The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) registers that the switch for the hazard warning signal flashers has been active for more than 1 minute.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- None.

Possible Source

- The switch for the hazard warning signal flasher has jammed in one position
- Damaged switch for the hazard warning signal flasher.

Fault symptom[s]

- The hazard warning signal flashers are not functioning.

ACTIVATED TOO LONG

CHECKING THE CONTROL

The diagnostic trouble code (DTC) is stored when a button or switch has been depressed for a long time.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up or can be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs.

Check that the button or switch does not stick in the activated position.

Remedy as necessary.

Other information

see **SWITCH HAZARD WARNING SIGNAL FLASHER, REPLACING**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-8F06: SWITCH, HAZARD WARNING SIGNAL FLASHERS. SIGNAL MISSING (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-8F06

Condition

Fig. 207: Identifying Switch For Hazard Warning Signal Flasher
Courtesy of VOLVO CARS CORPORATION

The central electronic module (CEM) checks the signal from the hazard warning signal flasher switch.

The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) registers that there is no signal from the switch for the hazard warning signal flasher.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- None.

Possible Source

- Open-circuit in the circuit for the switch for the hazard warning signal flasher.

Fault symptom[s]

- The hazard warning signal flashers are not functioning.

SIGNAL MISSING

CHECKING THE WIRING

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-8F07: SWITCH, HAZARD WARNING SIGNAL FLASHERS. SIGNAL TOO LOW (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-8F07

Condition

Fig. 212: Identifying Switch For Hazard Warning Signal Flasher
Courtesy of VOLVO CARS CORPORATION

The central electronic module (CEM) checks the signal from the hazard warning signal flasher switch.

The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) registers that the signal from the switch for the hazard warning signal flasher is too low.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- If the fault has been detected in 100 ignition cycles, the output is closed permanently until the diagnostic trouble code is erased (applies from structure week 200539).

Possible Source

- Short-circuit to ground in the circuit for the switch for the hazard warning signal flasher
- Overheated switch for the hazard warning signal flasher.

Fault symptom[s]

- The hazard warning signal flashers are not functioning.

SIGNAL TOO LOW

CHECKING THE WIRING

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-8F08: ENGINE CONTROL MODULE (ECM). SIGNAL TOO LOW (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-8F08

Condition

Fig. 217: Identifying Central Electronic Module (CEM)
Courtesy of VOLVO CARS CORPORATION

The central electronic module (CEM) checks the re-engagement signal from the driver circuit to the wake-up

signal for the engine control module (ECM) and to the hazard warning signal flasher. Both functions are controlled by the same driver circuit in the central electronic module (CEM) but can only be re-engaged once.

The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) registers that the wake-up signal to the engine control module (ECM) is too low.

The diagnostic trouble code (DTC) can be detected when the ignition is on and when the lamp in the switch for the hazard warning signal flasher is not lit.

Substitute Value

- If the fault has been detected in 100 ignition cycles, the output is closed permanently until the diagnostic trouble code is erased (applies from structure week 200539).

Possible Source

- Short-circuit to ground in the signal cable for the wake-up signal to the engine control module (ECM).

Fault symptom[s]

- The starter motor turns but the engine does not start.

SIGNAL TOO LOW

CHECKING THE STATUS

Fig. 218: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Read off the status of the waking signal for the engine control module (ECM).

  Change the ignition key position from position I to II.

  Check if the fault is permanent or intermittent.

  The status of the wake-up signal for the engine control module (ECM) must change when changing the ignition key position.

  If the status of the waking signal for the engine control module (ECM) does not change, the fault is permanent.

If the status of the waking signal for the engine control module (ECM) changes, this is an indication that the fault was present previously but that it is not active at the moment, i. e. the fault is intermittent.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-8F09: ENGINE CONTROL MODULE (ECM). SIGNAL TOO HIGH (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-8F09

Condition

Fig. 225: Identifying Central Electronic Module (CEM)
Courtesy of VOLVO CARS CORPORATION

The central electronic module (CEM) checks the re-engagement signal from the driver circuit to the wake-up signal for the engine control module (ECM) and to the hazard warning signal flasher. Both functions are controlled by the same driver circuit in the central electronic module (CEM) but can only be re-engaged once.

The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) registers that the wake-up signal to the engine control module (ECM) is too high.

The diagnostic trouble code (DTC) can be detected when the ignition is on and when the lamp in the switch for the hazard warning signal flasher is not lit.

Substitute Value

- None.

Possible Source

- Open-circuit in the signal cable for the engine control module (ECM).

Fault symptom[s]

- The starter motor turns but the engine does not start.

SIGNAL TOO HIGH

CHECKING THE STATUS

Fig. 226: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Read off the status of the waking signal for the engine control module (ECM).

  Change the ignition key position from position I to II.

Check if the fault is permanent or intermittent.

The status of the wake-up signal for the engine control module (ECM) must change when changing the ignition key position.

If the status of the waking signal for the engine control module (ECM) does not change, the fault is permanent.

If the status of the waking signal for the engine control module (ECM) changes, this is an indication that the fault was present previously but that it is not active at the moment, i. e. the fault is intermittent.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-8F11: CEM HEADLAMP BEAM HEIGHT CONTROL. SIGNAL TOO HIGH (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-8F11

Condition

Fig. 233: Identifying Headlamp Beam Height Control Unit
Courtesy of VOLVO CARS CORPORATION

The central electronic module (CEM) checks the signal for the headlamp beam height control.

The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) detects that the voltage to headlamp beam height control exceeds 90% of the supply voltage.

The diagnostic trouble code (DTC) can be diagnosed at ignition switch position II.

Substitute Value

- If the fault has been detected in 100 ignition cycles, the output is closed permanently until the diagnostic trouble code is erased (applies from structure week 200539).

Possible Source

- Damaged actuator motor for headlamp beam height control
- Short-circuit to supply voltage in signal cable.

Fault symptom[s]

- Incorrect setting for low beam.

SIGNAL TOO HIGH

CHECKING THE WIRING

Fig. 234: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 235: Disconnecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect central electronic module (CEM) connector C.

  Check the signal cable. Check for a short-circuit to supply voltage.

  Take readings between:

  - Central electronic module (CEM) terminal #C12 (#12) and left headlamp alignment motor terminal #2
  - Central electronic module (CEM) terminal #C11 (#11) and right headlamp alignment motor terminal #2.

If no fault was found, replace the actuator motor for headlamp beam height control.

Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-8F11: LIGHT WIDTH CONTROL. SIGNAL TOO HIGH. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If voltage in the lighting control exceeds 90% of the voltage in central electronic module (CEM), diagnostic trouble code CEM-8F11 is set.

Substitute Value

- None.

Possible Source

- Defective light width control actuator.
- Signal wire short circuited to voltage supply.

Fault symptom[s]

- Beam setting adjustment does not work.

SIGNAL TOO HIGH. INTERMITTENT FAULT

CHECKING THE WIRING

Check the wire between central electronic module #9A and light width control actuator 6/38 LH, and 6/39 RH actuator #2 for a short circuit to voltage supply as described in, see **SHORT-CIRCUIT TO SUPPLY VOLTAGE, INTERMITTENT FAULTS** .

Do the necessary corrective action

Additional information:

- For information on the central electronic module (CEM):
  - For -2004, see: **CENTRAL ELECTRONIC MODULE (CEM), REPLACING**

CEM-8F13: LIGHT WIDTH CONTROL. SIGNAL TOO HIGH. PERMANENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

see **DIAGNOSTIC TROUBLE CODE INFORMATION**

SIGNAL TOO HIGH. PERMANENT FAULT

CHECKING THE COMPONENT

Fig. 266: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Remove the light switch module (LSM).

  Check the Light Switch Module (LSM) and the connector (3/111).

Fig. 267: 10 CD Changer Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 268: Ground Terminals
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING THE SIGNAL CABLE**

CHECKING THE SIGNAL CABLE

Check the cable between the light switch module (LSM) terminal #3 (3/111) and central electronic module (CEM) terminal #18A. Check for a short-circuit to supply voltage.

Remedy as necessary.

Other information:

- For information on the central electronic module (CEM):
  - For -2004, see: **CENTRAL ELECTRONIC MODULE (CEM), REPLACING**
  - For 2005-, see: **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** .
- To replace the light switch module (LSM), see **SWITCHES LIGHTS, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 270: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

Fig. 271: Ground Terminals
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **INFORMATION**

VERIFICATION

VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 272: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 273: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect connectors, install components etc.
- Ignition on.

  Turn up and down and, see if the light changes.

Does it work?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-8F13: LSM HEADLAMP BEAM HEIGHT CONTROL. SIGNAL TOO HIGH (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-8F13

Condition

Fig. 274: Identifying Light Switch Module (LSM)
Courtesy of VOLVO CARS CORPORATION

The central electronic module (CEM) communicates with the light switch module (LSM).

The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) receives information from the light switch module (LSM) indicating that the signal from the headlamp beam height control is too high.

The diagnostic trouble code (DTC) can be diagnosed at ignition switch position II.

Substitute Value

- None.

Possible Source

- Damaged controller in the light switch module (LSM).

Fault symptom[s]

- Beam height control does not function.

SIGNAL TOO HIGH

REPLACING THE COMPONENT

The central electronic module (CEM) has registered an internal fault in the light switch module (LSM).

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up of the central electronic module (CEM) or may be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs. If the fault recurs, replace the light switch module (LSM).

see **SWITCHES LIGHTS, REPLACING**

Remedy as necessary.

Fig. 275: Identifying Light Switch Module (LSM)
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

CEM-8F14: LIGHT WIDTH CONTROL. SIGNAL TOO HIGH. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If the voltage in the central electronic module (CEM) exceeds 10 V for at least 1 second, diagnostic trouble

code CEM-8F14 is set.

Substitute Value

- None.

Possible Source

- Fault in light switch module (LSM).
- Defective connector to light switch module (LSM).
- Open circuit in wire.

Fault symptom[s]

- Beam setting adjustment does not work.

SIGNAL TOO HIGH. INTERMITTENT FAULT

CHECKING SIGNAL WIRES

Check the wire between light switch module (LSM) #3 (3/111) and central electronic module #18A for an open circuit as described in, see **OPEN-CIRCUIT, INTERMITTENT FAULTS** .

Additional information:

- For information on the central electronic module (CEM):
  - For -2004, see: **CENTRAL ELECTRONIC MODULE (CEM), REPLACING**
  - For 2005-, see: **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** .

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-8F14: LSM HEADLAMP BEAM HEIGHT CONTROL. SIGNAL TOO LOW (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-8F14

Condition

Fig. 287: Identifying Light Switch Module (LSM)
Courtesy of VOLVO CARS CORPORATION

The central electronic module (CEM) communicates with the light switch module (LSM).

The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) receives information from the light switch module (LSM) indicating that the signal from the headlamp beam height control is too low.

The diagnostic trouble code (DTC) can be diagnosed at ignition switch position II.

Substitute Value

- None.

Possible Source

- Damaged controller in the light switch module (LSM).

Fault symptom[s]

- Beam height control does not function.

SIGNAL TOO LOW

REPLACING THE COMPONENT

The central electronic module (CEM) has registered an internal fault in the light switch module (LSM).

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up of the central electronic module (CEM) or may be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs. If the fault recurs, replace the light switch module (LSM).

see **SWITCHES LIGHTS, REPLACING**

Remedy as necessary.

Fig. 288: Identifying Light Switch Module (LSM)
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

CEM-8F15: XENON LAMP LEFT. FAULTY SIGNAL (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The central electronic module checks the signal from the left Xenon lamp.

Diagnostic trouble code (DTC) CEM-8F15 is stored in the central electronic module if the central electronic

module registers a fault in the actuator motor for the left xenon lamp.

Diagnostic trouble code (DTC) CEM-8F15 can be detected with the ignition on and switching between low and high beam.

Substitute Value

- None.

Possible Source

- The actuator motor in the xenon lamp housing has jammed
- Defective actuator motor in the xenon lamp housing.

Fault symptom[s]

- The low beam is constantly lit
- The high beam is constantly lit
- The road surface is not illuminated.
- Headlights/Headlight aim is off

FAULTY SIGNAL

CHECKING THE STATUS

Check if the fault is permanent or intermittent by switching between high and low beam.

If the left xenon lamp does not switch between the high and low beam it means that the fault is permanent.

If the left xenon lamp switches between high and low beam it indicates that the fault was present previously but is no longer active, intermittent fault.

Is the fault permanent?

- **YES**

  Refer to **REPLACING THE COMPONENT**

- **NO**

  Refer to **VERIFICATION**

REPLACING THE COMPONENT

The diagnostic trouble code (DTC) indicates that the actuator motor in the left Xenon lamp is defective.

Replace the left lamp housing.

Other information:

- To replace the lamp housing, see **LIGHTING - REMOVAL, REPLACEMENT AND INSTALLATION** .
- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 289: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 290: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Switch on the lighting and shift between high and low beam.

Do the xenon lamps switch between high and low beam?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-8F15: XENON LAMP LEFT. FAULTY SIGNAL (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-8F15

Condition

The central electronic module (CEM) checks the signal from the left-hand Xenon lamp.

The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) registers a fault in the left-hand Xenon bulb.

The diagnostic trouble code (DTC) can be detected with the ignition on and when switching between low and high beam.

The diagnostic trouble code (DTC) can be diagnosed at ignition switch position II.

Substitute Value

- Shortest headlamp range will be used.

Possible Source

- The actuator motor in the xenon lamp housing has jammed
- Damaged actuator motor in the xenon lamp housing.

Fault symptom[s]

- The low beam is constantly lit
- The high beam is constantly lit
- The road surface is not illuminated.
- Headlights/Headlight aim is off

FAULTY SIGNAL

CHECKING THE STATUS

Fig. 291: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.
- Switch between high and low beam.

  If the left-hand Xenon lamp does not switch between high and low beam, the fault is permanent.

  If the left-hand Xenon lamp switches between high and low beam, the fault was present previously but is no longer active, intermittent fault.

Do the xenon lamps switch between high and low beam?

- **YES**

OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **REPLACING A COMPONENT**

REPLACING A COMPONENT

The diagnostic trouble code (DTC) indicates that the actuator motor in the left Xenon lamp is damaged.

Remedy as necessary.

Other information

- see **CONNECTING THE BREAKOUT BOX**
- -2004: **SIGNAL SPECIFICATION**
- 2005-: **SIGNAL SPECIFICATION**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-8F16: XENON LAMP LEFT. SIGNAL TOO LOW (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-8F16

Condition

The central electronic module (CEM) checks the signal from the left-hand Xenon lamp.

The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) registers that the signal from the left-hand Xenon bulb is too low.

The diagnostic trouble code (DTC) can be diagnosed at ignition switch position II.

Substitute Value

- Shortest headlamp range will be used.

Possible Source

- Short-circuit to ground in the signal cable
- The actuator motor in the xenon lamp housing has jammed
- Damaged actuator motor in the xenon lamp housing.

Fault symptom[s]

- The low beam is constantly lit
- The high beam is constantly lit
- The road surface is not illuminated.
- Headlights/Headlight aim is off

SIGNAL TOO LOW

CHECKING THE STATUS

Fig. 294: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.
- Switch between high and low beam.

  If the left-hand Xenon lamp does not switch between high and low beam, the fault is permanent.

  If the left-hand Xenon lamp switches between high and low beam, the fault was present previously but is no longer active, intermittent fault.

- **Continue**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Check the signal cable between the central electronic module (CEM) and the actuating motor in the left Xenon headlamp for short circuit to ground.

If no fault is found, replace the left headlamp.

Remedy as necessary.

Other information

- see **CONNECTING THE BREAKOUT BOX**
- -2004: **SIGNAL SPECIFICATION**
- 2005-: **SIGNAL SPECIFICATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-8F16: XENON LAMP LEFT. SIGNAL TOO LOW (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The central electronic module checks the signal from the left Xenon lamp.

Diagnostic trouble code (DTC) CEM-8F16 is stored in the central electrical module if the central electronic module registers too low a signal from the left Xenon lamp.

Diagnostic trouble code (DTC) CEM-8F16 can be detected when the ignition is on for at least 10 seconds and the battery voltage is > 10.5 volts.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the signal cable
- The actuator motor in the xenon lamp housing has jammed
- Defective actuator motor in the xenon lamp housing.

Fault symptom[s]

- The low beam is constantly lit
- The high beam is constantly lit
- The road surface is not illuminated.
- Headlights/Headlight aim is off

SIGNAL TOO LOW

CHECKING THE STATUS

Check if the fault is permanent or intermittent by switching between high and low beam.

If the left xenon lamp does not switch between the high and low beam it means that the fault is permanent.

If the left xenon lamp switches between high and low beam it indicates that the fault was present previously but is no longer active, intermittent fault.

CEM-8F18: XENON LAMP LEFT. SIGNAL TOO HIGH / SIGNAL MISSING (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The central electronic module checks the signal from the left Xenon lamp.

Diagnostic trouble code (DTC) CEM-8F18 is stored in the central electrical module if the central electronic module registers too high a signal from the left Xenon lamp.

Diagnostic trouble code (DTC) CEM-8F18 can be detected when the ignition is on for at least 10 seconds and the battery voltage is > 10.5 volts.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the signal cable
- Open-circuit in the signal cable
- The actuator motor in the xenon lamp housing has jammed
- Defective actuator motor in the xenon lamp housing.

Fault symptom[s]

- The low beam is constantly lit
- The high beam is constantly lit
- The road surface is not illuminated.
- Headlights/Headlight aim is off

SIGNAL TOO HIGH / SIGNAL MISSING

CHECKING THE STATUS

Check if the fault is permanent or intermittent by switching between high and low beam.

If the left xenon lamp does not switch between the high and low beam it means that the fault is permanent.

If the left xenon lamp switches between high and low beam it indicates that the fault was present previously but is no longer active, intermittent fault.

- **Continue**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Check the cable between the central electronic module (CEM) terminal #A2 and the left lamp housing terminal #5A (10/1). Check for an open-circuit. Check for a short-circuit to supply voltage.

HINT: The actuator motor is supplied with voltage via the parking lamp circuit. If the parking lamp does not function carry out the following checks:

Check the main fuse, passenger compartment fuse and relay for the parking lamps.

Check that the left parking lamp bulb is intact.

Check the cable between the passenger compartment fuse and lamp housing terminal #2A. Check the cable between lamp housing terminal #1A and the ground terminal. Check for an open-circuit.

Replace the lamp housing if no fault is found.

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-8F19: XENON LAMP RIGHT. FAULTY SIGNAL (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The central electronic module checks the signal from the right Xenon lamp.

Diagnostic trouble code (DTC) CEM-8F19 is stored in the central electronic module if the central electronic module registers a fault in the actuator motor for the right xenon lamp.

Diagnostic trouble code (DTC) CEM-8F19 can be detected with the ignition on and switching between low and high beam.

Substitute Value

- None.

Possible Source

- The actuator motor in the xenon lamp housing has jammed
- Defective actuator motor in the xenon lamp housing.

Fault symptom[s]

- The low beam is constantly lit
- The high beam is constantly lit
- The road surface is not illuminated.
- Headlights/Headlight aim is off

FAULTY SIGNAL

CHECKING THE STATUS

Check if the fault is permanent or intermittent by switching between high and low beam.

If the right xenon lamp does not switch between the high and low beam it means that the fault is permanent.

If the right xenon lamp switches between high and low beam it indicates that the fault was present previously but is no longer active, intermittent fault.

Is the fault permanent?

- **YES**

  Refer to **REPLACING THE COMPONENT**

- **NO**

  Refer to **VERIFICATION**

REPLACING THE COMPONENT

The diagnostic trouble code (DTC) indicates that the actuator motor in the right Xenon lamp is defective.

Replace the right lamp housing.

Other information:

- To replace the lamp housing, see **LIGHTING - REMOVAL, REPLACEMENT AND INSTALLATION** .

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Switch on the lighting and shift between high and low beam.

Do the xenon lamps switch between high and low beam?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-8F19: XENON LAMP RIGHT. FAULTY SIGNAL (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-8F19

Condition

The central electronic module (CEM) checks the signal from the right-hand Xenon lamp.

The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) registers a fault in the right-hand Xenon bulb.

The diagnostic trouble code (DTC) can be detected with the ignition on and when switching between low and high beam.

The diagnostic trouble code (DTC) can be diagnosed at ignition switch position II.

Substitute Value

- Shortest headlamp range will be used.

Possible Source

- The actuator motor in the xenon lamp housing has jammed
- Damaged actuator motor in the xenon lamp housing.

Fault symptom[s]

- The low beam is constantly lit
- The high beam is constantly lit
- The road surface is not illuminated.
- Headlights/Headlight aim is off

FAULTY SIGNAL

CHECKING THE STATUS

Fig. 311: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.
- Switch between high and low beam.

  If the right-hand Xenon lamp does not switch between high and low beam, the fault is permanent.

  If the right-hand xenon lamp switches between high and low beam, the fault was present previously but is no longer active, intermittent fault.

- **Continue**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

The diagnostic trouble code (DTC) indicates that the actuator motor in the right Xenon lamp is damaged.

Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-8F1A: XENON LAMP RIGHT. SIGNAL TOO LOW (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-8F1A

Condition

The central electronic module (CEM) checks the signal from the right-hand Xenon lamp.

The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) registers that the signal from the right-hand Xenon bulb is too low.

The diagnostic trouble code (DTC) can be diagnosed at ignition switch position II.

Substitute Value

- Shortest headlamp range will be used.

Possible Source

- Short-circuit to ground in the signal cable
- The actuator motor in the xenon lamp housing has jammed
- Damaged actuator motor in the xenon lamp housing.

Fault symptom[s]

- The low beam is constantly lit
- The high beam is constantly lit
- The road surface is not illuminated.
- Headlights/Headlight aim is off

SIGNAL TOO LOW

CHECKING THE STATUS

Fig. 314: Identifying Ignition ON

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-8F1A: XENON LAMP RIGHT. SIGNAL TOO LOW (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The central electronic module checks the signal from the right Xenon lamp.

Diagnostic trouble code (DTC) CEM-8F1A is stored in the central electrical module if the central electronic module registers too low a signal from the right Xenon lamp.

Diagnostic trouble code (DTC) CEM-8F1A can be detected when the ignition is on for at least 10 seconds and the battery voltage is > 10.5 volts.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the signal cable
- The actuator motor in the xenon lamp housing has jammed
- Defective actuator motor in the xenon lamp housing.

Fault symptom[s]

- The low beam is constantly lit
- The high beam is constantly lit
- The road surface is not illuminated.
- Headlights/Headlight aim is off

SIGNAL TOO LOW

CHECKING THE STATUS

Check if the fault is permanent or intermittent by switching between high and low beam.

If the right xenon lamp does not switch between the high and low beam it means that the fault is permanent.

If the right xenon lamp switches between high and low beam it indicates that the fault was present previously but is no longer active, intermittent fault.

- **Continue**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Check the cable between the central electronic module (CEM) terminal #D11 and the right lamp housing terminal #5A (10/2). Check for a short-circuit to ground.

Replace the right lamp housing if no fault is found.

Other information

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access or replace the lamp housing, see **LIGHTING - REMOVAL, REPLACEMENT AND INSTALLATION**

CEM-8F1B: XENON LAMP RIGHT FAULTY SIGNAL (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The central electronic module checks the signal from the right Xenon lamp.

Diagnostic trouble code (DTC) REM-8F1B is stored in the central electronic module if the central electronic module registers a faulty signal from the right Xenon lamp.

Diagnostic trouble code (DTC) CEM-8F1B can be detected when the ignition is on for at least 10 seconds and the battery voltage is > 10.5 volts.

Substitute Value

- None.

Possible Source

- Defective control box for the Xenon lamp.

Fault symptom[s]

- The low beam is constantly lit
- The high beam is constantly lit
- The road surface is not illuminated.
- Headlights/Headlight aim is off

FAULTY SIGNAL

CHECKING THE STATUS

Check if the fault is permanent or intermittent by switching between high and low beam.

If the right xenon lamp does not switch between the high and low beam it means that the fault is permanent.

If the right xenon lamp switches between high and low beam it indicates that the fault was present previously but is no longer active, intermittent fault.

Is the fault permanent?

- **YES**

  Refer to **REPLACING THE COMPONENT**

- **NO**

  Refer to **VERIFICATION**

REPLACING THE COMPONENT

The diagnostic trouble code (DTC) indicates that the control module in the right Xenon lamp is defective.

Replace the right lamp housing.

CEM-8F1C: XENON LAMP RIGHT. SIGNAL TOO HIGH / SIGNAL MISSING (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-8F1C

Condition

The central electronic module (CEM) checks the signal from the right-hand Xenon lamp.

The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) registers that the signal from the right-hand Xenon bulb is too high.

The diagnostic trouble code (DTC) can be detected when the ignition has been on for at least 10 seconds and the battery voltage is above 10.5 V.

