NO_x) is exactly right in the exhaust. This happens when the fuel air mixture before combustion is 14.7 kg of air per kg of fuel. The Lambda value is then said to be one, (lambda=1).

Fig. 285: Fuel Control Components
Courtesy of VOLVO CARS CORPORATION

A base program in the engine control module (ECM) calculates the injection period based on data about load, i. e. the measured air mass and engine speed (rpm). The calculated injection time (from the base program) is then modified by a circuit (short-term fuel trim). The signal from the heated oxygen sensor (HO2S) is used to finely adjust the injection period so that lambda=1 is reached. The short-term fuel trim is a circuit that finely adjusts the injection period so that the fuel/air mixture is optimized (lambda=1). The control module also used the signals from the front and rear heated oxygen sensors (HO2S) to correct the front heated oxygen sensor (HO2S) (offset adjustment) and thereby the injection period. This gives a higher degree of accuracy during fuel trim. Fuel trim is a rapid process which may take place several times a second. Adjustment of the injection period calculated in the base program is limited.

The short-term fuel trim can be read off.

Adaptive functions

Fig. 286: Adaptive Function Charts
Courtesy of VOLVO CARS CORPORATION

Certain factors, for example, tolerance deviations on certain components such as mass air flow (MAF) sensor and injectors, air leakage on the intake side, fuel pressure etc. affect the fuel / air mix. In order to compensate for this, the engine control module (ECM) has adaptive (self learning) functions. When the engine is new the short term fuel trim varies cyclically around a nominal central line (A) 1.00, with, for example, a 5% change of injection time when fuel trim is in operation.

If there is air leakage for example, the short-term fuel trim will quickly be offset to a new position (B) and will

then work for example between 1.10 (+10%) and 1.20 (+20%), although still at an amplitude of 5%, but with an offset in relation to the original center line (A). The injection period has then been increased to compensate the increase in the amount of air.

The adaptive functions will correct the change, so that the short-term fuel trim will work around the new center line (B) where it will again have its full range of control available.

Put simply, fuel trim is a measurement of the difference (C) between the original short-term fuel trim center line (A) and the new center line (B).

The adaptive functions are split into various operational ranges based on the load and speed of the engine.

The different adaption ranges can be read off.

The adaptive adjustments of injection time are continuously stored in the engine control module (ECM). This means that, at different operating ratios, the correct mixture ratio is achieved before the heated oxygen sensor (HO2S) reaches operating temperature.

The diagnostic trouble code (DTC) is stored in the engine control module (ECM) if any adaption value is too high or too low.

FUEL PRESSURE REGULATION

Fig. 287: Identifying Fuel Pressure Control Components
Courtesy of VOLVO CARS CORPORATION

General

Fuel pressure regulation for demand controlled fuel pumps (DECOS - DEmand COntrolled fuel Supply) means that the fuel pressure is controlled steplessly by varying the output of the fuel pump. The design of the system allows a greater maximum pressure (approximately 650kPa) in the fuel pump. This pressure is used in extreme situations, such as heavy engine load for example

The following components are used for fuel pressure regulation:

- engine control module (ECM) (4/46) with integrated atmospheric pressure sensor
- fuel pump control module (4/83)
- fuel pressure sensor with fuel temperature sensor (7/156)
- fuel pump with by-pass valve (6/33).

The time taken for the engine start procedure can be reduced by rapidly increasing the pressure in the fuel rail when the engine control module (ECM) receives a signal about the position of the ignition switch from the central electronic module (CEM).

The engine control module (ECM) is better able to calculate the injection period using the signal from the atmospheric pressure sensor and fuel pressure sensor. This particularly improves the cold starting characteristics of the engine.

The advantages of varying the output of the fuel pump so that it is not always at full power are:

- the total power consumption of the fuel pump (FP) is reduced, reducing the load on the power supply system
- the service life of the fuel pump (FP) is increased
- fuel pump noise is reduced.

Control

The engine control module (ECM) calculates the desired fuel pressure. A signal is then transmitted to the fuel pump control module indicating the desired fuel pressure. Serial communication between the engine control module (ECM) and the fuel pump control module is used to carry the signal. The fuel pump control module then operates the fuel pump unit to obtain the desired pressure using a pulse width modulation voltage on the ground lead. The fuel pump (FP) can be controlled steplessly by changing the pulse width modulation (PWM) signal. Only that pressure which is required at that specific time will then be released to the fuel rail/injectors. The value of the pulse width modulation (PWM) signal is a measurement of the operational load of the fuel pump (FP) (% duty, 100% = maximum pressure).

The engine control module (ECM) continuously monitors the fuel pressure using the signal from the fuel pressure sensor. This allows the desired fuel pressure to be reached, and if necessary a signal is transmitted to the fuel pump control module requesting that the fuel pressure is adjusted.

The engine control module (ECM) attempts too obtain a constant fuel pressure (approximately 380kPa relative to atmospheric pressure with the engine running).

By-pass valve

When the injectors close when the pressure is too great (during engine braking for example) there is a pressure peak. The by-pass valve in the fuel pump (FP) is used to even out the pressure peak. The opening pressure of the valve is approximately 650 kPa.

The by-pass valve also functions as a non-return valve, ensuring that the fuel pressure in the system is maintained when the engine is switched off.

There is high pressure before the engine is started. This high pressure means that the valve in the by-pass valve opens and the system is "flushed".

Passive safety

For safety reasons, the engine control module (ECM) shuts off the fuel pump (FP) if the supplemental restraint system module (SRS) detects a collision.

KNOCK CONTROL

Fig. 288: Locating Knock Sensors
Courtesy of VOLVO CARS CORPORATION

Knock occurs in the combustion chamber when the fuel and air mixture self ignites. This can occur either before or after the spark plug has produced an ignition spark. In both cases the gas in two or more places ignites in the combustion chamber.

This results in an extremely fast combustion process with flames from several directions. When these flames collide, the pressure in the cylinder increases rapidly and there is a mechanical knocking sound.

If one of the cylinders starts knocking there will be a certain type of vibration in the engine block. This vibration is transferred to the knock sensor, which are screwed to the engine block. One knock sensor detects knocking on cylinders 1, 2, 3 and 4. The other one detects knocking on cylinders 5, 6, 7 and 8. The mechanical stress that arises in the piezoelectric material of the knock sensors makes them generate a voltage. With the help of the camshaft position sensor and the impulse sensor, the Engine Control Module (ECM) can then determine which cylinder is knocking.

The knock sensors (KS) also interpret a proportion of normal engine sound. The control module is able to recognize the vibrations which correspond to knocking by filtering, amplifying and using software to evaluate

the signal.

If the knock sensors (KS) detect knocking in the engine above a certain threshold value, the ignition timing is first retarded and then the fuel/air mixture is enriched to eliminate knocking.

IGNITION CONTROL

Fig. 289: Components Used For Ignition Control
Courtesy of VOLVO CARS CORPORATION

The following components are used for ignition control:

- engine speed (RPM) sensor (7/25)
- camshaft position (CMP) sensor (7/172-173, 7/188-189)
- mass air flow (MAF) sensor (7/17)
- engine coolant temperature (ECT) sensor (7/16)
- throttle position (TP) sensor on the electronic throttle unit (6/120)
- knock sensor (KS) (7/23-24)
- transmission control module (TCM) (4/28)
- spark plugs with ignition coils (20/46-53).

The engine control module (ECM) calculates the optimum ignition advance based on the software and

information from the sensors. The engine control module (ECM) cuts the current to the ignition coil mounted on the cylinder to be ignited and produces a spark.

During the starting phase the engine control module (ECM) produces a fixed ignition setting. When the engine has started and the vehicle is being driven, the engine control module (ECM) calculates the optimum ignition setting, taking factors such as the following into account:

- engine speed (RPM)
- load
- temperature.

The engine control module (ECM) analyses the signal from the knock sensors (KS) when the engine reaches operating temperature. If any of the cylinders knock, the ignition is retarded for that specific cylinder until the knocking ceases.

The ignition then advanced to the normal position or until the knock recurs.

Before the transmission control module (TCM) changes gear, it sometimes transmits a torque limiting request to the engine control module (ECM). The engine control module (ECM) then retards the ignition momentarily to reduce the torque, resulting in smoother gear changes and reducing the load on the transmission. There are different ignition retardation levels depending on the signals from the transmission control module (TCM). The return signal from the engine control module (ECM) to the transmission control module (TCM) confirms that the signal reached the engine control module (ECM).

For further information, also see: **MISFIRE DIAGNOSTIC**

The engine misfires if the fuel does not ignite correctly. For further information, also see: **MISFIRE DIAGNOSTIC**

REGULATING THE AIR CONDITIONING (A/C) COMPRESSOR

Fig. 290: (A/C) Compressor Regulating Components
Courtesy of VOLVO CARS CORPORATION

The air conditioning (A/C) compressor is controlled by the engine control module (ECM) (4/46) on request from the climate control module (CCM) (3/112) via the controller area network (CAN). When the engine control module (ECM) receives a signal from the climate control module (CCM) to activate the air conditioning (A/C) compressor, the engine control module (ECM) grounds the circuit for the relay coil for the A/C compressor. See also: **AIR CONDITIONING (A/C) RELAY**

The relay (2/22) closes the circuit between the integrated relay/fusebox in the engine compartment and the clutch for the air conditioning (A/C) compressor (8/3). The air conditioning (A/C) compressor which has a variable cylinder displacement is always running during normal driving. Displacement in the compressor is regulated by a solenoid which is controlled by the engine control module (ECM).

The engine control module (ECM) regulates the solenoid (displacement) in relation to the driver's and vehicles' different driving styles. Starting the engine, moving off and acceleration means more regulated displacement so that the A/C compressor has less possible effect on engine torque. The climate control module (CCM) controls all functions in the climate control module which are related to the vehicle interface with the driver and passenger. I. E. the climate control buttons on the dashboard environment panel.

The climate control module (CCM) transmits information to the engine control module (ECM), which determines what must be prioritized. For example, the air conditioning (A/C) compressor in certain extreme cases is switched off completely, regardless of the climate control module (CCM) request. This is to prevent negative engine performance and to protect the air conditioning (A/C) system. As well as the information from

the climate control module (CCM), the engine control module (ECM) controls the air conditioning (A/C) compressor based on the information from:

- Air conditioning (A/C) pressure sensor (high pressure side) (7/8)
- the throttle position (TP) sensor (6/120)
- the engine coolant temperature (ECT) sensor (7/16).

SYSTEM OVERVIEW

CONTROL MODULE

Fig. 291: Identifying Engine Control Module (ECM)
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) controls, amongst others, the following functions:

- injectors
- ignition
- camshafts (CVVT)
- Evaporative emission system (EVAP) valve
- throttle angle
- engine cooling fan (FC)
- Air conditioning (A/C) compressor
- fuel pump.

The engine control module (ECM) is supplied with battery power (U_{bat}) via fuses in the central electronic module (CEM) and in the relay/fuse box, engine compartment.

To prevent certain stored data from being erased from the engine control module (ECM) when the ignition is switched off, the control module also has a 30-supply. This supply is from the integrated relay/fusebox, engine compartment.

The control module is grounded via the wiring which is connected at the right-hand suspension turret.

The engine control module (ECM) contains a voltage regulator which maintains a low voltage (5 V) in internal components in the control module such as:

- AC/DC converter
- DC/AC converter
- Micro-processor.

The functions which require battery power (U_{bat}) and high output are controlled by external or internal power stages. For example, ignition coils have external power stages (integrated into the ignition coils) while the power stages for the injectors are integrated in the engine control module (ECM).

The micro-processor in the engine control module (ECM) receives signals from the different sensors and control modules in the vehicle. The micro-processor uses a program which interprets the signals from the different sensors and how the components and functions should be controlled.

The engine control module (ECM) has several self-learning (adaptive) functions. It continually adapts ongoing calculations to changing circumstances (such as wear, air leaks, differences in fuel).

Emissions are kept low through efficient management of the injection period, ignition, evaporative emission system (EVAP) valve, camshafts etc. Faults which affect emissions for example can be detected by running diagnostics for functions and components.

The engine control module (ECM) is located on the air cleaner (ACL) box in the engine compartment. A temperature sensor and atmospheric pressure sensor are integrated in the engine control module (ECM).

The engine control module (ECM) communicates with other control modules using controller area network (CAN) communication or LIN communication.

The engine control module (ECM) checks activations, input and output signals and functions using an integrated diagnostic system. A diagnostic trouble code (DTC) is stored if, after validation, the control module detects a fault. In certain cases the faulty signal is also replaced with a substitute value or certain functions are limited.

For example, substitute values can be set for:

- engine temperature sensor
- mass air flow (MAF) sensor
- throttle position (TP) sensor
- air pressure
- fuel pressure.

Mathematical calculations and signals from certain components are used to calculate the substitute values. Other substitute values are fixed, predefined values in the engine control module (ECM).

The substitute value allows the vehicle to be driven and the emissions to be kept at a reasonable level, even though vital functions or components are malfunctioning.

Functions which may be limited are for example:

- camshaft control (CVVT)
- fuel trim
- throttle angle
- fuel pressure regulation.

The substitute values are used and functions restricted so that the system is still able to work while protecting components that are required for safety reasons (for example the throttle angle).

Any diagnostic trouble codes (DTCs) are stored in the internal memory of the engine control module (ECM). The information can be read off via the data link connector (DLC) in the vehicle.

SIGNALS

The table below summarizes the input signals to and output signals from the Engine Control Module (ECM). The signal types are divided into directly connected signals, LIN and controller area network (CAN) communication. The illustration below displays the same information with the Volvo component designations.

Input signals	Output signals
Directly connected: • Ignition switch (3/1) • Air conditioning (A/C) pressure sensor (7/8) • Stop lamp switch (3/9) • Accelerator pedal (AP) position sensor (7/51) • Electronic throttle unit (6/120) • Camshaft position (CMP) sensor, intake bank 2 (7/172) • Camshaft position (CMP) sensor, intake bank 1 (7/188) • Camshaft position (CMP) sensor, exhaust bank 2 (7/173) • Camshaft position (CMP) sensor, exhaust bank 1 (7/189) • Engine coolant temperature (ECT) sensor (7/16) • Engine speed (RPM) sensor (7/25) • Fuel pressure sensor / fuel temperature sensor (7/156) • Knock sensor (KS) (7/23-24) • Mass air flow (MAF) sensor/air temperature sensor (7/17)	**Directly connected:** • Air conditioning (A/C) relay (2/22) • Air conditioning (A/C) compressor (8/3) • Electronic throttle unit (6/120) • Engine cooling fan (FC) control module (4/71) • Evaporative emission system (EVAP) valve (8/18) • Injectors (8/146-153) • Fuel pump (FP) control module (4/83) • Ignition coils (20/46-53) • Leak diagnostic unit (6/67) (certain markets only) • Front oxygen sensor, bank 2 preheating (7/15) • Front oxygen sensor, bank 1 preheating (7/82) • Rear oxygen sensor, bank 2 preheating (7/103) • Rear oxygen sensor, bank 1 preheating (7/104) • Main relay (system relay) (2/32) • Starter motor relay (2/35) • Camshaft reset valve (Continuous variable

• Manifold absolute pressure (MAP) sensor (7/81) • Oil pressure switch (7/6) • Front oxygen sensor, bank 2 (7/15) • Front oxygen sensor, bank 1 (7/82) • Rear oxygen sensor, bank 2 (7/103) • Rear oxygen sensor, bank 1 (7/104) • Oil level sensor (7/35) • Outside temperature sensor (7/105) • Engine coolant level sensor (7/73) • Ignition coils (20/46-53) • Engine cooling fan (FC) control module (4/71) • Leak diagnostic unit (6/67) (certain markets only)	valve timing (CVVT)), intake bank 2 (8/19) • Camshaft reset valve (Continuous variable valve timing (CVVT)), intake bank 1 (8/117) • Camshaft reset valve (Continuous variable valve timing (CVVT)), exhaust bank 2 (8/81) • Camshaft reset valve (Continuous variable valve timing (CVVT)), exhaust bank 1 (8/118) • Emissions warning lamp (5/1) • Valve variable intake (8/107)
Via LIN communication: • Alternator control module (ACM) (6/26)	**Via LIN communication:** • Alternator control module (ACM) (6/26)
Via Controller Area Network (CAN) communication: • Central electronic module (CEM) (4/56) • Brake Control Module (BCM) (4/16) • Climate Control Module (CCM) (3/112) • Rear electronic module (REM) (4/58) • Transmission control module (TCM) (4/28) • Steering wheel module (SWM) (3/254)	**Via Controller Area Network (CAN) communication:** • Central electronic module (CEM) (4/56) • Brake Control Module (BCM) (4/16) • Climate Control Module (CCM) (3/112) • Rear electronic module (REM) (4/58) • Transmission control module (TCM) (4/28) • Steering wheel module (SWM) (3/254) • Driver Information Module (DIM) (5/1)

GDL BULBS (2003-2004)

DESIGN

HEADLAMP SYSTEM, BI-XENON

Fig. 294: Bi-Xenon Headlamp System
Courtesy of VOLVO CARS CORPORATION

1.	Ballast	5.	Internal headlamp surround
2.	Motor, headlamp range adjustment	6.	Motor, high and low beam
3.	Bulb connector, high tension	7.	Moving reflector
4.	Bulb		

Bi-Xenon uses gas discharge technology and is a headlamp system with moving reflectors. The system combines high and low beams in the same bulb.

It is a statutory requirement (for low beam) for vehicles with this type of bulb to be equipped with headlamps with automatic level control.

Xenon versus Halogen

Xenon:

- has higher color temperature which gives a whiter light
- reflects from road signs and markings better
- has lower power consumption. (approximately 2/3).

Worth knowing:

- Daylight has a color temperature of approximately 5000°K. The nearer to natural light, the easier the light is on the eye. Normal H4 bulb: approximately 3200 °K. Volvos gas discharge lamp : approximately 4200 °K
- The Bi-Xenon system also has the advantage of the high and low beam having the same color light. The human eye finds it easier to react between changes.

BULB

The light source consists of a discharge pipe surrounded by glass which filters out damaging UV radiation.

- The discharge tube is filled with a number of chemical compounds including the noble gas Xenon
- A light arc is created by an electrical discharge between two tungsten electrodes
- Because the bulb does not have a filament it is less susceptible to bumps and vibration
- Bulb designation: (special for reflector system).
- Power consumption: 35 W.

CAUTION: The bulb contains mercury (less than 0.5 mg) and when discarded must be treated as hazardous waste. Hazardous waste must be handled according to the relevant statutory regulations.

BALLAST

An electronic ballast is connected to each headlamp. The ballast functions as a voltage regulator and generates alternating current (AC).

Main tasks:

1. Light the bulb
2. Control the light during operation.

To light the bulb an initial voltage of approximately 24, 000 V is required for a very short time (less than 1ms).

The ballast transforms the vehicles 12 V (DC) to 1000 V (AC).

The high tension switch amplifies the voltage a further 25 times.

When the lamp is lit the voltage is reduced to the 100 V required to keep the lamp lit.

Power consumption: 10 W.

FUNCTION

HEADLAMPS, BI-XENON

Fig. 295: Bi-Xenon Headlamps
Courtesy of VOLVO CARS CORPORATION

1.	Moving reflector	3.	Motor, high and low beam
2.	Controls for reflector	4.	Position sensor, reflector

LIGHTING THE HEADLAMP

It normally takes 3 seconds from activation at the light switch with the ignition on to the lamp lighting.

- Like conventional headlamps the headlamps are out while the engine is cranking and do not light until the engine is running

- On each occasion that voltage is supplied to the ballast 3 attempts, within 1 second, are made to light the lamp.

COMBINED HIGH AND LOW BEAM

Reflector, left-hand headlamp

Fig. 296: Identifying Left-Hand Headlamp Reflector
Courtesy of VOLVO CARS CORPORATION

The illustration is a principle sketch showing the different segments of the moving reflector.

The reflector has a complex design where different segments are used depending on whether in high or low beam position.

The reflector is adjustable and can be moved between two fixed points.

- The reflector is moved 2 mm axially in relation to the bulb
- The direction of the movement means that position of reflector is also moved slightly vertically.

The bulb is fixed.

The headlamp lens is clear.

AUTOMATIC LEVEL CONTROL

Sensor

The following applies to vehicles without Four-C (Continuously Controlled Chassis Concept)

An inductive position sensor reads off the angle between the bodywork and the left rear control arm. The angle is a measurement of how much the vehicle is leaning (chassis height) and is dependent on weight distribution.

- The sensor is mounted differently in FWD to AWD
- The rear electronic module (REM) reads an analog signal (0.5-4.5 V) from the position sensor and

converts it to an angle value (±35°), which is transmitted to the central electronic module (CEM)
- Fully laden vehicles give a signal of 0.5 V which corresponds to minus 35°.
- The central electronic module (CEM) controls the motors for the headlamp range adjustment (PWM signal) and sets the headlamps vertically.

The following applies to vehicles with Four-C

Two sensors read off the angle between the bodywork and the left and right rear control arms. The angle is a measurement of how much the vehicle is leaning (chassis height) and is dependent on weight distribution.

The sensors are mounted differently in FWD to AWD.

The suspension module (SUM) reads the signals from the sensors and converts them to an angle value. The value is transmitted via the control area network (CAN) to the central electronic module (CEM). The central electronic module (CEM) uses this information to control the motors for headlamp range adjustment.

Level control

Controlled at speeds *below 4 km/h*

When the ignition is switched on, the position sensor is read off and the headlamp range adjustment motors set the headlamps.

Controlled at speeds *above 4 km/h*

At greater angle changes during driving the headlamps are controlled. Control is dependent on the time for the system not to react to short term changes such as uneven road surfaces etc.

Calibration

The position sensor must be calibrated after work on the rear suspension. Carry out calibration according to tab DIAGNOSTICS/VEHICLE COMMUNICATION, rear electronic module (REM).

CAUTION: Calibration must be carried out after work such as removing/installing the sensors and replacing the sensors, rear axle, bushings, shock absorbers or springs.

In vehicles with Four C, calibration is carried out via the suspension module (SUM).

Beam adjustment is carried out conventionally (via adjustment screws by the headlamp).

The light switch must be in the "on" position while calibrating.

SAFETY

- In the event of a short-circuit on the high tension side the power supply cuts in less than 10 ms
- If the high tension circuit is broken (for example by a broken cable, blown bulb or no bulb in the bulb connector) the system attempts to activate the lamp for a time of 700 ms. During this time the high voltage is outside the ballast
- Approximate temperatures on the components during operation are; Ballast = 130 °C, Bulb holder = 170 ° C, Bulb = 400 °C
- The glass body of the Bi-Xenon-lamp is filled with different gases and metal vapors which are under pressure. The lamp can explode as it is under gas pressure.

WARNING: **Follow the safety instructions and recommendations in VIDA carefully when working with high voltage.**

Use safety goggles when handling the bulb. Risk of explosion

The electrical system must be switched off before starting work.

Risk of burn injury. The components operate at very high temperatures.

HIGH VOLTAGE UNIT

Fig. 297: High Voltage Unit
Courtesy of VOLVO CARS CORPORATION

- High voltage is required to light the Xenon lamp
- A high voltage unit is attached to each Xenon lamp. It transforms 12 V voltage to approximately 24 000 V, which is necessary to light the lamp. When the lamp is lit the voltage is reduced to the 100 V required to keep the lamp lit
- On each occasion that voltage is supplied to the high voltage unit an attempt is made to light the Xenon lamp. If this voltage does not exceed 9.5 V within a time span of 200 ms the lamp does not light. If the voltage is too low, after a power consuming start for cold start, the lamp does not light until the engine is running and the generator starts to charge. A new start attempt of the lamp must be made by turning the knob of the light switch till "0" position or parking lamp position and then back to low beam again.

WARNING: Because of the high voltage it is important to follow the instructions for working with the Xenon lamps and high voltage unit

SYSTEM OVERVIEW

HEADLAMPS, BI-XENON

Fig. 298: Bi-Xenon Headlamps Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

		Power supply via relay.

1.	Motor, high / low beam	Reconnected PWM signal provides information about the position of the reflector to the central electronic module (CEM).
2.	Motor, headlamp range adjustment	Controlled by the central electronic module (CEM) using a PWM signal.
3.	Position sensor	Inductive sensor which sends an analog signal (voltage) to the rear electronic module (REM) (Does not apply to vehicles with Four-C (Continuously Controlled Chassis Concept)). In vehicles with Four C the signal travels via the suspension module.
4.	Ballast	High voltage regulator for switch and lamp.
5.	Gas discharge lamp	Socket

CONTROL

Fig. 299: Bi-Xenon Headlamps Control Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

1.	Central electronic module (CEM)	4.	Motor, headlamp range adjustment
2.	Rear electronic module (REM)	5.	Suspension module (SUM) (vehicles with Four-C (Continuously Controlled Chassis Concept) only)
3.	Position sensor		

An electric motor is controlled by the central electronic module (CEM) via a relay (ordinary high beam relay).

The motor drives a gear wheel which moves the reflector along its guides.

A sensor which detects the position of the reflector is connected to the motor.

- The electronics in the motor interprets the sensor information and generates a signal
- The signal is reconnected to the central electronic module (CEM).

If the reflectors are in the wrong position during high beam the reflectors are forced into a safety position;

- the warning lamp (orange) lights in the driver information module (DIM)
- an error message is also shown in the display in the driver information module (DIM).

If the high beam is activated with the light switch in 0 position, the high beam is only activated as long as the high beam lever is activated for a high beam flash. The headlamp switch must be in the "on" position in order for the high beam lamps to remain active.

GDL BULBS (2005-2012)

DESIGN

BI-XENON HEADLIGHT SYSTEM

Fig. 300: Identifying Bi-Xenon Headlight System Assembly

Courtesy of VOLVO CARS CORPORATION

1.	Ballast	5.	Internal headlight edge
2.	Motor, headlight levelling	6.	Motor, high and low beam
3.	Lamp contact, high voltage	7.	Movable reflector
4.	Lamp		

Bi-Xenon, a headlight system with moveable reflector, is based on gas discharge technology. The system combines high and low beam into the same lamp.

Due to legal requirements (regarding low beam) for this type of lamp, the vehicle must be equipped with automatic headlight levelling.

Xenon vs. Halogen

Xenon:

- higher color temperature, which produces a whiter light
- better reflection of road signs and road markings
- has lower power consumption.

Good to know:

- Daylight has a color temperature of about 5000 °K. The closer to natural light, the less strain on the eyes. Standard H4 bulb: 3200 °K. Volvo's gas discharge bulb: about 4200 °K.
- With the Bi-Xenon system, high and low beam generates the same light color. The human eye thus has an easier time adjusting to switches between high and low beam.

LAMP

The light source consists of a discharge tube surrounded by a glass that filters out harmful UV radiation.

- The discharge tube is filled with a blend of chemical compounds, including the inert gas Xenon.
- An electric arch is created through an electrical discharge between two tungsten electrodes.
- Because the lamp does not have a filament, it is less sensitive to bumps and vibrations.
- Bulb designation: (special for reflector system).
- Power consumption: 35 W.

CAUTION: The bulb contains mercury (less than 0.5 mg) and when discarded must be treated as hazardous waste. Hazardous waste must be handled according to the relevant statutory regulations.

BALLAST

An electronic ballast is connected to each headlight. The ballast serves as a voltage regulator and generates

alternating current (AC).

Primary tasks:

1. Light the bulb.
2. Regulate light during operation.

A initial voltage of about 24, 000 V for a very brief period (less than 1 ms) is required to light the bulb.

The ballast transforms the vehicle's 12 V (DC) to 1000 V (AC).

The high voltage contact amplifies the voltage an addition 25 times.

Once the bulb has been lit, voltage is regulated down to about 100 V, which is required to keep the bulb lit.

Power consumption: 10 W.

FUNCTION

BI-XENON HEADLIGHTS

Fig. 301: Identifying Bi-Xenon Headlight Assembly
Courtesy of VOLVO CARS CORPORATION

1.	Movable reflector	3.	Motor, high and low beam
2.	Reflector control	4.	Reflector position sensor

LIGHTING THE LAMP

There is normally a 3 second delay between activation with the light switch or ignition on and the lamp coming on.

- As with normal headlights, the lamps remain off while the starter motor is cranking and come on once the engine is running.
- Each time voltage is supplied to the ballast, 3 one-second attempts are made to light the lamp.

COMBINED HIGH AND LOW BEAM

Reflector, left headlight

Fig. 302: Identifying Segments Of Moveable Reflector
Courtesy of VOLVO CARS CORPORATION

The illustration is an outline diagram showing the various segments of the moveable reflector.

The reflector has a complex shape in which different segments are used depending on whether high beam or low beam is in use.

The reflector is moveable suspended and is moved between two fixed positions.

- The reflector is moved 2 mm (0.08 in) axially in relationship to the lamp.
- The direction of the movements also causes the reflector to shift slightly vertically.

The lamp remains in a fixed position.

The headlight lens is clear.

AUTOMATIC LEVEL CONTROL

Sensor

The following applies to cars without Four-C (Continuously Controlled Chassis Concept)

An inductive position sensor reads the angle between the body and the left rear control arm. The angle is a indication of how much the vehicle is leaning (chassis height) and depends on weight distribution.

- The sensor is mounted slightly differently for FWD and AWD.
- The rear electronic module (REM) reads off an analog signal (0.5 - 4.5 V) from the position sensor and converts it to an angle value (±35°), which is sent to the central electronic module (CEM).
- A fully loaded vehicle generates a signal of 0.5 V, which corresponds to negative 35°.
- The central electronic module (CEM) regulates the headlight levelling motors (PWM signal) to adjust the headlights vertically.

The following applies to vehicles with Four-C

Two sensors read the angle between the body and the left and right rear control arm. The angle is a indication of how much the vehicle is leaning (chassis height) and depends on weight distribution.

The sensors are mounted slightly differently for FWD and AWD.

The suspension module (SUM) reads off the signals from the sensors and converts them to an angle value. The value is sent to the central electronic module (CEM) via the CAN network. The central electronic module (CEM) uses the information to regulate the headlight levelling motors.

Level control

Regulation at speeds *below 4 km/h (2.5 mph)*

When the ignition is switched on, the position sensor is read and the headlight levelling motors adjust the headlights.

Regulation at speeds *above 4 km/h (2.5 mph)*

The headlights are regulated if there are great angle changes while driving. Regulation is time-dependant so that the system does not react to short changes, such as unevenness in the road surface.

Calibration

The position sensor must be calibrated after work on the rear suspension. Perform calibration as described in the tab DIAGNOSTICS/VEHICLE COMMUNICATION, Rear electronic module (REM).

CAUTION: Calibration must be carried out after work such as removing/installing the sensors and replacing the sensors, rear axle, bushings, shock absorbers or springs.

In vehicles with Four C, calibration is carried out via the suspension module (SUM).

Beam adjustment is carried out conventionally (via adjustment screws by the headlight).

The light switch must be in the "on" position while calibrating.

SAFETY

- In the event of a short-circuit on the high voltage side, the power supply is cut off for less than 10 ms.
- If the high voltage circuit is broken (such as due to an open circuit, defective bulb or no bulb in the lamp socket), during each activation the system attempts to light the lamp for a period of 700 ms. During the period, there is high voltage across the ballast.
- Approximate component temperatures during operation: Ballast = 130 °C (266 °F), Bulb holder = 170 °C (338 °F), Bulb = 400 °C (752 °F).
- The glass body of the Bi-Xenon lamp is filled with various gases and metal vapors and is under pressure. Because the lamp is subjected to gas pressure, it could explode.

WARNING: **Follow the safety instructions and recommendations in VIDA carefully when working with high voltage.**

Use safety goggles when handling the bulb. Risk of explosion

The electrical system must be switched off before starting work.

Risk of burn injury. The components operate at very high temperatures.

HIGH VOLTAGE UNIT

Fig. 303: Identifying High Voltage Unit & Graph
Courtesy of VOLVO CARS CORPORATION

- High voltage is required to light the Xenon lamp.
- A high voltage unit is connected to each Xenon lamp. This transforms 12-V voltage to the approximately 24, 000 V required to light the lamp. Once the lamp is on, voltage is lowered to the approximately 100 V required to keep the lamp lit.
- Each time voltage is supplied to the high voltage unit, an attempt is made to light the Xenon lamp. If this voltage does not exceed 9.5 V during a time period of 200 ms, the lamp does not light. If voltage is too low, such as after a voltage-consuming cold start, the lamp does not light just because the engine is running and the alternator begins charging. A new attempt must be made to start the lamp by turning the light switch to the "0" or parking light position and then back to the low beam position.

WARNING: **Because of the high voltage it is important to follow the instructions for working with the Xenon lamps and high voltage unit**

SYSTEM OVERVIEW

BI-XENON HEADLIGHTS

Fig. 304: Identifying Bi-Xenon Headlight Communication System & Components
Courtesy of VOLVO CARS CORPORATION

1.	Motor, high/low beam	Power supply via relay. Feedback PWM signal gives central electronic module (CEM) information on reflector position.
2.	Motor, headlight levelling	Regulated by central electronic module (CEM) via PWM signal.
3.	Position sensors	Inductive sensor that transmits an analogue signal (voltage) to the rear electronic module (REM) (not vehicles equipped with Four-C (Continuously Controlled Chassis Concept)). On vehicles with Four-C, the signal travels via the suspension module.
4.	Ballast	High voltage regulator for contact and lamp.
5.	Gas discharge lamp	Socket

CONTROL

Fig. 305: Identifying Bi-Xenon Headlight Control System Diagram
Courtesy of VOLVO CARS CORPORATION

1.	Central electronic module (CEM)	4.	Motor, headlight levelling
2.	Rear electronic module (REM)	5.	Suspension module (SUM) (only vehicles with Four-C (Continuously Controlled Chassis Concept))
3.	Position sensors		

An electric motor is controlled by the central electronic module (CEM) via a relay (standard high beam relay).

The motor drives a gear that moves the reflector along its guides.

A sensor connected to the motor detects the position of the reflector.

- The motor electronics interpret the sensor information and generate a signal.
- The signal is fed back to the central electronic module (CEM).

If the reflectors are in the wrong position for high beam, the are forced down into a so-called safety position;

- the warning lamp (orange) in the driver information module (DIM) illuminates
- an error message appears in the driver information module (DIM) display.

If high beam is activated with the light switch in position 0, high beam is only activated while the stalk is in the high beam position, so-called high beam flash. In order for high beam to remain on, the light switch must be in the "On" position.

GENERATOR (GEN) (2003-2004)

DESIGN

GENERATOR (GEN) DESIGN

Fig. 306: Cutaway View of Generator
Courtesy of VOLVO CARS CORPORATION

The main components of the generator (GEN) consist of:

1. Stator
2. Rotor with slip rings
3. Integrated cooling fans
4. DC bridge
5. Charge regulator
6. Pulley.

Generator (GEN) terminals:

Fig. 307: Generator Terminals
Courtesy of VOLVO CARS CORPORATION

- #A:1 (B+)
- #B:1 (L)

Ground terminal via the cylinder block.

STATOR

Fig. 308: Identifying Stator
Courtesy of VOLVO CARS CORPORATION

The stator is secured and consists of grooved plates which are insulated and pressed onto a secured plate unit. The stator winding coils are positioned in the grooves. They are delta connected at 120° and provide a three phase alternating current to the DC bridge.

ROTOR WITH SLIP RINGS

Fig. 309: Identifying Rotor With Slip Rings
Courtesy of VOLVO CARS CORPORATION

The rotor consists of two halves (claw-poles) which engage each other. The halves are pressed onto the rotor shaft. There are twelve claws on the rotor, i. e twelve poles. One half consists of six north poles and the other half six south poles. The excitation winding is secured on the rotor shaft between the claw-pole halves. The excitation winding (also known as rotor winding) consists of a circular coil winding which is connected to the slip rings and surrounded by the claw-poles. The charge regulator supplies a current to the rotor winding through the brushes which lie against the slip rings. The greater the current in the rotor the stronger the magnetic field in the rotor becomes, and thus a greater current is generated in the stator windings.

COOLING FANS

Fig. 310: Cooling Fans
Courtesy of VOLVO CARS CORPORATION

The heat distributed in the generator (GEN) is, in principle, proportional to the current generated and must be

directed away so that the insulation and diodes are not damaged. The generator (GEN) is therefore air cooled and equipped with two integrated cooling fans on the rotor shaft.

RECTIFIER

Fig. 311: Identifying Rectifier
Courtesy of VOLVO CARS CORPORATION

The current created in the generator (GEN) stator winding is AC and must be converted to DC before it can be used in the electrical system of the car. The conversion (rectifying) occurs using a DC bridge consisting of six diodes, two diodes per phase windings.

The stator windings generate three phases and are delta connected An exciter diode is connected to each of the three stator windings. The six rectifier diodes are bridge connected. The diodes are pressed into a diode holder.

CHARGE REGULATOR

General

Fig. 312: Charge Regulator
Courtesy of VOLVO CARS CORPORATION

The charge regulator is mounted at the rear edge of the generator (GEN). The role of the charge regulator is to constantly maintain the generator current at engine speeds, depending on the load and speed of the generator.

If the voltage produced exceeds the preset desired value depending on the load, the charge regulator reduces or cuts the magnetic current to the rotor. This, in turn, lowers the magnetic field. The voltage from the stator windings decreases. When the voltage is below the desired value, the current increases through the rotor so that magnetization increases as does the generator voltage until the desired value is exceeded again. This process is repeated continuously.

Charge voltage

Fig. 313: Charge Regulator Graph
Courtesy of VOLVO CARS CORPORATION

At room temperature a fully charged battery cell produces 2.12 V. A 12 V battery has 6 cells and therefore produces 12.72 V when the battery is fully charged. The battery has an internal resistance which must be overcome for charging to occur. At room temperature 0.2 V per cell or 1.2 V for the entire battery is required. 13.92 V (12.72 V+1.2 V) is required to charge a battery at room temperature. In cold weather conditions the chemical reactions are slower and the inner resistance becomes higher. This requires a greater voltage when charging to overcome the internal resistance.

The charge regulator controls the output voltage, depending on the engine compartment temperature, following a predetermined curve, see the illustration.

The charge regulator calculates the engine compartment temperature using integrated semi-conductor electronics. In cold conditions the charge regulator allows a higher voltage. At higher temperatures the voltage is lowered. This ensures full battery charging regardless of the temperature. A battery must have a greater charge voltage at lower temperature for charging to occur.

L-signal for the central electronic module (CEM)

Fig. 314: Generator And CEM Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The charge regulator is connected to the central electronic module via an L-signal.

The L-signal is used to pre-magnetize the generator rotor and to transmit signals to the central electronic module telling the central electronic module that the generator is charging or not when the engine is running.

When the engine is starting, the generator (GEN) does not charge. When the engine speed (RPM) passes approximately 550 rpm a delay of approximately 3 seconds occurs. After the delay a successive increase of charging begins. When the generator (GEN) is at full load the increase ranges from 0-100% for a period of 6 seconds.

If the engine speed (RPM) passes approximately 1300 rpm during the delay or the successive increase breaks the increase, full charging is obtained immediately. This is to successively increase the load on the engine during the start-up phase and to ensure the engine starts.

If the L-signal is missing the generator will not start charging on start-up. Charge regulator can self magnetize the rotor and start charging in this way. This only happens at speeds in excess of approximately 2300 rpm. There is no successive charge engagement with self magnetization, the generator operates at full charge immediately.

DF-signal to the engine control module (ECM)

FREEWHEEL

Fig. 315: Freewheel Generator
Courtesy of VOLVO CARS CORPORATION

Certain generators are equipped with a freewheel between the rotor shaft and the pulley. The cover over the pulley nut in the center of the pulley indicates whether a freewheel is installed. Using the freewheel, the generator rotor shaft can only rotate freely in one direction. This means that any jerking in the belt transmission is minimized.

FUNCTION

CHARGING

When the ignition key is turned to position II (and III) current goes from the central electronic module to connection L on the charge regulator. The regulator directs current to the excitation winding rotor and is then grounded via the regulator. When the current travels through the rotor a magnetic field is formed around the rotor. When the engine is started and the rotor begins to rotate, the magnetic field also rotates and then produces alternating current in the stator windings.

Alternating current is rectified when it passes the diodes and is then fed to the electrical system of the car. The voltage obtained from the stator winding also passes to the regulator via the rectifier and affects the control functions.

When the voltage exceeds the permitted value, the charge regulator reduces the current through the excitation winding. The strength of the magnetic field decreases as does the stator winding supplied alternating current.

The charge indicator lamp in the combined instrument panel is controlled by the driver information module via signals from the Controller area network (CAN).

SYSTEM OVERVIEW

GENERAL

Fig. 316: Freewheel Generator
Courtesy of VOLVO CARS CORPORATION

The purpose of the generator (GEN) is to supply the power consumers with power and to ensure that the battery remains charged. The generator (GEN) is mounted on the front edge of the engine.

The power handling capacity of the generator (GEN) depends on the engine speed (RPM). When the engine is idling the generator (GEN) only supplies approximately half the maximum power handling capacity. When the engine is idling with many power consumers connected battery recharge is negatively affected i. e, the battery does not charge. Battery charging is less efficient in cold conditions than at room temperature. This means that when the engine is idling for a long time, with large power consumers connected the battery can drain.

If the generator fails to charge the power consuming components will take their supply exclusively from the battery. In the end this will drain the battery completely.

The generator (GEN) first generates AC current which is converted to DC current in the DC bridge. the generator (GEN) has a built-in charge regulator.

The auxiliaries belt transfers power from the crankshaft pulley to the auxiliaries such as the power steering pump, air conditioning (A/C) compressor and generator (GEN). The belt tension is tensioned using an automatic belt tensioner. The belt is a Poly-v-belt.

The generator (GEN) with charge regulator can be diagnosed through the central electronic module.

ACCESSORIES AND EQUIPMENT

Miscellaneous - General Information

EXTERNAL EQUIPMENT (2003-12)

TRIM PANEL KIT (BODYKIT), SPRAYING

Fig. 1: Identifying Bodykit
Courtesy of VOLVO CARS CORPORATION

The Bodykit as shown is made of PUR-plastic. PUR-plastic can deform. If the plastic components are not sufficiently supported when stored, or hung after painting, there is a risk that the plastic will change shape.

CAUTION: Locating pins or other protruding components must not bear the weight of the plastic components.

HINT: Place the plastic components with supports on a large surface.

CAUTION: Heat causes the plastic to deform further. Oven drying must not be carried out at temperatures exceeding 50°C. Allow plastic components to dry at room temperature.

NOTE: Spraying must be carried out according to the instructions of the paint supplier.

Install the components in the bodykit according to the Installation Instructions, accessories.

INSTRUCTIONAL AND INFORMATIONAL PLATES (2003-12)

SPARE PART MARKING (R-DOT)

Some of the spare parts are selected to be marked with R-dot, which is an anti-theft marking that is only applicable in the USA.

Fig. 2: Identifying Side Door (R-Dot)
Courtesy of VOLVO CARS CORPORATION

The following components are R-dot marked:

- front and rear bumper cover
- all side doors
- bonnet
- tailgate
- left and right fender
- left and right fender (full side)
- engine (sump)
- the gearbox

Note that in certain cases the components may be punched or scribed.

Fig. 3: Identifying Side Door (R-Dot)
Courtesy of VOLVO CARS CORPORATION

On vehicles for USA, these components are marked with the vehicle's VIN number.

APPLIES TO VEHICLES IN THE USA

Repairing without spare parts - fixing:

Keep the VIN marking for as long as possible, for example, by masking before grinding and painting. However, the marking can be removed and/or affected without being replaced with a new one if required to achieve the correct quality and surface finish.

Repairing with spare parts - replacement:

Keep the R-dot marking for as long as possible, for example, by masking before grinding and painting. However, the marking can be removed and/or affected without being replaced with a new one if required to achieve the correct quality and surface finish.

Note that the labels, neither R-dot or VIN, are not available as separate spare parts.

Fig. 17: Identifying Installed Wheel Holders
Courtesy of VOLVO CARS CORPORATION

- Install the wheel holders (1) by twisting them. One wheel holder must be on the extension (2) and one on the strut (3).

NOTE: Only one wheel holder may be positioned on the extension.

- Position the short straps (4).

Fig. 18: Identifying Strap For Saddle Holder
Courtesy of VOLVO CARS CORPORATION

- Insert the strap for the saddle holder.

BICYCLE HOLDER, INTERIOR (2003-2008)

BICYCLE HOLDER, INTERIOR

INSTALLING THE BICYCLE HOLDER

Fig. 19: Identifying Two M6 Knobs With Threads, Two Washers And Two M6 Nuts On Wheel Holder
Courtesy of VOLVO CARS CORPORATION

- Install the two M6 knobs with threads, two washers and two M6 nuts (from the kit) on the sides of the wheel holder
- Repeat the operation on the wheel holder.

Fig. 20: Identifying Two T-Groove Screws And Two M6 Knobs
Courtesy of VOLVO CARS CORPORATION

- Take two T-groove screws and two M6 knobs from the kit. Install the T-groove screws underneath the wheel holder. Screw in the two knobs a few turns
- Repeat the operation on the wheel holder.

Fig. 21: Identifying M8 Knob With Washer And Screw On Fork Mounting
Courtesy of VOLVO CARS CORPORATION

- Take an M8 knob with a screw and washer from the kit. Position the washer against the knob
- Install the M8 knob with the washer and screw in the fork mounting
- Take another washer and M8 knob from the kit and position on the other end of the screw
- Repeat the operation with the other fork mounting.

Fig. 22: Identifying Two M6 Knobs And Mounting Underneath Fork Mounting
Courtesy of VOLVO CARS CORPORATION

- Take two M6 knobs and a mounting bracket from the kit. Install the bracket on the underside of the fork mounting. Screw in the two M6 knobs a few turns
- Repeat the operation with the other fork mounting.

Fig. 23: Positioning Fork Mountings In The Aluminum Rod
Courtesy of VOLVO CARS CORPORATION

- Position both the fork mountings in the center of the aluminum rod. They must be slightly apart and at an angle
- Tighten the knobs on top of the fork mountings so that both fork mountings are secure
- Compress both halves on the saddle holders
- Install the saddle holders on the aluminum rod, outside the fork mountings.

Fig. 24: Identifying Four Screws And Two Mountings
Courtesy of VOLVO CARS CORPORATION

- Take the four screws and the two mountings from the kit. Install the mountings underneath the aluminum rod outside of the saddle holders. Tighten the mountings.

Fig. 25: Installing The Wheel Holders
Courtesy of VOLVO CARS CORPORATION

- Install both the wheel holders at the top of the aluminum rod
- Tighten the knobs on the side so that both wheel holders are secure.

Fig. 26: Lifting In The Bicycle Holder
Courtesy of VOLVO CARS CORPORATION

- Fold the rear backrests forwards
- Lift in the bicycle holder through one of the rear doors
- Slide the two mountings on the bicycle holder into the eyelets at the bottom of the outer rear backrests.

Fig. 27: Securing The Bicycle Holder In The Eyelets
Courtesy of VOLVO CARS CORPORATION

- Secure the bicycle holder in the eyelets on the rear mountings on the front seats. Use the straps from the kit
- Tighten the straps fully.

Fig. 28: Securing The Front Forks
Courtesy of VOLVO CARS CORPORATION

- Remove the front wheel and the saddle from the bicycle
- Lift the bicycle into the car through the boot
- Secure the front forks in the right-hand fork mounting. Tighten the two knobs on the sides fully.

Fig. 29: Identifying Saddle Holder
Courtesy of VOLVO CARS CORPORATION

- Secure the saddle in the saddle holder. Tighten the knob fully.

Fig. 30: Securing The Front Wheel
Courtesy of VOLVO CARS CORPORATION

- Secure the front wheel in the right-hand wheel holder
- Adjust the angle of the wheel holder using the two knobs on the sides so that the wheel is correctly positioned in the wheel holder
- Install the wheel. Secure the wheel using the wheel nuts
- Tighten the wheel holder fully using the two knobs on the sides when the wheel is resting against the folded backrest.

Fig. 31: Securing The Bicycle Using A Strap
Courtesy of VOLVO CARS CORPORATION

- Secure the bicycle using a retaining strap through the rear wheel and through the load securing eyelet as illustrated. Tighten the bicycle so that it cannot move.

Fig. 32: Repeating Procedure When Loading Another Bicycle
Courtesy of VOLVO CARS CORPORATION

- Carry out the same procedure when loading further bicycles. Turn the other bicycle in the same direction as the first to ensure optimal utilization of the cargo compartment. Secure the bicycle using a strap as before.

BICYCLE HOLDER, ROOF MOUNTED (2003-2008)

BICYCLE HOLDER, ROOF MOUNTED

NOTE: Important:

- **Regularly check that the load carriers are properly secured**
- **Regularly check that the bicycle and bicycle holder are properly secured**
- **Handling is affected by the actual load and its position. The center of gravity of the car changes when driving with a load, which affects the handling of the car. Adjust your speed accordingly**
- **The load increases the total height of the car which affects accessibility. Be aware of low roofs and entrances.**

- Install the load carriers according to the separate Installation Instructions. If there are no set positions for the load carriers, they should be positioned approximately **800 mm (32")** apart
- **Applies to cars with rails:** Position the load carriers so that there is no risk of the tailgate catching the bicycle holder when it is opened.

ASSEMBLING THE BICYCLE HOLDER

Fig. 33: Identifying Frame Holders On Tubes
Courtesy of VOLVO CARS CORPORATION

- Install the frame holders (from the kit) on the tubes. Ensure that the frame holders are on the correct side for bicycle holders mounted on the left or right-hand sides. This is to ensure that the lock can be reached
- Cover the holes using the rubber blind cover plugs from the kit.

NOTE: Do not cover the holes where the latch will be positioned.

- Measure the diameter of the bicycle frame to determine which installation version applies for the bicycle.

Fig. 34: Identifying Bicycle Frame Diameter (1 Of 2)
Courtesy of VOLVO CARS CORPORATION

Frame diameter (A): 22 - 58 mm (0.87" - 2.28")

- Install the frame holder screw (from the kit) in the upper hole in the frame holder
- Take the short frame protection (B) from the kit. Thread the frame protection onto the screw
- Screw the latch (from the kit) on to the frame holder screw
- Secure the frame holder screw in its cut out.

Fig. 35: Identifying Bicycle Frame Diameter (2 of 2)
Courtesy of VOLVO CARS CORPORATION

Frame diameter (D): 59 - 70 mm (2.32" - 2.75") and Oval frame (E, F): max 65 x 80 mm (2.56" x 3.15")

- Install the frame holder screw (from the kit) in the lower hole in the frame holder
- Take the long frame protection (C) from the kit. Thread the frame protection onto the screw
- Screw the latch (from the kit) onto the frame holder screw

- Secure the frame holder screw in its cut out.

Fig. 36: Identifying Tensioner Straps On Bicycle Holders Mounted On Left Or Right-Hand Sides
Courtesy of VOLVO CARS CORPORATION

- Ensure that the tensioner straps are on the correct side for bicycle holders mounted on the left or right-hand sides. This is done by turning the entire bicycle holder. Thread the rubber straps (from the kit) onto the tensioner straps, as illustrated.

INSTALLING THE BICYCLE HOLDER ON THE LOAD CARRIERS

Fig. 37: Identifying Bicycle Holder On Load Carriers
Courtesy of VOLVO CARS CORPORATION

- Take mounting strips, U-shaped screws and knobs from the kit. Install the bicycle holder on the load carriers, as illustrated. Tighten to **3 Nm (2.2 lbf. ft.)** .

SECURING BICYCLES

Fig. 38: Identifying Frame Holders Squeezed Together Around Frame
Courtesy of VOLVO CARS CORPORATION

- Position the bicycle on the bicycle holder
- Squeeze the frame holders together around the frame. Tighten the frame holders using the lock handle
- Secure with the lock handle and engage the lock.

NOTE: **Always ensure that the lock handle is locked during transit to prevent the bicycle from shaking loose.**

Fig. 39: Securing Wheels With Tensioner Straps
Courtesy of VOLVO CARS CORPORATION

- Secure the wheels with the tensioner straps. Ensure that the bicycle is stable.

WARNING: **The bicycle can shake loose if it is not properly secured**

Fig. 40: Identifying Tensioner Strap Threaded Into Rubber Straps
Courtesy of VOLVO CARS CORPORATION

- Thread any excess tensioner strap into the rubber straps that were installed earlier. This holds the straps in place and prevents them rubbing against or hitting the roof of the car.

NOTE:

- **Check that the bicycle and bicycle holder are properly secured**
- **Check again after driving a short distance**
- **Repeat the check at suitable intervals**
- **Tighten the tensioning straps and frame holders if necessary.**

CARGO RACK, HITCH (2003)

CARGO RACK, HITCH

INSTALLING THE CARGO RACK

Fig. 41: Identifying Load Basket Installed In Base Unit's Square Pipe
Courtesy of VOLVO CARS CORPORATION

- Install the cargo rack on the square section tube on the base unit
- Tighten the cargo rack. Use the two screws, the sprung washers and the flat washers.

TILTING THE CARGO RACK

Fig. 42: Identifying Catch Pressed Down To Lower Base Unit
Courtesy of VOLVO CARS CORPORATION

- Press down the catch (A) to tilt the cargo rack
- Fold the cargo rack (B) downwards until the stop catches engage.

NOTE: The load may fall off when tilting if it is not secured properly.

TILTING THE CARGO RACK BACK INTO POSITION

Fig. 43: Identifying Lifted Up Stop Catch And Folded Back Load Basket
Courtesy of VOLVO CARS CORPORATION

- Lift the catch (A) and fold the cargo rack back into position (B).

Fig. 44: Folding Back Load Basket Until Two Clear Clicks Can Be Heard And Catch Rises
Courtesy of VOLVO CARS CORPORATION

- Fold the cargo rack forwards until two clicks are heard and the catch goes up.

SAFETY CHECKS BEFORE TRAVELLING

CAUTION: Ensure that all the screws, nuts and retaining straps are securely tightened before travelling. Check these regularly.

Any damaged straps must be replaced with new straps.

The base unit/cargo rack must not be used as a mounting point when towing.

Do not use the base unit/cargo rack when driving off road.

NOTE: If the car registration is covered by the base unit and cargo, an additional registration plate holder with lighting is available as an accessory. It must then be used.

CAUTION: The load must not protrude outside the cargo rack.

Do not exceed the maximum load on the base unit specified on the tow hitch identification plate (MAX TONGUE WEIGHT).

Note that the center of gravity and handling of the car are affected by the

load.

The base unit with accompanying cargo system must not be used to transport animals or people.

CRUISE CONTROL (2003-2008)

CARS EQUIPPED WITH SRS/SIPS (AIRBAG)

see **CARS EQUIPPED WITH SRS/SIPS (AIRBAG)**

CAUTION.

see **CAUTION.**

CRUISE CONTROL

NOTE: This accessory requires software unique to the car

PREPARATIONS

Fig. 45: Disconnect Battery Negative Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position "0". Remove the ignition key from the ignition switch
- Disconnect the battery negative lead.

NOTE: Wait at least five minutes before disassembling the connectors or removing other electrical equipment.

DISASSEMBLING, THE STEERING WHEEL

Fig. 46: Identifying Steering Wheel Turned To Access Holes On Back
Courtesy of VOLVO CARS CORPORATION

- Turn the steering wheel a quarter turn so that the holes on the reverse of the steering wheel are accessible.

Fig. 47: Screwdriver Inserted In Back Of Steering Wheel & Locating End Of Locking Spring
Courtesy of VOLVO CARS CORPORATION

- Insert a screwdriver in the hole (2) on the reverse of the steering wheel, at right angles to the rear surface of the steering wheel. Insert a screwdriver as far as possible to determine the position of the end of the spring clip (1)
- Position the end of the screwdriver on the top of the spring clip as illustrated
- Pry the screwdriver upwards towards the upper edge of the hole (2) so that the end of the screwdriver presses the spring clip down (1) until one side of the steering wheel module springs out and releases from the mounting
- Turn the steering wheel a half turn in the opposite direction. Carry out the same operation on the other side
- Turn the steering wheel to the neutral position.

Fig. 48: Identifying Airbag Cable Connectors
Courtesy of VOLVO CARS CORPORATION

- Fold the steering wheel module out
- Remove the two connectors (1) for the ignition cables for the airbag. First press in the catches on the sides. Then pull the connectors straight out.

NOTE: The connectors are tightly secured. However, tools must not be used when removing.

- Place the steering wheel module to one side.

Fig. 49: Identifying Steering Wheel, Horn And Keypads
Courtesy of VOLVO CARS CORPORATION

- Remove the screw (1). Remove the ground lead
- Disconnect the connector (2) for the horn and the keypads
- Remove the three screws (3). Lift the horn out (4).

Fig. 50: Identifying Catches On Dummy Button Connectors
Courtesy of VOLVO CARS CORPORATION

Applies to cars with pre-routed wiring

- Press in the catch (1) on the connectors for the left dummy button. Remove the connectors.

Fig. 51: Identifying Screw And Catch
Courtesy of VOLVO CARS CORPORATION

Applies to all cars

- Remove the screw (1) in the dummy button on the left hand side of the horn
- Press in the catch (2). At the same time pull the dummy button from its socket. Place the dummy button to one side. If there is existing wiring: continue with point **10** .

NOTE: If there is no existing wiring the horn must be replaced. A new horn is in the kit. Carry out points 8- 9.

Fig. 52: Identifying Screw And Catch
Courtesy of VOLVO CARS CORPORATION

Applies to cars without existing wiring

- Remove the screw (1) in the dummy button on the right hand side of the horn
- Press in the catch (2). At the same time pull the dummy button from its socket.

NOTE: Take care of the dummy button, it will be reused.

- Place the old horn to one side. The horn will not be reused.

Fig. 53: Identifying Screw Installation
Courtesy of VOLVO CARS CORPORATION

Applies to cars without existing wiring

- Install the new horn in position

- Insert the right dummy button into the groove until the catch engages
- Install the screw. Tighten the dummy button
- Connect the connector to the dummy button.

INSTALLING, THE KEYPAD FOR THE CRUISE CONTROL

Fig. 54: Identifying Keypad Installation
Courtesy of VOLVO CARS CORPORATION

Applies to all cars

- Insert the new keypad for the cruise control into the grooves until the catch engages
- Install the screw. Tighten the keypad
- Connect both the connectors to the keypad.

- Reinstall the horn. Ensure that the three springs are positioned correctly. Check that the ground lead is not trapped
- Tighten the screws crosswise. Tighten to **6.5 Nm (5 lbf. ft.)**
- Reinstall the ground lead using the screw. Tighten the ground lead
- Connect the connector for the horn and the keypads
- Check the function of the horn. Press the horn all the way around its circumference. (A metallic noise should be heard).

Fig. 55: Checking That Springs Are In Position
Courtesy of VOLVO CARS CORPORATION

- Check that the two springs (1) are in position
- Connect the two connectors for the ignition cables for the steering wheel module
- Insert the two pins on the reverse of the steering wheel module in the two springs. Ensure that the ignition cables are not trapped
- Press the steering wheel module into the mountings (two clicks should be heard).

FINISHING WORK

Fig. 56: Connecting Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position "II".
- Connect the battery negative lead
- Program the software according to the service information in VIDA (Volvo scan tool).

DETACHABLE TOW HITCH (2003-2005)

CARS EQUIPPED WITH SRS/SIPS (AIRBAG)

see **CARS EQUIPPED WITH SRS/SIPS (AIRBAG)**

CAUTION.

see **CAUTION.**

TOW HITCH, DETACHABLE

NOTE: **The ball and ball holder with the accompanying components are separate component kits and are not included in the kit but must be purchased separately.**

NOTE: **Kit contents:**

1. **Cross member**
2. **Screw M12x110 (x6)**
3. **Spacer washer, left-hand**
4. **Spacer washer, right-hand**
5. **Strap (purchased separately)**
6. **Bracket (purchased separately)**
7. **Nut M6 (purchased separately)**
8. **Protective cover (purchased separately)**
9. **Ball (purchased separately)**
10. **Washer (purchased separately)**
11. **Nut (purchased separately)**
12. **Ball holder (purchased separately)**
13. **Rubber tabs (x4) (purchased separately)**
14. **Locking bolt (purchased separately)**
15. **Cotter pin (purchased separately)**
16. **Cover**
17. **Mounting pin (x2).**

Fig. 57: Folding Up The Rear Floor Hatch
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Fold up the center rear floor hatch (1) slightly
- Remove it by pulling it off the mountings at the front edge
- Remove the storage box underneath and lift it out. If the floor hatch has a carrier bag holder on the underneath, it is secured by a strap on each of the shorter sides of the storage box. The straps must be undone.

Fig. 58: Folding Up The Centre Rear Floor Hatch (1)
Courtesy of VOLVO CARS CORPORATION

Applies to cars with three rows of seats and integrated carrier bag holder on the underside of the center floor hatch

- Fold up the center rear floor hatch (1)

- Release the two straps on the panel underneath. Lift up the panel at the rear edge. Fold back the floor hatch towards the panel. Lift out the floor hatch and panel.

Applies to cars with three rows of seats without an integrated carrier bag holder

- Lift up the center rear floor hatch (1) at the rear edge and lift it out.

Fig. 59: Removing The Side Floor Hatches
Courtesy of VOLVO CARS CORPORATION

Applies to all models

- Remove the side floor hatches (A) and the folding side panels (B) on the right and left-hand sides in the cargo compartment.

Fig. 60: Identifying Left-Hand C-Post Panel And Plastic Weatherstrip Tools
Courtesy of VOLVO CARS CORPORATION

- Pull off the rubber strip at the rear edge of the door opening to the left-hand rear door opposite the left C-

post panel

- Carefully pry off the left-hand C-post panel at the sides in the top edge using a plastic weatherstrip tool. Pull off until the three clips on the inside release. Do not damage the headlining or the panel
- Remove the panel by pulling upwards slightly and unhooking it from the side panel
- Repeat the operation on the right-hand side.

Fig. 61: Removing Cover And Screws For The Rear Headlining
Courtesy of VOLVO CARS CORPORATION

- Remove the cover and the screws underneath for the rear headlining
- Carefully pry off the panel at the rear edge. Use a plastic weatherstrip tool
- Pull the rear edge of the panel downwards until all clips on the inside have released
- If the car has lighting in the panel, disconnect the connector
- Pull the panel backwards to release it.

Fig. 62: Identifying D-Post Panel Removal From Side Panel
Courtesy of VOLVO CARS CORPORATION

- Pull off the left-hand D-post panel starting at the top edge. Then pull downwards until the three clips on the inside have released. Do not damage the panel
- Remove the panel by pulling upwards slightly and unhooking it from the side panel
- Disconnect the connector if the car has a loudspeaker in the D-post
- Repeat the operation on the right-hand side.

Illustration shows the removal of the cover for the load securing eyelets

Fig. 63: Identifying Load Securing Eyelet
Courtesy of VOLVO CARS CORPORATION

Applies to all models

- Fold out the load securing eyelet
- Insert a scriber with an angled tip into the hole in the top of the cover
- Turn the scriber so that the angled tip engages in the reverse of the cover (1). Pull the cover off
- Repeat the operation on the right-hand side.

Fig. 64: Cars With Two Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

Fig. 65: Cars With Three Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

- Fold up the seats in the third row (applies to cars with three rows of seats)
- Remove the screws (2) for the load securing eyelets in the left-hand side panel
- Remove the covers (3) over the front mountings for the left-hand side panel. Pry the covers off. Use a plastic weatherstrip tool or a small screwdriver
- Remove the screws (4)
- Remove the clip (5) at the bottom of the storage compartment in the panel (Applies to cars with three rows of seats)
- Pull up the panel slightly at the top edge so that the clips on the inside release. Remove the panel by pulling it straight upwards.

Fig. 66: Removing Panel By Pulling It Straight Up And Unhook It From Side Panel (1 Of 2)
Courtesy of VOLVO CARS CORPORATION

Applies to cars with accessory electronic modules (AEM)

- Remove the brackets with the accessory electronic module (AEM). If necessary disconnect the connectors.

Fig. 67: Removing Three Screws In Battery Holder
Courtesy of VOLVO CARS CORPORATION

- Remove the three screws in the battery holder. Lift the battery holder out
- Remove the battery cover
- Lower and remove the spare wheel.

Fig. 68: Making Two Parallel Slits In The Bumper Cover
Courtesy of VOLVO CARS CORPORATION

From underneath the car

1. Measure and draw a horizontal line 6 mm below the top of the ribs and a vertical line (A and B) 10 mm in towards the center from ribs 3 and 4. See the illustration
2. Cut along the inside of rib 2 and the new line A up to the line drawn 6 mm below the top of the ribs. Do the same between rib 5 and the new line B. Remove the shaded areas by cutting between the cuts along the horizontal line so that two parallel slits are made in the bumper cover
3. Cut away the remaining pieces of ribs 3 and 4 parallel to the bumper cover.

- Use a file to smooth off the edges of the cut outs.

Fig. 69: Cutting Away The Upright Ribs
Courtesy of VOLVO CARS CORPORATION

- Cut away all the upright ribs.

Fig. 70: Identifying the End Result
Courtesy of VOLVO CARS CORPORATION

- The end result must be as illustrated.

Fig. 71: Identifying The Rear Mounting
Courtesy of VOLVO CARS CORPORATION

- Remove the rear mounting for the silencer with the bracket from the underneath of the left-hand rear side member by removing the screws (1). Remove the silencer to gain access when installing the tow hitch.

Fig. 72: Identifying Front Mounting
Courtesy of VOLVO CARS CORPORATION

- Remove the front mounting for the rear silencer at the rear sub-frame by removing the screws (1)
- Carefully bend the heat deflector plate at the side member to one side, to gain more work space
- Remove the protective flaps covering the mounting holes on the inside of the side members (one on each side)
- Remove any sealant from the surface where the tow hitch member will be mounted.

APPLIES TO CARS EQUIPPED WITH A REVERSING WARNING SYSTEM

Fig. 73: Identifying The Right-Hand Side
Courtesy of VOLVO CARS CORPORATION

Fig. 74: Identifying The Left-Hand Side
Courtesy of VOLVO CARS CORPORATION

- Disconnect the cable for the reverse warning sensor from its clips in the rear section of the bumper.

APPLIES TO ALL MODELS

Fig. 75: Cut Out As Marked
Courtesy of VOLVO CARS CORPORATION

Right-hand side:

- Cut out the rear section at the existing cut out as marked in the illustration.

APPLIES TO CARS WITH REVERSING WARNING SYSTEMS

Fig. 76: Measuring Location of Hole
Courtesy of VOLVO CARS CORPORATION

Right-hand side:

- Measure up to drill the cable lead-in in the upper of the rear section plates as illustrated
- Pre-drill using a **3 mm (1/8")** diameter drill bit. Then drill out the hole to a diameter of **8 mm (5/16")** . Use an angle drill and short drill bits.

Fig. 77: Cutting a 2 mm (5/64") Groove
Courtesy of VOLVO CARS CORPORATION

- Cut a 2 mm (5/64") wide groove through the plate leading in to the hole.

APPLIES TO ALL MODELS

Fig. 78: Cutting Out As Marked
Courtesy of VOLVO CARS CORPORATION

Left-hand side:

- Cut out the rear section at the existing cut out as marked in the illustration.

APPLIES TO CARS WITH REVERSING WARNING SYSTEMS

Fig. 79: Measuring Hole Locations
Courtesy of VOLVO CARS CORPORATION

Left-hand side:

- Measure up to drill the cable lead-in on the left and right-hand sides of the cut-out in the upper of the rear section plates as illustrated
- Pre-drill using a **3 mm (1/8")** diameter drill bit. Then drill out the holes to a diameter of **8 mm (5/16")** . Use an angle drill and short drill bits.

Fig. 80: Cutting a 2 mm (5/64") Slot
Courtesy of VOLVO CARS CORPORATION

- Cut a 2 mm (5/64") wide groove through the plate leading in to the holes on both sides of the cut-out.

Fig. 81: Routing Cable
Courtesy of VOLVO CARS CORPORATION

Right-hand side:

- Press up the tab on the plate. Insert the cable in the previously drilled hole. The cable must be positioned as illustrated.

Fig. 82: Routing Cable
Courtesy of VOLVO CARS CORPORATION

Left-hand side:

- Press up the tabs on the plate and inset the cable in the holes drilled earlier. The cable must be positioned as illustrated.

HINT: It is recommended that two people carry out this procedure.

Fig. 83: Positioning The Tow Hitch Between The Two Side Members
Courtesy of VOLVO CARS CORPORATION

- Take the two mounting pins (1) from the kit
- With one person at each end, lift and position the tow hitch on the inside between the two side members, in between the holes. Start by angling up the face of the left-hand side above the tail pipe on the silencer and up between the heat deflector plate and the side member. Then angle the right-hand side face up to the side member

- Press the mounting pins into the center hole in the side members while holding the tow bar member in position so that the bar can hang freely without falling off
- Carefully lower the car.

Fig. 84: Inserting The Spacer Sleeves
Courtesy of VOLVO CARS CORPORATION

- Fold down the lower tailgate.

From the inside of the cargo compartment:

- Remove the protective flaps covering the mounting holes on the outside of the side members (one on each side)
- Remove any sealant from the surfaces where the spacer washers will be positioned
- Insert the spacer sleeves using only the front and rear screws on the outside of the two side members.

NOTE: Do not press out the mounting pins so that the tow bar detaches.

- Screw the front and rear screws in fully but do not tighten them
- Insert the center screws so that the mounting pins are pressed out. Screw the screws in fully but do no tighten them
- Hold the bar in the horizontal position. Tighten the screws.

NOTE: Rustproofing agent must be applied under the car before the screws are tightened. Apply the rustproofing agent to the side members all around the ends where any sealant was scraped off.

- Tighten all screws from inside the car. Tighten to **120 Nm (86 lbf. ft.)** in the following order:

1. The rear screws

2. The front screws

3. The center screws

NOTE: Wait five minutes so that the joint settles. Then re-check the torque.

- Raise the car again.

From underneath the car

- Carefully bend the heat deflector plate back so it does not touch the silencer
- Reinstall the front mounting for the rear silencer. Tighten the screws. Tighten to **24 Nm (18 lbf. ft.)**
- Reinstall the rear mounting for the rear silencer. Tighten the screws. Tighten to **48 Nm (35 lbf. ft.)** .

- Install the cable harness connector for the tow hitch according to point 1D in the installation instructions for the appropriate cable harness.

- Install the cable harness according to point 3 onwards in the Installation instructions for the appropriate cable harness.

NOTE: Ensure that the cable harness does not rub against the lower edge of the bumper and is not pressed back.

Fig. 85: Installing The Tow Hitch In The Square Section
Courtesy of VOLVO CARS CORPORATION

Securing the tow hitch

- Insert the tow hitch in the square section tube for the tow hitch member so that the tow hitch and holes in the tow hitch member and square section tube correspond
- Insert the pin through the holes and lock using the locking pin.

Fig. 86: Identifying Four Foam Rubber Pieces (From The Kit)
Courtesy of VOLVO CARS CORPORATION

- Position the four foam rubber pieces (from the kit) on the floor on the left-hand side of the battery, as illustrated, to prevent the tow hitch rattling when it is stored there.

Installing the bracket

- Install the bracket and M6 flange nut (from the kit) on the welded screw in the compartment to the left of the battery as illustrated. Tighten to **10 Nm (7.3 lbf. ft.)** .

Fig. 87: Stowing The Tow Hitch
Courtesy of VOLVO CARS CORPORATION

Storing the tow hitch

- Remove the tow hitch and place it in the supplied protective bag. Pull the string tight
- Take the tension strap from the tow hitch kit. Thread the strap through the two grooves in the rear bracket which is positioned to the left of the battery

- Place the cloth bag with the tow hitch over the bracket. Secure in position using the tension strap as illustrated.

FINISHING WORK

- Reinstall the cover and holder for the battery
- Reinstall the spare wheel.

Applies to cars with two rows of seats

- Reinstall the storage box.

Applies to cars with accessory electronic modules (AEM)

- Reinstall the bracket with the accessory electronic module (AEM). Connect the connectors if disconnected.

Applies to all models

- Reinstall the panels, storage boxes and floor hatches
- Tighten the screws in the load securing eyelets. Tighten to **24 Nm (18 lbf. ft.)** .

DETACHABLE TOW HITCH (2003-2005)

CARS EQUIPPED WITH SRS/SIPS (AIRBAG)

see **CARS EQUIPPED WITH SRS/SIPS (AIRBAG)**

CAUTION.

see **CAUTION.**

TOW HITCH, DETACHABLE

NOTE: **Kit contents:**

1. **Cross member**
2. **Screw M12x110 (x6)**
3. **Spacer washer, left-hand**
4. **Spacer washer, right-hand**
5. **Protective cover, assembly**
6. **Strap**
7. **Bracket**
8. **Nut M6**

9. **Protective bag**
10. **Decal**
11. **Detachable tow hitch**
12. **Cover plate (x4)**
13. **Mounting pin (x2).**

Fig. 88: Folding Up The Rear Floor Hatch
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Fold up the center rear floor hatch (1) slightly
- Remove the hatch by pulling it off the mountings at the front edge
- Remove the storage box underneath and lift it out. If the floor hatch has a carrier bag holder on the underneath, it is secured by a strap on each of the shorter sides of the storage box. These straps must be undone.

Fig. 89: Folding Up The Centre Rear Floor Hatch (1)
Courtesy of VOLVO CARS CORPORATION

Applies to cars with three rows of seats and the integrated carrier bag holder on the underside of the center floor hatch

- Fold up the center rear floor hatch (1)
- Release the two straps on the panel underneath. Lift up the panel at the rear edge. Fold back the floor hatch towards the panel. Lift out the floor hatch and panel.

Applies to cars with three rows of seats without an integrated carrier bag holder

- Fold up the center rear floor hatch (1) at the rear edge and lift it out.

Fig. 90: Removing The Side Floor Hatches
Courtesy of VOLVO CARS CORPORATION

Applies to all models

- Remove the side floor hatches (A) and the folding side panels (B) on the right and left-hand sides in the cargo compartment.

Fig. 91: Identifying Left-Hand C-Post Panel And Plastic Weatherstrip Tools
Courtesy of VOLVO CARS CORPORATION

- Pull off the rubber strip at the rear edge of the door opening for the left-hand rear door opposite the left C-post panel
- Carefully pry off the left-hand C-post panel at the sides at the top edge. Use a plastic weatherstrip tool. Pull off until the three clips on the inside release. Do not damage the headlining or the panel
- Remove the panel by pulling upwards slightly and unhooking it from the side panel
- Repeat the operation on the right-hand side.

Fig. 92: Removing Cover And Screws For The Rear Headlining
Courtesy of VOLVO CARS CORPORATION

- Remove the covers and the screws underneath for the rear headlining
- Carefully pry off the panel at the rear edge. Use a plastic weatherstrip tool
- Pull the rear edge of the panel downwards until all clips on the inside have released
- If the car has lighting in the panel, disconnect the connector

- Pull the panel backwards to release it.

Fig. 93: Identifying D-Post Panel Removal From Side Panel
Courtesy of VOLVO CARS CORPORATION

- Carefully pull off the left-hand D-post panel starting at the top edge. Then pull downwards until the three clips on the inside have released. Do not damage the panel
- Remove the panel by pulling upwards slightly and unhooking it from the side panel
- Disconnect the connector if the car has a loudspeaker in the D-post
- Repeat the operation on the right-hand side.