The diagnostic trouble code (DTC) can be diagnosed at ignition switch position II.

Substitute Value

- Shortest headlamp range will be used.

Possible Source

- Short-circuit to supply voltage in the signal cable
- Open-circuit in the signal cable
- The actuator motor in the xenon lamp housing has jammed
- Damaged actuator motor in the xenon lamp housing.
- Headlights/Headlight aim is off

Fault symptom[s]

- The low beam is constantly lit
- The high beam is constantly lit

- The road surface is not illuminated.
- Headlights/Headlight aim is off

SIGNAL TOO HIGH / SIGNAL MISSING

CHECKING THE STATUS

Fig. 324: Identifying Ignition ON

CEM-8F1C: XENON LAMP RIGHT. SIGNAL TOO HIGH / SIGNAL MISSING (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The central electronic module checks the signal from the right Xenon lamp.

Diagnostic trouble code (DTC) CEM-8F1C is stored in the central electrical module if the central electronic module registers too high a signal from the right Xenon lamp.

Diagnostic trouble code (DTC) CEM-8F1C can be detected when the ignition is on for at least 10 seconds and the battery voltage is > 10.5 volts.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the signal cable
- Open-circuit in the signal cable
- The actuator motor in the xenon lamp housing has jammed
- Defective actuator motor in the xenon lamp housing.

Fault symptom[s]

- The low beam is constantly lit
- The high beam is constantly lit
- The road surface is not illuminated.
- Headlights/Headlight aim is off

SIGNAL TOO HIGH / SIGNAL MISSING

CHECKING THE STATUS

Check if the fault is permanent or intermittent by switching between high and low beam.

If the right xenon lamp does not switch between the high and low beam it means that the fault is permanent.

If the right xenon lamp switches between high and low beam it indicates that the fault was present previously but is no longer active, intermittent fault.

- **Continue**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Check the cable between Central electronic module (CEM) #D11 and right light housing #C1 (10/2) for open circuit as well as short-circuiting to voltage.

HINT: The actuator motor is supplied with voltage via the parking lamp circuit. If the parking lamp does not function carry out the following checks:

Check the main fuse, passenger compartment fuse and relay for the parking lamps.

Check that the right parking lamp bulb is intact.

Check the cable between passenger compartment fuse and light housing #A3 as well as light housing #4A and ground connection for open circuit.

Replace the right lamp housing if no fault is found.

Other information

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access or replace the lamp housing, see **LIGHTING - REMOVAL, REPLACEMENT AND INSTALLATION**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-8F1D: X-SUPPLY RELAY CIRCUIT. SHORT-CIRCUIT TO SUPPLY VOLTAGE (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-8F1D

Condition

Fig. 329: Identifying Central Electronic Module (CEM)
Courtesy of VOLVO CARS CORPORATION

The central electronic module (CEM) checks the voltage on the driver circuits for the 15-supply and headlamp

range adjustment. This is achieved by a common re-activation of the drive circuit.

The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) registers from the re-engagement signal that there is a short-circuit to supply voltage in the output from one of the drive circuits.

The diagnostic trouble code (DTC) can be detected at ignition position 0 and I.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the signal cable.

Fault symptom[s]

- Beam height control does not function.
- Automatic headlamp range control is not functioning.
- Incorrect setting for low beam.

SHORT-CIRCUIT TO SUPPLY VOLTAGE

CHECKING THE WIRING

Fig. 330: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 331: Disconnecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect central electronic module (CEM) connector C.

  Check the signal cable. Check for a short-circuit to supply voltage.

  Take readings between:

  - Central electronic module (CEM) terminal #C12 (#12) and left headlamp alignment motor terminal #2
  - Central electronic module (CEM) terminal #C11 (#11) and right headlamp alignment motor terminal #2.

Remedy as necessary.

CEM-8F21: WINDSHIELD WIPER. FAULTY SIGNAL (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-8F21

Condition

Fig. 334: Identifying Windshield Wiper Lever
Courtesy of VOLVO CARS CORPORATION

The central electronic module (CEM) checks the windshield wipers.

The diagnostic trouble code (DTC) is stored if the central electronic module registers that the signal on the signal cable for the windshield wiper lever is too high or missing.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the signal cable
- Open-circuit in the signal cable.

Fault symptom[s]

- The windshield wipers are not working.

FAULTY SIGNAL

REPLACING THE COMPONENT

The central electronic module (CEM) has registered a faulty signal in the signal cable from the windshield wiper.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up of the steering wheel module (SWM) or may be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs. If the fault recurs, replace the windshield wiper.

see **WASHER / WIPER SWITCH, REPLACING**

Remedy as necessary.

- **Continue**

  Refer to **VERIFICATION**

CEM-8F21: WIPERS. SIGNAL TOO HIGH/SIGNAL MISSING. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If windscreen wiper is in its rest position (home position) but wiper switch is in an activated position (that is, one of the positions for full/half-speed, intermittent or single sweep wipe), diagnostic trouble code CEM 8F21 is displayed.

Substitute Value

Only low wiper speed works.

Possible Source

- Short circuit to voltage supply or open circuit on switch which indicates operation/ rest position
- Defective windscreen wiper lever
- Defective fuse 11C/22.

Fault symptom[s]

- Wiper only works on lowest speed

SIGNAL TOO HIGH/SIGNAL MISSING. INTERMITTENT FAULT

CHECKING THE WIRES

Check the wire between central electronic module (CEM) 4D and steering wheel module (SWM) 21 (3/130).

Trouble-shoot for an intermittent short circuit to voltage supply as described in, see **SHORT-CIRCUIT TO SUPPLY VOLTAGE, INTERMITTENT FAULTS** and for an open circuit as described in **OPEN-CIRCUIT, INTERMITTENT FAULTS** .

Do the necessary corrective action.

Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Activate the windshield wipers.

  Check that the windshield wipers are activated.

Are the windshield wipers working?

- **YES**

VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

CEM-8F22: WIPERS. SIGNAL TOO LOW. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If windscreen wiper is in its operating position (position on windscreen) but wiper switch is not in an activated position (that is, one of the positions for full/half-speed, intermittent or single sweep wipe), diagnostic trouble code CEM 8F22 is displayed.

Substitute Value

Only low wiper speed works.

Possible Source

- Short circuit to ground on switch which indicates operation/rest position
- Defective windscreen wiper lever
- Defective fuse 11C/22.

Fault symptom[s]

- Wiper only works on lowest speed

SIGNAL TOO LOW. INTERMITTENT FAULT

CHECKING THE WIRES

Check the wire between central electronic module (CEM) 4D and steering wheel module (SWM) 21 (3/130).

Trouble-shoot for an intermittent short circuit to ground as described in, see **SHORT-CIRCUIT TO GROUND, INTERMITTENT FAULTS** .

Do the necessary corrective action.

Additional information

- To connect the test box, see **CONNECTING THE BREAKOUT BOX** .
- -2004: **SIGNAL SPECIFICATION**
- 2005-: **SIGNAL SPECIFICATION**

CEM-8F22: WIPERS. SIGNAL TOO LOW. PERMANENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

see **DIAGNOSTIC TROUBLE CODE INFORMATION**

SIGNAL TOO HIGH OR SIGNAL MISSING. PERMANENT FAULT

CHECKING THE CABLE

Check the cable between central electronic module (CEM) terminal #4D and steering wheel module (SWM) (3/130) terminal #21.

Check for a short-circuit to supply voltage. Check for an open-circuit.

Remedy as necessary.

Other information

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- -2004: **SIGNAL SPECIFICATION**
- 2005-: **SIGNAL SPECIFICATION**
- see **CHECKING WIRING AND TERMINALS**

Are all windshield wiper functions switched off?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-8F23: RELAY, WINDSHIELD WIPER. SIGNAL TOO HIGH (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-8F23

Condition

Fig. 353: Identifying Central Electronic Module (CEM)
Courtesy of VOLVO CARS CORPORATION

The central electronic module (CEM) checks the windshield wipers.

The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) registers that the signal at the relay coil is too high when the windshield wipers are activated.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the relay coil.

Fault symptom[s]

- The windshield wipers are not working.

SIGNAL TOO HIGH

CHECKING THE COMPONENT

Replace relay 2/91.

Activate the relay for windshield wipers on.

If the function is OK, the cause of the fault was a damaged relay (short-circuit in the relay).

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING FUSEBOX**

CHECKING FUSEBOX

Remove windshield wiper relay 2/91 from the fusebox base.

Check the relay coil driver circuit for a short-circuit to supply voltage. Take a voltmeter reading between terminal #2 and ground in the relay base.

The voltage between terminal #2 and ground must be approximately 0 V.

Remedy as necessary.

Other information

- see **CHECKING WIRING AND TERMINALS**

Fig. 354: Identifying Fusebox
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING THE COMPONENT**

CHECKING THE WIRING

Check the cable between windshield wiper relay base terminal #2 and central electronic module (CEM) terminal #C4. Check for a short-circuit to supply voltage.

Remedy as necessary.

Replace the fusebox if no fault is found.

Other information

- see **CHECKING WIRING AND TERMINALS**
- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

- Reinstall the connectors, components etc.
- Ignition on.

  Activate the windshield wipers.

  Check that the windshield wipers work in all positions.

Are the windshield wipers working?

- **YES**

VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-8F23: RELAY, WINDSHIELD WIPER. SIGNAL TOO HIGH. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If the control unit registers signal too high in the relay coil (2/91) when the windscreen wiper relay is activated diagnostic trouble code CEM-8F23 will be set.

Substitute Value

- None.

Possible Source

- Defective relay (short circuit in the relay coil) which means that the windscreen wipers cannot be operated.

Fault symptom[s]

- Windscreen wiper motor does not work.

SIGNAL TOO HIGH. INTERMITTENT FAULT

CHECKING THE WIRING

Check the relay coil driver circuit for an intermittent short-circuit to supply voltage by taking a voltmeter reading between terminal #2 and ground in the relay base for relay 2/91.

HINT: The voltage between terminal #2 and ground should be approximately 0 volt.

Other information:

- see **CHECKING WIRING AND TERMINALS** .

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-8F25: RELAY, WINDSHIELD WIPER. SIGNAL TOO LOW (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-8F25

Condition

Fig. 366: Identifying Central Electronic Module (CEM)
Courtesy of VOLVO CARS CORPORATION

The central electronic module (CEM) checks the windshield wipers.

The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) registers that the signal at the relay coil is too low when the windshield wipers are activated.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the relay coil.

Fault symptom[s]

- The windshield wipers are not working.

SIGNAL TOO LOW

CHECKING THE COMPONENT

Check that the fuse for the intermittent relay, windshield wipers is intact.

Replace relay 2/91.

Activate the relay for windshield wipers on.

If the function is OK the cause of the fault was a damaged relay (open-circuit in the relay).

Was the function OK?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING FUSEBOX**

CHECKING FUSEBOX

Remove windshield wiper relay 2/91 from the fusebox base.

Check the relay base terminals. Check for contact resistance and oxidation.

Check the cable between relay base 2/91 terminal #2 and central electronic module (CEM) terminal #C4 (4). Check for an open-circuit.

Reinstall and activate the relay.

Remedy as necessary.

Other information

ELECTRICAL

Cables And Fuses - Diagnostic Trouble Codes and Associated Procedures

AEM-1A01: POWER SUPPLY. SIGNAL TOO LOW. INTERMITTENT FAULT (2003-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) AEM-1A01 is stored if the control module registers that the power supply to the auxiliary electronic module differs by more than two volts from the power supply to the central electronic module.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is on.

Substitute Value

- None.

Possible Source

- Open-circuit or short-circuit to ground in the 30-supply to the accessory electronic module
- Contact resistance, oxidation or loose connections in the 30-supply to the accessory electronic module.

Fault symptom[s]

- Accessories connected to the control module do not function.

SIGNAL TOO LOW

CHECKING THE POWER SUPPLY

Fig. 1: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check the voltage to ground at the following points:

  Rear main fuse.

  Rear fuse.

  The voltage must be at least battery voltage minus 3 V.

  Check that the fuses are intact.

  Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

AEM-1D01: CONTROL MODULE. INTERNAL FAULT. INTERMITTENT FAULT (2003-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AEM-1D01

Condition

Fig. 8: Accessory Electronic Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the control module registers an internal fault.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is off. Therefore the ignition must be switched on again so that the diagnostic trouble code (DTC) can be read off.

Substitute Value

- None.

Possible Source

- Internal fault in the control module.

Fault symptom[s]

- Accessories connected to the control module do not function.

INTERNAL FAULT

REPLACING THE ACCESSORY ELECTRONIC MODULE (AEM)

The Accessory Electronic Module (AEM) has registered an internal fault.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can occur for a number of different reasons. The fault is evaluated depending on how it occurs. Replace the Accessory Electronic Module (AEM) if the fault recurs.

Replace the Accessory Electronic Module (AEM) if the fault is permanent. See **ACCESSORY ELECTRONIC MODULE (AEM), REPLACING** .

Remedy as necessary.

AEM-5F10: RELAY, ENGINE BLOCK HEATER. SIGNAL TOO LOW. INTERMITTENT FAULT (2003-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) AEM-5F10 is stored if the control module registers that the signal is too low in the signal cable to the relay for the electrical engine block heater.

Diagnostic trouble codes (DTCs) can be diagnosed when the ignition is on and the relay for the electrical engine block heater is activated.

Substitute Value

- The relay for the electrical engine block heater shuts down until the next time the ignition is switched on.

Possible Source

- Short-circuit to ground in the signal cable to the relay for the electrical engine block heater
- Defective relay for the electrical engine block heater.

Fault symptom[s]

- Poor heating in the passenger compartment.

SIGNAL TOO LOW

CHECKING COMPONENTS AND WIRING

Check the signal cable to the relay for the electric engine block heater. Check between accessory control module terminal #B5 and the connector for the relay. Check for a short-circuit to ground.

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX. ACCESSORY ELECTRONIC MODULE**

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

AEM-5F11: RELAY, ENGINE BLOCK HEATER. SIGNAL TOO HIGH OR SIGNAL MISSING. INTERMITTENT FAULT (2003-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) AEM-5F11 is stored if the control module registers that the signal is too high or if there is an open-circuit in the cable to the relay for the electrical engine block heater.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is on and the relay for the electrical engine block heater is not activated.

Substitute Value

- The relay for the electrical engine block heater is switched off.

Possible Source

- Short-circuit to supply voltage in the signal cable for the relay for the electrical engine block heater
- Open-circuit in the signal cable for the relay for the electrical engine block heater
- Open-circuit in the ground cable for the relay for the electrical engine block heater
- Defective relay for the electrical engine block heater.

Fault symptom[s]

- Poor heating in the passenger compartment.

SIGNAL TOO HIGH / SIGNAL MISSING

CHECKING COMPONENTS AND WIRING

Check the signal cable for the relay for the electric engine block heater. Check between accessory control module terminal #B5 and the connector for the relay. Check for a short-circuit to supply voltage. Check for an

open-circuit.

Check the ground lead for the relay for the electric engine block heater. Check between accessory control module terminal #B4 and the connector for the relay. Check for an open-circuit.

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX. ACCESSORY ELECTRONIC MODULE**
- To access or replace the Accessory Electronic Module (AEM) and connector, see **ACCESSORY ELECTRONIC MODULE (AEM), REPLACING**
- For information about signals, see **SIGNAL DESCRIPTION. ACCESSORY ELECTRONIC MODULE (AEM)**
- To access and replace the relay for the electric engine block heater, see **RELAY ELECTRICAL ENGINE BLOCK HEATER, REPLACING**
- To fault-trace wiring and terminals, see **CHECKING WIRING AND TERMINALS**

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

AEM-6C50: ALARM OUTPUT P0. SIGNAL TOO LOW OR SIGNAL MISSING. INTERMITTENT FAULT (2003-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AEM-6C50

Condition

Fig. 26: Accessory Electronic Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the control module registers that the signal is too low or there is an open-circuit in the signal cable for alarm output P0.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is on and alarm output P0 is not activated.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the signal cable for alarm output P0
- Open-circuit in the signal cable for alarm output P0
- Damaged alarm.

Fault symptom[s]

- The alarm does not function at all.

SIGNAL TOO LOW OR SIGNAL MISSING

CHECKING COMPONENTS AND WIRING

Check the signal cable for alarm output P0. Check between accessory control module terminal #B15 and the alarm unit connector. Check for a short-circuit to ground. Check for an open-circuit.

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX. ACCESSORY ELECTRONIC MODULE**
- To access or replace the Accessory Electronic Module (AEM) and connector, see **ACCESSORY ELECTRONIC MODULE (AEM), REPLACING**

AEM-7A10: CARPHONE MUTE SIGNAL. SIGNAL TOO LOW. INTERMITTENT FAULT (2003-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) AEM-7A10 is stored if the control module registers that the signal is too low or there is an open-circuit in the signal cable (carphone mute) for the radio.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is on and the signal cable (carphone mute) is not activated.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the signal cable (carphone mute) for the radio
- Open-circuit in the signal cable (carphone mute) for the radio
- Defective radio.

Fault symptom[s]

- Carphone mute on the radio does not function.

SIGNAL TOO LOW

CHECKING COMPONENTS AND WIRING

Check the signal cable (carphone mute). Check between accessory control module terminal #B12 and the radio connector. Check for a short-circuit to ground.

Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

AEM-E001: CONTROL MODULE COMMUNICATION. FAULTY COMMUNICATION (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AEM-E001

Condition

Fig. 76: Accessory Electronic Module
Courtesy of VOLVO CARS CORPORATION

The control modules transmit and receive information via a standardized serial communication method - CAN (Control Area Network). The diagnostic trouble code (DTC) is stored if the control module registers serious interference (CAN communication blocked).

NOTE: **In the event of system communication problems, it is not possible to communicate with the control module. Therefore it will only be possible to read off the fault if it is intermittent.**

Substitute Value

- The control module shuts itself off ("bus-off").

  HINT: The control module will remain shut off until the power supply is broken (15, 30, X). When the power supply is connected the control module will make a new attempt to communicate.

Possible Source

- Short-circuit between the control area network (CAN) wiring
- Open-circuit in the control area network (CAN) wiring
- Internal fault in the control module
- Internal fault in another control module in the same part of the control area network (CAN).

Fault symptom[s]

- Accessories connected to the control module do not function.

FAULTY COMMUNICATION

see **FAULTY COMMUNICATION**

AEM-E001: CONTROL MODULE COMMUNICATION. FAULTY COMMUNICATION (2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AEM-E001

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AEM-E001**

SIGNAL MISSING

GENERAL INFORMATION

NOTE: Illustrations shown are only examples.

For general information about CAN-troubleshooting, see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK**

- General about CAN-related diagnostic trouble codes.

  CEM-DF01 - DF17 can only be stored in Central electronic module (CEM). These diagnostic trouble codes are stored when an electric fault is detected in CAN-lines. Start with these diagnostic trouble codes first.

  CEM-1AXX only stored in Central electronic module (CEM). One diagnostic trouble code for every control module on the CAN-net. These diagnostic trouble codes indicate that Central electronic module (CEM) does not receive any reply from other control modules.

  XXX-E000 (HS-CAN)/E001 (LS-CAN) can be stored in all CAN-connected control modules. These diagnostic trouble codes indicate that the control module has detected interference on the CAN-net.

  XXX-E003 can be stored in all CAN-connected control modules except in Central electronic module (CEM). The control modules on the CAN-net listen for a message (identity number) that is sent out at regular intervals from Central electronic module (CEM). This diagnostic trouble code indicates that the control module has not received any identity number, or that the expected number is not correct. Interference on the CAN-net can also store this diagnostic trouble code.

  NOTE: In case of CAN-related faults, it is likely that a combination of above diagnostic trouble codes occur.

NOTE: **After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.**

If diagnostic trouble codes (DTCs) for communication faults can be read off from a control module, the fault is probably intermittent.

Intermittent fault in the voltage supply and ground to a control module on the CAN network results in the Central electronic module (CEM) storing a diagnostic trouble code (DTC) for an open-circuit in communication with the control module where the voltage supply does not work. There will probably not be a diagnostic trouble code (DTC) in the control module where the open-circuit in the voltage supply occurred as the control module cannot store a diagnostic trouble code (DTC) when it is not supplied with power.

NOTE: **Central electronic module (CEM) should not be replaced in case of CAN-fault, unless troubleshooting reveals that Central electronic module (CEM) has an internal fault.**

- Ignition off
- Disconnect the battery negative lead
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

For general information about CAN-troubleshooting, see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK**

Measure resistance between the following connections on the OBDII-box/diagnostics socket.

- #3 and #11. The resistance should be approx. 55 - 65 ohms.
- If resistance is approx. 120 ohms, this indicates open circuit in the circuit so that only one terminating resistor (120 ohms) has been measured.
- If resistance is above 1 kohms this indicates open circuit/high contact resistance somewhere in the circuit.
- If resistance is below 55 ohms this indicates short-circuiting/contact resistance between the CAN-lines somewhere in the circuit.

HINT: For LS-CAN, terminating resistors are located in Upper electronic module (UEM) and Rear electronic module (REM).

Twist the cable harness and wiggle connectors where they can be accessed along the cable harness during every measurement, and note if the resistance changes to detect intermittent short-circuits or open circuit.

NOTE: **Resistance measurement measures only main lines in the CAN-net (in circuit where both terminating resistors are found), not branches to certain control modules. Open circuit on branching without a terminating resistor cannot be detected with this measurement. However, short-circuiting on a branch can be detected. To measure resistance in the CAN-net to control modules located in a branching of their own, the measurement shall be done against the CAN-net at that control module. The values shall be as above.**

NOTE: **After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery**

to "restart" the control module/CAN-net.

Remedy as necessary.

Other information

- see **BATTERY, DISCONNECTING**
- see **CHECKING WIRING AND TERMINALS**

Fig. 79: Checking Resistance In CAN Lines

CHECKING THE AMOUNT OF TRAFFIC ON THE LS-CAN

Fig. 80: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

- Connect the battery
- Ignition on.
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

For general information about CAN-troubleshooting, see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK**

Faults in the CAN network may be due to a control module sending faulty messages that disrupt normal communication. When messages are sent incorrectly, this results in a considerable increase in the amount of traffic on the CAN network. The load can be checked by reading the average value of the voltage on the CAN cables in relation to ground.

Measure voltage between the following connections on the OBDII-box/diagnostics socket.

- #3 and #4 (ground). The voltage should be approx:2, 8 - 3, 2 V.
- #11 and #4 (ground). The voltage should be approx:1, 8 - 2, 2 V.
- #3 and #11. The voltage shall be between approx. 0.55-1.4 V. The voltage shall normally be between 0.55 - 0.90 V. A higher voltage may indicate increased traffic on the CAN-net. In case of fault in communication/too high traffic on the CAN-net, the voltage is considerably higher than the above stated values.

NOTE: After fault with control modules that interfere with communication, other control modules may remain in Limp-Home even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.

HINT: DiCE can be used as fault detection tool if fault is suspected on the CAN-net that cannot be detected with normal troubleshooting. Interference, intermittent faults, faulty messages on the CAN-net etc., are examples of such faults. The tool registers fault messages used on the CAN-net. Fault messages may be caused by short intermittent malfunctions on the CAN-net or by a control module sending fault messages. See tools:951 3010 as well as associated TJ 20402.

- Ignition on.
- Connect DiCE to the diagnostics socket.
- Note the blue LED-indicator. The indicator flashes to show detection of fault messages.

NOTE: Certain interference may occur without any real fault

Cable fault

- Shake the cables lightly and pull lightly on the connections during the check to locate any fault. Note the blue LED-indicator.

"Chatting" control modules

- "Chatting" control modules may be difficult to find and troubleshooting may take time. Let the vehicle stand with DiCE connected for an extended time period. Afterwards, activate functions to provoke a malfunction. It may take up to several hours before the fault messages are sent. When the indicator starts to flash, remove the fuse for one control module at a time until the indicator stops flashing. When the indicator stops flashing, restore the fuse for the relevant control module and check that the indicator starts to flash again. Then it is likely that the problem is identified.

Remedy wiring as necessary.

Was a fault detected?

- **YES**

  Refer to **IDENTIFYING A CONTROL MODULE IN THE CAN NETWORK**

- **NO**

  Refer to **CHECKING VOLTAGE-DROP IN CABLE FOR CAN-H AND CAN-L, RESPECTIVELY**

IDENTIFYING A CONTROL MODULE IN THE CAN NETWORK

Fig. 82: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

For general information about CAN-troubleshooting, see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK**

HINT: DiCE can be used as fault detection tool if fault is suspected on the CAN-net that cannot be detected with normal troubleshooting. Interference, intermittent faults, faulty messages on the CAN-net (chattering control modules) etc., are examples of such faults. The tool registers fault messages used on the CAN-net. Fault messages may be caused by short intermittent malfunctions on the CAN-net or by a control module sending fault messages. See tools:951 3010 (memory card) as well as associated TJ 20402. If the load on the CAN network is too high, this may be due to a control module transmitting faulty messages on the CAN network. This is called a disruptive control module. The fault may also be due to an intermittent short-circuit to supply voltage or ground in one of the CAN cables. This results in the control modules on the CAN network starting to send faulty messages. The fault may occur without any of the control modules storing a diagnostic trouble code (DTC). The voltage can be measured between the CAN cables in order to check the load on the CAN network.

NOTE: **It is not necessarily the control module that has set the diagnostic trouble code that communicates incorrectly. Faulty messages can come from any control module in the same section of the CAN network. However, faulty communication in one network cannot affect the communication on the other network. In other words, faulty communication on the LS-CAN cannot disrupt communication on the HS-CAN and vice versa.**

- Ignition on.
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

Check communication/load on CAN-net by measuring voltage between CAN-L and CAN-H. Measure voltage between the following connections on the OBDII-box/diagnostics socket.

- #3 and #11. The average value of the voltage must be approximately 0.6-1.4 V. The voltage shall normally be between 0.55 - 0.90 V. A higher voltage may indicate increased traffic on the CAN-net. In case of fault in communication/too high traffic on the CAN-net, the voltage is considerably higher than the above stated values.

In order to identify which control module has faulty communication, cut the power supply to one control module at a time. Check the voltage in the CAN cables again. The easiest way to cut the power supply is to remove the fuse(s) for the relevant control module. Repeat until the voltage between the CAN wiring drops to the normal level.

NOTE: **When connecting and disconnecting certain control modules, diagnostic trouble codes (DTCs) may be stored in other control modules.**

HINT: When the suspected defective control module has been identified, connect and disconnect the supply voltage to the control module a number of times to verify that the malfunction appears and disappears. Switch off the ignition between each check.

NOTE: **Do not cut the power to the central electronic module (CEM) unless it is the last control module left to check.**

A control module that is communicating incorrectly must be replaced.

NOTE: **After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After rectifying a fault, a verification should be carried out.

Fig. 84: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 85: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

- Reinstall the connectors, components etc.
- Ignition on.

NOTE: **For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.**

- Erase diagnostic trouble codes (DTCs) in all control modules.
- Ignition off.
- Ignition on.
- Start the vehicle. Allow the vehicle to run for 10 minutes. Start the engine. Allow the engine to run at idle speed for 10 minutes
- Read out the diagnostic trouble codes in the vehicle via the DIAGNOSTICS tab.

Does the diagnostic trouble code (DTC) for faulty communication return?

- **YES**

  Refer to **INFORMATION**

- **NO**

  OKAY: Troubleshooting has been completed.

CHECKING SHORT-CIRCUITING TO GROUND/VOLTAGE IN CAN-NET

Fig. 86: Ignition Off And Disconnecting Battery Negative Lead
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Disconnect the battery negative lead.
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

  For general information about CAN-troubleshooting, see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK**

  Checking for a short-circuit to ground

  Measure resistance between the following connections on the OBDII-box/diagnostics socket.

  - #3 and #4 (ground). Measurement is shown in the illustration. The resistance should be above 1 kohms.

- #11 and #4 (ground). The resistance should be above 1 kohms.

If resistance is below 1 kohms this indicates short-circuiting between the CAN-line and ground.

Checking for a short-circuit to voltage

Measure resistance between the following connections on the OBDII-box/diagnostics socket.

- #3 and #16 (voltage). Measurement is shown in the illustration. The resistance should be above 1 kohms.
- #11 and #16 (voltage). The resistance should be above 1 kohms.

If resistance is below 1 kohms this indicates short-circuiting between the CAN-line and voltage cable.

Twist the cable harness and wiggle connectors where they can be accessed along the cable harness during every measurement, and note if the resistance changes to detect intermittent short-circuits or open circuit.

HINT: Part the CAN-net at suitable points to decide where a short-circuit may be found.

NOTE: After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.

Remedy as necessary.

Other information

- see **BATTERY, DISCONNECTING**

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING THE AMOUNT OF TRAFFIC ON THE LS-CAN**

CHECKING VOLTAGE-DROP IN CABLE FOR CAN-H AND CAN-L, RESPECTIVELY

Fig. 88: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

- Connect the battery.
- Ignition on.
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

  For general information about CAN-troubleshooting, see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK**

  In principle, the voltage measured in each cable in the CAN-net shall be the same at each control module

in the network. This means that the voltage-drop in the cable for CAN-H and CAN-L, respectively, between the control modules should be very low. If there is a voltage-difference in the CAN-lines between the diagnostics socket/Central electronic module (CEM) and a control module due to, e. g., contact resistance in a connector or branching, communication may be lost/interfered with. Check if there is voltage-drop in the cable for CAN-H and CAN-L between the diagnostics socket/Central electronic module (CEM) and the control module where there is problem with communication.

Carry out the following:

Measure voltage between the following connections on the OBDII-box/diagnostics socket.

- #3 and corresponding connection on relevant control module for CAN-H. The voltage shall be lower than 50 mV.
- #11 and corresponding connection on relevant control module for CAN-L. The voltage shall be lower than 50 mV.

If voltage is too high, this indicates too high contact resistance in cable, connector, or branching. Check the circuit between the diagnostics socket and control module in question for contact resistance and oxidation.

NOTE: **After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.**

Remedy wiring as necessary.

Other information

- see **CHECKING WIRING AND TERMINALS**

  Refer to **VERIFICATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

TROUBLESHOOTING USING DICE ERROR FRAME FINDER

Interference, intermittent faults, wrong messages on CAN-net (chattering modules), ground faults, and loose connections, etc., are examples of faults that can be detected using the tool DiCE Error Frame Finder during troubleshooting. The tool registers fault messages used on the CAN-net. Fault messages may be caused by short intermittent malfunctions on the CAN-net or by a control module sending fault messages. DiCE Error Frame Finder can only be used to detect CAN-faults of intermittent nature. If network does not work, use a multimeter to measure. Typical behavior for DiCE Error Frame Finder when a problem has occurred is that the blue LED flashes several times with short pauses, and then stops and then starts flashing again.

- Ignition on.
- Insert special tool 951 3010 in DiCE Error Frame Finder.
- Connect DiCE to the diagnostics socket.
- Note the blue LED-indicator. The indicator flashes to show detection of fault messages.

NOTE: Certain interference may occur without any real fault

1. Firmwire status, green. When the green light flashes with 4 second intervals DiCE is in fault indication mode.
2. CAN HS, yellow. When the yellow light flashes or is on constantly there is a data flow on CAN HS.
3. Fault code indicator, blue. When the blue light flashes with brief flashes DiCE indicates that there are fault code signals on CAN LS or CAN HS.
4. CAN LS, red/orange. When the red/orange light flashes or is on constantly there is a data flow on CAN LS.

Cable fault

- Shake the cables lightly and pull lightly on the connections during the check to locate any fault. Note the blue LED-indicator.

"Chatting" control modules

- "Chatting" control modules may be difficult to find and troubleshooting may take time. Let the vehicle stand with DiCE connected for an extended time period. Afterwards, activate functions to provoke a malfunction. It may take up to several hours before the fault messages are sent. When the indicator starts to flash, remove the fuse for one control module at a time until the indicator stops flashing. When the indicator stops flashing, restore the fuse for the relevant control module and check that the indicator starts to flash again. Then it is likely that the problem is identified.

Remedy wiring as necessary.

AEM-E003: CONFIGURATION FAULT. FAULTY CONFIGURATION (2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AEM-E003

Condition

Fig. 91: Accessory Electronic Module
Courtesy of VOLVO CARS CORPORATION

The control module compares its configuration ID with the signal configuration transmitted on the control area network (CAN) by the central electronic module (CEM). If the configuration IDs do not correspond the fault code is stored. The diagnostic trouble code (DTC) is also stored if the communication between the control module and the central electronic module (CEM) is interrupted.

NOTE: **In the event of an open-circuit in both the control area network (CAN) cables, it is not possible to communicate with the control module. Therefore it will only be possible to read off the diagnostic trouble code (DTC) if this type of fault is intermittent. When the diagnostic trouble code (DTC) is stored, the control module responds to the diagnostic command, however normal control area network (CAN) communication does not work. ("Expulsion mode")**

Substitute Value

- None.

Possible Source

- Faulty control area network (CAN) configuration ID. (The node is not intended for this car, for example a used control module with different software/hardware.)
- Open-circuit in the control area network (CAN) wiring between the control module and the central electrical module (CEM).

Fault symptom[s]

- Accessories connected to the control module do not function.

SIGNAL MISSING

see **SIGNAL MISSING**

AEM-E003: CONFIGURATION FAULT. FAULTY CONFIGURATION (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AEM-E003

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AEM-E003**

FAULTY CONFIGURATION (2003)

GENERAL INFORMATION

In order to check the control area network (CAN) cables, the resistance in the network must be measured. The resistance between the two controller area network (CAN) wiring, with the network connected 60 ohms. The resistance can differ depending on the configuration of the car. Permitted values are 55-65 ohms. This applies to both the high speed side network and the low speed side network.

HINT: Take a copy of the data communication side. Note which diagnostic trouble codes (DTCs) are stored in each control module. This facilitates fault-tracing considerably.

Also check if the diagnostic trouble codes (DTCs) for failed communication are stored in the central electronic module (CEM). If this is the case: first fault-trace according to these diagnostic trouble codes (DTCs).

Other information

- see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK**
- **Continue**

  Refer to **CHECKING THE RESISTANCE OF THE CONTROL AREA NETWORK (CAN) CABLES**

CHECKING THE RESISTANCE OF THE CONTROL AREA NETWORK (CAN) CABLES

- Disconnect the battery negative lead. The power to the network must be cut when taking resistance readings. The reading may otherwise be incorrect.

  NOTE: Also read: BATTERY, DISCONNECTING

- Connect the adapter wiring to the central electronic module (CEM).

HINT: Where a breakout box cannot be used, take readings from the rear of the affected connectors if possible. This prevents terminal pins and socket housings being damaged.

When taking readings on the low speed network

- When taking readings on the low speed network, the adapter wiring should be connected to the central electronic module (CEM) and the readings taken from there. The readings can also be taken in the connector for the power seat module (PSM). The advantage of using the adapter wiring connected to the central electronic module (CEM) is that all control modules can be connected to the network when taking readings and there is access to both the high speed and the low speed networks.

  This resistance reading only measures main arteries in the low speed network, not the junctions for the road traffic information module (RTI), accessory electronic module (AEM), power seat module (PSM), phone module (PHM), audio module (AUM), driver's door module (DDM) and passenger door module (PDM).

When taking readings on the high speed network

- When taking readings on the high speed network, the readings should be taken at the engine control module (ECM) using adapter wiring. The engine control module (ECM) must be connected. This resistance reading only takes readings from the main arteries in the high speed network.

Connect the ohmmeter to the terminals for CAN-L and CAN-H on the relevant network. Work the connectors and twist the cable harness. The resistance must be approximately 60 ohms. Permitted values are 55-65 ohms.

Other information

- see **CONNECTING THE BREAKOUT BOX**
- see **CHECKING WIRING AND TERMINALS**

Fig. 92: Identifying Ignition OFF & Negative Battery Cable Disconnected
Courtesy of VOLVO CARS CORPORATION

Fig. 93: Checking For Open Circuit
Courtesy of VOLVO CARS CORPORATION

Is the value OK?

- **YES**

  Refer to **CHECKING A SHORT-CIRCUIT IN CAN CABLES**

- **NO**

  Refer to **IDENTIFYING FAULT CAUSES IN THE CAN NETWORK**

CHECKING A SHORT-CIRCUIT IN CAN CABLES

Connect an ohmmeter between the relevant CAN cable (CAN-L and CAN-H) and the power supply, and between the CAN cable and ground. Twist the connectors and turn the cable harness to different positions at each reading to determine any intermittent short-circuits.

Take the following readings:

- The resistance between CAN-L and ground
- The resistance between CAN-L and voltage

- The resistance between CAN-H and ground
- The resistance between CAN-H and voltage.

The resistance must be infinite or very high in all cases (greater than 1 Mohms).

HINT: The reading can be taken from the same connector if the CAN cables, power supply and ground are exposed. If possible, take readings on the rear of the connector to prevent damage to the terminals in the connector. If this is not possible, use the adapter wiring or loose terminal pins to obtain a good contact.

Was a fault detected?

- **YES**

  Refer to **IDENTIFYING FAULT CAUSES IN THE CAN NETWORK**

- **NO**

  Refer to **CHECKING THE TRAFFIC LOAD ON THE CAN CABLES**

CHECKING THE TRAFFIC LOAD ON THE CAN CABLES

Fig. 94: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Connect the battery
- Ignition on

Also read: **BATTERY, DISCONNECTING**

Faults in the CAN network may be due to a control module sending faulty messages that disrupt "normal" communication. When messages are sent incorrectly, this results in a considerable increase in the amount of traffic on the CAN network. Check the load by measuring the average voltage value on the CAN cables in relation to ground.

Connect a voltmeter between CAN-L and ground. The voltage must be approximately 2.3 V.

Then connect a voltmeter between CAN-H and ground. The voltage must be approximately 2.8 V.

HINT: If possible measure from the rear of the affected connectors so that they are not damaged.

Is the value OK?

- **YES**

  Refer to **DOWNLOADING NEW SOFTWARE**

- **NO**

  Refer to **IDENTIFYING A CONTROL MODULE IN THE CAN NETWORK**

IDENTIFYING FAULT CAUSES IN THE CAN NETWORK

- Disconnect a control module that disconnects the CAN network (a control module that has four terminals to the CAN network).

  HINT: For the low speed network, suitable places for disconnecting the network are at the steering wheel module (SWM), the driver information module (DIM) or the climate control module (CCM).

  In the event of a short-circuit between one of the CAN cables and voltage or ground, the fault can be located by disconnecting a control module that disconnects the CAN network. Readings can then be taken to determine on which side of the disconnected control module the fault is located.

  Connect an ohmmeter between the CAN cable and supply voltage or ground. Take readings at both ends of the CAN network where the network is disconnected. Twist and bend the cable harness to locate any intermittent short-circuits. The resistance must be infinite or very high (greater than 1Mohms).

  If a fault can be localized in one direction, disconnect the network at a point further down on the CAN network in the direction in which the fault was discovered and repeat the reading. In this way, try to identify where in the network the fault might be located.

  HINT: A short-circuit between the CAN cables and supply voltage or ground may be in either the wiring or in a control module.

  Rectify the wiring as necessary. Replace the control module if the fault has been localized to a control module.

- **Continue**

  Refer to **VERIFICATION**

IDENTIFYING A CONTROL MODULE IN THE CAN NETWORK

Fig. 95: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Connect the battery

  Also read: **BATTERY, DISCONNECTING**

- Ignition on

  If the load on the CAN network is too high, this may be due to a control module sending faulty messages on the CAN network (known as a disruptive control module). The fault may also be due to an intermittent short-circuit to supply voltage or ground in one of the CAN cables. This results in the control modules on the CAN network starting to send faulty messages. The faults can occur without a diagnostic trouble code (DTC) being stored by the control modules. The voltage can be measured between the CAN cables in order to check the load on the CAN network.

Connect a voltmeter between the CAN cables. If the communication on the network is correct, the average voltage value should be approximately 0.5 V (0.4 V to 0.6 V). If there is a fault in the communication, the voltage reading will be approximately 0.7 V or higher.

In order to identify from which control module the faulty communication is being transmitted, cut the supply voltage to one control module at a time and check the voltage in the CAN cables again. The easiest way to cut the supply voltage is to remove a fuse. Repeat until the voltage between the CAN cables drops to approximately 0.5 V.

HINT: When the probable faulty control module has been identified, connect and disconnect the supply voltage to the control module a number of times to verify that the fault appears and disappears.

NOTE: Do not cut the power to the central electronic module (CEM) unless it is the last control module left to check.

The control module that is communicating incorrectly must be replaced. Remedy as necessary.

NOTE: Following a fault involving "disruptive" control modules, other modules may remain in "Limp-Home mode" even after switching the ignition off and on a number of times. To remedy this, disconnect and reconnect the battery negative terminal to restore the control modules to normal function.

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **DOWNLOADING NEW SOFTWARE**

IDENTIFYING FAULT CAUSES IN THE CAN NETWORK

- Disconnect a control module that disconnects the CAN network (a control module that has four terminals to the CAN network).

  HINT: For the low speed network, suitable places for disconnecting the network are at the steering wheel module (SWM), the driver information module (DIM) or the climate control module (CCM).

  In the event of an open-circuit or a short-circuit between the CAN cables, the fault can be localized by disconnecting a control module that disconnects the CAN network. Readings can then be taken to determine on which side of the disconnected control module the fault is located.

  Connect an ohmmeter between the CAN cables. Take readings at both ends of the CAN network where

the network is disconnected. Twist and bend the cable harness to locate any intermittent short-circuits. The resistance must be 120 ohm.

If a fault can be localized in one direction, disconnect the network at a point further down on the CAN network in the direction in which the fault was discovered and repeat the reading. In this way, try to identify where in the network the fault might be located.

Remedy the cables as necessary.

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **DOWNLOADING NEW SOFTWARE**

DOWNLOADING NEW SOFTWARE

HINT: If no other faults are found, new software can be downloaded to remedy the fault in the control module which stored the diagnostic trouble code (DTC). Downloading of software must occur after agreement with the customer.

Downloading of software occurs according to the replacement parts catalogue/Index Software components.

HINT: Install a bookmark on this side to continue fault-tracing after downloading new software.

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 96: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Reinstall the connectors, components, etc.
- Ignition on
- Erase diagnostic trouble codes using the VCT2000 (or appropriate scan tool)
- Start the car. Allow the car to run for 10 minutes.
- Read off diagnostic trouble codes (DTCs).

Does the diagnostic trouble code (DTC) for a communication fault recur (CEM-1A5X or CEM-1A6X)?

Fig. 98: Identifying Ignition OFF & Negative Battery Cable Disconnected
Courtesy of VOLVO CARS CORPORATION

Fig. 99: Checking For Open Circuit

Courtesy of VOLVO CARS CORPORATION

Is the value OK?

- **YES**

  Refer to **CHECKING A SHORT-CIRCUIT IN CAN CABLES**

- **NO**

  Refer to **IDENTIFYING FAULT CAUSES IN THE CAN NETWORK**

CHECKING A SHORT-CIRCUIT IN CAN CABLES

Connect an ohmmeter between the relevant CAN cable (CAN-L and CAN-H) and the power supply, and between the CAN cable and ground. Twist the connectors and turn the cable harness to different positions at each reading to determine any intermittent short-circuits.

Take the following readings:

- The resistance between CAN-L and ground
- The resistance between CAN-L and voltage
- The resistance between CAN-H and ground
- The resistance between CAN-H and voltage.

The resistance must be infinite or very high in all cases (greater than 1 Mohms).

HINT: The reading can be taken from the same connector if the CAN cables, power supply and ground are exposed. If possible, take readings on the rear of the connector to prevent damage to the terminals in the connector. If this is not possible, use the adapter wiring or loose terminal pins to obtain a good contact.

Was a fault detected?

- **YES**

  Refer to **IDENTIFYING FAULT CAUSES IN THE CAN NETWORK**

- **NO**

  Refer to **CHECKING THE TRAFFIC LOAD ON THE CAN CABLES**

CHECKING THE TRAFFIC LOAD ON THE CAN CABLES

Fig. 100: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Connect the battery
- Ignition on

Also read: **BATTERY, DISCONNECTING**

Faults in the CAN network may be due to a control module sending faulty messages that disrupt "normal" communication. When messages are sent incorrectly, this results in a considerable increase in the amount of traffic on the CAN network. Check the load by measuring the average voltage value on the CAN cables in relation to ground.

Connect a voltmeter between CAN-L and ground. The voltage must be approximately 2.3 V.

Then connect a voltmeter between CAN-H and ground. The voltage must be approximately 2.8 V.

HINT: If possible measure from the rear of the affected connectors so that they are not damaged.

Is the value OK?

- **YES**

  Refer to **DOWNLOADING NEW SOFTWARE**

- **NO**

  Refer to **IDENTIFYING A CONTROL MODULE IN THE CAN NETWORK**

IDENTIFYING FAULT CAUSES IN THE CAN NETWORK

- Disconnect a control module that disconnects the CAN network (a control module that has four terminals to the CAN network).

  HINT: For the low speed network, suitable places for disconnecting the network are at the steering wheel module (SWM), the driver information module (DIM) or the climate control module (CCM).

  In the event of a short-circuit between one of the CAN cables and voltage or ground, the fault can be located by disconnecting a control module that disconnects the CAN network. Readings can then be taken to determine on which side of the disconnected control module the fault is located.

  Connect an ohmmeter between the CAN cable and supply voltage or ground. Take readings at both ends of the CAN network where the network is disconnected. Twist and bend the cable harness to locate any intermittent short-circuits. The resistance must be infinite or very high (greater than 1Mohms).

  If a fault can be localized in one direction, disconnect the network at a point further down on the CAN network in the direction in which the fault was discovered and repeat the reading. In this way, try to identify where in the network the fault might be located.

  HINT: A short-circuit between the CAN cables and supply voltage or ground may be in either the wiring or in a control module.

  Rectify the wiring as necessary. Replace the control module if the fault has been localized to a control module.

- **Continue**

  Refer to **VERIFICATION**

IDENTIFYING A CONTROL MODULE IN THE CAN NETWORK

Fig. 101: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Connect the battery

  Also read: **BATTERY, DISCONNECTING**

- Ignition on

  If the load on the CAN network is too high, this may be due to a control module sending faulty messages on the CAN network (known as a disruptive control module). The fault may also be due to an intermittent short-circuit to supply voltage or ground in one of the CAN cables. This results in the control modules on the CAN network starting to send faulty messages. The faults can occur without a diagnostic trouble code (DTC) being stored by the control modules. The voltage can be measured between the CAN cables in order to check the load on the CAN network.

Connect a voltmeter between the CAN cables. If the communication on the network is correct, the average voltage value should be approximately 0.5 V (0.4 V to 0.6 V). If there is a fault in the communication, the voltage reading will be approximately 0.7 V or higher.

In order to identify from which control module the faulty communication is being transmitted, cut the supply voltage to one control module at a time and check the voltage in the CAN cables again. The easiest way to cut the supply voltage is to remove a fuse. Repeat until the voltage between the CAN cables drops to approximately 0.5 V.

HINT: When the probable faulty control module has been identified, connect and disconnect the supply voltage to the control module a number of times to verify that the fault appears and disappears.

NOTE: Do not cut the power to the central electronic module (CEM) unless it is the last control module left to check.

The control module that is communicating incorrectly must be replaced. Remedy as necessary.

NOTE: Following a fault involving "disruptive" control modules, other modules may remain in "Limp-Home mode" even after switching the ignition off and on a number of times. To remedy this, disconnect and reconnect the battery negative terminal to restore the control modules to normal function.

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **DOWNLOADING NEW SOFTWARE**

IDENTIFYING FAULT CAUSES IN THE CAN NETWORK

- Disconnect a control module that disconnects the CAN network (a control module that has four terminals to the CAN network).

  HINT: For the low speed network, suitable places for disconnecting the network are at the steering wheel module (SWM), the driver information module (DIM) or the climate control module (CCM).

  In the event of an open-circuit or a short-circuit between the CAN cables, the fault can be localized by disconnecting a control module that disconnects the CAN network. Readings can then be taken to determine on which side of the disconnected control module the fault is located.

  Connect an ohmmeter between the CAN cables. Take readings at both ends of the CAN network where

the network is disconnected. Twist and bend the cable harness to locate any intermittent short-circuits. The resistance must be 120 ohm.

If a fault can be localized in one direction, disconnect the network at a point further down on the CAN network in the direction in which the fault was discovered and repeat the reading. In this way, try to identify where in the network the fault might be located.

Remedy the cables as necessary.

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **DOWNLOADING NEW SOFTWARE**

DOWNLOADING NEW SOFTWARE

HINT: If no other faults are found, new software can be downloaded to remedy the fault in the control module which stored the diagnostic trouble code (DTC). Downloading of software must occur after agreement with the customer.

Downloading of software occurs according to the replacement parts catalogue/Index Software components.

HINT: Install a bookmark on this side to continue fault-tracing after downloading new software.

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 102: Identifying Ignition ON

AUU-0001: BATTERY VOLTAGE. ALGORITHM BASED FAILURES (2007-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AUU-0001

Condition

Accessory USB Unit (AUU) checks the voltage feed and compares it with the voltage across the central electronic module (CEM).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The difference between the voltage of Accessory USB Unit (AUU) and central electronic module (CEM) is greater than 2 V.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Activated control module.
- Battery voltage between 9 - 16 V.