Fig. 94: Identifying Load Securing Eyelet
Courtesy of VOLVO CARS CORPORATION

Applies to all models

- Fold out the load securing eyelet
- Insert a scriber with an angled tip into the hole in the top of the cover

- Turn the scriber so that the angled tip engages in the reverse of the cover (1). Pull the cover off
- Repeat the operation on the right-hand side.

Fig. 95: Cars With Two Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

Fig. 96: Cars With Three Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

- Fold up the seats in the third row (applies to cars with three rows of seats)
- Remove the screws (2) for the load securing eyelets in the left-hand side panel
- Remove the covers (3) over the front mountings for the left-hand side panel. Pry the covers off. Use a plastic weatherstrip tool or a small screwdriver
- Remove the screws (4)
- Remove the clip (5) at the bottom of the storage compartment in the panel (Applies to cars with three rows of seats)
- Pull up the panel slightly at the top edge so that the clips on the inside release. Remove the panel by

pulling it straight upwards.

Fig. 97: Removing Panel By Pulling It Straight Up And Unhook It From Side Panel (1 Of 2)
Courtesy of VOLVO CARS CORPORATION

Applies to cars with accessory electronic modules (AEM)

- Remove the bracket and the accessory electronic module (AEM). If necessary disconnect the connectors.

Fig. 98: Removing Three Screws In Battery Holder
Courtesy of VOLVO CARS CORPORATION

- Remove the three screws in the battery holder. Lift the battery holder out
- Remove the battery cover
- Lower and remove the spare wheel.

Fig. 99: Measure and Cut
Courtesy of VOLVO CARS CORPORATION

From underneath the car

1. Measure and draw a horizontal line 6 mm below the top of the ribs as illustrated
2. Cut along the inside of ribs 1 and 3 (the sides which face rib 2) up to the line drawn 6 mm below the top edge of the ribs. Do the same between ribs 6 and 4. Remove the shaded areas by cutting/sawing between the cuts along the horizontal line so that two parallel slits are made in the bumper cover
3. Cut away the remaining pieces of ribs 2 and 5 parallel to the bumper cover.

- Use a file to smooth off the edges of the cut outs.

Fig. 100: Cut Away The Upright Ribs
Courtesy of VOLVO CARS CORPORATION

- Cut away all the upright ribs.

Fig. 101: Identifying the End Result
Courtesy of VOLVO CARS CORPORATION

- The end result must be as illustrated.

Fig. 102: Identifying The Rear Mounting
Courtesy of VOLVO CARS CORPORATION

- Remove the rear mounting for the silencer and the bracket from the underneath of the left-hand rear side member by removing the screws (1). Remove the silencer to gain access when installing the tow hitch.

Fig. 103: Identifying Front Mounting
Courtesy of VOLVO CARS CORPORATION

- Remove the front mounting for the rear silencer at the rear sub-frame by removing the screws (1)
- Carefully bend the heat deflector plate at the side member to one side, to gain more work space
- Remove the protective flaps covering the mounting holes on the inside of the side members (one on each side)
- Remove any sealant from the surface where the tow hitch member will be mounted.

APPLIES TO CARS EQUIPPED WITH A REVERSING WARNING SYSTEM

Fig. 104: Identifying The Right-Hand Side
Courtesy of VOLVO CARS CORPORATION

Fig. 105: Identifying The Left-Hand Side
Courtesy of VOLVO CARS CORPORATION

- Disconnect the cable for the reverse warning sensor from its clips in the rear section of the bumper.

APPLIES TO ALL MODELS

Fig. 106: Cut Out As Marked
Courtesy of VOLVO CARS CORPORATION

Right-hand side:

- Cut out the rear section at the existing cut out as marked in the illustration.

APPLIES TO CARS WITH REVERSING WARNING SYSTEMS

Fig. 107: Measuring Location of Hole
Courtesy of VOLVO CARS CORPORATION

Right-hand side:

- Measure up to drill the cable lead-in in the upper of the rear section plates as illustrated
- Pre-drill using a **3 mm (1/8")** diameter drill bit. Then drill out the hole to a diameter of **8 mm (5/16")** . Use an angle drill and short drill bits.

Fig. 108: Cutting a 2 mm (5/64") Groove
Courtesy of VOLVO CARS CORPORATION

- Cut a 2 mm (5/64") wide groove through the plate leading in to the hole.

APPLIES TO ALL MODELS

Fig. 109: Cutting Out As Marked
Courtesy of VOLVO CARS CORPORATION

Left-hand side:

- Cut out the rear section at the existing cut out as marked in the illustration.

APPLIES TO CARS WITH REVERSING WARNING SYSTEMS

Fig. 110: Measuring Hole Locations
Courtesy of VOLVO CARS CORPORATION

Left-hand side:

- Measure up to drill the cable lead-in on the left and right-hand sides of the cut-out in the upper of the rear section plates as illustrated
- Pre-drill using a **3 mm (1/8")** diameter drill bit. Then drill out the holes to a diameter of **8 mm (5/16")** . Use an angle drill and short drill bits.

Fig. 111: Cutting a 2 mm (5/64") Slot
Courtesy of VOLVO CARS CORPORATION

- Cut a 2 mm (5/64") wide groove through the plate leading in to the holes on both sides of the cut-out.

Fig. 112: Routing Cable
Courtesy of VOLVO CARS CORPORATION

Right-hand side:

- Press up the tab on the plate. Insert the cable in the previously drilled hole. The cable must be positioned as illustrated.

Fig. 113: Routing Cable
Courtesy of VOLVO CARS CORPORATION

Left-hand side:

- Press up the tabs on the plates and insert the cable in the holes drilled earlier. The cable must be positioned as illustrated.

Fig. 114: Removing The Tow Hitch
Courtesy of VOLVO CARS CORPORATION

- Remove the tow hitch by turning the handle (1) to the right until a click is heard and the pin (2) is in the outer position. Pull out the hitch.

NOTE: The shaft is greased.

HINT: It is recommended that two people carry out this procedure.

Fig. 115: Positioning The Tow Hitch Between The Two Side Members
Courtesy of VOLVO CARS CORPORATION

- Take the two mounting pins (1) from the kit
- With one person at each end, lift and position the tow hitch on the inside between the two side members, in between the holes. Start by angling up the face of the left-hand side above the tail pipe on the silencer and up between the heat deflector plate and the side member. Then angle the right-hand side face up to the side member
- Press the mounting pins into the center hole in the side members while holding the tow bar member in position so that the bar can hang freely without falling off
- Carefully lower the car.

Fig. 116: Inserting The Spacer Sleeves
Courtesy of VOLVO CARS CORPORATION

- Fold down the lower tailgate.

From the inside of the cargo compartment:

- Remove the protective flaps covering the mounting holes on the outside of the side members (one on each side)
- Remove any sealant from the surfaces where the spacer washers will be positioned
- Insert the spacer sleeves using only the front and rear screws on the outside of the two side members.

NOTE: Be careful when installing the spacer sleeves and screws so that they do not press out the mounting pins, causing the tow bar to detach.

- Screw the front and rear screws in fully but do not tighten them
- Insert the center screws so that the mounting pins are pressed out. Screw the screws in fully but do no tighten them
- Hold the bar in the horizontal position. Tighten the screws.

NOTE: Rustproofing agent must be applied under the car before the screws are tightened. Apply the rustproofing agent to the side members all around the ends where any sealant was scraped off.

- Tighten all screws from inside the car. Tighten to **120 Nm (86 lbf. ft.)** in the following order:

1. The rear screws

2. The front screws

3. The center screws

NOTE: Wait five minutes so that the joint settles. Then re-check the torque.

- Raise the car again.

From underneath the car

- Carefully bend the heat deflector plate back into position so that it is not against the silencer
- Reinstall the front mounting for the rear silencer. Tighten the screws. Tighten to **24 Nm (18 lbf. ft.)**
- Reinstall the rear mounting for the rear silencer. Tighten the screws. Tighten to **48 Nm (35 lbf. ft.)** .

- Install the cable harness connector for the tow hitch according to point 1D in the installation instructions for the appropriate cable harness.

- Install the cable harness according to point 3 onwards in the installation instructions for the appropriate cable harness.

NOTE: Ensure that the cable harness does not rub against the lower edge of the bumper and is not pressed back.

- Check the function of the detachable tow hitch.

Fig. 117: Installing The Tow Hitch
Courtesy of VOLVO CARS CORPORATION

- Turn the handle (1) clockwise until a click is heard and the indicator pin (2) is in the outer position
- Install the tow hitch by pressing the tow hitch onto the connection stud (3).

Fig. 118: Locking The Tow Hitch
Courtesy of VOLVO CARS CORPORATION

- Check that the indicator pin (2) is in the inner position and that the handle (1) is horizontal
- Turn the lock cylinder (3) to the position illustrated.

STORING THE TOW HITCH

APPLIES TO CARS WITH THREE ROWS OF SEATS

Fig. 119: Installing The Storage Box Strap
Courtesy of VOLVO CARS CORPORATION

- Remove the storage box and the strap from the kit. Thread the strap through the holes in the storage box. See the illustration.

Fig. 120: Installing The Storage Box
Courtesy of VOLVO CARS CORPORATION

- Insert the storage box in the space to the right of the battery. Press the box into place against the floor. Be careful with the storage box. It is made of Frigolite which is brittle.

Fig. 121: Stowing The Tow Hitch
Courtesy of VOLVO CARS CORPORATION

- Thread the supplied protective bag over the towing ball before removing the tow hitch
- Remove the tow hitch. Pull the string tight on the protective bag
- Position the removed tow hitch and bag in the storage box. The ball must be pointing forwards to the right. Tighten in position using the strap.

APPLIES TO CARS WITH TWO ROWS OF SEATS

Fig. 122: Installing The Storage Box Strap
Courtesy of VOLVO CARS CORPORATION

- Remove the storage box and the strap from the kit. Thread the strap through the holes in the storage box. See the illustration.

Fig. 123: Installing The Storage Box
Courtesy of VOLVO CARS CORPORATION

- Insert the storage box in the space to the right of the battery. Press the box into place against the floor. Be careful with the storage box. It is made of Frigolite which is brittle.

Fig. 124: Stowing The Tow Hitch
Courtesy of VOLVO CARS CORPORATION

- Thread the supplied protective bag over the towing ball before removing the tow hitch
- Remove the tow hitch. Pull the string tight on the protective bag
- Position the removed tow hitch and bag in the storage box. The ball must be pointing forwards to the right. Tighten in position using the strap.

FINISHING WORK

Fig. 125: Cutting Along The Markings
Courtesy of VOLVO CARS CORPORATION

Applies to cars with a rear skid plate

- Saw or cut along the top of the markings on the inside of the cover as illustrated. Cut the material at right-angles. After cutting, smooth off the edges using a file.

Fig. 126: Install The Cover On The Connection Stud
Courtesy of VOLVO CARS CORPORATION

Applies to all models

- Install the cover on the connection stud. Press so that the cover is secure.

CAUTION: Do not use the cover as a step. There is a risk of personal injury by standing on the cover.

- Reinstall the protective cover and holder for the battery
- Reinstall the spare wheel.

Applies to cars with accessory electronic modules (AEM)

- Reinstall the bracket with the accessory electronic module (AEM). Connect the connectors if disconnected.

Applies to all models

- Reinstall the panels, storage boxes and floor hatches
- Tighten the screws in the load securing eyelets. Tighten to **24 Nm (18 lbf. ft.)** .

Fig. 127: Apply The Decal Supplied
Courtesy of VOLVO CARS CORPORATION

- Apply the decal supplied to the underside of the rear floor hatch as illustrated.

DYNAMIC SPACE BOX 65/85 (2003-2004)

DYNAMIC SPACE BOX 65/85

NOTE: **This space box is not suitable for the V40 with rails.**

NOTE: **The space box may only be opened on one side at a time.**

NOTE: **Regularly check that the load carriers are secured properly on the roof and that the space box is tightly secured on the load carriers. Be aware of the changed height and driving characteristics of the car with load carriers and box. Check that the box is properly locked and the key removed before travelling. The load must not exceed 75 kg and must always be secured. The total roof load capacity**

of the car must not be exceeded. See the owner's handbook. Highest permitted load = load carrier weight + box weight + load weight. For safety reasons the car should not be driven at top speed (maximum 130 km/h). Speeds should be adjusted to the load being carried and of course to legal speed limits. Note that there may be wind noise when the space box is installed. These installation instructions should be stored with the car handbook. Damage to the car and surroundings may occur if the instructions are not followed.

PREPARATIONS

APPLIES TO THE DYNAMIC 85 SPACE BOX

Fig. 128: Identifying Unlocked And Opened Space Box
Courtesy of VOLVO CARS CORPORATION

- Unlock and open the space box on one side. Ensure that the other side is locked
- Remove the transportation support at the front edge of the space box by slackening off one screw at the side and then pulling the support off. Ensure that the reinforcement rod which is secured with the same screw is secure
- Close the space box.

INSTALLING THE SPACE BOX

Fig. 129: Identifying Open Space Box
Courtesy of VOLVO CARS CORPORATION

- Place the space box on the load carriers parallel to the car. Ensure that the box and load carriers do not prevent the tailgate from opening fully
- Open the space box on one side. Ensure that the other side is locked.

Fig. 130: Identifying Quick-Release Mountings
Courtesy of VOLVO CARS CORPORATION

- If the quick-release mountings (A) are loose: turn them in the same direction and secure them in the bottom of the space box. The quick-release mountings must be turned in the same direction before the ski holders can be installed.

Fig. 131: Identifying Quick-Release Mounting
Courtesy of VOLVO CARS CORPORATION

- Take the clips (B) from the kit and press them into place in the quick-release mountings (A).

Fig. 132: Identifying Aligning Quick-Release Mountings To Load Carriers
Courtesy of VOLVO CARS CORPORATION

- Move the four quick-release mountings (A) in the bottom of the space box so that the two lugs (C) on each quick release mounting are on each side of the load carrier tubes
- Check that the box is centered on the roof and does not hit the tailgate when opened.

Fig. 133: Identifying U Bracket On Quick-Release Mounting
Courtesy of VOLVO CARS CORPORATION

Points 6-8 apply to all the quick-release mountings

- Fold up the red safety catches (D)
- Fold the lock handle (E) to the vertical position
- Insert a U bracket (F) upwards through the lugs (C) on the quick-release mounting (A).

Fig. 134: Identifying Quick-Release Mounting Engagement
Courtesy of VOLVO CARS CORPORATION

- Press the quick-release mounting (A) downwards towards the bottom of the space box. At the same time press the U bracket (F) upwards until it is against the underneath of the load carrier.

Fig. 135: Folding Lock Handle Down To Horizontal Position And Safety Catch Over Lock Handle
Courtesy of VOLVO CARS CORPORATION

- Fold the lock handle (E) down to the horizontal position. This requires a force of approximately 50 N. There should be considerable resistance. If this is not the case the U-bracket installation must be repeated
- Fold the safety catch (D) over the lock handle until it snaps into place. If this cannot be done, check that the lock handle has snapped shut in the final position.

NOTE: Regularly check that the box is securely fixed to the load carrier.

INSTALLING THE SKI HOLDER

Fig. 136: Identifying T-Shaped Groove On Ski Holders And T-Shaped Lug
Courtesy of VOLVO CARS CORPORATION

- Install the ski holders (G) by sliding the T-shaped groove (H) on the ski holders on to the T-shaped lug (I)
- Press the ski holders so that they are against the side of the box
- Close and lock the space box

- Open the space box on the other side. Slide the T-shaped groove on the ski holders on to the T-shaped lug on the clips. Ensure that the ends of the ski holders protrude by the same amount in relation to the T-shaped lugs.

APPLIES WHEN TRANSPORTING

TRANSPORTING SKIS

Fig. 137: Identifying Tensioning Strap Threaded Through Eyelets On Clips
Courtesy of VOLVO CARS CORPORATION

- Thread the tensioning strap (J) through the eyelets on the clips (A)
- Place the skis on the holders (G). Tighten them using the tensioning strap (J).

TRANSPORTING SHORTER GOODS

- Remove the ski holders and the clips for the quick-release mountings
- Insert the tensioning strap through the holes on the quick-release mountings where the clips were positioned
- Secure the goods using the tensioning strap.

ALL TRANSPORT

Fig. 138: Identifying Tensioning Straps Max Load
Courtesy of VOLVO CARS CORPORATION

- The load must be distributed as evenly as possible. **The maximum permitted load is 75 kg.** The maximum roof load of the vehicle must never be exceeded.
- Check that the tensioning straps are fully tightened regularly.

OPENING AND CLOSING THE SPACE BOX

Fig. 139: Ensuring That Each Locking Shackle Engages In Its Lock When Space Box Is Closed
Courtesy of VOLVO CARS CORPORATION

Fig. 140: Identifying Security System Released When Lug Is Pressed Down
Courtesy of VOLVO CARS CORPORATION

- The space box has a double sided locking system. When opening the box ensure that the opposite side is locked
- The lock system has a safety system which prevents the space box from locking if the cover is not correctly closed. Ensure that each locking shackle engages in its lock when the space box is closed. The security system releases when the lug (K) is pressed down
- If the space box cannot be locked, there may be snow or debris in the locking mechanism which prevents the safety system from disengaging. Clean and try to lock it again.

REMOVING THE SPACE BOX

- Open the space box and remove the load.

Applies to all quick-release mountings

Fig. 141: Identifying Safety Catches
Courtesy of VOLVO CARS CORPORATION

- Fold up the safety catches (D)
- Fold the lock handle (E) to the vertical position.

Fig. 142: Identifying U-Shaped Bracket
Courtesy of VOLVO CARS CORPORATION

- Press the quick-release mountings down towards the bottom of the space box. At the same time pull out the U-shaped bracket (F).

NOTE: Do not damage the roof.

FUEL DRIVEN HEATER 912-B (2003-2008)

FUEL DRIVEN HEATER 912-B

see **FUEL DRIVEN HEATER 912-B**

INSTALLATION KIT SPACE BOX (2003-2004)

INSTALLATION KIT SPACE BOX

Fig. 143: Identifying Mounting Removal
Courtesy of VOLVO CARS CORPORATION

- Remove the old mountings. Remove by tugging straight up. Put to one side.

Fig. 144: Identifying Cover Strip Removal
Courtesy of VOLVO CARS CORPORATION

- Pull out the old cover strip from the groove. Put to one side.

Fig. 145: Identifying Cover Strip
Courtesy of VOLVO CARS CORPORATION

- Take the new cover strip from the kit. Install the cover strip in the groove.

Fig. 146: Identifying Quick-Release Mounting Pressed Into Hole In Cover Strip
Courtesy of VOLVO CARS CORPORATION

- Take the quick release mounting from the kit. Press the quick-release mounting into the hole in the cover strip. Ensure that the hooks grip correctly
- When installing several quick-release mountings: turn all the quick-release mountings in the same directions.

Fig. 147: Identifying Quick-Release Mounting
Courtesy of VOLVO CARS CORPORATION

- Take a clip (B) from the kit and press them into place in the quick-release mounting (A). Ensure that the hooks grip correctly.

SECURING THE SPACE BOX ON THE LOAD CARRIERS

The space box is secured to the load carriers using the new U brackets from the kit.

Fig. 148: Identifying Aligning Quick-Release Mountings To Load Carriers
Courtesy of VOLVO CARS CORPORATION

- Move the quick-release mounting (A) in the bottom of the space box so that the two pins (C) are on either side of the load carriers.

Fig. 149: Identifying U Bracket On Quick-Release Mounting
Courtesy of VOLVO CARS CORPORATION

- Fold up the red safety catches (D)
- Fold the lock handle (E) to the vertical position
- Insert a U bracket (F) upwards through the lugs (C) on the quick-release mounting (A).

Fig. 150: Identifying Quick-Release Mounting Engagement
Courtesy of VOLVO CARS CORPORATION

- Press the quick-release mounting (A) downwards towards the bottom of the space box. At the same time press the U bracket (F) upwards until it is against the underneath of the load carrier.

Fig. 151: Folding Lock Handle Down To Horizontal Position And Safety Catch Over Lock Handle
Courtesy of VOLVO CARS CORPORATION

- Fold the lock handle (E) down to the horizontal position. This requires a force of approximately 50 N, there should be considerable tension. If this is not the case the U-bracket installation must be repeated
- Fold the safety catch (D) over the lock handle until it snaps into place. If this cannot be done, check that the lock handle has snapped shut in the final position.

NOTE: Check that the box is securely fixed to the load carrier at regular intervals.

LOAD BASKET, HITCH (2003-2008)

LOAD BASKET, HITCH

INSTALLING THE LOAD BASKET

Fig. 152: Identifying Load Basket Installed In Base Unit's Square Pipe
Courtesy of VOLVO CARS CORPORATION

- Install the load basket in the base unit's square pipe.
- Tighten in the load basket using the two screws, the spring washers and the flat washers.

TILTING THE LOAD BASKET

Fig. 153: Identifying Catch Pressed Down To Lower Base Unit
Courtesy of VOLVO CARS CORPORATION

- Press catch (A) down to tilt the load basket.
- Lower the load basket (B) until the stop catch engages.

NOTE: If the load is not secured firmly then it may fall out during tilting.

UNTILTING THE LOAD BASKET

Fig. 154: Identifying Lifted Up Stop Catch And Folded Back Load Basket
Courtesy of VOLVO CARS CORPORATION

- Lift up the stop catch (A) and fold back the load basket (B).

Fig. 155: Folding Back Load Basket Until Two Clear Clicks Can Be Heard And Catch Rises
Courtesy of VOLVO CARS CORPORATION

- Fold back the load basket until two clear clicks can be heard and the catch rises.

SAFETY CHECKS BEFORE A JOURNEY

CAUTION: Make sure that all screws, nuts and tensioning straps are firmly tightened before setting off. Check them at regular intervals.

Damaged tensioning straps must be replaced with new ones.

The base unit/load basket must not be used as an attachment point for towing.

The base unit/load basket must not be used when driving over terrain.

NOTE: If the car's number plate is obscured by a loaded base unit there is an extra number plate holder with lighting that is available as an accessory. This should then be used.

CAUTION: Do not allow the load to shift outside of the load basket.

Do not load more onto the base unit than what is specified on the original towbar's type plate (MAX TONGUE WEIGHT).

Remember that the car's center of gravity, and accordingly its driving characteristics, can be changed by the load.

The base unit and associated loading systems must not be used for

carrying animals or people.

LOAD CARRIERS FOR RAILS (2003-2010)

LOAD CARRIERS FOR RAILS

Applies to both types of load carriers

Fig. 156: Position Load Carrier On Rails For Car (1 Of 2)
Courtesy of VOLVO CARS CORPORATION

Fig. 157: Position Load Carrier On Rails For Car (2 Of 2)
Courtesy of VOLVO CARS CORPORATION

- Position the load carrier on the rails for the car. Ensure that the load carrier is symmetrical. (Positioned so that the ends protrude the same distance from the mountings on both sides)
- Adjust the position of the load carrier before mounting. Press the mountings inwards and upwards as illustrated.

Illustration applies to load carriers with T-grooves

Fig. 158: Identifying Load Carrier End Cover
Courtesy of VOLVO CARS CORPORATION

- Open the cover on the end of the load carrier to access the screw.

Illustration applies to both types of load carriers

Fig. 159: Insert A Torque Wrench In The End Of The Load Carrier
Courtesy of VOLVO CARS CORPORATION

- Insert a torque wrench in the end of the load carrier. Tighten until the mountings encircle the rails
- Repeat the operation on the other mountings.

Applies to both types of load carriers

Fig. 160: Tightening Screws In Ends Of Load Carriers Until Indicator On Wrench Handle Is In Between Two Markings
Courtesy of VOLVO CARS CORPORATION

- Tighten the screws in the ends of the load carriers until the indicator on the wrench handle is in between the two markings. The correct torque of **4 Nm (3 lbf. ft.)** has then been reached.

Applies to load carriers with T-grooves

- Fold the cover back into place on the end.

LOCK, HITCH (2003-2005)

LOCK, HITCH

Fig. 161: Identifying Lock Base
Courtesy of VOLVO CARS CORPORATION

Fig. 162: Identifying Lock, Hitch
Courtesy of VOLVO CARS CORPORATION

Fig. 163: Identifying Key And Lock Assembly
Courtesy of VOLVO CARS CORPORATION

Fig. 164: Identifying Insertion Of Lock Into Base
Courtesy of VOLVO CARS CORPORATION

Fig. 165: Identifying Lock, Hitch
Courtesy of VOLVO CARS CORPORATION

Fig. 166: Identifying Insertion Of Key Into Lock
Courtesy of VOLVO CARS CORPORATION

Fig. 167: Identifying Insertion Of Base On Hitch
Courtesy of VOLVO CARS CORPORATION

Fig. 168: Identifying Engagement Of Lock
Courtesy of VOLVO CARS CORPORATION

RAILS (2003-2008)

RAILS

Fig. 169: Identifying Six Covers (1)
Courtesy of VOLVO CARS CORPORATION

- Carefully pry off the six covers (1) using a plastic weatherstrip tool.

NOTE: **Be careful not to damage the paint. The covers are securely tightened. The best way of removing the covers is to grasp them at one of the longer sides. Then pull them outwards and pry up the other side.**

- Remove the screws and sealing washers underneath both sides of the car. The screws and sealing washers will not be reused.

INSTALLING RAILS

Fig. 170: Identifying Installing Rails
Courtesy of VOLVO CARS CORPORATION

- Remove one rail and three screws with washers and the rubber liner from the kit
- Carefully position the rail
- Using short screws, screw in the center mounting loosely
- Using short screws, screw in the front mounting loosely
- Using long screws, screw in the rear mounting
- Tighten all mounting screws. Tighten to 8 Nm (6 lbf. ft.). Carry out the work in two stages to prevent misalignment of the mountings.

INSTALLING THE FRONT COVER

Fig. 171: Identifying The Front Cover
Courtesy of VOLVO CARS CORPORATION

- Install the cover on the front mounting for the rail. (check that the correct cover is on the correct side, right/left)
- Insert the two locating pins for the cover in the load carrier
- Fold the cover down towards the front mounting. Press into place
- Repeat the operation on the rear mounting.

INSTALLING THE CENTER MOUNTING COVER

Fig. 172: Identifying The Center Mounting Cover
Courtesy of VOLVO CARS CORPORATION

- Install the cover on the center mounting
- Hook the cover onto the front edge of the mounting
- Press the cover backward. At the same time press the cover towards the rear edge of the mounting
- Carry outs points, see **INSTALLING RAILS** and **INSTALLING THE CENTER MOUNTING COVER** for the other rail.

RELAY KIT REAR FOG LAMP + RELAY KIT POSITIVE POWER SUPPLY (2003-2010)

CARS EQUIPPED WITH SRS/SIPS (AIRBAG)

see **CARS EQUIPPED WITH SRS/SIPS (AIRBAG)**

CAUTION

see **CAUTION**

RELAY KIT REAR FOG LAMP + RELAY KIT POSITIVE POWER SUPPLY

PREPARATORY WORK

Fig. 173: Folding Up The Middle, Rear Floor Hatch (1
Courtesy of VOLVO CARS CORPORATION

XC90 with two seating rows

- Fold up the middle, rear floor hatch (1)
- Remove it by pulling it away from the forefront.
- Remove storage bins underneath and lift out.
- Remove the front floor hatch

With three rows of seats and integrated mounts underside of the middle trapdoor

- Fold up the middle, rear floor hatch (1)
- Remove the storage box underneath and lift it out. If the floor hatch has a carrier bag holder on the underneath, it is secured by a strap on each of the shorter sides of the storage box. The straps must be undone

With three rows of seats, without integrated mounts

- Fold up the middle, rear floor hatch (1) at the rear and lift it out
- Remove lateral floor plate (2).

Fig. 174: Removing Panel
Courtesy of VOLVO CARS CORPORATION

- Remove panel.

Fig. 175: Identifying Left-Hand C-Post Panel And Plastic Weatherstrip Tools
Courtesy of VOLVO CARS CORPORATION

- Pull the rubber seal at the rear of backdoor for C-pillar panel.
- Bend gentle off C-pillar panel to the sides at the top with a weatherstrip tool of plastic and pull it until the three clips on the inside are loose.
- Remove the panel by pulling it up and unhook from the side panel.

Fig. 176: Identifying Cover And Screws Underneath Rear Headlining
Courtesy of VOLVO CARS CORPORATION

- Remove cover and screws underneath rear headlining
- Carefully remove the panel in the back with a plastic tool.
- Pull the panel down at rear until all clips on the inside have released.
- If the car is provided with lighting in the panel, remove the connector.
- Pull the panel back

Fig. 177: Identifying D-Post Panel Removal From Side Panel
Courtesy of VOLVO CARS CORPORATION

- Take off the D-pillar panel beginning at the top and then down until the three clips on the inside have released. Be careful of the panel.
- Remove the panel by pulling it up and unhook from the side panel
- If the car is provided with D-pillar speaker, loosen the connector to it.

Fig. 178: Identifying Load Securing Eyelet
Courtesy of VOLVO CARS CORPORATION

- Remove load securing eyelet
- Take a scribe with angled tip and pry at the top of the lid.
- Turn the scribe's angled tip on the back of the cover (1) and pull it away.

Fig. 179: Cars With Two Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

Fig. 180: Cars With Three Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

- Collapse the seats in the third row
- Remove the screws (2) to load securement at the left side panel
- Remove caps (3) to the left-hand side panel front using a plastic weatherstrip tool or small screwdriver.
- Remove the screws (4).
- Remove the clip (5) in the bottom of the storage compartment
- Pull out the panel at the top. (Clips on the inside.) Remove it by pulling panel straight up.

CONNECTION

Fig. 181: Identifying Fuse Panel
Courtesy of VOLVO CARS CORPORATION

Install the correct fuse

Applies to connection of the rear fog lights

- Install relay in the rear electronics module (REM), position MI7

Applies to connection of automatic shutdown feature of the rear fog lights

NOTE: The function requires specific software

- Program the software according to the service information in VIDA (Volvo scan tool).

- Install relay in the rear electronics module (REM) position MA 1.
- Install 20A fuse in the rear electronics module (REM), position 9, and 15A fuse in the position 15.

Fig. 182: Identifying Connector For Towbar Wiring
Courtesy of VOLVO CARS CORPORATION

- Loosen towing harness connector. Contact is found by following the wiring coming up through the rubber seal in the floor of the luggage compartment where the battery is vented.
- Release the red locks by pushing them forward.
- Connect the blue (BL) wire to the 1, 5 or 12, depending on the desired function. Positions: 1 = Charging, 5 = Rear fog light, 12 = Back-up lights.
- Return the levers to the locked position.

NOTE: Note. If the "Charge" is used cut the existing wire shoe and replace the line shoe from the kit.

- Reinstall the towing wiring harness connector.

FINISHING WORK

- Replace the panels, drawers and floor hatches

- Torque the anchor ring bolts to **24 Nm (18 lbf. ft.)** .

Fig. 189: Identifying Load Basket Components (5 Of 7)
Courtesy of VOLVO CARS CORPORATION

Fig. 190: Identifying Load Basket Components (6 Of 7)
Courtesy of VOLVO CARS CORPORATION

Fig. 191: Identifying Load Basket Components (7 Of 7)
Courtesy of VOLVO CARS CORPORATION

ROOF PROTECTION RIBS (2003-2004)

ROOF PROTECTOR RIBS

Fig. 192: Washing The Area
Courtesy of VOLVO CARS CORPORATION

- Remove the load carriers from the car (if equipped)
- Wash the car
- Wash the area of the car roof where the roof protector ribs are to be installed using a mixture of windscreen washer fluid and water. Mix 30%/70%. The temperature of the car must be at least **15°C (60° F)** when installing the roof protector ribs.

Fig. 193: Positioning The Guide Moulding
Courtesy of VOLVO CARS CORPORATION

- Take the guide moulding from the kit. Pull off a piece of the tape.

NOTE: **Take care when installing the guide moulding. The front-rear edge of the guide moulding must be positioned on the raised ridge where the flat surface starts to bend. The rear edge of the guide moulding must be positioned in the corresponding way at the roof joint.**

- Position the guide moulding as above at one of the front-rear raised ridges on the roof
- Pull the backing off the guide moulding as it is pressed over the raised ridge.

NOTE: Use pieces of tape to secure the guide moulding so that it does not move when installing the roof protector rib.

- Check that the guide moulding is straight by standing behind the car and looking along the guide moulding and the embossing on the roof.

Fig. 194: Position The Rib Along The Edge Of The Guide
Courtesy of VOLVO CARS CORPORATION

- Take a roof protector rib from the kit (one at a time). Position the rib on the raised ridge along the edge of the guide moulding edge to edge with the rear end on the guide moulding cut-out
- Lift the rear end of the roof protection rib and pull off the backing.

NOTE: The tape on the roof protector ribs bonds immediately and can be moved from side to side. The tape on the roof protector ribs is easily stretched.

It is important that force is applied at right angles to the roof protector ribs so that the ribs do not stretch and will not align with the cut-out in the guide moulding.

Take great care during the installation. Ensure that the ribs are positioned along and parallel to the installed guide moulding.

- Pull the backing off while pressing down the roof protector rib following the guide moulding
- Lift off the guide moulding

CAUTION: Carefully press the roof protector rib by hand so that the tape secures over the entire contact surface. Press hard repeatedly along

the entire length of the roof protector rib. It is particularly important at the end of the roof protector ribs.

- Repeat points 2 and 3 for the remaining roof protector ribs.

NOTE: After installing the roof protector ribs, the car must not be exposed to temperatures lower than 15°C (60°C) for 8 hours. Do not wash the car for 72 hours after installing the roof protector ribs.

SKI BOX (2003)

SKI BOX

NOTE: Regularly check that the load carriers are secured properly on the roof and that the ski box is tightly secured on the load carriers. Be aware of the changed height and driving characteristics of the car with load carriers and box. Always secure loads. Check that the box is properly locked and the key removed before travelling. The total roof load capacity of the car must not be exceeded. Highest permitted load = load carrier weight + box weight + load weight. For safety the car should not be driven at top speed. The speed should be adjusted to the load transported and of course to appropriate speed limits. Remember the following with the box mounted: - The increased height of the car. - Wind noise may occur. These installation instructions should be stored with the car handbook. Damage to the car and surroundings may occur if the instructions are not followed.

INSTALLING THE SKI BOX

Fig. 195: Identifying Open Space Box
Courtesy of VOLVO CARS CORPORATION

- Place the ski box on the load carriers parallel to the car. Ensure that neither the ski box nor the load

carrier obstruct the tailgate.

Fig. 196: Identifying Securing Plates And Grommets
Courtesy of VOLVO CARS CORPORATION

- When opening the box ensure that the opposite side is locked. The four moveable securing plates (A) in the bottom of the box should be moved so that they lie above the load carrier rails between the grommets (B) in the relevant securing plate (A).

Fig. 197: Identifying U-Bracket Inserted Upwards Through Grommets
Courtesy of VOLVO CARS CORPORATION

- Position the locking handle (C) in each securing plate in the vertical position. Insert the first U-bracket (D) upwards through the grommets (B).

Fig. 198: Identifying Center Section Of Securing Plates Pressed Downward And Against Indicated Pressure Point Beside Lock Handle
Courtesy of VOLVO CARS CORPORATION

- Press the center section of the securing plates downward, pressing against the indicated pressure point (K) beside the lock handle (C). Press the U-bracket (D) upwards until it is tight against the load carrier.

Fig. 199: Folding Down Lock Handle To Horizontal Position
Courtesy of VOLVO CARS CORPORATION

- Fold down the lock handle (C) to the horizontal position. This requires a force of approximately 50 N, there should be considerable tension. If this is not the case the U-bracket installation must be repeated
- Then fold the safety bracket (E) over the lock handle (C) until it snaps shut. If this cannot be done, check that the lock handle is snapped shut in the final position. Install the other three securing plates in the same way.

NOTE: Check that the box is securely fixed to the load carrier at regular intervals.

INSTALLING THE SKI HOLDER

Fig. 200: Identifying Ski Holder Installation
Courtesy of VOLVO CARS CORPORATION

- Install the ski holders (f) by first pressing the first and then the second bolt (G) onto the underneath of the ski holder and in fork (H) on the securing plate (A)
- Thread the tensioning strap (I) through the eyelets on the securing plates (A). When transporting skis, the skis must be placed on the ski holder (F) and tightened securely using the tensioning strap (I).

TRANSPORTING OTHER GOODS

Fig. 201: Identifying Load Distribution And Limits
Courtesy of VOLVO CARS CORPORATION

When transporting other goods other than skis the ski holders can be removed. Goods must be secured using the tensioning strap to prevent sliding. The strap must be tightened evenly. The load must be distributed evenly. **The maximum permitted load weight is 50 kg** . The maximum roof load must not be exceeded.

OPENING AND CLOSING THE SKI BOX

Fig. 202: Identifying Ski Box Closure
Courtesy of VOLVO CARS CORPORATION

- The ski box is equipped with a double sided locking system. When opening the box ensure that the opposite side is locked. The locking system is equipped with safety springs which prevent the keys from being removed if the box is not completely closed. Check that both sides are locked and the keys have been removed before a journey.

REMOVING THE SKI BOX

Fig. 203: Identifying Ski Box Removal
Courtesy of VOLVO CARS CORPORATION

- Open the ski box and remove the load and ski holders. Fold down the safety bracket (E), open the locking handle (C) and fold it to the vertical position. Press down the center of the securing plate in the roof box with one hand. Press against the pressure points (K) beside the lock handle (C) compare with illustration C. At the same time pull the U bracket (D) down from the mounting unit (A) using the other hand.

SKI HOLDER (2003-2009)

SKI HOLDER

INSTALLING THE COVER

Fig. 204: Identifying Cover Attachment Assembly
Courtesy of VOLVO CARS CORPORATION

Fig. 205: Identifying Latch And Upper Section
Courtesy of VOLVO CARS CORPORATION

- Unlock the holder (1)
- Press in the latch (2). Press the upper section upwards
- Install the rubber rings (5) as illustrated
- Open the lock facing (3). Place the holder on the load carrier by turning it over the load carrier.

Fig. 206: Identifying Lock And Screws
Courtesy of VOLVO CARS CORPORATION

- Press the lock facing up and tighten the screws (4)
- Press the upper section down and lock it in place.

SKI HOLDER, HITCH (2003-2004)

SKI HOLDER, HITCH

Fig. 207: Identifying Ski Holder And Base Unit
Courtesy of VOLVO CARS CORPORATION

- Install the ski holder in the square section pipe on the base unit
- Tighten the ski holder using the two screws, the sprung washers and the flat washers from the base unit kit.

Courtesy of VOLVO CARS CORPORATION

Fig. 223: Identifying Installation Of Two Snowboards
Courtesy of VOLVO CARS CORPORATION

Fig. 224: View Of Secured Rubber Straps
Courtesy of VOLVO CARS CORPORATION

- Slide the skis or snowboard down into the lower holder
- Hold them against the rear section of the upper holder
- Secure them against the rear section using the rubber straps to keep them in place while other skis/snowboards are positioned in the holder when the mounting bracket is closed.

SKI HOLDER

Fig. 225: Folding Mounting Bracket And Locking Knob Back Into Position
Courtesy of VOLVO CARS CORPORATION

- Fold the mounting bracket and locking knob back into position. Tighten the locking knob.

CAUTION: Check that the load on the ski holder is secured properly so there is no risk of it falling off. Regularly check the load during the journey. The load must not obstruct the number plate or lighting. Tighten all the screws,

nuts and knobs regularly to prevent any section of the accessory or the load from falling off.

The ski holder must not be used when driving off road.

Any damaged straps must be replaced with new straps.

The load must not protrude outside the ski holder.

Do not overload the car. The center of gravity can alter when loads are transported on the hitch unit.

An extra number plate holder with lighting is available as an accessory and must be used if the number plate for the car is hidden by the loaded ski holder.

SPACE BOX XPERIENCE (2003-2009)

SPACE BOX XPERIENCE

NOTE: **This space box is not suitable for the V40 with rails.**

NOTE: **The space box may only be opened on one side at a time.**

NOTE: **Regularly check that the load carriers are secured properly on the roof and that the space box is tightly secured on the load carriers. Be aware of the changed height and driving characteristics of the car with load carriers and box. Check that the box is properly locked and the key removed before travelling. The load must not exceed 75 kg and must always be secured. The total roof load capacity of the car must not be exceeded. Highest permitted load = load carrier weight + box weight + load weight. For safety reasons the car must not be driven at top speed (maximum 130 km/h). Speeds should be adjusted to the load being carried and of course to legal speed limits. Note that there may be wind noise when the space box is installed. These installation instructions should be stored with the car handbook. Damage to the car and surroundings may occur if the instructions are not followed.**

INSTALLING THE SPACE BOX

Fig. 226: Identifying Opening Space Box On One Side
Courtesy of VOLVO CARS CORPORATION

- Place the space box on the load carriers parallel to the car. Ensure that the box and load carriers do not prevent the tailgate from opening fully
- Open the space box on one side. Ensure that the other side is locked.

Fig. 227: Assembling Quick-Release Mounting And Rubber Liner
Courtesy of VOLVO CARS CORPORATION

- Assemble a quick-release mounting and a rubber liner from the kit
- Do the same with all the quick-release mountings.

Fig. 228: Identifying Quick-Release Mountings
Courtesy of VOLVO CARS CORPORATION

- Secure the quick-release mountings (A) in the bottom of the space box. Turn all the quick-release mountings in the same direction. Press them down properly.

Fig. 229: Identifying Quick-Release Mountings And Lugs
Courtesy of VOLVO CARS CORPORATION

- Move the four quick-release mountings (A) in the bottom of the space box so that the two lugs (B) on each quick-release mounting are on each side of the load carrier tubes
- Check that the box is centered on the roof and does not come into contact with the tailgate when open.

Points 5-7 apply to all the quick-release mountings

Fig. 230: Identifying U-Bracket And Lugs On Quick-Release Mounting
Courtesy of VOLVO CARS CORPORATION

- Fold up the red safety catches (C)
- Fold the lock handle (D) to the vertical position
- Insert a U-bracket (E) upwards through the lugs (B) on the quick-release mounting (A).

Fig. 231: Identifying Engagement Of Quick-Release Mounting
Courtesy of VOLVO CARS CORPORATION

- Press the quick-release mounting (A) downwards towards the bottom of the space box. At the same time press the U-bracket (E) upwards until it is against the underneath of the load carrier.

Fig. 232: Folding Lock Handle Down To Horizontal Position
Courtesy of VOLVO CARS CORPORATION

- Fold the lock handle (D) down to the horizontal position. This requires a force of approximately 50 N. There should be considerable resistance. If this is not the case the U-bracket installation must be repeated
- Fold the safety catch (C) over the lock handle until it snaps into place. If this cannot be done, check that the lock handle has snapped shut in the final position.

NOTE: Regularly check that the box is securely fixed to the load carrier.

APPLIES WHEN TRANSPORTING

Fig. 233: Identifying Tensioning Strap Threaded Through Holes On Quick-Release Mountings
Courtesy of VOLVO CARS CORPORATION

- Thread the tensioning strap (F) through the holes on the quick-release mountings (A)
- Secure the goods using the tensioning strap.

Fig. 234: Identifying Load Distribution
Courtesy of VOLVO CARS CORPORATION

- The load must be distributed as evenly as possible. **The maximum permitted load is 75 kg.** The maximum roof load of the vehicle must never be exceeded
- Check that the tensioning straps are fully tightened regularly.

OPENING AND CLOSING THE SPACE BOX

Opening the space box:

1. The space box has a double sided locking system. This means that it may only be opened on one side at a time.

- Unlock the space box on one side. Ensure that the other side is locked
- Fold up the cover.

Fig. 235: Identifying Pressed Down And Locked Cover

Courtesy of VOLVO CARS CORPORATION

Closing the space box:

1. The lock system has a safety system which prevents the space box from locking if the cover is not correctly closed. Ensure that each locking shackle engages in its lock when the space box is closed. The safety system releases when the lug (G) is pressed down.

- Press the cover down properly opposite the front and rear locks.

Fig. 236: Identifying Locked Space Box
Courtesy of VOLVO CARS CORPORATION

- Lock the space box. If the key cannot be turned, this may be because:
  - the cover is not properly pressed down. Press the cover and try locking again
  - there is snow or litter in the lock mechanism. Clean and try to lock it again.

REMOVING THE SPACE BOX

- Open the space box and remove the load.

Fig. 237: Identifying Safety Catches
Courtesy of VOLVO CARS CORPORATION

- Fold up the safety catches (C)
- Fold the lock handle (D) to the vertical position.

Fig. 238: Identifying U-Bracket
Courtesy of VOLVO CARS CORPORATION

- Press the quick-release mountings down towards the bottom of the space box. At the same time pull out the U-bracket (E).

NOTE: Do not damage the roof.

SPACE BOX, SPACER (2003-2012)

SPACE BOX, SPACER

Fig. 239: Cutting The Rubber Strip
Courtesy of VOLVO CARS CORPORATION

- Cut off the rubber strip so that the spacer can be slid into the groove.

MOUNTING USING A SCREW IN THE T-GROOVE

TOW BAR WIRING, 13-PIN (2003-2004)

CARS EQUIPPED WITH SRS/SIPS (AIRBAG)

see **CARS EQUIPPED WITH SRS/SIPS (AIRBAG)**

CAUTION

see **CAUTION**

CAUTION STATEMENT

see **CAUTION STATEMENT**

TOW BAR WIRING, 13-PIN

NOTE: The relay and fuses are not included in the kit.

INSTALLING THE CONNECTOR XC90

Fig. 265: Install Trailer Connector Using Three Screws And Nuts
Courtesy of VOLVO CARS CORPORATION

On the XC90 the cable harness is routed in the same way regardless of the tow hitch type

- Install the trailer connector (1). Use the three screws (2) and the nuts (3). Tighten
- Route the cable harness to the right along the front edge of the tow hitch member

NOTE: If the cable harness is stretched too far it may be worn through by the lower edge of the bumper.

- Ensure that the cable harness forms a small loop around the lower edge of the bumper as illustrated.
- Secure the cable harness using a tie strap on each side of the brackets for the tow hitch member.

Fig. 266: Secure Cable Harness Using A Tie Strap On Each Side Of Brackets For Tow Hitch Member
Courtesy of VOLVO CARS CORPORATION

CARGO COMPARTMENT PREPARATIONS

PREPARATIONS

Fig. 267: Removing Storage Boxes
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Fold up the center rear floor hatch (1)
- If the floor hatch is equipped with a carrier bag holder, it is secured by a strap on each of the shorter sides of the storage box. Release the straps and remove the carrier bag holder
- Remove the storage box
- If the fog tail lamp and/or positive power supply / charge function is being connected, remove the floor hatch completely by folding it almost all the way down and pulling it out backwards from its mountings.

Applies to cars with three rows of seats and integrated carrier bag holder on the underside of the center floor hatch

- Fold the rear center floor hatch up
- Detach the two straps from the panel. Lift up the rear edge of the panel. Fold the floor hatch back towards the panel and lift out the floor hatch and the panel.

Applies to cars with three rows of seats without integrated carrier bag holders

- Lift up the center, rear floor hatch at the rear edge and lift it out.

For all XC90

- Remove the two side floor hatches (2).

Fig. 268: Identifying Left-Hand Side Folding Side Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the folding side panel on the left and right-hand sides of the cargo compartment.

Fig. 269: Identifying Screw, Nuts And Bracket
Courtesy of VOLVO CARS CORPORATION

- Remove the screw (1), the nuts (2) and then the bracket (3) (pull the bracket forwards)
- Lift off the protective cover (4).

Fig. 270: Removing Three Screws In Battery Holder
Courtesy of VOLVO CARS CORPORATION

- Remove the three screws in the battery holder. Lift the battery holder out
- Remove the cover from the battery.

Fig. 271: Identifying Drain Hose (1)
Courtesy of VOLVO CARS CORPORATION

- Remove the drainage hose (1) from the battery
- Remove the rubber seal (2). The rubber seal will not be used again
- Pull off the small narrow rubber strap on the new rubber seal
- Thread the old drainage hose through the new rubber seal. Ensure that the hose is unimpeded and is not kinked.

CABLE ROUTING

Fig. 272: Identifying Connector For Towbar Wiring
Courtesy of VOLVO CARS CORPORATION

- Install the new holder for the connector
- Release the red catches by pressing them forward
- Connect the blue (BL) cable to terminals 1, 5 or 12, depending on the desired function. Terminals: 1 = Charging; 5 = Fog tail lamp; 12 = Reversing lamp

- Return the catches to the locked position.

NOTE: **If the "Charging" function is to be used, the existing cable terminal must be cut off and replaced with the cable terminal from the kit.**

Fig. 273: Identifying Restraining Strap For Jack
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

1. Release the restraining strap for the jack and lift it out.

Illustration A applies to cars with two rows of seats

Fig. 274: Cars With Two Rows Of Seats (Illustration A)
Courtesy of VOLVO CARS CORPORATION

Illustration B applies to cars with three rows of seats

Fig. 275: Cars With Three Rows Of Seats (Illustration B)
Courtesy of VOLVO CARS CORPORATION

1. Remove the screws holding the support for the floor in the cargo compartment at the rear edge.

Fig. 276: Identifying Screws
Courtesy of VOLVO CARS CORPORATION

1. Slacken off the two screws for the floor extension brackets.

Fig. 277: Routing The Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Route the cable harness from the tow bar socket through the hole in the floor. It may be necessary to remove the spare wheel which partially obstructs the hole in the floor
- Adjust the position of the rubber seal (1) so that there is not too much slack in the cable under the car
- Install the rubber seal in the hole
- Pull up the floor extension on the right-hand side. Position a shim underneath it
- Pull up the rear edge of the support for the floor in the cargo compartment. Push the connector into the space behind the right-hand rear wheel well.

NOTE: Do not damage the support for the floor in the cargo compartment. It is brittle.

- Position the cable in the cut-out at the rear edge of the support for the floor in the cargo compartment
- Reinstall the support for the floor in the cargo compartment and the floor extension. Tighten the three screws
- Applies to cars with two rows of seats: reinstall the jack.

Fig. 278: Connecting The Routed Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Connect the routed cable harness to the existing pre-routed cable harness in the space
- Route the excess cable into the small space and secure to the existing cable harness. Ensure that the connectors are secured so that they do not rattle
- Reinstall the drain hose for the battery
- If the fog tail lamp and/or positive power supply / charge function is being connected for the XC90, continue, otherwise go directly to point 25.

CONNECTING THE FOG TAIL LAMP AND/OR POSITIVE POWER SUPPLY / CHARGE FUNCTION

NOTE: To connect the positive power supply / charge function for the XC90, remove the side panel on the left-hand side of the cargo compartment

Fig. 279: Identifying Left-Hand C-Post Panel And Plastic Weatherstrip Tools
Courtesy of VOLVO CARS CORPORATION

- Pull off the rubber strip at the rear edge of the door opening to the left-hand rear door opposite the left C-post panel
- Carefully pry off the left-hand C-post panel sides at the top using a plastic weatherstrip tool Then pull until the three clips on the inside release. Do not damage the headlining or the panel
- Remove the panel by pulling upwards slightly and unhooking it from the side panel.

Fig. 280: Identifying Cover And Screws Underneath Rear Headlining
Courtesy of VOLVO CARS CORPORATION

- Remove the rear headlining covers and the screws underneath the covers
- Carefully pry off the panel at the rear edge using a plastic weatherstrip tool
- Pull the rear edge of the panel downwards until the four clips on the top have released
- If the car has lighting in the panel, disconnect the connector
- Pull the panel backwards to release it.

Fig. 281: Identifying D-Post Panel Removal From Side Panel
Courtesy of VOLVO CARS CORPORATION

- Carefully pull off the D-post panel. Start at the top edge then pull down until the three clips on the inside release. Do not damage the panel
- Disconnect the connector on the D-post panel (if the car has a loudspeaker in the D-post there is a connector in the loudspeaker)
- Remove the panel by pulling upwards slightly and unhooking it from the side panel.

Illustration shows the removal of the cover for the load securing eyelets

Fig. 282: Identifying Load Securing Eyelet
Courtesy of VOLVO CARS CORPORATION

- Fold out the load securing eyelet
- Insert a scriber with an angled tip into the hole in the top of the cover
- Turn the scriber so that the angled tip engages in the reverse of the cover (1). Pull off the cover.

Fig. 283: Cars With Two Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

Fig. 284: Cars With Three Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

- Fold up the seats in the third row (applies to cars with three rows of seats)
- Remove the screws (2) for the load securing eyelets in the left-hand side panel
- Remove the covers (3) over the front mountings for the left-hand side panel. Pry them off using a plastic weatherstrip tool or a small screwdriver
- Remove the screws (4)
- Remove the clip (5) at the bottom of the storage compartment in the panel (applies to cars with three rows of seats)
- Remove the panel by pulling it slightly at the top edge so that the clips on the inside release. Remove the panel by pulling it straight upwards.

Fig. 285: Identifying Fuse Panel
Courtesy of VOLVO CARS CORPORATION

Install the correct fuse / relay depending on the model (year) and desired function

Applies when connecting the fog tail lamp function

- Install the relay in the rear electronic module, terminal MI 7.

Applies when connecting the automatic shut-off function for the fog tail lamp

NOTE: This function requires software unique to the car.

- Program the software according to the service information in VIDA (Volvo scan tool).

Applies when connecting the positive power supply / charging function (15 I supply)

- Install the relay in the rear electronic module, terminal MA 1.

NOTE: The relay is already installed in MA1 on cars with all wheel drive and cars with reverse warning as an accessory.

- Install a 20A fuse in the rear electronic module (REM), terminal 15, and a 15A fuse in terminal 9.

FINISHING WORK

FINISHING

Reinstall:

- the left-hand side panel using the screws and cover. Tighten the screws in the load securing eyelets. Tighten to **24 Nm (18 lbf. ft.)**
- the covers for the load securing eyelets
- The D-post panel with the connector
- the rear roof lighting connector (if applicable)
- the rear headlining
- C-post panel.

- Reinstall the protective cover and the bracket for the battery.

- Reinstall the panels
- Re-position the cargo compartment carpet. Alternatively, reinstall the storage compartment and the floor hatches.

Fig. 286: 13-Pin Connector
Courtesy of VOLVO CARS CORPORATION

Checking the 13-pin connector:

1	Left indicators
2	Fog tail lamp
3	Ground
4	Right indicators
5	Right parking lamps
6	Brake lamp
7	Left parking lamps
8	Reversing lamp
9	+30 supply
10	Charging
11	Not used
12	Not used
13	Ground

TOW BAR WIRING, 7-PIN (2003-2004)

CARS EQUIPPED WITH SRS/SIPS (AIRBAG)

see **CARS EQUIPPED WITH SRS/SIPS (AIRBAG)**

CAUTION

see **CAUTION**

CAUTION STATEMENT

see **CAUTION STATEMENT**

TOW BAR WIRING, 7-PIN

NOTE: The relay and fuses are not included in the kit.

INSTALLING THE CONNECTOR XC90

Fig. 287: Install Trailer Connector Using Three Screws And Nuts
Courtesy of VOLVO CARS CORPORATION

On the XC90 the cable harness is routed in the same way regardless of the tow hitch type

- Install the trailer connector (1). Use the three screws (2) and the nuts (3). Tighten
- Route the cable harness to the right along the front edge of the tow hitch member

NOTE: If the cable harness is stretched too far it may be worn through by the lower edge of the bumper.

- Ensure that the cable harness forms a small loop around the lower edge of the bumper as illustrated in illustration B
- Secure the cable harness using a tie strap on each side of the brackets for the tow hitch member.

Fig. 288: Secure Cable Harness Using A Tie Strap On Each Side Of Brackets For Tow Hitch Member
Courtesy of VOLVO CARS CORPORATION

CARGO COMPARTMENT PREPARATIONS

PREPARATION

Fig. 289: Removing Storage Boxes
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Fold up the center rear floor hatch (1)
- If the floor hatch is equipped with a carrier bag holder, it is secured by a strap on each of the shorter sides of the storage box. Release the straps and remove the carrier bag holder
- Remove the storage box
- If the fog tail lamp and/or positive power supply / charge function is being connected, remove the floor hatch completely by folding it almost all the way down and pulling it out backwards from its mountings.

Applies to cars with three rows of seats and integrated carrier bag holder on the underside of the center floor hatch

- Fold the rear center floor hatch up
- Detach the two straps from the panel. Lift up the rear edge of the panel. Fold the floor hatch back towards the panel and lift out the floor hatch and the panel.

Applies to cars with three rows of seats without integrated carrier bag holders

- Lift up the center rear floor hatch at the rear edge and lift it out
- Remove the two side floor hatches (2).

For all CX90

- Remove the two side floor hatches (2).

Fig. 290: Identifying Left-Hand Side Folding Side Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the folding side panel on the left and right-hand sides of the cargo compartment.

Fig. 291: Identifying Screw, Nuts And Bracket
Courtesy of VOLVO CARS CORPORATION

- Remove the screw (1), the nuts (2) and then the bracket (3) (pull the bracket forwards)
- Lift off the protective cover (4).

Fig. 292: Removing Three Screws In Battery Holder
Courtesy of VOLVO CARS CORPORATION

- Remove the three screws in the battery holder. Lift out the battery holder
- Remove the cover from the battery.

Fig. 293: Identifying Drain Hose (1)
Courtesy of VOLVO CARS CORPORATION

- Remove the drainage hose (1) from the battery
- Remove the rubber seal (2). The rubber seal will not be used again
- Pull off the small narrow rubber strap on the new rubber seal
- Thread the old drainage hose through the new rubber seal. Ensure that the hose is unimpeded and is not kinked.

CABLE ROUTING

Fig. 294: Identifying Connector For Towbar Wiring
Courtesy of VOLVO CARS CORPORATION

- Install the new holder for the connector
- Unlock the red catches: Press the catches forward
- Connect the blue (BL) cable to terminals 1, 5 or 12, depending on the desired function. Terminals: 1 = Charging; 5 = Fog tail lamp; 12 = Reversing lamp

- Return the catches to the locked position.

NOTE: **If the "Charging" function is to be used, the existing cable terminal must be cut off and replaced with the cable terminal from the kit.**

Fig. 295: Identifying Restraining Strap For Jack
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

1. Release the restraining strap for the jack and lift it out.

Illustration A applies to cars with two rows of seats

Fig. 296: Cars With Two Rows Of Seats (Illustration A)
Courtesy of VOLVO CARS CORPORATION

Illustration B applies to cars with three rows of seats

Fig. 297: Cars With Three Rows Of Seats (Illustration B)
Courtesy of VOLVO CARS CORPORATION

1. Remove the screws holding the support for the floor in the cargo compartment at the rear edge.

Fig. 298: Identifying Screws
Courtesy of VOLVO CARS CORPORATION

1. Slacken off the two screws for the floor extension brackets.

Fig. 299: Routing The Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Route the cable harness from the tow bar socket through the hole in the floor. It may be necessary to remove the spare wheel which partially obstructs the hole in the floor
- Adjust the position of the rubber seal (1) so that there is not too much slack in the cable under the car
- Install the rubber seal in the hole
- Pull up the floor extension on the right-hand side. Position a shim underneath it
- Pull up the rear edge of the support for the floor in the cargo compartment. Push the connector into the space behind the right-hand rear wheel well.

NOTE: Do not damage the support for the floor in the cargo compartment. It is brittle.

- Position the cable in the cut-out at the rear edge of the support for the floor in the cargo compartment
- Reinstall the support for the floor in the cargo compartment and the floor extension. Tighten the three screws
- Applies to cars with two rows of seats: reinstall the jack.

Fig. 300: Connecting The Routed Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Connect the routed cable harness to the existing pre-routed cable harness in the space
- Route the excess cable into the small space and secure to the existing cable harness. Ensure that the connectors are secured so that they do not rattle
- Reinstall the drain hose for the battery
- If the fog tail lamp and/or positive power supply / charge function is being connected for the XC90, continue with point 21. Otherwise go directly to point 25.

CONNECTING THE FOG TAIL LAMP AND/OR POSITIVE POWER SUPPLY / CHARGE FUNCTION

NOTE: To connect the positive power supply / charge function for the XC90, remove the side panel on the left-hand side of the cargo compartment according to points 21-24.

Fig. 301: Identifying Left-Hand C-Post Panel And Plastic Weatherstrip Tools
Courtesy of VOLVO CARS CORPORATION

- Pull off the rubber strip at the rear edge of the door opening to the left-hand rear door opposite the left C-post panel
- Carefully pry off the left-hand C-post panel sides at the top using a plastic weatherstrip tool Then pull until the three clips on the inside release. Do not damage the headlining or the panel
- Remove the panel by pulling upwards slightly and unhooking it from the side panel.

Fig. 302: Identifying Cover And Screws Underneath Rear Headlining
Courtesy of VOLVO CARS CORPORATION

- Remove the rear headlining covers and the screws underneath the covers
- Carefully pry off the panel at the rear edge using a plastic weatherstrip tool
- Pull the rear edge of the panel downwards until the four clips on the top have released
- If the car has lighting in the panel, disconnect the connector
- Pull the panel backwards to release it.

Fig. 303: Identifying D-Post Panel Removal From Side Panel
Courtesy of VOLVO CARS CORPORATION

- Carefully pull off the D-post panel. Start at the top edge then pull down until the three clips on the inside release. Do not damage the panel
- Disconnect the connector on the D-post panel (if the car has a loudspeaker in the D-post there is a connector in the loudspeaker)
- Remove the panel by pulling upwards slightly and unhooking it from the side panel.

Illustration shows the removal of the cover for the load securing eyelets

Fig. 304: Identifying Load Securing Eyelet
Courtesy of VOLVO CARS CORPORATION

- Fold out the load securing eyelet
- Insert a scriber with an angled tip into the hole in the top of the cover
- Turn the scriber so that the angled tip engages in the reverse of the cover (1). Pull off the cover.

Fig. 305: Cars With Two Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

Fig. 306: Cars With Three Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

- Fold up the seats in the third row (applies to cars with three rows of seats)
- Remove the screws (2) for the load securing eyelets in the left-hand side panel
- Remove the covers (3) over the front mountings for the left-hand side panel. Pry them off using a plastic weatherstrip tool or a small screwdriver
- Remove the screws (4)
- Remove the clip (5) at the bottom of the storage compartment in the panel (applies to cars with three rows of seats)
- Remove the panel by pulling it slightly at the top edge so that the clips on the inside release. Remove the panel by pulling it straight upwards.

Fig. 307: Identifying Fuse Panel
Courtesy of VOLVO CARS CORPORATION

Install the correct fuse / relay depending on the model (year) and desired function

Applies when connecting the fog tail lamp function

- Install the relay in the rear electronic module, terminal MI 7.

Applies when connecting the automatic shut-off function for the fog tail lamp

NOTE: This function requires software unique to the car.

- Program the software according to the service information in VIDA (Volvo scan tool).

Applies when connecting the positive power supply / charging function (15 l supply)

- Install the relay in the rear electronic module, terminal MA 1.

NOTE: The relay is already installed in MA1 on cars with all wheel drive and cars with reverse warning as an accessory.

- Install a 20A fuse in the rear electronic module (REM), terminal 15, and a 15A fuse in terminal 9.

FINISHING WORK

FINISHING

Reinstall:

- the left-hand side panel using the screws and cover. Tighten the screws in the load securing eyelets. Tighten to **24 Nm (18 lbf. ft.)**
- the covers for the load securing eyelets
- The D-post panel with the connector
- the rear roof lighting connector (if applicable)
- the rear headlining
- C-post panel.

- Reinstall the protective cover and the bracket for the battery.

- Reinstall the panels
- Re-position the cargo compartment carpet. Alternatively, reinstall the storage compartment and the floor hatches.

Fig. 308: 7-Pin Connector
Courtesy of VOLVO CARS CORPORATION

Checking the 7-pin connector:

1	Left indicators
2	Fog tail lamp / reversing lamp / charging
3	Ground
4	Right indicators
5	Right parking lamps
6	Brake lamp
7	Left parking lamps

TOW HITCH WIRING, 7/4-PIN (2003)

CARS EQUIPPED WITH SRS/SIPS (AIRBAG)

see **CARS EQUIPPED WITH SRS/SIPS (AIRBAG)**

CAUTION

see **CAUTION**

CAUTION STATEMENT

see **CAUTION STATEMENT**

TOW HITCH WIRING, 7/4-PIN

NOTE: The relay and fuses are not included in the kit.

INSTALLING THE TOW HITCH CONNECTOR

Fig. 309: Installing The Tow Hitch Connector
Courtesy of VOLVO CARS CORPORATION

- Install the tow hitch connector using the four screws and nuts. Tighten
- Route the cable harness to the right along the front edge of the tow hitch member The cable harness is routed the same way regardless of the type of tow hitch
- Secure the cable harness using a tie strap on each side of the brackets for the tow hitch member.

Fig. 310: Secure Cable Harness Using A Tie Strap On Each Side Of Brackets For Tow Hitch Member
Courtesy of VOLVO CARS CORPORATION

NOTE: If the cable harness is stretched too far it may be worn through by the lower edge of the bumper.

- Ensure that the cable harness forms a small loop around the lower edge of the bumper as illustrated.

Fig. 311: Removing Storage Boxes
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Fold up the center rear floor hatch (1). If the floor hatch is equipped with a carrier bag holder on its underside, it secured by a strap on each of the shorter sides of the storage box. These must be removed
- Remove the storage box underneath
- Remove the floor hatch completely by folding it almost all the way down and pulling it out backwards from its mountings.

Applies to cars with three rows of seats and integrated carrier bag holder on the underside of the center floor hatch

- Fold up the center rear floor hatch (1)
- Detach the two straps from the panel underneath. Lift up the rear edge of the panel. Fold the floor hatch back towards the panel and lift out the floor hatch and the panel.

Applies to cars with three rows of seats without integrated carrier bag holders

- Fold up the center rear floor hatch (1) at the rear edge and lift it out.

Applies to all models

- Remove the right and left-hand side floor hatches (2).

Fig. 312: Identifying Left-Hand Side Folding Side Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the folding side panel on the left and right-hand sides of the cargo compartment.

Fig. 313: Removing Three Screws In Battery Holder
Courtesy of VOLVO CARS CORPORATION

- Remove the three screws in the battery holder. Lift out the battery holder
- Remove the cover from the battery.

Fig. 314: Identifying Drain Hose (1)
Courtesy of VOLVO CARS CORPORATION

- Remove the drainage hose (1) from the battery
- Remove the rubber seal (2). This will not be used again
- Open up the pre-punched hole for the drain hose in the new rubber bushing
- Thread the old drainage hose through the new rubber bushing. Ensure that the hose is unimpeded and is not kinked.

CABLE ROUTING AND CONNECTION

Fig. 315: Identifying Restraining Strap For Jack
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Release the tensioning strap for the jack and lift it out.

Illustration A applies to cars with two rows of seats

Fig. 316: Cars With Two Rows Of Seats (Illustration A)
Courtesy of VOLVO CARS CORPORATION

Illustration B applies to cars with three rows of seats

Fig. 317: Cars With Three Rows Of Seats (Illustration B)
Courtesy of VOLVO CARS CORPORATION

- Remove the screws holding the support for the floor in the cargo compartment at the rear edge.

Fig. 318: Identifying Screws
Courtesy of VOLVO CARS CORPORATION

- Slacken off the two screws for the floor extension brackets.

Fig. 319: Routing The Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Route the cable harness from the tow bar socket through the hole in the floor. It may be necessary to remove the spare wheel which partially obstructs the hole in the floor
- Adjust the position of the rubber seal (1) so that there is not too much slack in the cable under the car
- Install the rubber seal in the hole
- Pull up the floor extension on the right-hand side. Position a shim underneath it
- Pull up the rear edge of the support for the floor in the cargo compartment. Push the connector into the space behind the right-hand rear wheel well.

NOTE: Do not damage the support for the floor in the cargo compartment. It is brittle.

- Position the cable in the cut-out at the rear edge of the support for the floor in the cargo compartment. Reinstall the support for the floor and the floor extension in the cargo compartment
- Tighten the support for the floor in the cargo compartment and floor extension. **Applies to cars with two rows of seats:** Reinstall the jack.

Fig. 320: Connecting The Routed Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Connect the routed cable harness to the existing cable harness in the space
- Pull the excess cable into the small space. Secure everything to the existing cable harness using the tie straps from the kit. Ensure that the connectors are secured so that they do not rattle
- Reinstall the drain hose on the battery.

CONNECTING THE POSITIVE POWER SUPPLY / CHARGE FUNCTION

To connect the positive power supply / charge function, remove the side panel on the left-hand side of the cargo compartment in order to access the rear fusebox.

Fig. 321: Identifying Left-Hand C-Post Panel And Plastic Weatherstrip Tools
Courtesy of VOLVO CARS CORPORATION

- Pull off the rubber strip at the rear edge of the door opening to the left-hand rear door opposite the left C-post panel
- Carefully pry off the left-hand C-post panel sides at the top using a plastic weatherstrip tool Then pull until the three clips on the inside release.

NOTE: Do not damage the headlining or the panel.

- Remove the panel by pulling upwards slightly and unhooking it from the side panel.

Fig. 322: Identifying Cover And Screws Underneath Rear Headlining
Courtesy of VOLVO CARS CORPORATION

- Remove the panel and the screws for the rear headlining
- Carefully pry off the panel at the rear edge using a plastic weatherstrip tool
- Pull the rear edge of the panel downwards until the four clips on the top have released
- If the car has lighting in the panel, disconnect the connector
- Pull the panel backwards to release it.

Fig. 323: Identifying D-Post Panel Removal From Side Panel
Courtesy of VOLVO CARS CORPORATION

- Carefully detach the D-post panels starting at the top edge. Then pull down until the three clips on the inside release.

NOTE: Do not damage the panel.

- Disconnect the connector for the D-post loudspeaker if applicable
- Remove the panel by pulling upwards slightly and unhooking it from the side panel.

Fig. 324: Identifying Load Securing Eyelet
Courtesy of VOLVO CARS CORPORATION

Illustration shows the removal of the cover for the load securing eyelets

- Fold out the load securing eyelet
- Insert a scriber with an angled tip into the hole in the top of the cover

- Turn the scriber so that the angled tip engages in the reverse of the cover (1). Pull off the cover.

Fig. 325: Cars With Two Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

Fig. 326: Cars With Three Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

- **Applies to cars with three rows of seats:** Fold down the third row of seats
- Remove the screws (2) for the load securing eyelets in the left-hand side panel
- Remove the covers (3) over the front mountings for the left-hand side panel. Pry them off using a plastic weatherstrip tool or a small screwdriver
- Remove the screws (4)
- **Applies to cars with three rows of seats:** Remove the clip (5) at the bottom of the storage compartment in the panel
- Pull out the upper edge of the panel a little to release the clips on the inside. Remove the panel by pulling it straight upwards.

Fig. 327: Identifying Fuse and Relay Locations
Courtesy of VOLVO CARS CORPORATION

Connecting the positive power supply / charging function (15 I supply)

- Install the relay in the rear electronic module (REM) terminal MA 1.

NOTE: The relay is already installed in MA1 on cars with all wheel drive and cars with reverse warning as an accessory.

- Install a 20A fuse in the rear electronic module (REM) terminal 15.

FINISHING WORK

Reinstall:

- the left-hand side panel using the screws and cover if these were removed. Tighten the load securing eyelet screws. Tighten to **24 Nm (18 lbf. ft.)**
- the covers for the load securing eyelets
- the D-post panel and the connector for the D-post loudspeaker (if applicable)
- the rear roof lighting connector (if applicable)
- the rear headlining
- the C-post panel
- the protective cover and the bracket for the battery
- the folding side panels
- the storage compartment and floor hatches.

Fig. 328: Identifying 7-Pin Connector
Courtesy of VOLVO CARS CORPORATION

Checking the 7-pin connector

1. Parking lamps
2. Charging
3. Right indicators
4. Electrical brake
5. Ground
6. Left indicators
7. Reserve
8. Right indicators
9. Left indicators
10. Parking lamps
11. Ground.

TOW HITCH, FIXED (2003-2005)

CARS EQUIPPED WITH SRS/SIPS (AIRBAG)

see **CARS EQUIPPED WITH SRS/SIPS (AIRBAG)**

CAUTION

see **CAUTION**

CAUTION STATEMENT

see **CAUTION STATEMENT**

TOW HITCH, FIXED

NOTE: Kit contents:

1. **Cross member**
2. **Screw M12x110 (x6)**
3. **Spacer washer, left-hand**
4. **Spacer washer, right-hand**
5. **Mounting pin (x2)**
6. **Protective cover for the towing ball.**

Fig. 329: Folding Up The Rear Floor Hatch
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Fold up the center rear floor hatch (1) slightly
- Remove it by pulling it off the mountings at the front edge
- Remove the storage box underneath and lift it out. If the floor hatch has a carrier bag holder on the underneath, it is secured by a strap on each of the shorter sides of the storage box. The straps must be undone.

Fig. 330: Folding Up The Centre Rear Floor Hatch (1)
Courtesy of VOLVO CARS CORPORATION

Applies to cars with three rows of seats and the integrated carrier bag holder on the underside of the center floor hatch

- Fold up the center rear floor hatch (1)
- Release the two straps on the panel underneath. Lift up the panel at the rear edge. Fold back the floor hatch towards the panel. Lift out the floor hatch and panel.

Applies to cars with three rows of seats without integrated carrier bag holders

- Lift up the center rear floor hatch (1) at the rear edge and lift it out.

Fig. 331: Removing The Side Floor Hatches
Courtesy of VOLVO CARS CORPORATION

Applies to all models

- Remove the side floor hatches (A) and the folding side panels (B) on the right and left-hand sides in the cargo compartment.

Fig. 332: Identifying Left-Hand C-Post Panel And Plastic Weatherstrip Tools
Courtesy of VOLVO CARS CORPORATION

- Pull off the rubber strip at the rear edge of the door opening to the left-hand rear door opposite the left C-post panel
- Carefully pry off the left-hand C-post panel at the sides in the top edge using a plastic weatherstrip tool. Pull off until the three clips on the inside release. Do not damage the headlining or the panel
- Remove the panel by pulling upwards slightly and unhooking it from the side panel
- Repeat the operation on the right-hand side.

Fig. 333: Removing Cover And Screws For The Rear Headlining
Courtesy of VOLVO CARS CORPORATION

- Remove the cover and the screws underneath for the rear headlining
- Carefully pry off the panel at the rear edge. Use a plastic weatherstrip tool

- Pull the rear edge of the panel downwards until all clips on the inside have released
- If the car has lighting in the panel, disconnect the connector
- Pull the panel backwards to release it.

Fig. 334: Identifying D-Post Panel Removal From Side Panel
Courtesy of VOLVO CARS CORPORATION

- Pull off the left-hand D-post panel starting at the top edge. Then pull downwards until the three clips on the inside have released. Do not damage the panel
- Remove the panel by pulling upwards slightly and unhooking it from the side panel
- Disconnect the connector if the car has a loudspeaker in the D-post
- Repeat the operation on the right-hand side.

Illustration shows the removal of the cover for the load securing eyelets

Fig. 335: Identifying Load Securing Eyelet
Courtesy of VOLVO CARS CORPORATION

Applies to all models

- Fold out the load securing eyelet
- Insert a scriber with an angled tip into the hole in the top of the cover
- Turn the scriber so that the angled tip engages in the reverse of the cover (1). Pull the cover off
- Repeat the operation on the right-hand side.

Fig. 336: Cars With Two Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

Fig. 337: Cars With Three Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

- Fold up the seats in the third row (applies to cars with three rows of seats)
- Remove the screws (2) for the load securing eyelets in the left-hand side panel
- Remove the covers (3) over the front mountings for the left-hand side panel. Pry the covers off. Use a plastic weatherstrip tool or a small screwdriver

- Remove the screws (4)
- Remove the clip (5) at the bottom of the storage compartment in the panel (Applies to cars with three rows of seats)
- Pull up the panel slightly at the top edge so that the clips on the inside release. Remove the panel by pulling it straight upwards.

Fig. 338: Removing Panel By Pulling It Straight Up And Unhook It From Side Panel (1 Of 2)
Courtesy of VOLVO CARS CORPORATION

Applies to cars with accessory electronic modules (AEM)

- Remove the bracket with the accessory electronic module. If necessary disconnect the connectors.

Fig. 339: Removing Three Screws In Battery Holder
Courtesy of VOLVO CARS CORPORATION

- Remove the three screws in the battery holder. Lift the battery holder out
- Remove the battery cover

- Lower and remove the spare wheel.

Fig. 340: Measure and Cut
Courtesy of VOLVO CARS CORPORATION

From underneath the car

1. Measure and draw a horizontal line 6 mm below the top of the ribs as illustrated
2. Cut along the inside of ribs 1 and 3 (the sides which face rib 2) up to the line drawn 6 mm below the top edge of the ribs. Do the same between ribs 6 and 4. Remove the shaded areas by cutting between the cuts along the horizontal line so that two parallel slits are made in the bumper cover
3. Cut away the remaining pieces of ribs 2 and 5 parallel to the bumper cover.

- Use a file to smooth off the edges of the cut outs.

Fig. 341: Cut Away The Upright Ribs
Courtesy of VOLVO CARS CORPORATION

- Cut away all the upright ribs.

Fig. 342: Identifying the End Result
Courtesy of VOLVO CARS CORPORATION

- The end result must be as illustrated.

Fig. 343: Identifying The Rear Mounting
Courtesy of VOLVO CARS CORPORATION

- Remove the rear mounting for the silencer with the bracket from the underneath of the left-hand rear side member by removing the screws (1). Remove the silencer to gain access when installing the tow hitch.

Fig. 344: Identifying Front Mounting
Courtesy of VOLVO CARS CORPORATION

- Remove the front mounting for the rear silencer at the rear sub-frame by removing the screws (1)
- Carefully bend the heat deflector plate at the side member to one side, to gain more work space
- Remove the protective flaps covering the mounting holes on the inside of the side members (one on each side)
- Remove any sealant from the surface where the tow hitch member will be mounted.

APPLIES TO CARS EQUIPPED WITH A REVERSING WARNING SYSTEM

Fig. 345: Identifying The Right-Hand Side
Courtesy of VOLVO CARS CORPORATION

Fig. 346: Identifying The Left-Hand Side
Courtesy of VOLVO CARS CORPORATION

- Disconnect the cable for the reverse warning sensor from its clips in the rear section of the bumper.

APPLIES TO ALL MODELS

Fig. 347: Cut Out As Marked
Courtesy of VOLVO CARS CORPORATION

Right-hand side:

- Cut out the rear section at the existing cut out as marked in the illustration.

APPLIES TO CARS WITH REVERSING WARNING SYSTEMS

Fig. 348: Measuring Location of Hole
Courtesy of VOLVO CARS CORPORATION

Right-hand side:

- Measure up to drill the cable lead-in in the upper of the rear section plates as illustrated
- Pre-drill using a **3 mm (1/8")** diameter drill bit. Then drill out the hole to a diameter of **8 mm (5/16")** . Use an angle drill and short drill bits.

Fig. 349: Cutting a 2 mm (5/64") Groove
Courtesy of VOLVO CARS CORPORATION

- Cut a 2 mm (5/64") wide groove through the plate leading in to the hole.

APPLIES TO ALL MODELS

Fig. 350: Cutting Out As Marked
Courtesy of VOLVO CARS CORPORATION

Left-hand side:

- Cut out the rear section at the existing cut out as marked in the illustration.

APPLIES TO CARS WITH REVERSING WARNING SYSTEMS

Fig. 351: Measuring Hole Locations
Courtesy of VOLVO CARS CORPORATION

Left-hand side:

- Measure up to drill the cable lead-in on the left and right-hand sides of the cut-out in the upper of the rear section plates as illustrated
- Pre-drill using a **3 mm (1/8")** diameter drill bit. Then drill out the holes to a diameter of **8 mm (5/16")** . Use an angle drill and short drill bits.

Fig. 352: Cutting a 2 mm (5/64") Slot
Courtesy of VOLVO CARS CORPORATION

- Cut a 2 mm (5/64") wide groove through the plate leading in to the holes on both sides of the cut-out.

Fig. 353: Routing Cable
Courtesy of VOLVO CARS CORPORATION

Right-hand side:

- Press up the tab on the plate. Insert the cable in the previously drilled hole. The cable must be positioned as illustrated.

Fig. 354: Routing Cable
Courtesy of VOLVO CARS CORPORATION

Left-hand side:

- Press up the tabs on the plate and inset the cable in the holes drilled earlier. The cable must be positioned as illustrated.

HINT: It is recommended that two people carry out this procedure.

Fig. 355: Positioning The Tow Hitch Between The Two Side Members
Courtesy of VOLVO CARS CORPORATION

- Take the two mounting pins (1) from the kit
- With one person at each end, lift and position the tow hitch on the inside between the two side members, in between the holes. Start by angling up the face of the left-hand side above the tail pipe on the silencer and up between the heat deflector plate and the side member. Then angle the right-hand side face up to the side member

- Press the mounting pins (1) into the center hole in the side members while holding the tow bar member in position so that the bar can hang freely without falling off
- Carefully lower the car.

Fig. 356: Inserting The Spacer Sleeves
Courtesy of VOLVO CARS CORPORATION

- Fold down the lower tailgate.

From the inside of the cargo compartment:

- Remove the protective flaps covering the mounting holes on the outside of the side members (one on each side)
- Remove any sealant from the surfaces where the spacer washers will be positioned
- Insert the spacer sleeves using only the front and rear screws on the outside of the two side members.

NOTE: Do not press out the mounting pins so that the tow bar detaches.

- Screw the front and rear screws in fully but do not tighten them
- Insert the center screws so that the mounting pins are pressed out. Screw the screws in fully but do no tighten them
- Hold the bar in the horizontal position. Tighten the screws.

NOTE: Rustproofing agent must be applied under the car before the screws are tightened. Apply the rustproofing agent to the side members all around the ends where any sealant was scraped off.

- Tighten all screws from inside the car. Tighten to **120 Nm (86 lbf. ft.)** in the following order:

1. The rear screws

2. The front screws

3. The center screws

NOTE: Wait five minutes so that the joint settles. Then re-check the torque.

- Raise the car again.

From underneath the car

- Carefully bend the heat deflector plate back so it does not touch the silencer
- Reinstall the front mounting for the rear silencer. Tighten the screws. Tighten to **24 Nm (18 lbf. ft.)**
- Reinstall the rear mounting for the rear silencer. Tighten the screws. Tighten to **48 Nm (35 lbf. ft.)** .
- Install the cable harness connector for the tow hitch according to point 1D in the installation instructions for the appropriate cable harness.
- Install the cable harness according to point 3 onwards in the Installation instructions for the appropriate cable harness.

NOTE: Ensure that the cable harness does not rub against the lower edge of the bumper and is not pressed back.

- Reinstall the cover and holder for the battery
- Reinstall the spare wheel.

Applies to cars with accessory electronic modules (AEM)

- Reinstall the bracket with the accessory electronic module (AEM). Connect the connectors if disconnected.

Applies to all models

- Reinstall the panels, storage boxes and floor hatches
- Tighten the screws in the load securing eyelets. Tighten to **24 Nm (18 lbf. ft.)** .

TOW HITCH, FLANGE (2004-2005)

CAUTION STATEMENT

The impact sensor control module is located on the tunnel below the center console in front of the parking brake.

WARNING

The airbag inflation areas must be free from obstructions. Do not place any objects, e. g. clothes or accessories, within these areas. The panels must be able to open the exact right way at the exact right time. Otherwise there is a greater risk of injury in the event of an accident.

TOW HITCH, FLANGE

NOTE: Kit content:

1. **Crossmember**
2. **Screw M12X110 (x5)**
3. **Spacer washer, left**
4. **Spacer washer, right**
5. **Retaining pin (x2)**
6. **Screw M16x50 (x2)**
7. **Nut M16 (x2)**
8. **Tow ball**
9. **Tow ball protective cap**

PREPARATION

Fig. 357: Folding Up The Rear Floor Hatch
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Raise the center, rear floor hatch (1) a bit.
- Remove it by pulling it out of its mountings at the front edge.
- Remove the storage box underneath and lift it out. If the floor hatch has a grocery bag holder on the underside, it is secured with a strap on each short side of the storage box. These must be detached.

Fig. 358: Folding Up The Centre Rear Floor Hatch (1)
Courtesy of VOLVO CARS CORPORATION

Applies to cars with three rows of seats and integrated grocery bag holder on the underside of the center floor hatch

- Raise the center, rear floor hatch (1).
- Undo the two straps on the panel underneath. Lift up the panel at the rear edge, lower the floor hatch toward the panel and lift out the floor hatch with panel.

Applies to cars with three rows of seats without integrated grocery bag holder

- Raise the center, rear floor hatch (1) at the rear edge and lift it out.

Fig. 359: Removing The Side Floor Hatches
Courtesy of VOLVO CARS CORPORATION

Applies to all

- Remove the side floor hatches (A) and the foldable panels (B) on the right and left side of the cargo compartment.

Fig. 360: Prying Loose The Left-Hand C-Post Panel
Courtesy of VOLVO CARS CORPORATION

- Pull off the rubber strip at the rear edge of the left rear door opening in front of the left-hand C-post panel.
- Carefully pry loose the left-hand C-post panel at the sides of the top edge using a plastic weatherstrip tool. Pull it until the three clips on the inside have released. Be careful not to damage the headlining and panel.
- Remove the panel by pulling it up and releasing it from the side panel.
- Do the same on the right-hand side.

WARNING

The ignition key must be set to position '0' and removed from the ignition switch before any connector for the SRS system is unplugged. Then wait at least one minute. Disconnect the negative lead of the battery before unplugging any of the connectors. After work is complete, turn the ignition key to position 'II' before reconnecting the negative lead of the battery.

TOWBAR, FLANGE (2003-2005)

CARS EQUIPPED WITH SRS/SIPS (AIRBAG)

see **CARS EQUIPPED WITH SRS/SIPS (AIRBAG)**

CAUTION

see **CAUTION**

CAUTION STATEMENT

see **CAUTION STATEMENT**

TOW HITCH, FLANGE

NOTE: Kit contents:

1. **Cross member**
2. **Screw M12x110 (x6)**
3. **Spacer washer, left-hand**
4. **Spacer washer, right-hand**
5. **Mounting pin (x2)**
6. **Screw M16x50 (x2)**
7. **Nut M16 (x2)**
8. **Towing ball**
9. **Protective cover for the towing ball.**

Fig. 361: Folding Up The Rear Floor Hatch
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Fold up the center rear floor hatch (1) slightly
- Remove it by pulling it off the mountings at the front edge
- Remove the storage box underneath and lift it out. If the floor hatch has a carrier bag holder on the underneath, it is secured by a strap on each of the shorter sides of the storage box. The straps must be undone.

Fig. 362: Folding Up The Centre Rear Floor Hatch (1)
Courtesy of VOLVO CARS CORPORATION

Applies to cars with three rows of seats and the integrated carrier bag holder on the underside of the center floor hatch

- Fold up the center rear floor hatch (1)
- Release the two straps on the panel underneath. Lift up the panel at the rear edge. Fold back the floor hatch towards the panel. Lift out the floor hatch and panel.

Applies to cars with three rows of seats without integrated carrier bag holders

- Lift up the center rear floor hatch (1) at the rear edge and lift it out.

Fig. 363: Removing The Side Floor Hatches
Courtesy of VOLVO CARS CORPORATION

Applies to all models

- Remove the side floor hatches (A) and the folding side panels (B) on the right and left-hand sides in the cargo compartment.

Fig. 364: Identifying Left-Hand C-Post Panel And Plastic Weatherstrip Tools
Courtesy of VOLVO CARS CORPORATION

- Pull off the rubber strip at the rear edge of the door opening to the left-hand rear door opposite the left C-post panel
- Carefully pry off the left-hand C-post panel at the sides in the top edge using a plastic weatherstrip tool. Pull off until the three clips on the inside release. Do not damage the headlining or the panel
- Remove the panel by pulling upwards slightly and unhooking it from the side panel
- Repeat the operation on the right-hand side.

Fig. 365: Removing Cover And Screws For The Rear Headlining
Courtesy of VOLVO CARS CORPORATION

- Remove the cover and the screws underneath for the rear headlining
- Carefully pry off the panel at the rear edge. Use a plastic weatherstrip tool

- Pull the rear edge of the panel downwards until all clips on the inside have released
- If the car has lighting in the panel, disconnect the connector
- Pull the panel backwards to release it.

Fig. 366: Identifying D-Post Panel Removal From Side Panel
Courtesy of VOLVO CARS CORPORATION

- Pull off the left-hand D-post panel starting at the top edge. Then pull downwards until the three clips on the inside have released. Do not damage the panel
- Remove the panel by pulling upwards slightly and unhooking it from the side panel
- Disconnect the connector if the car has a loudspeaker in the D-post
- Repeat the operation on the right-hand side.

Illustration shows the removal of the cover for the load securing eyelets

Fig. 367: Identifying Load Securing Eyelet
Courtesy of VOLVO CARS CORPORATION

Applies to all models

- Fold out the load securing eyelet
- Insert a scriber with an angled tip into the hole in the top of the cover
- Turn the scriber so that the angled tip engages in the reverse of the cover (1). Pull the cover off
- Repeat the operation on the right-hand side.

Fig. 368: Cars With Two Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

Fig. 369: Cars With Three Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

- Fold up the seats in the third row (applies to cars with three rows of seats)
- Remove the screws (2) for the load securing eyelets in the left-hand side panel
- Remove the covers (3) over the front mountings for the left-hand side panel. Pry the covers off. Use a plastic weatherstrip tool or a small screwdriver

- Remove the screws (4)
- Remove the clip (5) at the bottom of the storage compartment in the panel (Applies to cars with three rows of seats)
- Pull up the panel slightly at the top edge so that the clips on the inside release. Remove the panel by pulling it straight upwards.

Fig. 370: Removing Panel By Pulling It Straight Up And Unhook It From Side Panel (1 Of 2)
Courtesy of VOLVO CARS CORPORATION

Applies to cars with accessory electronic modules (AEM)

- Remove the bracket with the accessory electronic module. If necessary disconnect the connectors.

Fig. 371: Removing Three Screws In Battery Holder
Courtesy of VOLVO CARS CORPORATION

- Remove the three screws in the battery holder. Lift the battery holder out
- Remove the battery cover

- Lower and remove the spare wheel.

Fig. 372: Measure and Cut
Courtesy of VOLVO CARS CORPORATION

From underneath the car

1. Measure and draw a horizontal line 6 mm below the top of the ribs as illustrated
2. Cut along the inside of ribs 1 and 3 (the sides which face rib 2) up to the line drawn 6 mm below the top edge of the ribs. Do the same between ribs 6 and 4. Remove the shaded areas by cutting between the cuts along the horizontal line so that two parallel slits are made in the bumper cover
3. Cut away the remaining pieces of ribs 2 and 5 parallel to the bumper cover.

- Use a file to smooth off the edges of the cut outs.

Fig. 373: Cut Away The Upright Ribs
Courtesy of VOLVO CARS CORPORATION

- Cut away all the upright ribs.

Fig. 374: Identifying the End Result
Courtesy of VOLVO CARS CORPORATION

- The end result must be as illustrated.

Fig. 375: Identifying The Rear Mounting
Courtesy of VOLVO CARS CORPORATION

- Remove the rear mounting for the silencer with the bracket from the underneath of the left-hand rear side member by removing the screws (1). Remove the silencer to gain access when installing the tow hitch.

Fig. 376: Identifying Front Mounting
Courtesy of VOLVO CARS CORPORATION

- Remove the front mounting for the rear silencer at the rear sub-frame by removing the screws (1)
- Carefully bend the heat deflector plate at the side member to one side, to gain more work space
- Remove the protective flaps covering the mounting holes on the inside of the side members (one on each side)
- Remove any sealant from the surface where the tow hitch member will be mounted.

APPLIES TO CARS EQUIPPED WITH A REVERSING WARNING SYSTEM

Fig. 377: Identifying The Right-Hand Side
Courtesy of VOLVO CARS CORPORATION

Fig. 378: Identifying The Left-Hand Side
Courtesy of VOLVO CARS CORPORATION

- Disconnect the cable for the reverse warning sensor from its clips in the rear section of the bumper.

APPLIES TO ALL MODELS

Fig. 379: Cut Out As Marked
Courtesy of VOLVO CARS CORPORATION

Right-hand side:

- Cut out the rear section at the existing cut out as marked in the illustration.

APPLIES TO CARS WITH REVERSING WARNING SYSTEMS

Fig. 380: Measuring Location of Hole
Courtesy of VOLVO CARS CORPORATION

Right-hand side:

- Measure up to drill the cable lead-in in the upper of the rear section plates as illustrated
- Pre-drill using a **3 mm (1/8")** diameter drill bit. Then drill out the hole to a diameter of **8 mm (5/16")** . Use an angle drill and short drill bits.

Fig. 381: Cutting a 2 mm (5/64") Groove
Courtesy of VOLVO CARS CORPORATION

- Cut a 2 mm (5/64") wide groove through the plate leading in to the hole.

APPLIES TO ALL MODELS

Fig. 382: Cutting Out As Marked
Courtesy of VOLVO CARS CORPORATION

Left-hand side:

- Cut out the rear section at the existing cut out as marked in the illustration.

APPLIES TO CARS WITH REVERSING WARNING SYSTEMS

Fig. 383: Measuring Hole Locations
Courtesy of VOLVO CARS CORPORATION

Left-hand side:

- Measure up to drill the cable lead-in on the left and right-hand sides of the cut-out in the upper of the rear section plates as illustrated
- Pre-drill using a **3 mm (1/8")** diameter drill bit. Then drill out the holes to a diameter of **8 mm (5/16")** . Use an angle drill and short drill bits.

Fig. 384: Cutting a 2 mm (5/64") Slot
Courtesy of VOLVO CARS CORPORATION

- Cut a 2 mm (5/64") wide groove through the plate leading in to the holes on both sides of the cut-out.

Fig. 385: Routing Cable
Courtesy of VOLVO CARS CORPORATION

Right-hand side:

- Press up the tab on the plate. Insert the cable in the previously drilled hole. The cable must be positioned as illustrated.

Fig. 386: Routing Cable
Courtesy of VOLVO CARS CORPORATION

Left-hand side:

- Press up the tabs on the plate and inset the cable in the holes drilled earlier. The cable must be positioned as illustrated.

HINT: It is recommended that two people carry out this procedure.

Fig. 387: Positioning The Tow Hitch Between The Two Side Members
Courtesy of VOLVO CARS CORPORATION

- Take the two mounting pins (1) from the kit
- With one person at each end, lift and position the tow hitch on the inside between the two side members, in between the holes. Start by angling up the face of the left-hand side above the tail pipe on the silencer and up between the heat deflector plate and the side member. Then angle the right-hand side face up to the side member

- Press the mounting pins (1) into the center hole in the side members while holding the tow bar member in position so that the bar can hang freely without falling off
- Carefully lower the car.

Fig. 388: Inserting The Spacer Sleeves
Courtesy of VOLVO CARS CORPORATION

- Fold down the lower tailgate.

From the inside of the cargo compartment:

- Remove the protective flaps covering the mounting holes on the outside of the side members (one on each side)
- Remove any sealant from the surfaces where the spacer washers will be positioned
- Insert the spacer sleeves using only the front and rear screws on the outside of the two side members.

NOTE: Do not press out the mounting pins so that the tow bar detaches.

- Screw the front and rear screws in fully but do not tighten them
- Insert the center screws so that the mounting pins are pressed out. Screw the screws in fully but do no tighten them
- Hold the bar in the horizontal position. Tighten the screws.

NOTE: Rustproofing agent must be applied under the car before the screws are tightened. Apply the rustproofing agent to the side members all around the ends where any sealant was scraped off.

- Tighten all screws from inside the car. Tighten to **120 Nm (86 lbf. ft.)** in the following order:

1. The rear screws

2. The front screws

3. The center screws

NOTE: Wait five minutes so that the joint settles. Then re-check the torque.

- Raise the car again.

From underneath the car

- Carefully bend the heat deflector plate back so it does not touch the silencer
- Reinstall the front mounting for the rear silencer. Tighten the screws. Tighten to **24 Nm (18 lbf. ft.)**
- Reinstall the rear mounting for the rear silencer. Tighten the screws. Tighten to **48 Nm (35 lbf. ft.)** .
- Install the cable harness connector for the tow hitch for the appropriate cable harness.
- Install the cable harness according to point 3 onwards in the Installation instructions for the appropriate cable harness.

NOTE: Ensure that the cable harness does not rub against the lower edge of the bumper and is not pressed back.

Fig. 389: Installing The Towing Ball On The Tow Bar (Observe Torque Specs)
Courtesy of VOLVO CARS CORPORATION

- Reinstall the cover and holder for the battery
- Reinstall the spare wheel.

Applies to cars with accessory electronic modules (AEM)

- Reinstall the bracket with the accessory electronic module (AEM). Connect the connectors if disconnected.

Applies to all models

- Reinstall the panels, storage boxes and floor hatches
- Tighten the screws in the load securing eyelets. Tighten to **24 Nm (18 lbf. ft.)**
- Install the towing ball on the tow bar using the screws and nuts from the kit. The nuts must be on the inside
- Tighten the towing ball. Tighten to **195 Nm (144 lbf. ft.)** .

CAUTION: The nuts for the towing ball may only be used once. Use new nuts if the towing ball has been removed.

TOWBAR, HITCH, BASE UNIT (2003-2012)

TOWBAR, HITCH, BASE UNIT

INSTALLATION OF THE BASE UNIT

Fig. 390: Identifying Installation Of Base Unit
Courtesy of VOLVO CARS CORPORATION

TIGHTENING THE BASE UNIT TO THE TOWBAR HITCH

Fig. 391: Identifying Installation Of Bolt, Sprung Washer And Flat Washer In Towbar Hitch
Courtesy of VOLVO CARS CORPORATION

- Install the bolt, as illustrated. The sprung washer (1) must be positioned between the towbar hitch and the flat washer.
- Use a fixed wrench when tightening. Tighten securely.

TILTING THE BASE UNIT

Fig. 392: Identifying Catch Pressed Down To Lower Base Unit
Courtesy of VOLVO CARS CORPORATION

- Press catch (A) down to tilt the base unit.
- Lower the base unit (B) until the stop catch engages.

TILTING THE BASE UNIT BACK

Fig. 393: Identifying Lifted Up Stop Catch And Folded Back Load Basket
Courtesy of VOLVO CARS CORPORATION

- Lift up the stop catch (A) and fold back the base unit (B).

Fig. 394: Folding Back Load Basket Until Two Clear Clicks Can Be Heard And Catch Rises
Courtesy of VOLVO CARS CORPORATION

- Fold the base unit back until two clicks are heard and the catch pops up.

LOCKING THE BASE UNIT

Fig. 395: Identifying Locking Cylinder And Lock Housing
Courtesy of VOLVO CARS CORPORATION

- The base unit can be equipped with a lock which is supplied with the kits for the different load units that can be combined with the base unit. Install the locking cylinder in the lock housing.

NOTE: On certain car models it may be necessary to saw/cut a piece out of the bumper casing to obtain room for the lock.

SAFETY CHECKS BEFORE A JOURNEY

CAUTION: Make sure that all screws, nuts and tensioning straps are firmly tightened before setting off. Check them at regular intervals.

Damaged tensioning straps must be replaced with new ones.

The base unit must not be used as an attachment point for towing.

The base unit must not be used when driving over terrain.

NOTE: If the car's license plate is obscured by the base unit there is an extra license plate holder with lighting that is available as an accessory. This should then be used.

CAUTION: Do not allow the load to shift outside of the base unit.

Do not load more onto the base unit than what is specified on the original towbar's type plate (MAX TONGUE WEIGHT).

Remember that the car's center of gravity, and consequently its driving characteristics, can be changed by the load.

The base unit and associated loading systems must not be used for carrying animals or people.

TOWBAR, HITCH, BICYCLE CARRIER (2003-2008)

TOWBAR, HITCH, BICYCLE CARRIER

ASSEMBLING AND ATTACHING TO THE CAR

Fig. 396: Identifying Bicycle Carrier's Vertical Mounting And Hitch Hook's Square Tube
Courtesy of VOLVO CARS CORPORATION

- Install the bicycle carrier's vertical mounting in the hitch hook's square tube.
- Tighten the mounting using the two screws, spring washers and flat washers.

Fig. 397: Identifying Plastic Protection Pressed In Position On Vertical Mounting
Courtesy of VOLVO CARS CORPORATION

- Press the plastic protection onto the vertical mounting in the position illustrated.

Fig. 398: Identifying Bicycle Carrier Installed On Vertical Mounting Using Screws, Flat Washers And Lock Nuts
Courtesy of VOLVO CARS CORPORATION

- Install the bicycle carrier on the vertical mounting using screws, flat washers and lock nuts.
- Tighten the screws and nuts. Do not overtighten so that the bicycle carrier can be tilted in the mounting.

Fig. 399: Identifying Locking Bracket Removal From Locking Pin
Courtesy of VOLVO CARS CORPORATION

- Remove the locking bracket from the locking pin and pull it out.
- Fold the bicycle carrier up, insert the locking pin through the hole and lock using the locking bracket.

Fig. 400: Identifying Mounting Brackets Secured Onto Bicycle Carrier's Lower Mounting
Courtesy of VOLVO CARS CORPORATION

- Secure the two mounting brackets onto the bicycle carrier's lower mounting

Fig. 401: Identifying Installation Of Long Screw And Spacer In Mounting Brackets
Courtesy of VOLVO CARS CORPORATION

- Install a long screw and spacer in the mounting brackets. Install the brackets on the bicycle carrier's square tube in the existing nuts. Adjust the lower bicycle carrier to the desired position and tighten to **10 Nm (7.5 lbf. ft.)** .

INSTALLING THE BICYCLE

Fig. 402: Always Place Heaviest Bicycle Innermost
Courtesy of VOLVO CARS CORPORATION

- Always place the heaviest bicycle innermost.

Fig. 403: Identifying Mounting Strap Procedure
Courtesy of VOLVO CARS CORPORATION

- The carriers on the two tubes can be adjusted to suit different bicycles. Place the bicycles so that every other bicycle is turned the opposite direction.

Fig. 404: Ensure That Mounting Straps Are Properly Tightened Around Bicycle Frames
Courtesy of VOLVO CARS CORPORATION

- Ensure that the mounting straps are properly tightened around the bicycle frames.

Fig. 405: Identifying Strap, Mounting Eyelet And Bicycle Carrier's Lower Mounting
Courtesy of VOLVO CARS CORPORATION

- Thread the strap through the mounting eyelet on the bicycle carrier's lower mounting.
- Insert the strap around a suitable location on the bicycle's lower section and then through its own buckle. Tighten securely.
- Tie up the excess of the strap.

CAUTION: Ensure that all screws, nuts, mounting straps and tensioning straps are properly tightened before traveling with the bicycle carrier. Make regular checks during the journey.

- The bicycle carrier must not be used when driving over terrain.

- Do not transport more than four bicycles at a time on the bicycle carrier.
- The bicycle carrier must not be used to transport tandem bicycles, recumbent bicycles or tricycles.
- Damaged tensioning straps and mounting straps must be replaced with new ones.
- If the car's license plate is concealed by a loaded bicycle carrier, an extra license plate holder with lighting must be used. The license plate holder must be purchased separately.

Fig. 406: Identifying Locking Pin And Locking Bracket
Courtesy of VOLVO CARS CORPORATION

The bicycle carrier can be folded as illustrated when no bicycles are being transported.

- Detach the locking bracket, pull out the locking pin and fold the bicycle carrier down.
- Insert the locking pin into the hole (1) and lock with the locking bracket.

SECURING BICYCLES WITH CABLE LOCKS

Fig. 407: Identifying Installation Of Lock Cylinder To Cable Lock
Courtesy of VOLVO CARS CORPORATION

- Install the lock cylinder to the cable lock as illustrated.

Fig. 408: View Of Locking The Bicycle Using The Cable Lock
Courtesy of VOLVO CARS CORPORATION

- Lock the bicycle using the cable lock as illustrated.

Fig. 409: Identifying Stowed Bicycle Cable Lock
Courtesy of VOLVO CARS CORPORATION

- When the cable lock is not in use, it can be locked to the bicycle carrier as illustrated

TOWBAR, HITCH, LICENSE PLATE HOLDER (2003-2008)

TOWBAR, HITCH, LICENSE PLATE HOLDER

Image A applies when mounting on the holder's horizontal square tube

Fig. 410: Identifying Installation Of Mounting On Holder's Horizontal Square Tube
Courtesy of VOLVO CARS CORPORATION

Image B applies when mounting on the holder's vertical square tube

Fig. 411: Identifying Installation Of Mounting On Holder's Vertical Square Tube
Courtesy of VOLVO CARS CORPORATION

- Take the license plate holder and tighten it at the holder with the clamp, spacer sleeves and nuts from the kit as illustrated. Tighten the nuts to **7 Nm (5.2 lbf. ft)** .

Fig. 412: Identifying Screws To Tighten License Plate Into Place
Courtesy of VOLVO CARS CORPORATION

- Take the two screws from the kit and tighten the license plate into place.

Fig. 413: Connect Connector For License Plate Holder's Lighting To Corresponding Connector From Car
Courtesy of VOLVO CARS CORPORATION

- Connect the connector for the license plate holder's lighting to the corresponding connector from the car.

TOWBAR, HITCH, SKI CARRIER (2003-2008)

TOWBAR, HITCH, SKI CARRIER

NOTE: **Some steps in these installation instructions are presented with illustration only.**

Fig. 414: Identifying Installation Of Ski Holder In Base Unit's Square Pipe
Courtesy of VOLVO CARS CORPORATION

- Install the ski holder in the base unit's square pipe.
- Tighten in the ski holder using the two screws, the spring washers and the flat washers from the base unit kit.

Fig. 432: Identifying The Installation Of Two Snowboards
Courtesy of VOLVO CARS CORPORATION

Fig. 433: Identifying Tensioning With A Rubber Strap
Courtesy of VOLVO CARS CORPORATION

- Guide the skis or snowboard down into the lower holder.
- Hold them in against the upper holder's rear section.
- Tension them in against the rear section using the rubber strap in order that they shall be held in place while more skis/snowboards are installed in the holder as well as when the attaching brace is closed.

Fig. 434: Fold Back Attaching Brace And Locking Wheel
Courtesy of VOLVO CARS CORPORATION

- Fold back the attaching brace and the locking wheel.

Fig. 435: Identifying Tightening Of Locking Wheel
Courtesy of VOLVO CARS CORPORATION

- Tighten the locking wheel.

CAUTION: Check that the load on the ski holder is well-tensioned so that there is no risk of it falling off. In addition, check periodically during the journey. The load must not obscure the number plate or lighting. Retighten all screws, nuts and locking wheels regularly to avoid the risk that any part of the accessory or load may fall off.

The ski holder must not be used when driving over terrain.

Damaged tensioning straps and mounting straps must be replaced with new ones.

Do not allow the load to shift outside of the ski holder.

Remember not to load too heavily and that the car's center of gravity can be changed by carrying a hitch unit load.

If the car's number plate could be obscured by a loaded ski holder there is an extra number plate holder with lighting that is available as an accessory and which should then be used.

TRAILER MODULE (TRM) (2005-2012)

TRAILER MODULE (TRM)

INSTALLING

Fig. 436: Folding Up The Centre Rear Floor Hatch (1)
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Fold up the center rear floor hatch (1). If the floor hatch is equipped with a grocery bag holder, the holder is secured with a strap on both ends of the storage compartment. Detach the straps.
- Remove the underlying storage compartment.
- Remove the floor hatch by folding it almost completely closed then pulling it backward from its mountings until it releases.

Applies to cars with three rows of seats and integrated carrier bag holder on the underside of the center floor hatch

- Fold up the center rear floor hatch (1).
- Detach the two straps on the underlying panel. Lift up the rear edge of the panel, fold the floor hatch back towards the panel and lift out the floor hatch with the panel.

Applies to cars with three rows of seats without an integrated carrier bag holder

- Fold up the center rear floor hatch (1) at the rear edge and lift it out.

Applies to all models

- Remove the left-hand side floor hatch (2).

Fig. 437: Identifying Left-Hand Side Folding Side Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the folding side panel on the left-hand side of the cargo compartment.

Fig. 438: Cleaning The Marked Surfaces
Courtesy of VOLVO CARS CORPORATION

- Clean the marked surfaces on the embossing on the rear edge of the left-hand rear wheel housing under the fuse holder with a mixture of 20 % isopropyl alcohol (P/N 1161721) and 80 % water.
- Wipe dry.

Fig. 439: Cutting A Velcro Fastener (1 3/16")
Courtesy of VOLVO CARS CORPORATION

- Take a Velcro fastener from the kit and cut a piece that is 30 mm (1 3/16") long.

Fig. 440: Cutting A Velcro Fastener (3")
Courtesy of VOLVO CARS CORPORATION

- Cut a piece that is 75 mm (3") long from the same Velcro fastener.

Fig. 441: Removing Protective Tape
Courtesy of VOLVO CARS CORPORATION

- Remove the protective tape from the Velcro fasteners.

Fig. 442: Attaching Velcro Fasteners
Courtesy of VOLVO CARS CORPORATION

- Attach both Velcro fasteners to the embossing as illustrated.

Fig. 443: Cleaning the Trailer Module
Courtesy of VOLVO CARS CORPORATION

- Take the trailer module from the kit and clean the flat surface with a mixture of 20 % isopropyl alcohol (P/N 1161721) and 80 % water.
- Wipe dry.

Fig. 444: Cutting A Velcro Fastener (3")
Courtesy of VOLVO CARS CORPORATION

- Take a new Velcro fastener from the kit and cut a piece that is 75 mm (3") long.

Fig. 445: Identifying Velcro Fastener
Courtesy of VOLVO CARS CORPORATION

- Cut a piece that is 90 mm (3 1/2") long from the same Velcro fastener.

Fig. 446: Removing Protective Tape
Courtesy of VOLVO CARS CORPORATION

- Remove the protective tape from the Velcro fasteners.

Fig. 447: Attaching Velcro Fasteners
Courtesy of VOLVO CARS CORPORATION

- Attach both Velcro fasteners to the trailer module.

Fig. 448: Attaching The Trailer Module To The Velcro Fasteners
Courtesy of VOLVO CARS CORPORATION

- Attach the trailer module to the newly installed Velcro fasteners on the rear edge of the left-hand rear wheel housing. Press firmly so that it is secured.

- Reinstall the folding panel.
- Reinstall the side floor hatch.
- Reinstall the storage compartment (if applicable).
- Reinstall the center rear floor hatch.

T-TRACK KIT, BICYCLE HOLDER (2003-2005)

T-TRACK KIT, BICYCLE HOLDER

WHEEL HOLDER (2003)

MA TITLE

Fig. 458: Identifying Wheel Holder Components (1 of 3)
Courtesy of VOLVO CARS CORPORATION

Fig. 459: Identifying Wheel Holder Components (2 of 3)
Courtesy of VOLVO CARS CORPORATION

Fig. 460: Identifying Wheel Holder Components (3 of 3)
Courtesy of VOLVO CARS CORPORATION

- Fold the wheel holder down when not in use.

WIND SURFER HOLDER, T-GROOVES (2003-2010)

WIND SURFER HOLDER, T-GROOVES

NOTE: Important

- **Regularly check that the load carriers are properly secured**
- **The maximum roof load is 100 kg**
- **Distribute the load evenly over the load carriers. Do not load at an angle**

- **Position the heaviest load underneath**
- **Remove the load carriers when not in use. Air resistance is thus reduced which improves fuel consumption and reduces wind noise**
- **Handling is affected by the actual load and its position. The center of gravity of the car changes when driving with a load, which affects the handling of the car. Adjust speed accordingly.**

SECURING THE WIND SURFER HOLDER ON THE WING PROFILE LOAD CARRIERS

Fig. 461: Identifying Load Carrier Cover, Rubber Seal, And T-Groove
Courtesy of VOLVO CARS CORPORATION

- Remove the cover on the load carriers
- Remove the rubber seal for the T-grooves
- Slide on the wind surfer holder in the T-groove to the desired position.

Fig. 462: Identifying Mast Holder, Latch, T-Groove, And Cover

Courtesy of VOLVO CARS CORPORATION

- Take the mast holder and position the latch on the horizontal position
- Slide on the mast holder in the T-groove to the desired position
- Twist the latch upwards to the vertical limit position
- Reinstall the cover.

Fig. 463: Cutting Out T-Groove Seals
Courtesy of VOLVO CARS CORPORATION

- Measure and cut-out and reinstall the T-groove seals so that they cover the sections of the T-grooves which are not covered by the holders. This is to reduce wind noise.

SECURING THE WIND SURFER HOLDER ON THE OVAL PROFILE LOAD CARRIERS

Fig. 464: Identifying T-Groove, Rubber Seal, And Load Carrier Cover
Courtesy of VOLVO CARS CORPORATION

- Fold out the cover on the end of the load carriers.
- Remove the rubber seal for the T-grooves
- Slide on the wind surfer holder in the T-groove to the desired position.

Fig. 465: Identifying Mast Holder, T-Groove, Latch, And Cover
Courtesy of VOLVO CARS CORPORATION

- Take the mast holder and position the latch on the horizontal position
- Slide on the mast holder in the T-groove to the desired position
- Twist the latch upwards to the vertical limit position
- Fold the cover back into place.

Fig. 466: Cutting Out T-Groove Seals
Courtesy of VOLVO CARS CORPORATION

- Measure and cut-out and reinstall the T-groove seals so that they cover the sections of the T-grooves which are not covered by the holders. This is to reduce wind noise.

Fig. 467: Identifying Securing Of Wind Surfer Board With Mast On Car
Courtesy of VOLVO CARS CORPORATION

Securing the wind surfer board with the mast on the car as illustrated.

WINDSURFER HOLDER, SQUARE PROFILE (2003-2010)

WINDSURFER HOLDER, SQUARE PROFILE

Assembling the mast holder

Fig. 468: Assembling Mast Holder
Courtesy of VOLVO CARS CORPORATION

Installing the mast holder on the load carriers

Fig. 469: Identifying Mast Holder Installed On Load Carriers
Courtesy of VOLVO CARS CORPORATION

Installing the guard

Fig. 470: Installing Guard
Courtesy of VOLVO CARS CORPORATION

- Poke in the strings into the guard so that they do not hit the roof of the car.

Fig. 471: Securing The Windsurf Board
Courtesy of VOLVO CARS CORPORATION

Secure the windsurf board with the front facing forward and the underside upwards as illustrated.

Fig. 472: Identifying Secured Mast
Courtesy of VOLVO CARS CORPORATION

NOTE: Important

- **Regularly check that the load carriers are properly secured**
- **The maximum roof load is 100 kg**
- **Distribute the load evenly over the load carriers. Do not load at an angle**
- **Position the heaviest load underneath**
- **Remove the load carriers when not in use. This reduces air resistance which improves fuel consumption and reduces wind noise**
- **Handling is affected by the actual load and its position. The center of**

gravity of the car changes when driving with a load, which affects the handling of the car. Adjust the speed accordingly.

CABLE HARNESS KIT FOR TOWBAR, 7/4-PIN (2005-2012)

see **ACCESSORY ELECTRONIC MODULE (AEM)**

CABLE HARNESS KIT FOR TOWBAR, 7/4-PIN

Fig. 473: Installing The Trailer Connector With Four Screws And Nuts
Courtesy of VOLVO CARS CORPORATION

- Install the trailer connector with the four screws and the nuts. Tighten.
- Pull the cable harness out towards the right along the front edge of the tow bar member.
- Secure the cable harness with a tie strap on the sides of the tow bar member brackets.

Figure B applies to cars with R-design Skidplate

Fig. 474: Figure B
Courtesy of VOLVO CARS CORPORATION

On cars with Skidplate, the contact shall be turned 90° counter-clockwise in relation to the placement in Figure A.

Fig. 475: Folding Up The Centre Rear Floor Hatch (1)
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Fold up the center rear floor hatch (1). If the underside of the floor hatch is equipped with a grocery bag holder, the holder is secured with a strap on both ends of the storage compartment. Detach the straps.
- Remove the underlying storage compartment.
- Remove the floor hatch by folding it almost completely closed and pulling it backwards from the mountings until it releases.

Applies to cars with three rows of seats and integrated carrier bag holder on the underside of the center floor hatch

- Fold up the center rear floor hatch (1).
- Detach the two straps on the underlying panel. Lift up the rear edge of the panel, fold the floor hatch back towards the panel and lift out the floor hatch with the panel.

Applies to cars with three rows of seats without an integrated carrier bag holder

- Fold up the center rear floor hatch (1) at the rear edge and lift it out.

Applies to all models

- Remove the left-hand side floor hatch (2).

Fig. 476: Identifying Left-Hand Side Folding Side Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the folding side panel from the left-hand side in the cargo compartment.

Fig. 477: Removing Three Screws In Battery Holder
Courtesy of VOLVO CARS CORPORATION

- Remove the three screws in the battery holder. Lift the battery holder out.
- Remove the battery cover.

Fig. 478: Identifying Left-Hand C-Post Panel And Plastic Weatherstrip Tools
Courtesy of VOLVO CARS CORPORATION

- Pull off the rubber strip at the rear edge of the door opening for the left-hand rear door opposite the left-hand C-post panel.
- Carefully pry off the left-hand C-post panel sides at the top. Use a plastic weatherstrip tool. Then pull until the three clips on the inside release. Do not damage the headlining or the panel.
- Remove the panel by pulling upwards slightly and unhooking it from the side panel.

Fig. 479: Identifying Cover And Screws Underneath Rear Headlining
Courtesy of VOLVO CARS CORPORATION

- Remove the rear roof panel covers and the screws beneath them.
- Carefully pry off the panel at the rear edge. Use a plastic weatherstrip tool.
- Pull the rear edge of the panel downwards until the four clips on the top release.
- If the car is equipped with lighting in the panel, unplug the connector from the panel.
- Pull the panel backwards to release it.

Fig. 480: Identifying D-Post Panel Removal From Side Panel
Courtesy of VOLVO CARS CORPORATION

- Carefully pull off the D-post panel. Start at the top edge then pull down until the three clips on the inside release. Do not damage the panel.
- Disconnect the connector on the D-post panel (if the car has a loudspeaker in the D-post, the connector is in the loudspeaker).
- Remove the panel by pulling upwards slightly and unhooking it from the side panel.

Illustration shows the removal of the cover for the load securing eyelets

Fig. 481: Identifying Load Securing Eyelet
Courtesy of VOLVO CARS CORPORATION

- Fold out the load securing eyelet.
- Insert a scriber with an angled tip into the hole in the top of the cover.
- Turn the scriber so that the angled tip engages in the reverse of the cover (1). Pull the cover off.

Fig. 482: Cars With Two Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

Fig. 483: Cars With Three Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

- Fold up the seats in the third row (applies to cars with three rows of seats).
- Remove the screws (2) for the load securing eyelets in the left-hand side panel.
- Remove the covers (3) over the front mountings for the left-hand side panel. Pry the covers off. Use a plastic weatherstrip tool or a small screwdriver.
- Remove the screws (4).
- Remove the clip (5) at the bottom of the storage compartment in the panel (Applies to cars with three rows of seats).
- Remove the panel by pulling out the upper edge slightly so that the clips on the inside release. Pull the panel straight up.

Fig. 484: Identifying Drain Hose (1)
Courtesy of VOLVO CARS CORPORATION

- Remove the drain hose (1) from the battery.
- Remove the rubber seal (2). It will not be re-used.
- Pull off the small, thin rubber strap on the new rubber seal.
- Insert the old drain hose through the new rubber seal. Make sure the hose is not obstructed and that it is not folded.

Fig. 485: Routing The Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Route the cable harness from the tow bar connector through the hole in the floor.
- Adjust the position of the rubber seal (1) so that there is not excessive cable slack under the car.
- Install the rubber seal in the hole.
- Route the cable harness as illustrated. Insert it through the hole along the rear edge of the left-hand cargo floor support.

- Secure the cable harness to the cable harness behind the battery with tie straps (2) from the kit.

Fig. 486: Connecting the Ground Cable
Courtesy of VOLVO CARS CORPORATION

- Connect the routed ground cable to the grounding point (3) behind the battery and tighten the grounding screw securely.
- Connect the drain hose (4) to the battery.

Fig. 487: Secure Cable Harness Using A Tie Strap On Each Side Of Brackets For Tow Hitch Member
Courtesy of VOLVO CARS CORPORATION

- Make sure the cable harness curves around the lower edge of the bumper as shown in the illustration.

NOTE: **If the cable harness is stretched too tightly, it can scrape against the lower edge of the bumper and become damaged.**

Fig. 488: Identifying Trailer Module (TRM)
Courtesy of VOLVO CARS CORPORATION

NOTE: **On the XC90 Executive, T-wiring is already installed in the fuse holder. As this is a cable with a black connector taped to it. The tow bar wiring's black connector is then connected to this.**

- Detach the trailer module (TRM) from the Velcro fastener on the floor along the rear edge of the left-hand rear wheel housing.

  green (GN) and grey (GR) connectors to the control module.

  black (SB) connector to the fuse holder.
- Plug in the tow bar wiring connectors:

  green (GN) and grey (GR) connectors to the control module.

  black (SB) connector to the fuse holder.
- Reinstall the control module.
- Secure the excess cable with a tie strap from the kit.

Fig. 489: Inserting Fuses From The Kit
Courtesy of VOLVO CARS CORPORATION

- Insert fuses from the kit in the following positions in the fuse holder (REM):
  20A in position 20 (mini fuse) if the charging function will be used
  25A in position 29
  25A in position 30.

Reinstall:

- the left-hand side panel using the screws and cover. Tighten the screws in the load securing eyelets. Tighten to **24 Nm (18 lbf ft)** .
- the covers for the load securing eyelets.
- D-post panel with connector.
- the connector for the rear roof lighting (if applicable).
- the rear headlining.
- C-post panel.
- protective cover and bracket for the battery.
- side floor hatch and folding panel.
- storage compartment and floor hatch.

CHECKING THE TRAILER CONNECTOR

Fig. 490: Identifying 7-Pin Connection
Courtesy of VOLVO CARS CORPORATION

7-pin connection

1. Brake lamp / Left-hand indicator lamp
2. Ground

3. Spare (Brake lamp, Electric brakes)
4. Brake lamp / Right-hand indicator lamp
5. Charging
6. Position lamps
7. Spare (Reversing lamp)

The cable to pin 3 is blue (BL) and the cable to pin 7 is violet (VO). They are taped to the wiring approximately 1 meter from the connector.

4-pin connection

1. Brake lamp / Right-hand indicator lamp
2. Brake lamp / Left-hand indicator lamp
3. Position lamps
4. Ground

NOTE: The following steps (16-25) only apply if further functions are desired.

These parts are not included in the kit. Specified part numbers can be purchased separately from Volvo dealerships.

STEPS ONLY APPLY IF ELECTRIC BRAKES ARE TO BE INSTALLED.

Fig. 491: Electric Brake Connecting
Courtesy of VOLVO CARS CORPORATION

The image with wiring diagram shows the principle of electric brake connection.

The system must be fused with quick-acting fuse, maximum 30A, and controlled with relay, see diagrammatic illustration. Use Maxi fuse (P/N 9441158), quick-acting fuse max. 30A by ATO (P/N 966331) or Mini (P/N 8470580) type. A separate holder must be used for these.

NOTE: **Installation of equipment for the electric brakes must be carried out according to the supplier's instructions. Volvo takes no responsibility for such equipment.**

Fig. 492: Identifying Position 3 In The Main Fuse Box
Courtesy of VOLVO CARS CORPORATION

- Obtain positive feed (30+) from position 3 in the main fuse box, which is located beside the battery. Insert a 40A Midi fuse in the holder (P/N 9441937).

CONNECTION OF RELAY CONTROL TO "IGNITION ON" IN THE REAR ELECTRONIC MODULE (REM)

Fig. 493: Identifying Front Black Connector
Courtesy of VOLVO CARS CORPORATION

- Press in the catch on the front black connector in the cargo compartment fuse holder. Turn up the lock arm as far as possible and pull out the connector.

Fig. 494: Pull Apart Sides Of Holder For Connector And Pull Out Connector
Courtesy of VOLVO CARS CORPORATION

- Carefully pry apart the sides of the connector holder in the ends so that the connector can pass by the retaining hooks.
- Pull the connector out from the holder.

Fig. 495: Connecting a Replacement Terminal (P/N 30656727) To Position 30
Courtesy of VOLVO CARS CORPORATION

- Connect a replacement part terminal (P/N 30656727) to position 30 in the connector.
- Reinstall the connector in the holder and reinstall the whole unit in the fuse holder.

Fig. 496: Connecting Routed Ground Lead To Grounding Point Behind Battery
Courtesy of VOLVO CARS CORPORATION

- Connect ground lead (31-) to the relay with a conductor with cable terminal (P/N 970784) to the existing ground terminal (1) behind the battery. Tighten the ground screw firmly.

Only applies if the brake lamp signal is to be connected to the electric brakes

- Connect a replacement part terminal (P/N 30656647) to position 1 in the tow hitch wiring's gray connector on the trailer module (TRM). Splice it with the cable for the brake lamp's input signal from the brake equipment, with a yellow butt connector (P/N 9130477).

- Connect the electric brakes after the relay with a fuse, maximum 30A. Connect the electric brake output to the trailer connector via pin 3,(spare).

  The cables should have a minimum 4 mm^2 cross-section if a 30A fuse is used.

  The equipment will be supplied with power as long as the car has its ignition on.

NOTE: **If the electric brakes are connected without relay control in accordance with above, then there is a risk that the car's battery will be discharged.**

ONLY APPLIES IF THE BRAKE LAMP FUNCTION IS TO BE USED.

- Connect a replacement part terminal (P/N 30656647) to position 1 in the tow hitch wiring's gray connector on the trailer module (TRM). Splice it with the blue (BL) cable that is taped to the wiring, with a yellow butt connector (P/N 9130477).

  The brake lamp signal is now in position 3 in the trailer connector.

ONLY APPLIES IF THE REVERSE LAMP FUNCTION IS TO BE USED.

- Connect a replacement part terminal (P/N 30656724) to position H in the tow hitch wiring's black

connector on the fuse holder (REM). Splice it with the violet (VO) cable that is taped to the wiring, with a yellow butt connector (P/N 9130477).

The reverse lamp signal is now in position 7 in the trailer connector.

TOW BAR WIRING, 13-PIN

INSTALLING THE CONNECTOR FOR FIXED/DETACHABLE TOW BARS

APPLIES TO THE XC90

Fig. 497: Installing the Trailer Connector (1)
Courtesy of VOLVO CARS CORPORATION

- Install the trailer connector (1). Use the three screws (2) and the nuts (3). Tighten.
- Pull the cable harness out towards the right along the front edge of the tow bar member.
- Secure the cable harness with a tie strap on the sides of the tow bar member brackets.

Figure B applies to cars with R-design Skidplate

Fig. 498: Identifying Connector Turned 90°
Courtesy of VOLVO CARS CORPORATION

On cars with Skidplate, the connector shall be turned 90° counter-clockwise in relation to the placement in Figure A.

STEPS APPLY TO THE XC90

Fig. 499: Folding Up The Centre Rear Floor Hatch (1)
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Fold up the center rear floor hatch (1). If the underside of the floor hatch is equipped with a grocery bag holder, the holder is secured with a strap on both ends of the storage compartment. Detach the straps.
- Remove the underlying storage compartment.
- Remove the floor hatch by folding it almost completely closed and pulling it backwards from the mountings until it releases.

Applies to cars with three rows of seats and integrated carrier bag holder on the underside of the center floor hatch

- Fold up the center rear floor hatch (1).
- Detach the two straps on the underlying panel. Lift up the rear edge of the panel, fold the floor hatch back towards the panel and lift out the floor hatch with the panel.

Applies to cars with three rows of seats without an integrated carrier bag holder

- Fold up the center rear floor hatch (1) at the rear edge and lift it out.

Applies to all models

- Remove the left-hand side floor hatch (2).

Fig. 500: Identifying Left-Hand Side Folding Side Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the folding side panel from the left-hand side in the cargo compartment.

Fig. 501: Removing Three Screws In Battery Holder
Courtesy of VOLVO CARS CORPORATION

- Remove the three screws in the battery holder. Lift the battery holder out.
- Remove the battery cover.

Fig. 502: Identifying Left-Hand C-Post Panel And Plastic Weatherstrip Tools
Courtesy of VOLVO CARS CORPORATION

- Pull off the rubber strip at the rear edge of the door opening for the left-hand rear door opposite the left-hand C-post panel.
- Carefully pry off the left-hand C-post panel sides at the top. Use a plastic weatherstrip tool. Then pull until the three clips on the inside release. Do not damage the headlining or the panel.
- Remove the panel by pulling upwards slightly and unhooking it from the side panel.

Fig. 503: Identifying Cover And Screws Underneath Rear Headlining
Courtesy of VOLVO CARS CORPORATION

- Remove the rear roof panel covers and the screws beneath them.
- Carefully pry off the panel at the rear edge. Use a plastic weatherstrip tool.
- Pull the rear edge of the panel downwards until the four clips on the top release.
- If the car is equipped with lighting in the panel, unplug the connector from the panel.
- Pull the panel backwards to release it.

Fig. 504: Identifying D-Post Panel Removal From Side Panel
Courtesy of VOLVO CARS CORPORATION

- Carefully pull off the D-post panel. Start at the top edge then pull down until the three clips on the inside release. Do not damage the panel.
- Disconnect the connector on the D-post panel (if the car has a loudspeaker in the D-post, the connector is in the loudspeaker).
- Remove the panel by pulling upwards slightly and unhooking it from the side panel.

Illustration shows the removal of the cover for the load securing eyelets

Fig. 505: Identifying Load Securing Eyelet
Courtesy of VOLVO CARS CORPORATION

- Fold out the load securing eyelet.
- Insert a scriber with an angled tip into the hole in the top of the cover.
- Turn the scriber so that the angled tip engages in the reverse of the cover (1). Pull the cover off.

Fig. 506: Cars With Two Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

Fig. 507: Cars With Three Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

- Fold up the seats in the third row (applies to cars with three rows of seats).
- Remove the screws (2) for the load securing eyelets in the left-hand side panel.
- Remove the covers (3) over the front mountings for the left-hand side panel. Pry the covers off. Use a plastic weatherstrip tool or a small screwdriver.
- Remove the screws (4).
- Remove the clip (5) at the bottom of the storage compartment in the panel (Applies to cars with three rows of seats).
- Remove the panel by pulling out the upper edge slightly so that the clips on the inside release. Pull the panel straight up.

Fig. 508: Identifying Drain Hose (1)
Courtesy of VOLVO CARS CORPORATION

- Remove the drain hose (1) from the battery.

- Remove the rubber seal (2). It will not be re-used.
- Pull off the small, thin rubber strap on the new rubber seal.
- Insert the old drain hose through the new rubber seal. Make sure the hose is not obstructed and that it is not folded.

Fig. 509: Routing The Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Route the cable harness from the tow bar connector through the hole in the floor.
- Adjust the position of the rubber seal (1) so that there is not excessive cable slack under the car.
- Install the rubber seal in the hole.
- Route the cable harness as illustrated. Insert it through the hole along the rear edge of the left-hand cargo floor support.
- Secure the cable harness to the cable harness behind the battery with tie straps (2) from the kit.

Fig. 510: Connecting the Ground Cable
Courtesy of VOLVO CARS CORPORATION

- Connect the routed ground cable to the grounding point (3) behind the battery and tighten the grounding screw securely.
- Connect the drain hose (4) to the battery.

Fig. 511: Secure Cable Harness Using A Tie Strap On Each Side Of Brackets For Tow Hitch Member
Courtesy of VOLVO CARS CORPORATION

NOTE: If the cable harness is stretched too tightly, it can scrape against the lower edge of the bumper and become damaged.

- Make sure the cable harness curves around the lower edge of the bumper as shown in the illustration.

Fig. 512: Identifying Trailer Module (TRM)
Courtesy of VOLVO CARS CORPORATION

NOTE: On the XC90 Executive, T-wiring is already installed in the fuse holder. A cable with a black connector is taped to this. The tow bar wiring's black connector is then connected to this cable.

- Detach the trailer module (TRM) from the Velcro fastener on the floor along the rear edge of the left-hand rear wheel housing.
  - green (GN) and grey (GR) connectors to the control module.
  - black (SB) connector to the fuse holder.
- Plug in the tow bar wiring connectors:
  - green (GN) and grey (GR) connectors to the control module.
  - black (SB) connector to the fuse holder.
- Reinstall the control module.
- Secure the excess cable with a tie strap from the kit.

Fig. 513: Inserting Fuses From The Kit
Courtesy of VOLVO CARS CORPORATION

- Insert fuses from the kit in the following positions in the fuse holder (REM):
  - 15A in position 7 (mini fuse) if the power supply function will be used
  - 20A in position 20 (mini fuse) if the charging function will be used
  - 25A in position 29
  - 25A in position 30.

Reinstall:

- the left-hand side panel using the screws and cover. Tighten the screws in the load securing eyelets. Tighten to **24 Nm (18 lbf ft)** .
- the covers for the load securing eyelets.
- D-post panel with connector.
- the connector for the rear roof lighting (if applicable).
- the rear headlining.
- C-post panel.

- protective cover and bracket for the battery.
- side floor hatch and folding panel.
- storage compartment and floor hatch.

Applies to connection of the function for automatic rear fog lamp deactivation

NOTE: The function requires car-specific software. Program the software according to the service information described in VIDA (Volvo scan tool).

CHECKING THE 13-PIN CONNECTOR:

Fig. 514: 13-Pin Connector
Courtesy of VOLVO CARS CORPORATION

1. Left indicator lamps
2. Rear fog lamps
3. Ground
4. Right indicator lamps
5. Right parking lamps
6. Brake lamp
7. Left parking lamps
8. Reversing lamp
9. Power supply
10. Charging
11. Ground
12. Not used
13. Ground

TOW BAR WIRING, 7-PIN

INSTALLING THE CONNECTOR FOR FIXED/DETACHABLE TOW BARS

APPLIES TO THE XC90

Fig. 515: Installing the Trailer Connector (1)
Courtesy of VOLVO CARS CORPORATION

- Install the trailer connector (1). Use the three screws (2) and the nuts (3). Tighten.
- Pull the cable harness out towards the right along the front edge of the tow bar member.
- Secure the cable harness with a tie strap on the sides of the tow bar member brackets.

Figure applies to cars with R-design Skidplate

Fig. 516: Identifying Connector Turned 90°
Courtesy of VOLVO CARS CORPORATION

On cars with Skidplate, the contact shall be turned 90° counter-clockwise in relation to the placement in Figure A.

STEPS APPLY TO THE XC90

Fig. 517: Folding Up The Centre Rear Floor Hatch (1)
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Fold up the center rear floor hatch (1). If the underside of the floor hatch is equipped with a grocery bag holder, the holder is secured with a strap on both ends of the storage compartment. Detach the straps.
- Remove the underlying storage compartment.
- Remove the floor hatch by folding it almost completely closed and pulling it backwards from the mountings until it releases.

Applies to cars with three rows of seats and integrated carrier bag holder on the underside of the center floor hatch

- Fold up the center rear floor hatch (1).
- Detach the two straps on the underlying panel. Lift up the rear edge of the panel, fold the floor hatch back towards the panel and lift out the floor hatch with the panel.

Applies to cars with three rows of seats without an integrated carrier bag holder

- Fold up the center rear floor hatch (1) at the rear edge and lift it out.

Applies to all models

- Remove the left-hand side floor hatch (2).

Fig. 518: Identifying Left-Hand Side Folding Side Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the folding side panel from the left-hand side in the cargo compartment.

Fig. 519: Removing Three Screws In Battery Holder
Courtesy of VOLVO CARS CORPORATION

- Remove the three screws in the battery holder. Lift the battery holder out.
- Remove the battery cover.

Fig. 520: Identifying Left-Hand C-Post Panel And Plastic Weatherstrip Tools
Courtesy of VOLVO CARS CORPORATION

- Pull off the rubber strip at the rear edge of the door opening for the left-hand rear door opposite the left-hand C-post panel.
- Carefully pry off the left-hand C-post panel sides at the top. Use a plastic weatherstrip tool. Then pull until the three clips on the inside release. Do not damage the headlining or the panel.
- Remove the panel by pulling upwards slightly and unhooking it from the side panel.

Fig. 521: Identifying Cover And Screws Underneath Rear Headlining
Courtesy of VOLVO CARS CORPORATION

- Remove the rear roof panel covers and the screws beneath them.
- Carefully pry off the panel at the rear edge. Use a plastic weatherstrip tool.
- Pull the rear edge of the panel downwards until the four clips on the top release.
- If the car is equipped with lighting in the panel, unplug the connector from the panel.
- Pull the panel backwards to release it.

Fig. 522: Identifying D-Post Panel Removal From Side Panel
Courtesy of VOLVO CARS CORPORATION

- Carefully pull off the D-post panel. Start at the top edge then pull down until the three clips on the inside release. Do not damage the panel.
- Disconnect the connector on the D-post panel (if the car has a loudspeaker in the D-post, the connector is in the loudspeaker).
- Remove the panel by pulling upwards slightly and unhooking it from the side panel.

Illustration shows the removal of the cover for the load securing eyelets

Fig. 523: Identifying Load Securing Eyelet
Courtesy of VOLVO CARS CORPORATION

- Fold out the load securing eyelet.
- Insert a scriber with an angled tip into the hole in the top of the cover.
- Turn the scriber so that the angled tip engages in the reverse of the cover (1). Pull the cover off.

Fig. 524: Cars With Two Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

Fig. 525: Cars With Three Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

- Fold up the seats in the third row (applies to cars with three rows of seats).
- Remove the screws (2) for the load securing eyelets in the left-hand side panel.
- Remove the covers (3) over the front mountings for the left-hand side panel. Pry the covers off. Use a plastic weatherstrip tool or a small screwdriver.
- Remove the screws (4).
- Remove the clip (5) at the bottom of the storage compartment in the panel (Applies to cars with three rows of seats).
- Remove the panel by pulling out the upper edge slightly so that the clips on the inside release. Pull the panel straight up.

Fig. 526: Identifying Drain Hose (1)
Courtesy of VOLVO CARS CORPORATION

- Remove the drain hose (1) from the battery.

- Remove the rubber seal (2). It will not be re-used.
- Pull off the small, thin rubber strap on the new rubber seal.
- Insert the old drain hose through the new rubber seal. Make sure the hose is not obstructed and that it is not folded.

CONNECTING THE FUNCTIONS

NOTE: It is only possible to connect one of the functions (rear fog lamps, charging or reversing lamps) according to steps, see CONNECTING THE FUNCTIONS or CONNECTING THE FUNCTIONS. You can also choose not to connect any of the functions.

If the rear fog lamp function will be used:

Fig. 527: Identifying 12-Pin Connector
Courtesy of VOLVO CARS CORPORATION

- Carefully press down the small catch in the locking mechanism for the grey (GR) 12-pin connector with a small screwdriver. Pull out the locking mechanism until it stops.

Fig. 528: Identifying Blue Cable To Position 2 In The Connector
Courtesy of VOLVO CARS CORPORATION

- Connect the blue (BL) cable to position 2 in the connector.
- Move the locking mechanism back to locked position.
- Insulate the cable terminal and secure the blue (BL) cable if it is not intended for connection.

CONNECTING THE CHARGING FUNCTION

If the charging function will be used:

Fig. 529: Identifying Blue Locking Mechanism In The Black 12-Pin Connector
Courtesy of VOLVO CARS CORPORATION

- Carefully press out the blue locking mechanism in the black 12-pin connector with a small screwdriver.

Fig. 530: Identifying Blue/Yellow (BL/Y) Cable To Position F In The Black (SB) 12-Pin Connector
Courtesy of VOLVO CARS CORPORATION

- Connect the blue/yellow (BL/Y) cable to position F in the black (SB) 12-pin connector.
- Move the locking mechanism back to locked position.
- Insulate the cable terminal on the unused black/yellow (SB/Y) cable and secure the cable to the cable harness. If neither cable is intended for connection, insulate and secure both cables.

CONNECTING THE FUNCTIONS

If the reversing light function will be used:

Fig. 531: Identifying Blue Locking Mechanism In The Black 12-Pin Connector
Courtesy of VOLVO CARS CORPORATION

- Carefully press out the blue locking mechanism in the black 12-pin connector with a small screwdriver.

Fig. 532: Identifying Black/Yellow (SB/Y) Cable To Position H In The Black (SB) 12-Pin Connector
Courtesy of VOLVO CARS CORPORATION

- Connect the black/yellow (SB/Y) cable to position H in the black (SB) 12-pin connector.
- Move the locking mechanism back to locked position.
- Insulate the cable terminal on the unused blue/yellow (BL/Y) cable and secure the cable to the cable harness. If neither cable is intended for connection, insulate and secure both cables.

CONNECTING THE FUNCTIONS

Fig. 533: Routing The Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Route the cable harness from the tow bar connector through the hole in the floor.
- Adjust the position of the rubber seal (1) so that there is not excessive cable slack under the car.
- Install the rubber seal in the hole.
- Route the cable harness as illustrated. Insert it through the hole along the rear edge of the left-hand cargo floor support.

- Secure the cable harness to the cable harness behind the battery with tie straps (2) from the kit.

Fig. 534: Connecting the Ground Cable
Courtesy of VOLVO CARS CORPORATION

- Connect the routed ground cable to the grounding point (3) behind the battery and tighten the grounding screw securely.
- Connect the drain hose (4) to the battery.

CONNECTING THE FUNCTIONS

Fig. 535: Secure Cable Harness Using A Tie Strap On Each Side Of Brackets For Tow Hitch Member
Courtesy of VOLVO CARS CORPORATION

NOTE: If the cable harness is stretched too tightly, it can scrape against the lower edge of the bumper and become damaged.

- Make sure the cable harness curves around the lower edge of the bumper as shown in the illustration.

CONNECTING THE FUNCTIONS

Fig. 536: Identifying Trailer Module (TRM)
Courtesy of VOLVO CARS CORPORATION

NOTE: On the XC90 Executive, T-wiring is already installed in the fuse holder. A cable with a black connector is taped to this. The tow bar wiring's black connector is then connected to this cable.

- Detach the trailer module (TRM) from the Velcro fastener on the floor along the rear edge of the left-hand rear wheel housing.

  green (GN) and grey (GR) connectors to the control module.

  black (SB) connector to the fuse holder.
- Plug in the tow bar wiring connectors:

  green (GN) and grey (GR) connectors to the control module.

  black (SB) connector to the fuse holder.
- Reinstall the control module.
- Secure the excess cable with a tie strap from the kit.

CONNECTING THE FUNCTIONS

Fig. 537: Inserting Fuses From The Kit
Courtesy of VOLVO CARS CORPORATION

- Insert fuses from the kit in the following positions in the fuse holder (REM):

  20A in position 20 (mini fuse) if the charging function according to step, see **CONNECTING THE CHARGING FUNCTION** has been selected

  25A in position 29

  25A in position 30

FINISHING

Reinstall:

- the left-hand side panel using the screws and cover. Tighten the screws in the load securing eyelets. Tighten to **24 Nm (18 lbf ft)** .
- the covers for the load securing eyelets.
- D-post panel with connector.
- the connector for the rear roof lighting (if applicable).
- the rear headlining.
- C-post panel.
- protective cover and bracket for the battery.
- side floor hatch and folding panel.
- storage compartment and floor hatch.

Applies to connection of the function for automatic rear fog lamp deactivation

NOTE: The function requires car-specific software. Program the software according to the service information described in VIDA (Volvo scan tool).

CHECKING THE 7-PIN CONNECTOR:

Fig. 538: 7-Pin Connector
Courtesy of VOLVO CARS CORPORATION

1. Left indicator lamps
2. Rear fog lamp / reversing lamp / charging
3. Ground
4. Right indicator lamps
5. Right parking lamps
6. Brake lamp
7. Left parking lamps

TOWBAR, INSTALLATION KIT, XC90 R-DESIGN (2009-2010)

TOWBAR, INSTALLATION KIT, XC90 R-DESIGN

Fig. 539: Identifying Two Screws For The Rear Silencer Mounting Bracket
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws from the bracket for the rear silencer mounting and lower the exhaust pipe towards the stop.
- Detach the bracket from the rubber mounting and place to one side. There is a new bracket in the kit.
- Repeat the operation on the other side.
- Carefully bend the radiated heat shield to one side by the left-hand silencer next to the side member for easier access.

Fig. 540: Make A Mark On The Exhaust Pipe
Courtesy of VOLVO CARS CORPORATION

- Make a mark on the exhaust pipe and pipe for the silencer so that the silencer's end pipe is correctly positioned in the skid plate cut-out when the towbar and skid plate are installed.
- Remove the screw in the joint for the right-hand silencer and angle downwards.

Fig. 541: Angling The Right-Hand Silencer Downwards
Courtesy of VOLVO CARS CORPORATION

Fig. 542: Removing The Four Clips
Courtesy of VOLVO CARS CORPORATION

- Remove the four clips that hold the skid plate to the inside of the lower edge by pressing in their central pins and removing them.

Fig. 543: Prying The Skid Plate Away
Courtesy of VOLVO CARS CORPORATION

- Carefully pry the skid plate away from the bumper cover using a weatherstrip tool. Start at the lowermost edge. The skid plate is secured by surrounding catches.

Fig. 544: Identifying The Cradle's Middle Section
Courtesy of VOLVO CARS CORPORATION

- Carefully saw off the cradle's middle section at the two marks and discard them.

Fig. 545: Identifying Protective Tags
Courtesy of VOLVO CARS CORPORATION

- Lift up the rear edge of the protective tags that cover the mounting holes in inside of the side members (one per side) and cut off **80 mm (3 1/8")** .
- Remove any sealant from all surfaces that the towbar with reinforcement plates are tightened to.

Fig. 546: Installing The Mounting Bracket Through Two Rear Holes
Courtesy of VOLVO CARS CORPORATION

- Remove the protective tags which cover the mounting holes on the outside of the side members.
- Fit the mounting bracket through the two rear holes in the outer wall of the side member. The threaded sections of the mounting bracket should now protrude through to the underside of the car. Repeat on the other side.
- Secure the mounting brackets using butyl tape in order to prevent them from falling back.

Fig. 547: Installing The Towing Member
Courtesy of VOLVO CARS CORPORATION

NOTE: This part should be performed by two persons.

- Remove the towbar from the towing member according to the handling instructions for the relevant towbar.
- Lift up the towing member. Start by angling up the left-hand side's end face above the silencer's end pipe and up behind the bumper to the side member. Following which, angle up the right-hand side's end face to

the side member, and position it opposite their holes on the side members.

NOTE: Ensure that the skid plate cradle does not crack.

- Fit an **M12x40** screw (1) in the front hole on each side, while holding the towing member in position.
- Install the remaining screws.
- Insert the screws all the way without tightening them.

NOTE: Apply rustproofing agent under the car and on the side members around the end faces, scraping away any sealing compound, before torque tightening the screws.

Fig. 548: Installing Reinforcement Plate
Courtesy of VOLVO CARS CORPORATION

- Take a reinforcement plate from the kit, place it on the mounting bracket with the oval holes facing upwards and install the flange nuts.
- Install the two screws in the lower edge.
- Screw in the nuts until they bottom out but do not tighten yet.
- Repeat the operation on the other side.

Fig. 549: Installing A Support Hook
Courtesy of VOLVO CARS CORPORATION

- Take a support hook with nuts from the kit. Install the hook on the screws.
- Install and tighten the nuts until they stop but do not tighten yet.
- Repeat the operation on the other side.

Fig. 550: Locating Screws (1)
Courtesy of VOLVO CARS CORPORATION

- Torque tighten the screws (1) to **120 Nm** on both sides.
- Torque tighten the upper and lower bolted joint for the mounting bracket to **50 Nm** . Use joint socket P/N **9814017** when tightening the upper bolted joint. Repeat on the other side.
- Bend back the heat deflector plate.

Fig. 551: Identifying Joint Socket P/N 9814017
Courtesy of VOLVO CARS CORPORATION

Fig. 552: Locating Rubber Mounting On The New Hook
Courtesy of VOLVO CARS CORPORATION

- Hook the silencer's rubber mounting on the new hook.

A

Fig. 553: Angling The Right Silencer Back
Courtesy of VOLVO CARS CORPORATION

- Angle the right silencer back and hook the rubber silencer onto the new hook.

B

Fig. 554: Adjusting The Position To The Markings
Courtesy of VOLVO CARS CORPORATION

- Adjust the position of the silencer on the exhaust pipe according to the markings.

Fig. 555: Identifying Shaded Area To Be Removed (A)
Courtesy of VOLVO CARS CORPORATION

- Saw out the skid plate according to the markings. The shaded area is to be removed.

NOTE: Do not damage the paintwork of the bumper cover.

- Smooth off the sawn edges with a fine toothed file.

A Detachable towbar

Fig. 556: Identifying Shaded Area To Be Removed (B)

TOWBAR, ADAPTER (2003-2004)

TOWBAR, ADAPTER

NOTE: Some steps in these installation instructions are presented with illustration only.

PREPARATIONS

APPLIES TO THE XC90

Fig. 560: Fold Up Center Rear Floor Hatch
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Fold up the center rear floor hatch (1). If the underside of the floor hatch is equipped with a grocery bag holder, the holder is secured with a strap on both ends of the storage compartment. Detach the straps.
- Remove the underlying storage compartment.
- Remove the floor hatch by folding it almost completely closed and pulling it backwards from the mountings until it releases.

Applies to cars with three rows of seats and integrated carrier bag holder on the underside of the center floor hatch

- Fold up the center rear floor hatch (1).
- Detach the two straps on the underlying panel. Lift up the rear edge of the panel, fold the floor hatch back towards the panel and lift out the floor hatch with the panel.

Applies to cars with three rows of seats without an integrated carrier bag holder

- Fold up the center rear floor hatch (1) at the rear edge and lift it out.

Fig. 561: Remove Right And Left Side Glove Box
Courtesy of VOLVO CARS CORPORATION

- Remove the right and left side glove box (1).

Fig. 562: Remove Folding Side Panel From Left And Right-Hand Sides In Cargo Compartment
Courtesy of VOLVO CARS CORPORATION

- Remove the folding side panel from the left and right-hand sides in the cargo compartment.

Fig. 563: Removing Three Screws In Battery Holder
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws and the nut from the holder for the battery cover and lift out.
- Remove the battery cover.

Fig. 564: Disconnect Battery Positive And Negative Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position 0.
- Disconnect the battery negative lead.
- Disconnect the battery positive lead.