Fig. 106: Identifying Accessory USB Unit (AUU)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

Signal too high:

- Short-circuit to supply voltage in the cable.

Signal too low:

- Short-circuit to ground in the cable.
- Open-circuit in the power supply cable.

Fault symptom[s]

- USB unit/Does not work

FAULT-TRACING

FAULT-TRACING INFORMATION

Use the following information and general checks during fault-tracing.

NOTE: Check that the fuses are intact. For locations, see the owner's manual, cover for fuse box, fuse ratings or similar.

1. Check, if possible, relevant functions in the vehicle using buttons/controls/test drives to determine the status of the fault.

NOTE: **If the vehicle does not show any of the given symptoms in the diagnostic trouble code information (DTC), this may mean that the fault is intermittent or that the control module is not detecting the fault at this moment.**

2. Use the diagnostic trouble code's **frozen values** , **status identifiers** and **counter** to determine the operating conditions when the fault was detected, the fault's current status and any degree of intermittence of the fault.
3. Check and fault-trace according to **the fault causes** that are specified in the **diagnostic trouble code (DTC) information** .
4. Use **VIDA (Volvo scan tool)** . Read off the parameters, activate components and functions, carry out quick tests and checking routines for the diagnostic trouble codes to identify the fault.
5. Check relevant components according to **Component specifications** .
6. Check relevant signals according to service information for **signal specification** and **breakout box** .

Remedy as necessary.

Other information

- see **SIGNAL SPECIFICATION**
- see **LOCATION OF COMPONENTS**
- see **CHECKING THE SUPPLY VOLTAGE/GROUND TERMINAL**

FAULT-TRACING INFORMATION

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

AUU-0002: CONTROL MODULE. SYSTEM PROGRAMMING FAILURES

(2007-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION AUU-0002

Condition

The control module compares its configuration ID with the signal configuration transmitted on the control area network (CAN) by the central electronic module (CEM).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The vehicle configuration file has too few parameters.
- Internal fault in the control module.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition on and battery voltage between 9 and 16 V.
- Ignition on for at least 60 seconds.

Fig. 110: Identifying Accessory USB Unit (AUU)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Disrupted communication between Accessory USB Unit (AUU) and central electronic module (CEM).
- Incorrect configuration ID (the control module is not intended for this vehicle, for example it is a used control module with different software/hardware).
- An internal program memory fault has occurred.

Fault symptom[s]

- USB unit/Does not work

FAULT-TRACING

FAULTY SOFTWARE

The control module has registered an internal fault.

- Load new software into the control module.

CEM-1A03: S-POWER SUPPLY SIGNAL TOO LOW (2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-1A03

Condition

Fig. 115: Identifying Central Electronic Module (CEM)
Courtesy of VOLVO CARS CORPORATION

The central electronic module (CEM) monitors the cable for S-supply from the ignition switch.

The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) registers an open-circuit or a short-circuit to ground in the S-supply.

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I and II.

Substitute Value

- None.

Possible Source

- Contact resistance in the terminals
- Open-circuit or short-circuit to ground in the S-supply
- No communication with the key
- Damaged ignition switch.

Fault symptom[s]

- The starter motor does not turn.

SIGNAL TOO LOW

CHECKING THE CONNECTORS

Fig. 116: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check central electronic module (CEM) connector D. Check for contact resistance and oxidation. Check for loose connections. Remedy as necessary.

  Check for any damage.

HINT: If the fault cause is found, reinstall the components, connectors etc.

HINT: If the fault cause was not found, do not reconnect the connector before carrying out further fault-tracing.

Other information:

- To replace the connectors for the central electronic module (CEM):
  - For -2004, see: **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** .

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-1A05: X-POWER SUPPLY SIGNAL TOO HIGH (2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-1A05

Condition

Fig. 155: Identifying Central Electronic Module (CEM)
Courtesy of VOLVO CARS CORPORATION

The central electronic module (CEM) monitors the cable for X-supply from the ignition switch.

The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) registers a short-circuit to supply voltage in the cable for the X-supply.

The diagnostic trouble code (DTC) can be diagnosed at ignition switch position III (start attempt).

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the cable for the X-supply
- Damaged ignition switch.

Fault symptom[s]

- The battery discharges.

SIGNAL TOO HIGH

CHECKING THE CONNECTORS

Fig. 156: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check central electronic module (CEM) connector D. Check for damage. Remedy as necessary.

  HINT: If the fault cause is found, reinstall the components, connectors etc.

  HINT: If the fault cause was not found, do not reconnect the connector before carrying out further

fault-tracing.

Other information:

Is voltage on the wire low?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-1A05: 30 POWER SUPPLY. SIGNAL TOO LOW. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) CEM-1C05 is stored if the central electronic module (CEM) registers that the 30-supply to central electronic module (CEM) terminals #3E and #6E is low.

Substitute Value

None.

Possible Source

- Contact resistance or loose connections in the terminals
- Low battery voltage, poor battery or the battery needs charging
- Defective generator (GEN).

Fault symptom[s]

- The "Generator not charging" warning lamp is lit with the engine running
- The headlamp bulbs blow
- The "Generator not charging" warning lamp is not lit when the ignition is switched on
- Low rotation speed in the starter motor
- The electrolyte in battery boils with the engine running
- The battery discharges.

SIGNAL TOO LOW. INTERMITTENT FAULT

CHECKING WIRE BETWEEN BATTERY AND ALTERNATOR.

Check the wire between alternator 1A and starter motor 1 (red/green wire and flat pin) for an open circuit as described in, see **OPEN-CIRCUIT, INTERMITTENT FAULTS** , and for a short circuit to ground as described in **SHORT-CIRCUIT TO GROUND, INTERMITTENT FAULTS** .

Also check the wire between starter motor 1 and battery positive terminal in the same way.

Fig. 162: Identifying Ohm Meter
Courtesy of VOLVO CARS CORPORATION

Is there a fault?

- **YES**

  Refer to **INFORMATION**

- **NO**

  Refer to **CHECKING THE WIRES AND CONNECTORS**

CHECKING THE WIRES AND CONNECTORS

Check wires and connectors between central electronic module (CEM) 6E and battery for an intermittent open

circuit as described in, see **OPEN-CIRCUIT, INTERMITTENT FAULTS** and for a loose contact as described in **LOOSE CONNECTIONS (TERMINALS)** . Check especially for any damage.

Check wires between central electronic module (CEM) 1E and ground point/ground on left A-pillar for an open circuit as described in, see **OPEN-CIRCUIT, INTERMITTENT FAULTS** . Check especially for any damage.

Do the necessary corrective action.

Additional information

- For -2004, see: **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** .
- For 2005-, see: **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** .
- To connect a test box, see **CONNECTING THE BREAKOUT BOX**

Fig. 163: Identifying Ohm Meter

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-1A07: 15-POWER SUPPLY. SIGNAL TOO HIGH. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) CEM-1A07 is stored if the central electronic module (CEM) registers a short-circuit to supply voltage in the 15-supply.

Substitute Value

None

Possible Source

- Short-circuit to supply voltage in 15-supply.
- Defective ignition switch.

Fault symptom[s]

- Windshield wiper motor does not operate.
- The starter motor does not turn.

SIGNAL TOO HIGH. INTERMITTENT FAULT

CHECKING THE CONNECTORS

Check the central electronic module (CEM) connector for contact resistance and oxidation and remedy according to **CONTACT RESISTANCE AND OXIDATION** and loose connections according to **LOOSE CONNECTIONS (TERMINALS)** .

Check for damage carefully.

HINT: If the fault cause is found, reinstall the components, connectors etc.

HINT: If the fault cause is not found, do not reinstall the central electronic module (CEM) before continuing with fault-tracing.

Other information:

- For -2004, see: **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** .
- For 2005-, see: **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** .

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-1A08: 50-POWER SUPPLY. SIGNAL MISSING (2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-1A08

Condition

Fig. 226: Identifying Central Electronic Module (CEM)
Courtesy of VOLVO CARS CORPORATION

The central electronic module (CEM) monitors the cable for 50-supply from the ignition switch.

The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) registers an open-circuit in the cable for the 50-supply.

The diagnostic trouble code (DTC) can be diagnosed at ignition switch position III (start attempt).

Substitute Value

- None.

Possible Source

- Open-circuit in the 50-supply cable
- Damaged ignition switch.

Fault symptom[s]

- The starter motor does not turn.

SIGNAL MISSING

CHECKING THE CONNECTORS

Fig. 227: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check central electronic module (CEM) connector D. Check for contact resistance and oxidation. Remedy as necessary.

  Check for any damage.

HINT: If the fault cause is found, reinstall the components, connectors etc.

HINT: If the fault cause was not found, do not reconnect the connector before carrying out further fault-tracing.

Other information:

- For -2004, see: **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** .
- For 2005-, see: **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** .

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-1A08: 50-POWER SUPPLY. SIGNAL MISSING. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) CEM-1A08 is stored if the central electronic module (CEM) registers an open-circuit or a short-circuit to ground in the 50-supply.

Substitute Value

None

Possible Source

- Contact resistance in terminals.
- Open-circuit or short-circuit to ground in 50-supply.
- Starter relay not active.
- Defective ignition switch.

Fault symptom[s]

- The starter motor does not turn.

SIGNAL MISSING. INTERMITTENT FAULT

CHECKING THE CONNECTORS

Check connector 54/3 and the connector for the central electronic module (CEM) for contact resistance and oxidation according to **CONTACT RESISTANCE AND OXIDATION** . Check for loose connections according to **LOOSE CONNECTIONS (TERMINALS)** . Remedy if necessary.

Check for any damage.

HINT: If the fault cause is found, reinstall the components, connectors etc.

HINT: If the fault cause is not found, do not reinstall the central electronic module (CEM) before continuing with fault-tracing.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-1A21: INCREASED POWER SUPPLY RELAY. SIGNAL TOO HIGH. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) CEM-1A21 is stored if the central electronic module (CEM) registers a short-circuit to supply voltage in the relay driver for relay 2/29 for extended X-supply.

Substitute Value

None

Possible Source

- Incorrectly installed relay.
- Contact resistance in relay terminals.

Fault symptom[s]

- Power seat does not operate at all.
- No gauges working.
- The instrument lighting does not operate.

SIGNAL TOO HIGH. INTERMITTENT FAULT.

CHECKING THE RELAY

Check that relay 2/29 is installed correctly.

At the same time check relay connection for contact resistance and oxidation as described in, see **CONTACT RESISTANCE AND OXIDATION** , and for a loose contact as described in **LOOSE CONNECTIONS (TERMINALS)** .

Additional information

- For -2004, see: **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** .
- For 2005-, see: **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** .

Fig. 269: Identifying Ohm Meter
Courtesy of VOLVO CARS CORPORATION

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-1A23: INCREASED POWER SUPPLY RELAY. NO SIGNAL. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) CEM-1A23 is stored if the central electronic module (CEM) registers an open-circuit in the signal cable to relay 2/29 for extended X-supply or that the relay has been incorrectly installed.

Substitute Value

None

Possible Source

- Incorrectly installed relay.
- Contact resistance in the relay terminal.

Fault symptom[s]

- Power seat does not operate at all.
- The instrument lighting does not operate.
- No instruments operating.

SIGNAL MISSING. INTERMITTENT FAULT.

CHECKING THE RELAY

Check that relay 2/29 is installed correctly.

At the same time check relay connection for contact resistance and oxidation as described in, see **CONTACT RESISTANCE AND OXIDATION** , and for a loose contact as described in **LOOSE CONNECTIONS (TERMINALS)** .

Additional information

- For interior main relay unit:
  - For -2004, see: **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** .
  - For 2005-, see: **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** .

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-1A41: REAL TIME CLOCK. FAULTY SIGNAL (2005)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-1A41

Condition

Fig. 293: Identifying Central Electronic Module (CEM)
Courtesy of VOLVO CARS CORPORATION

The central electronic module (CEM) has an internal clock which starts when the control module is powered for the first time in the factory. The time is kept from the time the internal timer circuit started.

The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) registers that the real time clock has stopped.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on and when the test is run at least once a minute.

Substitute Value

- None.

Possible Source

- Internal fault in the central electronic module (CEM).

Fault symptom[s]

- The parking heater does not operate.
- The clock in the information module is not working

FAULTY SIGNAL

REPLACING THE CONTROL MODULE

The diagnostic trouble code (DTC) indicates an internal fault in the central electronic module (CEM) which means that the control module needs to be replaced.

Read off the customer parameters from the control module before it is replaced. Use the VCT2000 (or appropriate scan tool). Make a note of the values.

- For -2004, see: **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** .
- For 2005-, see: **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** .

CEM-1A51: COMMUNICATION WITH THE SUPPLEMENTAL RESTRAINT

SYSTEM MODULE (SRS). SIGNAL MISSING (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-1A51

Condition

Fig. 297: Identifying SRS Control Module
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble codes (DTCs) are stored if the central electronic module (CEM) registers that communication with the supplementary restraint system (SRS) control module is not operating.

NOTE: **In the event of CEM-1A5X diagnostic trouble codes (DTCs), the central electronic module (CEM) must not be replaced as the diagnostic trouble code (DTC) indicates a communication fault in the Control area network**

Substitute Value

None.

Possible Source

- No power supply to SRS control module

- Open-circuit in the ground lead to the SRS control module
- Contact resistance in the terminals
- Open-circuit in the wiring for the CAN low speed network to the SRS control module
- The SRS control module is not intended for this car (for example a used control module with different software/hardware).

HINT: If several diagnostic trouble codes (DTCs) are stored in the central electronic module (CEM) for communication faults with other control modules in the low speed network, this indicates a common fault in the Control area network.

Fault symptom[s]

- The SRS indicator lamp is lit.

SIGNAL MISSING

CHECKING THE FUNCTION OF THE SUPPLEMENTAL RESTRAINT SYSTEM MODULE (SRS)

Check the power supply to the control module by turning the ignition to position II.

The SRS (supplemental restraint system) indicator lamp in the driver information module (DIM) must light. The lamp must go out after approximately 7 seconds.

Fig. 298: Locating SRS Control Module
Courtesy of VOLVO CARS CORPORATION

Does the warning lamp go out?

- **YES**

  Refer to **CHECKING COMMUNICATION WITH THE SUPPLEMENTAL RESTRAINT SYSTEM MODULE (SRS)**

- **NO**

Refer to **CHECKING THE POWER SUPPLY AND GROUND FOR THE SUPPLEMENTAL RESTRAINT SYSTEM MODULE (SRS)**

CHECKING THE POWER SUPPLY AND GROUND FOR THE SUPPLEMENTAL RESTRAINT SYSTEM MODULE (SRS)

Checking the power supply

- Check the fuse in the passenger compartment fusebox for the supplemental restraint system module (SRS).

NOTE: If a fuse is blown, check the circuit after the fuse before replacing the fuse. Check for a short-circuit to ground. Then replace the fuse.

- Check the power supply cable between the X-supply from the ignition switch and the supplemental restraint system module (SRS). Check for an open-circuit
- Check the power supply cable between the 15-supply and the supplemental restraint system module (SRS). Check for an open-circuit. Check for a short-circuit to ground.

Checking the ground terminal

- The supplemental restraint system module (SRS) is grounded when it is screwed into place in the car.

  The resistance between the control module casing and the ground terminal must be 0 ohms.

Remedy as necessary

Other information

- To access and replace the supplemental restraint system module (SRS) and connector, see **SUPPLEMENTAL RESTRAINT SYSTEM MODULE (SRS), REPLACING**
- For model year 2003-2004, see **CONNECTING THE BREAKOUT BOX** .
- For model year 2005-, see **CONNECTING THE BREAKOUT BOX** .
- With the ignition off and the supplemental restraint system module (SRS) installed, the resistance between the control module casing and the ground terminal must be approximately 0 ohms.
- For other values, see **SIGNAL SPECIFICATION**
- For information about checking the wiring, see **CHECKING WIRING AND TERMINALS**

Fig. 299: Identifying Voltage Display

Fig. 300: Identifying Breakout Box
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **CHECKING THE FUNCTION OF THE SUPPLEMENTAL RESTRAINT SYSTEM MODULE (SRS)**

- **NO**

  Refer to **SIGNAL MISSING**

CHECKING COMMUNICATION WITH THE SUPPLEMENTAL RESTRAINT SYSTEM MODULE (SRS)

HINT: The CAN communication with the control module is probably OK if the control module ID can be read off. In that case the fault is probably intermittent and will then be more difficult to trace.

Fig. 301: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- Try to communicate with the supplemental restraint system module (SRS) by reading off the control module ID using the VCT2000 (or appropriate scan tool)
- **Continue**

  Refer to **SIGNAL MISSING**

CHECKING THE FUNCTION OF THE SUPPLEMENTAL RESTRAINT SYSTEM MODULE (SRS)

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 302: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 303: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reconnect the connectors. Reinstall the components
- Ignition on.

  Check the power supply to the control module by turning the ignition to position II.

  The indicator lamp in the driver information module (DIM) must light up. The lamp must go out after approximately 7 seconds.

Does the indicator lamp go out?

- **YES**

OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

SIGNAL MISSING

GENERAL INFORMATION

HINT: For general information about fault-tracing the control area network (CAN), see the linked document below. See GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK (2005-2011)

In order to check the control area network (CAN) cables, the resistance in the network must be measured. The resistance between the two CAN cables, with the network connected, must be 60ohms in both the high speed network and the low speed network.

NOTE: **Resistance will only be 60 ohms if the main artery of the CAN network is whole and the network is connected. If the main artery of the CAN network is split somewhere and a reading is taken between the CAN cables, resistance will be 120 ohms.**

If diagnostic trouble codes (DTCs) can be read off from the relevant control module, the fault is probably intermittent. The locations that must be checked in the event of a fault in the low speed network are the junctions behind the central electronic module (CEM) and the audio module (AUM) as well as the cable harness behind the Audio module (AUM).

Intermittent fault in the current supply to the actual control module is indicated by the DTC in the Central electronic module (CEM) (CEM-1A5X or CEM-1A6X). There is probably no diagnostic trouble code (DTC) in the relevant control module as the control module cannot store a diagnostic trouble code (DTC) when it is without power.

- **Continue**

  Refer to **CHECKING THE RESISTANCE OF THE CONTROL AREA NETWORK (CAN) CABLES**

CHECKING THE RESISTANCE OF THE CONTROL AREA NETWORK (CAN) CABLES

Fig. 304: Identifying Ignition In Off Position And Disconnecting Negative Cable From Battery
Courtesy of VOLVO CARS CORPORATION

- Disconnect the battery negative lead. The network must not be powered when taking resistance readings. Otherwise an incorrect value may be obtained.
- Connect the adapter wiring to the central electronic module (CEM).

  HINT: Where a breakout box cannot be used, take readings from the rear of the affected connectors if possible. This prevents terminal pins and socket housings being damaged.

  When taking readings on the low speed network

  - When taking readings on the low speed network the adapter wiring should be connected to the Central electronic module (CEM) and readings taken from there. Readings can even be taken in the connector for the Power seat module (PSM). The advantage of the adapter wiring to the Central electronic module (CEM) is that all control module can be connected in the network when taking readings and access can be gained to both the high speed and low speed networks.

    The resistance reading only measures the main arteries in the low speed network, not the junctions that exist for different control modules.

  When taking readings on the high speed network

  - When taking readings on the high speed network the adapter wiring should be connected to the Engine control module (ECM) and readings taken from there. The Engine control module (ECM) must be connected. This resistance reading only measures the main arteries in the high speed network.

  Connect an ohmmeter to the terminals for CAN-L and CAN-H on the relevant network. Turn the contacts and turn the cable harness. Resistance must be approximately 60 ohms.

NOTE: **Resistance will only be 60 ohms if the main artery of the CAN network is whole and the network is connected. If the main artery of the CAN network is split somewhere and a reading is taken between the CAN cables, resistance will be 120 ohms.**

Other information

- see **BATTERY, DISCONNECTING**
- see **CONNECTING THE BREAKOUT BOX**
- see **CHECKING WIRING AND TERMINALS**

Fig. 305: Checking For Open Circuit
Courtesy of VOLVO CARS CORPORATION

Is the value OK?

- **YES**

  Refer to **CHECKING A SHORT-CIRCUIT IN CAN CABLES**

- **NO**

  Refer to **IDENTIFYING FAULT CAUSES IN THE CAN NETWORK**

CHECKING A SHORT-CIRCUIT IN CAN CABLES

Connect an ohmmeter between respective CAN cable and voltage supply and between the CAN cables and ground. Turn the contacts and turn the cable harness. The resistance must be infinite or very high.

HINT: Readings can be taken from one and the same connector if the CAN wiring, voltage supply and ground is pre-routed. If possible, measure from the rear of the affected connectors in order to minimize any damage and future loose connections. If this is not possible, use the adapter wiring or loose terminal pin for good contact.

Was a fault detected?

- **YES**

  Refer to **IDENTIFYING FAULT CAUSES IN THE CAN NETWORK**

- **NO**

  Refer to **CHECKING THE TRAFFIC LOAD ON THE CAN CABLES**

CHECKING THE TRAFFIC LOAD ON THE CAN CABLES

Fig. 306: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Connect the battery.
- Ignition on.

Faults in the CAN network may be due to a control module sending faulty messages that disrupt normal communication. When messages are sent incorrectly, this results in a considerable increase in the amount of traffic on the CAN network. The load can be checked by reading the average value of the voltage on the CAN cables in relation to ground.

The following applies for model year -2004:

Connect a voltmeter between CAN-L and ground. The voltage shall be approx. 2.3 V.

Then connect a voltmeter between CAN-H and ground. The voltage shall be approx. 2.8 V.

The following applies for model year 2004-:

Connect a voltmeter between CAN-L and ground. The voltage should be approx: V

Connect a voltmeter between CAN-H and ground. The voltage should be approx: V

NOTE: **For vehicles of later model years, normal voltage values lie within a specific interval due to increased traffic between the control modules on the CAN network upon update of the electrical system.**

HINT: If possible, measure from the rear of the affected connectors so that they are not damaged.

Other information

- see **BATTERY, DISCONNECTING**

Is the value OK?

- **YES**

  Refer to **INFORMATION**

- **NO**

  Refer to **IDENTIFYING A CONTROL MODULE IN THE CAN NETWORK**

IDENTIFYING FAULT CAUSES IN THE CAN NETWORK

- Disconnect a control module that disconnects the CAN network (a control module that has four terminals to the CAN network).

  HINT: For the low speed network, suitable places for disconnecting the network are at the steering wheel module (SWM), the driver information module (DIM) or the climate control module (CCM).

  In the event of an short-circuit between on of the CAN cables and voltage or ground, the fault can be localized disconnecting a control module that splits the CAN network. Readings can then be taken to determine on which side the fault is on the disconnected control module.

  Connect an ohmmeter between the CAN cable and voltage supply respectively ground. Take readings from both ends of the CAN networks at the network junction. Twist and bend the cable harness to find any intermittent short-circuits. The resistance must be infinite or very high (more than 1 Mohms).

  If a fault can be localized in one direction, split the network at a point further on in the CAN network in the direction that the fault was discovered and take a new reading. Try to locate the fault in this way.

  HINT: A short-circuit between the CAN cables and supply voltage or ground may be in either the wiring or in a control module.

Remedy the cables as necessary. If a fault is found on one control module, replace the control module.

- **Continue**

  Refer to **VERIFICATION**

IDENTIFYING A CONTROL MODULE IN THE CAN NETWORK

Fig. 307: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Connect the battery.
- Ignition on.

  If the load on the CAN network is too high, this may be due to a control module transmitting faulty messages on the CAN network. This is called a disruptive control module. The fault may also be due to

an intermittent short-circuit to supply voltage or ground in one of the CAN cables. This results in the control modules on the CAN network starting to send faulty messages. The fault may occur without any of the control modules storing a diagnostic trouble code (DTC). The voltage can be measured between the CAN cables in order to check the load on the CAN network.

The following applies for model year -2004:

Connect a voltmeter between the CAN cables. In the event of correct communication on the network, the average value of the voltage must be approximately 0.5 V (0.4 V to 0.6 V).

The following applies for model year 2004-:The following applies for model year 2004-:

Connect a voltmeter between the CAN cables. During correct CAN network communication, voltage should be about 0.6-1.4 V.

NOTE: For vehicles of later model years, the normal voltage value is slightly higher due to increased traffic between the control modules on the CAN network upon update of the electrical system.

In the event of a communication fault the voltage is significantly higher than the above specified values. In order to identify which control module has faulty communication, cut the power supply to one control module at a time. Check the voltage in the CAN cables again. The easiest way to cut the power supply is to remove the fuse(s) for the relevant control module. Repeat until the voltage between the CAN wiring drops to the normal level.

HINT: When the probable faulty control module has been identified, connect and disconnect the supply voltage to the control module a number of times to verify that the fault appears and disappears.