NOTE: **Wait at least three minutes before unplugging the connectors or removing other electrical equipment.**

Fig. 565: Remove Screw And Floor Mount For Battery
Courtesy of VOLVO CARS CORPORATION

- Remove the screw and floor mount for the battery.
- Remove the battery's drainage and place to one side.

Fig. 566: Remove Cover In Fuse Holder For Main Fuses
Courtesy of VOLVO CARS CORPORATION

- Remove the cover in the fuse holder for the main fuses.

Fig. 567: Disconnect Connectors For Towbar Wiring In Space Under Right-Hand Tail Lamp
Courtesy of VOLVO CARS CORPORATION

- Disconnect the connectors for the towbar wiring in the space under the right-hand tail lamp.

INSTALLATION

APPLIES TO THE XC90

Fig. 568: Route Long Cable From Space Where Towbar Wiring Is Connected And Up To Holder For Main Fuses
Courtesy of VOLVO CARS CORPORATION

- Take the adapter wiring from the kit. Route the long cable from the space where the towbar wiring is connected and up to the holder for the main fuses.

Fig. 569: Connect Cable With Small Ring Cable Terminal
Courtesy of VOLVO CARS CORPORATION

- Take a fuse, two nuts and two washers from the kit. Install the fuse in any free terminal.
- Connect the cable with the small ring cable terminal.
- Install washers and nuts. Torque tighten the nuts to **10 Nm (7.5 lbf. ft.)** .

Fig. 570: Close Fuse Box Cover
Courtesy of VOLVO CARS CORPORATION

Fig. 571: Secure Cable To Holder For Main Fuses Using Cable Ties From Kit
Courtesy of VOLVO CARS CORPORATION

- Secure the cable to the holder for the main fuses using cable ties from the kit.
- Route the excess cable in the space under the tail lamp.
- Make sure that the wiring does not chafe against sharp edges.

Fig. 572: Connect Adapter Cable's Gray Male And Female Connector To Corresponding Connectors For Towbar Wiring
Courtesy of VOLVO CARS CORPORATION

- Connect the adapter cable's gray male and female connector (1) to the corresponding connectors (2) for the towbar wiring.

Fig. 573: Secure Relay Holder With Relay And Fuse Holder With Fuse Around Existing Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Secure the relay holder with relay and fuse holder with fuse around the existing cable harness.

Fig. 574: Secure Four Gray Connected Connectors Around Existing Cable Harnesses Using Their Relevant Cable Ties From Kit
Courtesy of VOLVO CARS CORPORATION

- Secure the four gray connected connectors around the existing cable harnesses using their relevant cable ties from the kit.

Fig. 575: Connect Battery's Drainage Hose
Courtesy of VOLVO CARS CORPORATION

- Reinstall the battery.
- Install the mounting with the screw. Torque tighten to **24 Nm (18 lbf. ft.)** .
- Connect the battery's drainage hose.

Fig. 576: Remove 20A Fuse In Rear Fuse Holder In Terminal 15
Courtesy of VOLVO CARS CORPORATION

- Remove the **20A** fuse in the rear fuse holder in terminal **15** . Replace it with the **5A** fuse from the kit.

Fig. 577: Connect Positive And Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

Fig. 578: Removing Three Screws In Battery Holder
Courtesy of VOLVO CARS CORPORATION

- Reinstall the battery cover with holder, screws and nuts.
- Tighten screws and nuts to **24 Nm (18 lbf. ft)** .

Fig. 579: Reinstall Battery Cover With Holder, Screws And Nuts (1 Of 3)
Courtesy of VOLVO CARS CORPORATION

Fig. 580: Reinstall Battery Cover With Holder, Screws And Nuts (2 Of 3)
Courtesy of VOLVO CARS CORPORATION

Fig. 581: Reinstall Battery Cover With Holder, Screws And Nuts (3 Of 3)
Courtesy of VOLVO CARS CORPORATION

TOWBAR, ADAPTER (2005-2009)

TOWBAR, ADAPTER

NOTE: **Some steps in these installation instructions are presented with illustration only.**

PREPARATIONS

APPLIES TO THE XC90

Fig. 582: Folding Up The Centre Rear Floor Hatch (1)
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Fold up the center rear floor hatch (1). If the underside of the floor hatch is equipped with a grocery bag holder, the holder is secured with a strap at each end of the storage compartment. Detach the straps.
- Remove the underlying storage compartment.
- Remove the floor hatch by folding it almost completely closed and pulling it backwards from the mountings until it releases.

Applies to cars with three rows of seats and integrated carrier bag holder on the underside of the center floor hatch

- Fold up the center rear floor hatch (1).
- Detach the two straps on the underlying panel. Lift up the rear edge of the panel, fold the floor hatch back towards the panel and lift out the floor hatch with the panel.

Applies to cars with three rows of seats without an integrated carrier bag holder

- Fold up the center rear floor hatch (1) at the rear edge and lift it out.

Applies to all models

- Remove the left-hand side floor hatch (2).

Fig. 583: Identifying Left-Hand Side Folding Side Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the folding side panel from the left-hand side in the cargo compartment.

Fig. 584: Removing Three Screws In Battery Holder
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws and the nut from the holder for the battery cover and lift out.
- Remove the battery cover.

Fig. 585: Disconnect Battery Positive And Negative Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position 0.
- Disconnect the battery negative lead.
- Disconnect the battery positive lead.

NOTE: **Wait at least three minutes before unplugging the connectors or removing other electrical equipment.**

Fig. 586: Remove Screw And Floor Mount For Battery
Courtesy of VOLVO CARS CORPORATION

- Remove the screw and floor mount for the battery.
- Remove the battery's drainage and place to one side.

Fig. 587: Remove Cover In Fuse Holder For Main Fuses
Courtesy of VOLVO CARS CORPORATION

- Remove the cover in the fuse holder for the main fuses.

Fig. 588: Identifying Left-Hand C-Post Panel And Plastic Weatherstrip Tools
Courtesy of VOLVO CARS CORPORATION

- Pull off the rubber strip at the rear edge of the door opening for the left-hand rear door opposite the left-hand C-post panel.
- Carefully pry off the left-hand C-post panel sides at the top. Use a plastic weatherstrip tool. Then pull until the three clips on the inside release. Do not damage the headlining or the panel.
- Disconnect the connector from any headset sockets.
- Remove the panel by pulling upwards slightly and unhooking it from the side panel.

Fig. 589: Identifying Cover And Screws Underneath Rear Headlining
Courtesy of VOLVO CARS CORPORATION

- Remove the rear roof panel covers and the screws beneath them.
- Carefully pry off the panel at the rear edge. Use a plastic weatherstrip tool.
- Pull the rear edge of the panel downwards until the four clips on the top release.
- If the car is equipped with lighting in the panel, unplug the connector from the panel.
- Pull the panel backwards to release it.

Fig. 590: Identifying D-Post Panel Removal From Side Panel
Courtesy of VOLVO CARS CORPORATION

- Carefully pull off the D-post panel. Start at the top edge then pull down until the three clips on the inside release. Do not damage the panel.
- Disconnect the connector on the D-post panel (if the car has a loudspeaker in the D-post, the connector is in the loudspeaker).
- Remove the panel by pulling upwards slightly and unhooking it from the side panel.

Fig. 591: Identifying Load Securing Eyelet
Courtesy of VOLVO CARS CORPORATION

- Fold out the load securing eyelet.
- Insert a scriber with an angled tip into the hole in the top of the cover.
- Turn the scriber so that the angled tip engages in the reverse of the cover (1). Pull the cover off.

Fig. 592: Cars With Two Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

Fig. 593: Cars With Three Rows Of Seats
Courtesy of VOLVO CARS CORPORATION

- Fold up the seats in the third row (applies to cars with three rows of seats).
- Remove the screws (2) for the load securing eyelets in the left-hand side panel.
- Remove the covers (3) over the front mountings for the left-hand side panel. Pry the covers off. Use a plastic weatherstrip tool or a small screwdriver.
- Remove the screws (4).
- Remove the clip (5) at the bottom of the storage compartment in the panel (Applies to cars with three rows of seats).
- Remove the panel by pulling out the upper edge slightly so that the clips on the inside release. Pull the panel straight up.

INSTALLATION

APPLIES TO THE XC90

Fig. 594: Identifying F20 Fuse Location

Courtesy of VOLVO CARS CORPORATION

- Remove the **20A** fuse in the rear fuse holder in terminal **F20** . Replace it with the **5A** fuse from the kit.

Fig. 595: View Of Disconnect The Connector
Courtesy of VOLVO CARS CORPORATION

- Disconnect the connector for the cable harness for the towbar.

Fig. 596: Connect The Black Female Connector
Courtesy of VOLVO CARS CORPORATION

- Take the cable harness from the kit and connect the black female connector to the socket where the connector for the cable for the towbar was removed.
- Plug the remaining black connectors into each other.

Fig. 597: View Of Long Cable Route To Ground Terminal
Courtesy of VOLVO CARS CORPORATION

- Route the long cable ends out through the socket at the rear edge of the floor support and up to the ground terminal. Route the longer of the cables on the rear member's right-hand side, and the shorter to the holder for the main fuses.

Fig. 598: Connect Cable With Small Ring Cable Terminal
Courtesy of VOLVO CARS CORPORATION

- Take a fuse, two nuts and two washers from the kit and install the fuse in any free terminal.
- Connect the cable with the small ring cable terminal.
- Install washers and nuts. Torque tighten the nuts to **5 Nm (4 lbf. ft.)** .

Fig. 599: Identifying Larger Ring Cable Terminal
Courtesy of VOLVO CARS CORPORATION

- Connect the larger ring cable terminal to the ground terminal on the right-hand side in the rear member. Torque tighten to **24 Nm (18 lbf. ft.)** .

Fig. 600: Identifying Rear Fuse Holder Excess Cable
Courtesy of VOLVO CARS CORPORATION

- Route the cable excess to the rear fuse holder.
- Secure the wiring using cable ties from the kit.

Fig. 601: View Of Secured Relay Holder
Courtesy of VOLVO CARS CORPORATION

- Secure the relay holder with relay and fuse holder with fuse, at existing cable harnesses with cable ties from the kit.

Fig. 602: Close Fuse Box Cover
Courtesy of VOLVO CARS CORPORATION

Fig. 603: Connect Battery's Drainage Hose
Courtesy of VOLVO CARS CORPORATION

- Reinstall the battery.
- Tighten the mounting with the screw. Torque tighten to **24 Nm (18 lbf. ft.)** .
- Connect the battery's drainage hose.

Fig. 604: Connect Positive And Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

Fig. 605: Removing Three Screws In Battery Holder
Courtesy of VOLVO CARS CORPORATION

- Reinstall the battery cover with holder, screws and nuts.
- Tighten screws and nuts to **24 Nm (18 lbf. ft)** .

Fig. 606: Identifying Left-Hand Side Panel (1 of 3)
Courtesy of VOLVO CARS CORPORATION

Fig. 607: Identifying Left-Hand Side Panel (2 of 3)
Courtesy of VOLVO CARS CORPORATION

Fig. 608: Identifying Left-Hand Side Panel (3 of 3)
Courtesy of VOLVO CARS CORPORATION

- Reinstall the left-hand side panel with screws and cover. Tighten the screws in the load securing eyelets. Tighten to **24 Nm (18 lbf ft)** .

Fig. 609: Reinstalling The Left-Hand Side Panel
Courtesy of VOLVO CARS CORPORATION

Fig. 610: Installing Roof Panel
Courtesy of VOLVO CARS CORPORATION

Fig. 611: Installing C-Pillar Cover
Courtesy of VOLVO CARS CORPORATION

Fig. 612: Installing Storage Bins
Courtesy of VOLVO CARS CORPORATION

Fig. 613: Installing Floor Panels
Courtesy of VOLVO CARS CORPORATION

TOWBAR, DETACHABLE (2003-2012)

TOWBAR, DETACHABLE

PREPARATIONS

Fig. 614: Removing Storage Boxes
Courtesy of VOLVO CARS CORPORATION

- Fold up the center rear floor hatch (1). If the floor hatch is equipped with a grocery bag holder on the underside then it is fixed with a strap on each short side of the storage box, and these must be detached.
- Remove the storage box underneath and lift it out.
- Remove the side floor hatches (2) on the right and left-hand sides in the cargo compartment.
- If the car is equipped with a spare wheel, remove it.

Fig. 615: Measuring On The Inside Of The Rear Bumper Cover
Courtesy of VOLVO CARS CORPORATION

- Raise the car.
- Measure out and draw a horizontal line **15 mm (9/16")** under the top edge of the grooves (1), on the inside of the rear bumper cover.
- Draw a vertical line **18 mm (11/16)** from the inside of the grooves (1).
- Cut/saw along the drawn lines so that two parallel slits are formed in the bumper cover.
- Smooth off all edges with a file.

Fig. 616: Identifying Front Mounting
Courtesy of VOLVO CARS CORPORATION

- Detach the silencer's front mounting in the rear subframe by removing the screws (1).

Fig. 617: Identifying The Rear Mounting
Courtesy of VOLVO CARS CORPORATION

- Detach the rubber mounting (1).
- Detach the silencer's rear mounting bracket from the lower edge of the left-hand side member by removing the screws (2).
- Carefully bend aside the heat deflector plate at the side member to make more space to work in.

APPLIES TO CARS WITH REAR PARKING ASSISTANCE

Fig. 618: Identifying The Right-Hand Side
Courtesy of VOLVO CARS CORPORATION

Fig. 619: Identifying The Left-Hand Side
Courtesy of VOLVO CARS CORPORATION

- Detach the cable to the parking assistance sensors from its clips in the rear section of the bumper.

APPLIES TO ALL MODELS

Fig. 620: Cut Out As Marked
Courtesy of VOLVO CARS CORPORATION

Right-hand side:

- Cut/saw out the rear section at the existing cut-out in accordance with the markings in the illustration.

APPLIES TO CARS WITH REAR PARKING ASSISTANCE

Fig. 621: Measuring Hole Locations
Courtesy of VOLVO CARS CORPORATION

Right-hand side:

- Measure out for drilling the hole for the cable grommet in the upper of the rear section's plates as illustrated.
- Pre-drill using a **O3 mm (1/8")** diameter drill bit, and then drill out the hole to **O8 mm (5/16")** . Use an angle drilling machine and short drill bits.

Fig. 622: Cutting a 2 mm (5/64") Groove
Courtesy of VOLVO CARS CORPORATION

- Cut open a **2 mm (5/64")** wide slot through the plate up to the hole.

APPLIES TO ALL MODELS

Fig. 623: Cutting Out As Marked
Courtesy of VOLVO CARS CORPORATION

Left-hand side:

- Cut/saw out the rear section at the existing cut-out in accordance with the markings in the illustration.

APPLIES TO CARS WITH REAR PARKING ASSISTANCE

Fig. 624: Measuring Hole Locations
Courtesy of VOLVO CARS CORPORATION

Left-hand side:

- Measure out for drilling the hole for the cable grommet on the right and left-hand sides of the cut-out, in the upper of the rear section's plates as illustrated.
- Pre-drill using a **O3 mm (1/8")** diameter drill bit, and then drill out the holes to **O8 mm (5/16")** . Use an angle drilling machine and short drill bits.

Fig. 625: Cutting a 2 mm (5/64") Slot
Courtesy of VOLVO CARS CORPORATION

- Cut open a **2 mm (5/64")** wide slot through the plate up to the holes on both sides of the cut-out.

Fig. 626: Routing Cable
Courtesy of VOLVO CARS CORPORATION

Right-hand side:

- Press up one of the plate's tabs and guide the cable into the previously drilled hole. The cable must be routed as illustrated.

Fig. 627: Routing Cable
Courtesy of VOLVO CARS CORPORATION

Left-hand side:

- Press up the plate's tabs and guide the cable into the previously drilled holes. The cable must be routed as illustrated.

INSTALLING THE TOWING MEMBER

APPLIES TO ALL MODELS

Fig. 628: Identifying The Protective Tags (1)
Courtesy of VOLVO CARS CORPORATION

- Lift up the protective tags (1) (at the rear edge) which cover the mounting holes on the inside of the side members (one on each side) and cut away 80 mm.
- Remove the bracket for the towing eye by removing the screws (2).
- Remove any sealing compound from the surface where the end faces of the towing member shall be

located.

Fig. 629: Leaving An Imprint On The Plate
Courtesy of VOLVO CARS CORPORATION

- Get a brace and a foam rubber plate from the kit.

  Centre the brace on the plate and press, so that the threaded ends leave an imprint on the plate

Fig. 630: Locating Measurements
Courtesy of VOLVO CARS CORPORATION

Fig. 631: Cutting Between The Circles
Courtesy of VOLVO CARS CORPORATION

- Get a knife and ruler, and place a straight cut between the outsides of both circles.

Fig. 632: Pressing The Plate On The Brace
Courtesy of VOLVO CARS CORPORATION

- Press down the plate on the brace approx. **30 mm** , with protective tape facing the two nuts.

Fig. 633: Removing The Protective Tape
Courtesy of VOLVO CARS CORPORATION

- Remove the protective tape from the foam rubber plate.
- Repeat steps for the other brace.

Fig. 634: Fitting The Mounting Bracket Through Two Holes
Courtesy of VOLVO CARS CORPORATION

- Lower the car.
- Remove the protective tags which cover the mounting holes on the outside of the side members.
- Fit the mounting bracket through the two rear holes in the outer wall of the side member. The threaded sections of the mounting bracket should now protrude through to the underside of the car. Repeat on the other side.
- Secure the mounting brackets using butyl tape for example in order to prevent them from falling back.

Fig. 635: Fitting The M12X40 Screws (1) On Each Side
Courtesy of VOLVO CARS CORPORATION

- Raise the car.
- Remove the towbar from the towing member.
- Lift up the towing member. Start by angling up the left-hand side's end face above the silencer's end pipe and up behind the bumper to the side member. Following which, angle up the right-hand side's end face to the side member, and position it on the side members, opposite their holes.
- Fit the M12x40 screw (1) in the front hole on each side, while holding the towing member in position.
- Install the remaining screws (2).
- Insert the screws all the way without tightening them.

NOTE: **Apply rustproofing agent under the car and on the side members around the end faces, scraping away any sealing compound, before torque tightening the screws.**

Fig. 636: Installing The Reinforcing Plate

Courtesy of VOLVO CARS CORPORATION

- Install the reinforcing plate with the oval holes facing up.
- Install the flange nuts (1) on the mounting bracket.
- Install the bolts and the flange nuts (2).
- Insert the screws all the way without tightening them. Carry out the above procedure on the other side too.

Fig. 637: Centering The Towbar In Relation To The Bumper.
Courtesy of VOLVO CARS CORPORATION

- Centre the towbar in relation to the cut-out in the bumper.

Fig. 638: Identifying Joint Socket (P/N 9814017)
Courtesy of VOLVO CARS CORPORATION

- Torque tighten the screws (1) to **120 Nm** on both sides.
- Torque tighten the upper and lower bolted joint for the mounting bracket to **50 Nm** . Use joint socket

(P/N 9814017) when tightening the upper one. Repeat on the other side.

- Bend back the heat deflector plate.
- Reinstall the silencer's rear mounting.
- Reinstall the silencer's front mounting. Torque tighten the screws to **24 Nm** .

Fig. 639: Pressing The Foam Rubber Plate So It Seals Around The Holes
Courtesy of VOLVO CARS CORPORATION

- Remove the pieces of butyl tape, if used to secure the brace.
- Press on the foam rubber plate against the side member so that it seals tightly around the holes.
- Repeat the operation on the other side.

Fig. 640: Installing The Protective Plug
Courtesy of VOLVO CARS CORPORATION

- Check the function of the detachable towbar.
- Install the protective plug.

- Fit the towbar wiring in accordance with the separate installation instructions.

INSTALLING THE HOLDER

Fig. 641: Measurement For Drilling
Courtesy of VOLVO CARS CORPORATION

- Measure out for drilling the hole for the towbar holder, to the right of the battery as illustrated. Use a **O6.5 mm (1/4")** diameter drill bit.

  NOTE: Remove any spare wheel before drilling.

- Remove any shavings.

  Apply rustproofing agent to the hole.

Fig. 642: Installing The Holder
Courtesy of VOLVO CARS CORPORATION

- Install the holder using an M6 x 10 screw and M6 nut. Torque tighten to **10 Nm** .

Fig. 643: Fitting The Four Foam Plastic Pieces
Courtesy of VOLVO CARS CORPORATION

- Fit the four foam plastic pieces as illustrated. This is to avoid rattling when the towbar is stored there.

Applies to cars with warning triangle

- Move the warning triangle approx. 80 mm sideways into the center to make space for the towbar. Mark out the inner wall locations for the warning triangle's Velcro fasteners.
- Secure two Velcro fasteners at the markings on the inner wall. Install the warning triangle.

STORING THE TOWBAR

Fig. 644: Stowing The Towbar
Courtesy of VOLVO CARS CORPORATION

- Take the retaining strap and thread it through the holder's two eyelets.
- Thread the accompanying protective bag over the towbar and tighten the protective bag's cord. Position the towbar with bag in the holder with the ball section to the rear, and tighten with the strap.

FINISHING WORK

- Put the spare wheel back in place.
- Reinstall the storage box and floor hatches.
- Affix the accompanying decal to the underside of the floor hatch, as illustrated.
- Fill in the registration card and send it to the local Volvo dealer.

TOWBAR, FIXED (2006-2012)

TOWBAR, FIXED

PREPARATIONS

Fig. 645: Removing Storage Boxes
Courtesy of VOLVO CARS CORPORATION

- Fold up the center rear floor hatch (1). If the floor hatch is equipped with a grocery bag holder on the underside then it is fixed with a strap on each short side of the storage box, and these must be detached.
- Detach the storage box underneath and lift it out.
- Remove the side floor hatches (2) on the right and left-hand sides in the cargo compartment.
- If the car is equipped with a spare wheel, remove it.

Fig. 646: Measure And Cut Along The Inside Of Groove 1 And Groove 3
Courtesy of VOLVO CARS CORPORATION

- Raise the car.
- Measure out and draw a horizontal line (A) **6 mm (1/4")** under the top edge of the grooves, on the inside of the rear bumper cover.
- Cut/saw along the inside of groove 1 and groove 3 (the sides which face groove 2) up to the horizontal line which was drawn.
- Repeat this between groove 6 and groove 4. Remove the shadowed areas (B) by cutting/sawing between the cuts along the horizontal line, so that two parallel slits are formed in the bumper cover.

Fig. 647: Identifying the End Result
Courtesy of VOLVO CARS CORPORATION

- Smooth off all edges with a file.
- Cut away all of the grooves' ridges level with the bumper cover. The end result should appear as illustrated.

Fig. 648: Identifying Front Mounting
Courtesy of VOLVO CARS CORPORATION

- Detach the silencer's front mounting in the rear subframe by removing the screws (1).

Fig. 649: Identifying The Screws (2)
Courtesy of VOLVO CARS CORPORATION

- Detach the rubber mounting (1).
- Detach the silencer's rear mounting bracket from the lower edge of the left-hand side member by removing the screws (2).
- Carefully bend aside the heat deflector plate at the side member to make more space to work in.

APPLIES TO CARS WITH REAR PARKING ASSISTANCE

Fig. 650: Identifying The Right-Hand Side
Courtesy of VOLVO CARS CORPORATION

Fig. 651: Identifying The Left-Hand Side
Courtesy of VOLVO CARS CORPORATION

- Detach the cable to the parking assistance sensors from its clips in the rear section of the bumper.

APPLIES TO ALL MODELS

Fig. 652: Cut Out As Marked
Courtesy of VOLVO CARS CORPORATION

Right-hand side:

- Cut/saw out the rear section at the existing cut-out in accordance with the markings in the illustration.

APPLIES TO CARS WITH REAR PARKING ASSISTANCE

Fig. 653: Measuring Hole Locations
Courtesy of VOLVO CARS CORPORATION

Right-hand side:

- Measure out for drilling the hole for the cable grommet in the upper of the rear section's plates as illustrated.
- Pre-drill using a **O3 mm (1/8")** diameter drill bit, and then drill out the hole to **O8 mm (5/16")** . Use an angle drilling machine and short drill bits.

Fig. 654: Cutting a 2 mm (5/64") Groove
Courtesy of VOLVO CARS CORPORATION

- Cut open a **2 mm (5/64")** wide slot through the plate up to the hole.

APPLIES TO ALL MODELS

Fig. 655: Cutting Out As Marked
Courtesy of VOLVO CARS CORPORATION

Left-hand side:

- Cut/saw out the rear section at the existing cut-out in accordance with the markings in the illustration.

APPLIES TO CARS WITH REAR PARKING ASSISTANCE

Fig. 656: Measuring Hole Locations
Courtesy of VOLVO CARS CORPORATION

Left-hand side:

- Measure out for drilling the hole for the cable grommet on the right and left-hand sides of the cut-out, in the upper of the rear section's plates as illustrated.
- Pre-drill using a**O3 mm (1/8")** diameter drill bit, and then drill out the holes to **O8 mm (5/16")** . Use an angle drilling machine and short drill bits.

Fig. 657: Cutting a 2 mm (5/64") Slot
Courtesy of VOLVO CARS CORPORATION

- Cut open a **2 mm (5/64")** wide slot through the plate up to the holes on both sides of the cut-out.

Fig. 658: Routing Cable
Courtesy of VOLVO CARS CORPORATION

Right-hand side:

- Press up one of the plate's tabs and guide the cable into the previously drilled hole. The cable must be routed as illustrated.

Fig. 659: Routing Cable
Courtesy of VOLVO CARS CORPORATION

Left-hand side:

- Press up the plate's tabs and guide the cable into the previously drilled holes. The cable must be routed as illustrated.

INSTALLING THE TOWING MEMBER

APPLIES TO ALL MODELS

Fig. 660: Identifying The Protective Tags (1)
Courtesy of VOLVO CARS CORPORATION

- Lift up the protective tags (1) (at the rear edge) which cover the mounting holes on the inside of the side members (one on each side) and cut away 80 mm.
- Remove the bracket for the towing eye by removing the screws (2).
- Remove any sealing compound from the surface where the end faces of the towing member shall be located.

Fig. 661: Leaving An Imprint On The Plate
Courtesy of VOLVO CARS CORPORATION

- Get a brace and a foam rubber plate from the kit.

  Centre the brace on the plate and press, so that the threaded ends leave an imprint on the plate

Fig. 662: Locating Measurements
Courtesy of VOLVO CARS CORPORATION

Fig. 663: Cutting Between The Circles
Courtesy of VOLVO CARS CORPORATION

- Get a knife and ruler, and place a straight cut between the outsides of both circles.

Fig. 664: Pressing The Plate On The Brace
Courtesy of VOLVO CARS CORPORATION

- Press down the plate on the brace approx. **30 mm** , with protective tape facing the two nuts.

Fig. 665: Removing The Protective Tape
Courtesy of VOLVO CARS CORPORATION

- Remove the protective tape from the foam rubber plate.
- Repeat steps 16-19 for the other brace.

Fig. 666: Fitting The Mounting Bracket Through Two Holes
Courtesy of VOLVO CARS CORPORATION

- Lower the car.
- Remove the protective tags which cover the mounting holes on the outside of the side members.
- Fit the mounting bracket through the two rear holes in the outer wall of the side member. The threaded sections of the mounting bracket should now protrude through to the underside of the car. Repeat on the other side.
- Secure the mounting brackets using butyl tape for example in order to prevent them from falling back.

Fig. 667: Fitting The M12X40 Screws (1) On Each Side
Courtesy of VOLVO CARS CORPORATION

- Raise the car.
- Lift up the towing member. Start by angling up the left-hand side's end face above the silencer's end pipe and up behind the bumper to the side member. Following which, angle up the right-hand side's end face to the side member, and position it on the side members, opposite their holes.
- Fit the M12x40 screw (1) in the front hole on each side, while holding the towing member in position.

- Install the remaining screws (2).
- Insert the screws all the way without tightening them.

NOTE: Apply rustproofing agent under the car and on the side members around the end faces, scraping away any sealing compound, before torque tightening the screws.

Fig. 668: Installing The Reinforcing Plate
Courtesy of VOLVO CARS CORPORATION

- Install the reinforcing plate with the oval holes facing up.
- Install the flange nuts (1) on the mounting bracket.
- Install the bolts and the flange nuts (2) as illustrated.
- Insert the screws all the way without tightening them. Carry out the above procedure on the other side too.

Fig. 669: Centering The Towbar In Relation To The Bumper.

Courtesy of VOLVO CARS CORPORATION

- Centre the towbar in relation to the cut-out (1) in the bumper.

Fig. 670: Identifying Joint Socket (P/N 9814017)
Courtesy of VOLVO CARS CORPORATION

- Torque tighten the screws (1) to **120 Nm** on both sides.
- Torque tighten the upper and lower bolted joint for the mounting bracket to **50 Nm** . Use joint socket (P/N 9814017) when tightening the upper one. Repeat on the other side.
- Bend back the heat deflector plate.
- Reinstall the silencer's rear mounting.
- Reinstall the silencer's front mounting. Torque tighten the screws to **24 Nm** .

Fig. 671: Pressing The Foam Rubber Plate So It Seals Around The Holes
Courtesy of VOLVO CARS CORPORATION

- Remove the pieces of butyl tape, if used to secure the brace.

- Press on the foam rubber plate against the side member so that it seals tightly around the holes.
- Repeat the operation on the other side.

FINISHING WORK

- Fit the towbar wiring in accordance with the separate installation instructions.
- Put the spare wheel back in place.
- Reinstall the panels, storage box and floor hatches.

TOWBAR, HITCH (2006-2012)

TOWBAR, HITCH

NOTE: **Member kit**

1. **Cross member**
2. **Mounting bracket (x2)**
3. **Screw M10x30 (x4)**
4. **Flange nuts (x8)**
5. **Screw M12x40 (x6)**

15. **Locking pin**
16. **Screw M6X10**
17. **Velcro fastener (x2)**

Ball kit

18. **Washer**
19. **Ball**
20. **Nut**

PREPARATIONS

Fig. 672: Removing Storage Boxes
Courtesy of VOLVO CARS CORPORATION

- Fold up the center rear floor hatch (1). If the floor hatch is equipped with a grocery bag holder on the underside, it is fixed with a strap on each short side of the storage box, and these must be detached.
- Remove the storage box underneath and lift it out.
- Remove the side floor hatches (2) on the right and left-hand sides in the cargo compartment.
- If the car is equipped with a spare wheel, remove it.

Fig. 673: Making Two Parallel Slits In The Bumper Cover
Courtesy of VOLVO CARS CORPORATION

- Raise the car.
- Measure out and draw a horizontal line **6 mm (1/4")** under the top edge of the grooves, on the inside of the rear bumper cover.
- Draw a vertical line (A and B) **10 mm (3/8")** in towards the center of each side from groove 3 and 4.

- Cut/saw along the inside of groove 2 and line A up to the line which was drawn 6 mm (1/4") under the top edge of the grooves. Repeat this between groove 5 and line B. Remove the shadowed areas by cutting/sawing between the cuts along the horizontal line, so that two parallel slits are formed in the bumper cover.
- Cut away the remaining pieces of groove 3 and 4 level with the bumper.
- Smooth off all edges with a file.

Fig. 674: Cutting Away The Upright Ribs
Courtesy of VOLVO CARS CORPORATION

- Cut away all of the grooves' ridges.

Fig. 675: Identifying the End Result
Courtesy of VOLVO CARS CORPORATION

- The end result should appear as illustrated.

Fig. 676: Identifying Front Mounting
Courtesy of VOLVO CARS CORPORATION

- Detach the silencer's front mounting in the rear subframe by removing the screws (1).

Fig. 677: Identifying The Rear Mounting
Courtesy of VOLVO CARS CORPORATION

- Detach the rubber mounting (1).
- Detach the silencer's rear mounting bracket from the lower edge of the left-hand side member by removing the screws (2).
- Carefully bend aside the heat deflector plate at the side member to make more space to work in.

APPLIES TO CARS WITH REAR PARKING ASSISTANCE

Fig. 678: Identifying The Right-Hand Side
Courtesy of VOLVO CARS CORPORATION

Fig. 679: Identifying The Left-Hand Side
Courtesy of VOLVO CARS CORPORATION

- Detach the cable to the parking assistance sensors from its clips in the rear section of the bumper.

APPLIES TO ALL MODELS

Fig. 680: Cut Out As Marked
Courtesy of VOLVO CARS CORPORATION

Right-hand side:

- Cut/saw out the rear section at the existing cut-out in accordance with the markings in the illustration.

APPLIES TO CARS WITH REAR PARKING ASSISTANCE

Fig. 681: Measuring Location of Hole
Courtesy of VOLVO CARS CORPORATION

Right-hand side:

- Measure out for drilling the hole for the cable grommet in the upper of the rear section's plates as illustrated.
- Pre-drill using a **O3 mm (1/8")** diameter drill bit, and then drill out the hole to **O8 mm (5/16")** . Use an angle drilling machine and short drill bits.

Fig. 682: Cutting a 2 mm (5/64") Groove
Courtesy of VOLVO CARS CORPORATION

- Cut open a **2 mm (5/64")** wide slot through the plate up to the hole.

APPLIES TO ALL MODELS

Fig. 683: Cutting Out As Marked
Courtesy of VOLVO CARS CORPORATION

Left-hand side:

- Cut/saw out the rear section at the existing cut-out in accordance with the markings in the illustration.

APPLIES TO CARS WITH REAR PARKING ASSISTANCE

Fig. 684: Measuring Hole Locations
Courtesy of VOLVO CARS CORPORATION

Left-hand side:

- Measure out for drilling the hole for the cable grommet on the right and left-hand sides of the cut-out, in the upper of the rear section's plates as illustrated.
- Pre-drill using a **O3 mm (1/8")** diameter drill bit, and then drill out the holes to **O8 mm (5/16")** . Use an angle drilling machine and short drill bits.

Fig. 685: Cutting a 2 mm (5/64") Slot
Courtesy of VOLVO CARS CORPORATION

- Cut open a **2 mm (5/64")** wide slot through the plate up to the holes on both sides of the cut-out.

Fig. 686: Routing Cable
Courtesy of VOLVO CARS CORPORATION

Right-hand side:

- Press up one of the plate's tabs and guide the cable into the previously drilled hole. The cable must be routed as illustrated.

Fig. 687: Routing Cable
Courtesy of VOLVO CARS CORPORATION

Left-hand side:

- Press up the plate's tabs and guide the cable into the previously drilled holes. The cable must be routed as illustrated.

INSTALLING THE TOWING MEMBER

APPLIES TO ALL MODELS

Fig. 688: Identifying The Protective Tags (1)
Courtesy of VOLVO CARS CORPORATION

- Lift up the protective tags (1) (at the rear edge) which cover the mounting holes on the inside of the side members (one on each side) and cut away 80 mm.
- Remove the bracket for the towing eye by removing the screws (2).
- Remove any sealing compound from the surface where the end faces of the towing member shall be located.

Fig. 689: Leaving An Imprint On The Plate
Courtesy of VOLVO CARS CORPORATION

- Get a brace and a foam rubber piece from the kit.

  Centre the brace on the plate and press, so that the threaded ends leave an imprint on the plate.

Fig. 690: Locating Measurements
Courtesy of VOLVO CARS CORPORATION

Fig. 691: Cutting Between The Circles
Courtesy of VOLVO CARS CORPORATION

- Get a knife and a ruler, and cut a straight line between the outsides of both circles.

Fig. 692: Pressing The Plate On The Brace
Courtesy of VOLVO CARS CORPORATION

- Press down the plate on the brace approx. **30 mm** with the protective tape facing the two nuts.

Fig. 693: Removing The Protective Tape
Courtesy of VOLVO CARS CORPORATION

- Remove the protective tape from the foam rubber plate.
- Repeat steps 16-19 for the other brace.

Fig. 694: Fitting The Mounting Bracket Through Two Holes
Courtesy of VOLVO CARS CORPORATION

- Lower the car.
- Remove the protective tags which cover the mounting holes on the outside of the side members.
- Fit the mounting bracket through the two rear holes in the outer wall of the side member. The threaded sections of the mounting bracket should now protrude through to the underside of the car. Repeat on the other side.
- Secure the mounting brackets using butyl tape for example in order to prevent them from falling back.

Fig. 695: Fitting The M12X40 Screws (1) On Each Side
Courtesy of VOLVO CARS CORPORATION

- Raise the car.
- Remove the towbar from the towing member.
- Lift up the towing member. Start by angling up the left-hand side's end face above the silencer's end pipe and up behind the bumper to the side member. Following which, angle up the right-hand side's end face to the side member, and position it on the side members, opposite their holes.

- Fit the M12x40 screw (1) in the front hole on each side, while holding the towing member in position.
- Install the remaining screws (2).
- Insert the screws all the way without tightening them.

NOTE: Apply rustproofing agent under the car and on the side members around the end faces, scraping away any sealing compound, before torque tightening the screws.

Fig. 696: Installing The Reinforcing Plate
Courtesy of VOLVO CARS CORPORATION

- Install the reinforcing plate with the oval holes facing up.
- Install the flange nuts (1) on the mounting bracket.
- Install the bolts and the flange nuts (2).
- Insert the screws all the way without tightening them. Carry out the above procedure on the other side too.

Fig. 697: Centering The Towbar In Relation To The Bumper
Courtesy of VOLVO CARS CORPORATION

- Centre the towbar in relation to the cut-out in the bumper.

Fig. 698: Identifying Joint Socket (P/N 9814017)
Courtesy of VOLVO CARS CORPORATION

- Torque tighten the screws (1) to **120 Nm** on both sides.
- Torque tighten the upper and lower bolted joint for the mounting bracket to **50 Nm** . Use joint socket (P/N 9814017) when tightening the upper one. Repeat on the other side.
- Bend back the heat deflector plate.
- Reinstall the silencer's rear mounting.
- Reinstall the silencer's front mounting. Torque tighten the screws to **24 Nm** .

Fig. 699: Pressing The Foam Rubber Plate So It Seals Around The Holes
Courtesy of VOLVO CARS CORPORATION

- Remove the pieces of butyl tape, if it has been used to secure the brace.
- Press the foam rubber plate against the side member so that it seals tight around the holes.
- Repeat the operation on the other side.

INSTALLING THE BALL HOLDER AND BALL

Fig. 700: Installing The Ball and Holder (Observe Torque Spec.)
Courtesy of VOLVO CARS CORPORATION

- Take the ball holder and insert it into the towing member's square tube until the holes in the ball holder and towing member correspond. Insert the lock bolt through the holes and secure it with the locking pin.
- Position the ball in the hole on the ball holder.
- Install washer and nut, torque tighten to **244 Nm (180 lbf. ft)** .

INSTALLING THE HOLDER

Fig. 701: Measuring For Drilling
Courtesy of VOLVO CARS CORPORATION

- Measure out for drilling the hole for the towbar holder, to the right of the battery as illustrated. Use a **O6.5 mm (1/4")** diameter drill bit.
- Remove any shavings.

  Apply rustproofing agent to the hole.

Fig. 702: Bending The Holder's Mounting Eyelets Out Approx. 10 Mm
Courtesy of VOLVO CARS CORPORATION

- Bend both of the holder's mounting eyelets out approx. 10 mm (3/8").

Fig. 703: Installing The Holder With M6 X 10 Screw And M6 Nut
Courtesy of VOLVO CARS CORPORATION

- Install the holder using an M6 x 10 screw and M6 nut. Torque tighten to **10 Nm** .

Fig. 704: Fitting The Four Foam Plastic Pieces
Courtesy of VOLVO CARS CORPORATION

- Fit the four foam plastic pieces as illustrated. This is to avoid rattling when the towbar is stored there.

Applies to cars with warning triangle

- Move the warning triangle approx. 80 mm sideways into the center to make space for the towbar. Mark out the inner wall locations for the warning triangle's Velcro fasteners.
- Secure two Velcro fasteners at the markings on the inner wall. Install the warning triangle.

Fig. 705: Stowing the Towbar
Courtesy of VOLVO CARS CORPORATION

- Take the retaining strap and thread it through the holder's two eyelets.
- Take the towbar and insert it into the protective bag. Tighten the protective bag's cord
- Position the protective bag with the towbar over the holder and secure it with the retaining strap as illustrated.

- Install the cover plug in the socket for the towbar.

FINISHING WORK

- Fit the towbar wiring in accordance with the separate installation instructions.
- Put the spare wheel back in place.
- Reinstall the panels, storage box and floor hatches.

ACCESSORIES AND EQUIPMENT

Miscellaneous - Removal, Replacement And Installation

BODYKIT AND ROOF RAILS

BODYKIT, REPLACING

Special tools:

see **9512942**

see **9512949**

NOTE: **The graphics in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the graphics is always correct.**

PREPARATORY WORK

CLEANING

NOTE: **Wash and degrease the car before replacing the body kit.**

METHOD CONTENT

This method consists of:

- see **REPLACING THE BODYKIT PANEL FRONT FENDER**
- see **REPLACING BODYKIT PANEL REAR FENDER**
- see **REPLACING BODYKIT PANEL REAR SIDE DOOR**
- see **REPLACING BODYKIT PANEL FRONT SIDE DOOR**.

REPLACING THE BODYKIT PANEL FRONT FENDER

REMOVING THE BODYKIT PANEL FRONT FENDER

Fig. 1: Marking Location Of Bodykit Panel
Courtesy of VOLVO CARS CORPORATION

Mark the location of the bodykit panel against the bodywork using a whiteboard marker pen.

Fig. 2: Drilling Out Rivets
Courtesy of VOLVO CARS CORPORATION

Drill out the rivets in the front wheel arch. Use a **6 mm (1/4")** diameter drill bit.

Remove the remains of the rivets from the wheel arch.

Fig. 3: Using Plastic Weatherstrip Tool
Courtesy of VOLVO CARS CORPORATION

Use a plastic weatherstrip tool to detach the bodykit panel. Start at the rear corner.

CAUTION: Do not damage painted surfaces.

HINT: If the tape is difficult to remove, use a hot-air gun and heat gently until the tape softens up.

CLEANING THE BODYWORK AROUND THE BODYKIT PANEL FRONT FENDER

Fig. 4: Cleaning Adhesive Residue Off Bodywork
Courtesy of VOLVO CARS CORPORATION

Clean any adhesive residue off the bodywork. Use see **9512942** . Clean using Isopropanol.

CAUTION: Do not use the tool on painted surfaces with plastic carriers.

All adhesive residue must be removed from painted surfaces with plastic carriers mechanically. Use a plastic weatherstrip tool and then clean using Isopropanol.

PREPARING THE BODYKIT PANEL FRONT FENDER

Fig. 5: Cleaning Tape Residue From Bodykit Panel
Courtesy of VOLVO CARS CORPORATION

Clean tape residue from the bodykit panel. Use a knife or putty knife.

Clean and dry the area for the tape. Use isopropanol.

Fig. 6: Applying Enamel Primer
Courtesy of VOLVO CARS CORPORATION

Apply enamel primer to the surfaces for the tape on the bodykit panel.

CAUTION: Install the tape after 15 minutes, and within 3 hours, of applying the primer.

Fig. 7: Identifying Tape On Bodykit Panel
Courtesy of VOLVO CARS CORPORATION

Install the tape on the bodykit panel as shown.

INSTALLING THE BODYKIT PANEL FRONT FENDER

Installing the bodykit panel front fender, see

Installation instructions, accessory

86, Bumper, mudguard

Side panel

Step 15: "Securing the rear fender side panel".

REPLACING BODYKIT PANEL REAR FENDER

REMOVING THE BODYKIT PANEL REAR FENDER

Fig. 8: Marking Location Of Bodykit Panel
Courtesy of VOLVO CARS CORPORATION

Mark the location of the bodykit panel against the bodywork using a whiteboard marker pen.

Fig. 9: Drilling Out Rivets
Courtesy of VOLVO CARS CORPORATION

Drill out the rivets in the rear wheel arch. Use a **6 mm (1/4)** diameter drill bit.

Remove the remains of the rivets from the wheel arch.

Fig. 10: Using Plastic Weatherstrip Tool
Courtesy of VOLVO CARS CORPORATION

Use a plastic weatherstrip tool to detach the bodykit panel. Start at the rear corner.

CAUTION: Do not damage painted surfaces.

HINT: If the tape is difficult to remove, use a hot-air gun and heat gently until the tape softens up.

CLEANING THE BODYWORK AROUND THE BODYKIT PANEL REAR FENDER

Fig. 11: Cleaning Adhesive Residue
Courtesy of VOLVO CARS CORPORATION

Clean any adhesive residue off the bodywork. Use see **9512942** . Clean using Isopropanol.

CAUTION: Do not use the tool on painted surfaces with plastic carriers.

All adhesive residue must be removed from painted surfaces with plastic carriers mechanically. Use a plastic weatherstrip tool and then clean using Isopropanol.

PREPARING BODYKIT PANEL REAR FENDER

Fig. 12: Cleaning Tape Residue
Courtesy of VOLVO CARS CORPORATION

Clean tape residue from the bodykit panel. Use a knife or putty knife.

Clean and dry the area for the tape. Use isopropanol.

Fig. 13: Applying Enamel Primer
Courtesy of VOLVO CARS CORPORATION

Apply enamel primer to the surfaces for the tape on the bodykit panel.

CAUTION: Install the tape after 15 minutes, and within 3 hours, of applying the primer.

Fig. 14: Identifying Tape On Bodykit Panel
Courtesy of VOLVO CARS CORPORATION

Install the tape on the bodykit panel as shown.

INSTALLING THE BODYKIT PANEL REAR FENDER

Installing the bodykit panel rear fender, see

Installation instructions, accessory

86, Bumper, mudguard

Side panel

Step 16: "Securing the rear fender side panel".

REPLACING BODYKIT PANEL REAR SIDE DOOR

REMOVING THE BODYKIT PANEL REAR SIDE DOOR

Fig. 15: Marking Location Of Bodykit Panel
Courtesy of VOLVO CARS CORPORATION

Mark the location of the bodykit panel against the bodywork using a whiteboard marker pen.

Fig. 16: Using Plastic Weatherstrip Tool
Courtesy of VOLVO CARS CORPORATION

Use a plastic weatherstrip tool to detach the bodykit panel. Start at the rear corner.

CAUTION: Do not damage painted surfaces.

HINT: If the tape is difficult to remove, use a hot-air gun and heat gently until the tape softens up.

CLEANING THE BODYWORK AROUND THE BODYKIT PANEL REAR SIDE DOOR

Fig. 17: Cleaning Adhesive Residue
Courtesy of VOLVO CARS CORPORATION

Clean any adhesive residue off the bodywork. Use see **9512942** . Clean using Isopropanol.

PREPARING THE BODYKIT PANEL REAR SIDE DOOR

Fig. 18: Cleaning Tape Residue
Courtesy of VOLVO CARS CORPORATION

Clean tape residue from the bodykit panel. Use a knife or putty knife.

Clean and dry the area for the tape. Use isopropanol.

Install the tape on the bodykit panel as shown.

Fig. 19: Applying Enamel Primer
Courtesy of VOLVO CARS CORPORATION

Apply enamel primer to the surfaces for the tape on the bodykit panel.

CAUTION: Install the tape after 15 minutes, and within 3 hours, of applying the primer.

Fig. 20: Identifying Tape On Bodykit Panel
Courtesy of VOLVO CARS CORPORATION

Install the tape on the bodykit panel as shown.

INSTALLING THE BODYKIT PANEL REAR SIDE DOOR

Installing the bodykit panel rear side door, see

Installation instructions, accessory

86, Bumper, mudguard

Side panel

Step 17: "Securing the rear door side panel".

REPLACING BODYKIT PANEL FRONT SIDE DOOR

REMOVING THE BODYKIT FRONT SIDE DOOR

Fig. 21: Marking Location Of Bodykit Panel
Courtesy of VOLVO CARS CORPORATION

Mark the location of the bodykit panel against the bodywork using a whiteboard marker pen.

Fig. 22: Using Plastic Weatherstrip Tool (1 Of 2)
Courtesy of VOLVO CARS CORPORATION

Remove the parking lamp. Carefully pry off in the cut out in the lower edge of the parking lamp. Use a plastic weatherstrip tool.

NOTE: Ensure that the connector does not fall into the door.

Fig. 23: Using Plastic Weatherstrip Tool (2 Of 2)
Courtesy of VOLVO CARS CORPORATION

Use a plastic weatherstrip tool to detach the bodykit panel. Start at the rear corner.

CAUTION: Do not damage painted surfaces.

HINT: If the tape is difficult to remove, use a hot-air gun and heat gently until the tape softens up.

CLEANING THE BODYWORK AROUND THE BODYKIT PANEL FRONT SIDE DOOR

Fig. 24: Cleaning Adhesive Residue
Courtesy of VOLVO CARS CORPORATION

Clean any adhesive residue off the bodywork. Use see **9512942** . Clean using Isopropanol.

PREPARING THE BODYKIT PANEL REAR SIDE DOOR

Fig. 25: Installing Tape On Bodykit Panel
Courtesy of VOLVO CARS CORPORATION

Clean tape residue from the bodykit panel. Use a knife or putty knife.

Clean and dry the area for the tape. Use isopropanol.

Install the tape on the bodykit panel as shown.

Fig. 26: Applying Enamel Primer
Courtesy of VOLVO CARS CORPORATION

Apply enamel primer to the surfaces for the tape on the bodykit panel.

CAUTION: Install the tape after 15 minutes, and within 3 hours, of applying the primer.

Fig. 27: Installing Tape On Bodykit Panel
Courtesy of VOLVO CARS CORPORATION

Install the tape on the bodykit panel as shown.

INSTALLING THE BODYKIT PANEL FRONT SIDE DOOR

Installing the bodykit panel front side door, see

Installation instructions, accessory

86, Bumper, mudguard

Side panel

Step 18: "Securing the front door side panel".

ROOF RAILS, REPLACING

NOTE: **As the graphics in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the graphics is always correct.**

REMOVING RAILS

Fig. 28: Identifying Lug
Courtesy of VOLVO CARS CORPORATION

Remove:

- the front and the rear cover by pulling them to the side so that the lug (3) releases. Pull forwards.

Fig. 29: Identifying Side
Courtesy of VOLVO CARS CORPORATION

- the center cover by grasping the lower corner and pulling up at an angle and to the side (4).

Fig. 30: Identifying Screw, Rubber Seal And Small Foam Seal
Courtesy of VOLVO CARS CORPORATION

- the 5 screws on each side
- the 3 rubber seals on each side
- the 3 small foam seals on each side
- 1 large foam seal from each side and the center foot.

NOTE: **The foam seals and the screws must be replaced during installation. Replace the rubber seals if necessary.**

INSTALLING RAILS

Install:

- the 3 rubber seals on each side
- the 3 small foam seals on each side
- 1 large foam seal each side at the center mounting.

NOTE: **Ensure that the foam seals are completely undamaged.**

Install:

- the center mounting but do not tighten the screw
- the front and the rear mounting but do not tighten the screws
- the 5 screws on each side. See **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS** .

Check that the screw threads engage.

NOTE: Do not over tighten. The gasket may no longer seal correctly.

HINT: Tighten the screws in two stages to prevent misalignment.

Install the 3 covers.

ACCESSORIES AND BODY, CAB

Roof Panel, Replacing - General Information

HOOD, EMERGENCY OPENING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

Fig. 1: Identifying Emergency Hood Opening Location
Courtesy of VOLVO CARS CORPORATION

Make a stable hook from a piece of wire, approximately 1.5 mm thick.

Insert the hook up beside the radiator (see the illustration).

Secure the hook on the arm on the right-hand side of the hood catch. It will be difficult to hook the wire into place if it is too thick.

Hook the hook onto the latch and pull downwards.

ACCESSORIES AND EQUIPMENT

Roof Panel, Replacing - Installation Instructions, Accessories

FENDER PANELS, BODY KIT (2003-06)

WARNING: PUR adhesive can cause respiratory difficulties similar to asthma. Vapours with isocyanate content from non-hardened primer or adhesive can cause allergy in respiratory tracts. Persons with the allergy will react to very low contents. The risk remains as long as the material has not fully hardened. Ensure good ventilation. Use a fresh air mask. Never touch the adhesive surface with fingers. Use protective gloves.

NOTE: The PUR adhesive kit must be ordered separately. P/N 1161694

INSTALLING THE REAR WING (FENDER) PANELS

Fig. 1: Applying Primer To Bodywork
Courtesy of VOLVO CARS CORPORATION

NOTE: The temperature of the car must be at least 20°C (68°F) when installing the side panels. Two people must help each other to align and secure the side panels.

For cleaning and washing the bodywork, see the normal Installation Instructions 30730138.

Mark the body for the outer contours of the panels before priming in accordance with steps 14 and 15 B in the normal Installation Instructions 30730138.

Applying primer to the bodywork

- Take the primer (part no. 1161727) and cotton buds from the kit.

CAUTION: The side panels must be installed at the earliest 15 minutes, and at the latest 3 hours, after applying the primer.

NOTE: The primer must be applied to the whole car in one operation. Any spillage must be wiped up immediately.

- Apply the primer inside the outer contours of the panels. It is important that nothing goes outside the markings, particularly on the upper sides of the panels, where there should be a space of approximately 1 mm between the primer and the marking.
- Allow the primer to harden for 15 minutes.

Fig. 2: Cutting Away Marked Section Of Tape
Courtesy of VOLVO CARS CORPORATION

Preparatory work, rear wings' panels

Applies to cars where the rear section of the side panel's tape is not rubbed away

- Cut away the marked section of the tape to a length of **185 mm (7 5/16")** . Make sure the knife is sharp and thin. Half of the width of the tape must be cut away so that the intermediate space A between the two tape surfaces is uncovered. This is so that any excess PUR adhesive can be collected here. Make sure that the tape residue is removed.

Fig. 3: Peeling Tape Away From Intermediate Space
Courtesy of VOLVO CARS CORPORATION

Fig. 4: Cleaning Surface
Courtesy of VOLVO CARS CORPORATION

Applies to cars where the rear section of the side panel's tape is not rubbed away

- Clean the surface where the tape is removed from using Cleaner H (P/N 1161436).
- Wipe dry.

Fig. 5: Applying Primer On Cleaned Surface Of Side Panel
Courtesy of VOLVO CARS CORPORATION

Applies to all models

- Take the primer (part no. 1161727) and cotton buds from the kit.
- Apply the primer on the cleaned surface of the side panel.
- Allow the primer to harden for 15 minutes.

Fig. 6: Folding Up Ends Of Protective Film
Courtesy of VOLVO CARS CORPORATION

- Fold up the ends of the protective film **(NOTE: Do not remove the protective film yet)** so that it can be easily pulled off after the side panel has been positioned using the guide pins. Detach and fold up the protective film for the long pieces of tape at both ends.

Fig. 7: Identifying Long Bead Of Adhesive
Courtesy of VOLVO CARS CORPORATION

Applies when using mixing injector gun P/N 1161394 (220 V) or 1161395 (110 V).

- Take the mixing injector gun P/N 1161394 (220 V) or 1161395 (110 V) and install both tubes of PUR adhesive P/N 1161698 and 1161699 from the kit.
- Run out a 100 mm (4 ") long bead on a piece of cardboard and discard it. This is to ensure that the contents of both tubes have mixed thoroughly.

Fig. 8: Identifying Small Syringe
Courtesy of VOLVO CARS CORPORATION

- Take the small syringe from the kit and fill it with the mixed PUR adhesive.

Fig. 9: Identifying Adhesive On Plate Of Glass
Courtesy of VOLVO CARS CORPORATION

Applies to manual mixing of the PUR adhesive

- Take the PUR adhesive from the accompanying kit P/N 1161694 and press out an equal quantity of P/N 1161698 and 1161699 on a plate of glass or similar using a syringe.

Fig. 10: Identifying Mixture
Courtesy of VOLVO CARS CORPORATION

- Mix thoroughly for 1-2 minutes.

Fig. 11: Filling Mixture In Syringe
Courtesy of VOLVO CARS CORPORATION

- Fill the mixture in the syringe from the kit. Avoid getting air into it as this makes it difficult to apply an even bead to the panel.

Fig. 12: Identifying Plunger In Syringe
Courtesy of VOLVO CARS CORPORATION

- Install the plunger into the syringe.

Fig. 13: Applying PUR Adhesive On Primed Surface
Courtesy of VOLVO CARS CORPORATION

- Now take the syringe and carefully apply an even bead of PUR adhesive on the primed surface starting inwards on the panel and out. Apply an even bead **3.5 mm (25/64")** . The bead of PUR adhesive must not be higher than the level of the tape. Apply the bead of adhesive in one sequence without a break.

Fig. 14: Identifying Tape
Courtesy of VOLVO CARS CORPORATION

Fig. 15: Identifying Rear Wing Side Panel
Courtesy of VOLVO CARS CORPORATION

NOTE: This procedure should be carried out by two people, one at the front and one at the back of the side panel:

Securing the rear wing side panel

- Insert the four mounting hooks in the rear edge of the side panel in the corresponding recess in the bumper shell end.
- Bend the panel in toward the rear wing while making sure that each side panel locating pin fits in the corresponding hole in the edge of the wheel arch.
- Move the panel as close as possible to the wing without the tape in the corners sticking.
- Pull away the protective film by carefully pulling the upturned ends.

NOTE: Ensure that the protective film does not come off on the reverse of the panel as the panel may be firmly attached to the front wing.

- Press in the upper section of the side panel against the rear wing at all points where there is tape and PUR adhesive.
- Apply a pressure of **1-2 kg/cm^2 (14-28 lbf/in^2)** around the entire panel so that the tape sticks firmly.
- Apply a constant pressure against the section of the panel bonded with PUR adhesive, using a piece of styrofoam and suction clamp kit P/N 9512841, or if this is not available, a pole with a fixed object as shown. Place a piece of cardboard between the paintwork and tensioning yoke to protect the paintwork as shown. Apply the force at right-angles so that the panel is not displaced. The rear section of the panel must be pressurized in this way for 4-5 hours.
- Remove the tensioning tools after the adhesive has hardened.

Fig. 16: Identifying Suction Clamp Kit
Courtesy of VOLVO CARS CORPORATION

Fig. 17: Identifying Pole With Fixed Object
Courtesy of VOLVO CARS CORPORATION

ACCESSORIES AND BODY, CAB

Roof Panel, Replacing - Removal, Replacement And Installation

FRONT END, FRONT SECTION (2003-2011)

BUMPER RAIL FRONT, REPLACING

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE FRONT BUMPER RAIL

Fig. 1: Removing The Front Bumper Rail
Courtesy of VOLVO CARS CORPORATION

The bumper rail is secured to the side members using four screws and two plug welds on each side. The plug welds are in metal washers pressed into the aluminum member.

Check that the general dimensions of the car are correct. See **SIDE MEMBERS / WHEEL ARCHES FRONT, ALIGNMENT CHART** .

Remove:

- the components. See **FRONT SECTION, EXPOSING** .
- the 4 screws.

Drill out the spot welds.

Grind clean.

Apply welding primer.

INSTALLING THE FRONT BUMPER RAIL

Fig. 2: Installing The Front Bumper Rail
Courtesy of VOLVO CARS CORPORATION

Install:

- the member
- the 4 screws. M10. Tighten.

Spot-weld.

HOOD (2003-2011)

CABLE HOOD CATCH, REPLACING

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE HOOD CATCH CABLE

Fig. 3: Removing The Hood Catch Cable
Courtesy of VOLVO CARS CORPORATION

Disconnect the mechanical cable. See **HOOD CATCH, REPLACING**.

Remove:

- the sill trim panel. See **SILL TRIM PANEL, REPLACING**
- the hood catch mechanism
- the panel for the hood catch mechanism.

Unhook the cable from the hood catch mechanism.

Fig. 4: Identifying Hood Catch Mechanism
Courtesy of VOLVO CARS CORPORATION

HINT: Before pulling out the cable sleeve, mark the sleeve using tape or a marker pen. Then install the new cable sleeve following the old one, so that the marking is in the correct place.

Pull the cable sleeve out of the engine compartment. Leave the plastic pipe in position.

NOTE: Note how the cable sleeve is routed to the hood catches.

INSTALLING THE MECHANICAL CABLE FOR THE HOOD CATCHES

NOTE: For tightening torques, see TIGHTENING TORQUE .

Feed the cable sleeve into the plastic pipe to its correct position. Ensure that the marking is at the front of the plastic pipe.

NOTE: Note how the cable sleeve is routed to the hood catches.

Install the panel for the hood catch mechanism. Hook the cable into place.

Install:

- the hood catch mechanism
- the 1 M6 screw for the hood catch mechanism. Tighten
- the sill trim panel. See **SILL TRIM PANEL, REPLACING**
- the hood catch cable. See **HOOD CATCH, REPLACING**.

HOOD CATCH, REPLACING

The illustrations in this service information are used for different model years and / or models. Some variation may occur. However, the essential information in the illustrations is always correct.

HOOD RELEASE CATCH (LEFT-HAND SIDE), REPLACING

REMOVING THE HOOD RELEASE CATCH (LEFT-HAND SIDE)

Fig. 5: Identifying Air Baffle For The Air Cleaner (ACL) Box
Courtesy of VOLVO CARS CORPORATION

Remove:

- the air baffle for the air cleaner (ACL) box.

Fig. 6: Identifying Screws For The Hood Catch
Courtesy of VOLVO CARS CORPORATION

- the headlamp. See **HEADLIGHT/BULB, REPLACING** (2003-2006) or **HEADLIGHT/BULB, REPLACING** (2007-2012).
- the 2 screws for the hood catch.

Fig. 7: View Of Nuts For The Vacuum Pump
Courtesy of VOLVO CARS CORPORATION

- the 2 nuts for the vacuum pump.

Move the vacuum pump to one side.

Fig. 8: View Of 2 Screws For The Latch
Courtesy of VOLVO CARS CORPORATION

Remove:

- the 2 screws for the latch
- the latch.

Fig. 9: Identifying Lock Cable Position
Courtesy of VOLVO CARS CORPORATION

Unhook the cable.

NOTE: Note the position of the lock cable.

Replace the lock.

INSTALLING THE HOOD RELEASE CATCH (LEFT-HAND SIDE)

NOTE: For tightening torques, see TIGHTENING TORQUE .

Angle in the hood catch together with the latch.

Secure the hood catch using the 2 M6 screws. Finger tighten.

HINT: Do not tighten the screws for the hood catch until the hood is closed (see the illustration).

Install:

- the 2 M8 screws for the latch. Tighten
- the vacuum pump

- 2 M6 nuts. Tighten
- the air baffle
- the 2 M6 screws. Tighten.

Fig. 10: Tighten The 2 M6 Screws For The Hood Catch
Courtesy of VOLVO CARS CORPORATION

Close the hood.

Tighten the 2 M6 screws for the hood catch.

Open the hood.

Install the headlamp. See **HEADLIGHT/BULB, REPLACING** (2003-2006) or **HEADLIGHT/BULB, REPLACING** (2007-2012).

HOOD RELEASE CATCH (RIGHT-HAND SIDE), REPLACING

REMOVING THE HOOD RELEASE CATCH (RIGHT-HAND SIDE)

Fig. 11: Removing The Hood Release Catch (Right-Hand Side)
Courtesy of VOLVO CARS CORPORATION

Remove:

- the headlamp. See **HEADLIGHT/BULB, REPLACING** (2003-2006) or **HEADLIGHT/BULB, REPLACING** (2007-2012).
- the 2 screws for the hood catch.

Fig. 12: Unhooking The Lock Cable
Courtesy of VOLVO CARS CORPORATION

Move the hood catch to one side.

Unhook the cable.

NOTE: Note the position of the lock cable.

Replace the lock.

INSTALLING THE HOOD RELEASE CATCH (RIGHT-HAND SIDE)

NOTE: For tightening torques, see TIGHTENING TORQUE .

Install the hood catch.

Secure the hood catch using the 2 M6 screws. Finger tighten.

HINT: Do not tighten the screws for the hood catch until the hood is closed (see the illustration).

Close the hood.

Tighten the 2 M6 screws for the hood catch.

Open the hood.

Install the headlamp. See **HEADLIGHT/BULB, REPLACING** (2003-2006) or **HEADLIGHT/BULB, REPLACING** (2007-2012).

RADIATOR MASKING (2003-2011)

RADIATOR GRILLE, REPLACING

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE RADIATOR GRILLE

Fig. 13: Remove The Radiator Grille
Courtesy of VOLVO CARS CORPORATION

Remove the radiator grille (1) by pressing in the seven hooks on the inside of the grille while pulling outwards.

HINT: Use a weatherstrip tool to carefully release the hooks.

Fig. 14: Remove The Radiator Grille Trim Strip
Courtesy of VOLVO CARS CORPORATION

Remove the trim strip by carefully releasing the four hooks holding it in place.

HINT: Use a small screwdriver to carefully release the hooks.

INSTALLING THE RADIATOR GRILLE

Install:

- the trim strip and badge
- the radiator grille.

NOTE: Check that all the hooks have engaged.

FRONT MUDGUARD (2003-2011)

FRONT FENDER WIDENER

Special tools:

see **9512942**

see **9512949**

The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE FENDER EXTENSION

Fig. 15: Removing Front Inner Fender
Courtesy of VOLVO CARS CORPORATION

Remove:

- the pop rivets from the front inner fender, 6 x, according to **REMOVING RIVET** .

Fig. 16: Removing Tape Residue
Courtesy of VOLVO CARS CORPORATION

Remove the covered clips and the double-sided tape by pulling straight out.

The front moulding has five clips and the rear has six clips.

HINT: Use a weatherstrip tool to facilitate removal. Start at the front or rear edge of the moulding.

Remove any tape residue. Use: see **9512942** and: see **9512949** .

INSTALLING FENDER EXTENSION

NOTE: **Always use a new molding and new clips when installing.**

NOTE: **The car must be at least room temperature, i. e. warmer than 20°C in order for the tape to bond correctly.**

Fig. 17: Identifying Fender Extension Tape
Courtesy of VOLVO CARS CORPORATION

Wash the area for the moulding with isopropanol and water, 50/50 mix.

Wipe dry using a lint-free cloth or similar.

Locate the locating pins and clips in the holes.

Press down firmly across the entire moulding and check that the clips engage in the fender.

HINT: Detach about 50 mm of the tape's protective film before pressing the moulding in place. This facilitates when removing the remaining protective film.

Fig. 18: Installing Fender Extension
Courtesy of VOLVO CARS CORPORATION

Check the position of the moulding.

Remove the rest of the tape's protective film, and apply firm pressure to the moulding with your hand so that the tape adheres to the fender.

Install 5 new pop rivets on the front moulding.

NOTE: To ensure optimal adhesion, do not wash the car for 72 hours.

FRONT WING, REPLACING

REMOVING THE FRONT WING

Fig. 19: Identifying Upper Rear Corner Rubber
Courtesy of VOLVO CARS CORPORATION

Remove:

- the rubber at the upper rear corner (1) by pressing down and lifting out the front corner first. Repeat the procedure for the rear section
- the bumper. See **CASING BUMPER FRONT, REPLACING**
- the bracket for the bumper
- the wing liner which is secured by three plastic nuts and twelve rivets. To remove the rivets, see **REMOVING RIVET**
- the wing edge is secured with double-sided adhesive tape, five clips and the rivets securing the wing lining
- the front section of the plastic sill.

Slacken off the eight screws for the front wing (see the illustration).

INSTALLING THE FRONT WING

Apply adhesive 116 1767 to the foam in the upper, rear corner.

Clean using an alcohol cloth 919 2678.

Apply an adhesive bead, approximately 20 mm in height, approximately 8 mm wide, according to the adhesive symbol in the illustration above.

Install:

- the front wing. Then adjust the wing at the rear edge and against the bonnet
- the wing liner. Do not use rivets
- the wing edge

- the front section of the plastic sill
- the bumper. See **CASING BUMPER FRONT, REPLACING**
- the rivets in the wing edge, wing liner and sill
- the rubber cover.

REAR MUDGUARD (2003-2011)

REAR FENDER EXTENSION

Special tools:

see **9512942**

see **9512949**

The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE FENDER EXTENSION

Fig. 20: Identifying Rear Inner Fender
Courtesy of VOLVO CARS CORPORATION

Remove:

- the pop rivets from the rear inner fender, 4 x, according to **REMOVING RIVET** .

Fig. 21: Removing Tape Residue
Courtesy of VOLVO CARS CORPORATION

Remove the covered clips and the double-sided tape by pulling straight out.

The front moulding has five clips and the rear has six clips.

HINT: Use a weatherstrip tool to facilitate removal. Start at the front or rear edge of the moulding.

Remove any tape residue. Use: see **9512942** and: see **9512949** .

INSTALLING FENDER EXTENSION

NOTE: Always use a new molding and new clips when installing.

NOTE: The car must be at least room temperature, i. e. warmer than 20°C in order for the tape to bond correctly.

Fig. 22: Identifying Fender Extension Tape
Courtesy of VOLVO CARS CORPORATION

Wash the area for the moulding with isopropanol and water, 50/50 mix.

Wipe dry using a lint-free cloth or similar.

Locate the locating pins and clips in the holes.

Press down firmly across the entire moulding and check that the clips engage in the fender.

HINT: Detach about 50 mm of the tape's protective film before pressing the moulding in place. This facilitates when removing the remaining protective film.

Fig. 23: Installing Fender Extension
Courtesy of VOLVO CARS CORPORATION

Check the position of the moulding.

Remove the rest of the tape's protective film, and apply firm pressure to the moulding with your hand so that the tape adheres to the fender.

Install 4 new pop rivets on the rear moulding.

NOTE: To ensure optimal adhesion, do not wash the car for 72 hours.

REAR FENDER, REPLACING

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE REAR FENDER

Remove the components. See **REAR SECTION, EXPOSING** and **SIDE SECTION, EXPOSING** .

Fig. 24: Identifying Rear Fender Cut Points
Courtesy of VOLVO CARS CORPORATION

Pull out the damaged section to make it easier to re-align internal components.

Determine the extent of the damage. See **REAR END, ALIGNMENT CHART** and **BODY SIDE, ALIGNMENT CHART** .

Roughly cut at an appropriate point. See the recommended cutting points in the illustration.

The join marked (1) is recommended so that the foam seal does not need to be replaced with foam substitute. Cut 60 mm below the lower hole on the striker plate.

30 mm below the cutting point the foam seal (2) is positioned.

Fig. 25: View Of Panel Spot Weld Sections
Courtesy of VOLVO CARS CORPORATION

The inner flange of the rear fender is inside the tail panel.

Drill out the spot welds through all three panels.

Angle out the flange along the score (A-A) so that the spot welds in the two inner sections can be accessed. This also makes installation easier.

Drill out the spot welds in the rear fender and pry it off.

Grind clean and apply welding primer.

INSTALLING THE REAR FENDER

Fig. 26: Installing Rear Fender Foam Rubber Replacement Points
Courtesy of VOLVO CARS CORPORATION

Rough cut the replacement part so that the replacement part overlaps at the cutting points.

Knock the wheel arch out of the way slightly to obtain more freedom when aligning the rear fender.

Weld the threaded plate to the striker plate if it was removed.

Use foam rubber replacement at points (1) and (2). This is to prevent noise spreading through the car body.

Fig. 27: View Of Welding The Tail Panel And Rear Fender
Courtesy of VOLVO CARS CORPORATION

Secure the rear fender.

Install the rear door, the tail lamps and the tailgate to check the alignment.

Saw the cutting points.

Drill holes for plug welding through the tail panel and rear fender so that the plug weld secures against the inner D-post.

Weld the rear fender into place.

Seal the seams and joins. See **BODY SEAL** .

BRAKES

Brake Control System - Cleaning, Inspection and Adjustment

ANTI-LOCK BRAKES

TEST DRIVE FORM (ABS), DESCRIPTION

NOTE: **To test drive the DSTC functions, see TEST DRIVE FORM (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL) /BRAKE CONTROL MODULE), DESCRIPTION.**

WARNING: **Problems with the brakes may make the car difficult to maneuver. Always test drive cars under safe, controlled conditions. Follow the appropriate traffic and speed regulations.**

Fig. 1: Identifying Ignition In Off Position
Courtesy of VOLVO CARS CORPORATION

- The ignition must be switched off so that the control module can engage the ABS system
- Start the engine and watch for the brake failure warning lamp. If this comes on, do not drive car. Check the brake fluid level. The hydraulic braking system must be checked for leaks if the brake fluid level is too low. Fault-trace according to the fault symptom "Brake circuit out of function, warning lamp lit" if the brake fluid level is OK.
- Drive at a speed of at least 50 km/h. If the ABS warning lamp lights or does not go out, read off any diagnostic trouble codes (DTCs) that have been stored and fault-trace accordingly. If no diagnostic trouble code (DTC)s are stored but the light comes on, fault-trace according to the fault symptoms
- Brake several times to stop from a suitable speed on an even, dry road. At least one braking should activate ABS control from a speed above 50 km/h. Make a note of any unusual noise or abnormal behavior. Listen particularly for clicks or bangs. See whether the car pulls to one side or if the brake pedal does not seem to be working normally. Fault-trace according to the relevant symptom.

Fig. 2: ABS Warning Indicator
Courtesy of VOLVO CARS CORPORATION

If the ABS (Anti-spin) warning indicator comes on, return to the workshop and read off any diagnostic trouble codes (DTCs) which have been stored. Make a note of the driving conditions under which the warning lamp(s) came on. Carry out fault-tracing according to the diagnostic trouble code (DTC) that is stored.

TEST DRIVE FORM (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL) /BRAKE CONTROL MODULE), DESCRIPTION

NOTE: **To test drive the ABS/STC (stability and traction control) / TRACS (traction control system) functions, see TEST DRIVE FORM (ABS), DESCRIPTION.**

WARNING: **Problems with the brakes may make the car difficult to maneuver. Always test drive cars under safe, controlled conditions. Follow the appropriate traffic and speed regulations.**

TEST DRIVING CARS WITH MODEL YEAR -2001

NOTE: Drive where other traffic will not be disrupted

Fig. 3: DSTC Warning Lamp
Courtesy of VOLVO CARS CORPORATION

The car must **first be calibrated** and then test driven if work is carried out on any vital components in the DSTC-system (steering wheel angle sensor, control module DSTC, control module steering angle sensor, brake pressure sensor (1 and 2), power brake booster, yaw rate sensor (1 and 2) or lateral acceleration sensor). Calibrating is carried out using VIDA vehicle communication or according to the last description in this document.

When calibrating in the workshop, position the car on a flat surface with the wheels pointing forward. Turn the steering wheel with the ignition turned on at least 15° to the right or left. Then turn the steering wheel to the center position and start calibrating.

The test drive must include at least one right and one left turn (more than 45°), cover at least 100 meters and a braking from 70 km/h to 50 km/h.

The test is passed if the DSTC warning lamp does not light.

Calibrate and test drive as above if any work that may have affected the steering and /or the wheel alignment (straight ahead position) has been carried out.

TEST DRIVING CARS MODEL YEAR 2002-

NOTE: Drive where other traffic will not be disrupted.

The car must **first be calibrated** and then test driven if work is carried out on any vital components in the DSTC-system (steering wheel angle sensor, control module DSTC, control module steering angle sensor, brake pressure sensor (1 and 2), power brake booster or active yaw control sensor). Calibrating is carried out using VIDA vehicle communication or according to the last description in this document.

When calibrating in the workshop, position the car on a flat surface with the wheels pointing forward. Turn the steering wheel with the ignition turned on at least 15° to the right or left. Then turn the steering wheel to the center position and start calibrating.

The test drive must include at least one right and one left turn (more than 45°), cover at least 100 meters and a braking from 50 km/h to a standstill.

The car has passed the test if the dynamic stability and traction control (DSTC) system does not light any lamps (the traction control lamp, the ABS warning lamp or the general brake warning lamp).

Calibrate and test drive as above if any work that may have affected the steering and /or the wheel alignment (straight ahead position) has been carried out.

CALIBRATING (ADAPTATION) WITHOUT DIAGNOSTIC TOOLS

Fig. 4: Identifying Test Drive
Courtesy of VOLVO CARS CORPORATION

A special test drive can be carried out as an alternative to using VIDA for calibration. Two basic requirements needed in order to carry out the calibration is that the lateral acceleration whilst driving must not be too high (no sharp turns) and the road surface must be even, smooth (no potholes, grooves etc) and not slippery.

1. Erase diagnostic trouble codes (DTCs). Certain diagnostic trouble codes (DTCs) corresponding to calibration cannot be erased until calibration has been successfully carried out
2. Drive the car a distance of 30 km (18.64 miles) with regard to the above requirements. Calibration (adaptation)has been carried out 100% after driving the recommended distance. Driving a distance of 10 km (6.21 miles) gives a calibration of up to 75-80%. Calibration is not cancelled if diagnostic trouble codes (DTCs) are stored, which means that the test drive can continue
3. Return to the workshop and read off the diagnostic trouble codes (DTCs). Calibration has been successful if no diagnostic trouble codes (DTCs) have been stored
4. If diagnostic trouble codes (DTCs) have been stored again, erase the diagnostic trouble codes (DTCs) and test drive again.

BRAKES

Brake Control System - Design and Function

ABBREVIATIONS

BRAKE SYSTEM, ABBREVIATIONS

ABBREVIATIONS

NOTE: **All functions below are not available in all vehicles or vehicle models. The brake system can consist of only ABS or ABS including TRACS, STC, or DSTC.**

Function	Description
ABS (Anti-lock Braking System)	Anti-lock braking. Prevents wheels from locking when braking.
AYC (Active Yaw Control)	Stability control. Prevents oversteering and understeering with active braking.
BA (Brake Assistance)	Brake assistance. Boosts braking force in case of sudden heavy braking. Brake assistance is electronic for vehicles with DSTC, mechanical for others.
EBD (Electronic Brake Distribution)	Electronic distribution of braking force. Distributes braking force between front and rear brakes.
SC (Stability Control)	Stability control. Reduces engine torque to obtain increased lateral stability when the wheels spin at speeds from 0 km/h to top speed.
TC (Traction Control)	Traction control. Brakes spinning wheel from 0 km/h - top speed.
RSC (Roll over Stability Control)	Monitors the car's inclination angle and acts on the brakes if the car is at risk of rolling over.

System	Description
ABS (Anti-lock Braking System)	Anti-lock braking. Includes the functions ABS and EBD.
DSTC (Dynamic STC)	Dynamic stability and traction control. Includes the functions ABS, EBD, SC, TC and AYC.
STC (Stability and Traction Control)	Traction and stability control. Includes the functions ABS, EBD, SC and TC.
TRACS (Traction Control System)	Traction control system for four-wheel drive cars. Includes the functions ABS, EBD and TC.

Other abbreviations	Description
BCM (Brake Control Module)	Name of control module for brake system (BCM). Includes functions such as ABS, AYC, EBA, EBD,

	SC, TC and RSC.
CAN (Controller Area Network)	Standardized protocol for serial communication between control modules.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION**

BCM-0118: POWER SUPPLY FOR THE ACTIVE YAW CONTROL SENSOR. VOLTAGE TOO HIGH (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 1: Identifying Brake Control Module & Active Yaw Control Sensor
Courtesy of VOLVO CARS CORPORATION

NOTE: The diagnostic trouble code (DTC) applies only to cars with dynamic stability and traction control (DSTC).

Diagnostic trouble code (DTC) BCM-0118 is stored if the brake control module (BCM) registers that the power supply from the active yaw control sensor exceeds 17 V.

Substitute Value

- Traction control is blocked
- Stability control is blocked
- Active yaw control is blocked.

HINT: For information about abbreviations, see BRAKE SYSTEM, ABBREVIATIONS .

Possible Source

- Short-circuit to supply voltage in the power supply cable
- Internal fault in the active yaw control sensor.

NOTE: This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.

Fault symptom[s]

- The anti-spin warning lamp is lit (up to and including 2002 model year)
- General yellow warning lamp lit (from model year 2003 inclusive)

- Anti-spin does not function
- The stability control system does not function
- The traction control system does not function.

VOLTAGE TOO HIGH

CHECKING THE WIRING

Fig. 2: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Connect the breakout box.

  Check the wiring between the connector for the active yaw control sensor

- terminal #3 and control module terminal #6 (#A6)
- terminal #5 and control module terminal #39 (terminal #A39).

check for a short-circuit to supply voltage.

Other information

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- To access and replace the active yaw control sensor, see **ACTIVE YAW CONTROL SENSOR, REPLACING**
- For information about signals, see **SIGNAL SPECIFICATION, BRAKE CONTROL MODULE (BCM) WITH DSTC (DYNAMIC STABILITY AND TRACTION CONTROL)**
- see **CONTENTS**

Fig. 3: Identifying Active Yaw Control Sensor Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 4: Identifying Ohm Meter
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  see **VERIFICATION**

- **NO**

  see **CHECKING THE CONTROL MODULE**

CHECKING THE CONTROL MODULE

Fig. 5: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 6: Identifying Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Breakout box connected to the brake control module (BCM)
- The active yaw control sensor disconnected
- Start the engine
- Read off the power supply to the brake control module (BCM).

  Check the power supply to the active yaw control sensor by connecting a voltmeter between brake control module (BCM) terminals #6 (#A6) and #39 (#A39).

  Check that the voltage is approximately the same as the value read from the brake control module (BCM).

  Replace the active yaw control sensor if the power supply to the sensor is OK.

Check the charging system if the voltage to the brake control module (BCM) is too high.

Remedy as necessary.

Other information

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- To access and replace the active yaw control sensor, see **ACTIVE YAW CONTROL SENSOR, REPLACING**
- For information about signals, see **SIGNAL SPECIFICATION, BRAKE CONTROL MODULE (BCM) WITH DSTC (DYNAMIC STABILITY AND TRACTION CONTROL)** .

VOLTAGE TOO HIGH

see **VOLTAGE TOO HIGH**

BCM-0119: POWER SUPPLY FOR THE ACTIVE YAW CONTROL SENSOR. VOLTAGE TOO LOW (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 11: Identifying Brake Control Module & Active Yaw Control Sensor
Courtesy of VOLVO CARS CORPORATION

NOTE: **The diagnostic trouble code (DTC) applies only to cars with dynamic stability**

and traction control (DSTC).

Diagnostic trouble code (DTC) BCM-0119 is stored if the brake control module (BCM) registers that the power supply to the active yaw control sensor is below 6 V ±0.5 V.

Substitute Value

- Traction control is blocked
- Stability control is blocked
- Active yaw control is blocked.

HINT: For information about abbreviations, see BRAKE SYSTEM, ABBREVIATIONS .

Possible Source

- Contact resistance in the terminals on the active yaw control sensor
- Short-circuit to ground in the wiring
- Open-circuit in the wiring
- Internal fault in the active yaw control sensor

NOTE: This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.

Fault symptom[s]

- The anti-spin warning lamp is lit (up to and including 2002 model year)
- General yellow warning lamp lit (from 2003)
- Anti-spin does not function
- The stability control system does not function
- The traction control system does not function.

VOLTAGE TOO LOW

CHECKING THE STATUS OF THE DIAGNOSTIC TROUBLE CODE (DTC)

Fig. 12: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connectors for the brake control module (BCM) and the active yaw control sensor. Check for contact resistance and oxidation
- Test drive the car. See **TEST DRIVE FORM (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL) /BRAKE CONTROL MODULE), DESCRIPTION**
- Ignition on
- Wait approximately 60 seconds
- Read off diagnostic trouble codes (DTCs).

  If the status of the diagnostic trouble code (DTC) intermittent, the cause of the fault was probably contact resistance or oxidation in the connectors for the control module or the active yaw control sensor.

Other information

- To remove the control module connector, see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- To access the active yaw control sensor, see **ACTIVE YAW CONTROL SENSOR, REPLACING**
- see **CONTENTS**

Fig. 13: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

BCM-0121: YAW RATE SENSOR. SIGNAL OUTSIDE ITS PERMITTED RANGE (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 27: Identifying Brake Control Module & Active Yaw Control Sensor
Courtesy of VOLVO CARS CORPORATION

NOTE: The diagnostic trouble code (DTC) applies only to cars with dynamic stability and traction control (DSTC).

The yaw rate sensor, lateral accelerometer, accelerometer (only AWD) and angle of lean sensor (only RSC) are integrated in the active yaw control sensor. This in turn is connected to the brake control module (BCM) via its own Control area network (CAN) cable. The sensors transmit information to the brake control module (BCM) indicating the size of the yaw angle, the lateral acceleration of the car, the forward acceleration and the car's lateral angle of lean.

Diagnostic trouble code (DTC) BCM-0121, BCM-0125, BCM-0127 or BCM-0129 is stored, depending on the sensor, if the control module registers that the signal from any of the sensors is outside its permitted range.

- BCM-0121: Yaw rate sensor
- BCM-0125: Lateral acceleration sensor
- BCM-0127: Tilt angle sensor
- BCM-0129: Accelerometer.

Substitute Value

- Traction control is blocked
- Stability control is blocked
- Active yaw control is blocked
- RSC is blocked (cars equipped with RSC only).

HINT: For information about abbreviations, see BRAKE SYSTEM, ABBREVIATIONS .

Possible Source

- Interference or noise on the wiring has disrupted the active yaw control sensor calculations
- The power supply to the active yaw control sensor is too low
- Incorrect wheel alignment
- Internal fault in the active yaw control sensor.

NOTE: **This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.**

Fault symptom[s]

- The anti-spin warning lamp is lit (up to and including 2002 model year)
- General yellow warning lamp lit (from model year 2003)
- Anti-spin does not function
- The stability control system does not function
- The traction control system does not function.

SIGNAL OUTSIDE ITS PERMITTED RANGE

CHECKING THE CONNECTORS

NOTE: **If diagnostic trouble codes (DTCs) other than BCM-0121, BCM-0125, BCM-0127 or BCM-0129 are stored in the brake control module (BCM), select cancel and fault trace these diagnostic trouble codes (DTCs) first.**

Fig. 28: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the brake control module (BCM) and the active yaw control sensor connectors. Check for contact resistance and oxidation
- Ensure that no sources of interference, such as a mobile telephone or radio receiver, are in the vicinity of the active yaw control sensor
- Test drive the car. See the test drive schedule. See **TEST DRIVE FORM (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL) /BRAKE CONTROL MODULE), DESCRIPTION**
- Ignition on
- Read off diagnostic trouble codes (DTCs).

  If the diagnostic trouble code (DTC) status is intermittent the cause of the fault was probably either contact resistance in the control module or active yaw control sensor connectors, or a source of

interference too close to the sensor.

Other information

- To remove the connector for the active yaw control sensor, see **ACTIVE YAW CONTROL SENSOR, REPLACING**
- To remove the brake control module (BCM) connector, see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)** .

Fig. 29: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 30: Identifying Brake Control Module & Active Yaw Control Sensor
Courtesy of VOLVO CARS CORPORATION

Was the status of the diagnostic trouble code (DTC) permanent?

- **YES**

  see **CHECKING THE WIRING**

- **NO**

  OKAY: Troubleshooting has been completed.

CHECKING THE WIRING

Fig. 31: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check the brake control module (BCM) and the active yaw control sensor connectors. Check for contact resistance and oxidation.

  Check the wiring between the connector for the active yaw control sensor:

  - terminal #1 and control module terminal #A25 (#A25)
  - terminal #2 and control module terminal #A29 (#A29)
  - terminal #3 and control module terminal #A6 (#A6)
  - terminal #5 and control module terminal #A39 (#A39).

Check for an open-circuit.

Check the wheel alignment.

Remedy as necessary.

Other information

BCM-0123: ACTIVE YAW CONTROL SENSOR. INTERNAL FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 35: Identifying Brake Control Module & Active Yaw Control Sensor
Courtesy of VOLVO CARS CORPORATION

NOTE: **The diagnostic trouble code (DTC) applies only to cars with dynamic stability**

and traction control (DSTC).

The active yaw control sensor is supplied with 12 V. The signal voltage of the sensors to the brake control module (BCM) is approximately 2.5 V for a stationary car. The control module compares the voltage with a reference value.

Diagnostic trouble code (DTC) BCM-0123 is stored if the voltage is outside the reference value or if an internal fault in the active yaw control sensor is registered.

Substitute Value

- Traction control is blocked
- Stability control is blocked
- Active yaw control is blocked.

HINT: For information about abbreviations, see BRAKE SYSTEM, ABBREVIATIONS .

Possible Source

- Signals which disrupt the active yaw control sensor
- Voltage to the active yaw control sensor is too low
- Internal fault in the active yaw control sensor.

Fault symptom[s]

- The anti-spin warning lamp is lit (up to and including 2002 model year)
- General yellow warning lamp lit (from model year 2003 inclusive)
- Anti-spin does not function
- The stability control system does not function
- The traction control system does not function.

INTERNAL FAULT

CHECKING THE PRESENT VALUE OF THE SENSORS

Fig. 36: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connectors for the brake control module (BCM) and the active yaw control sensor. Check for contact resistance and oxidation
- Ignition on
- Read off the present value.

  Check the read off value for the relevant component against the value in the table.

Component	Value
Yaw rate sensor	-6°/s - +6°/s
Lateral accelerometer	-1.7 m/s^2 - +1.7 m/s^2

Accelerometer	-1.7 m/s^2 - +1.7 m/s^2

NOTE: The accelerometer can only be read off if the car is four wheel drive.

Fig. 37: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

BCM-0123: ACTIVE YAW CONTROL SENSOR. INTERNAL FAULT (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION**

INTERNAL FAULT

CHECKING THE PRESENT VALUE OF THE SENSORS

Fig. 46: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connectors for the brake control module (BCM) and the active yaw control (AYC) sensor. Check for contact resistance. Check for oxidation
- Ignition on

- Read off the present value.

  Check the read off value for the relevant component against the value in the table.

Component	Value
Yaw rate sensor	-6°/s - +6°/s
Lateral accelerometer	-1.7 m/s^2 - +1.7 m/s^2
Accelerometer	-1.7 m/s^2 - +1.7 m/s^2

NOTE: The accelerometer can only be read off if the car is four wheel drive.

Fig. 47: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 48: Identifying Brake Control Module & Active Yaw Control Sensor
Courtesy of VOLVO CARS CORPORATION

Are the present values OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CHECKING THE POWER SUPPLY**

CHECKING THE POWER SUPPLY

Fig. 49: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Connect the breakout box to the brake control module (BCM)
- Ignition on.

  Check the power supply to the active yaw control sensor by connecting a voltmeter between terminals #6 (#A6) and #39 (#A39) on the breakout box. The voltage must be normal system voltage.

  Replace the control module if the voltage is incorrect.

  If the voltage is OK, check the power supply cables between the active yaw control sensor (AYC):

  - terminal #3 and control module terminal #6 (#A6)

- terminal #5 and control module terminal #39 (terminal #A39).

check for an open-circuit.

Replace the active yaw control sensor if the wiring is OK.

Other information

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- To replace the control module, see **BRAKE CONTROL MODULE (BCM), REPLACING**
- To access and replace the active yaw control sensor (AYC), see **ACTIVE YAW CONTROL SENSOR, REPLACING**
- For information about signals, see **SIGNAL SPECIFICATION, BRAKE CONTROL MODULE (BCM) WITH DSTC (DYNAMIC STABILITY AND TRACTION CONTROL)**
- see **CONTENTS** .

INTERNAL FAULT

see **INTERNAL FAULT**

BCM-0130: BRAKE PRESSURE SENSOR 1. SIGNAL TOO LOW (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 55: Identifying Brake Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

NOTE: This diagnostic trouble code (DTC) applies only to vehicles with dynamic stability and traction control (DSTC).

The brake pressure sensors transmit signals to the brake control module (BCM) indicating the pressure in the brake system. If the control module registers an incorrect signal from any brake pressure sensor, then trouble code BCM-0130 or BCM-0133 is generated depending on sensor.

NOTE: **As the cables to the brake pressure sensors can be switched physically upon installation, both sensors must be fault-traced when DTC BCM-0130 or BCM-0133 has been detected.**

Substitute Value

- Traction control is blocked.
- SC is blocked.
- Active yaw control is blocked.

HINT: For more information about abbreviations, see: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Open-circuit in the wiring.
- Wiring is short-circuited to ground or supply voltage.
- Damaged pressure sensor.
- Internal fault in the control module.

Fault symptom[s]

- Warning light antispinn on (applies to model year -2002)
- General yellow warning light on (applies to model year 2003-)
- Anti-spin not working
- Stability function is not working
- Anti skid function is not working

SIGNAL TOO LOW

CHECKING THE CONNECTORS

NOTE: **As the cables to the brake pressure sensors can be switched physically upon installation, both sensors must be fault-traced when DTC BCM-0130 or BCM-0133 has been detected.**

Fig. 56: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 57: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the brake control module (BCM) and the brake pressure sensor connectors. Check for contact resistance and oxidation
- Reinstall the components, reconnect the connectors etc.
- Ignition on
- Read off the pressure in the brake system from the relevant pressure sensor
- Depress the brake pedal.

  The brake pressure must increase with increased pedal pressure. If the brake pressure increases the cause of the fault was probably contact resistance or oxidation in the control module or pressure sensor connectors.

Other information

- To remove the control module connector, see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- see **CONTENTS**

Fig. 58: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

Does the brake pressure increase?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CHECKING THE CONTROL MODULE**

CHECKING THE CONTROL MODULE

Fig. 60: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 61: Identifying Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Pressure sensor connector disconnected
- The breakout box connected.

Check the voltage supply using a voltmeter:

Pressure sensor 1

- between terminal #A21 and terminal #A22 on the breakout box.

Pressure sensor 2

- between terminal #A18 and terminal #A19 on the breakout box.

The voltage must be approximately 5 V. Replace the brake control module (BCM) if the voltage is incorrect.

Other information

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- To replace the control module, see **BRAKE CONTROL MODULE (BCM), REPLACING**
- For information about signals, see **SIGNAL SPECIFICATION, BRAKE CONTROL MODULE (BCM) WITH DSTC (DYNAMIC STABILITY AND TRACTION CONTROL)** .

Fig. 62: Identifying Pedal Position Sensor Connector
Courtesy of VOLVO CARS CORPORATION

Fig. 63: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

Was the voltage OK?

- **YES**

  see **CHECKING WIRING AND SENSORS**

- **NO**

  see **VERIFICATION**

CHECKING WIRING AND SENSORS

Fig. 64: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Connect the breakout box.

  Check the wiring between the pressure sensor and the control module. Check for an open-circuit. Check for a short-circuit to ground.

  For pressure sensor 1, check the wiring

  - between pressure sensor terminal #1 and control module terminal #21 (#A21)
  - between pressure sensor terminal #2 and control module terminal #23 (#A23)
  - between pressure sensor terminal #3 and control module terminal #22 (#A22).

For pressure sensor 2, check the wiring

- between pressure sensor terminal #1 and control module terminal #19 (#A19)
- between pressure sensor terminal #2 and control module terminal #20 (#A20)
- between pressure sensor terminal #3 and control module terminal #18 (#A18).

HINT: Check the relevant brake pressure sensor by measuring the signal from the sensor, with the ignition switched on and the breakout box connected:

Pressure sensor 1

- between terminal #A21 and terminal #A22 on the breakout box. The voltage must be approximately 5 V
- between terminal #A21 and terminal #A23 on the breakout box. Voltage must be between 0.25-4.75 V, depending on brake pressure.

Pressure sensor 2

- between terminal #A18 and terminal #A19 on the breakout box. The voltage must be approximately 5 V
- between terminal #A19 and terminal #A20 on the breakout box. Voltage must be between 0.25-4.75 V, depending on brake pressure.

Replace the pressure sensor if the voltage does not change when the brake pedal is depressed.

Other information

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- To replace the pressure sensor, see **PRESSURE SENSOR, MASTER CYLINDER, REPLACING**
- For information about signals, see **SIGNAL SPECIFICATION, BRAKE CONTROL MODULE (BCM) WITH DSTC (DYNAMIC STABILITY AND TRACTION CONTROL)** .

BCM-0136: BRAKE PRESSURE SENSOR 1 AND 2. SIGNAL OUTSIDE ITS PERMITTED RANGE (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 70: Identifying Brake Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

NOTE: The diagnostic trouble code (DTC) applies only to ABS systems equipped with dynamic stability and traction control (DSTC).

Brake pressure sensors 1 and 2 provide a signal with the brake system pressure to the brake control module (BCM). Diagnostic trouble code (DTC) BCM-0136 is stored if the control module registers that the signal from any of the pressure sensors is outside its permitted range.

Substitute Value

- Traction control is blocked
- Stability control is blocked
- Active yaw control is blocked.

HINT: For information about abbreviations, see BRAKE SYSTEM, ABBREVIATIONS .

Possible Source

- Open-circuit in the ground lead
- Fault in the brake circuit

- Defective pressure sensor.

Fault symptom[s]

- The anti-spin warning lamp is lit (up to and including 2002 model year)
- General yellow warning lamp lit (from model year 2003 inclusive)
- Anti-spin does not function
- The stability control system does not function
- The traction control system does not function.

SIGNAL OUTSIDE ITS PERMITTED RANGE

CHECKING THE CONNECTORS

NOTE: **As the cables to the brake pressure sensors can be switched physically upon installation, both sensors must be fault-traced when DTC BCM-0136 has been detected.**

BCM-0138: POWER SUPPLY FOR THE ACTIVE YAW CONTROL SENSOR. FAULTY VOLTAGE (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 85: Identifying Brake Control Module & Active Yaw Control Sensor
Courtesy of VOLVO CARS CORPORATION

NOTE: This diagnostic trouble code (DTC) applies only to brake systems with dynamic stability and traction control (DSTC).

The active yaw control sensor is supplied with 12 V.

Diagnostic trouble code (DTC) BCM-0138 is stored if the brake control module (BCM) registers that the supply voltage to the active yaw control sensor is too high or too low.

Substitute Value

- Traction control is blocked
- Stability control is blocked
- Active yaw control is blocked.

HINT: For information about abbreviations, see BRAKE SYSTEM, ABBREVIATIONS .

Possible Source

- Contact resistance or oxidation in the terminals or connections
- Short-circuit to ground or to supply voltage in the power supply wiring for the active yaw control sensor
- Open-circuit in the power supply cable for the active yaw control sensor
- Internal fault in the active yaw control sensor
- Internal fault in the control module.

Fault symptom[s]

- The anti-spin warning lamp is lit (up to and including 2002 model year)

- General yellow warning lamp lit (from model year 2003 inclusive)
- Anti-spin does not function
- The stability control system does not function
- The traction control system does not function.

FAULTY VOLTAGE

CHECKING THE CONNECTORS

Fig. 86: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connectors for the brake control module (BCM) and the active yaw control sensor. Check for contact resistance and oxidation

- Ignition on
- Wait approximately 60 seconds
- Read off diagnostic trouble codes (DTCs).

  If the status of the diagnostic trouble code (DTC) is intermittent, the cause of the fault was probably contact resistance or oxidation in the connectors for the control module or the active yaw control sensor.

  Other information

  - To access the control module connector, see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
  - To access the active yaw control sensor, see **ACTIVE YAW CONTROL SENSOR, REPLACING**
  - see **CONTENTS**

BCM-0139: PRESSURE BUILD-UP VALVE, POWER BRAKE BOOSTER. SIGNAL OUTSIDE ITS PERMITTED RANGE (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 100: Identifying Brake Booster
Courtesy of VOLVO CARS CORPORATION

NOTE: This diagnostic trouble code (DTC) applies only to brake systems with dynamic stability and traction control (DSTC).

During stability control the brake control module (BCM) transmits a signal to the pressure build-up valve. The valve opens and releases atmospheric pressure into the brake power booster. This increases the brake pressure in the brake system automatically. The function is used for traction control and in active brake assistance.

Diagnostic trouble code (DTC) BCM-0139 is stored if the control module registers an implausible signal from the pressure build-up valve.

Substitute Value

- Traction control is blocked
- Stability control is blocked
- Active yaw control is blocked
- Brake assistance is blocked.

HINT: For information about abbreviations, see BRAKE SYSTEM, ABBREVIATIONS .

Possible Source

- Contact resistance or oxidation in the terminals or connections
- Short-circuit to ground or supply voltage in the wiring
- Incorrectly installed sensor
- Defective pressure build-up valve
- Internal fault in the control module.

Fault symptom[s]

- General warning lamp lit
- The anti-spin warning lamp is lit (up to and including 2002 model year)
- Anti-spin does not function
- The stability control system does not function
- The traction control system does not function.

SIGNAL OUTSIDE ITS PERMITTED RANGE

CHECKING THE CONNECTORS

Fig. 101: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connectors of the brake control module (BCM) and the pressure build-up valve/pedal pressure sensor for contact resistance and oxidation.
- Reinstall the components, reconnect the connectors etc.
- Ignition on
- Use the Activation function to activate the pressure build-up valve.

  A mechanical pumping sound should be audible from the engine compartment and the pedal should move slightly.

  Other information

- For removal of the control module connectors: **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- see **CONTENTS**

Fig. 102: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

Fig. 103: Identifying Brake Booster
Courtesy of VOLVO CARS CORPORATION

Was the function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CHECKING WIRING AND SENSORS**

CHECKING WIRING AND SENSORS

Check the cables between the pressure build-up valve:

- #3 and brake control module (BCM) #31 (#A31)
- #4 and brake control module (BCM) #17 (#A17)

check for an open-circuit, a short-circuit to ground and a short-circuit to supply voltage.

HINT: Check the pressure build-up valve by, with the ignition off and the breakout box connected,

reading the resistance between terminals #17 and #31 on the breakout box. Resistance must be approximately 3ohms.

Remedy as necessary.

Other information

- see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- see **SIGNAL SPECIFICATION, BRAKE CONTROL MODULE (BCM) WITH DSTC (DYNAMIC STABILITY AND TRACTION CONTROL)**
- For replacing the pressure build-up valve (brake booster):
  - For B6xxxx, see **POWER BRAKE BOOSTER, REPLACING**
  - For B5xxxx, see **POWER BRAKE BOOSTER, REPLACING** .

BCM-0140: PEDAL PRESSURE SENSOR. SIGNAL OUTSIDE ITS PERMITTED RANGE (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 109: Identifying Brake Booster
Courtesy of VOLVO CARS CORPORATION

NOTE: This diagnostic trouble code (DTC) applies only to brake systems with dynamic stability and traction control (DSTC).

The pedal pressure sensor is located in the power brake booster and informs the brake control module (BCM) when the brake pedal is pressed. The control module uses the information to disengage active yaw control and active brake assistance if the functions are activated and the driver presses the brake pedal.

Diagnostic trouble code (DTC) BCM-0140 is stored if the control module registers an implausible signal from the pedal pressure sensor.

Substitute Value

- Traction control is blocked
- Stability control is blocked
- Active yaw control is blocked
- Brake assistance is blocked.

HINT: For information about abbreviations, see BRAKE SYSTEM, ABBREVIATIONS .

Possible Source

- Contact resistance or oxidation in the terminals or connections
- Open-circuit in the wiring
- Short-circuit to ground or supply voltage in the wiring
- Defective pedal pressure sensor
- Defective brake control module (BCM).

Fault symptom[s]

- The anti-spin warning lamp is lit (up to and including 2002 model year)
- General warning lamp lit
- Anti-spin does not function
- The stability control system does not function
- The traction control system does not function.

SIGNAL OUTSIDE ITS PERMITTED RANGE

CHECKING THE CONNECTORS

Fig. 110: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 111: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the brake control module (BCM) and pedal pressure sensor connectors. Check for contact resistance and oxidation
- Reinstall the components, reconnect the connectors etc.
- Ignition on
- Read off the status of the pedal pressure sensor.

  The status must be OFF with the brake pedal unaffected and change to ON when the brake pedal is pressed. If the status changes, the cause of the fault was probably contact resistance or oxidation in the control module or in the pedal pressure sensor connectors.

Fig. 112: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 113: Identifying Brake Booster
Courtesy of VOLVO CARS CORPORATION

Does the status change?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CHECKING THE WIRING**

CHECKING THE WIRING

Check the wiring between the pedal pressure sensor:

- terminal #1 and control module terminal #27 (#A27)
- terminal #2 and control module terminal #30 (#A30)
- terminal #5 and control module terminal #28 (#A28).

check for an open-circuit, a short-circuit to ground and a short-circuit to supply voltage.

Remedy as necessary.

Other information

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- To fault-trace the wiring and connections, see **CONTENTS**
- To replace the pedal pressure sensor (power brake booster):
  - For B6xxxx, see **POWER BRAKE BOOSTER, REPLACING**
  - For B5xxxx, see **POWER BRAKE BOOSTER, REPLACING** .
- For information about signals, see **SIGNAL SPECIFICATION, BRAKE CONTROL MODULE (BCM) WITH DSTC (DYNAMIC STABILITY AND TRACTION CONTROL)** .

Was a fault detected?

- **YES**

  see **VERIFICATION**

- **NO**

  see **CHECKING THE CONNECTORS**

CHECKING THE CONNECTORS

Fig. 117: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Connect the breakout box to the cable harness (not control module side).

  Connect an ohmmeter between terminals #28 and #27 on the breakout box. When the brake pedal is not depressed the resistance must be infinite. When the brake pedal is depressed the resistance must be 0 ohms.

  Connect an ohmmeter between terminals #28 and #30 on the breakout box. When the brake pedal is not depressed the resistance should be 0 ohms. When the brake pedal is depressed the resistance should be infinite.

  Replace the power brake booster if the resistance is incorrect.

Other information

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- To replace the power brake booster:
  - For B6xxxx, see **POWER BRAKE BOOSTER, REPLACING**
  - For B5xxxx, see **POWER BRAKE BOOSTER, REPLACING** .

Fig. 118: Breakout Box
Courtesy of VOLVO CARS CORPORATION

Fig. 119: Identifying Ohm Meter
Courtesy of VOLVO CARS CORPORATION

Fig. 120: Identifying Brake Booster
Courtesy of VOLVO CARS CORPORATION

Was the resistance OK?

- **YES**

  FAULT NOT FOUND: Troubleshooting has been completed.

- **NO**

  see **VERIFICATION**

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 121: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 122: Connecting Connector

BCM-0145: STABILITY CONTROL. TOO LONG STABILITY CONTROL (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 124: ABS Control Module
Courtesy of VOLVO CARS CORPORATION

NOTE: The diagnostic trouble code (DTC) applies only to cars with dynamic stability and traction control (DSTC).

Diagnostic trouble code (DTC) BCM-0145 is stored If the brake control module (BCM) registers that the stability function operates for more than 15 seconds non-stop.

Substitute Value

- Traction control is blocked
- Stability control is blocked
- Active yaw control is blocked.

HINT: For information about abbreviations, see BRAKE SYSTEM, ABBREVIATIONS .

Possible Source

- Incorrectly installed steering wheel
- Incorrect wheel alignment
- Loose or incorrectly installed active yaw control sensor

- Defective active yaw control sensor.

NOTE: **This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.**

Fault symptom[s]

- The anti-spin warning lamp is lit (up to and including 2002 model year)
- General yellow warning lamp lit (from model year 2003 inclusive)
- Anti-spin does not function
- The stability control system does not function
- The traction control system does not function.

TOO-LONG: STABILITY CONTROL

VISUALLY CHECKING THE BRAKES

HINT: The diagnostic trouble code (DTC) indicates that the stability function has been active for too long.

Check the front and rear brakes. Check there is no overheating damage to brake caliper, brake pads or brake disc. Replace damaged components.

Tell the customer why the anti-spin function was temporarily blocked and why the ABS warning lamp was lit.

Other information

- To remove or replace brake calipers, see **BRAKE CALIPERS FRONT, REPLACING** and **BRAKE CALIPERS REAR, REPLACING**
- To remove or replace brake pad, see **BRAKE PADS FRONT, REPLACING** and **BRAKE PADS REAR, REPLACING**
- To remove or replace brake disc, see **BRAKE DISC FRONT, REPLACING** and **BRAKE DISC REAR, REPLACING** .

BCM-0146: FACTORY TEST, DYNAMIC STABILITY AND TRACTION CONTROL (DSTC). TEST CYCLE NOT APPROVED (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 125: ABS Control Module
Courtesy of VOLVO CARS CORPORATION

NOTE: **The diagnostic trouble code (DTC) applies only to cars with dynamic stability**

and traction control (DSTC).

Diagnostic trouble code (DTC) BCM-0146 is stored if the brake control module (BCM) registers that the factory test was not completed.

Substitute Value

- Traction control is blocked
- Stability control is blocked
- Active yaw control is blocked.

HINT: For information about abbreviations, see BRAKE SYSTEM, ABBREVIATIONS .

Possible Source

- Active yaw control operation during the factory test
- Factory test not completed satisfactorily.

NOTE: This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.

Fault symptom[s]

- The anti-spin warning lamp is lit (up to and including 2002 model year)
- General yellow warning lamp lit (from model year 2003 inclusive)
- Anti-spin does not function
- The stability control system does not function
- The traction control system does not function.

TEST CYCLE NOT APPROVED

FAULT-TRACING INFORMATION

The diagnostic trouble code (DTC) indicates that active yaw control has been active. This means that the test cycle was not completed correctly and must be repeated.

BCM-0146: FACTORY TEST, DYNAMIC STABILITY AND TRACTION CONTROL (DSTC). TEST CYCLE NOT APPROVED (B5254T2; 2005-2007)

BCM-0147: PEDAL POSITION SENSOR. SIGNAL OUTSIDE ITS PERMITTED RANGE (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 126: Identifying Pedal Position Sensor

Courtesy of VOLVO CARS CORPORATION

The brake pedal position sensor is part of "Active brake assistance". The sensor transmits a signal to the brake control module about the position of the brake pedal and the speed at which it is pressed. These signals are required to determine how much brake power is required in each brake situation.

The pedal position sensor is included on cars without brake assistance and is then used by the control module to check the operation of the stop lamp switch.

Diagnostic trouble code (DTC) BCM-0147 is stored if the control module registers a faulty signal from the pedal position sensor.

The diagnostic trouble code (DTC) can be diagnosed after the brake pedal has been depressed to the maximum, the engine has been started, and the brake pedal released. After having been stationary for approximately 10 seconds and then driven faster than 10 km/h for at least 10 seconds. Then stopped the car by braking.

Substitute Value

- Brake assistance is blocked.

HINT: For information about abbreviations, see BRAKE SYSTEM, ABBREVIATIONS .

Possible Source

- Open-circuit in the wiring
- Short-circuit to ground or supply voltage in the wiring
- Incorrectly installed pedal position sensor
- Defective pedal position sensor
- Defective brake control module.

Fault symptom[s]

- General yellow warning lamp lit.

BCM-0148: COMMUNICATION BETWEEN CONTROL MODULES. FAULTY CONFIGURATION ID (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 127: Identifying Brake Control Module (BCM) & Steering Wheel Angle Sensor
Courtesy of VOLVO CARS CORPORATION

The control module for the steering angle sensor communicates with the brake control module (BCM) with data which is transmitted in "small packages". Each package has an ID number.

Diagnostic trouble code (DTC) BCM-0148 is stored if the brake control module (BCM) registers an ID number that does not correspond to what the brake control module (BCM) expects.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- Traction control is blocked
- Stability control is blocked
- Active yaw control is blocked.

HINT: For information about abbreviations, see BRAKE SYSTEM, ABBREVIATIONS .

Possible Source

- Disruption or intermittent open-circuit on the Control area network (CAN)
- Internal fault in the control module for the steering wheel angle sensor.

NOTE: This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.

Fault symptom[s]

- The anti-spin warning lamp is lit (up to and including 2002 model year)
- General yellow warning lamp lit (from model year 2003 inclusive)
- Anti-spin does not function
- The stability control system does not function
- The traction control system does not function.

FAULTY CONFIGURATION ID

INFORMATION

HINT: Diagnostic trouble code (DTC) BCM-0148 can be stored when programming the brake control module. If this is the case, erase the diagnostic trouble code (DTC).

Fig. 128: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Erase the diagnostic trouble code (DTC) if it was stored during programming.

Fig. 129: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

- Read off the status of the diagnostic trouble code (DTC).

Fig. 131: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the status of the diagnostic trouble code (DTC) intermittent?

- **YES**

  see **INTERMITTENT FAULT**

- **NO**

  see **FAULT-TRACING INFORMATION**

FAULT-TRACING INFORMATION

The diagnostic trouble code (DTC) indicates that the fault is in the control module for the steering wheel angle sensor.

Fault-trace according to the relevant information. If no fault is found, replace the control module for the steering angle sensor.

INTERMITTENT FAULT

HINT: The status of the diagnostic trouble code (DTC) indicates that the control module has previously

registered a fault but that the fault is not now active.

Check the connectors for the brake control module and the control module for the steering wheel angle sensor. Check for contact resistance and oxidation.

Check that the communication wiring is not too close to a source of interference such as a carphone etc.

Remedy as necessary.

Other information

- see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- For connection of breakout box to Steering wheel angle sensor module (SAS), see: **CONNECTING THE BREAKOUT BOX TO THE STEERING ANGLE SENSOR**
- see **CONTENTS** .

BCM-0150: STOP LAMP SWITCH. SIGNAL OUTSIDE ITS PERMITTED RANGE (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 142: Brake Light Switch
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) BCM-0150 is stored if the brake control module (BCM) registers that the stop (brake) lamp switch is not activated when the brake pedal is depressed.

There are diagnostics for this diagnostic trouble code (DTC) when the ignition is on and in the following cases:

- Braking from a speed in excess of 40 km/h to standstill 3 times in succession within the same ignition cycle without control
- The brake pedal is kept pressed down and the stop lamp switch is activated for longer than 6 minutes.

Substitute Value

- None.

Possible Source

- Mechanical fault in the stop lamp switch.

NOTE: **This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.**

Fault symptom[s]

- None.

SIGNAL OUTSIDE ITS PERMITTED RANGE

CHECKING THE CONTROL MODULE AND WHEEL SENSOR CONNECTORS

Fig. 143: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 144: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the brake control module (BCM) and stop (brake) lamp switch connectors. Check for contact resistance and oxidation
- Reinstall the components, reconnect the connectors etc.
- Ignition on
- Read off the status of the stop lamp switch.

  Depress and release the brake pedal. The value must change between OFF and ON.

  If the value changes, the cause of the fault was loose connections in the control module or wheel sensor connectors.

Other information

- For information about removing the brake control module (BCM) connector, see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- To fault-trace the wiring and connections, see **CONTENTS** .

Fig. 145: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

Does the value change?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CHECKING THE FUSE, WIRING AND SENSORS**

CHECKING THE FUSE, WIRING AND SENSORS

Check that the fuse for the stop (brake) lamp switch in the integrated relay / fusebox in the engine compartment is intact.

Check the cable between stop lamp switch terminal #1 and the fuse in the integrated relay / fusebox in the engine compartment and between stop lamp switch terminal #5 and the splice. Check for an open-circuit. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Check the cable between the splice and central electronic module (CEM) terminal #B4 and between the splice and engine control module (ECM) terminal #B26. Check for an open-circuit. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

HINT: Check the stop lamp switch by measuring the resistance between terminals #1 and #5 on the stop lamp switch. When the brake pedal is depressed the resistance should be infinite. When the brake pedal is not depressed the resistance should be 0 ohms.

Remedy as necessary.

Other information

- To connect the breakout box to the brake control module (BCM), see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 157: ABS Control Module
Courtesy of VOLVO CARS CORPORATION

The control modules in the car continually transmit and receive information over the data network (Controller Area Network). When the brake control module (BCM) is supplied with voltage the CAN controller which handles Controller Area Network communication is initialized.

Diagnostic trouble code (DTC) BCM-0151 is stored if initialization of the CAN controller fails.

The diagnostic trouble code (DTC) can be diagnosed while the ignition is switched on.

Substitute Value

- Traction control is blocked
- Stability control is blocked
- Active yaw control is blocked
- All communication to and from the brake control module (BCM) is shut off.

HINT: For information about abbreviations, see BRAKE SYSTEM, ABBREVIATIONS .

Possible Source

- Internal fault in the brake control module (BCM).

Fault symptom[s]

- The anti-spin warning lamp is lit (up to and including 2002 model year)
- General yellow warning lamp lit (from model year 2003 inclusive)
- The stability control system does not function
- The traction control system does not function.

INTERNAL MEMORY FAULT

CHECKING DIAGNOSTIC TROUBLE CODES (DTCS)

Fig. 158: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 159: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the brake control module (BCM) connector. Check for contact resistance and oxidation
- Reinstall the components, reconnect the connectors etc.
- Ignition on
- Wait approximately 60 seconds
- Read off the status of the diagnostic trouble code (DTC).

  Replace the brake control module (BCM) if the status of the fault is permanent.

  Other information

  - To access the control module connector, see **CONNECTING THE BREAKOUT BOX, BRAKE**

CONTROL MODULE (BCM)

- To replace the brake control module (BCM), see **BRAKE CONTROL MODULE (BCM), REPLACING**
- see **CONTENTS**

Fig. 160: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Was the status of the diagnostic trouble code (DTC) permanent?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.

It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

BCM-A030: COMMUNICATION BETWEEN CONTROL MODULES. STEERING ANGLE SENSOR. INITIALIZATION CHECK NOT RUN (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 161: Identifying Control Unit
Courtesy of VOLVO CARS CORPORATION

The steering wheel angle sensor is initialized when the steering wheel is moved at least ±5° within a certain amount of time of the ignition being switched on.

Diagnostic trouble code (DTC) BCM-A030 is stored if the steering angle is not initialized after 2 minutes driving at a speed above 10 km/h.

The initialization can be run before the ignition is switched off even after diagnostic trouble code (DTC) BCM-A030 has been stored. The anti spin warning lamp then goes out. Diagnostic trouble code (DTC) BCM-0108 is also stored if the initialization is not completed before the ignition is switched off.

Substitute Value

- Active yaw control is blocked.

Possible Source

- The steering wheel angle sensor is uninitiated after two minutes driving above 10 km/h.

NOTE: **This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.**

Fault symptom[s]

- The anti-spin warning lamp is lit (up to and including 2002 model year)
- General yellow warning lamp lit (from model year 2003 inclusive)
- The traction control system does not function.

THE-INITIALIZATION: CHECK HAS NOT BEEN RUN

CHECKING DIAGNOSTIC TROUBLE CODES (DTCS)

If diagnostic trouble code (DTC) BCM-A030 is stored on its own it must be erased.

If diagnostic trouble code (DTC) BCM-0108 is stored at the same time as BCM-A030, read off the diagnostic trouble codes (DTCs) from the control module for the steering angle sensor. Fault-trace the system.

Select an option:

1. Diagnostic trouble code (DTC) BCM-A030 is stored on its own

   see **ERASING DIAGNOSTIC TROUBLE CODES (DTCS)**

2. Diagnostic trouble codes (DTCs) BCM-0108 and BCM-A030 are stored at the same time.

OKAY: Troubleshooting has been completed.

BCM-A031: COMMUNICATION BETWEEN CONTROL MODULES. STEERING ANGLE SENSOR. TOLERANCE CHECK NOT RUN (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION BCM-A031

Condition

Fig. 169: Identifying Steering Wheel Angle Sensor
Courtesy of VOLVO CARS CORPORATION

After the steering wheel angle sensor has been initialized, a check of the plausibility of the steering wheel angle is run.

The diagnostic trouble code (DTC) is stored if the check is not approved and speed exceeds 50 km/h.

The feasibility check can be performed after the relevant diagnostic trouble code is generated, but before the ignition is switched off. If the check is not complete within one minute, BCM-0111 is also generated.

Substitute Value

- Active yaw control is blocked.

Possible Source

- The plausibility check of the steering wheel angle is not approved.

NOTE: **This diagnostic trouble code is not due to an internal hardware fault in the Brake control module and must not be remedied by replacing the control module.**

Fault symptom[s]

- Anti-spin warning lamp lit
- General warning lamp lit
- Anti skid function is not working

PLAUSIBILITY CHECK NOT RUN

CHECKING DIAGNOSTIC TROUBLE CODES (DTCS)

If diagnostic trouble code (DTC) BCM-A031 is stored on its own it must be erased.

If diagnostic trouble code (DTC) BCM-0111 is stored at the same time as BCM-A031, read off the diagnostic trouble codes (DTCs) from the control module for the steering angle sensor. Fault-trace the system.

Select an option:

1. Diagnostic trouble code (DTC) BCM-A031 is stored on its own

   see **ERASING DIAGNOSTIC TROUBLE CODES (DTCS)**

2. Diagnostic trouble codes (DTCs) BCM-0111 and BCM-A031 are stored at the same time.

BCM-A032: STABILITY FUNCTION. TOO LONG STABILITY CONTROL (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION BCM-A032

Condition

The diagnostic trouble code (DTC) is stored in the subsequent operating cycle (ignition off and ignition on) if the brake control module (BCM) performs an extended start up check of the DSTC system due to a number of different faults during the previous operating cycle.

Substitute Value

- None.

Possible Source

- The diagnostic trouble code (DTC) has been stored in the previous operating cycle.

NOTE: **This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.**

Fault symptom[s]

- The information lamp is lit.

TOO-LONG: STABILITY CONTROL

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

If diagnostic trouble code (DTC) BCM-A032 is stored on its own it must be erased.

If diagnostic trouble code (DTC) BCM-0145 is stored at the same time as BCM-A032, fault-tracing must be carried out according to the relevant information for diagnostic trouble code (DTC) BCM-0145.

Select an option:

1. Only BCM-A032 stored

   see **ERASING DIAGNOSTIC TROUBLE CODES (DTCS)**

2. Diagnostic trouble codes (DTCs) BCM-0145 and BCM-A032 are stored at the same time.

OKAY: Troubleshooting has been completed.

BCM-C002001: ABS PUMP MOTOR CONTROL. GENERAL MALFUNCTION INFORMATION. GENERAL ELECTRICAL MALFUNCTION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-C002001

Condition

Fig. 175: Identifying Brake Pump Motor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code BCM-C002001 is generated if the brake control module registers that the pump motor does not start or if there is no pump motor signal.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- ABS is blocked.
- TC is blocked.

- SC is blocked.
- AYC is blocked.
- BA is blocked.

HINT: For information on brake system abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Contact resistance in the terminals
- Defective pump motor fuse.
- Open circuit on voltage feed to pump motor.
- Open circuit on pump motor ground cable.
- Defective pump motor.
- Defective brake control module (BCM).

Fault symptom[s]

- General warning light on.
- ABS warning light on.
- ABS is not operational.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING BCM-C002001

CHECKING PUMP MOTOR FUNCTION

Fig. 176: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 177: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connectors of the brake control module (BCM) and the pump motor for contact resistance and oxidation.
- Reconnect the connectors, components, etc.
- Ignition on
- Activate the pump motor.

  Check that the pump motor starts and runs normally.

  If the pump motor starts and runs normally, the malfunction was probably caused by contact resistance and oxidation in the brake control module (BCM) or pump motor connectors.

Other information

- see **BRAKE CONTROL MODULE (BCM), REPLACING**
- see **CHECKING WIRING AND TERMINALS**

Fig. 178: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

BCM-C00201C: ABS PUMP MOTOR CONTROL. GENERAL ELECTRICAL MALFUNCTION. INCORRECT VOLTAGE (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-C00201C

Condition

Fig. 186: Identifying Brake Pump Motor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code BCM-C00201C is generated if the brake control module registers that voltage to the pump motor is incorrect.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- ABS is blocked.
- TC is blocked.
- SC is blocked.
- AYC is blocked.
- BA is blocked.

HINT: For information on brake system abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Contact resistance in the terminals
- Defective pump motor fuse.

- Open circuit on voltage feed to pump motor.
- Open circuit on pump motor ground cable.
- Open circuit on voltage feed (30-feed) to pump motor control module.
- Defective pump motor.
- Defective brake control module (BCM).

Fault symptom[s]

- General warning light on.
- ABS warning light on.
- ABS is not operational.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

BCM-C002201: BRAKE SERVO SOLENOID. GENERAL MALFUNCTION INFORMATION. GENERAL ELECTRICAL MALFUNCTION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-C002201

Condition

Fig. 208: Identifying Brake Booster
Courtesy of VOLVO CARS CORPORATION

NOTE: The diagnostic trouble code only applies to brake systems with DSTC.

During stability control, the brake control module (BCM) sends a signal to the pressure build-up valve, which opens and allows atmospheric pressure to enter the brake booster, which automatically increases brake pressure in the brake system. This function is used by the anti-skid function and active brake assist (BA).

Diagnostic trouble code BCM-C002201 is generated if the brake control module (BCM) registers an unreasonable signal from the pressure build-up valve.

Substitute Value

- TC is blocked.
- SC is blocked.
- AYC is blocked.
- BA is blocked.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Contact resistance or oxidation in the connectors or connections.
- The cables are short-circuited to ground or voltage.
- Improperly installed sensor.
- Defective pressure build-up valve.
- Internal malfunction in brake control module (BCM).

Fault symptom[s]

- General warning light on.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING BCM-C002201

CHECKING THE CONNECTORS

Fig. 209: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connectors of the brake control module (BCM) and the pressure build-up valve/pedal pressure sensor for contact resistance and oxidation.
- Reinstall the components, reconnect the connectors etc.
- Ignition on
- Use the Activation function to activate the pressure build-up valve.

  The status should switch between OFF and ON.

  Other information

  - For removal of the control module connectors: **CONNECTING THE BREAKOUT BOX,**

BRAKE CONTROL MODULE (BCM)

- see **CONTENTS**

Fig. 210: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

Fig. 211: Identifying Brake Booster
Courtesy of VOLVO CARS CORPORATION

Does the status switch between OFF and ON?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CHECKING WIRING AND SENSORS**

CHECKING WIRING AND SENSORS

Check the cables between the pressure build-up valve for open circuit, short-circuit to ground and short circuit to voltage.

Measure between:

- Pressure build-up valve terminal #3 and brake control module (BCM) terminal #31 (#A31).
- Pressure build-up valve terminal #4 and brake control module (BCM) terminal #17 (#A17).

HINT: With the ignition off and the pressure build-up valve disconnected, check the pressure build-up valve by measuring the resistance between pressure build-up valve connector terminals #3 and #4 on the breakout box. The resistance must be approximately 3 ohms.

Remedy as necessary.

Other information

- see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)** .
- see **SIGNAL SPECIFICATION, BRAKE CONTROL MODULE (BCM) WITH DSTC (DYNAMIC STABILITY AND TRACTION CONTROL)**
- For replacing the pressure build-up valve (brake booster):
  - For B6xxxx, see **POWER BRAKE BOOSTER, REPLACING**
  - For B5xxxx, see **POWER BRAKE BOOSTER, REPLACING** .

BCM-C003007: TOOTHED WHEEL LEFT FRONT. GENERAL MALFUNCTION INFORMATION. MECHANICAL MALFUNCTION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 217: Identifying Wheel Sensor
Courtesy of VOLVO CARS CORPORATION

The brake control module (BCM) receives wheel speed information for the wheel in question by the wheel sensors, which are housed in the wheel mounting, reading off a toothed wheel on the wheel axle.

If the control module registers that the wheel sensor signal is distorted or interrupted too many times, diagnostic trouble code BCM-C003007, BCM-C003307, BCM-C003607 or BCM-C003907 is generated depending on the wheel sensor.

- BCM-C003007: Wheel sensor, front left
- BCM-C003307: Wheel sensor, front right
- BCM-C003607: Wheel sensor, rear left
- BCM-C003907: Wheel sensor, rear right

The diagnostic trouble code can be diagnosed at speeds over 10 km/h (6.2 mph).

Substitute Value

- ABS is blocked.
- TC is blocked.
- SC is blocked.

- AYC is blocked.
- BA is blocked.
- EBD is blocked if two or more wheel sensors are inoperable.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Loose wheel sensor.
- Damaged cables.
- Damaged toothed wheel.

NOTE: This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.

Fault symptom[s]

- ABS warning light on.
- General warning light is on.
- ABS is not operational.
- Anti-spin is not operational.
- The anti-skid function is not operational.

NOTE: If the malfunction is intermittent, the ABS warning light will go out when speed exceeds 10 km/h (6.2 mph) in the next operating cycle.

TROUBLESHOOTING

CHECKING WHEEL SENSOR AND TOOTHED WHEEL

Fig. 218: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Remove the wheel for better accessibility.

  Check that the wheel sensor is mounted close to the spindle/hub. There must not be any dirt between the sensor and the contact surface.

  Check that the toothed wheel is properly mounted and is free from damage (all teeth intact, no scratches or deformity, etc.)

  Remedy as necessary.

  Other information

- For wheel sensor access/replacement: **WHEEL SENSOR FRONT, REPLACING** or **WHEEL SENSOR REAR, REPLACING** .

Fig. 219: Identifying Brake Rotor Test Assembly
Courtesy of VOLVO CARS CORPORATION

Was a malfunction detected?

- **YES**

  see **VERIFICATION**

- **NO**

  see **CHECKING CONNECTORS AND CABLES**

CHECKING CONNECTORS AND CABLES

Check the connectors of the brake control module (BCM) and the relevant wheel sensors for contact resistance and oxidation.

Check the connectors and wiring harness insulation for damage.

Check that the wheel sensor cables are not positioned too close to a source of interference.

Remedy as necessary.

Other information

- see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- see **SIGNAL SPECIFICATION, BRAKE CONTROL MODULE (BCM) WITH STC/ TRACS**
- see **SIGNAL SPECIFICATION, BRAKE CONTROL MODULE (BCM) WITH DSTC (DYNAMIC STABILITY AND TRACTION CONTROL)**
- For wheel sensor check/replacement: **WHEEL SENSOR FRONT, REPLACING** or **WHEEL SENSOR REAR, REPLACING**
- see **CHECKING WIRING AND TERMINALS**

Fig. 220: Breakout Box

BCM-C003101: WHEEL SPEED SENSOR LEFT FRONT. GENERAL MALFUNCTION INFORMATION. GENERAL ELECTRICAL MALFUNCTION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 223: Identifying Wheel Sensor
Courtesy of VOLVO CARS CORPORATION

The brake control module (BCM) receives wheel speed information by the wheel sensors, which are housed in the wheel mounting, reading off a toothed wheel on the wheel axle. If the control module registers that the signal from a wheel sensor is distorted or cut off too many times, diagnostic code BCM-C003101, BCM-C003401, BCM-C003701 or BCM-C003A01 is generated depending on which wheel sensor was involved.

- BCM-C003101: Wheel sensor, front left
- BCM-C003401: Wheel sensor, front right
- BCM-C003701: Wheel sensor, rear left
- BCM-C003A01: Wheel sensor, rear right

The diagnostic trouble code can be diagnosed at speeds over 10 km/h (6.2 mph).

Substitute Value

- ABS is blocked.
- EBD is blocked if two or more wheel sensors are inoperable.
- TC is blocked.

- SC is blocked.
- AYC is blocked.
- BA is blocked.

HINT: For information on brake system abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Contact resistance in the terminals
- Open circuit, short circuit to ground or supply voltage on voltage feed to wheel sensor.
- The signal cables are short-circuited to one another.
- The signal cable is short-circuited to ground or supply voltage.
- Open circuit on signal cable.
- Damaged wheel sensor.
- Internal error in the control module

Fault symptom[s]

- General warning light on.
- ABS warning light on.
- Brake circuit not working; warning light on.
- ABS is not operational.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

NOTE: If the malfunction is intermittent, the ABS warning light will go out when speed exceeds 10 km/h (6.2 mph) in the next operating cycle.

TROUBLESHOOTING

CHECKING BRAKE CONTROL MODULE (BCM) AND WHEEL SENSOR'S CONNECTOR

Fig. 224: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 225: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connectors of the brake control module (BCM) and the wheel sensors for contact resistance and oxidation.
- Reinstall the components, reconnect the connectors etc.
- Lift the vehicle so that the wheel in question hangs freely.
- Ignition on
- Read off the speed for the wheel in question.

  Rotate the wheel in question and check that wheel speed is updated.

  If wheel speed is updated, the malfunction was caused by poor contact in the control module's or wheel sensor's connector.

NOTE: **The wheel signal will only be active for approx. 20 seconds. Activate the service again if necessary.**

Other information

- Disconnecting the brake control module's connector: **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- Disconnecting the wheel sensor's connector: **WHEEL SENSOR FRONT, REPLACING**
- see **CHECKING WIRING AND TERMINALS**

Fig. 226: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is wheel speed updated?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CHECKING WIRING AND SENSORS**

CHECKING WIRING AND SENSORS

Fig. 227: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 228: Identifying Connector
Courtesy of VOLVO CARS CORPORATION

Checking the voltage feed

Check the signal cable for open circuit, short circuit to ground and short circuit to supply voltage.

Measure between:

- Brake control module (BCM) terminal #45 (#A45) (front left) and terminal #1 of the relevant sensor.
- Brake control module (BCM) terminal #34 (#A34) (front right) and terminal #1 of the relevant sensor.

Checking the signal cable

Check the signal cable for open circuit, short circuit to ground and short circuit to supply voltage.

Measure between:

- Brake control module (BCM) terminal #46 (#A46) (front left) and terminal #2 of the relevant sensor.
- Brake control module (BCM) terminal #33 (#A33) (front right) and terminal #2 of the relevant sensor.

Checking sensor function

With the sensor connected and the ignition on, check the sensor by connecting a breakout box and measuring the signal from the sensor.

Measure on the breakout box between:

- #45 (#A45) and #46 (#A46) (front left).
- #34 (#A34) and #33 (#A33) (front right).

Voltage should vary approx. 1 V when the toothed wheel rotates. If voltage is incorrect, replace the wheel sensor.

Remedy as necessary.

Other information

BCM-C003107: WHEEL SPEED SENSOR LEFT FRONT. GENERAL MALFUNCTION INFORMATION. MECHANICAL MALFUNCTION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 233: Identifying Wheel Sensor
Courtesy of VOLVO CARS CORPORATION

Control module for the brake system (BCM) can for diagnostic trouble codes BCM-C003107 (wheel sensor left front), BCM-C003407 (wheel sensor right front), BCM-C003707 (wheel sensor left rear) and BCM-C003A07 (wheel sensor right rear) register malfunctions in three different ways:

1. When the wheel sensor indicates to the control module that the wheel has stopped or rotates too slowly in relation to the vehicle reference speed while driving or during ABS control when speed exceeds 20 km/h (12.4 mph), diagnostic trouble code BCM-C003107, BCM-C003407, BCM-C003707 or BCM-C003A07 is generated depending on the wheel sensor.
2. The control module has an extrapolation counter that counts the number of times the wheel's change of speed is too large compared to what is permitted (calculated). If wheel acceleration is greater than that of the other wheel sensors, BCM-C003107, BCM-C003407, BCM-C003707 or BCM-C003A07 is generated depending on the wheel sensor.
3. If the control module registers that there is no signal from the wheel sensor when starting off from a speed below 6 km/h (3.7 mph) or if the slowest wheel rotates at a speed less than 40-60 % (depending on vehicle speed) that of the fastest wheel but the wheel sensor circuit remains unbroken, diagnostic trouble code BCM-C003107, BCM-C003407, BCM-C003707 or BCM-C003A07 is generated depending on the wheel sensor.

The diagnostic trouble code can be diagnosed at speeds over 10 km/h (6.2 mph).

Substitute Value

- ABS is blocked.
- EBD is blocked if two or more wheel sensors are inoperable.
- TC is blocked.
- SC is blocked.
- AYC is blocked.
- BA is blocked.

HINT: For information on brake system abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- A wheel was blocked while driving.
- Loose wheel sensor.
- Too little or too large of a gap between wheel sensor and toothed wheel.
- Wheel bearing play or axle vibrations.
- Damaged toothed wheel.
- Damaged wheel sensor.
- Dirt between wheel sensor and pulse wheel.

NOTE: **This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.**

Fault symptom[s]

- General warning light on.
- ABS warning light on.
- ABS is not operational.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING

CHECKING WHEEL SENSOR AND TOOTHED WHEEL

Fig. 234: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Remove the wheel for better accessibility.

  Check that the wheel sensor is mounted close to the spindle/hub. There must not be any dirt between the sensor and the contact surface.

  Check that the toothed wheel is properly mounted and is free from damage (all teeth intact, no scratches or deformity, etc.)

  Remedy as necessary.

  Other information

- For wheel sensor removal/replacement: **WHEEL SENSOR FRONT, REPLACING** or **WHEEL SENSOR REAR, REPLACING**

Is wheel speed updated?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CHECKING WIRING AND SENSORS**

CHECKING WIRING AND SENSORS

Checking the voltage feed

Check the voltage supply cable for open circuit, short-circuit to ground and short-circuit to voltage.

Measure between:

- Brake control module (BCM) terminal #36 (#A36) (rear left) and terminal #1 of the relevant sensor.
- Brake control module (BCM) terminal #43 (#A43) (rear right) and terminal #1 of the relevant sensor.

HINT: With the ignition on, voltage on the cable should be approx. 1 V below Ubat measured at the grounding point.

Checking the signal cable

Check the voltage cable for open circuit, short-circuit to ground and short-circuit to voltage.

Measure between:

- Brake control module (BCM) terminal #37 (#A37) (rear left) and terminal #2 of the relevant sensor.
- Brake control module (BCM) terminal #42 (#A42) (rear right) and terminal #2 of the relevant sensor.

Checking sensor function

With the sensor connected and the ignition on, check the sensor by connecting a breakout box and measuring the signal from the sensor.

Measure on the breakout box between:

- #36 (#A36) and #37 (#A37) (front left).
- #43 (#A43) and #42 (#A42) (front right).

Voltage should vary approx. 1 V when the toothed wheel rotates. If voltage is incorrect, replace the wheel sensor.

Remedy as necessary.

BCM-C004064: BRAKE PEDAL SWITCH "A". ALGORITHM ERROR. SIGNAL OUTSIDE PERMITTED RANGE (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-C004064

Condition

Fig. 246: Brake Light Switch
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code BCM-CO04064 is generated if the brake control module (BCM) registers that brake light switch is not active when the brake pedal is depressed.

The diagnostic trouble code can be diagnosed when the ignition is on and in the following cases:

- Braking from a speed over 40 km/h (25 mph) to stationary 3 times in the same ignition cycle without regulation.
- The brake pedal is held depressed and the brake light switch is active for more than 6 minutes.

Substitute Value

- Nothing.

Possible Source

- Mechanical defect in the brake light switch.

NOTE: **This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.**

Fault symptom[s]

- Nothing.

TROUBLESHOOTING BCM-C004064

CHECKING THE BRAKE CONTROL MODULE (BCM) AND THE BRAKE LIGHT SWITCH CONNECTOR

Fig. 247: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 248: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connectors of the brake control module (BCM) and the brake light switch for contact resistance and oxidation.
- Reinstall the components, reconnect the connectors etc.
- Ignition on
- Read the status of the brake light switch.

  Depress the brake pedal and release it. The value should change between OFF and ON.

  If the value changes, the malfunction was caused by poor contact in the brake control module (BCM) or brake light switch connector.

Other information

- For information on brake control module (BCM) connector removal: **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- see **CONTENTS**

Fig. 249: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Does the value change?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CHECKING FUSES, WIRING AND SENSORS**

CHECKING FUSES, WIRING AND SENSORS

Check that the brake light switch fuse in the engine compartment relay/fuse box is intact.

Check the cable between brake light switch terminal #1 and the fuse in the engine compartment relay/fuse box as well as between brake light switch terminal #5 and the connector for open circuit, short-circuit to ground and short-circuit to voltage.

Check the cable between the connector and central electronic module (CEM) terminal #B4 and between the connector and engine electronic module (ECM) terminal #B26 for open circuit, short-circuit to ground and short-circuit to voltage.

HINT: Check the brake light switch by measuring the resistance between terminals #1 and #5 on the brake light switch. Resistance should be infinite when the brake light switch is activated and 0 ohms when the brake light switch is not activated.

Remedy as necessary.

Other information

- see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- To connect the breakout box to the Engine control module (ECM), see: **CONNECTING THE BREAKOUT BOX**
- For connection of the breakout box to the central electronic module (CEM): **CONNECTING THE BREAKOUT BOX**
- see **STOP LAMP SWITCH, REPLACING**
- see **CONTENTS**

Fig. 250: Brake Light Switch

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

BCM-C004401: BRAKE PRESSURE SENSOR "A". GENERAL MALFUNCTION INFORMATION. GENERAL ELECTRICAL MALFUNCTION

(B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 259: Identifying Brake Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

NOTE: The diagnostic trouble code only applies to vehicles equipped with DSTC.

Brake pressure sensors provide the brake control module (BCM) signals regarding the pressure in the brake system. If the brake control module (BCM) registers an incorrect signal from a brake pressure sensor, diagnostic code BCM-C004401 or BCM-C004501 is generated depending on which sensor is involved.

Substitute Value

- TC is blocked.
- SC is blocked.
- AYC is blocked.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Open circuit in the cables.
- The cables are short-circuited to ground or voltage.
- Damaged pressure sensor.
- Internal malfunction in brake control module (BCM).

Fault symptom[s]

- General warning light on.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING

CHECKING THE CONNECTORS

Fig. 260: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 261: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connectors of the brake control module (BCM) and the brake pressure sensor for contact resistance and oxidation.
- Reinstall the components, reconnect the connectors etc.
- Ignition on
- Read off the brake system pressure for the relevant pressure sensor.
- Depress the brake pedal.

  Brake pressure should increase with increased pressure on the pedal. If brake pressure increases, the malfunction was caused by contact resistance in the connectors of the control module or the pressure sensor.

Other information

- For removal of the control module connectors: **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- see **CONTENTS**

Fig. 262: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 263: Brake Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

Does brake pressure increase?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CHECKING THE CONTROL MODULE**

CHECKING THE CONTROL MODULE

Fig. 264: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 265: Identifying Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Pressure sensor connector unplugged.
- Breakout box connected.

Check the voltage feed with a voltmeter:

Check the voltage feed with a voltmeter.

For pressure sensor A, measure between #A21 and #A22 on the breakout box.

For pressure sensor B, measure between #A18 and #A19 on the breakout box.

The voltage should be approx. 5 V. If the voltage is incorrect, replace the brake control module (BCM).

Other information

- see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- see **SIGNAL SPECIFICATION, BRAKE CONTROL MODULE (BCM) WITH DSTC (DYNAMIC STABILITY AND TRACTION CONTROL)**
- see **BRAKE CONTROL MODULE (BCM), REPLACING**

Fig. 266: Identifying Pedal Position Sensor Connector
Courtesy of VOLVO CARS CORPORATION

Was the voltage OK?

- **YES**

  see **CHECKING WIRING AND SENSORS**

- **NO**

  see **VERIFICATION**

CHECKING WIRING AND SENSORS

Fig. 267: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Connect a breakout box.

  Check the cables between the pressure sensor and the brake control module (BCM) for open circuit and short circuit to ground.

  For pressure sensor B, check the cables:

  - between pressure sensor terminal #1 and brake control module (BCM) terminal #19 (#A19)
  - between pressure sensor terminal #2 and brake control module (BCM) terminal #20 (#A20)
  - between pressure sensor terminal #3 and brake control module (BCM) terminal #18 (#A18)

For pressure sensor A, check the cables:

- between pressure sensor terminal #1 and brake control module (BCM) terminal #21 (#A21)
- between pressure sensor terminal #2 and brake control module (BCM) terminal #23 (#A23)
- between pressure sensor terminal #3 and brake control module (BCM) terminal #22 (#A22)

HINT: With the ignition on and the breakout box connected, check the relevant brake pressure sensor by measuring the sensor signal:

Pressure sensor B

- between terminals #A18 and #A19 on the breakout box. The voltage should be approx. 5 V.
- between terminals #A19 and #A20 on the breakout box. The voltage should be 0.25-4.75 V depending on brake pressure.

Pressure sensor A

- between terminals #A21 and #A22 on the breakout box. The voltage should be approx. 5 V.
- between terminals #A21 and #A23 on the breakout box. The voltage should be 0.25-4.75 V depending on brake pressure.

If the voltage does not change when the brake pedal is depressed, replace the pressure sensor.

Other information

- see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- see **SIGNAL SPECIFICATION, BRAKE CONTROL MODULE (BCM) WITH DSTC (DYNAMIC STABILITY AND TRACTION CONTROL)**
- see **PRESSURE SENSOR, MASTER CYLINDER, REPLACING**

BCM-C004664: BRAKE PRESSURE SENSOR "A"/"B". ALGORITHM ERROR. SIGNAL OUTSIDE PERMITTED RANGE (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-C004664

Condition

Fig. 272: Identifying Brake Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

NOTE: The diagnostic trouble code only applies to ABS systems with DSTC.

Brake pressure sensors A and B give Brake control module (BCM) signal about the pressure in the brake system. Diagnostic trouble code BCM-C004664 is generated if Brake control module (BCM) registers that the signal from any of the pressure sensors is unreasonable.

Substitute Value

- TC is blocked.
- SC is blocked.
- AYC is blocked.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Open circuit in the ground cable.
- Malfunction in the brake circuit.
- Damaged pressure sensor.

Fault symptom[s]

- General warning light on.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING BCM-C004664

CHECKING THE CONNECTORS

Fig. 273: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 274: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connectors of the brake control module (BCM) and the brake pressure sensor for contact resistance and oxidation.
- Reinstall the components, reconnect the connectors etc.
- Ignition on
- Read off the brake system pressure.
- Depress the brake pedal.

  The brake pressure indicated by both pressure sensors should increase with increased pressure on the pedal. If the brake pressure indicated by both pressure sensors increases, the malfunction was caused by contact resistance in the connectors of the control module or the pressure sensor.

Other information

- To access brake control module (BCM) connectors: **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)** .

BCM-C004801: PEDAL POSITION SENSOR. GENERAL MALFUNCTION INFORMATION. GENERAL ELECTRICAL MALFUNCTION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-C004801

Condition

Fig. 285: Identifying Brake Pedal Position Sensor
Courtesy of VOLVO CARS CORPORATION

The pedal position sensor sends the brake control module (BCM) a signal indicate the position of the brake pedal and the speed with which it was depressed. The brake control module (BCM) uses the signal to activate the active brake assist (BA) function during sudden heavy braking.

Diagnostic trouble code BCM-C004801 is generated if the brake control module (BCM) registers a defective signal from the pedal position sensor.

The diagnostic trouble code can be diagnosed when the ignition is on and if the pedal position sensor signal is more than 4.85 V or less than 0.15 V for a long period of time.

Substitute Value

- BA is blocked.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Open-circuit on the signal cable.
- The cables are short-circuited to ground or supply voltage.

- Improperly installed sensor.
- Damaged sensor.
- Internal malfunction in brake control module (BCM).

Fault symptom[s]

- General warning light on.

TROUBLESHOOTING BCM-C004801

CHECKING THE CONNECTORS

Fig. 286: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connectors of the brake control module (BCM) and the pedal position sensor for contact resistance and oxidation.
- Reinstall the components, reconnect the connectors etc.
- Connect a breakout box to the brake control module (BCM).
- Ignition on
- Read off the status and speed of the pedal position sensor.

Depress the brake pedal and check that the signals are updated.

The pedal position sensor signal should increase upon increased pressure on the brake pedal.

Depress the brake pedal at different speeds. Check that the speed signal is updated.

Other information

- see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- see **CONTENTS**

Fig. 287: Identifying Brake Pedal Position Sensor Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 288: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

Is the signal updated?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CHECKING WIRING AND SENSORS**

CHECKING WIRING AND SENSORS

Fig. 290: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off

  Check the cables for open circuit, short circuit to ground and short circuit to supply voltage.

  Measure between: the pedal position sensor

  - Pedal position sensor terminal #1 and brake control module (BCM) terminal #7 (#A7).
  - Pedal position sensor terminal #2 and brake control module (BCM) terminal #5 (#A5).
  - Pedal position sensor terminal #3 and brake control module (BCM) terminal #3 (#A3).

  Check the pedal position sensor

- with the ignition off
- a breakout box connected to the wiring harness
- the brake control module (BCM) disconnected

by measuring the resistance on the pedal position sensor.

When the brake pedal is not actuated, the resistance between terminals #3 (#A3) and #5 (#A5) on the breakout box should be approx. 0.5 kohms. The resistance should increase when the brake pedal is depressed.

When the brake pedal is not actuated, the resistance between terminals #3 (#A3) and #7 (#A7) on the breakout box should be approx. 2.5 kohms. The resistance should decrease when the brake pedal is depressed.

Remedy as necessary.

BCM-C004864: PEDAL POSITION SENSOR. ALGORITHM ERROR. SIGNAL OUTSIDE PERMITTED RANGE (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-C004864

Condition

Fig. 296: Identifying Pedal Position Sensor
Courtesy of VOLVO CARS CORPORATION

The pedal position sensor is part of the "Active brake assist" (BA) function and sends a signal to the brake control module (BCM) regarding the position of the brake pedal and the speed with which it was depressed. These signals are used to determine how much brake force is needed in each braking situation.

The pedal position sensor is also found in vehicles without BA. It is then used by the brake control module (BCM) to check the function of the brake light switch.

Diagnostic trouble code BCM-C004864 is generated if the brake control module (BCM) registers an unreasonable signal from the pedal position sensor.

The diagnostic trouble code can be diagnosed after the following: The brake pedal is pressed all the way down, the engine is started and the brake pedal released. After remaining stationary for approx. 10 seconds, the vehicle is driven faster than 10 km/h (6.2 mph) for at least 10 seconds. The vehicle is then stopped by braking.

Substitute Value

- BA is blocked.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Open circuit in the cables.
- The cables are short-circuited to ground or voltage.
- Improperly installed pedal position sensor.
- Damaged pedal position sensor.
- Damaged brake control module (BCM).

Fault symptom[s]

- General warning light on.

TROUBLESHOOTING BCM-C004864

CHECKING DIAGNOSTIC TROUBLE CODES IN CEM AND ECM

If there are any diagnostic trouble codes for the brake pedal position sensor or the brake light switch stored in the engine control module (ECM) or in the central electronic module (CEM), perform troubleshooting of these first.

Were any diagnostic trouble codes stored for the pedal position sensor or brake light switch?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CHECKING CONTROL MODULE AND THE SENSOR'S CONNECTOR**

CHECKING CONTROL MODULE AND THE SENSOR'S CONNECTOR

HINT: The cause of the diagnostic trouble code can be found in the circuit for the brake light switch or the pedal position sensor.

Fig. 297: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 298: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connectors of the brake control module (BCM), brake light switch, and the pedal position sensor for contact resistance and oxidation.
- Reinstall the components, reconnect the connectors etc.
- Ignition on
- Read off the status of the brake light switch and the pedal position sensor's position.

  Depress the brake pedal and let it up again. The value shall change between OFF and ON, and the pedal position sensor's position shall be updated.