NOTE: Do not cut the power to the central electronic module (CEM) unless it is the last control module left to check.

The control module that is communicating incorrectly must be replaced. Remedy as necessary.

NOTE: After a fault with "interfering" control modules, other control modules may remain in "Limp-Home mode" even when the ignition has been switched off and on several times. To remedy this, disconnect and reconnect the battery negative terminal to restore the control modules to normal function.

Other information

- see **BATTERY, DISCONNECTING**

- **Continue**

Refer to **VERIFICATION**

IDENTIFYING FAULT CAUSES IN THE CAN NETWORK

- Disconnect a control module that disconnects the CAN network (a control module that has four terminals to the CAN network).

  HINT: For the low speed network, suitable places for disconnecting the network are at the steering wheel module (SWM), the driver information module (DIM) or the climate control module (CCM).

  In the event of an open-circuit on, or short-circuit between the CAN cables, the fault can be localized by disconnecting a control module that splits the CAN network. Readings can then be taken to determine on which side the fault is on the disconnected control module.

  Connect an ohmmeter between the CAN cables. Take readings from both ends of the CAN networks at the network junction. Twist and bend the cable harness to find any intermittent short-circuits. Resistance should be 120 ohms.

  If a fault can be localized in one direction, split the network at a point further on in the CAN network in the direction that the fault was discovered and take a new reading. Try to locate the fault in this way.

  Remedy the cables as necessary.

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After rectifying a fault, a verification should be carried out.

Fig. 308: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Reinstall the connectors, components etc.
- Ignition on.
- Erase diagnostic trouble codes using the VCT2000 (or appropriate scan tool).
- Start the car. Allow the vehicle to run for 10 minutes.
- Read off diagnostic trouble codes (DTCs).

Fig. 309: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Does the diagnostic trouble code (DTC) for a communication fault recur (CEM-1A5X or CEM-1A6X)?

- **YES**

  Refer to **INFORMATION**

- **NO**

  OKAY: Troubleshooting has been completed.

INFORMATION

FAULT-TRACING INFORMATION

Verification shows that the fault is no longer present. The diagnostic trouble code (DTC) was probably caused by an intermittent fault.

Fault-tracing for this diagnostic trouble code (DTC) is not followed by a verification.

You can view the information again or exit fault-tracing for this diagnostic trouble code (DTC).

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

SIGNAL SPECIFICATION

Fig. 310: Control Module Terminals
Courtesy of VOLVO CARS CORPORATION

NOTE: **It is important to connect the breakout box and check the ground terminals before taking readings.**

Two breakout boxes are required to take readings from the SRS control module.

NOTE: **The terminals for connector C are split between breakout boxes 1 and 2.**

From model year 2003, the connectors are numbered 1-84.

- Terminals #1A-#28A correspond to terminals #1-#28
- Terminals #1B-#28B correspond to terminals #29-#56
- #1C-#28C correspond to #57-#84

CEM-1A51: COMMUNICATION WITH THE SUPPLEMENTAL RESTRAINT SYSTEM MODULE (SRS). SIGNAL MISSING (2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-1A51

Condition

Fig. 311: Identifying SRS Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) registers that communication with the supplementary restraint system (SRS) control module is not operating.

The diagnostic trouble code (DTC) can be diagnosed when the ignition has been on for more than 10 seconds.

NOTE: **In the event of CEM-1A5X diagnostic trouble codes (DTCs), the central electronic module (CEM) must not be replaced as the diagnostic trouble code (DTC) indicates a communication fault in the controller area network (CAN)**

Substitute Value

- None.

Possible Source

- No power supply to SRS control module
- Open-circuit in the ground lead for the supplemental restraint system module (SRS)
- Contact resistance in the terminals

- Open-circuit in the wiring for the CAN low speed network to the SRS control module
- The supplemental restraint system module (SRS) is not intended for this vehicle (for example a used control module with different software/hardware).

HINT: If several diagnostic trouble codes (DTCs) are stored in the central electronic module (CEM) for communication faults with other control modules in the low speed network, this indicates a common fault in the controller area network (CAN).

Fault symptom[s]

- The SRS indicator lamp is lit.

SIGNAL MISSING

CHECKING THE POWER SUPPLY FOR THE SUPPLEMENTAL RESTRAINT SYSTEM MODULE (SRS)

Check the power supply to the control module by turning the ignition key to ignition position II.

The SRS (supplemental restraint system) indicator lamp in the driver information module (DIM) must light. The lamp must go out after a few seconds.

Fig. 312: Locating SRS Control Module
Courtesy of VOLVO CARS CORPORATION

Does the warning lamp go out?

- **YES**

  Refer to **CHECKING COMMUNICATION WITH THE SUPPLEMENTAL RESTRAINT SYSTEM MODULE (SRS)**

- **NO**

  Refer to **CHECKING THE POWER SUPPLY AND GROUND FOR THE SUPPLEMENTAL RESTRAINT SYSTEM MODULE (SRS)**

CHECKING THE POWER SUPPLY AND GROUND FOR THE SUPPLEMENTAL RESTRAINT SYSTEM MODULE (SRS)

Check that the fuse for the control module is intact.

Check the power supply and ground terminal for the supplemental restraint system module (SRS).

NOTE: The supplemental restraint system module (SRS) is powered via two power inputs. Check that the control module is powered in all ignition positions according to the instructions below.

Remedy as necessary

Other information

- see **CHECKING THE SUPPLY VOLTAGE/GROUND TERMINAL**
- see **CHECKING WIRING AND TERMINALS**

Was a fault detected?

- **YES**

  Refer to **CHECKING THE FUNCTION OF THE SUPPLEMENTAL RESTRAINT SYSTEM MODULE (SRS)**

- **NO**

  Refer to **SIGNAL MISSING**

CHECKING COMMUNICATION WITH THE SUPPLEMENTAL RESTRAINT SYSTEM MODULE (SRS)

HINT: The CAN communication with the control module is probably OK if the control module ID can be read off. In that case the fault is probably intermittent and will then be more difficult to trace.

Fig. 313: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- Try to communicate with the supplemental restraint system module (SRS) by reading off the control module ID using the VCT2000 (or appropriate scan tool)
- **Continue**

  Refer to **SIGNAL MISSING**

CHECKING THE FUNCTION OF THE SUPPLEMENTAL RESTRAINT SYSTEM MODULE (SRS)

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 314: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 315: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reconnect the connectors. Reinstall the components
- Ignition on.

  Check the power supply to the control module by turning the ignition key to ignition position II.

  The indicator lamp in the driver information module (DIM) must light up. The lamp must go out after a few seconds.

Does the indicator lamp go out?

- **YES**

OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

SIGNAL MISSING

GENERAL INFORMATION

NOTE: Illustrations shown are only examples.

For general information about CAN-troubleshooting, see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK**

- General about CAN-related diagnostic trouble codes.

  CEM-DF01 - DF17 can only be stored in Central electronic module (CEM). These diagnostic trouble codes are stored when an electric fault is detected in CAN-lines. Start with these diagnostic trouble codes first.

  CEM-1AXX only stored in Central electronic module (CEM). One diagnostic trouble code for every control module on the CAN-net. These diagnostic trouble codes indicate that Central electronic module (CEM) does not receive any reply from other control modules.

  XXX-E000 (HS-CAN)/E001 (LS-CAN) can be stored in all CAN-connected control modules. These diagnostic trouble codes indicate that the control module has detected interference on the CAN-net.

  XXX-E003 can be stored in all CAN-connected control modules except in Central electronic module (CEM). The control modules on the CAN-net listen for a message (identity number) that is sent out at regular intervals from Central electronic module (CEM). This diagnostic trouble code indicates that the control module has not received any identity number, or that the expected number is not correct. Interference on the CAN-net can also store this diagnostic trouble code.

  NOTE: In case of CAN-related faults, it is likely that a combination of above diagnostic trouble codes occur.

  NOTE: After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.

  If diagnostic trouble codes (DTCs) for communication faults can be read off from a control module, the fault is probably intermittent.

Intermittent fault in the voltage supply and ground to a control module on the CAN network results in the Central electronic module (CEM) storing a diagnostic trouble code (DTC) for an open-circuit in communication with the control module where the voltage supply does not work. There will probably not be a diagnostic trouble code (DTC) in the control module where the open-circuit in the voltage supply occurred as the control module cannot store a diagnostic trouble code (DTC) when it is not supplied with power.

NOTE: **Central electronic module (CEM) should not be replaced in case of CAN-fault, unless troubleshooting reveals that Central electronic module (CEM) has an internal fault.**

Fig. 316: High-Speed CAN And Low-Speed CAN Communication Diagram
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **CHECKING RESISTANCE IN CAN-NET**

CHECKING RESISTANCE IN CAN-NET

Fig. 317: Ignition Off And Disconnecting Battery Negative Lead
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the battery negative lead
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

For general information about CAN-troubleshooting, see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK**

Measure resistance between the following connections on the OBDII-box/diagnostics socket.

- #3 and #11. The resistance should be approx. 55 - 65 ohms.
- If resistance is approx. 120 ohms, this indicates open circuit in the circuit so that only one terminating resistor (120 ohms) has been measured.
- If resistance is above 1 kohms this indicates open circuit/high contact resistance somewhere in the circuit.
- If resistance is below 55 ohms this indicates short-circuiting/contact resistance between the CAN-lines somewhere in the circuit.

HINT: For LS-CAN, terminating resistors are located in Upper electronic module (UEM) and Rear electronic module (REM).

Twist the cable harness and wiggle connectors where they can be accessed along the cable harness during every measurement, and note if the resistance changes to detect intermittent short-circuits or open circuit.

NOTE: **Resistance measurement measures only main lines in the CAN-net (in circuit where both terminating resistors are found), not branches to certain control modules. Open circuit on branching without a terminating resistor cannot be detected with this measurement. However, short-circuiting on a branch can be detected. To measure resistance in the CAN-net to control modules located in a branching of their own, the measurement shall be done against the CAN-net at that control module. The values shall be as above.**

NOTE: **After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.**

Remedy as necessary.

Other information

- see **BATTERY, DISCONNECTING**
- see **CHECKING WIRING AND TERMINALS**

Fig. 318: Checking Resistance In CAN Lines
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING SHORT-CIRCUITING TO GROUND/VOLTAGE IN CAN-NET**

CHECKING THE AMOUNT OF TRAFFIC ON THE LS-CAN

Fig. 319: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

- Connect the battery
- Ignition on.
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

  For general information about CAN-troubleshooting, see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK**

  Faults in the CAN network may be due to a control module sending faulty messages that disrupt normal

communication. When messages are sent incorrectly, this results in a considerable increase in the amount of traffic on the CAN network. The load can be checked by reading the average value of the voltage on the CAN cables in relation to ground.

Measure voltage between the following connections on the OBDII-box/diagnostics socket.

- #3 and #4 (ground). The voltage should be approx:2, 8 - 3, 2 V.
- #11 and #4 (ground). The voltage should be approx:1, 8 - 2, 2 V.
- #3 and #11. The voltage shall be between approx. 0.55-1.4 V. The voltage shall normally be between 0.55 - 0.90 V. A higher voltage may indicate increased traffic on the CAN-net. In case of fault in communication/too high traffic on the CAN-net, the voltage is considerably higher than the above stated values.

NOTE: After fault with control modules that interfere with communication, other control modules may remain in Limp-Home even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.

HINT: DiCE can be used as fault detection tool if fault is suspected on the CAN-net that cannot be detected with normal troubleshooting. Interference, intermittent faults, faulty messages on the CAN-net etc., are examples of such faults. The tool registers fault messages used on the CAN-net. Fault messages may be caused by short intermittent malfunctions on the CAN-net or by a control module sending fault messages. See tools:951 3010 as well as associated TJ 20402.

- Ignition on.
- Connect DiCE to the diagnostics socket.
- Note the blue LED-indicator. The indicator flashes to show detection of fault messages.

NOTE: Certain interference may occur without any real fault

Cable fault

- Shake the cables lightly and pull lightly on the connections during the check to locate any fault. Note the blue LED-indicator.

"Chatting" control modules

- "Chatting" control modules may be difficult to find and troubleshooting may take time. Let the vehicle stand with DiCE connected for an extended time period. Afterwards, activate functions to provoke a malfunction. It may take up to several hours before the fault messages are sent. When the indicator starts to flash, remove the fuse for one control module at a time until the indicator stops flashing. When the indicator stops flashing, restore the fuse for the relevant control module and check that the indicator starts to flash again. Then it is likely that the problem is identified.

Remedy wiring as necessary.

Other information

- see **BATTERY, DISCONNECTING**
- see **TROUBLESHOOTING USING DICE ERROR FRAME FINDER**
- see **CHECKING WIRING AND TERMINALS**

Fig. 320: Checking Amount Of Traffic On LS-CAN
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **IDENTIFYING A CONTROL MODULE IN THE CAN NETWORK**

- **NO**

  Refer to **CHECKING VOLTAGE-DROP IN CABLE FOR CAN-H AND CAN-L, RESPECTIVELY**

IDENTIFYING A CONTROL MODULE IN THE CAN NETWORK

Fig. 321: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

For general information about CAN-troubleshooting, see **GENERAL INFORMATION ABOUT FAULT-**

TRACING IN THE CAN NETWORK

HINT: DiCE can be used as fault detection tool if fault is suspected on the CAN-net that cannot be detected with normal troubleshooting. Interference, intermittent faults, faulty messages on the CAN-net (chattering control modules) etc., are examples of such faults. The tool registers fault messages used on the CAN-net. Fault messages may be caused by short intermittent malfunctions on the CAN-net or by a control module sending fault messages. See tools:951 3010 (memory card) as well as associated TJ 20402. If the load on the CAN network is too high, this may be due to a control module transmitting faulty messages on the CAN network. This is called a disruptive control module. The fault may also be due to an intermittent short-circuit to supply voltage or ground in one of the CAN cables. This results in the control modules on the CAN network starting to send faulty messages. The fault may occur without any of the control modules storing a diagnostic trouble code (DTC). The voltage can be measured between the CAN cables in order to check the load on the CAN network.

NOTE: **It is not necessarily the control module that has set the diagnostic trouble code that communicates incorrectly. Faulty messages can come from any control module in the same section of the CAN network. However, faulty communication in one network cannot affect the communication on the other network. In other words, faulty communication on the LS-CAN cannot disrupt communication on the HS-CAN and vice versa.**

- Ignition on.
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

Check communication/load on CAN-net by measuring voltage between CAN-L and CAN-H. Measure voltage between the following connections on the OBDII-box/diagnostics socket.

- #3 and #11. The average value of the voltage must be approximately 0.6-1.4 V. The voltage shall normally be between 0.55 - 0.90 V. A higher voltage may indicate increased traffic on the CAN-net. In case of fault in communication/too high traffic on the CAN-net, the voltage is considerably higher than the above stated values.

In order to identify which control module has faulty communication, cut the power supply to one control module at a time. Check the voltage in the CAN cables again. The easiest way to cut the power supply is to remove the fuse(s) for the relevant control module. Repeat until the voltage between the CAN wiring drops to the normal level.

NOTE: **When connecting and disconnecting certain control modules, diagnostic trouble codes (DTCs) may be stored in other control modules.**

HINT: When the suspected defective control module has been identified, connect and disconnect the supply voltage to the control module a number of times to verify that the malfunction appears and disappears. Switch off the ignition between each check.

NOTE: **Do not cut the power to the central electronic module (CEM) unless it is the last control module left to check.**

A control module that is communicating incorrectly must be replaced. See Repairing and installing/Removing, replacing and installing.

NOTE: **After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.**

Fig. 322: Checking Communication/Load On CAN-net Between CAN-L And CAN-H
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After rectifying a fault, a verification should be carried out.

Fig. 323: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 324: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

- Reinstall the connectors, components etc.
- Ignition on.

NOTE: **For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.**

- Erase diagnostic trouble codes (DTCs) in all control modules.
- Ignition off.
- Ignition on.
- Start the vehicle. Allow the vehicle to run for 10 minutes. Start the engine. Allow the engine to run at idle speed for 10 minutes
- Read out the diagnostic trouble codes in the vehicle via the DIAGNOSTICS tab.

Does the diagnostic trouble code (DTC) for faulty communication return?

- **YES**

  Refer to **INFORMATION**

- **NO**

  OKAY: Troubleshooting has been completed.

CHECKING SHORT-CIRCUITING TO GROUND/VOLTAGE IN CAN-NET

Fig. 325: Ignition Off And Disconnecting Battery Negative Lead
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Disconnect the battery negative lead.
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

  For general information about CAN-troubleshooting, see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK**

  Checking for a short-circuit to ground

  Measure resistance between the following connections on the OBDII-box/diagnostics socket.

  - #3 and #4 (ground). Measurement is shown in the illustration. The resistance should be above 1 kohms.

- #11 and #4 (ground). The resistance should be above 1 kohms.

If resistance is below 1 kohms this indicates short-circuiting between the CAN-line and ground.

Checking for a short-circuit to voltage

Measure resistance between the following connections on the OBDII-box/diagnostics socket.

- #3 and #16 (voltage). Measurement is shown in the illustration. The resistance should be above 1 kohms.
- #11 and #16 (voltage). The resistance should be above 1 kohms.

If resistance is below 1 kohms this indicates short-circuiting between the CAN-line and voltage cable.

Twist the cable harness and wiggle connectors where they can be accessed along the cable harness during every measurement, and note if the resistance changes to detect intermittent short-circuits or open circuit.

HINT: Part the CAN-net at suitable points to decide where a short-circuit may be found.

NOTE: After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.

Remedy as necessary.

Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING THE AMOUNT OF TRAFFIC ON THE LS-CAN**

CHECKING VOLTAGE-DROP IN CABLE FOR CAN-H AND CAN-L, RESPECTIVELY

Fig. 327: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

- Connect the battery.
- Ignition on.
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

  For general information about CAN-troubleshooting, see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK**

  In principle, the voltage measured in each cable in the CAN-net shall be the same at each control module

in the network. This means that the voltage-drop in the cable for CAN-H and CAN-L, respectively, between the control modules should be very low. If there is a voltage-difference in the CAN-lines between the diagnostics socket/Central electronic module (CEM) and a control module due to, e. g., contact resistance in a connector or branching, communication may be lost/interfered with. Check if there is voltage-drop in the cable for CAN-H and CAN-L between the diagnostics socket/Central electronic module (CEM) and the control module where there is problem with communication.

Carry out the following:

Measure voltage between the following connections on the OBDII-box/diagnostics socket.

- #3 and corresponding connection on relevant control module for CAN-H. The voltage shall be lower than 50 mV.
- #11 and corresponding connection on relevant control module for CAN-L. The voltage shall be lower than 50 mV.

If voltage is too high, this indicates too high contact resistance in cable, connector, or branching. Check the circuit between the diagnostics socket and control module in question for contact resistance and oxidation.

NOTE: **After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.**

Remedy wiring as necessary.

Other information

- see **CHECKING WIRING AND TERMINALS**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-1A52: COMMUNICATION WITH THE DRIVER DOOR MODULE (DDM). SIGNAL MISSING (2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-1A52

Condition

Fig. 329: Identifying Driver's Door Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) registers that communication with the driver's door module (DDM) is not operating.

The diagnostic trouble code (DTC) can be diagnosed when the ignition has been on for more than 10 seconds.

NOTE: **In the event of CEM-1A5X diagnostic trouble codes (DTCs), the central electronic module (CEM) must not be replaced as the diagnostic trouble code (DTC) indicates a communication fault in the controller area network (CAN)**

Substitute Value

- None.

Possible Source

- No power supply to the driver's door module (DDM)
- Open-circuit in the ground lead for the driver's door module (DDM)
- Contact resistance in the terminals
- Open-circuit in the wiring for the CAN low speed network to the driver's door module (DDM)

- The driver door module (DDM) is not intended for this vehicle (for example a used control module with different software/hardware).

HINT: If several diagnostic trouble codes (DTCs) are stored in the central electronic module (CEM) for communication faults with other control modules in the low speed network, this indicates a common fault in the controller area network (CAN).

Fault symptom[s]

- Does not lock / unlock a door.
- The driver's door switch panel does not work.

SIGNAL MISSING

CHECKING THE POWER SUPPLY AND GROUND FOR THE DRIVER DOOR MODULE (DDM)

Fig. 330: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check that the fuse for the control module is intact.

  Check the power supply and ground terminal as instructed.

  Other information:

  - see **CHECKING THE POWER SUPPLY AND GROUND TERMINALS**
  - see **CHECKING WIRING AND TERMINALS**

Was a fault detected?

- **YES**

  Refer to **CHECKING THE FUNCTION OF THE DRIVER DOOR MODULE (DDM)**

- **NO**

  Refer to **SIGNAL MISSING**

CHECKING THE COMMUNICATION WITH THE DRIVER DOOR MODULE (DDM)

HINT: The CAN communication with the control module is probably OK if the control module ID can be read off. The fault is probably intermittent and may therefore be difficult to locate.

Fig. 331: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Try to communicate with the driver door module (DDM) by reading off the control module ID using the VCT2000 (or appropriate scan tool)

- **Continue**

  Refer to **SIGNAL MISSING**

CHECKING THE FUNCTION OF THE DRIVER DOOR MODULE (DDM)

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 332: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 333: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reconnect the connectors. Reinstall the components
- Ignition on.

  Check the function of the control module by pressing the up and down buttons for the power window mechanism. The window must open or close.

  Also activate the central locking buttons. The doors must lock and unlock.

Is the function OK?

- **YES**

OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

SIGNAL MISSING

GENERAL INFORMATION

NOTE: Illustrations shown are only examples.

For general information about CAN-troubleshooting, see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK**

- General about CAN-related diagnostic trouble codes.

  CEM-DF01 - DF17 can only be stored in Central electronic module (CEM). These diagnostic trouble codes are stored when an electric fault is detected in CAN-lines. Start with these diagnostic trouble codes first.

  CEM-1AXX only stored in Central electronic module (CEM). One diagnostic trouble code for every control module on the CAN-net. These diagnostic trouble codes indicate that Central electronic module (CEM) does not receive any reply from other control modules.

  XXX-E000 (HS-CAN)/E001 (LS-CAN) can be stored in all CAN-connected control modules. These diagnostic trouble codes indicate that the control module has detected interference on the CAN-net.

  XXX-E003 can be stored in all CAN-connected control modules except in Central electronic module (CEM). The control modules on the CAN-net listen for a message (identity number) that is sent out at regular intervals from Central electronic module (CEM). This diagnostic trouble code indicates that the control module has not received any identity number, or that the expected number is not correct. Interference on the CAN-net can also store this diagnostic trouble code.

  NOTE: In case of CAN-related faults, it is likely that a combination of above diagnostic trouble codes occur.

  NOTE: After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.

  If diagnostic trouble codes (DTCs) for communication faults can be read off from a control module, the fault is probably intermittent.

Intermittent fault in the voltage supply and ground to a control module on the CAN network results in the Central electronic module (CEM) storing a diagnostic trouble code (DTC) for an open-circuit in communication with the control module where the voltage supply does not work. There will probably not be a diagnostic trouble code (DTC) in the control module where the open-circuit in the voltage supply occurred as the control module cannot store a diagnostic trouble code (DTC) when it is not supplied with power.

NOTE: **Central electronic module (CEM) should not be replaced in case of CAN-fault, unless troubleshooting reveals that Central electronic module (CEM) has an internal fault.**

Fig. 334: High-Speed CAN And Low-Speed CAN Communication Diagram
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **CHECKING RESISTANCE IN CAN-NET**

CHECKING RESISTANCE IN CAN-NET

Fig. 335: Ignition Off And Disconnecting Battery Negative Lead
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the battery negative lead
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

For general information about CAN-troubleshooting, see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK**

Measure resistance between the following connections on the OBDII-box/diagnostics socket.

- #3 and #11. The resistance should be approx. 55 - 65 ohms.
- If resistance is approx. 120 ohms, this indicates open circuit in the circuit so that only one terminating resistor (120 ohms) has been measured.
- If resistance is above 1 kohms this indicates open circuit/high contact resistance somewhere in the circuit.
- If resistance is below 55 ohms this indicates short-circuiting/contact resistance between the CAN-lines somewhere in the circuit.

HINT: For LS-CAN, terminating resistors are located in Upper electronic module (UEM) and Rear electronic module (REM).

Twist the cable harness and wiggle connectors where they can be accessed along the cable harness during every measurement, and note if the resistance changes to detect intermittent short-circuits or open circuit.

NOTE: **Resistance measurement measures only main lines in the CAN-net (in circuit where both terminating resistors are found), not branches to certain control modules. Open circuit on branching without a terminating resistor cannot be detected with this measurement. However, short-circuiting on a branch can be detected. To measure resistance in the CAN-net to control modules located in a branching of their own, the measurement shall be done against the CAN-net at that control module. The values shall be as above.**

NOTE: **After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.**

Remedy as necessary.