  Other information

- see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- see **STOP LAMP SWITCH, REPLACING**
- see **PEDAL SENSOR POWER BRAKE BOOSTER, REPLACING**
- see **CONTENTS**

Select an alternative:

1. The value for the brake light switch does not change.

   see **CHECKING FUSES, WIRING AND SENSORS**

2. The value for the pedal position sensor is not updated.

   see **SIGNAL OUTSIDE PERMITTED RANGE**

3. The values are OK.

   FAULT NOT FOUND: Troubleshooting has been completed.

Fig. 299: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Select an alternative.

CHECKING FUSES, WIRING AND SENSORS

Fig. 300: Disconnecting Connector
Courtesy of VOLVO CARS CORPORATION

Check that the fuse for the brake light circuit is okay. If the fuse is damaged, first check the circuit to the brake light switch for short-circuiting to voltage before the replacing the fuse.

If the fuse is okay, check the circuit for the brake light switch for open circuit and short-circuit to ground.

Remedy as necessary.

Other information

- see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- To connect the breakout box to the Engine control module (ECM), see: **CONNECTING THE**

BREAKOUT BOX

- For connecting breakout box to Central Electronic Module (CEM):**CONNECTING THE BREAKOUT BOX**
- see **STOP LAMP SWITCH, REPLACING**

  see **VERIFICATION**

- **NO**

  FAULT NOT FOUND: Troubleshooting has been completed.

SIGNAL OUTSIDE PERMITTED RANGE

CHECKING THE CONNECTORS

Fig. 302: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 303: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connectors of the brake control module (BCM) and the pedal position sensor for contact resistance and oxidation.
- Reinstall the components, reconnect the connectors etc.
- Connect a breakout box.
- Ignition on
- Read off the pedal position sensor signal.

  Press down the brake pedal and check that the pedal's signals are updated.

  Other information

- see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- see **CONTENTS** .

Fig. 304: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 305: Identifying Pedal Position Sensor
Courtesy of VOLVO CARS CORPORATION

Were the signals updated?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CHECKING WIRING AND SENSORS**

CHECKING WIRING AND SENSORS

Check the cables between:

- pedal position sensor terminal #1 and brake control module (BCM) terminal #7 (#A7)
- pedal position sensor terminal #2 and brake control module (BCM) terminal #5 (#A5)
- pedal position sensor terminal #3 and brake control module (BCM) terminal #3 (#A3)

check for open circuit, short-circuit to ground and short-circuit to voltage.

HINT: Connect an ohmmeter between #2 and #3 on the pedal position sensor's connector.

HINT: The resistance shall be approx. 0.5 kohms with the brake pedal inactivated and approx. 2.5-3 kohms with depressed brake pedal.

HINT:

HINT: Connect the ohmmeter between #1 and #3 on the pedal position sensor's connector.

HINT: The resistance shall be approx. 2.5-3 kohms with the brake pedal inactivated and approx. 0.5 kohms with depressed brake pedal.

HINT:

HINT: If resistance is incorrect, replace the pedal position sensor.

If no defect is found, replace the pedal position sensor.

Other information

- see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**

CHECKING DIAGNOSTIC TROUBLE CODES IN CEM AND ECM

If there are any diagnostic trouble codes for the brake pedal position sensor or the brake light switch stored in the engine control module (ECM) or in the central electronic module (CEM), perform troubleshooting of these first.

Were any diagnostic trouble codes stored for the pedal position sensor or brake light switch?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CHECKING CONTROL MODULE AND THE SENSOR'S CONNECTOR**

CHECKING CONTROL MODULE AND THE SENSOR'S CONNECTOR

HINT: The cause of the diagnostic trouble code can be found in the circuit for the brake light switch or the pedal position sensor.

Fig. 315: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 316: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connectors of the brake control module (BCM), brake light switch, and the pedal position sensor for contact resistance and oxidation.
- Reinstall the components, reconnect the connectors etc.
- Ignition on
- Read off the status of the brake light switch and the pedal position sensor's position.

  Depress the brake pedal and let it up again. The value shall change between OFF and ON, and the pedal position sensor's position shall be updated.

  Other information

- see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- see **STOP LAMP SWITCH, REPLACING**
- see **PEDAL SENSOR POWER BRAKE BOOSTER, REPLACING**
- see **CONTENTS**

Select an alternative:

1. The value for the brake light switch does not change.

   see **CHECKING FUSES, WIRING AND SENSORS**

2. The value for the pedal position sensor is not updated.

   see **SIGNAL OUTSIDE PERMITTED RANGE**

3. The values are OK.

   FAULT NOT FOUND: Troubleshooting has been completed.

Fig. 317: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Select an alternative.

CHECKING FUSES, WIRING AND SENSORS

Fig. 318: Disconnecting Connector
Courtesy of VOLVO CARS CORPORATION

Check that the fuse for the brake light circuit is okay. If the fuse is damaged, first check the circuit to the brake light switch for short-circuiting to voltage before the replacing the fuse.

If the fuse is okay, check the circuit for the brake light switch for open circuit and short-circuit to ground.

Remedy as necessary.

Other information

- see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- To connect the breakout box to the Engine control module (ECM), see: **CONNECTING THE**

BREAKOUT BOX

BRAKES

Brake Control System - Diagnostic Trouble Codes and Associated Procedures

ACCELERATION SENSOR LATERAL. GENERAL MALFUNCTION INFORMATION. GENERAL ELECTRICAL MALFUNCTION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 1: Identifying Brake Control Module & Active Yaw Control Sensor
Courtesy of VOLVO CARS CORPORATION

NOTE: The diagnostic trouble code only applies to vehicles equipped with DSTC.

The AYC sensor for DSTC consists of a yaw speed sensor, lateral accelerometer, accelerometer (AWD only) and inclination sensor (RSC only). Via its own internal CAN network, the sensors transmit information to the brake control module (BCM) on the size of the yaw angle, vehicle acceleration both laterally and straight ahead as well as lateral inclination.

If the brake control module (BCM) registers a defective signal from one of the sensors, diagnostic trouble code BCM-C006101, BCM-C006201, BCM-C006301, or BCM-C111401 is generated depending on the sensor.

- BCM-C006101: Lateral accelerometer
- BCM-C006201: Accelerometer
- BCM-C006301: Yaw speed sensor
- BCM-C111401: Inclination sensor

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- TC is blocked.
- SC is blocked.
- AYC is blocked.
- RSC is blocked (only vehicles with RSC).

HINT: For information on brake system abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Open circuit or short circuit to ground on AYC sensor cables.
- Internal malfunction in AYC sensor.

NOTE: This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.

Fault symptom[s]

- General warning light on.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING

CHECKING THE WIRING

Fig. 2: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off

  Check the cables for an open circuit.

  Measure between:

  - The connector for AYC sensor terminal #1 and brake control module (BCM) terminal #A25 (#A25).
  - The connector for AYC sensor terminal #2 and brake control module (BCM) terminal #A29 (#A29).
  - The connector for AYC sensor terminal #3 and brake control module (BCM) terminal #A6 (#A6).
  - The connector for AYC sensor terminal #5 and brake control module (BCM) terminal #A39

(#A39).

If no defect is found on the cables, replace the AYC sensor.

Remedy as necessary.

BCM-C006128: ACCELERATION SENSOR LATERAL. GENERAL SIGNAL ERROR. SIGNAL DISPLACEMENT ERROR/ZERO ADJUSTMENT ERROR (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 8: Identifying Brake Control Module & Active Yaw Control Sensor
Courtesy of VOLVO CARS CORPORATION

NOTE: The diagnostic trouble code only applies to vehicles equipped with DSTC.

The AYC sensor for DSTC consists of a yaw speed sensor, lateral accelerometer, accelerometer (AWD only) and inclination sensor (RSC only). Via its own internal CAN network, the sensors transmit information to the brake control module (BCM) on the size of the yaw angle, vehicle acceleration both laterally and straight ahead as well as lateral inclination. Each sensor has an offset value, correction value, for individual sensor deviations.

If the brake control module (BCM) registers an incorrect offset value from one of the sensors, diagnostic trouble code BCM-C006128, BCM-C006228, BCM-C006328 or BCM-C111486 is generated depending on the sensor.

- BCM-C006128: Lateral accelerometer
- BCM-C006228: Accelerometer
- BCM-C006328: Yaw speed sensor
- BCM-C111486: Inclination sensor

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- TC is blocked.
- SC is blocked.
- AYC is blocked.
- RSC is blocked (only vehicles with RSC).

HINT: For information on brake system abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- AYC sensor improperly mounted.
- Loose AYC sensor.
- Bent AYC sensor bracket.
- Internal malfunction in AYC sensor.

NOTE: This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.

Fault symptom[s]

- General warning light on.
- Anti-spin is not operational.

- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING

CHECKING THE COMPONENT

Fig. 9: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off

  Check that the AYC sensor is properly secured and correctly mounted on the bracket under the passenger seat.

Also check that the bracket is not bent or damaged in any way.

Remedy as necessary.

BCM-C006164: ACCELERATION SENSOR LATERAL. ALGORITHM ERROR. SIGNAL OUTSIDE PERMITTED RANGE (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 14: Identifying Brake Control Module & Active Yaw Control Sensor

Courtesy of VOLVO CARS CORPORATION

NOTE: The diagnostic trouble code only applies to vehicles equipped with DSTC.

The AYC sensor for DSTC consists of a yaw speed sensor, lateral accelerometer, accelerometer (AWD only) and inclination sensor (RSC only). Via its own internal CAN network, the sensors transmit information to the brake control module (BCM) on the size of the yaw angle, vehicle acceleration both laterally and straight ahead as well as lateral inclination.

If the brake control module (BCM) registers an unreasonable signal from one of the sensors, diagnostic trouble code BCM-C006364, BCM-C006164, BCM-C111464 or BCM-C006264 is generated depending on which sensor is involved.

- BCM-C006364: Yaw speed sensor
- BCM-C006164: Lateral acceleration sensor
- BCM-C111464: Inclination sensor
- BCM-C006264: Accelerometer

Substitute Value

- TC is blocked.
- SC is blocked.
- AYC is blocked.
- RSC is blocked (only vehicles with RSC).

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Interference or noise on the cables that disrupted AYC sensor calculations.
- The voltage feed to the AYC sensor is too low.
- Defective wheel alignment.
- Internal malfunction in AYC sensor.

NOTE: This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.

Fault symptom[s]

- General warning light on.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING

CHECKING THE CONNECTORS

NOTE: **If other diagnostic trouble codes are stored in the brake control module (BCM) in addition to BCM-C006364, BCM-C006164, BCM-C111464 or BCM-C006264, select Cancel and troubleshoot these diagnostic trouble codes first.**

Fig. 15: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connectors of the brake control module (BCM) and the AYC sensor for contact resistance and oxidation.
- Check that a source of interference, such as a cellular phone or a radio receiver, is not positioned too close

to the AYC sensor.

- Test-drive following operating cycle: **TEST DRIVE FORM (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL) /BRAKE CONTROL MODULE), DESCRIPTION**
- Ignition on
- Read off diagnostic trouble codes (DTCs).

If the status of the diagnostic trouble code is intermittent, the malfunction was probably caused by contact resistance or oxidation in the brake control module (BCM) or AYC sensor connector or a source of interference too close to the sensor.

Other information

- For removal of the AYC sensor connector: **ACTIVE YAW CONTROL SENSOR, REPLACING**
- For removal of the brake control module (BCM) connector: **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**

Fig. 16: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-C006A01

Condition

Fig. 22: Identifying Brake Control Module & Active Yaw Control Sensor
Courtesy of VOLVO CARS CORPORATION

NOTE: The diagnostic trouble code only applies to brake systems with DSTC.

The AYC sensor is supplied with voltage 12 V.

Diagnostic trouble code BCM-C006A01 is generated if the brake control module (BCM) registers that the voltage feed to the AYC sensor is too high or too low.

Substitute Value

- TC is blocked.
- SC is blocked.
- AYC is blocked.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Contact resistance or oxidation in the connectors or connections.
- The voltage feed cables of the AYC sensor are short-circuited to ground or voltage.
- Open circuit on the voltage feed cable of the AYC sensor.
- Internal malfunction in AYC sensor.
- Internal malfunction in brake control module (BCM).

Fault symptom[s]

- General warning light on.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING BCM-C006A01

CHECKING THE CONNECTORS

BCM-C006A04 MULTI-AXIAL ACCELERATION SENSOR. GENERAL MALFUNCTION INFORMATION. INTERNAL ERROR (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-C006A04

Condition

Fig. 36: Identifying Brake Control Module & Active Yaw Control Sensor

Courtesy of VOLVO CARS CORPORATION

NOTE: The diagnostic trouble code only applies to vehicles equipped with DSTC.

The AYC sensor is supplied 12 V. The sensor signal voltage to the brake control module (BCM) is approx. 2.5 V when the vehicle is stationary. The brake control module (BCM) compares the voltage to a reference value.

Diagnostic trouble code BCM-C006A04 is generated if the voltage does not match the reference value or if an internal malfunction is registered in the AYC sensor.

Substitute Value

- TC is blocked.
- SC is blocked.
- AYC is blocked.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Signals that interfere with the AYC sensor.
- Too low voltage to the AYC sensor.
- Internal malfunction in AYC sensor.

NOTE: This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.

Fault symptom[s]

- General warning light on.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING BCM-C006A04

CHECKING THE SENSOR'S PRESENT VALUE.

Fig. 37: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connectors of the brake control module (BCM) and AYC sensor for contact resistance and oxidation.
- Ignition on
- Read off the value in question.

Check the read value of the respective component to the value in the table.

Component	Value
Yaw sensor	-81.9 degrees/second - +81.9 degrees/second
Lateral accelerometer	

	-17.9 m/s^2 - +17.9 m/s^2
Accelerometer	-17.9 m/s^2 - +17.9 m/s^2

NOTE: **The value for the accelerometer can only be read out in four-wheel drive vehicles.**

Fig. 38: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 39: Identifying Brake Control Module & Active Yaw Control Sensor
Courtesy of VOLVO CARS CORPORATION

Are the present values OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CHECKING THE VOLTAGE FEED**

CHECKING THE VOLTAGE FEED

Fig. 40: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Connect a breakout box to the brake control module (BCM).
- Ignition on

  Check the voltage feed to the AYC sensor by connecting a voltmeter between terminals #6 (#A6) and #39 (#A39) on the breakout box. The voltage should equal normal system voltage.

  If the voltage is incorrect, replace the brake control module (BCM).

  If the voltage is OK, check the cables for an open circuit.

  Measure between:

- AYC sensor terminal #3 and brake control module (BCM) terminal #6 (#A6).
- AYC sensor terminal #5 and brake control module (BCM) terminal #39 (#A39).

If the cables are OK, replace the AYC sensor.

BCM-C006A16 MULTI-AXIAL ACCELERATION SENSOR. GENERAL ELECTRICAL MALFUNCTION. VOLTAGE TOO LOW (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-C006A16

Condition

Fig. 46: Identifying Brake Control Module & Active Yaw Control Sensor
Courtesy of VOLVO CARS CORPORATION

NOTE: **The diagnostic trouble code only applies to vehicles equipped with DSTC.**

Diagnostic trouble code BCM-C006A16 is generated if the brake control module (BCM) registers that the voltage feed to the AYC sensor is below approx. 6 V ±0.5 V.

Substitute Value

- TC is blocked.
- SC is blocked.
- AYC is blocked.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Contact resistance in AYC sensor connections.
- Cables short-circuited to ground.
- Open circuit in the cables.
- Internal malfunction in AYC sensor.
- Internal malfunction in brake control module (BCM).

NOTE: This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.

Fault symptom[s]

- General warning light on.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING BCM-C006A16

CHECKING DIAGNOSTIC TROUBLE CODE STATUS

Fig. 47: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connectors of the brake control module (BCM) and AYC sensor for contact resistance and oxidation.
- Test-drive the vehicle, see **TEST DRIVE FORM (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL) /BRAKE CONTROL MODULE), DESCRIPTION**
- Ignition on
- Wait approximately 60 seconds.
- Read off diagnostic trouble codes (DTCs).

  If the status of the diagnostic trouble code is intermittent, the malfunction was probably caused by contact resistance or oxidation in the brake control module (BCM) or AYC sensor connector.

Other information

- For removal of the brake control module (BCM) connector: **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- see **ACTIVE YAW CONTROL SENSOR, REPLACING**
- see **CONTENTS**

Fig. 48: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-C006A17

Condition

Fig. 60: Identifying Brake Control Module & Active Yaw Control Sensor
Courtesy of VOLVO CARS CORPORATION

NOTE: The diagnostic trouble code only applies to vehicles equipped with DSTC.

Diagnostic trouble code BCM-C006A17 is generated if the brake control module (BCM) registers that the voltage feed from the AYC sensor exceeds approx. 17 V.

Substitute Value

- TC is blocked.
- SC is blocked.
- AYC is blocked.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- The voltage feed cable is short-circuited to voltage.
- Internal malfunction in AYC sensor.

NOTE: This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.

Fault symptom[s]

- General warning light on.
- Anti-spin is not operational.

- The stability function is not operational.
- The anti-skid function is not operational.

BCM-C006B00 STABILITY SYSTEM ACTIVE TOO LONG. GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-C006B00

Condition

Fig. 69: ABS Control Module
Courtesy of VOLVO CARS CORPORATION

NOTE: The diagnostic trouble code only applies to vehicles equipped with DSTC.

Diagnostic trouble code BCM-C006B00 is generated if the brake control module (BCM) registers that the stability function regulates continuously for more than 15 seconds.

Substitute Value

- TC is blocked.
- SC is blocked.
- AYC is blocked.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Improperly installed steering wheel.
- Defective wheel alignment.
- Loose or improperly installed AYC sensor.
- Damaged AYC sensor.

NOTE: **This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.**

Fault symptom[s]

- General warning light on.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING BCM-C006B00

VISUAL BRAKE CHECK

HINT: The diagnostic trouble code indicates that the stability function has regulated too long.

Check the front and rear brakes for overheating damage on the brake caliper, brake pads and brake disc. Replace damaged components.

Inform the customer why the anti-spin function was temporarily blocked and the ABS warning light was on.

BCM-C007200: BRAKE TEMPERATURE TOO HIGH. GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-C007200

Condition

Fig. 70: Identifying Brake Caliper Mounting Bolt
Courtesy of VOLVO CARS CORPORATION

On vehicles with the STC/DSTC/TRACS anti-spin function, the brake control module (BCM) registers how much the brakes are used and then calculates the temperature of all brake discs. If the calculated temperature exceeds 450 °C (842 °F), diagnostic trouble code BCM-C007200 is generated.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- TC is blocked.

HINT: For information on brake system abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Anti-spin control too long.
- Brake actuation too long (the brakes were used so much that brake disc temperature has become too high).

NOTE: This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.

Fault symptom[s]

- Anti-spin is not operational.

  NOTE: The anti-spin function is blocked until brake disc temperature is below 300 °C (572 °F).

TROUBLESHOOTING BCM-C007200

VISUAL BRAKE CHECK

- Remove the front wheels.

  Visually check the front wheel brakes.

  Check for overheating damage on the brake caliper, brake pads and brake disc. Replace damaged components.

  Inform the customer why the anti-spin function was temporarily blocked and the ABS warning light was on.

  Remedy as necessary.

BCM-C008204: BRAKE SYSTEM MALFUNCTION INDICATOR. GENERAL MALFUNCTION INFORMATION. INTERNAL ERROR (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-C008204

Condition

Fig. 72: ABS Control Module

Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code BCM-C008204 is generated if the brake control module (BCM) registers an internal error, such as interference or open hydraulic valve circuit.

Substitute Value

- ABS is blocked.
- EBD is blocked.
- SC is blocked.
- TC is blocked.
- AYC is blocked.
- BA is blocked.

HINT: For information on brake system abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Interference, noise, etc. that have disrupted control module calculations.
- Internal error in the control module.

Fault symptom[s]

- General warning light is on.
- ABS warning light is on.
- Brake circuit not working; warning light on.
- ABS is not operational.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING BCM-C008204

Was diagnostic trouble code BCM-C008204 stored as a permanent error?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **TROUBLESHOOTING INFORMATION**

TROUBLESHOOTING INFORMATION

The brake control module (BCM) has previously registered a malfunction, but the malfunction is no longer active. Check that the cables are not positioned too close to a source of interference, such as a cellular phone.

BCM-C008216: BRAKE SYSTEM MALFUNCTION INDICATOR. GENERAL ELECTRICAL MALFUNCTION. VOLTAGE TOO LOW (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-C008216

Condition

Fig. 79: Identifying Battery
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code BCM-C008216 is generated if the brake control module (BCM) registers that battery voltage is less than 9.5 V and the speed of the fastest rotating wheel exceeds 20 km/h (12.4 mph).

The diagnostic trouble code can be diagnosed when speed exceeds 20 km/h (12.4 mph) and low voltage has been detected for more than 0.5 ms.

Substitute Value

- ABS is blocked.
- EBD is blocked if voltage is below 8 V.
- TC is blocked.
- SC is blocked.
- AYC is blocked.
- BA is blocked.

HINT: For information on brake system abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Contact resistance in the terminals
- Battery voltage too low.
- Malfunction in charging system.
- Open circuit or short circuit to ground on voltage feed cable.
- Damaged fuse in circuit.
- Interference on the cables.
- Damaged brake control module (BCM).

Fault symptom[s]

- General warning light on.
- ABS warning light on.
- Brake circuit not working; warning light on.
- ABS is not operational.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING BCM-C008216

CHECKING THE BATTERY VOLTAGE

Fig. 80: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start the engine and let it idle.
- Connect a voltmeter between the positive and negative battery terminals.

  The voltage should be normal system voltage.

  If voltage is low, check the charging system as described in relevant information.

Was the voltage too low?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CHECKING THE VOLTAGE FEED**

CHECKING THE VOLTAGE FEED

Fig. 81: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off

  Check the connector of the brake control module (BCM) for contact resistance and oxidation.

  Check the voltage feed cable between the brake system fuse in the engine compartment relay/fuse box and control module connector terminal #A32 (#32) for short circuit to ground.

HINT: With the ignition on and the voltmeter connected between terminals #A32 (#32) and #A47 (#A47) on the breakout box, the voltmeter should show battery voltage.

Other information

BCM-C008249: BRAKE SYSTEM MALFUNCTION INDICATOR. INTERNAL ERROR. ELECTRICAL MALFUNCTION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-C008249

Condition

Fig. 90: ABS Control Module
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code BCM-C008249 is generated if the brake control module (BCM) registers an internal error.

Substitute Value

- ABS is blocked.
- EBD is blocked.
- TC is blocked.
- SC is blocked.
- AYC is blocked.
- BA is blocked.

HINT: For information on brake system abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Interference, noise, etc. that have disrupted control module calculations.
- Internal error in the control module

Fault symptom[s]

- General warning light on.
- ABS warning light on.
- Brake circuit not working; warning light on.
- ABS is not operational.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING BCM-C008249

READING OFF DIAGNOSTIC TROUBLE CODES (DTCS)

Fig. 91: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Read off diagnostic trouble codes (DTCs).

  If other diagnostic trouble codes are stored in addition to BCM-C008249, perform troubleshooting of these first.

Fig. 92: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Are other diagnostic trouble codes stored in addition to BCM-C008249?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CONTROL MODULE REPLACEMENT AND PROGRAMMING**

CONTROL MODULE REPLACEMENT AND PROGRAMMING

The brake control module (BCM) has registered an internal error.

CAUTION: A new control module is delivered without software. The control module must be programmed in order to function after replacement.

Other information

- see **BRAKE CONTROL MODULE (BCM), REPLACING**

Fig. 93: ABS Control Module

BCM-C110668: COMMUNICATION BETWEEN CONTROL MODULES. ALGORITHM ERROR. EVENT-CONTROLLED INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-C110668

Condition

Fig. 94: Identifying Steering Wheel Angle Sensor
Courtesy of VOLVO CARS CORPORATION

After the steering angle sensor has been initialized, there is a plausibility check of the steering angle.

If the check is not passed and speed exceeds 50 km/h (31 mph), diagnostic trouble code BCM-C110668 is generated.

The plausibility check can be passed after BCM-C110687 is generated but before the ignition is turned off. If the check is not finished within one minute, BCM-C110687 is also generated.

Substitute Value

- AYC is blocked.

Possible Source

- The steering angle did not pass the plausibility check.

NOTE: **This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.**

Fault symptom[s]

- General warning light on.
- The anti-skid function is not operational.

TROUBLESHOOTING BCM-C110668

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

If diagnostic trouble code BCM-C110668 is stored by itself, it can be erased.

If diagnostic trouble code BCM-C110687 is stored together with BCM-C110668, read out the diagnostic trouble codes from the steering angle sensor (SAS) and troubleshoot the system.

Select an alternative:

1. Diagnostic trouble code BCM-C110668 is stored by itself.

   see **ERASING DIAGNOSTIC TROUBLE CODES (DTCS)**

2. Diagnostic trouble codes BCM-C110687 and BCM-C110668 are stored together.

   OKAY: Troubleshooting has been completed.

BCM-C110687: COMMUNICATION BETWEEN CONTROL MODULES. BUS/MESSAGE ERROR. MESSAGE MISSING (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-C110687

Condition

Fig. 98: ABS Control Module
Courtesy of VOLVO CARS CORPORATION

NOTE: The diagnostic trouble code only applies to vehicles equipped with DSTC.

Diagnostic trouble code BCM-C110687 is generated if the brake control module (BCM) registers that the wheel or steering wheel alignment is defective.

Substitute Value

- TC is blocked.
- SC is blocked.

- AYC is blocked.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Defective wheel alignment.
- Defective steering wheel alignment.
- Damaged steering angle sensor.

NOTE: This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.

Fault symptom[s]

- General warning light on.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING BCM-C110687

TROUBLESHOOTING INFORMATION

The diagnostic trouble code indicates a malfunction in the steering angle sensor module (SAS).

Read out the diagnostic trouble codes from the steering angle sensor module (SAS) and troubleshoot as described in corresponding information.

BCM-C110687: COMMUNICATION BETWEEN CONTROL MODULES. BUS/MESSAGE ERROR. MESSAGE MISSING (B6324S5; 2011-2012)

BCM-C110768: COMMUNICATION BETWEEN CONTROL MODULES. ALGORITHM ERROR. EVENT-CONTROLLED INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION BCM-C110768

Condition

Fig. 99: Identifying Steering Wheel Angle Sensor, Cables & Connectors
Courtesy of VOLVO CARS CORPORATION

The steering angle sensor is initiated with a steering wheel movement of at least ±5° within a certain period after turning the ignition on.

Diagnostic trouble code BCM-110768 is generated if the steering angle is not initialized after 2 minutes of driving at a speed over 10 km/h (6.2 mph).

Initialization can also be performed after BCM-110768 has been stored before the ignition is turned off. The anti-spin warning light will then go off. BCM-110787 is also generated if initialization is not performed before the ignition is turned off.

Substitute Value

- AYC is blocked.

Possible Source

- The steering angle sensor has not been initialized after two minutes of driving over 10 km/h (6.2 mph).

NOTE: **This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.**

Fault symptom[s]

- General warning light on.
- The anti-skid function is not operational.

TROUBLESHOOTING BCM-C110768

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

If diagnostic trouble code BCM-C110768 is stored by itself, it can be erased.

If diagnostic trouble code BCM-C110787 is stored together with BCM-C110768, read out the diagnostic trouble codes from the steering angle sensor (SAS) and troubleshoot the system.

Select an alternative:

1. Diagnostic trouble code BCM-C110768 is stored by itself.

   see **ERASING DIAGNOSTIC TROUBLE CODES (DTCS)**

2. Diagnostic trouble codes BCM-C110787 and BCM-C110768 are stored together.

   OKAY: Troubleshooting has been completed.

BCM-C110787: COMMUNICATION BETWEEN CONTROL MODULES. BUS/MESSAGE ERROR. MESSAGE MISSING (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-C110787

Condition

Fig. 103: Identifying Steering Angle Sensor
Courtesy of VOLVO CARS CORPORATION

NOTE: The diagnostic trouble code only applies to vehicles equipped with DSTC.

The steering angle sensor module (SAS) is initialized by turning the steering wheel in either direction within 120 seconds of the vehicle being started. The brake control module (BCM) retrieves the signals from the steering angle sensor on the CAN network. Diagnostic trouble code BCM-C110787 is generated if the brake control module (BCM) registers that the steering angle sensor module (SAS) was not initiated within 120 seconds of starting and speed has exceeded approx. 10 km/h (6.2 mph).

Substitute Value

- AYC is blocked.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- After start, the vehicle was given straight ahead for more than two minutes and then the ignition was turned off, thus there was no steering angle sensor module (SAS) initialization.

- Internal malfunction in steering angle sensor (SAS).

NOTE: **This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.**

Fault symptom[s]

- General warning light on.
- The anti-skid function is not operational.

TROUBLESHOOTING BCM-C110787

TROUBLESHOOTING INFORMATION

The steering angle sensor module (SAS) is initiated when the steering wheel is turned more than 5° in either direction. If the vehicle is driven for 2 minutes without sufficient steering wheel movement, diagnostic trouble code BCM-C110787 can be generated. Consult with the customer if this may have happened.

If this is not the case, read out the diagnostic trouble codes from the steering angle sensor module (SAS) and troubleshoot as described in the information for this system.

BCM-C110801: VOLTAGE FEED SENSOR. GENERAL MALFUNCTION

INFORMATION. GENERAL ELECTRICAL MALFUNCTION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-C110801

Condition

NOTE: The diagnostic trouble code only applies to vehicles equipped with DSTC.

The brake pressure sensors and the pedal position sensor have a common voltage feed internally in the brake control module (BCM).

Diagnostic trouble code BCM-C110801 is generated if the brake control module (BCM) detects that voltage to the sensors is defective.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- SC is blocked.
- TC is blocked.
- AYC is blocked.
- TRACS is blocked.
- BA is blocked.

HINT: For information on brake system abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- The cables are short-circuited to ground or supply voltage.
- Damaged sensor.
- Damaged brake control module (BCM).

Fault symptom[s]

- General warning light on.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING BCM-C110801

CHECKING THE CONNECTORS

Fig. 104: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 105: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connectors of the brake control module (BCM), pedal position sensor and brake pressure sensors for contact resistance and oxidation.
- Reinstall the components, reconnect the connectors etc.
- Ignition on

Test-drive the vehicle, see **TEST DRIVE FORM (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL) /BRAKE CONTROL MODULE), DESCRIPTION**

NOTE: **Do not turn off the ignition between test-driving and reading out diagnostic trouble codes. This is to obtain the correct status of the diagnostic trouble codes.**

Read out the diagnostic trouble code's status without turning off the ignition after the test-drive.

Other information

- see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- see **PEDAL SENSOR POWER BRAKE BOOSTER, REPLACING**
- see **PRESSURE SENSOR, MASTER CYLINDER, REPLACING**
- see **CHECKING WIRING AND TERMINALS**

Fig. 106: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the status of the diagnostic trouble code intermittent?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CHECKING THE WIRING AND COMPONENT**

CHECKING THE WIRING AND COMPONENT

Check the cables between pedal position sensor

terminal #1 and brake control module (BCM) terminal #7 (#A7)
terminal #2 and brake control module (BCM) terminal #5 (#A5)
terminal #3 and brake control module (BCM) terminal #3 (#A3)

check for open circuit, short circuit to ground and short circuit to supply voltage.

Check the pedal position sensor

- with the ignition off
- a breakout box connected to the wiring harness
- the brake control module (BCM) disconnected

by measuring the resistance on the pedal position sensor.

When the brake pedal is not actuated, the resistance between terminals #3 (#A3) and #5 (#A5) should be approx. 0.5 kohms. The resistance should increase when the brake pedal is depressed.

When the brake pedal is not actuated, the resistance between terminals #3 (#A3) and #7 (#A7) should be approx. 2.5 kohms. The resistance should decrease when the brake pedal is depressed.

If resistance is incorrect, replace the pedal position sensor.

Remedy as necessary.

Other information

- see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- see **PEDAL SENSOR POWER BRAKE BOOSTER, REPLACING**
- see **SIGNAL SPECIFICATION, BRAKE CONTROL MODULE (BCM) WITH DSTC (DYNAMIC STABILITY AND TRACTION CONTROL)**

Fig. 107: Identifying Pedal Position Sensor Connector
Courtesy of VOLVO CARS CORPORATION

Was a malfunction detected?

- **YES**

  see **VERIFICATION**

- **NO**

  see **CHECKING WIRING AND SENSORS**

CHECKING WIRING AND SENSORS

Check the cables between the brake control module (BCM) and the brake pressure sensor connectors.

For brake pressure sensor 1:

- terminal #1 and brake control module (BCM) terminal #19 (#A19)
- terminal #2 and brake control module (BCM) terminal #20 (#A20)
- terminal #3 and brake control module (BCM) terminal #18 (#A18)

For brake pressure sensor 2:

- terminal #1 and brake control module (BCM) terminal #21 (#A21)
- terminal #2 and brake control module (BCM) terminal #23 (#A23)
- terminal #3 and brake control module (BCM) terminal #22 (#A22)

check for an open-circuit, a short-circuit to ground and a short-circuit to supply voltage.

HINT: With the breakout box and sensor connectors connected and the ignition on, check the brake

pressure sensors by measuring the signal from the sensor between:

Brake pressure sensor 1:

- terminals #A19 and #A20 on the breakout box. The voltage should be approx. 0.25-4.75 V depending on brake pressure.
- terminals #A18 and #A19 on the breakout box. The voltage should be approx. 5 V.

Brake pressure sensor 2:

- terminals #A21 and #A23 on the breakout box. The voltage should be approx. 0.25-4.75 V depending on brake pressure.
- terminals #A21 and #A22 on the breakout box. The voltage should be approx. 5 V.

Remedy as necessary.

Other information

- see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- see **SIGNAL SPECIFICATION, BRAKE CONTROL MODULE (BCM) WITH DSTC (DYNAMIC STABILITY AND TRACTION CONTROL)**
- see **PRESSURE SENSOR, MASTER CYLINDER, REPLACING**
- see **CONTENTS**

Fig. 108: Identifying Pedal Position Sensor Connector
Courtesy of VOLVO CARS CORPORATION

Was a malfunction detected?

- **YES**

see **VERIFICATION**

- **NO**

  see **INFORMATION**

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the malfunction has been remedied.

Fig. 109: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 110: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reconnect the connectors, components, etc.
- Test-drive the vehicle according to **TEST DRIVE FORM (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL) /BRAKE CONTROL MODULE), DESCRIPTION** .

NOTE: **Do not turn off the ignition between test-driving and reading out diagnostic trouble codes. This is to obtain the correct status of the diagnostic trouble codes.**

Then read out the diagnostic trouble code's status without turning off the ignition after the test-drive.

Fig. 111: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

BCM-C111154: AYC SENSOR. PROGRAMMING ERROR. CALIBRATION MISSING (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-C111154

Condition

Fig. 112: ABS Control Module
Courtesy of VOLVO CARS CORPORATION

NOTE: The diagnostic trouble code only applies to vehicles equipped with DSTC.

When calibrating sensors that are part of active yaw control (AYC), a checksum is stored in the brake control module (BCM). At start-up, the control module checks the stored checksum against a calculated checksum.

Diagnostic trouble code BCM-C111154 is generated if the checksums do not match.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- TC is blocked.
- SC is blocked.
- AYC is blocked.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Damaged brake control module (BCM).

NOTE: **This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.**

Fault symptom[s]

- General warning light on.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING BCM-C111154

TROUBLESHOOTING INFORMATION

HINT: The diagnostic trouble code can be stored during software download and just needs to be erased.

NOTE: **Only erase the diagnostic trouble code if it was stored during software download.**

BCM-C111301: HYDRAULIC VALVES. GENERAL MALFUNCTION INFORMATION. GENERAL ELECTRICAL MALFUNCTION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-C111301

Condition

Fig. 122: ABS Control Module
Courtesy of VOLVO CARS CORPORATION

For diagnostic trouble code BCM-C111301, the brake control module can register a malfunction for different reasons. Diagnostic trouble code BCM-C111301 is generated:

- if the inlet or outlet valve circuits in the control module are short-circuited to ground or if there if the circuit is open.
- if the control module is subjected to interference so that its calculation is incorrect
- if the control module registers that there is a malfunction in internal control module circuits for the inlet and outlet valves
- if the inlet valve in the anti-spin circuit of the control module is short-circuited to ground or voltage or if the circuit is open
- if the control module registers an open circuit or short circuit in one of the internal control module circuits.

Substitute Value

- ABS is blocked.
- TC is blocked.
- SC is blocked.
- AYC is blocked.

- EBD is blocked.
- BA is blocked.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Internal error in the control module

Fault symptom[s]

- ABS warning light on.
- Brake circuit not working; warning light on.
- ABS is not operational.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

BCM-C111495: INCLINATION SENSOR. COMPONENT MALFUNCTION. INCORRECT ASSEMBLY (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-C111495

Condition

Fig. 127: Identifying Brake Control Module & Active Yaw Control Sensor
Courtesy of VOLVO CARS CORPORATION

The AYC sensor comes in two variants: one for a two-wheel drive vehicle and one for a four-wheel drive vehicle. Diagnostic trouble code BCM-C111495 is generated if the brake control module (BCM) registers that the installed AYC sensor is not appropriate for the vehicle.

Substitute Value

- TC is blocked.
- SC is blocked.
- AYC is blocked.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Incorrect AYC sensor installed.

NOTE: **This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.**

Fault symptom[s]

- General warning light on.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING BCM-C111495

CHECKING THE AYC SENSOR

The diagnostic trouble code indicates that an AYC sensor for a four-wheel drive vehicle is installed in a two-wheel drive vehicle or that an AYC sensor for a two-wheel drive vehicle is installed in a four-wheel drive vehicle.

Change to the right sensor type, see **ACTIVE YAW CONTROL SENSOR, REPLACING**

BCM-C111542: CONTROL MODULE. INTERNAL MALFUNCTION. GENERAL MEMORY ERROR (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-C111542

Condition

Fig. 132: ABS Control Module
Courtesy of VOLVO CARS CORPORATION

The control modules continually transmit and receive information via the vehicle's CAN data network (Controller Area Network). When voltage is supplied to the brake control module (BCM), the CAN controller that handles CAN communication is initialized.

Diagnostic trouble code BCM-C111542 is generated if CAN controller initialization fails.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- TC is blocked.
- SC is blocked.
- AYC is blocked.
- All communication to and from the brake control module (BCM) is deactivated.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Internal malfunction in brake control module (BCM).

Fault symptom[s]

- General warning light on.
- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING BCM-C111542

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

Fig. 133: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 134: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connector of the brake control module (BCM) for contact resistance and oxidation.
- Reinstall the components, reconnect the connectors etc.
- Ignition on
- Wait approximately 60 seconds.
- Read the status of the diagnostic trouble code.

  If the diagnostic trouble code status is permanent, replace the brake control module (BCM).

  Other information

  - To access brake control module (BCM) connectors: **CONNECTING THE BREAKOUT BOX,**

BRAKE CONTROL MODULE (BCM)

- see **BRAKE CONTROL MODULE (BCM), REPLACING**
- see **CONTENTS**

Fig. 135: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

BCM-C11164A: FACTORY TEST DSTC. INTERNAL MALFUNCTION. INCORRECT COMPONENT (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-C11164A

Condition

Fig. 136: ABS Control Module
Courtesy of VOLVO CARS CORPORATION

NOTE: The diagnostic trouble code only applies to vehicles equipped with DSTC.

Diagnostic trouble code BCM-C11164A is generated if the brake control module (BCM) registers that the factory test was not completed.

Substitute Value

- TC is blocked.
- SC is blocked.
- AYC is blocked.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- AYC regulation during the factory test.
- Factory test not completed.

NOTE: This diagnostic trouble code (DTC) is not due to an internal hardware fault in

the Brake control module (BCM) and must not be remedied by replacing the control module.

Fault symptom[s]

- General warning light on.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING BCM-C11164A

TROUBLESHOOTING INFORMATION

The diagnostic trouble code indicates that the brake system AYC function regulated, which means that the test cycle was not completed properly and must be redone.

BCM-C111768: STABILITY FUNCTION. ALGORITHM ERROR. EVENT-CONTROLLED INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-C111768

Condition

If the brake control module (BCM) performs an extended start-up check of the DSTC system due to a number of malfunctions during the previous operating cycle, the diagnostic trouble code is generated in the subsequent operating cycle (ignition off and ignition on).

Substitute Value

- Nothing.

Possible Source

- The diagnostic trouble code was generated in the previous operating cycle.

Fault symptom[s]

- Information light on.

TROUBLESHOOTING BCM-C111768

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

If diagnostic trouble code BCM-C111768 is stored by itself, it can be erased.

If diagnostic trouble code BCM-406B00 is stored together with BCM-C111768, troubleshoot according to information for diagnostic trouble code BCM-406B00.

Select an alternative:

1. Only BCM-C111768 is stored.

   OKAY: Troubleshooting has been completed.

2. Diagnostic trouble codes BCM-406B00 and BCM-C111768 are stored together.

ERASING DIAGNOSTIC TROUBLE CODES (DTCS)

ERASING DIAGNOSTIC TROUBLE CODES (DTCS)

BCM-C111802: BRAKE SERVO DISENGAGE SWITCH. GENERAL MALFUNCTION INFORMATION. GENERAL SIGNAL ERROR (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-C111802

Condition

Fig. 139: Identifying Brake Booster
Courtesy of VOLVO CARS CORPORATION

NOTE: The diagnostic trouble code only applies to brake systems with DSTC.

The pedal pressure sensor, located in the brake booster, informs the brake control module (BCM) when the brake pedal is depressed. The brake control module (BCM) uses this information to disengage the active yaw control (AYC) stability function and engage active brake assist (BA) if the functions are active when the driver depresses the brake pedal.

Diagnostic trouble code BCM-C111802 is generated if the brake control module (BCM) registers an unreasonable signal from the pedal pressure sensor.

Substitute Value

- TC is blocked.
- SC is blocked.
- AYC is blocked.
- BA is blocked.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Contact resistance or oxidation in the connectors or connections.
- Open circuit in the cables.
- The cables are short-circuited to ground or voltage.
- Damaged pedal pressure sensor.
- Damaged brake control module (BCM).

Fault symptom[s]

- General warning light on.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING BCM-C111802

CHECKING THE CONNECTORS

Fig. 140: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 141: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connectors of the brake control module (BCM) and the pedal pressure sensor for contact resistance and oxidation.
- Reinstall the components, reconnect the connectors etc.
- Ignition on
- Read off the pedal pressure sensor status.

  The status should be OFF if the brake pedal is not actuated and should switch to ON when the brake pedal is actuated. If the status changes, the malfunction was probably caused by contact resistance or oxidation in the connectors of the brake control module (BCM) or the pedal pressure sensor.

Fig. 142: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 143: Identifying Brake Booster
Courtesy of VOLVO CARS CORPORATION

Does the status change?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CHECKING THE WIRING**

CHECKING THE WIRING

Check the cables for open circuit, short-circuit to ground and short-circuit to voltage.

Measure between:

- Pedal pressure sensor terminal #1 and brake control module (BCM) terminal #27 (#A27).
- Pedal pressure sensor terminal #2 and brake control module (BCM) terminal #30 (#A30).
- Pedal pressure sensor terminal #5 and brake control module (BCM) terminal #28 (#A28).

Remedy as necessary.

BCM-E000: CONTROL MODULE COMMUNICATION. FAULTY COMMUNICATION (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION BCM-E000

Condition

Fig. 152: ABS Control Module
Courtesy of VOLVO CARS CORPORATION

The control modules transmit and receive information via a standardized serial communication method - CAN (Control Area Network). The diagnostic trouble code (DTC) is stored if the control module registers serious interference (CAN communication blocked).

NOTE: **In the event of system communication problems, it is not possible to communicate with the control module. Therefore it will only be possible to read off the fault if it is intermittent.**

Substitute Value

- The control module shuts itself off ("bus-off")

  HINT: The control module will remain shut off until the power supply is broken (15, 30, X). When the power supply is connected the control module will make a new attempt to communicate.

Possible Source

- Short-circuit between the control area network (CAN) wiring
- Open-circuit in the control area network (CAN) wiring
- Internal fault in the control module

- Internal fault in another control module in the same part of the control area network (CAN).

Fault symptom[s]

- The ABS warning lamp is lit
- No ABS function
- Message in the display.

FAULTY COMMUNICATION

BCM-E003: CONFIGURATION FAULT. FAULTY CONFIGURATION (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION BCM-E003

Condition

Fig. 153: ABS Control Module
Courtesy of VOLVO CARS CORPORATION

The control module compares its configuration ID with the signal configuration transmitted on the control area network (CAN) by the central electronic module (CEM). If the configuration IDs do not correspond the fault code is stored. The diagnostic trouble code (DTC) is also stored if the communication between the control module and the central electronic module (CEM) is interrupted.

NOTE: **In the event of an open-circuit in both the control area network (CAN) cables, it is not possible to communicate with the control module. Therefore it will only be possible to read off the diagnostic trouble code (DTC) if this type of fault is intermittent. When the diagnostic trouble code (DTC) is stored, the control module responds to the diagnostic command, however normal control area network (CAN) communication does not work. ("Expulsion mode")**

Substitute Value

- None.

Possible Source

- Faulty control area network (CAN) configuration ID. (The node is not intended for this car, for example a used control module with different software/hardware.)

- Open-circuit in the control area network (CAN) wiring between the control module and the central electrical module (CEM).

NOTE: **This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.**

Fault symptom[s]

- The ABS warning lamp is lit
- No ABS function
- Message in the display.

BCM-U000100: HS-CAN COMMUNICATION BUS. GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-U000100

Condition

Fig. 154: ABS Control Module
Courtesy of VOLVO CARS CORPORATION

The control modules transmit and receive information via a standardized serial communication method - CAN (Controller Area Network). The diagnostic trouble code (DTC) is generated if the brake control module (BCM) registers serious interference (CAN communication blocked).

NOTE: **In the event of a system communication malfunction, it is not possible to communicate with the brake control module (BCM). Thus, the diagnostic trouble code can only be read out if the malfunction is intermittent.**

Substitute Value

- The brake control module (BCM) deactivates itself ("bus off")

  HINT: The control module will remain deactivated until the voltage feed is interrupted (15, 30, X). When the voltage feed is reconnected, the control module will make new attempts to communicate.

Possible Source

- Short-circuit between CAN cables.
- Open circuit in CAN cables.
- Internal malfunction in brake control module (BCM).

- Internal malfunction in another control module in the same part of the CAN network.

Fault symptom[s]

- ABS warning light on.
- No ABS function.
- Message in the text display.

BCM-U010000: FAILED COMMUNICATION WITH THE ENGINE CONTROL MODULE (ECM). GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-U010000

Condition

Fig. 155: Identifying Brake Control Module (BCM) & Engine Control Module (ECM)
Courtesy of VOLVO CARS CORPORATION

NOTE: The diagnostic trouble code only applies to vehicles equipped with STC/DSTC.

Diagnostic trouble code BCM-U010000 is generated if the brake control module registers that there is no speed or torque signal from the engine control module (ECM) from more than 500 ms.

Substitute Value

- TC is blocked.
- SC is blocked.
- AYC is blocked.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Open circuit or short circuit on CAN cable.
- Malfunction in engine control module (ECM).

Fault symptom[s]

- General warning light on.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING BCM-U010000

CHECKING DIAGNOSTIC TROUBLE CODES (DTCS) IN THE CENTRAL ELECTRONIC MODULE

CHECKING OTHER DIAGNOSTIC TROUBLE CODES (DTCS)

In the event of communication problems, the fault may exist in other parts of the communications network.

The role of the central electronic module is to generally control the communications network and to store diagnostic trouble codes (DTCs) in the event of communication problems between control modules.

If there are diagnostic trouble codes (DTCs) stored for communication problems in the central electronic module, stop the fault tracing and fault trace the central electronic module.

Were diagnostic trouble codes (DTCs) for communication problems stored in the central electronic module?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CHECKING DIAGNOSTIC TROUBLE CODES IN THE ENGINE CONTROL MODULE (ECM)**

CHECKING DIAGNOSTIC TROUBLE CODES IN THE ENGINE CONTROL MODULE (ECM)

The diagnostic trouble code is due to no torque signal or rpm signal from the engine for more than 500 ms. The brake control module (BCM) uses the signals to control the stability function.

If there are any diagnostic trouble codes stored for the engine control module (ECM), perform troubleshooting of these first.

Were any diagnostic trouble codes stored for the engine control module (ECM)?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)**

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

Fig. 156: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Wait approximately 60 seconds.
- Read the status of the diagnostic trouble code.

Fig. 157: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the status of the diagnostic trouble code permanent?

- **YES**

  see **CHECKING WIRING AND TERMINALS**

- **NO**

  see **INTERMITTENT MALFUNCTION**

CHECKING WIRING AND TERMINALS

Fig. 158: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off

  Check the brake control module (BCM) connector for damaged or bent pins as well as contact resistance and oxidation.

  Check the cables for CAN-communication between brake control module (BCM) and engine control module (ECM) for open circuit, short-circuit to ground as well as short-circuit to voltage.

  Also check that the cables are not positioned too close to a source of interference, such as a cellular phone.

  Remedy as necessary.

Other information

- see **CONTENTS**

- **Continue**

  see **VERIFICATION**

INTERMITTENT MALFUNCTION

HINT: The diagnostic trouble code status indicates that the brake control module (BCM) has previously registered a malfunction, but the malfunction is no longer active.

Check the connectors of the brake control module (BCM) and the engine control module (ECM) for contact resistance and oxidation.

Also check that the cables are not positioned too close to a source of interference, such as a cellular phone.

Remedy as necessary.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the malfunction has been remedied.

Fig. 159: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 160: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reconnect the connectors, components, etc.
- Test-drive the vehicle according to **TEST DRIVE FORM (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL) /BRAKE CONTROL MODULE), DESCRIPTION** .

NOTE: **Do not turn off the ignition between test-driving and reading out diagnostic trouble codes. This is to obtain the correct status of the diagnostic trouble codes.**

Then read out the diagnostic trouble code's status without turning off the ignition after the test-drive.

Fig. 161: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the status of the diagnostic trouble code intermittent?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  see **INFORMATION**

BCM-U011400: FAILED COMMUNICATION WITH DIFFERENTIAL ELECTRONIC MODULE (DEM). GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (2004-2012)

FAULT-TRACING

GENERAL INFORMATION

The DTC is generated when communication between two control modules has been cancelled. There can be a number of causes for interruptions in the communication:

- The transmitting control module has stopped transmitting the signal that the transmitting module (the control module that has generated the DTC) expects.
- Intermittent open-circuit in one or both CAN cables in part of the network
- Intermittent short-circuits between the CAN cables
- Intermittent short-circuits between one of the CAN cables and ground or supply voltage
- Incorrect signal configuration in control module that set diagnostic trouble code. The fault can be due to a customer or workshop replacing a control module without downloading new software for the replacement.

NOTE: **If there is a diagnostic trouble code (DTC) for a communication fault in a control module, check whether diagnostic trouble codes (DTCs) have been stored in the central electronic module (CEM). Central electronic module (CEM) monitors the voltage level on the CAN-lines, and is the only control module that directly can set a diagnostic trouble code for short-circuiting to ground or to voltage for any of the leads. Central electronic module (CEM) shall not be replaced in case of CAN-fault, unless troubleshooting reveals that the module has an internal fault.**

Corrective actions

1. If there are diagnostic trouble codes stored in several control modules that indicate lost communication on the CAN-net, first try to troubleshoot diagnostic trouble codes in Central electronic module (CEM).
2. Fault trace the transmitting control module.
3. If the problem is intermittent, erase the diagnostic trouble code and check that it is not generated again.
4. If there are only diagnostic trouble codes that indicate lost communication on the CAN-net stored in the control module that generated this trouble code, try to solve the problem by downloading new software to the control unit.
5. Check the cables in the controller area network (CAN) according to the following fault-tracing.

Other information

- see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK (2005-2012)** **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK (2004)**
- Go to the tab software and program the control module with the latest software.

- **Continue**

  see **VERIFICATION**

VERIFICATION

Fig. 162: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Wait for 20 seconds.

NOTE: **This first verification assumes that download of new software was required in the control module that generated the diagnostic trouble code. If download of new software was not required: read out diagnostic trouble codes and check if the code status is permanent or intermittent to learn how difficult it will be to find the fault.**

Read out the diagnostic trouble codes in the vehicle via the DIAGNOSTICS tab.

Check that the diagnostic trouble code (DTC) for faulty communication is not stored again.

Has the fault been remedied?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **TAKING READING ON CABLE IN THE CAN NETWORK (HS-CAN)**

TAKING READING ON CABLE IN THE CAN NETWORK (HS-CAN)

Fig. 163: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off

- Disconnect the battery negative lead.
- Remove the central electronic module (CEM)
- Connect the breakout box to the cable harness for the central electronic module (CEM). Do not connect the central electronic module (CEM).

HINT: Where a breakout box cannot be used, take readings from the rear of the affected connectors if possible. This prevents terminal pins and socket housings being damaged.

Disconnect the CAN network to make it easier to locate a fault. A suitable point to disconnect the network is at the central electronic module (CEM). Fault-tracing therefore starts from the central electronic module (CEM).

Take resistance readings across the following terminals. Various readings will be obtained due to the structure of the network. Twist the cable harness and work the connectors at accessible points along the cable harness in order to check whether the resistance changes during each measurement. This method can be used to detect intermittent short-circuits or open-circuits.

NOTE: The following resistance readings only measure the main arteries in the high speed network, not the junctions that exist for some control modules. If an open-circuit is suspected in a cable, or a short-circuit is suspected in one of its junctions, the connector at the control module for this junction must be disconnected and the reading taken from there.

Take the following readings

- Resistance between CAN_H and CAN_L, high-speed network. Resistance should be 120 ohms.

  NOTE: Measuring will only give value 120 ohms if the main circuit in the CAN-net is intact. If there is a short-circuit somewhere in the CAN-net (either main circuit or other branching) the resistance will be 0 ohms.

- The resistance between CAN_L, high-speed network, and a connection to voltage, as well as between CAN_L, high-speed network and a connection to ground. The resistance shall be very high (more than 1 Mohms).
- The resistance between CAN, high-speed network, and a connection to voltage, as well as between CAN, high-speed network and a connection to ground. The resistance shall be very high (more than 1 Mohms).

HINT: Any short-circuit detected on the CAN-net may be on the main circuit or on any branching running out to some control modules. If a fault is found, try to disconnect the junction with the fault at a point further forward. Try to locate the fault in this way.

Remedy as necessary.

Other information

- see **BATTERY, DISCONNECTING**
- see **CHECKING WIRING AND TERMINALS**

Was a fault detected?

- **YES**

  see **VERIFICATION**

- **NO**

  see **CHECKING THE TRAFFIC LOAD ON THE CAN CABLES**

CHECKING THE TRAFFIC LOAD ON THE CAN CABLES

Fig. 164: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Connect the central electronic module (CEM) to the breakout box
- Connect the battery.
- Ignition on

NOTE: **When the adapter cable harness and the central electronic module (CEM) have been connected, there is access to both sides of the CAN network (both LS-CAN and HS-CAN). There will also be traffic on both networks. Be careful to check the terminals between which the readings are to be taken so that the intended reading is not taken on the wrong network.**

Faults in the CAN network may be due to a control module sending faulty messages that disrupt normal communication. When messages are sent incorrectly, this results in a considerable increase in the amount of traffic on the CAN network. Check the load by measuring the average voltage value on the CAN cables in relation to ground.

Check as follows:

- Measure the voltage between CAN_L, high-speed network, and ground. The voltage shall be approx. 2.3 V.
- Measure the voltage between CAN_H, high-speed network, and ground. The voltage shall be approx. 2.8 V.

Other information

- see **BATTERY, DISCONNECTING**

Is the value OK?

- **YES**

  see **INFORMATION**

- **NO**

  see **IDENTIFYING A CONTROL MODULE IN THE CAN NETWORK**

IDENTIFYING A CONTROL MODULE IN THE CAN NETWORK

If the load on the CAN network is too high, this may be due to a control module sending faulty messages on the CAN network (known as a disruptive control module). The fault may also be due to an intermittent short-circuit to supply voltage or ground in one of the CAN cables. This results in the control modules on the CAN network starting to send faulty messages. The faults can occur without a diagnostic trouble code (DTC) being stored by the control modules. The voltage can be measured between the CAN cables in order to check the load on the

CAN network.

NOTE: **It is not necessarily the control module that has set the diagnostic trouble code that communicates incorrectly. Faulty messages can come from any control module in the same section of the CAN network. However, faulty communication in one network cannot affect the communication on the other network. In other words, faulty communication on the LS-CAN cannot disrupt communication on the HS-CAN and vice versa.**

- Check communication/load on CAN-net by measuring voltage between CAN-L and CAN-H. The voltage's average value shall be approx. 0.5 V (permitted is 0.4 to 0.6 V). In case of communication error, the voltage is approx. 0.7 V and higher.

In order to identify which control module is communicating incorrectly, cut the power supply to one control module at a time. Check the voltage in the CAN cables again. The easiest way to cut the power supply is to remove the fuse(s) for the relevant control module. Continue until the voltage between the CAN cables drops to approximately 0.5 V.

HINT: When the suspected control module has been identified, connect and disconnect the supply voltage to the control module a number of times to verify that the fault appears and disappears. Ignition off between each check.

NOTE: **Do not cut the power to the central electronic module (CEM) unless it is the last control module left to check.**

The control module that is communicating incorrectly must be replaced.

NOTE: **A faulty control module that disrupts communication can place other control modules in Limp-Home mode (i. e. they work but with limited functionality) even after switching the ignition off and on a number of times. To remedy this, disconnect and reconnect the battery negative terminal to restore the control modules to normal function.**

Remedy as necessary.

Other information

- See Signal specification for Central Electronic Module (CEM).
- **Continue**

  see **VERIFICATION**

VERIFICATION

HINT: Once a fault has been repaired, conduct a verification to check that the fault has been remedied.

Fig. 165: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Reinstall the connectors, components etc.
- Ignition on
- Erase diagnostic trouble codes (DTCs) in all control modules
- Start the vehicle. Allow the vehicle to run for 10 minutes.

  Read out the diagnostic trouble codes in the vehicle via the DIAGNOSTICS tab.

Is the diagnostic trouble code for configuration fault regenerated?

- **NO**

  OKAY: Troubleshooting has been completed.

- **YES**

  see **INFORMATION**

INFORMATION

In exceptions the fault code can be generated as a result of a damaged control module. However, do not replace control module, unless complete troubleshooting has been performed according to all earlier steps in the troubleshooting, and no other faults have been confirmed. Also, do not replace control module if the fault is intermittent.

Has the fault been remedied?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

INFORMATION

FAULT-TRACING INFORMATION

Verification shows that the fault is no longer present. The diagnostic trouble code (DTC) was probably caused by an intermittent fault.

Fault-tracing for this diagnostic trouble code (DTC) is not followed by a verification.

You can view the information again or exit fault-tracing for this diagnostic trouble code (DTC).

BCM-U011400: FAILED COMMUNICATION WITH DIFFERENTIAL ELECTRONIC MODULE (DEM). GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-U011400

Condition

NOTE: The diagnostic trouble code only applies to vehicles equipped with AWD and DSTC.

The differential electronic module (DEM) informs the brake control module (BCM) when all wheel drive is active. During all wheel drive operation, the brake control module (BCM) should not activate the stability function due to the risk of disrupting the differential electronic module (DEM). Diagnostic trouble code BCM-U011400 is generated if the brake control module (BCM) registers that there is no signal from the differential electronic module (DEM) or if the signal indicates that all wheel drive is not operational.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- SC is blocked.
- TC is blocked (AWD TRACS is blocked even though no warning light is on).
- AYC is blocked.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Fault-trace the Differential electronic module (DEM).

Fault symptom[s]

- General warning light on.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-U012587

Condition

Fig. 166: Identifying Brake Control Module & Active Yaw Control Sensor
Courtesy of VOLVO CARS CORPORATION

NOTE: The diagnostic trouble code only applies to vehicles equipped with DSTC.

Diagnostic trouble code BCM-U012587 is generated if the brake control module (BCM) registers no signal or a defective signal from the AYC sensor.

Substitute Value

- TC is blocked.
- SC is blocked.
- AYC is blocked.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Contact resistance in the terminals
- Open circuit on the cables between the brake control module (BCM) and the AYC sensor.

- No AYC sensor connected.
- Internal malfunction in AYC sensor.

NOTE: **This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.**

Fault symptom[s]

- General warning light on.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING BCM-U012587

CHECKING FOR CONTACT RESISTANCE AND OXIDATION

Fig. 167: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connectors of the brake control module (BCM) and AYC sensor for contact resistance and oxidation.
- Reinstall the components, reconnect the connectors etc.
- Test-drive the vehicle, see **TEST DRIVE FORM (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL) /BRAKE CONTROL MODULE), DESCRIPTION**

NOTE: **Do not turn off the ignition between test-driving and reading out diagnostic trouble codes. This is to obtain the correct status of the diagnostic trouble codes.**

- Read out the diagnostic trouble code's status without turning off the ignition after the test-drive.

If the status of the diagnostic trouble code is intermittent, the malfunction was probably caused by contact resistance or oxidation in the connectors of the control module or AYC sensor.

  see **CHECKING THE DIAGNOSTIC TROUBLE CODE**

CHECKING THE DIAGNOSTIC TROUBLE CODE

Fig. 180: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 181: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reconnect the connectors, components, etc.
- Test-drive the vehicle according to **TEST DRIVE FORM (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL) /BRAKE CONTROL MODULE), DESCRIPTION** .
- Ignition on
- Read off diagnostic trouble codes (DTCs).

  If the status of the diagnostic trouble code is still permanent, the brake control module (BCM) is defective.

  Reinstall the old AYC sensor and replace the brake control module (BCM)

Other information

- see **BRAKE CONTROL MODULE (BCM), REPLACING**

Fig. 182: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the diagnostic trouble code status permanent?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **INFORMATION**

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the malfunction has been remedied.

Fig. 183: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 184: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reconnect the connectors, components, etc.
- Test-drive the vehicle according to **TEST DRIVE FORM (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL) /BRAKE CONTROL MODULE), DESCRIPTION** .

NOTE: **Do not turn off the ignition between test-driving and reading out diagnostic trouble codes. This is to obtain the correct status of the diagnostic trouble codes.**

Then read out the diagnostic trouble code's status without turning off the ignition after the test-drive.

Fig. 185: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the status of the diagnostic trouble code intermittent?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  see **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

INFORMATION

FAULT-TRACING INFORMATION

The fault should be diagnosed and remedied. Since this is not the case the fault-tracing process has failed.

Complete the fault-tracing for those fault or try again.

BCM-U012600: FAILED COMMUNICATION WITH STEERING ANGLE SENSOR MODULE (SAS). GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-U012600

Condition

Fig. 186: Identifying Steering Angle Sensor
Courtesy of VOLVO CARS CORPORATION

NOTE: The diagnostic trouble code only applies to vehicles equipped with DSTC.

The steering angle sensor module (SAS) sends a signal to the brake control module (BCM) via CAN to indicate whether the steering angle sensor is functioning correctly or not.

Diagnostic trouble code BCM-U012600 is generated if the brake control module (BCM) registers that there is no signal from the steering angle sensor module (SAS).

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- TC is blocked.
- SC is blocked.
- AYC is blocked.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Interference or open circuit on CAN.
- The steering angle sensor module (SAS) is not connected to CAN.
- Internal malfunction in steering angle sensor (SAS).

Fault symptom[s]

- General warning light on.
- Anti-spin is not operational.

- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING BCM-U012600

CHECKING DIAGNOSTIC TROUBLE CODES (DTCS) IN THE CENTRAL ELECTRONIC MODULE

CHECKING OTHER DIAGNOSTIC TROUBLE CODES (DTCS)

In the event of communication problems, the fault may exist in other parts of the communications network.

The role of the central electronic module is to generally control the communications network and to store diagnostic trouble codes (DTCs) in the event of communication problems between control modules.

If there are diagnostic trouble codes (DTCs) stored for communication problems in the central electronic module, stop the fault tracing and fault trace the central electronic module.

Were diagnostic trouble codes (DTCs) for communication problems stored in the central electronic module?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CHECKING DIAGNOSTIC TROUBLE CODES IN THE STEERING ANGLE SENSOR MODULE (SAS)**

CHECKING DIAGNOSTIC TROUBLE CODES IN THE STEERING ANGLE SENSOR MODULE (SAS)

If there are any diagnostic trouble codes stored in the steering angle sensor module (SAS), perform troubleshooting of these first.

Were any diagnostic trouble codes stored in the steering angle sensor module (SAS)?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CHECKING WIRING AND TERMINALS**

CHECKING WIRING AND TERMINALS

Fig. 187: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off

  Check the brake control module (BCM) connector for damaged or bent pins as well as contact resistance and oxidation.

  Check the CAN communication cables for open circuit, short circuit to ground and short circuit to supply voltage.

  Measure between:

  - Brake control module (BCM) terminal #A11 (#A11) and steering angle sensor module (SAS) terminal #6 (#A36).
  - Brake control module (BCM) terminal #15 (#A15) and steering angle sensor module (SAS)

terminal #15 (#A45).

Also check that the cables are not positioned too close to a source of interference, such as a cellular phone.

Remedy as necessary.

BCM-U030000: INTERNAL SOFTWARE INCOMPATIBLE WITH THE CONTROL MODULE. GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-U030000

Condition

Fig. 188: ABS Control Module
Courtesy of VOLVO CARS CORPORATION

The brake control module (BCM) compares its configuration ID with the signal configuration sent by the central electronic module (CEM) on the CAN network. If the configuration IDs do not match, the diagnostic trouble code is generated. It is also generated if communication between the brake control module (BCM) and the central electronic module (CEM) is interrupted.

NOTE: **If there is an open circuit on both CAN cables, it is not possible to communicate with the brake control module (BCM). Thus, the diagnostic trouble code can only be read out if the malfunction is intermittent. When the diagnostic trouble code has been generated, the control module responds to diagnostic commands, but normal CAN communication is not possible ("Expulsion mode").**

Substitute Value

- Nothing.

Possible Source

- The brake control module (BCM) has an incorrect configuration ID (control module not intended for this vehicle, such as a used control module with different software/hardware).

- Open circuit in the CAN cables between the brake control module (BCM) and the central electronic module (CEM).

NOTE: **This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.**

Fault symptom[s]

- ABS warning light on.
- No ABS function.
- Message in the text display.

BCM-U030087: CONTROL MODULE INCOMPATIBLE INTERNAL SOFTWARE. BUS/MESSAGE ERROR. MESSAGE MISSING (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-U030087

Condition

Fig. 196: ABS Control Module
Courtesy of VOLVO CARS CORPORATION

The brake control module (BCM) is factory-programmed with software for several vehicle models. During the first ignition cycle, the brake control module (BCM) reads vehicle configuration data from the central electronic module (CEM) and then configures itself to the vehicle model and equipment.

The diagnostic trouble code can be generated if

- a brake control module (BCM) that was previously in a different vehicle model is installed
- a central electronic module (CEM) that was previously in a different vehicle model is installed
- software for a different vehicle model has been downloaded to the brake control module (BCM).

Substitute Value

- TC is blocked.
- SC is blocked.
- AYC is blocked.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- A brake control module (BCM) from a different vehicle model is installed.
- A central electronic module (CEM) from a different vehicle model is installed.
- Software for a different vehicle model has been downloaded to the brake control module (BCM).

NOTE: This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.

Fault symptom[s]

- General warning light on.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING BCM-U030087

CHECKING THE CENTRAL ELECTRONIC MODULE (CEM)

CAUTION: This diagnostic trouble code may be generated if the central electronic module (CEM) is replaced in the vehicle and either comes from another vehicle or is loaded with incompatible software.

Check that the correct central electronic module (CEM) is installed.

Check that the central electronic module (CEM) is loaded with the correct software for this vehicle. Read off the vehicle configuration via service for central electronic module (CEM).

Fig. 197: ABS Control Module
Courtesy of VOLVO CARS CORPORATION

Is this the correct central electronic module (CEM) and software?

- **YES**

  see **REPROGRAMMING BCM**

- **NO**

  FAULT NOT FOUND: Troubleshooting has been completed.

REPROGRAMMING BCM

NOTE: The diagnostic trouble code may also be stored if the brake control module (BCM) has been tested in another vehicle that does not have engine B8444S.

The diagnostic trouble code may in certain cases have been stored after reprogramming of the brake system control module (BCM). If this is the case, then the brake control module (BCM) must be configured.

Fig. 198: ABS Control Module
Courtesy of VOLVO CARS CORPORATION

Is the diagnostic trouble code stored after reprogramming of the brake control module (BCM)?

- **YES**

  see **RESETTING AND CONFIGURING THE BRAKE CONTROL MODULE (BCM)**

- **NO**

  see **ERASING DIAGNOSTIC TROUBLE CODES (DTCS)**

ERASING DIAGNOSTIC TROUBLE CODES (DTCS)

Fig. 199: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Erase the diagnostic trouble codes from the brake control module (BCM).

Fig. 200: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

BCM-U040164: INVALID DATA RECEIVED FROM ENGINE CONTROL MODULE (ECM). ALGORITHM ERROR. SIGNAL OUTSIDE PERMITTED RANGE (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-U040164

Condition

Fig. 208: Identifying Brake Control Module (BCM) & Engine Control Module (ECM)
Courtesy of VOLVO CARS CORPORATION

NOTE: The diagnostic trouble code only applies to vehicles equipped with STC/DSTC.

The engine control module (ECM) sends a signal to the brake control module (BCM) via CAN to indicate

whether the rpm signal is correct. The brake control module (BCM) uses the rpm signal to control the stability function.

Diagnostic trouble code BCM-U040164 is generated if the brake control module (BCM) registers that the engine control module (ECM) has sent a signal indicating that the rpm signal is unreasonable.

The diagnostic trouble code can be diagnosed after the engine has started.

Substitute Value

- TC is blocked.
- SC is blocked.
- AYC is blocked.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Malfunction in engine control module (ECM).

NOTE: This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.

Fault symptom[s]

- General warning light on.
- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING BCM-U040164

CHECKING DIAGNOSTIC TROUBLE CODES (DTCS) IN THE CENTRAL ELECTRONIC MODULE

CHECKING OTHER DIAGNOSTIC TROUBLE CODES (DTCS)

In the event of communication problems, the fault may exist in other parts of the communications network.

The role of the central electronic module is to generally control the communications network and to store diagnostic trouble codes (DTCs) in the event of communication problems between control modules.

If there are diagnostic trouble codes (DTCs) stored for communication problems in the central electronic module, stop the fault tracing and fault trace the central electronic module.

Were diagnostic trouble codes (DTCs) for communication problems stored in the central electronic

module?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **TROUBLESHOOTING INFORMATION**

TROUBLESHOOTING INFORMATION

The diagnostic trouble code indicates that the malfunction is engine-related.

Read the diagnostic trouble codes from the engine control module (ECM) and troubleshoot as described in relevant information.

BCM-U040482: INVALID DATA RECEIVED FROM TRANSMISSION CONTROL MODULE (TCM). BUS/MESSAGE ERROR. SEQUENCE COUNTER NOT CORRECT OR NOT UPDATED (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-U040482

Condition

Fig. 209: Identifying Brake Control Module (BCM) & Engine Control Module (ECM)
Courtesy of VOLVO CARS CORPORATION

NOTE: The diagnostic trouble code only applies to vehicles equipped with DSTC.

The brake control module (BCM) receives a signal from the central electronic module (CEM) (manual transmission) or from the transmission control module (TCM) (automatic transmission) with information on the engaged gear. If reverse (R) is engaged, it should not be possible to activate the stability function.

Diagnostic trouble code BCM-U040482 is generated in the following cases:

- If the brake control module (BCM) registers no signal or a disrupted signal.
- If the brake control module (BCM) receives a signal indicating that reverse gear is engaged while the vehicle is being driven forward for more than one second.

The diagnostic trouble code can be diagnosed when speed exceeds 40 km/h (25 mph) and the direction of travel is straight ahead followed by a turn.

Substitute Value

- Nothing.

Possible Source

- Open circuit or short-circuit in the circuit for the back-up light switch (manual transmission).
- Interference on the CAN network.

- Short circuit or open circuit on CAN cable.

NOTE: **This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.**

Fault symptom[s]

- None.

TROUBLESHOOTING BCM-U040482

CHECKING DIAGNOSTIC TROUBLE CODES IN THE CENTRAL ELECTRONIC MODULE (CEM)

If there are any diagnostic trouble codes stored in the central electronic module (CEM) for communication errors or the back-up lights, perform troubleshooting of these first.

Were any diagnostic trouble codes stored in the central electronic module (CEM) for communication errors or the back-up lights?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **INFORMATION**

INFORMATION

NOTE: **If the back-up lights are on with reverse gear engaged and off in other positions, the function is okay. This indicates that the control module has previously registered a malfunction, but the malfunction no longer exists.**

Vehicle with manual transmission

In vehicles with manual transmission, there is a reverse gear switch on the transmission. The switch closes and gives a directly connected signal to the central electronic module (CEM) when reverse gear is engaged. This signal is then sent from the transmission control module (TCM) via the CAN-net to the brake control module (BCM). Check the function of the reverse gear switch.

Vehicle with automatic transmission

In vehicles with automatic transmission a signal is sent from the transmission control module (TCM) via the CAN-net to the central electronic module (CEM) that reverse gear is selected. This signal is also sent from the transmission control module (TCM) via the CAN-net to the brake control module (BCM). Check the function in the automatic transmission and lever carrier.

Remedy as necessary.

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-U041464

Condition

NOTE: **The diagnostic trouble code only applies to vehicles equipped with AWD and DSTC.**

The differential electronic module (DEM) informs the brake control module (BCM) when all wheel drive is active. During all wheel drive operation, the brake control module (BCM) should not activate the stability function due to the risk of disrupting the differential electronic module (DEM). Diagnostic trouble code BCM-U041464 is generated if the brake control module (BCM) registers that the speed of the front and rear wheels

differs too much.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- SC is blocked.
- AYC is blocked.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Internal error in differential electronic module (DEM).

NOTE: This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.

Fault symptom[s]

- General warning light on.
- Anti-spin is not operational.
- The stability function is not operational.

TROUBLESHOOTING BCM-U041464

CHECKING DIAGNOSTIC TROUBLE CODES (DTCS) IN THE CENTRAL ELECTRONIC MODULE

CHECKING OTHER DIAGNOSTIC TROUBLE CODES (DTCS)

BCM-U042829: INVALID DATA RECEIVED FROM STEERING ANGLE SENSOR MODULE (SAS). GENERAL SIGNAL ERROR. SIGNAL INVALID (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-U042829

Condition

Fig. 210: Identifying Steering Angle Sensor
Courtesy of VOLVO CARS CORPORATION

The steering angle sensor module (SAS) communicates with the brake control module (BCM) with data sent in "small bundles". Each bundle has an ID number.

Diagnostic trouble code BCM-U042829 is generated if the brake control module (BCM) registers an unexpected ID number.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- TC is blocked.
- SC is blocked.
- AYC is blocked.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Interference or intermittent open circuit on CAN.
- Internal malfunction in steering angle sensor (SAS).

NOTE: This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.

Fault symptom[s]

- General warning light on.
- Anti-spin is not operational.

- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING BCM-U042829

INFORMATION

HINT: The diagnostic trouble code can be stored during brake control module (BCM) programming. If this is the case, erase the code.

Fig. 211: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Erase the diagnostic trouble code if it was generated during programming.

Fig. 212: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Was the diagnostic trouble code stored during brake control module (BCM) programming?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CHECKING DIAGNOSTIC TROUBLE CODES (DTCS) IN THE CENTRAL ELECTRONIC MODULE**

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

Fig. 213: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Wait approx. 1 minute.
- Read the status of the diagnostic trouble code.

Fig. 214: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the status of the diagnostic trouble code intermittent?

- **YES**

  see **INTERMITTENT MALFUNCTION**

- **NO**

  see **TROUBLESHOOTING INFORMATION**

TROUBLESHOOTING INFORMATION

The diagnostic trouble code indicates that the malfunction is in the steering angle sensor module (SAS).

Troubleshoot the system as described in relevant information. If no malfunction is found, replace the steering angle sensor module (SAS).

INTERMITTENT MALFUNCTION

HINT: The diagnostic trouble code status indicates that the brake control module (BCM) has previously registered a malfunction, but the malfunction is no longer active.

Check the connectors of the brake control module (BCM) and the steering angle sensor module (SAS) for contact resistance and oxidation.

Also check that the cables are not positioned too close to a source of interference, such as a cellular phone.

Remedy as necessary.

Other information

- For removal of the brake control module (BCM) connector: **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**
- see **CONNECTING THE BREAKOUT BOX**
- see **CONTENTS** .
- **Continue**

  see **INFORMATION**

CHECKING DIAGNOSTIC TROUBLE CODES (DTCS) IN THE CENTRAL ELECTRONIC MODULE

CHECKING OTHER DIAGNOSTIC TROUBLE CODES (DTCS)

In the event of communication problems, the fault may exist in other parts of the communications network.

The role of the central electronic module is to generally control the communications network and to store diagnostic trouble codes (DTCs) in the event of communication problems between control modules.

If there are diagnostic trouble codes (DTCs) stored for communication problems in the central electronic module, stop the fault tracing and fault trace the central electronic module.

Were diagnostic trouble codes (DTCs) for communication problems stored in the central electronic module?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

INFORMATION

FAULT-TRACING INFORMATION

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.

It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

BCM-U042829: INVALID DATA RECEIVED FROM STEERING ANGLE SENSOR MODULE (SAS). GENERAL SIGNAL ERROR. SIGNAL INVALID (B6324S5; 2011-2012)

BCM-U042862: INVALID DATA RECEIVED FROM STEERING ANGLE SENSOR MODULE (SAS). ALGORITHM ERROR. COMPARISON ERROR (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-U042862

Condition

Fig. 215: Identifying Steering Angle Sensor
Courtesy of VOLVO CARS CORPORATION

NOTE: The diagnostic trouble code only applies to vehicles equipped with DSTC.

The steering angle sensor module (SAS) transmits steering angle sensor signals on the CAN network that the brake control module (BCM) retrieves. A reference signal is calculated using the signals from the wheels sensors, yaw speed sensor and the lateral accelerometer. Diagnostic trouble code BCM-U042862 is generated if the brake control module (BCM) registers that the reference signal is unreasonable.

Substitute Value

- SC is blocked.
- AYC is blocked.
- TC is blocked.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Defective front end alignment.
- Improperly installed steering angle sensor.
- Damaged steering angle sensor.

NOTE: This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.

Fault symptom[s]

- General warning light on.

- Anti-spin is not operational.
- The stability function is not operational.
- The anti-skid function is not operational.

TROUBLESHOOTING BCM-U042862

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

NOTE: **If there are any diagnostic trouble codes stored for the steering angle sensor module (SAS), the wheel sensors or the AYC sensor (including yaw sensor and lateral accelerometer), perform troubleshooting of these first.**

Are any diagnostic trouble codes stored for the steering angle sensor module (SAS), the wheel sensors or the AYC sensor?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)**

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

Fig. 216: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off

  Check whether the AYC sensor is loose or improperly installed as described in: **ACTIVE YAW CONTROL SENSOR, REPLACING**

Is the AYC sensor properly secured?

- **YES**

  see **CHECKING THE CONNECTORS**

- **NO**

see **VERIFICATION**

CHECKING THE CONNECTORS

Fig. 217: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Move the steering wheel to the straight-ahead position.
- Read off the steering angle.

  With the steering wheel and front wheels in the straight-ahead position, the steering angle value should be approx. 0°.

  If the steering angle does not match the position of the steering wheel, reset and steering angle and calibrate DSTC.

If the front end alignment does not match with the steering angle, adjust the front end and calibrate DSTC.

Other information

- For resetting the steering angle sensor: **CONTACT REEL, REPLACEMENT**
- For adjusting the front end: **WHEEL ALIGNMENT, CHECKING / ADJUSTING**

Fig. 218: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Was steering wheel and front end alignment OK?

- **YES**

  see **INTERMITTENT MALFUNCTION**

- **NO**

  see **CALIBRATION**

CALIBRATION

Fig. 219: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on

  Calibrate the brake control module (BCM).

Fig. 220: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  see **VERIFICATION**

INTERMITTENT MALFUNCTION

HINT: The diagnostic trouble code status indicates that the brake control module (BCM) has previously registered a malfunction, but the malfunction is no longer active.

Check the connectors of the brake control module (BCM) and the steering angle sensor module (SAS) for contact resistance and oxidation.

Also check that the cables are not positioned too close to a source of interference, such as a cellular phone.

Remedy as necessary.

Other information

- see **CONTENTS**
- **Continue**

see **INFORMATION**

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the malfunction has been remedied.

Fig. 221: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 222: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reconnect the connectors, components, etc.
- Test-drive the vehicle according to **TEST DRIVE FORM (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL) /BRAKE CONTROL MODULE), DESCRIPTION** .

NOTE: **Do not turn off the ignition between test-driving and reading out diagnostic trouble codes. This is to obtain the correct status of the diagnostic trouble codes.**

Then read out the diagnostic trouble code's status without turning off the ignition after the test-drive.

Fig. 223: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the status of the diagnostic trouble code intermittent?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  see **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

INFORMATION

FAULT-TRACING INFORMATION

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.

It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

DIAGNOSTIC TROUBLE CODE INFORMATION BCM-U042864

Condition

Fig. 224: Identifying Steering Angle Sensor
Courtesy of VOLVO CARS CORPORATION

NOTE: The diagnostic trouble code only applies to vehicles equipped with DSTC.

The steering angle sensor module (SAS) sends a status signal to the brake control module (BCM).

Diagnostic trouble code BCM-U042864 is generated if the message sent to the brake control module (BCM) by the steering angle sensor (SAS) indicates an internal malfunction.

Substitute Value

- TC is blocked.
- SC is blocked.
- AYC is blocked.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

Possible Source

- Internal malfunction in steering angle sensor (SAS).

NOTE: This diagnostic trouble code (DTC) is not due to an internal hardware fault in the Brake control module (BCM) and must not be remedied by replacing the control module.

Fault symptom[s]

- General warning light on.
- Anti-spin is not operational.
- The stability function is not operational.

- The anti-skid function is not operational.

TROUBLESHOOTING BCM-U042864

INFORMATION

The diagnostic trouble code indicates an internal malfunction in the steering angle sensor (SAS). Read out the diagnostic trouble codes from the steering angle sensor (SAS) and troubleshoot as described in the information for the system.

BRAKES

Brake Control System - General Diagnostics and Tests

CHECKING THE GROUND TERMINALS, BRAKE CONTROL MODULE

CHECKING THE GROUND TERMINALS, BRAKE CONTROL MODULE

CHECKING THE GROUND TERMINALS

Fig. 1: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 2: Disconnecting Control Unit
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Connect the breakout box
- Control module disconnected.
- Switch off all equipment that takes power from the battery (for example, courtesy lighting, radio etc.).

  Check the resistance between the battery negative terminal and breakout box terminal #16 and between the battery negative terminal and breakout box terminal #46. The resistance must be 0 ohms.

  Check the ground terminal 1/1 (battery negative terminal) if the resistance is incorrect. Check for an open-circuit and contact resistance.

  Check the cable between ground terminal 31/95 (left-hand wheel arch) and brake control module

terminals #16 and #46. Check for an open-circuit. Check for contact resistance.

Other information

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**

Fig. 3: Breakout Box
Courtesy of VOLVO CARS CORPORATION

Fig. 4: Identifying Ohm Meter
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  See **VERIFICATION**

- **NO**

  see **INFORMATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 5: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 6: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reconnect the connectors, reinstall components etc.
- Ignition on.

The ABS warning lamp lights when the ignition is switched on.

Check that the warning lamp goes out after approximately 2 seconds.

NOTE: **The warning lamp will not go out if a fault has been stored in the control module.**

Fig. 7: Identifying ABS Control Module And ABS Warning Lamp
Courtesy of VOLVO CARS CORPORATION

Does the warning lamp go out after 2 seconds?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should be diagnosed and remedied. Since this is not the case the fault-tracing process has failed.

Complete the fault-tracing for those fault or try again.

CHECKING THE POWER SUPPLY, BRAKE CONTROL MODULE

CHECKING THE POWER SUPPLY, BRAKE CONTROL MODULE

CHECKING THE 15-SUPPLY TO THE CONTROL MODULE

Fig. 8: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 9: Disconnecting Control Unit
Courtesy of VOLVO CARS CORPORATION

- The breakout box connected
- Control module disconnected.
- Ignition on.

  Check the 15-supply by measuring the voltage between terminal #4 (#A4) and ground terminals #16 (#A16) and #46 (#A46). The voltmeter should read battery voltage.

  Check that the fuse for the circuit is intact if the voltage is incorrect.

  If the fuse is blown, check the cable between brake control module terminal #4 (#A4) and the fuse. Check for a short-circuit to ground.

If the fuse is intact, check the cable between brake control module terminal #4 (#A4) and the fuse. Check for an open-circuit.

If no fault is found in the cable between brake control module terminal #4 (#A4) and the fuse, check the cable between the fuse and the ignition switch.

Other information

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**

Fig. 10: Breakout Box
Courtesy of VOLVO CARS CORPORATION

Fig. 11: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CHECKING THE 30-SUPPLY (VALVES) TO THE CONTROL MODULE**

CHECKING THE 30-SUPPLY (VALVES) TO THE CONTROL MODULE

Fig. 12: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- The breakout box connected
- Ignition on.

  Check the voltage between breakout box terminals #16 and #32 and between terminals #32 and #46. The voltmeter should read battery voltage.

  Check that the fuse for the circuit is intact if the voltage is incorrect.

  If the fuse is blown, check the cable between brake control module terminal #32 (#A32) and the fuse. Check for a short-circuit to ground.

  If the fuse is intact, check the cable between brake control module terminal #32 (#A32) and the fuse. Check for an open-circuit.

Remedy as necessary.

Fig. 13: Breakout Box
Courtesy of VOLVO CARS CORPORATION

Fig. 14: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

CONNECTING THE BREAKOUT BOX

CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)

see **CONNECTING THE BREAKOUT BOX**

CONNECTING THE BREAKOUT BOX

Special tools:

see **9511428**

see **9512958**

CONNECTING THE BREAKOUT BOX

Fig. 15: Identifying Catch & Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Expose the brake control module. See **BRAKE CONTROL MODULE (BCM), REPLACING**
- Disconnect the control module by pressing in the catch on top of the connector and **carefully** work the cover up so that the connector lifts.

CAUTION: Do not bend the cover up by more than 90°.

- Check in particular that the male and female terminals on the control module and the control module connector are intact, secure and cannot be pressed in. Check that the female terminal cables are securely connected
- In particular, check the terminal pins relevant to the diagnostic trouble code (DTC) / symptom. See **SIGNAL SPECIFICATION, BRAKE CONTROL MODULE (BCM) WITH STC/ TRACS** or **SIGNAL SPECIFICATION, BRAKE CONTROL MODULE (BCM) WITH DSTC (DYNAMIC STABILITY AND TRACTION CONTROL)** .
- Connect adapter see **9512958** to the control module's connector (wiring side) and connect breakout box see **9511428** to the adapter.

- The breakout box is designed to facilitate reading off the control module input and output signals when the control module is connected; and the resistance of the cable and component when the control module is disconnected. The use of a breakout box reduces the risk of accidental short-circuits and damage to the connector pins.

BRAKES

Brake Control System - Removal, replacement and installation

BRAKE CONTROL SYSTEM

BRAKE CONTROL MODULE (BCM), REPLACING

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

BRAKE CONTROL MODULE (BCM), REPLACING

PREPARATION

Remove the battery lead. See **BATTERY, DISCONNECTING** .

REMOVING THE AIR CLEANER (ACL) HOUSING

Fig. 1: Air Cleaner (ACL) Housing
Courtesy of VOLVO CARS CORPORATION

Remove the screws (1) for the intake manifold.

Disconnect the hose clamp (2) for the air hose.

Remove the connector (3) from the mass air flow (MAF) sensor.

Remove the air cleaner (ACL) housing from its mountings. Pull it straight up.

REMOVING THE INTEGRATED RELAY / FUSEBOX

Fig. 2: Identifying Battery Leads, Screws And Nut
Courtesy of VOLVO CARS CORPORATION

Remove:

- the nut for the power supply cables
- the 2 power supply cables
- the 2 screws for the mounting.

Fig. 3: Locating Connector And Cable Harness From Fusebox
Courtesy of VOLVO CARS CORPORATION

Open the integrated relay/fusebox. Remove the connector (1).

Disconnect the cable harness from the box (2).

Lift the box out of the mounting and move it to one side.

DISCONNECTING THE CONNECTOR

Fig. 4: Identifying Catch & Connector
Courtesy of VOLVO CARS CORPORATION

Disconnect the connector from the control module.

Press the catch and pull up the connector. Pull up the connector **a maximum of 90 °** .

Pull the connector up from the control module.

REMOVING THE CONTROL MODULE

Fig. 5: Brake Control Module And Screws
Courtesy of VOLVO CARS CORPORATION

Remove the screws.

Use a 6 mm torx external socket.

Carefully pull the control module down so that the terminal pin on the control module comes loose inside the ABS modulator.

Continue pulling the control module down towards the brake lines and lift it out.

INSTALLING THE CONTROL MODULE

INSTALLING THE CONTROL MODULE

Fig. 6: ABS Control Module
Courtesy of VOLVO CARS CORPORATION

Check:

- the control module is correct (compare to the old one)
- that none of the pins on the connector are damaged
- that there are no contaminants on the mating surfaces between the control module and the ABS hydraulic modulator
- that no parts of the old control module seals remain on the old ABS hydraulic modulator valves.

Position the control module on the brake lines.

Center the control module with the ABS modulator valves so that the terminal pins are correctly positioned in the modulator.

Press the control module up so that the terminal pins connect.

Install:

- the screws. Tighten to **1.8 Nm**
- the connector on the control module. Lock the connector.

INSTALLING THE INTEGRATED RELAY / FUSEBOX

Install the box in its mounting.

Install:

- the cable harness
- the connector
- the 2 screws in the mounting. Tighten to **10 Nm**
- the 2 power supply cables
- the nut for the mounting for the power supply cables.

INSTALLING THE AIR CLEANER (ACL) HOUSING

Press the air cleaner (ACL) housing into place.

Install the air hoses and the connector.

FINISHING

WARNING: **No ABS, stability and traction control functions are available when there is communication with the Brake control module (BCM) (Volvo Diagnostics are activated). ABS warning lamp flashes for as long as the diagnostics are activated. To cancel the diagnostics before test driving the vehicle, the ignition must be switched off**

Fig. 7: Identifying Warning Light
Courtesy of VOLVO CARS CORPORATION

NOTE: Switch on the ignition.

Order the software. 8682705 .

Use VIDA vehicle communication to calibrate the control module.

Visual check.

Turn on the ignition.

Wait five seconds and until the symbol for the brakes on the dashboard has gone out.

In the event of a fault (the symbol is lit).

Check that the connector is connected.

Read off any diagnostic trouble codes (DTCs) stored in the control module. Erase.

Interrupt the diagnostic function by turning off the ignition.

Test drive the car, see **TEST DRIVE FORM (ABS), DESCRIPTION** .

Check that no diagnostic trouble codes (DTCs) are stored.

Interrupt the diagnostic function by turning off the ignition.

HYDRAULIC UNIT, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATION

Remove the battery lead. See **BATTERY, DISCONNECTING**

WARNING: **The hydraulic unit must not be opened under any circumstances. Reassembling it requires special equipment and facilities.**

NOTE: **An hydraulic unit for ABS has only eight valves while a unit for ABS and STC (stability and traction control) has ten valves.**

The method for replacing the unit is the same for both types. Check thoroughly when installing the new unit that the unit is the correct type.

Fig. 8: Bleeding Brakes
Courtesy of VOLVO CARS CORPORATION

Secure the pedal in the depressed position.

Use a pedal jack.

Remove the protective cap from the bleed nipple at the left front wheel.

Install a plastic hose on the nipple. Open the bleed nipple.

Collect the brake fluid in a container (bottle).

Shut the bleed nipple.

REMOVING THE BRAKE PIPE FOR THE MASTER CYLINDER / ABS UNIT

Remove the brake pipe between the master cylinder and the ABS hydraulic modulator. See **BRAKE PIPE MASTER CYLINDER/ABS UNIT, REPLACING**

REMOVING THE ABS HYDRAULIC MODULATOR

Fig. 9: Brake Pipes To Wheel Brakes From ABS Hydraulic Modulator
Courtesy of VOLVO CARS CORPORATION

Disconnect the brake pipes to the wheel brakes from the ABS hydraulic modulator.

NOTE: Note the position of the pipes in the hydraulic unit.

Hang the brake pipes on the cross member.

Plug the brake pipes and connections for the ABS hydraulic modulator and master cylinder.

Remove the connector from the control module.

Remove the 3 mounting screws for the bracket by the side member.

Raise the ABS hydraulic modulator and bracket.

Fig. 10: ABS Hydraulic Modulator Bracket
Courtesy of VOLVO CARS CORPORATION

Remove:

- the connector for the pump motor from the control module
- the bracket from the ABS hydraulic modulator
- the control module.

INSTALLING THE ABS HYDRAULIC MODULATOR

Fig. 11: ABS Control Module
Courtesy of VOLVO CARS CORPORATION

WARNING: **The ABS hydraulic modulator must not be opened under any circumstances. Reassembling it requires special equipment and facilities.**

On the control module check:

- that none of the pins on the connector are damaged
- that there are no contaminants on the mating surfaces between the control module and the ABS hydraulic modulator.

Install:

- the control module on the ABS hydraulic modulator
- the screws. Tighten to **1.8 Nm** .

NOTE: **The ABS hydraulic modulator is filled with brake fluid. It is important that the plugs are not removed until the brake pipes are to be connected.**

Fig. 12: Brake Pipes To Wheel Brakes From ABS Hydraulic Modulator
Courtesy of VOLVO CARS CORPORATION

Install:

- the new hydraulic unit on the bracket. Tighten the mounting screws. Tighten to **8 Nm**
- the connector for the pump motor to the control module
- the ABS hydraulic modulator and bracket
- the three screws. Tighten to **10 Nm** .

Remove the protective plugs. Connect the brake pipes to the wheel brakes. Tighten to **15 Nm** .

INSTALLING THE BRAKE PIPES ON THE MASTER CYLINDER / ABS UNIT

WARNING: **No ABS, stability and traction control functions are available when there is communication with the Brake control module (BCM) (Volvo Diagnostics are activated). ABS warning lamp flashes for as long as the diagnostics are activated. To cancel the diagnostics before test driving the vehicle, the ignition must be switched off**

Install the brake pipe between the master cylinder and the ABS hydraulic modulator. Then carry out the following. See **BRAKE PIPE MASTER CYLINDER/ABS UNIT, REPLACING**

NOTE: **Remember to remove the pedal jack after installing all brake pipes.**

RING GEAR (TOOTHED WHEEL) FRONT, CHANGE (2003-2005)

NOTE: **Some variation may occur. However, the essential information in the illustrations is always correct.**

Remove drive axle front, see **REAR AXLE, DRIVE SHAFTS - REMOVAL, REPLACEMENT AND INSTALLATION**

Fig. 13: Identifying Drive Axle Front Removal
Courtesy of VOLVO CARS CORPORATION

Fig. 14: Clean With Wire Brush
Courtesy of VOLVO CARS CORPORATION

COMPONENT SPECIFICATIONS (2003-2004)

COMPONENT SPECIFICATIONS

The component specification gives the value of the component when the connector is disconnected. Where no value is given, it is not possible to measure a relevant value at the component.

The figure within the brackets indicates the terminal pin on the component to which the value refers.

Designation	Type	Supply voltage	Value	Other
Active yaw control sensor	CAN node with integrated yaw rate sensor, lateral accelerometer and accelerometer (AWD only)	12 V (#3-#5)	Yaw rate sensor: °/s Lateral accelerometer: m/s^2 Accelerometer: m/s^2	The active yaw control sensor either contains two (2WD) or three (AWD) sensors and is connected to the brake control module with its own CAN lead.
Brake pressure sensor 1 & 2	Pressure switch (Pressostat)	5 V (#1-#3)	Operating range 0-170 bar 21 bar when brake pedal is not depressed	-
Pressure build-up valve	Electro magnetically controlled valve	12 V	Pulse width modulated (PWM) signal	-
Wheel sensor	Hall sensor	12 V	Tooth against sensor: Iapprox. 14mA Uapprox.9V Cover against sensor: Iapprox.7 mA Uapprox.1V below Ubat	-
Pedal pressure sensor	Two position switch	12 V (#2-#5) NO (#1-#5) NC	NO=Normally open NC=Normally closed	-
Pedal position sensor	Slide potentiometer	12 V	0 mm: approx. 0 V 38.5 mm: approx. 95 % of Ubat	-

SIGNAL SPECIFICATION, BRAKE CONTROL MODULE (2003-2004)

SIGNAL SPECIFICATION, BRAKE CONTROL MODULE (BCM) WITH DSTC (DYNAMIC STABILITY AND TRACTION CONTROL)

All values given are between the relevant terminal in column 1 and terminal #A16 or #A47 (ground), unless otherwise indicated in brackets.

Connections 9, 13, 24, 26, 35, 38, 40-41 and 44 are not used.

NOTE: **It is important that the breakout box is connected and that the ground connections have been checked before starting to measure.**

	U=	DC voltage in volts (V)	U_{bat} =	battery voltage (V)
	I =	current in amperes (A)	U_{low} =	voltage approximately 0 V
	F =	Frequency in Hertz (Hz)		

Breakout box terminal	Terminal ECU	Signal type	Ignition on	Miscellaneous
#A1	#1	30-supply pump motor (power supply from battery)	U = U_{bat}	With a 30 A fuse.
#A2	#2	Diagnostic lead C-link	-	-
#A3	#3	Pedal position sensor, signal	0-5 V	Brake pedal position, analog signal. 0 mm: approx.0 V 38.5 mm: approx. 95% of 5 V
#A4	#4	15-supply (power supply from the ignition switch)	U = U_{bat}	-
#A5	#5	Pedal position sensor, signal ground	U=U_{low}	-
#A6	#6	Active yaw control sensor, power supply	U = U_{bat}	The active yaw control sensor receives 12 V from the control module.
#A7	#7	Pedal position sensor, power supply	U =5 V	The pedal position sensor receives 5 V from the control module.
#A8	#8	Wheel sensor right rear, signal output.	Tooth at sensor Uapprox.U_{low} Cover at sensor Uapprox.U_{bat}	Measure by creating a temporary voltage supply between #1 via a resistance of 1kohms and #8. Connect a voltmeter between #8 and ground connection #16. Turn the wheel slowly.
#A9	#9	-	-	-
#A10	#10	Wheel sensor left rear, signal output.	Tooth at sensor Uapprox.U_{low} Cover at sensor Uapprox.U_{bat}	Measure by creating a temporary voltage supply between #1 via a resistance of 1kohms and #10. Connect a voltmeter between #10 and ground connection #16. Turn the wheel slowly.
#A11	#11	Control modules communication cable (CAN H)	U=2-3 V	-
#A12	#12	Wheel sensor right front,	Tooth at sensor Uapprox.U_{low}	Measure by creating a temporary voltage supply between #1 via a resistance of 1kohms and

		signal output.	Cover at sensor Uapprox.U_{bat}	#12. Connect a voltmeter between #12 and ground connection #16. Turn the wheel slowly.
#A13	#13	-	-	-
#A14	#14	Wheel sensor left front, signal output.	Tooth at sensor Uapprox.U_{low} Cover at sensor Uapprox.U_{bat}	Measure by creating a temporary voltage supply between #1 via a resistance of 1kohms and #14. Connect a voltmeter between #14 and ground connection #16. Turn the wheel slowly.
#A15	#15	Control modules communication cable (CAN L)	U=2-3 V	-
#A16	#16	Power and signal ground	U=U_{low}	Ground terminal for the input and outlet valves and signal to the control module.
#A17	#17	Pressure build-up valve, power supply.	U=4.75-5.25 V	-
#A18	#18	Brake pressure sensor 2 (B), voltage-feed	U=4.75-5.25 V	Due to possibility of incorrect installation,#18-#20 may also be Brake pressure sensor 1 (A).
#A19	#19	Brake pressure sensor 2 (B), signal ground	U=U_{low}	-
#A20	#20	Brake pressure sensor 2 (B), signal	U=0.25-4.75 V	Analog signal 0-170 bar 23 mV/bar 0 bar = 0.5 V
#A21	#21	Brake pressure sensor 1 (A), signal ground.	U=U_{low}	Due to possibility of incorrect installation,#21-#23 may also be Brake pressure sensor 2 (B).
#A22	#22	Brake pressure sensor 1 (A), voltage-feed.	U=4.75-5.25 V	-
#A23	#23	Brake pressure sensor 1 (A), signal	U=0.25-4.75 V	Analog signal 0-170 bar 23 mV/bar 0 bar = 0.5 V
#A24	#24	-	-	-
#A25	#25	Active yaw control sensor, communication cable (CAN L)	U=2-3 V	-

#A26	#26	-	-	-
#A27	#27	Pedal pressure switch, signal	Open: Uapprox.U_{low} Closed: U approx.U_{bat}	The pedal pressure switch is open when the brake pedal is depressed.
#A28	#28	Test signal for the pedal pressure switch	-	-
#A29	#29	Active yaw control sensor, communication cable (CAN H)	U=2-3 V	-
#A30	#30	Pedal pressure switch, signal		The pedal pressure switch is closed when the brake pedal is not pressed.
#A31	#31	Pressure build-up valve, power supply	12 V	Pulse width modulated signal: maximum 4A 18kHz
#A32	#32	30-supply for the valves (power supply from battery)	U = U_{bat}	With a 30 A fuse.
#A33	#33	Front right wheel sensor. signal	Tooth against sensor: Iapprox.14 mA Cover against sensor: I approx. 7 mA	The sensor generates a pulsed signal (quadratic wave) with a fixed pulse ratio when the pulse wheel rotates. The frequency increases with speed. For test of sensor's function, see #12
#A34	#34	Front right wheel sensor, power supply.	U = U_{bat}	The wheel sensor receives 12 V from the control module.
#A35	#35	-	-	-
#A36	#36	Rear left wheel sensor, power supply.	U = U_{bat}	The wheel sensor receives 12 V from the control module.
#A37	#37	Rear left wheel sensor, signal	Tooth against sensor: Iapprox.14 mA Cover against sensor: I approx. 7 mA	The sensor generates a pulsed signal (quadratic wave) with a fixed pulse ratio when the pulse wheel rotates. The frequency increases with speed. For test of sensor's function, see #10 in the table
#A38	#38	-	-	-

#A39	#39	Active yaw control sensor, ground	$U=U_{low}$	-
#A40	#40	-	-	-
#A41	#41	-	-	-
#A42	#42	Rear right wheel sensor, signal	Tooth against sensor: Iapprox.14 mA Cover against sensor: I approx. 7 mA	The sensor generates a pulsed signal (quadratic wave) with a fixed pulse ratio when the pulse wheel rotates. The frequency increases with speed. For test of sensor's function, see #8 in the table
#A43	#43	Right rear wheel sensor, power supply	$U = U_{bat}$	The wheel sensor receives 12 V from the control module.
#A44	#44	-	-	-
#A45	#45	Front left wheel sensor, power supply	$U = U_{bat}$	The wheel sensor receives 12 V from the control module.
#A46	#46	Front left wheel sensor, signal	Tooth against sensor: Iapprox.14 mA Cover against sensor: I approx. 7 mA	The sensor generates a pulsed signal (quadratic wave) with a fixed pulse ratio when the pulse wheel rotates. The frequency increases with speed. For test of sensor's function, see #14 in the table
#A47	#47	Power and signal ground	$U=U_{low}$	Ground terminal for the pump motor.

SIGNAL SPECIFICATION, BRAKE CONTROL MODULE (BCM) WITH STC/ TRACS

All values given are between the relevant terminal in column 1 and terminal #A16 or #A47 (ground), unless otherwise indicated in brackets.

Pins 6, 9, 13, 17-31, 35, 38-41 and 44 are not used.

NOTE: **It is important that the breakout box is connected and that the ground connections have been checked before starting to measure.**

U=	DC voltage in volts (V)	Ubat =	battery voltage (V)
I =	current in amperes (A)	Ulow =	voltage approximately 0 V

	F =	Frequency in Hertz (Hz)		

Breakout box terminal	Terminal ECU	Signal type	Ignition on	Miscellaneous
#A1	#1	Pump motor, 30-supply (power supply from the battery)	U = Ubat	With a 30 A fuse.
#A2	#2	Diagnostic lead C-link	-	-
#A3	#3	Pedal position sensor, signal	0-5 V	Analogue signal which indicates the position of the brake pedal. 0 mm: approx.0V 38 mm: approx. 95% of 5 V
#A4	#4	15-supply (power supply from the ignition switch)	U = Ubat	-
#A5	#5	Pedal position sensor, signal ground	U = Ulow	-
#A6	#6	-	-	-
#A7	#7	Pedal position sensor, power supply	U =5 V	The pedal position sensor receives 5 V from the control module.
#A8	#8	Wheel sensor right rear, signal output	Tooth against sensor Uapprox.U_{low} Cover against sensor Uapprox.U_{bat}	Measure by creating a temporary voltage supply between #1 via a 1kohms and #8. Connect a voltmeter between #8 and ground connection #16. Turn the wheel slowly.
#A9	#9	-	-	-
#A10	#10	Wheel sensor left rear, signal output	Tooth against sensor Uapprox.U_{low} Cover against sensor Uapprox.U_{bat}	Measure by creating a temporary voltage supply between #1 via a 1kohms and #10. Connect a voltmeter between #10 and ground connection #16. Turn the wheel slowly.
#A11	#11	Control modules communication cable (CAN H)	U=2-3 V	-
#A12	#12		Tooth against sensor	Measure by creating a temporary voltage supply between #1 via a

		Wheel sensor right front, signal output	Uapprox.U_{low} Cover against sensor Uapprox.U_{bat}	1kohms and #12. Connect a voltmeter between #12 and ground connection #16. Turn the wheel slowly.
#A13	#13	-	-	-
#A14	#14	Wheel sensor left front, signal output	Tooth against sensor Uapprox.U_{low} Cover against sensor Uapprox.U_{bat}	Measure by creating a temporary voltage supply between #1 via a 1kohms and #14. Connect a voltmeter between #14 and ground connection #16. Turn the wheel slowly.
#A15	#15	Control modules communication cable (CAN L)	U=2-3 V	-
#A16	#16	Power and signal ground	U = Ulow	Ground terminal for the input and outlet valves and signal to the control module.

BRAKES

Brake Control System - Specifications, other

VEHICLE COMMUNICATION INFORMATION (2003-2004)

DESCRIPTION OF ACTIVATIONS

DESCRIPTION OF ACTIVATIONS

A number of the components in the brake system can be activated using VIDA vehicle communication. Because the brake systems can be differently equipped with for example anti spin and stability functions, not all components can necessarily be activated.

ACTIVATING ALL VERSIONS

PUMP MOTOR

Activating the hydraulic modulator pump motor.

The pump motor should "hum".

LEFT FRONT INLET VALVE

Activating left front wheel inlet valve.

"Clicking sound" in the ABS hydraulic modulator.

RIGHT FRONT INLET VALVE

Activating right front wheel inlet valve.

"Clicking sound" in the ABS hydraulic modulator.

LEFT REAR INLET VALVE

Activating left rear wheel inlet valve.

"Clicking sound" in the ABS hydraulic modulator.

RIGHT REAR INLET VALVE

Activating right rear wheel inlet valve.

"Clicking sound" in the ABS hydraulic modulator.

LEFT FRONT OUTLET VALVE

Activating left front wheel outlet valve.

"Clicking sound" in the ABS hydraulic modulator.

RIGHT FRONT OUTLET VALVE

Activating right front wheel outlet valve.

"Clicking sound" in the ABS hydraulic modulator.

LEFT REAR OUTLET VALVE

Activating left rear wheel outlet valve.

"Clicking sound" in the ABS hydraulic modulator.

RIGHT REAR OUTLET VALVE

Activating right rear wheel outlet valve.

"Clicking sound" in the ABS hydraulic modulator.

ANTI SPIN FUNCTION STC (STABILITY AND TRACTION CONTROL) / TRACS (TRACTION CONTROL SYSTEM)

INLET VALVE STC (STABILITY AND TRACTION CONTROL) / TRACS (TRACTION CONTROL SYSTEM)

NOTE: Only STC (Stability and traction control) / TRACS (traction control system).

Activating the STC (Stability and Traction control) or TRACS (traction control system) inlet valve.

"Clicking sound" in the ABS hydraulic modulator.

DSTC (DYNAMIC STABILITY AND TRACTION CONTROL) FUNCTION

ACTIVE YAW CONTROL INLET VALVE

NOTE: Only DSTC (dynamic stability and traction control).

Activating the active yaw control inlet valve.

"Clicking sound" in the ABS hydraulic modulator.

ACTIVE YAW CONTROL OUTLET VALVE

NOTE: Only DSTC (dynamic stability and traction control).

Activating the active yaw control outlet valve.

"Clicking sound" in the hydraulic modulator

ACTIVE YAW CONTROL PRESSURE BUILD-UP VALVE

NOTE: Only DSTC (dynamic stability and traction control).

Activating the active yaw control pressure build-up valve.

A barely audible "clicking sound" from the power brake booster. If the pressure build-up valve is activated while the car is idling, the engine will splutter and the engine speed (RPM) will drop slightly.

DESCRIPTION OF PARAMETERS

PARAMETERS, STATUS

NOTE: The parameters that can be read off are determined by the systems with which the car is equipped.

STC (STABILITY AND TRACTION CONTROL) ENGAGEMENT INDICATION

The value indicates the status of the switch for STC (stability and traction control).

The function is always active with ignition switched on and is deactivated when the STC (stability and traction control) button is held in for approximately 2 seconds.

Active = STC (stability and traction control) activated.

Not activated = STC (stability and traction control) not activated.

DSTC (DYNAMIC STABILITY AND TRACTION CONTROL) ENGAGEMENT INDICATION

The value indicates the status of the switch for DSTC (dynamic stability and traction control).

The function is always active with ignition switched on and is deactivated when the DSTC (dynamic stability and traction control) button is held in for approximately 2 seconds.

Active = DSTC (dynamic stability and traction control) activated.

Not activated = DSTC (dynamic stability and traction control) not activated.

STOP LAMP SWITCH

The value indicates the status of the stop lamp switch.

Active (pressed in) = Stop (brake) lamp switch activated.

Not activated = Stop (brake) lamp switch not activated.

DIRECTION OF STEERING RIGHT / LEFT

The value indicates in which direction the steering wheel is turned.

Right = The steering wheel is turned to the right.

Left = The steering wheel is turned to the left.

PEDAL PRESSURE SENSOR STATUS

The value indicates the status of the pedal pressure sensor.

The pedal pressure sensor senses when the brake pedal is depressed. The brake control module (BCM) uses the signal to switch off the active yaw control (AYC) when the driver needs to brake.

OFF= Brake pedal unaffected.

ON = Brake pedal affected.

PARAMETERS, VALUE

WHEEL SPEED

The brake control module (BCM) calculates the wheel speed using the relevant wheel sensor.

Measurement range: 0.60 to 327 km/h

WHEEL ACCELERATION

The brake control module (BCM) derives the wheel acceleration / deceleration from the relevant wheel sensor signal. The value may vary dependent on the road surface. Uneven road surfaces give large variations.

Measurement range: -12.8 to +12.7 m/s^2

Positive value = acceleration.

Negative value = deceleration.

VEHICLE REFERENCE SPEED

The brake control module (BCM) derives the cars reference speed from the wheel sensor signal.

Measurement range: 0.60 to 327 km/h

ACCELERATION OF THE CAR, POSITIVE OR NEGATIVE

The vehicle's acceleration or deceleration.

The brake control module (BCM) derives the reference acceleration / deceleration from the relevant wheel sensor signal.

Measurement range: -12.8 to +12.7 m/s^2

Positive value = acceleration.

Negative value = deceleration.

BRAKE DISC, TEMPERATURE

The brake control module (BCM) derives the brake disc temperature depending on the length of time the anti-spin system has been operating or the ABS has been activated.

Measurement range: 0 to 918 °C

RATE OF YAW, SIGNAL (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The signal from the yaw rate sensor, which is integrated in the active yaw control (AYC) sensor, transmits information to the brake control module (BCM) about the rate of yaw (steering direction) of the car in °/s. A positive value indicates a steering direction to the right. A negative value indicates a steering direction to the left.

Measurement range: -75 to +75 °/s (model year -2004)

Measurement range: -82 to +82 °/s (model year 2004-)

LATERAL ACCELEROMETER, SIGNAL (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The signal from the lateral accelerometer, which is integrated in the active yaw control (AYC) sensor, transmits information to the brake control module (BCM) about the lateral acceleration of the car. A positive value indicates acceleration to the right. A negative value indicates acceleration to the left.

Measurement range: -16.7 to +16.7 m/s^2 (model year -2004)

Measurement range: -18 to +18 m/s^2 (model year 2004-)

ACCELEROMETER, SIGNAL (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The signal from the accelerometer, which is integrated in the active yaw control (AYC) sensor, transmits information to the brake control module (BCM) about the longitudinal acceleration of the car. Positive value indicates acceleration. Negative value indicates deceleration.

Measurement range: -16.7 to +16.7 m/s^2 (model year -2004)

Measurement range: -18 to +18 m/s^2 (model year 2004-)

BRAKE PRESSURE SENSOR 1 (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

Brake pressure sensor 1 transmits a signal with the brake system pressure to the brake control module (BCM).

Measurement range: 0 to 170 bar

BRAKE PRESSURE SENSOR 2 (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

Brake pressure sensor 2 transmits a signal with the brake system pressure to the brake control module (BCM).

Measurement range: 0 to 170 bar

PEDAL POSITION SENSOR, POSITION

The pedal position sensor transmits a signal to the brake control module (BCM) indicating the brake system pressure.

Measurement range: 0 to 42 mm

PEDAL POSITION SENSOR, SPEED

The pedal position sensor transmits a signal to the brake control module (BCM) indicating the pedal position sensor speed when depressed.

Measurement range: 0 to 11, 770 mm/s

STEERING WHEEL ANGLE (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The steering wheel angle sensor transmits a signal to the brake control module (BCM) indicating the steering wheel turn.

Measurement range: -81.92 to +81.88 °/s

STEERING ANGLE, VALUE (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The steering wheel angle sensor transmits a signal to the brake control module (BCM) indicating the steering wheel turn.

Measurement range: -700° to +700°

+700° = Left

-700° = Right

POWER SUPPLY

Power supply to the brake control module (BCM).

Measurement range: 0 to 18 V

OFFSET VALUES

HINT: The offset value is an adaptive correction value which gives the individual sensor offset for the sensor. The brake control module uses the value to determine the correct start value when the DSTC (dynamic stability and traction control) system is started up. If the normal value has changed during an operating cycle, the value is stored in the EEPROM memory of the brake control module (BCM) after the ignition is switched off. The value is then reloaded to the internal memory when the ignition is switched on.

HINT: The offset values can also change shortly after the ignition was switched off.

STEERING ANGLE SENSOR, OFFSET VALUE (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

A diagnostic trouble code (DTC) is stored and DSTC (dynamic stability and traction control) is shut off at ±17 °/s.

Measurement range: -22 to +22 °/s

STEERING WHEEL ANGLE SENSOR, OFFSET VALUE (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

A diagnostic trouble code (DTC) is stored and DSTC (dynamic stability and traction control) is shut off at ±17 °/s.

Measurement range: -22 to +22 °/s

YAW RATE SENSOR, OFFSET VALUE (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

A diagnostic trouble code (DTC) is stored and DSTC (dynamic stability and traction control) is shut off at ±6.0 °/s.

Measurement range: -9.4 to +9.4 °/s

LATERAL ACCELEROMETER, OFFSET VALUE (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

A diagnostic trouble code (DTC) is stored and DSTC (dynamic stability and traction control) is shut off at ± 1.7 m/s^2 .

Measurement range: -3.2 to +3.2 m/s^2

ACCELEROMETER, SIGNAL (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

A diagnostic trouble code (DTC) is stored and DSTC (dynamic stability and traction control) is shut off at ± 1.7 m/s^2 .

Measurement range: -3.2 to +3.2 m/s^2

BRAKE PRESSURE SENSOR 1, OFFSET VALUE (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

A diagnostic trouble code (DTC) is stored and DSTC (dynamic stability and traction control) is shut off at ±8 bar.

Measurement range: -20 to +20 bar

BRAKE PRESSURE SENSOR 2, OFFSET VALUE (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

A diagnostic trouble code (DTC) is stored and DSTC (dynamic stability and traction control) is shut off at ±8 bar.

Measurement range: -20 to +20 bar

- see **STATUS IDENTIFIER, DESCRIPTION**

FROZEN VALUES IN THE BRAKE CONTROL MODULE, DESCRIPTION

EXPLANATION

The values described below were stored in the control module memory when the diagnostic trouble code (DTC) was stored.

All parameters do not need to be implemented in one control module. This varies from system to system.

NOTE: **Parameters marked with STC (stability and traction control)/DSTC (dynamic stability and traction control) are only displayed on cars equipped with STC (stability and traction control) and DSTC (dynamic stability and traction control). Parameters marked with DSTC (dynamic stability and traction control) are only displayed on cars equipped with DSTC (dynamic stability and traction control).**

HINT: For information about abbreviations, see BRAKE SYSTEM, ABBREVIATIONS .

TIME SINCE THE DIAGNOSTIC TROUBLE CODE (DTC) WAS FIRST STORED

The time in hours since the diagnostic trouble code (DTC) was first stored. The brake control module obtains the value via the Control Area Network (CAN) from the central electronic module. The time is the total time that the central electronic module has been running.

OUTSIDE TEMPERATURE

The value indicates the outside temperature when the diagnostic trouble code (DTC) was stored. The brake control module obtains the value via the Control Area Network (CAN) from the central electronic module.

ACTUAL GEAR

The value indicates the selected gear when the diagnostic trouble code (DTC) was stored. The brake control module obtains the value via the CAN from the transmission control module (TCM) if the car is equipped with automatic transmission or from the central electronic module if the car is equipped with manual transmission.

ENGINE TORQUE

The value displays the engine torque. The value is given in Nm.

REQUESTED TORQUE

The value indicates the requested torque depending on the driving instance the brake control module has sent to the engine control module. The value is indicated in Nm.

CLUTCH PEDAL

The value displays if the clutch pedal has been affected or not.

Value:

Affected

Unaffected (or the car is equipped with automatic transmission)

STABILITY TRACTION CONTROL (STC)/DSTC (DYNAMIC STABILITY AND TRACTION CONTROL) FUNCTION

The value indicates the function status. The function is automatically switched on at ignition but can be switched off manually.

Value:

Manually disconnected

Engaged

ENGINE SPEED (RPM)

The engine control module (ECM) transmits the engine speed (RPM) on the Control area network (CAN) from where the brake control module retrieves the signal. The value of the engine speed is given in rpm.

CONTROL MODULE POWER SUPPLY

The value indicates the system voltage. The value is given in volts (V).

PUMP MOTOR

The value indicates the pump motor status

Value:

Active

Not active

VEHICLE SPEED

The value indicates the vehicle speed in km/h.

THE VEHICLE ACCELERATION

The value indicates the forward acceleration of the car in m/s^2 .

THE BRAKE DISC TEMPERATURE

The value indicates the highest temperature on any of the brake discs in °C.

STEERING WHEEL ANGLE (DSTC)

The value displays the steering wheel angle in degrees.

PEDAL POSITION SENSOR POSITION

The value indicates the position of the pedal position sensor.

Value:

0-1 cm

1-2 cm

>3 cm

DIRECTION OF TRAVEL (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The value indicates the direction of travel of the car at the moment the diagnostic trouble code (DTC) was stored.

Value:

Forward

Backward

PRESSURE SENSOR 1, BRAKE PRESSURE (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The value indicates the pressure in the primary circuit of the brake system.

The value is indicated in bar.

PRESSURE SENSOR 2, BRAKE PRESSURE (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The value indicates the pressure in the secondary circuit of the brake system.

The value is indicated in bar

ABS CONTROL

The value indicates if the ABS function was operating at the moment the diagnostic trouble code (DTC) was stored.

Value:

Active

Not active

STABILITY CONTROL CONTROL (STC (STABILITY AND TRACTION CONTROL) /DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The value indicates if the traction control function was operating at the moment the diagnostic trouble code (DTC) was stored.

Value:

Active

Not active

TRACTION CONTROL CONTROL (STC (STABILITY AND TRACTION CONTROL) /DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The value indicates if the TRACS (traction control system) was operating at the moment the diagnostic trouble code (DTC) was stored.

Value:

Active

Not active

ACTIVE YAW CONTROL CONTROL (STC (STABILITY AND TRACTION CONTROL) / DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The value indicates if the stability function was operating at the moment the diagnostic trouble code (DTC) was stored.

Value:

Active

Not active

TRACTION CONTROL CONTROL ALL-WHEEL DRIVE (AWD) (STC (STABILITY AND TRACTION CONTROL) / DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The value indicates if the TRACS (traction control system) was operating at the moment the diagnostic trouble code (DTC) was stored

Value:

Active

Not active

OVER OR UNDER STEER (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The value indicates if the car was in under steer or over steer when the fault code was stored.

Value:

No over- or under steer

Over steer

Under steer

PEDAL PRESSURE SENSOR (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The value indicates if the pedal pressure sensor was active or not.

Value:

Active

Not active

LATERAL ACCELEROMETER (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The value indicates the lateral acceleration in m/s^2 .

ACCELEROMETER (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The value indicates the acceleration in m/s^2 .

YAW RATE SENSOR, PRESENT VALUE (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The value indicates the yaw rate in °/s.

YAW RATE SENSOR, REQUESTED YAW RATE (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The value indicates the calculated yaw rate sensor based on the driver's behavior in °/s.

PRESSURE BUILD-UP VALVE (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The value displays the status of the pressure build-up valve.

Value:

Active

Not active

ELECTRONIC BRAKE ASSISTANCE CONTROL FUNCTION (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The value indicates if the electronic brake assistance was accessible or blocked at the moment the diagnostic trouble code (DTC) was stored.

Value:

Function accessible

The function is blocked

ELECTRONIC BRAKE FORCE DISTRIBUTION CONTROL FUNCTION

The value indicates if the electronic brake assistance was accessible or blocked at the moment the diagnostic trouble code (DTC) was stored.

Value:

Function accessible

The function is blocked

TRACTION CONTROL CONTROL FUNCTION (STC (STABILITY AND TRACTION CONTROL) /DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The value indicates if the traction control was active or switched off at the moment the diagnostic trouble code (DTC) was stored.

Value:

Function accessible

The function is blocked

STABILITY CONTROL CONTROL FUNCTION (STC (STABILITY AND TRACTION CONTROL) /DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The value indicates if the stability control was accessible or blocked at the moment the diagnostic trouble code (DTC) was stored

Value:

Function accessible

The function is blocked

ACTIVE YAW CONTROL CONTROL FUNCTION (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The value indicates if the active yaw control was accessible or blocked at the moment the diagnostic trouble code (DTC) was stored.

Value:

Function accessible

The function is blocked

TRACTION CONTROL CONTROL FUNCTION AWD

The value indicates if the traction control was accessible or blocked at the moment the diagnostic trouble code (DTC) was stored.

Value:

Function accessible

The function is blocked

CONTROL FUNCTION ABS

The value indicates if the ABS system was accessible or blocked at the moment the diagnostic trouble code (DTC) was stored.

Value:

Function accessible

The function is blocked

BRAKE SYSTEM, ABBREVIATIONS

see **BRAKE SYSTEM, ABBREVIATIONS**

DESCRIPTION OF ACTIVATIONS

see **DESCRIPTION OF ACTIVATIONS**

DESCRIPTION OF PARAMETERS

PARAMETERS, STATUS

NOTE: Parameters that it is possible to read out is decided by the functions (STC/TRACS/DSTC) with which the vehicle is equipped.

BRAKE LIGHT SWITCH

The value shows status of the brake light switch. The brake control module (BCM) obtains the values via CAN from the engine control module (ECM).

Active (pressed in) = Brake light switch activated.

Not activated = Brake light switch not activated.

PEDAL PRESSURE SENSOR STATUS

The value shows status of the pedal pressure sensor. The brake control module (BCM) obtains the values via CAN from the engine control module (ECM).

Active (pressed in) = Pedal pressure sensor activated.

Not activated = Pedal pressure sensor not activated.

ENGINE RUNNING

The value shows the engine's status. The brake control module (BCM) obtains the value via CAN from the central electronic module (CEM).

Yes = Engine running.

No = Engine off.

SAFETY LEVEL

The value shows which safety level the brake control module (BCM) has at the time. The safety level changes depending on which safety functions that have been activated by VIDA in the control module. VIDA automatically selects the correct safety level depending on the diagnostic function. Activation of components/functions as well as calibration can only be performed at level 1 or 2.

Basic level = Normal position.

Level 1 = Safety level 1 activated.

Level 2 = Safety level 2 activated.

CONTROL FUNCTION ABS/EBD/TC/SC/AYC/EBA/RSC/TC-AWD

NOTE: Parameter SC/DSTC is only updated in vehicles with STC/DSTC.

The values show respective function's status.

Depending on the detected malfunction, driving, etc., status may vary.

AYC is shown as off until the steering wheel has been initiated and driven faster than 10 km/h.

Off = Function blocked.

Permitted = Function available.

STC/DSTC SWITCH INDICATION (STC)

NOTE: Only vehicles with SC/DSTC.

The value shows the status of the indicator diode in the STC/DSTC-switch. Requested status from the brake control module (BCM) that is sent on the CAN-network.

On = STC/DSTC indication activated.

Off = STC/DSTC indication not activated.

STEERING DIRECTION RIGHT/LEFT

NOTE: Only vehicles with DSTC.

The value shows which way the steering wheel is turned in relation to stored middle position. The brake control module (BCM) obtains the value via CAN from the steering wheel module (SWM).

Right = Steering wheel is turned to the right.

Left = Steering wheel is turned to the left.

PARAMETERS, VALUE

VOLTAGE FEED

The value shows brake control module (BCM) voltage feed.

Measurement range: 0-18 V

BATTERY VOLTAGE, CENTRAL ELECTRONIC MODULE (CEM)

The value shows battery voltage at the central electronic module (CEM). The brake control module (BCM) obtains the value via CAN from the central electronic module (CEM).

Measurement range: 0-32 V.

OUTDOOR TEMPERATURE

The value shows the outdoor temperature. The brake control module (BCM) obtains the value via CAN from the central electronic module (CEM).

Measurement range: -128 till +127 °C.

DRIVING DISTANCE

The value shows driven distance. The brake control module (BCM) obtains the value via CAN from the central electronic module (CEM).

Measurement range: 0 and up

PEDAL POSITION SENSOR'S POSITION

Value from pedal position sensor. The value shows the pedal position sensor's position.

Measurement range: 0-45 mm.

PEDAL POSITION SENSOR'S SPEED

Value from pedal position sensor. The value shows the pedal position sensor's speed, that is, how fast the brake pedal is pressed down or let up. Positive values are shown when the pedal is pressed down, negative values are shown when the pedal is let up.

Measurement range: -200 till +200 mm/s.

WHEEL SPEED

Value from wheel sensors. The brake control module (BCM) calculates wheel speed using respective wheel sensor.

Measurement range: 0.60-300 km/h.

VEHICLE'S REFERENCE SPEED

The value shows the vehicle's speed in km/h. Calculated value based on all wheel sensors' values.

Measurement range: 0.60-300 km/h.

WHEEL ACCELERATION

The value shows the wheels' acceleration or retardation. The brake control module (BCM) calculates the wheels' acceleration or retardation based on respective wheel sensor signal. The value may vary depending on the road surface. Uneven road surface may cause great variation.

Measurement range: 0-200 m/s^2

VEHICLE'S ACCELERATION, POSITIVE/NEGATIVE

The value shows the vehicle's acceleration/retardation. The brake control module (BCM) calculates the vehicle's acceleration/retardation based on respective wheel sensor signal.

Measurement range: 0-200 m/s^2 .

BRAKE DISC'S TEMPERATURE

The value shows temperature of the brake discs. The brake control module (BCM) calculates the temperature of the brake discs with regards to how long the traction function has controlled or ABS has been activated.

Measurement range: 0- 920 °C

STEERING ANGLE VALUE

NOTE: Only vehicles with DSTC.

The value shows the position of the steering angle. The brake control module (BCM) obtains the value via CAN from the steering wheel module (SWM).

Measurement range: -720 till +720°/s.

Positive values = Left

Negative values = Right

STEERING ANGLE SPEED

NOTE: Only vehicles with DSTC.

The value shows the speed of the steering angle. The brake control module (BCM) obtains the value via CAN from the steering wheel module (SWM).

Measurement range: -1500 till +1500°/s.

YAW ANGLE SIGNAL (DSTC)

NOTE: Only vehicles with DSTC.

The value shows yaw angle speed, that is, how fast the vehicle is turned on level ground. The signal from the

yaw speed sensor, which is built in to the stability sensor (BSC), give s the brake control module (BCM) information about the vehicle's yaw angle speed (steering direction) in °/s. Positive value indicate steering direction to the left, negative value indicates steering direction to the right.

Measurement range: -80 till +80°/s.

HINT: The value can be affected by sudden lateral movement of the vehicle's rear end or front end.

LATERAL ACCELEROMETER, SIGNAL

NOTE: Only vehicles with DSTC.

The value shows the lateral accelerometer's signal, that is, the vehicle's lateral inclination. The signal from the lateral accelerometer, which is built in to the stability sensor(BSC), give s the brake control module (BCM) information about the vehicle's lateral acceleration. Left turn gives a roll to the right, which gives a positive value. A right turn gives a roll to the left, which gives a negative value.

Measurement range: -20 to +20 m/s^2

HINT: The value can be affected by changing the vehicle's lateral inclination, e. g., by raising or lowering the vehicle's right or left side.

BRAKE PRESSURE SENSOR A AND B

NOTE: Only vehicles with DSTC.

The value shows the brake pressure in the hydraulic unit. The signal from the brake pressure sensors gives the brake control module (BCM) information about the pressure in the brake system.

Measurement range: 0-300 bar.

ACCELEROMETER, SIGNAL

NOTE: Only vehicles with DSTC and AWD.

The value shows the accelerometer's signal, that is, the vehicle's longitudinal inclination. The signal from the accelerometer, which is built in to the stability sensor (BSC), give s the brake control module (BCM) information about the vehicle's longitudinal acceleration. Positive value indicates acceleration, that is, the front of the vehicle is raised. Negative value indicates retardation, that is, the front of the vehicle is lowered.

Measurement range: -20 till +20 m/s^2

HINT: The value can be affected by changing the vehicle's longitudinal inclination, e. g., by raising or lowering the vehicle's front or rear end.

ROLL ANGLE, SIGNAL

NOTE: Only vehicles with DSTC and AWD.

The value shows the roll angle sensor's signal, that is, the vehicle's lateral inclination. The signal from the roll angle sensor, which is built in to the stability sensor (BSC), give s the brake control module (BCM) information about the vehicle's roll angle.

Measurement range: 0-90°/s.

HINT: The value can be affected by changing the vehicle's lateral inclination.

OFFSET VALUES (ONLY VEHICLES WITH DSTC)

HINT: The offset value is an adaptive correction value that indicates the individual deviation for the sensor. The brake control module (BCM) uses the value to always have the correct start value at start-up of the system for DSTC. If the normal value has been changed during an operating cycle, the value is stored after ignition off in the brake control module (BCM) EEPROM-memory and uploaded to the working memory at ignition on.

HINT: The offset values can also be changed shortly after the ignition has been turned off.

STEERING ANGLE SENSOR, STORED OFFSET VALUE

The value stored in the brake control module (BCM) EEPROM-memory.

Measurement range: -20 till +20°/s

YAW ANGLE SENSOR, STORED OFFSET VALUE

Current value for this operating cycle. Diagnostic trouble code is generated and DSTC is shut off at ±10°/s

Measurement range: -25 till +25°/s

LATERAL ACCELEROMETER, STORED OFFSET VALUE

The value stored in the brake control module (BCM) EEPROM-memory.

Measurement range: -10 to +10 m/s^2

BRAKE PRESSURE SENSOR A AND B, STORED OFFSET VALUE

The value stored in the brake control module (BCM) EEPROM-memory.

Measurement range: -20 till +20 bar

ACCELEROMETER, STORED OFFSET VALUE (DSTC AWD)

The value stored in the brake control module (BCM) EEPROM-memory.

Measurement range: -10 to +10 m/s^2

DESCRIPTION OF READING OFF OF EXTENDED DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

CONTENTS

Select type of description.

- see **FROZEN VALUES BRAKE CONTROL MODULE (BCM), DESCRIPTION**
- see **DESCRIPTION OF STATUS IDENTIFIER**
- see **DESCRIPTION OF COUNTER**

FROZEN VALUES BRAKE CONTROL MODULE (BCM), DESCRIPTION

EXPLANATION

When a diagnostic trouble code is generated, status or values are stored for certain parameters in the control module's memory. Then these can be read out using freeze frames.

Some parameters are not implemented in all models.

NOTE: Parameters marked with STC/DSTC are only shown for vehicles equipped with STC and DSTC. Parameters marked with DSTC are only shown for vehicles equipped with DSTC.

HINT: For information on abbreviations: BRAKE SYSTEM, ABBREVIATIONS

GLOBAL TIME

The value shows time in question when the diagnostic trouble code was stored. The brake control module (BCM) obtains the value via CAN from the central electronic module (CEM).

MILEAGE

The value shows total mileage in kilometers when the diagnostic trouble code was stored. The brake control module (BCM) obtains the value via CAN from the central electronic module (CEM).

BATTERY VOLTAGE CENTRAL ELECTRONIC MODULE (CEM)

The value shows battery voltage in volts when the diagnostic trouble code was stored. The brake control module (BCM) obtains the value via CAN from the central electronic module (CEM).

ENGINE RUNNING

The status indicates if the engine was running or not when the diagnostic trouble code was stored. The brake control module (BCM) obtains the value via CAN from the central electronic module (CEM).

Values:

Engine running

Not running

OUTSIDE TEMPERATURE

The value shows outdoor temperature in degrees Celsius at the time when the diagnostic trouble code was stored. The brake control module (BCM) obtains the value via CAN from the central electronic module (CEM).

CURRENT GEAR

The status indicates gear position at the time when the diagnostic trouble code was stored. The brake control module (BCM) obtains the value via CAN from the transmission control module (TCM) if the vehicle is equipped with automatic transmission or central electronic module (CEM) if the vehicle is equipped with manual transmission.

Values:

1st gear

2nd gear

3rd gear

4th gear

5th gear

6th gear

Reverse gear

Undefined

ENGINE TORQUE

The value shows the engine's torque in Nm at the time when the diagnostic trouble code was stored.

REQUESTED TORQUE

The value shows requested torque in Nm at the time when the diagnostic trouble code was stored. The brake control module (BCM) requests a certain torque from engine control module (ECM) depending on the situation.

CLUTCH PEDAL POSITION

The status indicates position of the clutch pedal at the time when the diagnostic trouble code was stored.

Values:

Activated

Not activated

DSTC-SWITCH (DSTC)

The status indicates position of the switch at the time when the diagnostic trouble code was stored. The function is engaged automatically when the ignition is on but can be disengaged manually.

Values:

Activated

Not activated

ENGINE SPEED (RPM)

The value shows the engine's rpm at the time when the diagnostic trouble code was stored. The brake control module (BCM) obtains the value via CAN from the central electronic module (CEM).

VOLTAGE FEED CONTROL MODULE

The value shows system voltage in volts at the time when the diagnostic trouble code was stored.

PUMP MOTOR

The status indicates if the pump motor for ABS was activated or not at the time when the diagnostic trouble code was stored.

Values:

Activated

Not activated

VEHICLE'S REFERENCE SPEED

The value indicates the vehicle speed in km/h.

VEHICLE'S ACCELERATION (DSTC)

The value shows the vehicle's acceleration straight ahead in m/s^2 .

STEERING WHEEL ANGLE CURRENT VALUE (DSTC)

The value shows the steering angle in degrees at the time when the diagnostic trouble code was stored.

OVERSTEERING/UNDERSTEERING (DSTC)

The status indicates if the vehicle understeered or oversteered at the time when the diagnostic trouble code was stored.

Values:

No understeering or oversteering

Understeer

Oversteer

PEDAL POSITION SENSOR

The status indicates the brake pedal's position at the time when the diagnostic trouble code was stored.

Values:

PTS inactive

0-1 cm

1-2 cm

>2 cm

TRAVEL DIRECTION (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The status indicates the vehicle's travel direction at the time when the diagnostic trouble code was stored.

Values:

Backward

Forward

BRAKE PRESSURE SENSOR A (DSTC)

The value shows the pressure in the brake system's primary circuit, given in bar.

BRAKE PRESSURE SENSOR B (DSTC)

The value shows the pressure in the brake system's secondary circuit, given in bar.

CONTROL FUNCTION RCS (DSTC)

The status indicates if the RCS-function controlled at the time when the diagnostic trouble code was stored.

Values:

Activated

Not activated

ACTIVE YAW CONTROL CONTROL FUNCTION (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The status indicates if the stability function controlled at the time when the diagnostic trouble code was stored.

Values:

Activated

Not activated

TRACTION CONTROL CONTROL FUNCTION (STC (STABILITY AND TRACTION CONTROL) /DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The status indicates if the anti-spin function (TRACS) controlled at the time when the diagnostic trouble code was stored.

Values:

Activated

Not activated

STABILITY CONTROL CONTROL FUNCTION (STC (STABILITY AND TRACTION CONTROL) /DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The status indicates if the anti-spin function (TRACS) controlled at the time when the diagnostic trouble code was stored.

Values:

Activated

Not activated

CONTROL FUNCTION ABS

The status indicates if the ABS-function controlled at the time when the diagnostic trouble code was stored.

Values:

Activated

Not activated

PRESSURE BUILD-UP VALVE BRAKE BOOSTER (DSTC)

The status indicates if the pressure build-up valve for active brake booster was activated at the time when the diagnostic trouble code was stored.

Values:

Activated

Not activated

PEDAL PRESSURE SENSOR (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL))

The status indicates if the brake pedal was activated when the diagnostic trouble code was stored.

Values:

Activated

Not activated

BRAKES

Brake Control System - Symptom Related Diagnostic Procedures

CHECKING BRAKE CALIPER FUNCTION

CHECKING THE FUNCTION OF THE BRAKE CALIPER

CHECKING THE FUNCTION OF THE BRAKE CALIPER

- Check that the brake calipers operate correctly
- If a brake caliper does not operate properly, replace. See **BRAKE CALIPERS FRONT, REPLACING** or **BRAKE CALIPERS REAR, REPLACING** .

FAULT-TRACING INFORMATION

Condition

- No diagnostic trouble codes (DTCs) stored.
- The fault is permanent.

Possible Source

- Defective brake caliper.

CHECKING BRAKE CALIPER MOUNTING

CHECKING BRAKE CALIPER MOUNTING

CHECKING BRAKE CALIPER MOUNTING

- Check that all brake calipers are properly mounted. Tighten if necessary.

FAULT-TRACING INFORMATION

Condition

- No diagnostic trouble codes (DTCs) stored.
- The fault is permanent.

Possible Source

- Loose brake caliper.

CHECKING BRAKE DISC

CHECKING BRAKE DISCS

CHECKING BRAKE DISCS

- Check discs and turn or replace. See **BRAKE DISC FRONT, REPLACING** or **BRAKE DISC REAR, REPLACING** as necessary.

FAULT-TRACING INFORMATION

Condition

Fig. 2: Identifying Brake Caliper Mounting Bolt
Courtesy of VOLVO CARS CORPORATION

- No diagnostic trouble codes (DTCs) stored.
- The fault is permanent.

Possible Source

- Faulty brake disc.

CHECKING BRAKE DISC LATERAL RUNOUT

CHECKING THE BRAKE DISC LATERAL RUNOUT

CHECKING THE BRAKE DISC LATERAL RUNOUT

- Check the brake discs. See **BRAKE DISC FRONT, CALIBRATING** and, see **BRAKE DISC REAR, CALIBRATING**
- If necessary turn on a lathe or replace brake disc. See **BRAKE DISC FRONT, REPLACING** or **BRAKE DISC REAR, REPLACING** .

Fig. 3: Identifying Brake Caliper Mounting Bolt
Courtesy of VOLVO CARS CORPORATION

BRAKE DISC FRONT, CALIBRATING

- see **BRAKE DISC FRONT, CALIBRATING** .

FAULT-TRACING INFORMATION

Condition

- No diagnostic trouble codes (DTCs) stored.
- The fault is permanent.

Possible Source

- Vibrations from brake pedal (caused by variations in brake disc thickness).

CHECKING BRAKE FAILURE WARNING LAMP

CHECKING BRAKE FAILURE WARNING LAMP

CHECKING BRAKE FLUID LEVEL

Check brake fluid level is not too low. Brake fluid reservoir should be full.

If the brake fluid level is low, check that there are no brake fluid leaks in the hydraulic brake system.

Remedy as necessary.

- Top up brake fluid.
- Start engine and check that the brake failure warning lamp goes out.

Fig. 4: Identifying Brake Fluid Reservoir
Courtesy of VOLVO CARS CORPORATION

FAULT-TRACING INFORMATION

Condition

- No diagnostic trouble codes (DTCs) stored.
- The fault is permanent.

Condition

- Low brake fluid level.
- Signal cable short-circuited to ground.
- Defective brake fluid level switch.
- Defective combined sensor.
- Faulty charging system.

WARNING: **If light comes on while driving or when braking, the brake fluid level is too low and the fault must be remedied before driving the car any further.**

CHECKING BRAKE FLUID LEVEL

CHECKING BRAKE FLUID LEVEL

CHECKING BRAKE FLUID LEVEL

- Check for leakage, top up and bleed the system, see **BRAKE SYSTEM, BLEEDING (USING BLEEDING UNIT)** .

Fig. 5: Identifying Brake Hydraulic System
Courtesy of VOLVO CARS CORPORATION

FAULT-TRACING INFORMATION

Condition

- No diagnostic trouble codes (DTCs) stored.
- The fault is permanent.

Possible Source

- Low brake fluid level.

CHECKING BRAKE LIGHT SWITCH ADJUSTMENT (2003-2004)

CHECKING BRAKE LIGHT SWITCH ADJUSTMENT

CHECKING BRAKE LIGHT SWITCH ADJUSTMENT

Fig. 6: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- VIDA (scan tool) connected to the vehicle.
- Start the engine.

  Activate readout of components by clicking on the symbol for VCT2000.

  Slowly press down the brake pedal.

  Check the pedal position sensor's value when the brake light switch status changes from **Off** to **On** .

  The pedal position sensor shall have a value of at least 0.8 mm when the brake light switch status changes from **Off** to **On** .

  If the pedal position sensor's value is below the value given above, the brake light switch shall be

readjusted.

Other information

- To adjust the brake light switch: **STOP LAMP SWITCH, REPLACING** .

CHECKING BRAKE LIGHT SWITCH ADJUSTMENT (B6324S; 2007-2010)

CHECKING BRAKE LIGHT SWITCH ADJUSTMENT

CHECKING BRAKE LIGHT SWITCH ADJUSTMENT

Fig. 8: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- VIDA connected to the vehicle.
- Start the engine.

  Activate readout of components by clicking on the symbol for VCT2000.

  Slowly press down the brake pedal.

  Check the pedal position sensor's value when the brake light switch status switches from **Nor activated** to **Activated** .

The pedal position sensor must have a value of at least 0.8 mm when the stop lamp switch status shifts from **Not activated** to **Activated** .

If the pedal position sensor's value is below the value given above, the brake light switch shall be readjusted.

Other information

- see **STOP LAMP SWITCH, ADJUSTMENT**

Fig. 9: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

STOP LAMP SWITCH, ADJUSTMENT

Fig. 10: Identifying Stop Lamp Switch, Adjustment
Courtesy of VOLVO CARS CORPORATION

Ignition off.

Remove the panel under the dashboard on the driver's side.

Depress the brake pedal.

Press the stop (brake) lamp switch, from the side of the connector A, completely forwards.

NOTE: A number of clicks should be heard and felt when pressing.

Carefully release the brake pedal.

The stop (brake) lamp switch is now adjusted.

Check the function.

NOTE: The stop lamp must light when the brake pedal is pressed down more than approximately 1 mm.

Reinstall the panel under the dashboard on the driver's side.

CHECKING BRAKE LIGHT SWITCH ADJUSTMENT (B6324S5; 2011-2012)

CHECKING BRAKE LIGHT SWITCH ADJUSTMENT

see **CHECKING BRAKE LIGHT SWITCH ADJUSTMENT**

CHECKING BRAKE LIGHT SWITCH ADJUSTMENT (B8444S; 2005-2011)

see **CHECKING BRAKE LIGHT SWITCH ADJUSTMENT**

CHECKING BRAKE PADS

CHECKING THE BRAKE PADS

CHECKING THE BRAKE PADS

- Measure the thickness of the brake pads. Minimum thickness 3.0 mm
- If necessary, replace the brake pads. See **BRAKE PADS FRONT, REPLACING** or **BRAKE PADS REAR, REPLACING**

Fig. 11: Identifying Brake Caliper & Brake Pads

Courtesy of VOLVO CARS CORPORATION

FAULT-TRACING INFORMATION

Condition

- No diagnostic trouble codes (DTCs) stored.
- The fault is permanent.

Possible Source

- Play in wheel hub.

CHECKING BRAKE PIPES

CHECKING THE BRAKE PIPES

CHECKING THE BRAKE PIPES

- Check that the brake pipes are undamaged and not deformed. If necessary, replace. See **BRAKE PIPE REAR WHEEL, REPLACING** , see **BRAKE PIPE MASTER CYLINDER / ABS UNIT, REPLACING** and **BRAKE PIPE JUNCTION/ABS UNIT, REPLACING** .

Fig. 12: Identifying Brake Hydraulic System
Courtesy of VOLVO CARS CORPORATION

BRAKE PIPE REAR WHEEL, REPLACING

- see **BRAKE PIPE REAR WHEEL, REPLACING** .

BRAKE PIPE HYDRAULIC UNIT / JUNCTION / FRONT WHEEL, REPLACING

FAULT-TRACING INFORMATION

Condition

Fig. 13: Identifying Brake Hydraulic System
Courtesy of VOLVO CARS CORPORATION

- No diagnostic trouble codes (DTCs) stored.
- The fault is permanent.

Possible Source

- Deformed brake pipe.

CHECKING BRAKE SHOES AND BRAKE CABLES

CHECKING BRAKE SHOES AND BRAKE CABLES

CHECKING BRAKE SHOES AND BRAKE CABLES

- Check the adjustment of the brake shoes. If necessary, adjust. See **BRAKE SHOES PARKING BRAKE, REPLACING**
- Check the adjustment of the brake cable. If necessary, adjust. See **PARKING BRAKE CABLE REAR, REPLACING** .

Fig. 14: Brake Pads
Courtesy of VOLVO CARS CORPORATION

BRAKE SHOES PARKING BRAKE, REPLACING

- see **BRAKE SHOES PARKING BRAKE, REPLACING** .

FAULT-TRACING INFORMATION

Condition

- No diagnostic trouble codes (DTCs) stored.
- The fault is permanent.

Possible Source

- Incorrectly adjusted brake shoes or cables.

CHECKING CONTROL MODULE CONNECTION

CHECKING CONTROL MODULE CONNECTION

CHECKING CONTROL MODULE CONNECTION

Fig. 15: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check that control module connector is correctly connected to control module and that connector lock is working.

  Check that control module connector, pins and socket housings are not damaged.

Fig. 16: Brake Control Module
Courtesy of VOLVO CARS CORPORATION

Is the control module correctly connected?

- **YES**

  fault not found

- **NO**

  see **CORRECTIVE ACTION, CONTROL MODULE CONNECTION**

CORRECTIVE ACTION, CONTROL MODULE CONNECTION

Connect control module.

- **Continue**

  see **VERIFICATION**

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 17: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Reconnect connectors, reinstall components.
- Ignition on.

When the ignition is switched on the control module lights the ABS warning lamp. Check that the warning lamp goes out after approximately 2 seconds.

NOTE: The warning lamp will not go out if a fault has been stored in the control module.

Fig. 18: Identifying ABS Control Module And ABS Warning Lamp
Courtesy of VOLVO CARS CORPORATION

Does the ABS warning lamp light and go out shortly afterwards?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  see **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should be diagnosed and remedied. Since this is not the case the fault-tracing process has failed.

Complete the fault-tracing for those fault or try again.

FAULT-TRACING INFORMATION

Condition

Fig. 19: Brake Control Module
Courtesy of VOLVO CARS CORPORATION

- No diagnostic trouble codes (DTCs) stored.
- Normal battery voltage.
- Charging system operating.
- The fault is permanent.

Possible Source

- Control module not/badly connected.

CHECKING DISC BRAKE CALIPER

CHECKING THE BRAKE CALIPERS

CHECKING THE BRAKE CALIPERS

- Check brake calipers for worn seals

- Replace the brake caliper if a seal is worn. See **BRAKE CALIPERS FRONT, REPLACING** or **BRAKE CALIPERS REAR, REPLACING** .

FAULT-TRACING INFORMATION

Condition

- No diagnostic trouble codes (DTCs) stored.
- The fault is permanent.

Possible Source

- Worn seal in brake caliper.

CHECKING FOR AIR IN BRAKE SYSTEM

CHECKING FOR AIR IN BRAKE SYSTEM

CHECKING FOR AIR IN BRAKE SYSTEM

- Bleed brake system according to **BRAKE SYSTEM, BLEEDING (USING BLEEDING UNIT)** .

FAULT-TRACING INFORMATION

Condition

- No diagnostic trouble codes (DTCs) stored.
- The fault is permanent.

Possible Source

- Air in brake system.

CHECKING FOR GREASE OR OIL ON PADS AND DISCS

CHECKING FOR GREASE OR OIL ON PADS AND DISCS

GREASE OR OIL ON PADS AND DISCS

- Replace brake pads. See **BRAKE PADS FRONT, REPLACING** or **BRAKE PADS REAR, REPLACING** and check nearby seals.

FAULT-TRACING INFORMATION

Condition

- No diagnostic trouble codes (DTCs) stored.
- The fault is permanent.