Other information

- see **BATTERY, DISCONNECTING**
- see **CHECKING WIRING AND TERMINALS**

Fig. 336: Checking Resistance In CAN Lines

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING SHORT-CIRCUITING TO GROUND/VOLTAGE IN CAN-NET**

CHECKING THE AMOUNT OF TRAFFIC ON THE LS-CAN

Fig. 337: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

- Connect the battery
- Ignition on.
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

  For general information about CAN-troubleshooting, see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK**

  Faults in the CAN network may be due to a control module sending faulty messages that disrupt normal

communication. When messages are sent incorrectly, this results in a considerable increase in the amount of traffic on the CAN network. The load can be checked by reading the average value of the voltage on the CAN cables in relation to ground.

Measure voltage between the following connections on the OBDII-box/diagnostics socket.

- #3 and #4 (ground). The voltage should be approx:2, 8 - 3, 2 V.
- #11 and #4 (ground). The voltage should be approx:1, 8 - 2, 2 V.
- #3 and #11. The voltage shall be between approx. 0.55-1.4 V. The voltage shall normally be between 0.55 - 0.90 V. A higher voltage may indicate increased traffic on the CAN-net. In case of fault in communication/too high traffic on the CAN-net, the voltage is considerably higher than the above stated values.

NOTE: After fault with control modules that interfere with communication, other control modules may remain in Limp-Home even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.

HINT: DiCE can be used as fault detection tool if fault is suspected on the CAN-net that cannot be detected with normal troubleshooting. Interference, intermittent faults, faulty messages on the CAN-net etc., are examples of such faults. The tool registers fault messages used on the CAN-net. Fault messages may be caused by short intermittent malfunctions on the CAN-net or by a control module sending fault messages. See tools:951 3010 as well as associated TJ 20402.

- Ignition on.
- Connect DiCE to the diagnostics socket.
- Note the blue LED-indicator. The indicator flashes to show detection of fault messages.

NOTE: Certain interference may occur without any real fault

Cable fault

- Shake the cables lightly and pull lightly on the connections during the check to locate any fault. Note the blue LED-indicator.

"Chatting" control modules

- "Chatting" control modules may be difficult to find and troubleshooting may take time. Let the vehicle stand with DiCE connected for an extended time period. Afterwards, activate functions to provoke a malfunction. It may take up to several hours before the fault messages are sent. When the indicator starts to flash, remove the fuse for one control module at a time until the indicator stops flashing. When the indicator stops flashing, restore the fuse for the relevant control module and check that the indicator starts to flash again. Then it is likely that the problem is identified.

Remedy wiring as necessary.

Other information

- see **TROUBLESHOOTING USING DICE ERROR FRAME FINDER**
- see **CHECKING WIRING AND TERMINALS**

Fig. 338: Checking Amount Of Traffic On LS-CAN
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **IDENTIFYING A CONTROL MODULE IN THE CAN NETWORK**

- **NO**

  Refer to **CHECKING VOLTAGE-DROP IN CABLE FOR CAN-H AND CAN-L, RESPECTIVELY**

IDENTIFYING A CONTROL MODULE IN THE CAN NETWORK

Fig. 339: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

For general information about CAN-troubleshooting, see **GENERAL INFORMATION ABOUT FAULT-**

TRACING IN THE CAN NETWORK

HINT: DiCE can be used as fault detection tool if fault is suspected on the CAN-net that cannot be detected with normal troubleshooting. Interference, intermittent faults, faulty messages on the CAN-net (chattering control modules) etc., are examples of such faults. The tool registers fault messages used on the CAN-net. Fault messages may be caused by short intermittent malfunctions on the CAN-net or by a control module sending fault messages. See tools:951 3010 (memory card) as well as associated TJ 20402. If the load on the CAN network is too high, this may be due to a control module transmitting faulty messages on the CAN network. This is called a disruptive control module. The fault may also be due to an intermittent short-circuit to supply voltage or ground in one of the CAN cables. This results in the control modules on the CAN network starting to send faulty messages. The fault may occur without any of the control modules storing a diagnostic trouble code (DTC). The voltage can be measured between the CAN cables in order to check the load on the CAN network.

NOTE: **It is not necessarily the control module that has set the diagnostic trouble code that communicates incorrectly. Faulty messages can come from any control module in the same section of the CAN network. However, faulty communication in one network cannot affect the communication on the other network. In other words, faulty communication on the LS-CAN cannot disrupt communication on the HS-CAN and vice versa.**

- Ignition on.
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

Check communication/load on CAN-net by measuring voltage between CAN-L and CAN-H. Measure voltage between the following connections on the OBDII-box/diagnostics socket.

- #3 and #11. The average value of the voltage must be approximately 0.6-1.4 V. The voltage shall normally be between 0.55 - 0.90 V. A higher voltage may indicate increased traffic on the CAN-net. In case of fault in communication/too high traffic on the CAN-net, the voltage is considerably higher than the above stated values.

In order to identify which control module has faulty communication, cut the power supply to one control module at a time. Check the voltage in the CAN cables again. The easiest way to cut the power supply is to remove the fuse(s) for the relevant control module. Repeat until the voltage between the CAN wiring drops to the normal level.

NOTE: **When connecting and disconnecting certain control modules, diagnostic trouble codes (DTCs) may be stored in other control modules.**

HINT: When the suspected defective control module has been identified, connect and disconnect the supply voltage to the control module a number of times to verify that the malfunction appears and disappears. Switch off the ignition between each check.

NOTE: **Do not cut the power to the central electronic module (CEM) unless it is the last control module left to check.**

A control module that is communicating incorrectly must be replaced.

NOTE: **After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.**

Fig. 340: Checking Communication/Load On CAN-net Between CAN-L And CAN-H
Courtesy of VOLVO CARS CORPORATION

  Refer to **VERIFICATION**

VERIFICATION

HINT: After rectifying a fault, a verification should be carried out.

Fig. 341: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 342: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

- Reinstall the connectors, components etc.
- Ignition on.

NOTE: **For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.**

- Erase diagnostic trouble codes (DTCs) in all control modules.
- Ignition off.
- Ignition on.
- Start the vehicle. Allow the vehicle to run for 10 minutes. Start the engine. Allow the engine to run at idle speed for 10 minutes
- Read out the diagnostic trouble codes in the vehicle via the DIAGNOSTICS tab.

Does the diagnostic trouble code (DTC) for faulty communication return?

- **YES**

  Refer to **INFORMATION**

- **NO**

  OKAY: Troubleshooting has been completed.

CHECKING SHORT-CIRCUITING TO GROUND/VOLTAGE IN CAN-NET

Fig. 343: Ignition Off And Disconnecting Battery Negative Lead
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Disconnect the battery negative lead.
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

  For general information about CAN-troubleshooting, see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK**

  Checking for a short-circuit to ground

  Measure resistance between the following connections on the OBDII-box/diagnostics socket.

  - #3 and #4 (ground). Measurement is shown in the illustration. The resistance should be above 1 kohms.

- #11 and #4 (ground). The resistance should be above 1 kohms.

If resistance is below 1 kohms this indicates short-circuiting between the CAN-line and ground.

Checking for a short-circuit to voltage

Measure resistance between the following connections on the OBDII-box/diagnostics socket.

- #3 and #16 (voltage). Measurement is shown in the illustration. The resistance should be above 1 kohms.
- #11 and #16 (voltage). The resistance should be above 1 kohms.

If resistance is below 1 kohms this indicates short-circuiting between the CAN-line and voltage cable.

Twist the cable harness and wiggle connectors where they can be accessed along the cable harness during every measurement, and note if the resistance changes to detect intermittent short-circuits or open circuit.

HINT: Part the CAN-net at suitable points to decide where a short-circuit may be found.

NOTE: After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.

Remedy as necessary.

Other information

- see **BATTERY, DISCONNECTING**
- see **CHECKING WIRING AND TERMINALS**

Fig. 344: Checking For Short-Circuiting To Ground/Voltage In CAN-net

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING THE AMOUNT OF TRAFFIC ON THE LS-CAN**

CHECKING VOLTAGE-DROP IN CABLE FOR CAN-H AND CAN-L, RESPECTIVELY

Fig. 345: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

- Connect the battery.
- Ignition on.
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

  For general information about CAN-troubleshooting, see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK**

  In principle, the voltage measured in each cable in the CAN-net shall be the same at each control module

in the network. This means that the voltage-drop in the cable for CAN-H and CAN-L, respectively, between the control modules should be very low. If there is a voltage-difference in the CAN-lines between the diagnostics socket/Central electronic module (CEM) and a control module due to, e. g., contact resistance in a connector or branching, communication may be lost/interfered with. Check if there is voltage-drop in the cable for CAN-H and CAN-L between the diagnostics socket/Central electronic module (CEM) and the control module where there is problem with communication.

Carry out the following:

Measure voltage between the following connections on the OBDII-box/diagnostics socket.

- #3 and corresponding connection on relevant control module for CAN-H. The voltage shall be lower than 50 mV.
- #11 and corresponding connection on relevant control module for CAN-L. The voltage shall be lower than 50 mV.

If voltage is too high, this indicates too high contact resistance in cable, connector, or branching. Check the circuit between the diagnostics socket and control module in question for contact resistance and oxidation.

NOTE: **After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.**

Remedy wiring as necessary.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ELECTRICAL

Cables And Fuses - Diagnostic Trouble Codes and Associated Procedures

CEM-DF05: CAN-H, LOW SPEED NETWORK. SIGNAL TOO LOW (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-DF05

Condition

Fig. 1: Identifying Central Electronic Module
Courtesy of VOLVO CARS CORPORATION

The central electronic module (CEM) checks the voltage in the CAN wiring in the low speed network. The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) registers that there is a short-circuit to ground in the CAN H in the low speed network.

NOTE: **If DFxx diagnostic trouble codes (DTCs) are stored the central electronic module (CEM) must not be replaced as the diagnostic trouble code (DTC) indicates a short-circuit in one or more conductors in the Control area network. The central electronic module (CEM) is the only control module that monitors the voltage level in the Control area network wiring. The central electronic module (CEM) is therefore the only control module that can store a diagnostic**

trouble code (DTC) for a short-circuit in one of the cables to ground or supply voltage. Do not replace the central electronic module (CEM) in the event of a CAN fault unless VIDA fault-tracing has indicated that the central electronic module (CEM) has an internal fault.

The diagnostic trouble code (DTC) can be diagnosed when the ignition has been on for more than 10 seconds.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the low speed network.

Fault symptom[s]

- No gauges working.
- The central locking system does not function at all.

SIGNAL MISSING

see **SIGNAL MISSING**

CEM-DF05: CAN-H, LOW-SPEED NETWORK. SIGNAL TOO LOW. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-DF05

Condition

Diagnostic trouble codes (DTCs) are stored if the central electronic module (CEM) registers that there is a short-circuit to ground in the CAN H in the low speed network.

NOTE: **In the event of DFxx diagnostic trouble codes (DTCs), the central electronic module (CEM) must not be replace as the diagnostic trouble code (DTC) indicates a short-circuit in one or more conductors in the Control area network The central electronic module (CEM) is the only control module that monitors the voltage level in the Control area network wiring. The central electronic module (CEM) is therefore the only control module that can store a diagnostic trouble code (DTC) for a short-circuit in one of the cables to ground or supply voltage. Do not replace the central electronic module (CEM) in the event of a CAN fault unless VIDA fault-tracing has indicated that the central electronic module (CEM) has an internal fault.**

Substitute Value

None.

Possible Source

- Short-circuit to ground in the low speed network.

Fault symptom[s]

- No gauges working
- The instrument lighting does not operate
- The central locking system does not function at all.

SIGNAL TOO LOW. INTERMITTENT FAULT.

CHECKING CONNECTORS AND BUS WIRE

NOTE: **Remember that the CAN network is only a communications network. There are therefore no fuses, switches and sensors on the CAN bus. Check the resistance as described below (see references).**

NOTE: **To maintain the correct values the battery should be disconnected when measuring resistance.**

Check the bus wire for a short circuit to ground as described in, see **SHORT-CIRCUIT TO GROUND, INTERMITTENT FAULTS** .

Also check the intermediate connectors for contact resistance and oxidation as described in, see **CONTACT RESISTANCE AND OXIDATION** and for a loose contact as described in **LOOSE CONNECTIONS (TERMINALS)** .

HINT: If the fault is found before all the wires below have been checked trouble-shooting is not necessary on the wires.

The following wires and connectors should be checked to locate the short circuit.

Wire between:

- road traffic information module (RTI) 10A and rear electronic module (REM) 15A.

  To connect the test box to the RTI control unit, see **CONNECTING THE BREAKOUT BOX TO THE ROAD TRAFFIC INFORMATION (RTI) CONTROL MODULE**

  To connect the test box to the REM control unit, see **CONNECTING THE BREAKOUT BOX TO THE REAR ELECTRONIC MODULE (REM)**

- rear electronic module (REM) 14A, driver information module (DIM) 8 and intermediate connector

54/40.

To connect the test box to the REM control unit, see **CONNECTING THE BREAKOUT BOX TO THE REAR ELECTRONIC MODULE (REM)**

To connect the test box to the DIM control unit, see **CONNECTING THE DRIVER INFORMATION MODULE (DIM) TEST BOX**

- central electronic module (CEM) 3D and driver information module (DIM) 8.

  To connect the test box to the CEM control unit, see **CONNECTING THE BREAKOUT BOX**

  To connect the test box to the DIM control unit, see **CONNECTING THE DRIVER INFORMATION MODULE (DIM) TEST BOX**

- power seat module (PSM) 2B and driver information module (DIM) 8.

  To connect the test box to the PSM control unit, see **CONNECTING THE BREAKOUT BOX, POWER SEAT MODULE (PSM)**

  To connect the test box to the DIM control unit, see **CONNECTING THE DRIVER INFORMATION MODULE (DIM) TEST BOX**

- driver information module (DIM) 2 and climate control module (CCM) 14A.

  To connect the test box to the DIM control unit, see **CONNECTING THE DRIVER INFORMATION MODULE (DIM) TEST BOX**

  To connect the test box to the CCM control unit, see **CONNECTING THE BREAKOUT BOX**

- audio module (AUM) 7A and climate control module (CCM) 14A.

  To connect the test box to the AUM control unit, see **CONNECTING THE BREAKOUT BOX, AUDIO CONTROL MODULE**

  To connect the test box to the CCM control unit, see **CONNECTING THE BREAKOUT BOX**

- phone module (PHM) 22A and climate control module (CCM) 14A.

  To connect the test box to the PHM control unit, see **CONNECTING THE BREAKOUT BOX, CARPHONE MODULE**

  To connect the test box to the CCM control unit, see **CONNECTING THE BREAKOUT BOX**

- passenger door module (PDM) 2A, climate control module (CCM) 14A and intermediate connector 54/11.

To connect the test box to the PDM/DDM control units, see **CONNECTING THE BREAKOUT BOX**

To connect the test box to the CCM control unit, see **CONNECTING THE BREAKOUT BOX**

- climate control unit (CCM) 13A and steering wheel module (SWM) 9.

  To connect the test box to the CCM control unit, see **CONNECTING THE BREAKOUT BOX**

  To connect the test box to the SWM control unit, see **CONNECTING THE BREAKOUT BOX**

- steering wheel module (SWM) 10 and supplemental restraint system (SRS) 23B.

  To connect the test box to the SWM control unit, see **CONNECTING THE BREAKOUT BOX**

  To connect the test box to the SRS control unit, see **CONNECTING THE BREAKOUT BOX**

- supplemental restraint system (SRS) 24B, upper electronic module (UEM) 3 and intermediate connector 54/13.

  To connect the test box to the SRS control unit, see **CONNECTING THE BREAKOUT BOX**

  To connect the test box to the UEM control unit, see **CONNECTING THE BREAKOUT BOX**

- driver door module (DDM) 2A, upper electronic module (UEM) 3 and intermediate connector 54/10.

  To connect the test box to the DDM/PDM control units, see **CONNECTING THE BREAKOUT BOX**

  To connect the test box to the UEM control unit, see **CONNECTING THE BREAKOUT BOX**

Additional information:

- The voltage should be between approximately 2.0 V and 3.5 V.
-
- To disconnect the battery, see **BATTERY, DISCONNECTING**

CEM-DF05: CAN-H, LOW-SPEED NETWORK. SIGNAL TOO LOW. PERMANENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-DF05

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-DF05**

SIGNAL TOO LOW. PERMANENT FAULT

CHECKING CONNECTORS AND BUS WIRE

NOTE: **Remember that the CAN network is only a communications network. There are**

therefore no fuses, switches and sensors on the CAN bus. Check the resistance as described below (see references).

NOTE: To maintain the correct values the battery should be disconnected when measuring resistance.

Check the bus wire for a short circuit to ground as described in, see **SHORT-CIRCUIT TO GROUND, PERMANENT FAULTS** . Also check the intermediate connectors for contact resistance and oxidation as described in **CONTACT RESISTANCE AND OXIDATION** .

The following wires and connectors should be checked to locate the short circuit.

Wire between:

- road traffic information module (RTI) 10A and rear electronic module (REM) 15A.

  To connect the test box to the RTI control unit, see **CONNECTING THE BREAKOUT BOX TO THE ROAD TRAFFIC INFORMATION (RTI) CONTROL MODULE**

  To connect the test box to the REM control unit, see **CONNECTING THE BREAKOUT BOX TO THE REAR ELECTRONIC MODULE (REM)**

- rear electronic module (REM) 14A, driver information module (DIM) 8 and intermediate connector 54/40.

  To connect the test box to the REM control unit, see **CONNECTING THE BREAKOUT BOX TO THE REAR ELECTRONIC MODULE (REM)**

  To connect the test box to the DIM control unit, see **CONNECTING THE DRIVER INFORMATION MODULE (DIM) TEST BOX**

- central electronic module (CEM) 3D and driver information module (DIM) 8.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-DF06: CAN-L, LOW SPEED NETWORK. SIGNAL TOO HIGH (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-DF06

Condition

Fig. 9: Identifying Central Electronic Module
Courtesy of VOLVO CARS CORPORATION

The central electronic module (CEM) checks the voltage in the CAN wiring in the low speed network. The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) registers a short-circuit to supply voltage in the CAN L in the low speed network.

NOTE: **If DFxx diagnostic trouble codes (DTCs) are stored the central electronic module (CEM) must not be replaced as the diagnostic trouble code (DTC) indicates a short-circuit in one or more conductors in the Control area network. The central electronic module (CEM) is the only control module that monitors the voltage level in the Control area network wiring. The central electronic module (CEM) is therefore the only control module that can store a diagnostic trouble code (DTC) for a short-circuit in one of the cables to ground or supply voltage. Do not replace the central electronic module (CEM) in the event of a CAN fault unless VIDA fault-tracing has indicated that the central electronic module (CEM) has an internal fault.**

The diagnostic trouble code (DTC) can be diagnosed when the ignition has been on for more than 10 seconds.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the low speed network.

Fault symptom[s]

- No gauges working.
- The lighting in the instrument panel does not function.
- The central locking system does not function at all.

SIGNAL MISSING

see **SIGNAL MISSING**

CEM-DF06: CAN-L, LOW-SPEED NETWORK. SIGNAL TOO HIGH. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-DF06

Condition

Diagnostic trouble codes (DTCs) are stored if the central electronic module (CEM) registers that there is a short-circuit to supply voltage in the CAN L in the low speed network.

NOTE: **In the event of DFxx diagnostic trouble codes (DTCs), the central electronic module (CEM) must not be replace as the diagnostic trouble code (DTC) indicates a short-circuit in one or more conductors in the Control area network The central electronic module (CEM) is the only control module that monitors the voltage level in the Control area network wiring. The central electronic module (CEM) is therefore the only control module that can store a diagnostic trouble code (DTC) for a short-circuit in one of the cables to ground or supply voltage. Do not replace the central electronic module (CEM) in the event of a CAN fault unless VIDA fault-tracing has indicated that the central electronic module (CEM) has an internal fault.**

Substitute Value

None.

Possible Source

- Short-circuit to supply voltage in the low speed network.

Fault symptom[s]

- No gauges working
- The lighting in the instrument panel does not function
- The central locking system does not function at all.

SIGNAL TOO HIGH. INTERMITTENT FAULT.

CHECKING CONNECTORS AND BUS WIRE

NOTE: **Remember that the CAN network is only a communications network. There are therefore no fuses, switches and sensors on the CAN bus. Check the resistance as described below (see references).**

NOTE: **To maintain the correct values the battery should be disconnected when measuring resistance.**

Check the bus wire for a short circuit to voltage supply as described in, see **SHORT-CIRCUIT TO SUPPLY VOLTAGE, INTERMITTENT FAULTS** and for an intermittent open circuit as described in **OPEN-CIRCUIT, INTERMITTENT FAULTS** .

When checking for an open circuit, check if possible from the rear of the connector concerned so that it is not damaged.

Also check the intermediate connectors for contact resistance and oxidation as described in, see **CONTACT RESISTANCE AND OXIDATION** and for a loose contact as described in **LOOSE CONNECTIONS (TERMINALS)** .

HINT: If the fault is found before all the wires below have been checked trouble-shooting is not necessary on the wires.

The following wires and connectors should be checked to locate the short circuit.

Wire between:

- road traffic information module (RTI) 22A and rear electronic module (REM) 17A.

  To connect the test box to the RTI control unit, see **CONNECTING THE BREAKOUT BOX TO THE ROAD TRAFFIC INFORMATION (RTI) CONTROL MODULE**

  To connect the test box to the REM control unit, see **CONNECTING THE BREAKOUT BOX TO THE REAR ELECTRONIC MODULE (REM)** .

- rear electronic module (REM) 16A, driver information module (DIM) 9 and intermediate connector 54/40.

  To connect the test box to the REM control unit, see **CONNECTING THE BREAKOUT BOX TO THE REAR ELECTRONIC MODULE (REM)** .

To connect the test box to the DIM control unit, see **CONNECTING THE DRIVER INFORMATION MODULE (DIM) TEST BOX** .

- central electronic module (CEM) 2D and driver information module (DIM) 9.

  To connect the test box to the CEM control unit, see **CONNECTING THE BREAKOUT BOX** .

  To connect the test box to the DIM control unit, see **CONNECTING THE DRIVER INFORMATION MODULE (DIM) TEST BOX** .

- power seat module (PSM) 3B and driver information module (DIM) 9.

  To connect the test box to the PSM control unit, see **CONNECTING THE BREAKOUT BOX, POWER SEAT MODULE (PSM)** .

  To connect the test box to the DIM control unit, see **CONNECTING THE DRIVER INFORMATION MODULE (DIM) TEST BOX**

- driver information module (DIM) 3 and climate control module (CCM) 12A.

  To connect the test box to the DIM control unit, see **CONNECTING THE DRIVER INFORMATION MODULE (DIM) TEST BOX**

  To connect the test box to the CCM control unit, see **CONNECTING THE BREAKOUT BOX**

- audio module (AUM) 8A and climate control module (CCM) 12A.

  To connect the test box to the AUM control unit, see **CONNECTING THE BREAKOUT BOX, AUDIO CONTROL MODULE**

  To connect the test box to the CCM control unit, see **CONNECTING THE BREAKOUT BOX**

- phone module (PHM) 10A and climate control module (CCM) 12A.

  To connect the test box to the PHM control unit, see **CONNECTING THE BREAKOUT BOX, CARPHONE MODULE**

  To connect the test box to the CCM control unit, see **CONNECTING THE BREAKOUT BOX**

- passenger door module (PDM) 3A, climate control module (CCM) 12A and intermediate connector 54/11.

  To connect the test box to the PDM/DDM control units, see **CONNECTING THE BREAKOUT BOX**

  To connect the test box to the CCM control unit, see **CONNECTING THE BREAKOUT BOX**

- climate control module (CCM) 11A and steering wheel module (SWM) 19.

To connect the test box to the CCM control unit, see **CONNECTING THE BREAKOUT BOX**

To connect the test box to the SWM control unit, see **CONNECTING THE BREAKOUT BOX**

- steering wheel module (SWM) 20 and supplemental restraint system (SRS) 25B.

  To connect the test box to the SWM control unit, see **CONNECTING THE BREAKOUT BOX**

  To connect the test box to the SRS control unit, see **CONNECTING THE BREAKOUT BOX**

- supplemental restraint system (SRS) 26B, upper electronic module (UEM) 5 and intermediate connector 54/13.

  To connect the test box to the SRS control unit, see **CONNECTING THE BREAKOUT BOX**

  To connect the test box to the UEM control unit, see **CONNECTING THE BREAKOUT BOX**

- driver door module (DDM) 3A, upper electronic module (UEM) 5 and intermediate connector 54/10.