Possible Source

- Grease or oil on pads and discs.

CHECKING FOR MOISTURE ON PADS AND DISCS

CHECKING FOR MOISTURE ON PADS AND DISCS

CHECKING FOR MOISTURE ON PADS AND DISCS

- Brake several times to dry pads.

Fig. 20: Brake Pedal Pressed Several Times To Stop
Courtesy of VOLVO CARS CORPORATION

FAULT-TRACING INFORMATION

Condition

- No diagnostic trouble codes (DTCs) stored.

- The fault is permanent.

Possible Source

- Moisture on pads and discs.

CHECKING FOR UNEVEN TIRE WEAR

CHECKING FOR UNEVEN TIRE WEAR

CHECKING FOR UNEVEN TIRE WEAR

- Check tire wear on all tires.
- If a tire displays uneven tire wear that wheels alignment should be adjusted.

FAULT-TRACING INFORMATION

Condition

- No diagnostic trouble codes (DTCs) stored.
- The fault is permanent.

Possible Source

- Uneven tire wear.

CHECKING FRONT WHEEL ALIGNMENT

CHECKING FRONT WHEEL ALIGNMENT

CHECKING FRONT WHEEL ALIGNMENT

- Check front wheel alignment.
- Adjust if necessary.

FAULT-TRACING INFORMATION

Condition

- No diagnostic trouble codes (DTCs) stored.
- The fault is permanent.

Possible Source

- Front end incorrectly aligned.

CHECKING HOSES

CHECKING HOSES

CHECKING HOSES

- Check hydraulic hoses for leakage.
- If a hose is leaking, replace the hose according to **BRAKE HOSE FRONT, REPLACING** or **BRAKE HOSE REAR, REPLACING** .

Fig. 21: Identifying Brake Hydraulic System
Courtesy of VOLVO CARS CORPORATION

FAULT-TRACING INFORMATION

Condition

Fig. 22: Identifying Brake Hydraulic System
Courtesy of VOLVO CARS CORPORATION

- No diagnostic trouble codes (DTCs) stored.
- The fault is permanent.

Possible Source

- Leaking hose.

CHECKING LEAKAGE IN HYDRAULIC BRAKE SYSTEM

CHECKING LEAKAGE IN HYDRAULIC BRAKE SYSTEM

CHECKING LEAKAGE IN HYDRAULIC BRAKE SYSTEM

- Check hydraulic brake system. Repair and bleed system according to **BRAKE SYSTEM, BLEEDING (USING BLEEDING UNIT)** .

Fig. 23: Identifying Brake Hydraulic System
Courtesy of VOLVO CARS CORPORATION

FAULT-TRACING INFORMATION

Condition

- No diagnostic trouble codes (DTCs) stored.
- The fault is permanent.

Possible Source

- Leakage in hydraulic brake system.

CHECKING PARKING BRAKE CABLE

CHECKING PARKING BRAKE CABLE

CHECKING PARKING BRAKE CABLE

- Check that the mechanical cables are not damaged or sticking. If necessary replace the mechanical cable. See **PARKING BRAKE CABLE REAR, REPLACING** .

Fig. 24: Brake Pads
Courtesy of VOLVO CARS CORPORATION

FAULT-TRACING INFORMATION

Condition

- No diagnostic trouble codes (DTCs) stored.
- The fault is permanent.

Possible Source

- Sticking parking brake cable.

CHECKING PLAY IN WHEEL HUB

CHECKING PLAY IN WHEEL HUB

CHECKING PLAY IN WHEEL HUB

- Check play in wheel hub.
- If play is greater than tolerances, replace wheel hub.

FAULT-TRACING INFORMATION

Condition

- No diagnostic trouble codes (DTCs) stored.
- The fault is permanent.

Possible Source

- Play in wheel hub.

CHECKING POWER BRAKE BOOSTER

CHECKING THE POWER BRAKE BOOSTER

- Check the vacuum and the condition of the power brake booster. See **VACUUM SYSTEM, CHECKING**
- Replace hoses or power brake booster.
  - For XC90 B6xxxx, see **POWER BRAKE BOOSTER, REPLACING**
  - For XC90 B5xxxx, see **POWER BRAKE BOOSTER, REPLACING** .

Fig. 25: Locating Power Brake Booster

Courtesy of VOLVO CARS CORPORATION

FAULT-TRACING INFORMATION

Condition

Fig. 26: Identifying Power Brake Booster
Courtesy of VOLVO CARS CORPORATION

- No diagnostic trouble codes (DTCs) stored.
- The fault is permanent.

Possible Source

- Defective power brake booster.

CHECKING POWER BRAKE BOOSTER CHECK VALVE

CHECKING THE CHECK VALVE FOR THE POWER BRAKE BOOSTER

- Check the function of the check valve. See **VACUUM SYSTEM, CHECKING** . Replace the check valve if the valve is faulty.

Fig. 27: Identifying Power Brake Booster Check Valve
Courtesy of VOLVO CARS CORPORATION

FAULT-TRACING INFORMATION

Condition

Fig. 28: Identifying Power Brake Booster
Courtesy of VOLVO CARS CORPORATION

- No diagnostic trouble codes (DTCs) stored.
- The fault is permanent.

Possible Source

- Defective power brake booster check valve (1).

CHECKING REAR BRAKE DISCS

CHECKING THE REAR BRAKE DISCS

- Check the brake discs. Replace. See **BRAKE DISC REAR, REPLACING**

Fig. 29: Identifying Brake Caliper Mounting Bolt
Courtesy of VOLVO CARS CORPORATION

FAULT-TRACING INFORMATION

Condition

- No diagnostic trouble codes (DTCs) stored.
- The fault is permanent.

Possible Source

- Brake pads in rear brake caliper vibrating.

CHECKING THE GROUND TERMINAL, BRAKE CONTROL MODULE

CHECKING THE GROUND TERMINALS, BRAKE CONTROL MODULE

see **CHECKING THE GROUND TERMINALS, BRAKE CONTROL MODULE**

CHECKING THE POWER SUPPLY, BRAKE CONTROL MODULE

CHECKING THE POWER SUPPLY, BRAKE CONTROL MODULE

CHECKING THE 15-SUPPLY TO THE CONTROL MODULE

Fig. 30: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 31: Disconnecting Control Unit
Courtesy of VOLVO CARS CORPORATION

- The breakout box connected
- Control module disconnected.
- Ignition on.

  Check the 15-supply by measuring the voltage between terminal #4 (#A4) and ground terminals #16 (#A16) and #46 (#A46). The voltmeter should read battery voltage.

  Check that the fuse for the circuit is intact if the voltage is incorrect.

  If the fuse is blown, check the cable between brake control module terminal #4 (#A4) and the fuse. Check for a short-circuit to ground.

If the fuse is intact, check the cable between brake control module terminal #4 (#A4) and the fuse. Check for an open-circuit.

If no fault is found in the cable between brake control module terminal #4 (#A4) and the fuse, check the cable between the fuse and the ignition switch.

Other information

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX, BRAKE CONTROL MODULE (BCM)**

Fig. 32: Breakout Box
Courtesy of VOLVO CARS CORPORATION

Fig. 33: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **OK**

  see **VERIFICATION**

- **NOT OK**

  see **CHECKING THE 30-SUPPLY (VALVES) TO THE CONTROL MODULE**

CHECKING THE 30-SUPPLY (VALVES) TO THE CONTROL MODULE

Fig. 34: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- The breakout box connected
- Ignition on.

  Check the voltage between breakout box terminals #16 and #32 and between terminals #32 and #46. The voltmeter should read battery voltage.

  Check that the fuse for the circuit is intact if the voltage is incorrect.

  If the fuse is blown, check the cable between brake control module terminal #32 (#A32) and the fuse. Check for a short-circuit to ground.

  If the fuse is intact, check the cable between brake control module terminal #32 (#A32) and the fuse. Check for an open-circuit.

Remedy as necessary

Fig. 35: Breakout Box
Courtesy of VOLVO CARS CORPORATION

Fig. 36: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  see **VERIFICATION**

- **NO**

  see **INFORMATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 37: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 38: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reconnect the connectors, reinstall components etc.
- Ignition on.

The ABS warning lamp lights when the ignition is switched on.

Check that the warning lamp goes out after approximately 2 seconds.

NOTE: **The warning lamp will not go out if a fault has been stored in the control module.**

Fig. 39: Identifying ABS Control Module And ABS Warning Lamp
Courtesy of VOLVO CARS CORPORATION

Does the warning lamp go out after 2 seconds?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should be diagnosed and remedied. Since this is not the case the fault-tracing process has failed.

Complete the fault-tracing for those fault or try again.

CHECKING THE VACUUM PUMP

CHECKING THE VACUUM PUMP

FAULT-TRACING INFORMATION

The vacuum pump raises the power brake booster efficiency when the negative pressure of the engine is too low, e. g. when the engine is switched off (ignition on).

Operating difficulties may make the brake pedal stiff.

Reasons for the vacuum pump not working can include:

- Open-circuit, short-circuit in the wiring to the vacuum pump
- Defective vacuum pump switch
- Defective vacuum pump.

Reasons for the vacuum pump operating constantly can include:

- Short-circuit to supply voltage in the cable to the vacuum pump
- Defective vacuum pump switch
- Defective hoses to the vacuum pump.

- **Continue**

  see **CHECK THE FUNCTION OF THE VACUUM PUMP**

CHECK THE FUNCTION OF THE VACUUM PUMP

Fig. 40: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the hoses and connections. Check for leakage
- Before the next corrective action - wait approximately 3 minutes after switching the ignition off (system relay disconnected).

  Pump the brake pedal a few times to that all negative pressure in the power brake booster disappears.

  Check the function of the vacuum pump by pressing the brake pedal with the ignition on. The Vacuum pump should start and run for a few seconds to build up a new vacuum and then stop.

  Select an option:

1. The vacuum pump is functioning normally

   FAULT NOT FOUND: Troubleshooting has been completed.

2. The vacuum pump is operating constantly

   see **CHECKING THE WIRING**

3. The vacuum pump is not operating.

   see **CHECKING THE WIRING**

CHECKING THE WIRING

Fig. 41: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check the fuse for the vacuum pump in the integrated relay/fusebox in the engine compartment. If the fuse is blown, check the cable for power supply between vacuum pump switch terminal #1 and the fuse. Check the cable between vacuum pump switch terminal #2 and vacuum pump connector terminal #1. Check for an open-circuit or short-circuit to ground.

  Check the function of the vacuum pump switch. With the ignition on, connect a temporary cable looped between terminals #1 and #2 on the connector for the switch (vacuum pump side). If the vacuum pump starts, replace the switch.

  If the vacuum pump does not start, measure the resistance to vacuum pump terminals #1 and #2. If there is infinite resistance, there is an open-circuit in the vacuum pump or in the cable between the vacuum pump and the connector. If the resistance is 0 ohms there is a short-circuit in the vacuum pump or in the cable between the vacuum pump and connector.

  Remedy as necessary.

  Other information:

  - see **CHECKING WIRING AND TERMINALS** .

Fig. 42: Identifying 2 Pin Connector
Courtesy of VOLVO CARS CORPORATION

Fig. 43: Identifying Ohm Meter
Courtesy of VOLVO CARS CORPORATION

Fig. 44: Identifying Engine Coolant Temperature (ECT) Sensor And Connector Terminals
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  see **VERIFICATION**

CHECKING THE WIRING

Fig. 45: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check the cable for power supply between the vacuum pump switch terminal #2 and vacuum pump connector terminal #1. Check for a short-circuit to supply voltage.

  HINT: Check the switch for the vacuum pump by measuring the resistance between terminals #1 and #2. The resistance must be infinite.

  Remedy as necessary.

  Other information:

  - see **CHECKING WIRING AND TERMINALS** .

Fig. 46: Identifying 2 Pin Connector
Courtesy of VOLVO CARS CORPORATION

Fig. 47: Identifying Ohm Meter
Courtesy of VOLVO CARS CORPORATION

Fig. 48: Identifying Engine Coolant Temperature (ECT) Sensor And Connector Terminals
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  see **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 49: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Before the next corrective action - wait approximately 3 minutes after switching the ignition off (system relay disconnected).

  Pump the brake pedal a few times to that all negative pressure in the power brake booster disappears.

  Check the function of the vacuum pump by pressing the brake pedal with the ignition on. The Vacuum pump should start and run for a few seconds to build up a new vacuum and then stop.

Is the function correct?

- **YES**

OKAY: Troubleshooting has been completed.

- **NO**

  see **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CHECKING TIRES

CHECKING TIRES

CHECKING TIRES

- The tire should be mounted on the rim with the DOT marking outwards to counteract the taper.
- Reinstall the tire if necessary.

FAULT-TRACING INFORMATION

Condition

- No diagnostic trouble codes (DTCs) stored.
- The fault is permanent.

Possible Source

- Tire not fitted with DOT marking outwards.

REPLACING A DEFECTIVE BRAKE FLUID RESERVOIR

FAULT-TRACING INFORMATION

Condition

- No DTCs.
- Fault is permanent.

Possible Source

- Faulty charging system.

REPLACING A DEFECTIVE BRAKE FLUID RESERVOIR

FAULT TRACING INFORMATION

It is important to observe the following before proceeding:

- All tests for the symptom in question must have been carried out.
- No faults on components, connectors or leads have been found.

Have all tests been carried out without finding any faults?

- **YES**

  see **REPLACING A DEFECTIVE BRAKE FLUID RESERVOIR**

- **NO**

  NO. Perform additional fault tracing to locate fault.

REPLACING A DEFECTIVE BRAKE FLUID RESERVOIR

Try with a new brake fluid reservoir.

Other information

- see **BRAKE FLUID RESERVOIR, REPLACING**

Fig. 50: Identifying Brake Fluid Reservoir
Courtesy of VOLVO CARS CORPORATION

REPLACING A DEFECTIVE MASTER CYLINDER

FAULT-TRACING INFORMATION

Condition

- No diagnostic trouble codes (DTCs) stored.
- The fault is permanent.

Possible Source

- Faulty master cylinder.

REPLACING A DEFECTIVE MASTER CYLINDER

QUESTION

Does the car have a DSTC system?

- **YES**

see **REPLACING A DEFECTIVE MASTER CYLINDER**

- **NO**

  see **REPLACING THE MASTER CYLINDER**

REPLACING THE MASTER CYLINDER

NOTE: All tests must be carried out before the master cylinder is replaced. Select cancel if this is not the case.

- Replace the master cylinder. See **MASTER CYLINDER, REPLACING** .

Fig. 51: Identifying Power Brake Booster Check Valve
Courtesy of VOLVO CARS CORPORATION

REPLACING A DEFECTIVE MASTER CYLINDER

REPLACING THE MASTER CYLINDER

NOTE: All tests must be carried out before the master cylinder is replaced. Select cancel if this is not the case.

- Replace the master cylinder. See **MASTER CYLINDER, REPLACING**

Fig. 52: Identifying Power Brake Booster Check Valve
Courtesy of VOLVO CARS CORPORATION

MASTER CYLINDER, REPLACING

- see **MASTER CYLINDER, REPLACING** .

REPLACING DEFECTIVE BRAKE FLUID RESERVOIR

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

REPLACING DEFECTIVE BRAKE FLUID RESERVOIR

FAULT TRACING INFORMATION

It is important to observe the following before proceeding:

- All tests for the symptom in question must have been carried out.
- No faults on components, connectors or leads have been found.

Have all tests been carried out without finding any faults?

- **YES**

  see **REPLACING DEFECTIVE BRAKE FLUID RESERVOIR**

- **NO**

  NO. Continue with fault tracing to determine fault.

REPLACING DEFECTIVE BRAKE FLUID RESERVOIR

Try with a new brake fluid reservoir.

Other information

- see **BRAKE FLUID RESERVOIR, REPLACING**

Fig. 53: Identifying Brake Fluid Reservoir
Courtesy of VOLVO CARS CORPORATION

ANTI-LOCK/TRACTION CONTROL

Brakes

ANTI-LOCK/TRACTION CONTROL

ACTIVE YAW CONTROL SENSOR, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

LOCATION

The active yaw control sensor (AYC) is under the right-hand front seat.

PREPARATORY WORK

Fig. 1: Identifying Front Screws For Seat Rails And Bracket
Courtesy of VOLVO CARS CORPORATION

Remove the Audio module (AUD) see **AUDIO MODULE (AUD), REPLACING** .

Remove the panels over the front screws for the seat rails (pull straight up).

Remove the 2 front screws for the seat rails.

Fold the seat backwards.

Fold away the carpet.

Remove the right-hand screw for the seat bracket. See the illustration.

NOTE: Handle the active yaw control sensor with care as it is sensitive to mechanical damage.

REMOVING THE ACTIVE YAW CONTROL SENSOR

Remove the 2 screws for the bracket (see the illustration).

Disconnect the connector.

Lift the seat bracket. Remove the active yaw control (AYC) sensor.

Replace the sensor assembly together with the bracket.

TIGHTENING TORQUE

For tightening torques, see **TIGHTENING TORQUE** .

INSTALLING THE ACTIVE YAW CONTROL SENSOR

Lift the seat bracket. Install the active yaw control (AYC) sensor.

Install the 2 screws. M6

Connect the connector.

FINISHING WORK

Install:

- The right-hand screw for the seat bracket. M10
- The carpet
- The 2 front screws for the seat rails. M10
- The panels
- Audio module (AUD).

Calibrate using VIDA (Volvo scan tool)

CHECK

Fig. 2: Identifying Warning Light
Courtesy of VOLVO CARS CORPORATION

Turn on the ignition.

The symbol on the dashboard must go out within 5 seconds.

In the event of a fault the symbol is on continuously.

Test drive the car after repair. See **TEST DRIVE FORM (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL) /BRAKE CONTROL MODULE), DESCRIPTION** .

BRAKE PIPE MASTER CYLINDER/ABS UNIT, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

REPLACING THE BRAKE PIPE FOR THE LEFT-HAND FRONT WHEEL / ABS UNIT

PREPARATORY WORK

Disconnect the battery lead. See **BATTERY, DISCONNECTING** .

Fig. 3: Bleeding Brakes
Courtesy of VOLVO CARS CORPORATION

Secure the pedal in the depressed position. Use a pedal jack.

Remove the protective cap from the bleed nipple at the left front wheel.

Install a plastic hose on the nipple.

Open the bleed nipple.

Collect the brake fluid in a container.

Shut the bleed nipple.

REMOVING THE AIR CLEANER (ACL) HOUSING

Fig. 4: Air Cleaner (ACL) Housing
Courtesy of VOLVO CARS CORPORATION

Remove the screws (1) for the intake manifold.

Disconnect the hose clamp (2) for the air hose.

Remove the connector (3) from the mass air flow (MAF) sensor.

Remove the air cleaner (ACL) housing from its mountings. Pull it straight up.

REMOVING THE INTEGRATED RELAY / FUSEBOX

Fig. 5: Identifying Battery Leads, Screws And Nut
Courtesy of VOLVO CARS CORPORATION

Remove:

- the nut for the power cables
- the 2 power cables
- the 2 screws for the mounting.

Fig. 6: Locating Connector And Cable Harness From Fusebox
Courtesy of VOLVO CARS CORPORATION

Open the integrated relay/fusebox. Remove the connector (1).

Disconnect the cable harness from the box (2).

Lift the box out of the mounting and move it to one side.

REMOVING THE LEFT-HAND BRAKE PIPE

Fig. 7: Front Left Brake Pipe
Courtesy of VOLVO CARS CORPORATION

Clean around the brake pipe on the ABS hydraulic modulator. Remove the brake pipe from the ABS hydraulic modulator and the clips.

Blow clean around the brake pipe using compressed air.

Place paper under the ABS hydraulic modulator as protection against brake fluid spillage.

Remove:

- the brake pipe from the ABS hydraulic modulator
- the brake pipe from its clips and holder. Open the holder.

NOTE: Do not damage the ABS line.

Fig. 8: Brake Pipe From Car
Courtesy of VOLVO CARS CORPORATION

Separate the brake pipe and the brake hose at the bracket.

Counterhold the brake hose so that it does not twist.

Remove the brake pipe from the car.

INSTALLING THE BRAKE PIPE FOR THE LEFT-HAND FRONT WHEEL / ABS UNIT

NOTE: **For tightening torques, see: TIGHTENING TORQUE .**

NOTE: **The new brake pipe must be bent into the correct shape when installing.**

This is important otherwise the pipe may be subject to stresses when it is in place.

Tighten the pipe to the brake hose. Tighten. See: **TIGHTENING TORQUE** .

Check that the hose is not twisted.

Install:

- the brake pipe in the ABS hydraulic modulator. Tighten. See: **TIGHTENING TORQUE**
- the pipe in its holder
- the ABS line in its clips on the brake pipe.

INSTALLING THE INTEGRATED RELAY / FUSEBOX

Install the box in its mounting.

Install:

- the cable harness
- the connector
- the 2 M6 screws for the mounting
- the 2 power cables
- the M8 nut to secure the power cables.

INSTALLING THE AIR CLEANER (ACL) HOUSING

Press the air cleaner (ACL) housing into place.

Install the air hoses and connector

FINISHING

Bleed the brake system. See **BRAKE SYSTEM, BLEEDING (USING BLEEDING UNIT)** .

Connect the battery lead.

TESTING THE PRESSURE OF THE BRAKE SYSTEM

Fig. 9: Depressing Brake Pedal As If Braking Suddenly (So That Wheels Would Almost Lock) For 30 Seconds
Courtesy of VOLVO CARS CORPORATION

Depress the brake pedal hard for 30 seconds. Check that no leakage occurs from the brake nipples, hoses and joints.

Remedy any leakage.

Install the wheel. See **INSTALLING WHEELS** .

REPLACING THE BRAKE PIPE FOR THE RIGHT-HAND FRONT WHEEL / ABS UNIT

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATORY WORK

Disconnect the battery lead. See **BATTERY, DISCONNECTING** .

Fig. 10: Bleeding Brakes
Courtesy of VOLVO CARS CORPORATION

Secure the pedal in the depressed position. Use a pedal jack.

Remove the protective cap from the bleed nipple at the left front wheel.

Install a plastic hose on the nipple.

Open the bleed nipple.

Collect the brake fluid in a container.

Shut the bleed nipple.

REMOVING THE AIR CLEANER (ACL) HOUSING

Fig. 11: Air Cleaner (ACL) Housing
Courtesy of VOLVO CARS CORPORATION

Remove the screws (1) for the intake manifold.

Disconnect the hose clamp (2) for the air hose.

Remove the connector (3) from the mass air flow (MAF) sensor.

Remove the air cleaner (ACL) housing from its mountings. Pull it straight up.

REMOVING THE INTEGRATED RELAY / FUSEBOX

Fig. 12: Identifying Battery Leads, Screws And Nut
Courtesy of VOLVO CARS CORPORATION

Remove:

- the nut for the power cables
- the 2 power cables
- the 2 screws for the mounting.

Fig. 13: Locating Connector And Cable Harness From Fusebox
Courtesy of VOLVO CARS CORPORATION

Open the integrated relay/fusebox. Remove the connector (1).

Disconnect the cable harness from the box (2).

Lift the box out of the mounting and move it to one side.

REMOVING THE BRAKE PIPE FOR THE RIGHT-HAND FRONT WHEEL / ABS UNIT

Fig. 14: Front Right Brake Pipe
Courtesy of VOLVO CARS CORPORATION

Clean around the brake pipe on the ABS hydraulic modulator. Remove the brake pipe from the ABS hydraulic modulator and holder.

Fig. 15: Brake Pipe Removal Procedure
Courtesy of VOLVO CARS CORPORATION

Raise the car. Remove:

- the screws for the front cross member (1)
- the pipe from the bracket, left-hand side (2)
- the cross member.

Remove the brake pipe from its clips.

Separate the brake pipe and brake hose at the bracket (3).

Counterhold the brake hose so that it does not twist.

Remove the brake pipe from the car.

INSTALLING THE BRAKE PIPE FOR THE RIGHT-HAND FRONT WHEEL / ABS UNIT

NOTE: For tightening torques, see: TIGHTENING TORQUE .

Fig. 16: Brake Pipe Removal Procedure
Courtesy of VOLVO CARS CORPORATION

NOTE: **The new brake pipe must be bent into the correct shape when installing.**

This is important otherwise the pipe may be subject to stresses when it is in place.

Install:

- the brake pipe between the ABS hydraulic modulator and the bracket, left-hand side (1)
- the brake pipe in its clips in the front cross member (2)
- the front cross member. Use the M6 screws.

Tighten the cross member. Tighten. See: **TIGHTENING TORQUE** .

Install the ABS line in its clips.

Lower the car.

Tighten the brake pipe. Tighten. See: **TIGHTENING TORQUE** .

Fig. 17: Front Right Brake Pipe
Courtesy of VOLVO CARS CORPORATION

Install the brake pipe in the ABS hydraulic modulator.

Tighten. See: **TIGHTENING TORQUE** .

INSTALLING THE INTEGRATED RELAY / FUSEBOX

Install the box in its mounting.

Install:

- the cable harness
- the connector
- the 2 M6 screws for the mounting
- the 2 power cables
- the M8 nut to secure the power cables.

INSTALLING THE AIR CLEANER (ACL) HOUSING

Press the air cleaner (ACL) housing into place.

Install the air hoses and connector

FINISHING

Bleed the brake system. See **BRAKE SYSTEM, BLEEDING (USING BLEEDING UNIT)** .

Connect the battery lead.

TESTING THE PRESSURE OF THE BRAKE SYSTEM

Fig. 18: Depressing Brake Pedal As If Braking Suddenly (So That Wheels Would Almost Lock) For 30 Seconds
Courtesy of VOLVO CARS CORPORATION

Depress the brake pedal hard for 30 seconds. Check that no leakage occurs from the brake nipples, hoses and joints.

Remedy any leakage.

Install the wheel. See **INSTALLING WHEELS** .

CONTROL MODULE, PREPARATIONS FOR REPLACEMENT

REMOVE THE AIR CLEANER (ACL) HOUSING

See **REMOVE THE AIR CLEANER (ACL) HOUSING** .

REMOVE THE INTEGRATED RELAY / FUSEBOX. REMOVE THE CONNECTOR FOR THE ABS UNIT

See **REMOVING THE INTEGRATED RELAY / FUSEBOX**.

WHEEL SENSOR FRONT, REPLACING

NOTE: The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATORY WORK

Raise the vehicle. Remove the front wheels.

REPLACEMENT

ABS SENSOR FRONT, REPLACING

NOTE: The work must be carried out on both sides unless otherwise indicated in the heading.

Fig. 19: Identifying Wheel Speed Sensor Cable
Courtesy of VOLVO CARS CORPORATION

Clean the sensor seat using a soft brush. Blow clean.

Remove:

- the screw for the sensor
- the cable from the brackets and the clip.

Fig. 20: Taping Connector For New Sensor To Old Sensor
Courtesy of VOLVO CARS CORPORATION

Tape the connector for the new sensor to the old sensor.

Lower the car.

REMOVING THE CABLE DUCT, RIGHT-HAND SIDE

Fig. 21: Identifying Cable Duct At Torque Rod Bracket
Courtesy of VOLVO CARS CORPORATION

Disconnect the connector for the sensor.

Disconnect the cable duct from the torque rod bracket by carefully prying it off.

REPLACING SENSOR CABLE, RIGHT-HAND SIDE

Fig. 22: Securing New Sensor Cable Inside Cable Duct Using New Tie Strap
Courtesy of VOLVO CARS CORPORATION

Pull up the sensor together with the cable duct so that the new sensor connector can be connected.

Remove:

- the tape. Connect the connector
- the old sensor cable from the cable duct.

Install:

- the new sensor cable in the cable duct. Use a new tie strap
- the cable duct on the torque rod bracket.

REMOVING THE AIR CLEANER (ACL) HOUSING, LEFT-HAND SIDE

Fig. 23: Air Cleaner (ACL) Housing
Courtesy of VOLVO CARS CORPORATION

Remove the air cleaner (ACL) housing.

Remove:

- the 2 screws (1)
- the inlet hose
- the hose clamp (2)
- the connector (3)
- the tie strap for the cable.

Remove the turbocharger (TC) control valve from the air cleaner (ACL) housing

Remove:

- the plastic nut on the wheel arch side
- the air cleaner (ACL) housing.

REPLACING SENSOR CABLE, LEFT-HAND SIDE

Fig. 24: Identifying Wheel Speed Sensor Cable
Courtesy of VOLVO CARS CORPORATION

Insert a hand under the fuse box. Disconnect the cable from the clips on the brake cable.

Pull up the sensor until the connector for the new cable is up.

Remove the tape and connect the connector.

Install the cable in the clips on the brake cable.

CAUTION: The yellow markings on the cables must be in the clip.

Raise the car.

INSTALLATION

NOTE: For tightening torques, see: TIGHTENING TORQUE .

INSTALLING THE SENSOR AND THE CABLE

Fig. 25: Identifying Wheel Speed Sensor Cable
Courtesy of VOLVO CARS CORPORATION

Install:

- the cable in the clip and the brackets
- the sensor in the wheel spindle. Tighten. See: **TIGHTENING TORQUE** .

FITTING THE WHEEL

Install the wheels. See: **INSTALLING WHEELS** .

INSTALLING THE AIR CLEANER (ACL) HOUSING

Fig. 26: Air Cleaner (ACL) Housing
Courtesy of VOLVO CARS CORPORATION

Install the air cleaner (ACL) housing. Check that the hoses are not trapped under the air cleaner (ACL) housing.

Install:

- the plastic nut on the wheel arch side
- the inlet hose using the hose clamp (2)
- the connector (3)
- the cable using the new cable tie to the air cleaner (ACL) housing
- the turbocharger (TC) control valve on the air cleaner (ACL) housing
- the inlet hose with the 2 screws (1).

FINISHING

FUNCTION TESTING AFTER REPLACEMENT

Read off any diagnostic trouble codes (DTCs).

Erase diagnostic trouble codes (DTCs).

Ignition off.

Start the engine. Check that the stop (brake) warning lamp does not light. If the stop (brake) warning lamp lights, the car must not be driven.

TEST DRIVING

Test drive the vehicle. See: **TEST DRIVE FORM (ABS), DESCRIPTION** .

WHEEL SENSOR REAR, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATION

Remove:

- the outer rear seats. See **UPHOLSTERY SEAT CUSHION OUTER (SECOND ROW), REPLACING**
- the center rear seats. See **UPHOLSTERY SEAT CUSHION CENTER (SECOND ROW), REPLACING** .

Fig. 27: Identifying Carpet And Insulation Blocks
Courtesy of VOLVO CARS CORPORATION

Fold the carpet back (1).

Remove:

- the insulation block (2)
- the insulation block (3).

APPLIES ONLY WHEN REPLACING THE SENSOR ON THE LEFT-HAND SIDE

Fig. 28: Raising Rear Edge Of Seat Frame Approximately 25mm And Positioning Block Between Frame And Transmission Tunnel
Courtesy of VOLVO CARS CORPORATION

Remove:

- the 8 seat frame screws (1)
- the 8 seat frame screws (2).

Raise the rear edge of the seat frame approximately 25 mm. Position a block between the frame and the transmission tunnel.

REMOVING THE CAP OVER THE LEVEL SENSOR

Fig. 29: Identifying Cover, Fuel Level Sensor, And Connector
Courtesy of VOLVO CARS CORPORATION

Remove the cover (1) to replace the right-hand sensor and (2) to replace the left-hand sensor.

REMOVING SENSOR

Fig. 30: Locating Wheel Sensor
Courtesy of VOLVO CARS CORPORATION

Disconnect the connector for the relevant sensor.

Tie a section of cable or wire onto the connector. Pull the cable harness from underneath between the tank and bodywork.

Detach the cable harness from the tank.

Remove the cable/wire from the connector.

NOTE: Blow clean around the sensor using compressed air before removing.

Remove the mounting screws for the sensor. Pull out the sensor.

Disconnect the cable harness from the clips on the brake hose.

Remove the cable harness and sensor.

INSTALLING SENSOR

Clean around the sensor seat so that when installed the sensor will be in the correct position against the pulse

wheel. Use a soft brush.

Install:

- the wheel sensor (**10 Nm**)
- the wheel sensor wiring in the clip on the brake hose and on the tank.

Secure the new connector to the loose cable/wire.

Pull up the sensor connector between the fuel tank and the body.

Disconnect the cable / wire from the connector.

Install the cover over the level sensor. Tighten the nuts.

Connect the wiring and the connectors.

APPLIES ONLY WHEN REPLACING THE LEFT-HAND SENSOR

Remove the block from under the seat frame.

Install:

- the 8 seat frame screws. Tighten to **50 Nm**
- the 2 seat frame screws. Tighten to **24 Nm** .

FINISHING

Fold the carpet down.

Install:

- the center rear seat. See **UPHOLSTERY BACKREST CUSHION CENTER (SECOND ROW), REPLACING**
- the outer rear seat. See **UPHOLSTERY BACKREST CUSHION OUTER (SECOND ROW)** .

Install the wheels. See **INSTALLING WHEELS** .

FUNCTION TEST

Check the function. See **WHEEL SENSOR FRONT, REPLACING**.

BRAKES

Brakes

BRAKES

CONNECT THE BLEEDING UNIT

Fig. 1: Bleeding Unit Connected to Brake Fluid Reservoir
Courtesy of VOLVO CARS CORPORATION

Connect the bleeding unit to the brake fluid reservoir. Follow the manufacturer's instructions for connecting and using bleeding unit.

Pressurize the brake system. Check the connection to the brake fluid reservoir.

Depressurize the system after the check.

Raise the car and remove the wheels

PARKING BRAKE CABLE FRONT, REPLACING

NOTE: The illustrations in this service information are used for different model years

and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

REMOVAL

REMOVING THE CENTER CONSOLE

Remove the center console. See: **CENTER CONSOLE, REPLACING**

REMOVING THE FRONT BRAKE CABLE

Fig. 2: Identifying Power Distributor And Brake Cables
Courtesy of VOLVO CARS CORPORATION

Unhook the power distributor for the front brake cable from the two rear brake cables. Remove the clips for the mechanical cable casing using long nose pliers. Lift the cable from the bracket.

Fig. 3: View Of Cable In Pulley
Courtesy of VOLVO CARS CORPORATION

Remove:

- the cable from the cable pulley in the pedal
- the outer casing for the cable from the pedal using round-nose pliers.

REMOVING THE ACCELERATOR PEDAL (AP)

Fig. 4: Accelerator Pedal
Courtesy of VOLVO CARS CORPORATION

Slacken off and remove the lower screw for the accelerator pedal (AP). Slacken off the two upper screws.

Lift the accelerator pedal (AP). Pull the mechanical cable downwards so that it comes out from the underside of the mounting plate for the accelerator pedal (AP).

Pull the mechanical cable backwards at the tunnel. Ensure that the clip for the outer casing at the pedal end does not catch at the accelerator pedal/heater.

INSTALLATION

INSTALLING THE FRONT BRAKE CABLE

For tightening torques, see **TIGHTENING TORQUE** .

Pull the mechanical cable into the center of the tunnel above the insulation.

NOTE: The mechanical cable for the parking brake pedal must be installed before the power distributor at the tunnel.

INSTALLING THE ACCELERATOR PEDAL (AP)

Install:

- the lower screw for the accelerator pedal (AP)
- tighten the 3 M6 screws for the accelerator pedal (AP). The mechanical cable must be underneath the mounting plate for the accelerator pedal (AP) so that the 2 pieces of tape on the mechanical cable are hidden by the mounting.

INSTALLING THE CABLE FOR THE PARKING BRAKE PEDAL

Fig. 5: View Of Cable In Pulley
Courtesy of VOLVO CARS CORPORATION

Press the cable into place in the pedal.

Install the cylindrical steel end piece for the cable in the cable pulley in the pedal.

INSTALLING THE BRAKE CABLE IN THE CENTER CONSOLE

Install the casing for the cable in the bracket.

Hook the power distributor for the front brake cable into place in the two rear brake cables.

INSTALLING THE PARKING BRAKE PEDAL

Install the parking brake pedal. See: **PARKING BRAKE SELF-ADJUSTMENT, RESETTING** .

NOTE: Activate the parking brake firmly for 10 minutes.

INSTALLING THE CENTER CONSOLE

Install the center console. See: **CENTER CONSOLE, REPLACING** .

PEDAL SENSOR, POWER BRAKE BOOSTER, REPLACING

NOTE: The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATORY WORK

Ignition off.

Press the brake pedal a few times until the pedal becomes stiff and rises slightly. This releases the vacuum in the brake servo and thus prevents the O-ring from being sucked in when the pedal position sensor is removed.

REMOVAL

REMOVING PEDAL POSITION SENSOR

Fig. 6: Identifying Pedal Position Sensor Assembly
Courtesy of VOLVO CARS CORPORATION

Slacken off the snap ring around the mounting on the sensor slightly. Insert a narrow screwdriver or wedge. Press one end of the snap ring in approximately 10 mm. Press radially backwards in the groove in the snap ring.

Pull out the sensor slightly and disconnect the connector. Remove the sensor and the O-ring.

INSTALLATION

INSTALLING PEDAL POSITION SENSOR

Fig. 7: Identifying Pedal Position Sensor Assembly
Courtesy of VOLVO CARS CORPORATION

Install:

- The O-ring on the sensor
- the sensor for the brake servo so that the locking lug goes into position. Press the snap ring into its original position if necessary.

Gently pull the sensor. Check that the sensor is secure.

Connect the connector.

PRESSURE SENSOR, MASTER CYLINDER, REPLACING

REMOVAL

PREPARATIONS FOR CHECKING THE PRESSURE SENSOR

Fig. 8: DSTC Warning Lamp
Courtesy of VOLVO CARS CORPORATION

Turn on the ignition.

Press the dynamic stability and traction control (DSTC) button on the dashboard (the green lamp lights in the button) so that the DSTC system is engaged.

CHECKING PRESSURE SENSOR

Fig. 9: Checking Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

Fig. 10: Identifying Warning Light
Courtesy of VOLVO CARS CORPORATION

This check assumes that other faults that were diagnosed in the system have been rectified.

Switch off the ignition.

Disconnect one connector from one of the sensors.

Take out a new sensor.

Install the connector on the new sensor.

Switch on the ignition. Check whether the symbol on the dashboard lights or not.

If the symbol does not light the fault was in the old sensor. Test with the other sensor if the symbol lights.

NOTE: Reconnect the connector to the sensor after each test (the connectors should not be mixed up.)

Replacing the pressure sensor. See **PREPARATIONS BEFORE REPLACING THE PRESSURE SENSOR**

PREPARATIONS BEFORE REPLACING THE PRESSURE SENSOR

Fig. 11: Identifying Pedal Secured In Depressed Position Using Pedal Jack
Courtesy of VOLVO CARS CORPORATION

Apply the brake pedal lightly using a pedal jack.

Position paper under the master cylinder (to collect any brake fluid spillage).

Disconnect the connector from the pressure sensor.

REPLACING THE PRESSURE SENSOR

Fig. 12: Removing/Installing Pressure Sensor Using An Extended Socket
Courtesy of VOLVO CARS CORPORATION

Remove the pressure sensor using an extended socket.

INSTALLATION

INSTALLING THE PRESSURE SENSOR

Fig. 13: Removing/Installing Pressure Sensor Using An Extended Socket
Courtesy of VOLVO CARS CORPORATION

Install the pressure sensor.

Tighten to 25 Nm.

Connect the connector.

Remove the pedal jack.

CHECKING THE PRESSURE SENSORS VISUALLY

Fig. 14: Identifying Warning Light
Courtesy of VOLVO CARS CORPORATION

Switch on the ignition. Wait for 5 seconds. The symbol on the dashboard should go out.

BLEEDING THE BRAKE SYSTEM

With the bleeding unit. See **BRAKE SYSTEM, BLEEDING (USING BLEEDING UNIT)**

Without the bleeding unit. See **BRAKE SYSTEM BLEEDING**

AIRING

Bleed the circuit that the pressure sensor is on.

If both the pressure sensors have been replaced, bleed the whole system.

CHECKING THE BRAKES

see **BRAKE DISC FRONT, CALIBRATING** and **BRAKE DISC REAR, CALIBRATING**

RELAY BOX - AIR CLEANER (ACL) HOUSING

see **INSTALL THE INTEGRATED RELAY / FUSEBOX**

AIR CLEANER (ACL)

see **INSTALL THE AIR CLEANER (ACL) HOUSING**

VACUUM SYSTEM, CHECKING

PREPARATION

DISCONNECT THE BATTERY LEAD

See **BATTERY, DISCONNECTING** .

PREPARATIONS FOR CHECKING THE CHECK VALVE

Fig. 15: Identifying Engine Stabilizer Brace And Mounting Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the mounting screws for the torque rod
- the screw and nut for the engine mounting in the torque rod
- the torque rod.

CHECK THE VACUUM HOSE

Fig. 16: Vacuum Hose Connections At Manifold And Check Valve
Courtesy of VOLVO CARS CORPORATION

Check:

- the vacuum hose connections at the manifold and the check valve
- that the vacuum hose is not crimped or rubbing anywhere
- that the vacuum hose inner weave has not broken and blocked the through flow.

Disconnect the hose. Start the engine. Check the vacuum.

CHECK THE CHECK VALVE

Fig. 17: Checking Function Of Check Valve
Courtesy of VOLVO CARS CORPORATION

Check the function of the check valve.

Start the engine.

Remove the check valve from the power brake booster.

Check that there is a vacuum. Feel the check valve.

Reinstall the check valve.

Press the vacuum hose. Listen for a leak. Replace the rubber bushing if there is a leak.

Switch off the engine.

NOTE: Replace a defective check valve .

Check the function after replacing the check valve

Depress the brake pedal several times to so that it has no travel.

Hold the pedal down. Start the engine. The pedal should travel and feel softer.

Release the brake. switch off the engine. Wait 1 minute. Then depress the pedal. The pedal should still feel soft but should become stiffer when it is depressed several times.

REPLACING THE VACUUM HOSE

REMOVE THE AIR CLEANER (ACL) HOUSING

See **BRAKE PIPE MASTER CYLINDER/ABS UNIT, REPLACING** .

REMOVE THE CHECK VALVE FROM THE POWER BRAKE BOOSTER. REMOVE THE VACUUM HOSE

Fig. 18: Removing Check Valve From Power Brake Booster
Courtesy of VOLVO CARS CORPORATION

Pull out the check valve.

Remove the hose from the intake manifold.

Pull the hose forwards between the bracket for the ABS hydraulic modulator and the side member.

Replace the part of the hose which is damaged.

Transfer the check valve to the new hose section.

INSTALL THE VACUUM HOSE

Fig. 19: Installing Vacuum Hose
Courtesy of VOLVO CARS CORPORATION

Install:

- the hose with the check valve behind the bracket for the ABS hydraulic modulator
- the check valve in the power brake booster
- the hose to the intake manifold.

INSTALL THE TORQUE ROD

Fig. 20: Identifying Engine Stabilizer Brace And Mounting Screws
Courtesy of VOLVO CARS CORPORATION

Install:

- the torque rod. Tighten the mounting screws. Tighten to **50 Nm**
- the screw and a new nut for the engine mounting. Tighten to **80 Nm** .

CHECK THE POWER BRAKE BOOSTER

Fig. 21: Checking Power Brake Booster
Courtesy of VOLVO CARS CORPORATION

Check if there is a vacuum to the power brake booster. Do this by removing the hose from the check valve.

Depress the brake pedal several times to so that it has no travel.

Hold the pedal down. Start the engine. The pedal should travel and feel softer.

Release the brake. switch off the engine. Wait 1 minute. Then depress the pedal. The pedal should still feel soft but should become stiffer when it is depressed several times.

Replace the power brake booster if the pedal feels hard and unresponsive when the engine is idling.

To replace the power brake booster:

- For B6xxxx engine, see **POWER BRAKE BOOSTER, REPLACING**
- For B5xxxx engine, see **POWER BRAKE BOOSTER, REPLACING** .

BRAKES

General - General Safety Information

HEALTH AND SAFETY INSTRUCTIONS (2007-2012)

SAFETY INFORMATION BRAKE SYSTEM

WARNING: Brake fluid contains polyglycol ethers and polyglycols.

WARNING: Avoid contact with the eyes.

If the brake fluid comes into contact with the eyes, rinse the eyes with cold running water for 15 minutes. Seek medical attention if the irritation persists.

Wash your hands thoroughly after handling.

WARNING: If swallowed, drink water and induce vomiting.

Seek medical attention immediately.

CAUTION: If the brake fluid is spilt on a painted surface, the surface must be washed with cold water immediately.

BRAKES

General - Specifications, mechanical

TIGHTENING TORQUE

GENERAL TIGHTENING TORQUE

NOTE: Screws coated with a locking fluid or self locking nuts must be replaced with new when reinstalled.

See the table below to find the tightening torques for components not included in the summary.

Nuts and screws which are not self locking can be reused provided that they are in good condition.

Applies to screwed joint with strength class 8.8.	
Thread	Tightening torque (Nm)
M5	5
M6	10
M7	17
M8	24
M10	50
M12	80
M14	130

SUMMARY OF SPECIFIC COMPONENTS AND TIGHTENING TORQUES

NOTE: Screws coated with locking fluid or sealant must always be replaced with new when installing.

Always use **new screws and nuts** when angle tightening. Any exceptions to this rule will be indicated in the method.

Angle-tightening in tight spaces. See **SCREWED JOINT, TORQUE/ANGLE TIGHTENING** .

Brake caliper in wheel spindle not XC90	100 Nm
Brake caliper in steel wheel spindle only XC90 (M14)	1st step, 105 Nm 2nd stage, 60°
Bleed nipple in brake caliper (M10)	9 Nm
Slide pin in brake caliper, wrench size 7 mm	27.5 Nm
Slide pin in brake caliper, wrench size 9 mm, only applies to XC90 USA and CDN	60 Nm
Brake shield front in wheel spindle steel up to and including w918 and XC90 (M8)	20 Nm

Brake shield front in wheel spindle, aluminum not XC90 (M8)	15 Nm
Brake caliper Rear in wheel bearing housing not XC90 (M10)	60 Nm
Brake caliper rear in wheel bearing housing XC90 (M10)	1st step, 35 Nm 2nd stage, 60°
Brake shield rear in wheel bearing housing (M6)	12 Nm
Brake pipe in ABS modulator (M12)	14 Nm
Brake pipe in master cylinder (M12)	14 Nm
Brake pipe in brake hose (M10)	14 Nm
Brake hose in brake caliper (M10)	18 Nm
Brake pipe in joint fitting (M10)	14 Nm
Brake fluid reservoir in master cylinder (M5)	3.5 Nm
Bracket, ABS in hydraulic unit (M6)	8 Nm
Bracket ABS cable in shock absorber front (M5)	6 Nm
Bracket brake cable in sub-frame rear (M8)	20 Nm
Screw control module (BCM)	1.8 Nm
Mounting Brake pedal LHD automatic (M10)	30 Nm
Mounting Brake pedal RHD manual (M10)	35 Nm
Mounting Brake pedal LHD manual (M10)	40 Nm
Vacuum pump bracket in front cross member, only XC90 (M6)	8 Nm
Heat deflector plate in activation unit, RHD only (M8)	10 Nm

BRAKES

Hydraulic-Vacuum-Hydraulic Brakes - Removal, replacement and installation

BRAKE CONTROLS (2003-2012)

BUSHING, BRAKE PEDAL, REPLACING

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATORY WORK

Remove the brake lamp switch. See: **STOP LAMP SWITCH, REPLACING** .

REMOVAL

REMOVING THE STEERING COLUMN FROM THE LOWER STEERING SHAFT JOINT

Fig. 1: Identifying Lower Steering Shaft Joint
Courtesy of VOLVO CARS CORPORATION

Fold the floor carpet out of the way.

Bend up the outer section of the steering shaft boot.

Remove the retaining clip around the boot.

Pull the boot up.

Remove:

- the screw for the steering wheel shaft's mounting in the joint, 1 pc.
- the joint from the steering shaft.

NOTE: Remove the ignition key so that the steering wheel lock is activated.

REMOVING THE BRAKE PEDAL

Fig. 2: Identifying Pedal Mounting Screw And Nut
Courtesy of VOLVO CARS CORPORATION

Remove:

- the screw and nut

- the pedal.

REMOVING BUSHINGS

Fig. 3: Brake Pedal Bushings
Courtesy of VOLVO CARS CORPORATION

Press out the spacer sleeve. Pry the old bushings out of the way using a screwdriver.

INSTALLATION

TIGHTENING TORQUE

For tightening torques see: **TIGHTENING TORQUE** .

INSTALLING BUSHINGS

Press in:

- the bushings. Lubricate using grease, part number 1161241-3
- the spacer sleeve.

INSTALLING THE BRAKE PEDAL

Install:

- the pedal
- the nut and the screw, 1 pc. M10.

INSTALLING THE STEERING COLUMN ON THE LOWER STEERING SHAFT JOINT

Install the steering shaft on the lower steering shaft joint.

Install:

- a new screw, 1 pc. M8
- the steering shaft boot and snap ring.

Fold back the carpet.

FINISHING

Fit the brake lamp switch. See : **STOP LAMP SWITCH, REPLACING** .

BUSHING, PUSH ROD, REPLACING

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATORY WORK

Remove the brake lamp switch. See: **STOP LAMP SWITCH, REPLACING** .

REMOVAL

REMOVING THE BUSHING

Fig. 4: Brake Pedal Push Rod
Courtesy of VOLVO CARS CORPORATION

Remove the small bushing located on the brake pedal.

INSTALLATION

INSTALLING THE BUSHING

Fig. 5: Brake Pedal Push Rod
Courtesy of VOLVO CARS CORPORATION

Lubricate the new bushing with grease, P/N 1161241-3.

Fit the bushing on the brake pedal.

FINISHING

Fit the brake lamp switch. See: **STOP LAMP SWITCH, REPLACING** .

BRAKE PIPES AND CONNECTIONS (2003-2012)

BRAKE HOSE FRONT, REPLACING

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATORY WORK

Fig. 6: Bleeding Brakes
Courtesy of VOLVO CARS CORPORATION

Secure the pedal in the depressed position. Use a pedal jack.

Remove the protective cap from the bleed nipple at the left front wheel. Install a plastic hose on the nipple.

Open the bleed nipple. Collect the brake fluid in a container.

Shut the bleed nipple.

REMOVAL

REMOVE THE BRAKE HOSE

Fig. 7: Brake Pipe And Brake Caliper Hoses
Courtesy of VOLVO CARS CORPORATION

Remove:

- the brake hose from the brake pipe (1)
- the brake hose from the brake caliper (2).

INSTALLATION

INSTALL THE BRAKE HOSE

NOTE: For tightening torques, see: TIGHTENING TORQUE .

Fig. 8: Brake Pipe And Brake Caliper Hoses
Courtesy of VOLVO CARS CORPORATION

Install:

- the brake hose to the caliper (1). Tighten. See: **TIGHTENING TORQUE**
- brake pipe in the hose (2). Tighten. See: **TIGHTENING TORQUE** .

Check the brake hose

Ensure that the brake hose is not twisted. If necessary alter the hose at the other end (brake pipe end).

NOTE: **If the brake hose is twisted it may rub against the tire, rim or wheel arch. This could cause the circuit to fail.**

Top up with brake fluid and bleed the braking system. See: **BRAKE SYSTEM, BLEEDING (USING BLEEDING UNIT)** .

Install the wheel. See: **INSTALLING WHEELS** .

BRAKE HOSE REAR, REPLACING

PREPARATORY WORK

Fig. 9: Bleeding Brakes
Courtesy of VOLVO CARS CORPORATION

Secure the pedal in the depressed position. Use a pedal jack.

Remove the protective cap from the bleed nipple for the left rear wheel.

Install a plastic hose on the nipple. Open the bleed nipple.

Collect the brake fluid in a container.

Shut the bleed nipple.

REMOVAL

REMOVING THE BRAKE HOSE

Fig. 10: Identifying Brake Hose, Bracket And Brake Pipe
Courtesy of VOLVO CARS CORPORATION

Remove:

- the bracket (1) for the brake pipe and brake hose. Pull the bracket backward a little
- the brake pipe (2) from the brake hose
- the brake hose (3) from the brake caliper.

INSTALLATION

INSTALL THE BRAKE HOSE

NOTE: For tightening torques, see: TIGHTENING TORQUE .

Fig. 11: Identifying Brake Hose, Bracket And Brake Pipe
Courtesy of VOLVO CARS CORPORATION

Install:

- the brake hose (1) to the caliper. Tighten. See: **TIGHTENING TORQUE**
- the brake pipe (2) in the hose. Tighten. See: **TIGHTENING TORQUE** . Check that the hose is not twisted
- the bracket (3).

Top up and bleed the braking system. See: **BRAKE SYSTEM, BLEEDING (USING BLEEDING UNIT)** .

Install the wheel. See: **INSTALLING WHEELS** .

BRAKE PIPE JUNCTION/ABS UNIT, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATORY WORK

Disconnect the battery lead. See **BATTERY, DISCONNECTING** .

Fig. 12: Bleeding Brakes
Courtesy of VOLVO CARS CORPORATION

Secure the pedal in the depressed position. Use a pedal jack.

Remove the protective cap from the bleed nipple at the left front wheel.

Install a plastic hose on the nipple. Open the bleed nipple. Collect the brake fluid in a container.

Shut the bleed nipple.

REMOVAL

REMOVING THE AIR CLEANER (ACL) HOUSING

Fig. 13: Air Cleaner (ACL) Housing
Courtesy of VOLVO CARS CORPORATION

Disconnect the hose clamp for the air hose.

Remove all the air hoses and connectors from the air cleaner (ACL) housing.

Remove the air cleaner (ACL) housing from its mountings. Pull it straight up.

REMOVING THE INTEGRATED RELAY / FUSEBOX

Fig. 14: Identifying Battery Leads, Screws And Nut
Courtesy of VOLVO CARS CORPORATION

Remove:

- the nut for the power cables
- the 2 power cables
- the 2 screws for the mounting.

Fig. 15: Locating Connector And Cable Harness From Fusebox
Courtesy of VOLVO CARS CORPORATION

Open the integrated relay/fusebox. Remove the connector (1).

Disconnect the cable harness from the box (2).

Lift the box out of the mounting and move it to one side.

REMOVING THE BRAKE PIPE JUNCTION / ABS UNIT

Fig. 16: Front-Rear Brake Pipe
Courtesy of VOLVO CARS CORPORATION

Clean around the brake pipe on the ABS hydraulic modulator. Remove the brake pipe from the ABS hydraulic modulator and holder.

Fig. 17: Brake Pipe Removal Procedure
Courtesy of VOLVO CARS CORPORATION

Straighten the brake pipe by the ABS hydraulic modulator.

Raise the car.

Remove:

- the left front wheel
- the screw for the bracket for the brake pipe and brake hose
- the holder from the brake pipes.

Clean the brake pipe and joint nipple.

Separate the brake pipe at the joint nipple.

Remove the brake pipe from its clips.

NOTE: Cut the brake pipe at the bracket. Leave the pipe that has been cut in place as a guide for installation of the new brake pipe.

INSTALLATION

INSTALLING THE BRAKE PIPE JUNCTION / ABS UNIT

NOTE: For tightening torques, see: TIGHTENING TORQUE .

NOTE: The new brake pipe must be bent into the correct shape when installing. This is important otherwise the pipe may be subject to stresses when it is in place.

Remove the cut-off brake pipe. Install the new one.

Tighten the brake pipe in the joint nipple. Tighten. See: **TIGHTENING TORQUE** .

Secure the brake pipe in its clips in the body floor.

Bend and adjust the brake pipe so that it aligns with the hydraulic unit.

Fig. 18: Front-Rear Brake Pipe
Courtesy of VOLVO CARS CORPORATION

Install:

- the brake pipe in the ABS hydraulic modulator. Tighten. See: **TIGHTENING TORQUE**
- the brake pipe in its clips at the bracket. Adjust the pipe as necessary
- the clip holder on the brake pipes by the side member

- the bracket. Tighten. See: **TIGHTENING TORQUE** .

NOTE: The brake pipes must not be in contact with each other or the car body.

INSTALLING THE INTEGRATED RELAY / FUSEBOX

Install the box in its mounting.

Install:

- the cable harness
- the connector
- the 2 x M6 screws in the mounting
- the 2 x power cables
- the M8 nut to secure the power cables.

INSTALLING THE AIR CLEANER (ACL) HOUSING

Press the air cleaner (ACL) housing into place.

Install the air hoses and the connector.

FINISHING

Bleed the brake system. See **BRAKE SYSTEM, BLEEDING (USING BLEEDING UNIT)** .

Connect the battery lead.

TESTING THE PRESSURE OF THE BRAKE SYSTEM

Fig. 19: Depressing Brake Pedal As If Braking Suddenly (So That Wheels Would Almost Lock) For 30 Seconds
Courtesy of VOLVO CARS CORPORATION

Depress the brake pedal hard for 30 seconds. Check that no leakage occurs from the brake nipples, hoses and joints.

Remedy any leakage.

Install the wheel. See **INSTALLING WHEELS** .

BRAKE PIPE MASTER CYLINDER / ABS UNIT, REPLACING

To replace the brake pipes for the left-hand front wheel / ABS unit, see **REPLACING THE BRAKE PIPE FOR THE LEFT-HAND FRONT WHEEL / ABS UNIT** .

To replace the brake pipes for the right-hand front wheel / ABS unit, see **REPLACING THE BRAKE PIPE FOR THE RIGHT-HAND FRONT WHEEL / ABS UNIT** .

BRAKE PIPE MASTER CYLINDER/ABS UNIT, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information**

in the illustrations is always correct.

PREPARATION

Disconnect the battery lead. See **BATTERY, DISCONNECTING**

REMOVING THE UPPER TORQUE ROD

Fig. 20: Identifying Engine Stabilizer Brace And Mounting Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the mounting screws for the torque rod
- the screw and nut for the engine mounting and torque rod
- the engine stabilizer brace.

REMOVING THE AIR CLEANER (ACL) HOUSING

Fig. 21: Air Cleaner (ACL) Housing
Courtesy of VOLVO CARS CORPORATION

Remove the screws (1) for the intake manifold.

Disconnect the hose clamp (2) for the air hose.

Remove the connector (3) from the mass air flow (MAF) sensor.

Remove the air cleaner (ACL) housing from its mountings. Pull it straight up.

REMOVING THE INTEGRATED RELAY / FUSEBOX

Fig. 22: Identifying Battery Leads, Screws And Nut
Courtesy of VOLVO CARS CORPORATION

Remove:

- the nut for the power cables
- the 2 power cables
- the 2 screws for the mounting.

Fig. 23: Locating Connector And Cable Harness From Fusebox
Courtesy of VOLVO CARS CORPORATION

Open the integrated relay/fusebox. Remove the connector (1).

Disconnect the cable harness from the box (2).

Lift the box out of the mounting and move it to one side.

REMOVING THE BRAKE PIPES BETWEEN THE MASTER CYLINDER AND ABS UNIT

Fig. 24: Brake Pipe
Courtesy of VOLVO CARS CORPORATION

Clean the brake pipes terminals at the master cylinder and ABS unit.

Place paper under the master cylinder to avoid brake fluid spillage.

Remove the brake pipes from the master cylinder and ABS unit. Install sealing plugs.

INSTALLATION

INSTALLING THE BRAKE PIPES

NOTE: **For tightening torques, see: TIGHTENING TORQUE .**

NOTE: **The new brake pipe must be bent into the correct shape when installing.**

This is important otherwise the pipe may be subject to stresses when it is in place.

Install the brake pipes. Tighten. See: **TIGHTENING TORQUE** .

INSTALLING THE INTEGRATED RELAY / FUSEBOX

Install the box in its mounting.

Install:

- the cable harness
- the connector
- the 2 x M6 screws for the mounting
- the 2 x power cables
- the M8 nut to secure the power cables.

INSTALLING THE AIR CLEANER (ACL) HOUSING

Press the air cleaner (ACL) housing into place.

Install the air hoses and the connector.

INSTALLING THE UPPER TORQUE ROD

Install:

- the engine stabilizer brace
- the M12 screw and nut for the engine mounting
- the 4 x M10 mounting screws for the torque rod.

FINISHING

Fig. 25: Bleeding Brake System
Courtesy of VOLVO CARS CORPORATION

Bleed the brake system. See **BRAKE SYSTEM, BLEEDING (USING BLEEDING UNIT)** .

Check if there is still air in the system by pressing down the brake pedal with a jack at a pressure equivalent to heavy braking, 200 Nm. With the engine off and the brake pedal depressed 3-4 times, the pedal travel must not exceed 40 mm.

If the pedal travel exceeds this limit, bleed again and re-check the pedal travel.

That there is no brake fluid leakage.

Remove the bleed unit connector from the brake fluid reservoir.

Check that the brake fluid level is not above the maximum marking.

Connect the battery lead.

BRAKE PIPE REAR WHEEL, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information**

in the illustrations is always correct.

PREPARATORY WORK

Fig. 26: Bleeding Brakes
Courtesy of VOLVO CARS CORPORATION

Secure the pedal in the depressed position. Use a pedal jack.

Remove the protective cap from the bleed nipple at the left front wheel.

Install a plastic hose on the nipple. Open the bleed nipple.

Collect the brake fluid in a container.

Shut the bleed nipple.

Fig. 27: Identifying Center Member Bearing, Crossmember And Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the screws for the center bearing member
- the screws for the rear cross member.

Slide the rear heat deflector forward over the front heat deflector to expose the right brake pipe.

REMOVAL

REMOVING THE BRAKE PIPE

Fig. 28: Brake Pipe, Clips And Mountings
Courtesy of VOLVO CARS CORPORATION

Remove:

- the brake pipe from the clip
- the brake pipe at the joint.

Remove the screw at the mounting for the fuel filter.

Fold the mounting down.

Fig. 29: Identifying Brake Pipe
Courtesy of VOLVO CARS CORPORATION

Disconnect the brake pipe at the bracket.

Remove the brake pipe.

INSTALLATION

INSTALLING THE BRAKE PIPES

NOTE: For tightening torques, see: TIGHTENING TORQUE .

Fig. 30: Identifying Brake Pipe
Courtesy of VOLVO CARS CORPORATION

NOTE: Seal the ends of the pipe before installing the new brake pipe.

Thread the brake pipe between the bodywork and the fuel lines.

Continue under the parking brake cable and over the muffler down to the other brake pipe.

Remove the seal from the pipe end.

Install:

- the brake pipes. Tighten. See: **TIGHTENING TORQUE**
- the brake pipe and the brake hose in the bracket. Tighten. See: **TIGHTENING TORQUE** .

NOTE: The brake pipe must not be in contact with the car body. The brake hose must not be twisted.

Install:

- fuel filter

- the M8 screw for the fuel filter mounting.

FINISHING

Pull the heat deflector plate to the installation position.

Install:

- the cross member
- the 2 x M8 screws
- the 4 M8 screws for the support for the center bearing.

Remove the pedal jack.

Top up and bleed the braking system. See **BRAKE SYSTEM, BLEEDING (USING BLEEDING UNIT)** .

TESTING THE PRESSURE OF THE BRAKE SYSTEM

Fig. 31: Depressing Brake Pedal As If Braking Suddenly (So That Wheels Would Almost Lock) For 30 Seconds
Courtesy of VOLVO CARS CORPORATION

Depress the brake pedal hard for 30 seconds.

Check that no leakage occurs from the brake nipples, hoses and joints.

Remedy any leakage.

Install the wheel. See **INSTALLING WHEELS** .

REPLACING THE BRAKE PIPE FOR THE LEFT-HAND REAR WHEEL

PREPARATORY WORK

Fig. 32: Bleeding Brakes
Courtesy of VOLVO CARS CORPORATION

Secure the pedal in the depressed position. Use a pedal jack.

Remove the protective cap from the bleed nipple at the left front wheel.

Install a plastic hose on the nipple. Open the bleed nipple.

Collect the brake fluid in a container.

Shut the bleed nipple.

REMOVING THE BRAKE PIPE

Fig. 33: Identifying Brake Pipe
Courtesy of VOLVO CARS CORPORATION

Separate the brake pipe and the brake hose at the bracket.

Fig. 34: Brake Pipe Joint And Clips
Courtesy of VOLVO CARS CORPORATION

Separate the brake pipe at the joint nipple under the car.

Remove the brake pipe from its clips.

Remove the brake pipe.

INSTALLING THE BRAKE PIPES

NOTE: **For tightening torques, see: TIGHTENING TORQUE .**

NOTE: **The new brake pipe must be bent into the correct shape when installing. This is important otherwise the pipe may be subject to stresses when it is in place.**

Install:

- the brake pipes. Tighten. See: **TIGHTENING TORQUE**
- the brake pipe and the brake hose in the bracket. Tighten. See: **TIGHTENING TORQUE** .

Remove the pedal jack.

NOTE: **The brake pipe must not be in contact with the car body. The brake hose must not be twisted.**

FINISHING

Top up and bleed the braking system. See **BRAKE SYSTEM, BLEEDING (USING BLEEDING UNIT)** .

TESTING THE PRESSURE OF THE BRAKE SYSTEM

Fig. 35: Depressing Brake Pedal As If Braking Suddenly (So That Wheels Would Almost Lock) For 30 Seconds
Courtesy of VOLVO CARS CORPORATION

Depress the brake pedal hard for 30 seconds.

Check that no leakage occurs from the brake nipples, hoses and joints.

Remedy any leakage.

Install the wheel. See **INSTALLING WHEELS** .

MASTER CYLINDER, BRAKE BOOSTER (2003-2012)

MASTER CYLINDER, REPLACING

NOTE: The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATORY WORK

Disconnect the battery lead. See: **BATTERY, DISCONNECTING** .

CAUTION: It is important that no contaminants enter the brake system.

Before starting work, clean around the brake fluid reservoir cap and the pipe couplings.

If necessary, also clean the hose connections and the connections between the reservoir and the master cylinder.

CAUTION: Relieve the check valve in the power brake booster; alternatively pump the brake pedal until it has no travel.

This is so that no vacuum remains when the master cylinder is removed. Otherwise there is a risk that the O-ring will be sucked into the brake booster.

HINT: Position paper under the master cylinder to protect the paintwork.

CAUTION: Never, under any circumstances, open the master cylinder. Reassembling it requires special equipment and facilities.

REMOVAL

REMOVING THE TORQUE ROD

Remove the torque rod. See: **BRAKE FLUID RESERVOIR, REPLACING**.

DISCONNECTING THE CONNECTORS

Fig. 36: Brake Fluid Reservoir And Power Brake Booster Connectors
Courtesy of VOLVO CARS CORPORATION

Disconnect the connectors at the brake fluid reservoir and at the power brake booster.

Block the hose to the clutch cylinder. (Applies only to cars with manual transmission).

Use hose pliers.

REMOVING THE BRAKE PIPE

Fig. 37: Brake Pipe
Courtesy of VOLVO CARS CORPORATION

Remove:

- the brake pipes at the master cylinder
- the 2 upper brake pipes on the hydraulic modulator.

Plug the holes on the ABS hydraulic modulator so that that contaminants cannot get into it.

REMOVING THE MASTER CYLINDER

Fig. 38: Identifying Master Cylinder Removal
Courtesy of VOLVO CARS CORPORATION

Remove:

- the 2 nuts
- the master cylinder from the power brake booster
- the hose from the brake fluid reservoir (applies to cars with hydraulic clutch).

INSTALLATION

NOTE: For tightening torques, see: TIGHTENING TORQUE .

INSTALLING THE MASTER CYLINDER

Fig. 39: Identifying Master Cylinder Removal
Courtesy of VOLVO CARS CORPORATION

Transfer the brake fluid reservoir to the new master cylinder.

Check that there is no dirt in the terminals.

Lubricate the O-rings and any hoses with brake fluid or glycerin.

NOTE: **Do not use a soap solution or mineral oil to lubricate the hoses. Use brake fluid or glycerin.**

Install:

- the brake fluid reservoir from directly above -
- the screw on the underneath of the brake fluid reservoir. Tighten. See: **TIGHTENING TORQUE** .

INSTALLING THE BRAKE PIPES

Fig. 40: Brake Pipe
Courtesy of VOLVO CARS CORPORATION

Install the brake pipes on the ABS hydraulic modulator and the master cylinder. Tighten. See: **TIGHTENING TORQUE** .

INSTALLING THE CONNECTORS

Fig. 41: Brake Fluid Reservoir And Power Brake Booster Connectors
Courtesy of VOLVO CARS CORPORATION

Install the connectors on the brake fluid reservoir and the power brake booster.

INSTALLING THE TORQUE ROD

Install the torque rod. See: **BRAKE FLUID RESERVOIR, REPLACING**.

FINISHING

Bleed the brake system. See: **BRAKE SYSTEM, BLEEDING (USING BLEEDING UNIT)** .

Check the air in the brake system. Check for brake fluid leakage. See: **BRAKE PIPE MASTER CYLINDER/ABS UNIT, REPLACING**.

Connect the battery lead. See: **BATTERY, DISCONNECTING** .

PEDAL POSITION SENSOR, REPLACING

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATORY WORK

Fig. 42: Identifying Pedal Position Sensor Assembly
Courtesy of VOLVO CARS CORPORATION

Ignition off.

Press the brake pedal a few times until the pedal becomes stiff and rises slightly. This releases the vacuum in the power brake booster and thus prevents the O-ring from being sucked in when the pedal position sensor is removed.

REMOVAL

REMOVING PEDAL POSITION SENSOR

Fig. 43: Identifying Snap Ring, Sensor Mounting & Narrow Screwdriver
Courtesy of VOLVO CARS CORPORATION

Disconnect the connector from the sensor.

Slacken off the snap ring around the mounting for the sensor slightly. Insert a narrow screwdriver or wedge. Press one end of the snap ring in approximately 10 mm. Press radially backwards in the groove for the snap ring.

Remove the sensor and the O-ring.

INSTALLATION

INSTALLING PEDAL POSITION SENSOR

Fig. 44: Identifying Pedal Position Sensor
Courtesy of VOLVO CARS CORPORATION

NOTE: **Check that the snap ring is in position in the groove. Check that the ends of the snap ring lie against the stop lug.**

Install:

- The O-ring on the sensor
- lubricate the O-ring lightly using a soap solution
- the sensor for the power brake booster so that the locking lug goes into position.

Gently pull the sensor. Check that the sensor is secure.

Check that the snap ring is in position.

Connect the connector to the sensor.

MASTER CYLINDER, BRAKE BOOSTER (B5254T2; 2003-2007)

REPLACING THE VACUUM PUMP

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATORY WORK

Ignition off.

Disconnect the battery negative lead. See: **BATTERY, DISCONNECTING** .

REMOVING THE VACUUM PUMP

Fig. 45: Identifying Vacuum Pump Removal
Courtesy of VOLVO CARS CORPORATION

Remove:

- the hose (1)
- the connector (2).
- the 2 x screws (3)
- the pump.

NOTE: **For tightening torques, see: TIGHTENING TORQUE .**

FITTING OF VACUUM PUMP

Install:

- the pump.
- the 2 M6 screws.
- the hose

- the connector.

FINISHING

Install the battery negative lead. See **BATTERY, DISCONNECTING** .

BRAKE FLUID RESERVOIR, REPLACING

PREPARATORY WORK

Fig. 46: Identifying Pedal Secured In Depressed Position Using Pedal Jack
Courtesy of VOLVO CARS CORPORATION

Switch off the ignition.

Clean around filler cap at the connector between the reservoir and master cylinder and at any hose connector. This is to ensure that no contaminants enter the brake system.

Place paper under the master cylinder. This is to protect the paintwork from damage if brake fluid is spilled.

Secure the pedal in the depressed position. Use a pedal jack.

REMOVAL

REMOVE THE UPPER ENGINE STABILIZER BRACE

Fig. 47: Identifying Engine Stabilizer Brace And Mounting Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the mounting screws for the torque rod
- the screw and nut for the engine mounting and torque rod
- the engine stabilizer brace.

PREPARATIONS FOR REMOVING THE BRAKE FLUID RESERVOIR

Fig. 48: Hose To Clutch Cylinder
Courtesy of VOLVO CARS CORPORATION

Block the hose to the clutch cylinder. **Applies to cars with manual transmissions** .

Pull out the master cylinder

Remove the connector from the brake fluid level sensor.

Remove the mounting nuts from the master cylinder.

Pull out the cylinder slightly.

REMOVE THE BRAKE FLUID RESERVOIR

Fig. 49: Brake Fluid Reservoir From Master Cylinder
Courtesy of VOLVO CARS CORPORATION

Remove:

- the screw on the side of the brake fluid reservoir
- the brake fluid reservoir from the master cylinder. Pull the reservoir straight up
- the hose for the clutch cylinder. Applies to cars with manual transmissions.

CLEANING AND CHECKING

Fig. 50: Checking Brake Fluid Reservoir, Level Switch, Check Valves And Seals
Courtesy of VOLVO CARS CORPORATION

Check the brake fluid reservoir, the level switch, the check valves and seals.

Replace the seals if necessary.

Carefully clean the components that were not replaced. Clean off all contaminants and old brake fluid. Use new brake fluid.

INSTALLATION

INSTALL THE BRAKE FLUID RESERVOIR

NOTE: For tightening torques, see: TIGHTENING TORQUE .

Fig. 51: Brake Fluid Reservoir From Master Cylinder
Courtesy of VOLVO CARS CORPORATION

Check that all connections are free of contaminants.

Lubricate the O-rings and any hoses with brake fluid or glycerin.

NOTE: **Do not use a soap solution or mineral oil to lubricate the hoses. Use brake fluid or glycerin.**

Install:

- the hose for the clutch cylinder. Remove the hose clip
- the brake fluid reservoir from directly above
- the screw on side of the brake fluid reservoir. Tighten. See: **TIGHTENING TORQUE** .

INSTALL THE MASTER CYLINDER

Fig. 52: Hose To Clutch Cylinder
Courtesy of VOLVO CARS CORPORATION

Install:

- the 2 M8 nuts for the master cylinder
- the connector on the brake fluid reservoir.

INSTALL THE UPPER TORQUE ROD

Fig. 53: Identifying Engine Stabilizer Brace And Mounting Screws
Courtesy of VOLVO CARS CORPORATION

Install:

- the torque rod, M10
- the screw and a new nut for the engine mounting, M12.

FINISHING

Fig. 54: Bleeding Brake System
Courtesy of VOLVO CARS CORPORATION

Fill the brake fluid reservoir with new brake fluid. Use Volvo Genuine parts, DOT 4+.

Remove the pedal jack.

Cars with manual transmissions: Bleed the clutch

If necessary:

Bleed the brake system. See **BRAKE SYSTEM, BLEEDING (USING BLEEDING UNIT)** .

see **BRAKE SYSTEM BLEEDING** .

Bleed the system again if the pedal travel is more than 40 mm.

Check for leakage.

The brake fluid level must not be above the maximum mark.

POWER BRAKE BOOSTER, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATION

Fig. 55: Locating Connectors
Courtesy of VOLVO CARS CORPORATION

Remove the master cylinder. See **MASTER CYLINDER, REPLACING**.

Disconnect the connectors from the cable duct.

REMOVING THE ABS UNIT

Fig. 56: Viewing 3 Screws For The Mounting Bracket
Courtesy of VOLVO CARS CORPORATION

Remove the 3 screws for the mounting bracket.

Carefully press the ABS unit to one side.

REMOVING SOUNDPROOFING PANELS