  To connect the test box to the DDM/PDM control units, see **CONNECTING THE BREAKOUT BOX**

  To connect the test box to the UEM control unit, see **CONNECTING THE BREAKOUT BOX**

Additional information:

- The voltage should be between approximately 1.5 V and 2.5 V.
- To disconnect the battery, see **BATTERY, DISCONNECTING**

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-DF07: CAN-H, LOW SPEED NETWORK. FAULTY SIGNAL (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-DF07

Condition

Fig. 17: Identifying Central Electronic Module
Courtesy of VOLVO CARS CORPORATION

The central electronic module (CEM) checks the voltage in CAN L and CAN H on the low speed network. The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) registers a short-circuit between CAN L and CAN H in the low speed network.

The diagnostic trouble code (DTC) can be diagnosed when the ignition has been on for at least 10 seconds.

NOTE: **If DFxx diagnostic trouble codes (DTCs) are stored the central electronic module (CEM) must not be replaced as the diagnostic trouble code (DTC) indicates a short-circuit in one or more conductors in the Control area network. The central electronic module (CEM) is the only control module that monitors the voltage level in the Control area network wiring. The central electronic module (CEM) is therefore the only control module that can store a diagnostic trouble code (DTC) for a short-circuit in one of the cables to ground or supply voltage. Do not replace the central electronic module (CEM) in the event of a CAN fault unless VIDA fault-tracing has indicated that the central electronic module (CEM) has an internal fault.**

The diagnostic trouble code (DTC) can be diagnosed when the ignition has been on for more than 10 seconds.

Substitute Value

- None.

Possible Source

- Short-circuit between CAN L and CAN H in the low speed network.

Fault symptom[s]

- No gauges working.
- The instrument lighting does not operate
- The central locking system does not function at all.

SIGNAL MISSING

see **SIGNAL MISSING**

CEM-DF11: CAN-H, HIGH SPEED NETWORK. SIGNAL MISSING (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-DF11

Condition

Fig. 18: Identifying Central Electronic Module
Courtesy of VOLVO CARS CORPORATION

The central electronic module (CEM) checks the voltage in the CAN wiring in the high speed network. The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) registers an open-circuit in CAN H or CAN L in the high speed network.

NOTE: **The central electronic module (CEM) is the only control module that monitors the voltage level in the Control area network wiring. The central electronic module (CEM) is the only control module that can directly store diagnostic trouble codes (DTCs) for an open-circuit in these conductors. However other control modules can store diagnostic trouble codes (DTCs) as a result of the open-circuit. Do not replace the central electronic module (CEM) in the event of a CAN fault unless VIDA fault-tracing has indicated that the central electronic module (CEM) has an internal fault.**

The diagnostic trouble code (DTC) can be diagnosed when the ignition has been on for more than 10 seconds.

Substitute Value

- None.

Possible Source

- Open-circuit in one of the control area network (CAN) cables on the high speed network
- Contact resistance in the terminals.

Fault symptom[s]

- The engine does not start.
- Malfunction indicator lamp (MIL) lit.
- Message in the display.

SIGNAL MISSING

GENERAL INFORMATION

NOTE: Figures shown are only examples.

HINT: For general information about CAN-troubleshooting, see

General about CAN-related diagnostic trouble codes.

CEM-DF01 - DF17 can only be stored in Central electronic module (CEM). These diagnostic trouble codes are stored when an electric fault is detected in CAN-lines. Start with these diagnostic trouble codes first.

CEM-1AXX only stored in Central electronic module (CEM). One diagnostic trouble code for every control module on the CAN-net. These diagnostic trouble codes indicate that Central electronic module (CEM) does not receive any reply from other control modules.

XXX-E000 (HS-CAN)/E001 (LS-CAN) can be stored in all CAN-connected control modules. These diagnostic trouble codes indicate that the control module has detected interference on the CAN-net.

XXX-E003 can be stored in all CAN-connected control modules except in Central electronic module (CEM). The control modules on the CAN-net listen for a message (identity number) that is sent out at regular intervals from Central electronic module (CEM). This diagnostic trouble code indicates that the control module has not received any identity number, or that the expected number is not correct. Interference on the CAN-net can also store this diagnostic trouble code.

NOTE: In case of CAN-related faults, it is likely that a combination of above diagnostic trouble codes occur.

NOTE: After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.

If a communication diagnostic trouble code can be read from the control module, the malfunction is probably intermittent.

Intermittent fault in the voltage supply and ground to a control module on the CAN network results in the Central electronic module (CEM) storing a diagnostic trouble code (DTC) for an open-circuit in communication with the control module where the voltage supply does not work. There will probably not be a diagnostic trouble code (DTC) in the control module where the open-circuit in the voltage supply occurred as the control module cannot store a diagnostic trouble code (DTC) when it is not supplied with power.

NOTE: **Central electronic module (CEM) should not be replaced in case of CAN-fault, unless troubleshooting reveals that Central electronic module (CEM) has an internal fault.**

Fig. 19: Identifying High-Speed CAN And Low-Speed CAN Communication Diagram
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING RESISTANCE IN CAN-NET**

CHECKING RESISTANCE IN CAN-NET

Fig. 20: Identifying Ignition OFF And Disconnected Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Ignition off

- Disconnect the battery negative lead
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

For general information about CAN-troubleshooting, see

- see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK**

Measure resistance between the following connections on the OBDII-box/diagnostics socket.

- #6 and #14. The resistance should be approx. 55 - 65 ohms.
- If resistance is approx. 120 ohms, this indicates open circuit in the circuit so that only one terminating resistor (120 ohms) has been measured.
- If resistance is above 1 kohms this indicates open circuit/high contact resistance somewhere in the circuit.
- If resistance is below 55 ohms this indicates short-circuiting/contact resistance between the CAN-lines somewhere in the circuit.

HINT: For HS-CAN the terminating resistors are located in Brake control module (BCM) and in Engine control module (ECM).

Twist the cable harness and wiggle connectors where they can be accessed along the cable harness during every measurement, and note if the resistance changes to detect intermittent short-circuits or open circuit.

NOTE: **Resistance measurement measures only main lines in the CAN-net (in circuit where both terminating resistors are found), not branches to certain control modules.**

Open circuit on branching without a terminating resistor cannot be detected with this measurement. However, short-circuiting on a branch can be detected. To measure resistance in the CAN-net to control modules located in a branching of their own, the measurement shall be done against the CAN-net at that control module. The values shall be as above.

NOTE: **After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.**

Remedy wiring as necessary.

Other information

- see **BATTERY, DISCONNECTING**

- see **CHECKING WIRING AND TERMINALS**

Fig. 21: Identifying HS CAN (High Speed) Component Resistance Measurement

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING SHORT-CIRCUITING TO GROUND/VOLTAGE IN CAN-NET**

CHECKING THE TRAFFIC LOAD ON THE CAN CABLES

Fig. 22: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Connect the battery
- Ignition on.
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

  For general information about CAN-troubleshooting, see

- see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK**

Faults in the CAN network may be due to a control module sending faulty messages that disrupt normal communication. When messages are sent incorrectly, this results in a considerable increase in the amount of traffic on the CAN network. Check the load by measuring the average voltage value on the CAN cables in relation to ground.

Measure voltage between the following connections on the OBDII-box/diagnostics socket.

- #6 and #4 (ground). The voltage should be approx:2, 8 - 3, 2 V.
- #14 and #4 (ground). The voltage should be approx:1, 8 - 2, 2 V.
- #6 and #14. The voltage shall be between approx. 0.55-1.4 V. The voltage shall normally be between 0.55 - 0.90 V. A higher voltage may indicate increased traffic on the CAN-net. In case of fault in communication/too high traffic on the CAN-net, the voltage is considerably higher than the above stated values.

NOTE: After fault with control modules that interfere with communication, other control modules may remain in Limp-Home even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.

HINT: DiCE can be used as fault detection tool if fault is suspected on the CAN-net that cannot be detected with normal troubleshooting. Interference, intermittent faults, faulty messages on the CAN-net etc., are examples of such faults. The tool registers fault messages used on the CAN-net. Fault messages may be caused by short intermittent malfunctions on the CAN-net or by a control module sending fault messages. See tools:951 3010 as well as associated TJ 20402.

- Ignition on.
- Connect DiCE to the diagnostics socket.
- Note the blue LED-indicator. The indicator flashes to show detection of fault messages.

NOTE: Certain interference may occur without any real fault

Cable fault

- Shake the cables lightly and pull lightly on the connections during the check to locate any fault. Note the blue LED-indicator.

"Chatting" control modules

- "Chatting" control modules may be difficult to find and troubleshooting may take time. Let the vehicle stand with DiCE connected for an extended time period. Afterwards, activate functions to provoke a malfunction. It may take up to several hours before the fault messages are sent. When the indicator starts to flash, remove the fuse for one control module at a time until the indicator stops flashing. When the indicator stops flashing, restore the fuse for the relevant control module and

check that the indicator starts to flash again. Then it is likely that the problem is identified.

Remedy wiring as necessary.

Other information

- see **BATTERY, DISCONNECTING**
- see **CHECKING WIRING AND TERMINALS**

Fig. 23: Identifying Control Modules Interference Diagram
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **IDENTIFYING A CONTROL MODULE IN THE CAN NETWORK**

- **NO**

  Refer to **CHECKING VOLTAGE-DROP IN CABLE FOR CAN-H AND CAN-L, RESPECTIVELY**

IDENTIFYING A CONTROL MODULE IN THE CAN NETWORK

Fig. 24: Identifying Ignition ON

Courtesy of VOLVO CARS CORPORATION

For general information about CAN-troubleshooting, see

- see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK**

HINT: DiCE can be used as fault detection tool if fault is suspected on the CAN-net that cannot be detected with normal troubleshooting. Interference, intermittent faults, faulty messages on the CAN-net (chattering control modules) etc., are examples of such faults. The tool registers fault messages used on the CAN-net. Fault messages may be caused by short intermittent malfunctions on the CAN-net or by a control module sending fault messages. See tools:951 3010 (memory card) as well as associated TJ 20402.

If the load on the CAN network is too high, this may be due to a control module sending faulty messages on the CAN network (known as a disruptive control module). The fault may also be due to an intermittent short-circuit to supply voltage or ground in one of the CAN cables. This results in the control modules on the CAN network starting to send faulty messages. The faults can occur without a diagnostic trouble code (DTC) being stored by the control modules. The voltage can be measured between the CAN cables in order to check the load on the CAN network.

NOTE: **It is not necessarily the control module(s) that stored the diagnostic trouble code (DTC) that is communicating faultily. Faulty messages can come from any control module in the same section of the CAN network. However, faulty communication in one network cannot affect the communication on the other network. In other words, faulty communication on the LS-CAN cannot disrupt communication on the HS-CAN and vice versa.**

- Ignition on.
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

Check communication/load on CAN-net by measuring voltage between CAN-L and CAN-H. Measure voltage between the following connections on the OBDII-box/diagnostics socket.

- #6 and #14. The average value of the voltage must be approximately 0.6-1.4 V. The voltage shall normally be between 0.55 - 0.90 V. A higher voltage may indicate increased traffic on the CAN-net. In case of fault in communication/too high traffic on the CAN-net, the voltage is considerably higher than the above stated values.

In order to identify which control module has faulty communication, cut the power supply to one control module at a time. Check the voltage in the CAN cables again. The easiest way to cut the power supply is to remove the fuse(s) for the relevant control module. Repeat until the voltage between the CAN wiring drops to the normal level.

NOTE: **When connecting and disconnecting individual control modules, other diagnostic trouble codes (DTCs) may be stored in certain control modules.**

HINT: When the suspected defective control module has been identified, connect and disconnect the supply voltage to the control module a number of times to verify that the malfunction appears and

disappears. Switch off the ignition between each check.

NOTE: Do not cut the power to the central electronic module (CEM) unless it is the last control module left to check.

A control module that is communicating incorrectly must be replaced. See Repairing and installing/Removing, replacing and installing.

NOTE: After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.

Fig. 27: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Reinstall the connectors, components etc.
- Ignition on.

NOTE: **For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.**

- Erase diagnostic trouble codes (DTCs) in all control modules.
- Ignition off.
- Ignition on.
- Start the vehicle. Allow the vehicle to run for 10 minutes.
- Read out the diagnostic trouble codes in the vehicle via the DIAGNOSTICS tab.

Does the diagnostic trouble code (DTC) for faulty communication return?

- **YES**

  Refer to **INFORMATION**

- **NO**

  OKAY: Troubleshooting has been completed.

CHECKING SHORT-CIRCUITING TO GROUND/VOLTAGE IN CAN-NET

Fig. 28: Identifying Ignition OFF And Disconnected Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Disconnect the battery negative lead.
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

  For general information about CAN-troubleshooting, see

  - see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK**

  Checking for a short-circuit to ground

  Measure resistance between the following connections on the OBDII-box/diagnostics socket.

  - #6 and #4 (ground). Measurement is shown in the figure. The resistance should be above 1 kohms.
  - #14 and #4 (ground). The resistance should be above 1 kohms.

If resistance is below 1 kohms this indicates short-circuiting between the CAN-line and ground.

Checking for a short-circuit to voltage

Measure resistance between the following connections on the OBDII-box/diagnostics socket.

- #6 and #16 (voltage). Measurement is shown in the figure. The resistance should be above 1 kohms.
- #14 and #16 (voltage). The resistance should be above 1 kohms.

If resistance is below 1 kohms this indicates short-circuiting between the CAN-line and voltage cable.

Twist the cable harness and wiggle connectors where they can be accessed along the cable harness during every measurement, and note if the resistance changes to detect intermittent short-circuits or open circuit.

HINT: Part the CAN-net at suitable points to decide where a short-circuit may be found.

NOTE: After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.

Remedy wiring as necessary.

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING THE TRAFFIC LOAD ON THE CAN CABLES**

CHECKING VOLTAGE-DROP IN CABLE FOR CAN-H AND CAN-L, RESPECTIVELY

Fig. 30: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Connect the battery.
- Ignition on.
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

  For general information about CAN-troubleshooting, see

  - see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK**

  In principle, the voltage measured in each cable in the CAN-net shall be the same at each control module in the network. This means that the voltage-drop in the cable for CAN-H and CAN-L, respectively, between the control modules should be very low. If there is a voltage-difference in the CAN-lines between the diagnostics socket/Central electronic module (CEM) and a control module due to, e. g., contact resistance in a connector or branching, communication may be lost/interfered with.

  Check if there is voltage-drop in the cable for CAN-H and CAN-L between the diagnostics socket/Central electronic module (CEM) and the control module where there is problem with communication.

  Carry out the following:

  Measure voltage between the following connections on the OBDII-box/diagnostics socket.

  - #6 and corresponding connection on relevant control module for CAN-H. The voltage shall be lower than 50 mV.

- #14 and corresponding connection on relevant control module for CAN-L. The voltage shall be lower than 50 mV.

If voltage is too high, this indicates too high contact resistance in cable, connector, or branching. Check the circuit between the diagnostics socket and control module in question for contact resistance and oxidation.

NOTE: **After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.**

Remedy wiring as necessary.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-DF13: CAN-H, HIGH SPEED NETWORK. SIGNAL TOO HIGH (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-DF13

Condition

Fig. 32: Identifying Central Electronic Module
Courtesy of VOLVO CARS CORPORATION

The central electronic module (CEM) checks the voltage in the CAN wiring in the high speed network. The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) registers a short-circuit to supply voltage in the CAN H in the high speed network.

NOTE: **If DFxx diagnostic trouble codes (DTCs) are stored the central electronic module (CEM) must not be replaced as the diagnostic trouble code (DTC) indicates a short-circuit in one or more conductors in the Control area network. The central electronic module (CEM) is the only control module that monitors the voltage level in the Control area network wiring. The central electronic module (CEM) is therefore the only control module that can store a diagnostic trouble code (DTC) for a short-circuit in one of the cables to ground or supply**

voltage. Do not replace the central electronic module (CEM) in the event of a CAN fault unless VIDA fault-tracing has indicated that the central electronic module (CEM) has an internal fault.

The diagnostic trouble code (DTC) can be diagnosed when the ignition has been on for more than 10 seconds.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the high speed network.

Fault symptom[s]

- Poor performance.
- Poor accelerator pedal (AP) response.
- Malfunction indicator lamp (MIL) lit.
- Message in the display.

SIGNAL MISSING

see **SIGNAL MISSING**

CEM-DF13: CAN-H, HIGH-SPEED NETWORK. SIGNAL TOO HIGH. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-DF13

Condition

Diagnostic trouble codes (DTCs) are stored if the central electronic module (CEM) registers that there is a short-circuit to supply voltage in the CAN H in the high speed network.

NOTE: **In the event of DFxx diagnostic trouble codes (DTCs), the central electronic module (CEM) must not be replace as the diagnostic trouble code (DTC) indicates a short-circuit in one or more conductors in the Control area network The central electronic module (CEM) is the only control module that monitors the voltage level in the Control area network wiring. The central electronic module (CEM) is therefore the only control module that can store a diagnostic trouble code (DTC) for a short-circuit in one of the cables to ground or supply voltage. Do not replace the central electronic module (CEM) in the event of a CAN fault unless VIDA fault-tracing has indicated that the central electronic module (CEM) has an internal fault.**

Substitute Value

The transmission control module (TCM) goes into Limp home mode.

Possible Source

- Short-circuit to supply voltage in the high speed network.

Fault symptom[s]

- Deterioration in performance
- Poor accelerator pedal (AP) response
- Malfunction indicator lamp (MIL) lit
- Message in the display.

SIGNAL TOO HIGH. INTERMITTENT FAULT.

CHECKING CONNECTORS AND BUS WIRE

NOTE: Remember that the CAN network is only a communications network. There are therefore no fuses, switches and sensors on the CAN bus. Check the resistance as described below (see references).

NOTE: To maintain the correct values the battery should be disconnected when measuring resistance.

Check the bus wire for a short circuit to voltage supply as described in, see **SHORT-CIRCUIT TO SUPPLY VOLTAGE, INTERMITTENT FAULTS** and for an intermittent open circuit as described in **OPEN-CIRCUIT, INTERMITTENT FAULTS** .

HINT: When checking for an open circuit, check if possible from the rear of the connector concerned so that it is not damaged.

Also check the intermediate connectors for contact resistance and oxidation as described in, see **CONTACT RESISTANCE AND OXIDATION** and for a loose contact as described in **LOOSE CONNECTIONS (TERMINALS)** .

HINT: If the fault is found before all the wires below have been checked trouble-shooting is not necessary on the wires.

The following wires and connectors should be checked to locate the short circuit.

Wire between:

- electronic throttle module (ETM) 3 and engine control module (ECM) 37A.

electronic throttle module (ETM) 4 and engine control module (ECM) 55A.

To connect the test box to the ETM control unit, see **CONNECTING THE BREAKOUT BOX**

To connect the test box to the ECM control unit, see **CONNECTING THE BREAKOUT BOX**

NOTE: Applies to automatic gear box.

- engine control module (ECM) 13B and transmission control module (TCM) 13B.

  engine control module (ECM) 1B and transmission control module (TCM) 1B.

  To connect the test box to the ECM control unit, see **CONNECTING THE BREAKOUT BOX** .

  To connect the test box to the TCM control unit, see **CONNECTING BREAKOUT BOX, TRANSMISSION CONTROL MODULE (TCM)** (AW) or **CONNECTING THE BREAKOUT BOX** (GM).

NOTE: Applies to automatic gear box.

- transmission control module (TCM) 14B and anti-lock braking system (ABS) 11 (or 19 if the vehicle has a switch button with the text "DSTC" on the center console).

  transmission control module (TCM) 2B and anti-lock braking system (ABS) 10 (or 20 if the vehicle has a switch button with the text "DSTC" on the center console).

  To connect the test box to the TCM control unit, see **CONNECTING BREAKOUT BOX, TRANSMISSION CONTROL MODULE (TCM)** (AW) or **CONNECTING THE BREAKOUT BOX** (GM).

  To connect the test box to the ABS control unit, see **CONNECTING THE ABS BREAKOUT BOX** .

NOTE: Applies to manual gear boxes.

- engine control module (ECM) 13B and anti-lock braking system (ABS) 11 (or 19 if the vehicle has a switch button with the text "DSTC" on the center console).

  engine control module (ECM) 1B and anti-lock braking system (ABS) 10 (or 20 if the vehicle has a switch button with the text "DSTC" on the center console).

  To connect the test box to the ECM control unit, see **CONNECTING THE BREAKOUT BOX**

  To connect the test box to the ABS control unit, see **CONNECTING THE ABS BREAKOUT BOX**

- central electronic module (CEM) 17B and anti-lock braking system (ABS) 11 (or 19 if the vehicle has a switch button with the text "DSTC" on the center console.) Also check intermediate connector 54/3R.

central electronic module (CEM) 18B and anti-lock braking system (ABS) 10 (or 20 if the vehicle has a switch button with the text "DSTC" on the center console.) Also check intermediate connector 54/3R.

To connect the test box to the CEM control unit, see **CONNECTING THE BREAKOUT BOX**

To connect the test box to the DIM control unit, see **CONNECTING THE DRIVER INFORMATION MODULE (DIM) TEST BOX**

Additional information:

- The voltage should be between approximately 1.5 V and 3.5 V.
- To disconnect the battery, see **BATTERY, DISCONNECTING**

SIGNAL MISSING

see **SIGNAL MISSING**

CEM-DF15: CAN-H, HIGH-SPEED NETWORK. SIGNAL TOO LOW. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-DF15

Condition

Diagnostic trouble codes (DTCs) are stored if the central electronic module (CEM) registers that there is a short-circuit to ground in the CAN H in the high speed network.

NOTE: **In the event of DFxx diagnostic trouble codes (DTCs), the central electronic module (CEM) must not be replace as the diagnostic trouble code (DTC) indicates a short-circuit in one or more conductors in the Control area network The central electronic module (CEM) is the only control module that monitors the voltage level in the Control area network wiring. The central electronic module (CEM) is therefore the only control module that can store a diagnostic trouble code (DTC) for a short-circuit in one of the cables to ground or supply voltage. Do not replace the central electronic module (CEM) in the event of a CAN fault unless VIDA fault-tracing has indicated that the central electronic module (CEM) has an internal fault.**

Substitute Value

None.

Possible Source

- Short-circuit to ground in the high speed network.

Fault symptom[s]

- The starter motor turns but the engine does not start
- The engine cuts out
- Malfunction indicator lamp (MIL) lit
- Message in the display.

SIGNAL TOO LOW. INTERMITTENT FAULT.

CHECKING CONNECTORS AND BUS WIRE

NOTE: Remember that the CAN network is only a communications network. There are therefore no fuses, switches and sensors on the CAN bus. Check the resistance as described below (see references).

NOTE: To maintain the correct values the battery should be disconnected when measuring resistance.

Check the bus wire for a short circuit to ground as described in, see **SHORT-CIRCUIT TO GROUND, INTERMITTENT FAULTS** .

Also check the intermediate connectors for contact resistance and oxidation as described in, see **CONTACT RESISTANCE AND OXIDATION** and for a loose contact as described in **LOOSE CONNECTIONS (TERMINALS)** .

HINT: If the fault is found before all the wires below have been checked trouble-shooting is not necessary on the wires.

The following wires and connectors should be checked to locate the short circuit.

Wire between:

- electronic throttle module (ETM) 3 and engine control module (ECM) 37A.

  To connect the test box to the ETM control unit, see **CONNECTING THE BREAKOUT BOX**

  To connect the test box to the ECM control unit, see **CONNECTING THE BREAKOUT BOX**

  NOTE: Applies to automatic gear box.

- engine control module (ECM) 13B and transmission control module (TCM) 13B.

  To connect the test box to the ECM control unit, see **CONNECTING THE BREAKOUT BOX**

To connect the test box to the TCM control unit, see **CONNECTING BREAKOUT BOX, TRANSMISSION CONTROL MODULE (TCM)** (AW) or **CONNECTING THE BREAKOUT BOX** (GM).

NOTE: Applies to automatic gear box.

- transmission control module (TCM) 14B and anti-lock braking system (ABS) 11 (or 19 if the vehicle has a switch button with the text "DSTC" on the center console).

  To connect the test box to the TCM control unit, see **CONNECTING BREAKOUT BOX, TRANSMISSION CONTROL MODULE (TCM)** (AW) or **CONNECTING THE BREAKOUT BOX** (GM).

  To connect the test box to the ABS control unit, see **CONNECTING THE ABS BREAKOUT BOX**

NOTE: Applies to manual gear box.

- engine control module (ECM) 13B and anti-lock braking system (ABS) 11 (or 19 if the vehicle has a switch button with the text "DSTC" on the center console).

  To connect the test box to the ECM control unit, see **CONNECTING THE BREAKOUT BOX**

  To connect the test box to the ABS control unit, see **CONNECTING THE ABS BREAKOUT BOX**

- central electronic module (CEM) 17B and anti-lock braking system (ABS) 11 (or 19 if the vehicle has a switch button with the text "DSTC" on the center console.) Also check intermediate connector 54/3R.

  To connect the test box to the CEM control unit, see **CONNECTING THE BREAKOUT BOX**

  To connect the test box to the ABS control unit, see **CONNECTING THE ABS BREAKOUT BOX**

Additional information:

- The voltage should be between approximately 2.0 V and 3.5 V.
- To disconnect the battery, see **BATTERY, DISCONNECTING**

SIGNAL TOO LOW. PERMANENT FAULT

CHECKING CONNECTORS AND BUS WIRE

NOTE: **Remember that the CAN network is only a communications network. There are**

therefore no fuses, switches and sensors on the CAN bus. Check the resistance as described below (see references).

NOTE: To maintain the correct values the battery should be disconnected when measuring resistance.

Check the bus wire for a short circuit to ground as described in, see **SHORT-CIRCUIT TO GROUND, PERMANENT FAULTS** . Also check the intermediate connectors for contact resistance and oxidation as described in **CONTACT RESISTANCE AND OXIDATION** .

The following wires and connectors should be checked to locate the short circuit.

Wire between:

- electronic throttle module (ETM) 3 and engine control module (ECM) 37A.

  To connect the test box to the ETM control unit, see **CONNECTING THE BREAKOUT BOX**

  To connect the test box to the ECM control unit, see **CONNECTING THE BREAKOUT BOX**

  NOTE: Applies to automatic gear box.

- engine control module (ECM) 13B and transmission control module (TCM) 13B.

  To connect the test box to the ECM control unit, see **CONNECTING THE BREAKOUT BOX**

  To connect the test box to the TCM control unit, see **CONNECTING BREAKOUT BOX, TRANSMISSION CONTROL MODULE (TCM)** (AW) or **CONNECTING THE BREAKOUT BOX** (GM).

  NOTE: Applies to automatic gear box.

- transmission control module (TCM) 14B and anti-lock braking system (ABS) 11 (or 19 if the vehicle has a switch button with the text "DSTC" on the center console).

  To connect the test box to the TCM control unit, see **CONNECTING BREAKOUT BOX, TRANSMISSION CONTROL MODULE (TCM)** (AW) or **CONNECTING THE BREAKOUT BOX** (GM).

  To connect the test box to the ABS control unit, see **CONNECTING THE ABS BREAKOUT BOX**

  NOTE: Applies to manual gear box.

- engine control module (ECM) 13B and anti-lock braking system (ABS) 11 (or 19 if the vehicle has a switch button with the text "DSTC" on the center console).

To connect the test box to the ECM control unit, see **CONNECTING THE BREAKOUT BOX**

To connect the test box to the ABS control unit, see **CONNECTING THE ABS BREAKOUT BOX**

- central electronic module (CEM) 17B and anti-lock braking system (ABS) 11 (or 19 if the vehicle has a switch button with the text "DSTC" on the center console.) Also check intermediate connector 54/3R.

  To connect the test box to the CEM control unit, see **CONNECTING THE BREAKOUT BOX**

  To connect the test box to the ABS control unit, see **CONNECTING THE ABS BREAKOUT BOX**

Additional information

- The voltage should be between approximately 2.0V and 3.5V.
- To disconnect the battery, see **BATTERY, DISCONNECTING**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-DF16: CAN-L, HIGH SPEED NETWORK. SIGNAL TOO HIGH (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-DF16

Condition

Fig. 56: Identifying Central Electronic Module
Courtesy of VOLVO CARS CORPORATION

The central electronic module (CEM) checks the voltage in the CAN wiring in the high speed network. The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) registers a short-circuit to supply voltage in the CAN L in the high speed network.

NOTE: **If DFxx diagnostic trouble codes (DTCs) are stored the central electronic module (CEM) must not be replaced as the diagnostic trouble code (DTC) indicates a short-circuit in one or more conductors in the Control area network. The central electronic module (CEM) is the only control module that monitors the voltage level in the Control area network wiring. The central electronic module (CEM) is therefore the only control module that can store a diagnostic trouble code (DTC) for a short-circuit in one of the cables to ground or supply voltage. Do not replace the central electronic module (CEM) in the event of a CAN fault unless VIDA fault-tracing has indicated that the central electronic module (CEM) has an internal fault.**

The diagnostic trouble code (DTC) can be diagnosed when the ignition has been on for more than 10 seconds.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the high speed network.

Fault symptom[s]

- The engine does not start.
- Engine cuts out when running
- Malfunction indicator lamp (MIL) lit.
- Message in the display.

SIGNAL MISSING

see **SIGNAL MISSING**

CEM-DF16: CAN-L, HIGH-SPEED NETWORK. SIGNAL TOO HIGH. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-DF16

Condition

Diagnostic trouble codes (DTCs) are stored if the central electronic module (CEM) registers that there is a short-circuit to supply voltage in the CAN L in the high speed network.

NOTE: **In the event of DFxx diagnostic trouble codes (DTCs), the central electronic module (CEM) must not be replace as the diagnostic trouble code (DTC) indicates a short-circuit in one or more conductors in the Control area network The central electronic module (CEM) is the only control module that monitors the voltage level in the Control area network wiring. The central electronic module (CEM) is therefore the only control module that can store a diagnostic trouble code (DTC) for a short-circuit in one of the cables to ground or supply voltage. Do not replace the central electronic module (CEM) in the event of a CAN fault unless VIDA fault-tracing has indicated that the central electronic module (CEM) has an internal fault.**

Substitute Value

Possible Source

- Short-circuit to supply voltage in the high speed network.

Fault symptom[s]

- The starter motor turns but the engine does not start
- The engine cuts out
- Malfunction indicator lamp (MIL) lit
- Message in the display.

SIGNAL TOO HIGH. INTERMITTENT FAULT.

CHECKING CONNECTORS AND BUS WIRE

NOTE: Remember that the CAN network is only a communications network. There are therefore no fuses, switches and sensors on the CAN bus. Check the resistance as described below (see references).

NOTE: To maintain the correct values the battery should be disconnected when measuring resistance.

Check the bus wire for a short circuit to voltage supply as described in, see **SHORT-CIRCUIT TO SUPPLY VOLTAGE, INTERMITTENT FAULTS** and for an intermittent open circuit as described in **OPEN-CIRCUIT, INTERMITTENT FAULTS** .

HINT: When checking for an open circuit, check if possible from the rear of the connector concerned so that it is not damaged.

Also check the intermediate connectors for contact resistance and oxidation as described in, see **CONTACT RESISTANCE AND OXIDATION** and for a loose contact as described in **LOOSE CONNECTIONS (TERMINALS)** .

HINT: If the fault is found before all the wires below have been checked trouble-shooting is not necessary on the wires.

The following wires and connectors should be checked to locate the short circuit.

Wire between:

- electronic throttle module (ETM) 4 and engine control module (ECM) 55A.

  To connect the test box to the ETM control unit, see **CONNECTING THE BREAKOUT BOX**

  To connect the test box to the ECM control unit, see **CONNECTING THE BREAKOUT BOX**

  NOTE: Applies to automatic gear box.

- engine control module (ECM) 1B and transmission control module (TCM) 1B.

  To connect the test box to the ECM control unit, see **CONNECTING THE BREAKOUT BOX**

  To connect the test box to the TCM control unit, see **CONNECTING BREAKOUT BOX, TRANSMISSION CONTROL MODULE (TCM)** (AW) or **CONNECTING THE BREAKOUT BOX** (GM).

  NOTE: Applies to automatic gear box.

- transmission control module (TCM) 2B and anti-lock braking system (ABS) 10 (or 20 if the vehicle has a switch button with the text "DSTC" on the center console).

  To connect the test box to the TCM control unit, see **CONNECTING BREAKOUT BOX, TRANSMISSION CONTROL MODULE (TCM)** (AW) or **CONNECTING THE BREAKOUT BOX** (GM).

  To connect the test box to the ABS control unit, see **CONNECTING THE ABS BREAKOUT BOX**

  NOTE: Applies to manual gear box.

- engine control module (ECM) 1B and anti-lock braking system (ABS) 10 (or 20 if the vehicle has a switch button with the text "DSTC" on the center console).

  To connect the test box to the ECM control unit, see **CONNECTING THE BREAKOUT BOX**

  To connect the test box to the ABS control unit, see **CONNECTING THE ABS BREAKOUT BOX**

- central electronic module (CEM) 18B and anti-lock braking system (ABS) 10 (or 20 if the vehicle has a switch button with the text "DSTC" on the center console.) Also check intermediate connector 54/3R.

  To connect the test box to the CEM control unit, see **CONNECTING THE BREAKOUT BOX**

  To connect the test box to the ABS control unit, see **CONNECTING THE ABS BREAKOUT BOX**

Additional information:

- The voltage should be between approximately 1.5 V and 2.5 V.
- To disconnect the battery, see **BATTERY, DISCONNECTING**

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CEM-DF17: CAN-H, HIGH SPEED NETWORK. FAULTY SIGNAL (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-DF17

Condition

Fig. 64: Identifying Central Electronic Module
Courtesy of VOLVO CARS CORPORATION

The central electronic module (CEM) checks the voltage in CAN L and CAN H on the high speed network. The diagnostic trouble code (DTC) is stored if the central electronic module (CEM) registers a short-circuit between CAN L and CAN H in the high speed network.

NOTE: **If DFxx diagnostic trouble codes (DTCs) are stored the central electronic module (CEM) must not be replaced as the diagnostic trouble code (DTC) indicates a short-circuit in one or more conductors in the Control area network. The central electronic module (CEM) is the only control module that monitors the voltage level in the Control area network wiring. The central electronic module (CEM) is therefore the only control module that can store a diagnostic trouble code (DTC) for a short-circuit in one of the cables to ground or supply voltage. Do not replace the central electronic module (CEM) in the event of a CAN fault unless VIDA fault-tracing has indicated that the central electronic module (CEM) has an internal fault.**

The diagnostic trouble code (DTC) can be diagnosed when the ignition has been on for more than 10 seconds.

Substitute Value

- None.

Possible Source

- Short-circuit between CAN L and CAN H in the high speed network.

Fault symptom[s]

- The engine does not start.
- The engine cuts out when driving.
- Malfunction indicator lamp (MIL) lit.
- Message in the display.

SIGNAL MISSING

see **SIGNAL MISSING**

CEM-E000: CONTROL MODULE COMMUNICATION (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-E000

Condition

Fig. 65: Identifying Central Electronic Module
Courtesy of VOLVO CARS CORPORATION

The control modules transmit and receive information via a standardized serial communication method - CAN (Control Area Network). The diagnostic trouble code (DTC) is stored if the control module registers serious interference on the high speed network (CAN communication blocked).

NOTE: **In the event of system communication problems, it is not possible to communicate with the control module. Therefore it will only be possible to read off the diagnostic trouble code (DTC) if this type of fault is intermittent.**

The diagnostic trouble code (DTC) can be diagnosed when the HS CAN is active.

Substitute Value

- The control module shuts itself off ("bus-off").

HINT: The control module will remain shut off until the power supply is broken (15, 30, X). When the power supply is connected the control module will make a new attempt to communicate.

Possible Source

- Short-circuit between the control area network (CAN) wiring

- Open-circuit in one of the control area network (CAN) cables
- Internal fault in another control module in the same part of the control area network (CAN)
- Internal fault in the control module.

Fault symptom[s]

- The starter motor turns but the engine does not start.
- The speedometer does not operate.
- Tachometer not working.
- Engine coolant temperature (ECT) gauge does not function.
- Cruise control does not function at all.
- Jerky operation.

CEM-E001: CONTROL MODULE COMMUNICATION (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CEM-E001

Condition

Fig. 66: Identifying Central Electronic Module
Courtesy of VOLVO CARS CORPORATION

The control modules transmit and receive information via a standardized serial communication method - CAN (Control Area Network). The diagnostic trouble code (DTC) is stored if the control module registers serious interference on the low speed network (CAN communication blocked).

Substitute Value

- The control module shuts itself off ("bus-off").

  HINT: The control module will remain shut off until the power supply is broken (15, 30, X). When the power supply is connected the control module will make a new attempt to communicate.

Possible Source

- Short-circuit between the control area network (CAN) wiring
- Open-circuit in one of the control area network (CAN) cables
- Internal fault in the control module
- Internal fault in another control module in the same part of the control area network (CAN).

Fault symptom[s]

- No gauges are working
- The instrument lighting does not operate
- Cannot be controlled with the remote control.

SIGNAL MISSING

REM-1A01: 30-POWER SUPPLY. SIGNAL TOO LOW. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If the control unit registers that the power supply to the rear electronic module (REM) is more than three volts below the power supply to the central electronic module (CEM), the diagnostic trouble code is displayed.

Substitute Value

None

Possible Source

- Open circuit or short circuit to ground on 30 supply to rear electronic module (REM)
- Contact resistance, oxidation or loose contact on 30 supply to rear electronic module (REM).

Fault symptom[s]

- Boot lighting is faint
- Rear lights do not work
- Central locking does not work on rear doors and boot lid
- Heated rear window does not work.

SIGNAL TOO LOW. INTERMITTENT FAULT

CHECKING WIRING AND CONNECTORS

Fig. 70: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check the wiring and connectors between rear control module terminal #B26 (#E6) and the battery.

Check for an intermittent open-circuit. Check for loose connections. Check for contact resistance and oxidation. Check for damage carefully.

Check the wiring between rear control module terminal #B21 (#E1) and the ground terminal. Check for an open-circuit. Check for damage carefully.

Remedy as necessary.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-1A02

Condition

The rear electronic module (REM) checks the output signal to the relay coil for relay, extended power supply.

Diagnostic trouble code (DTC) REM-1A02 is stored if the rear electronic module (REM) registers that the output signal to the relay coil is too high.

Diagnostic trouble code (DTC) REM-1A02 can be detected when activating the relay.

Substitute Value

None

Possible Source

- Short-circuit to supply voltage in the relay circuit
- Defective relay.

Fault symptom[s]

- The tailgate wiper does not return to the start position.

SIGNAL TOO HIGH. INTERMITTENT FAULT

REPLACING THE COMPONENT

Replace relay 2/72.

Other information:

- To access the integrated relay / fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .

Is the status intermittent?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-1A03: RELAY, EXTENDED POWER SUPPLY. SIGNAL TOO LOW. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-1A03

Condition

The rear electronic module (REM) checks the output signal to the relay coil for relay, extended power supply.

Diagnostic trouble code (DTC) REM-1A03 is stored if the rear electronic module (REM) registers that the output signal to the relay coil is too low or missing.

Diagnostic trouble code (DTC) REM-1A03 can be detected when the relay driver is not activated.

Substitute Value

None

Possible Source

- Relay missing
- Defective relay
- Contact resistance in the relay base.

Fault symptom[s]

- The tailgate wiper does not return to the start position.

SIGNAL TOO LOW. INTERMITTENT FAULT

REPLACING THE COMPONENT

Remove relay 2/72 and check the relay base switches for contact resistance and oxidation according to **CHECKING WIRING AND TERMINALS. INTERMITTENT FAULTS** .

Install the relay.

Other information:

- To access the integrated relay / fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-1A04: RELAY, 15I POWER SUPPLY. SIGNAL TOO HIGH (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The diagnostic trouble code (DTC) is stored if the control module registers a high signal from the status flag when activating the relay guide for the 15I supply relay.

Diagnostic trouble code (DTC) REM-1A04 can be detected at ignition on.

Substitute Value

- None.

Possible Source

- The relay guide for relay 2/52 is short-circuited to battery voltage.

Fault symptom[s]

- Anti-spin warning lamp lit.

SIGNAL TOO HIGH

CHECKING COMPONENTS AND WIRING

Check the cable between rear electronic module terminal #D2(terminal #B02) and "15I supply" relay 2/52 terminal #2. Check for a short-circuit to supply voltage.

Check the relay terminal, in particular relay guide 2/52 terminal #2, for a short-circuit to supply voltage.

Remedy as necessary.

Try a new relay if no faults are found.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For information about signals, see **SIGNAL SPECIFICATION**
- When the relay is installed and activated, the voltage at the relay guide must be 0 V
- see **CHECKING WIRING AND TERMINALS** .

Is there a click in the relay at activation and deactivation?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-1A05: RELAY, 15I POWER SUPPLY. SIGNAL TOO LOW (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The diagnostic trouble code (DTC) is stored if the control module registers an open-circuit from the status flag when the relay guide for relay 15I-supply is not activated.

Diagnostic trouble code (DTC) REM-1A05 can be detected at ignition on.

Substitute Value

- None.

Possible Source

- Open-circuit in the relay guide for relay 2/52
- Relay 2/52 not installed.

Fault symptom[s]

- Anti-spin warning lamp lit.

SIGNAL TOO LOW

CHECKING COMPONENTS AND WIRING

Check that the "15I supply" relay 2/52 is intact. Check that the relay is correctly installed.

Check that fuse 11D/5 is intact.

Check the cable between fuse 11D/5 and "15I supply" relay 2/52 #1. Check the cable between the rear electrical module terminal #D2 (#B02) and "15I supply" relay 2/52 #2. Check for an open-circuit.

Check the relay terminals. Check for an open-circuit.

Remedy as necessary.

Try a new relay if no faults are found.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For information about signals, see **SIGNAL SPECIFICATION**
- When the relay is installed and activated, the voltage at the relay guide must be 12 V

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-1D01: CONTROL MODULE. INTERNAL FAULT (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-1D01

Condition

Fig. 99: Identifying Central Electronic Module (CEM)
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the rear electronic module (REM) registers an internal fault.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- None.

Possible Source

- Internal fault in the control module.

Fault symptom[s]

- The fuel gauge does not work
- No locking/unlocking of the tailgate
- Does not lock / unlock the fuel tank filler cap.

INTERNAL FAULT

REPLACING THE COMPONENT

The rear electronic module (REM) has registered an internal fault.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up of the rear electronic module (REM) or may be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs. Replace the rear electronic module (REM) if the fault recurs.

Replace the rear electronic module (REM) in the event of a permanent fault.

Remedy as necessary.

Other information

- For -2004, see: **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- For 2005-, see: **REAR ELECTRONIC MODULE (REM), REPLACING** .

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

REM-1D01: CONTROL MODULE. INTERNAL FAULT. PERMANENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) REM-1D01 is stored if the control module registers an internal fault.

Substitute Value

None

Possible Source

- Internal fault in the control module.

Fault symptom[s]

- The fuel gauge does not work.
- Does not lock / unlock the tailgate.
- Does not lock / unlock the fuel tank filler cap.

INTERNAL FAULT. PERMANENT FAULT

REPLACING THE COMPONENT

HINT: The rear control module has registered an internal fault.

Fig. 101: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Replace the rear control module.

NOTE: **A new control module is delivered without software. The control module must be programmed when it has been replaced.**

Other information:

- To access and replace the rear electronic module, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .

The information can be displayed again or the fault-tracing for this fault can be interrupted.

REM-1F8C: TRAILER FOGLIGHT DRIVER, SIGNAL OR TEMPERATURE TOO HIGH (2006-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-1F8C

Condition

The Rear electronic module (REM) checks the voltage supply to the fog lamp via the trailer connector.

The diagnostic trouble code (DTC) is stored if the control module detects that the output has a short-circuit to supply voltage or if the driver stage has a too high a temperature.

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I or II.

Fig. 113: Identifying Rear Electronic Module (REM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- The control module deactivates the output.
- If the fault has been detected in 100 ignition cycles, the output is closed permanently until the diagnostic trouble code is erased (applies from structure week 200539).

Possible Source

- Short-circuit to supply voltage in the signal cable.
- Internal fault in Rear electronic module (REM).

Fault symptom[s]

- Rear fog lamps lit constantly
- Rear fog lamp not working

SIGNAL TOO HIGH OR TEMPERATURE TOO HIGH

CHECKING THE WIRING

Fig. 114: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Erase diagnostic trouble codes by clicking the VCT2000 symbol.

  NOTE: Note any other diagnostic trouble codes (DTCs) that are in the control module, before the diagnostic trouble codes (DTCs) are erased, in order to carry out other fault-traces.

  Activate the rear fog lamp using the switch on the Light switch module (LSM).

  The fog lamp relay clicks when it is deactivated.

  If a clicking sound can be heard, the circuit up to the Rear electronic module (REM) is fault free.

  Deactivate the rear fog lamp.

  Measure the voltage between the lead for voltage feed and a safe grounding point.

  The voltage must be 0 V.

  Check the connectors between the Rear electronic module (REM) and the Trailer module (TRM). Check for contact resistance and oxidation. Check for loose connections.

  Remedy as necessary.

Other information

- see **CHECKING WIRING AND TERMINALS**

Fig. 115: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **INFORMATION**

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 116: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 117: Identifying Connector(s) Reinstallation
Courtesy of VOLVO CARS CORPORATION

- Switch off the ignition. Wait at least 15 seconds
- Reinstall the connectors, components etc.
- Read off the diagnostic trouble codes (DTCs) by clicking on the VCT2000 symbol.

  Check that the diagnostic trouble code (DTC) for too high voltage is not stored again.

Fig. 118: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Does the diagnostic trouble code (DTC) recur?

- **YES**

  Refer to **INFORMATION**

- **NO**

  VERIFIED: Troubleshooting has been completed.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-3C01: RELAY, PREHEATING THE DIESEL FILTER. SIGNAL TOO HIGH (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) REM-3C01 is stored if the rear electronic module registers that the signal from the relay coil is too high.

Diagnostic trouble code (DTC) REM-3C01 can be diagnosed when the ignition is on.

Substitute Value

- None.

Possible Source

- Defective relay (short-circuit in the relay coil).

Fault symptom[s]

- The engine fails to start
- The engine is difficult to start.

SIGNAL TOO HIGH

CHECKING COMPONENTS AND WIRING

Fig. 119: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Check relay 2/142 for damage.

Check the signal cable between relay 2/142 terminal #2 and connector terminal #1 (thermostat 8/85) on the diesel filter. Check the signal cable between connector terminal #2 (thermostat 8/85) on the diesel filter and rear electronic module terminal #D16 (#B16). Check for a short-circuit to supply voltage.

Remedy as necessary.

Other information:

- To fault-trace wiring and terminals, see **CHECKING WIRING AND TERMINALS**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**

- For information about signals, see **SIGNAL SPECIFICATION**
- To access and replace the relay, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 120: Identifying Connector(s) Reinstallation
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.

  This type of fault cannot be accurately verified electronically. Check that the connectors and components are installed and, if possible, that the symptoms are no longer present.

Is everything correctly installed?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-4A31: FUEL LEVEL SENSOR. FAULTY SIGNAL. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If the control unit registers that, when engine is running, the fuel level in the left tank half is more than 2 liters and unchanged for 100km (60 miles), the diagnostic trouble code is displayed.

Substitute Value

Fuel gauge is reset.

Possible Source

- Defective sensor (left side).

Fault symptom[s]

- Trip computer indicates too soon that fuel tank is empty
- Fuel gauge does not work.

FAULTY SIGNAL. INTERMITTENT FAULT

CHECKING WIRING AND CONNECTORS

Check the rear electronic module (REM) and fuel level sensor connectors. Check for contact resistance and oxidation. Check for loose connections.

Check the signal cable between control module terminal #2A and fuel level sensor connector terminal #5. Check for an intermittent open-circuit. Check for an intermittent short-circuit to supply voltage.

Check the ground lead between control module terminal #10A and fuel level sensor connector terminal #6. Check for an intermittent open-circuit.

Other information:

- For information about signals and other values, see **SIGNAL SPECIFICATION**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access the rear electronic module (REM), see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- To access the fuel level sensor (left-hand side), see **LEVEL SENSOR FUEL TANK LEFT, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-4A33: FUEL LEVEL SENSOR. SIGNAL TOO HIGH OR SIGNAL MISSING. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If control unit registers that, with ignition on, A/D input is higher than 4 V, the diagnostic trouble code is displayed.

Substitute Value

Fuel gauge is reset.

Possible Source

- Left fuel gauge sensor has an open circuit or short circuited to battery voltage.

Fault symptom[s]

- Trip computer indicates too soon that fuel tank is empty
- Fuel gauge does not work.

SIGNAL TOO HIGH OR SIGNAL MISSING. INTERMITTENT FAULT

CHECKING WIRING AND CONNECTORS

Check the rear electronic module (REM) and fuel level sensor connectors. Check for loose connections. Check for contact resistance and oxidation.

Check the cables between fuel level sensor connector terminal #5 and breakout box terminal #A02 (#A2). Check for an intermittent open-circuit. Check for an intermittent short-circuit to ground. Check for an intermittent short-circuit to supply voltage.

Check the ground lead between breakout box terminal #A10 (#A10) and fuel level sensor connector terminal #6. Check for an intermittent open-circuit.

Other information:

- For further information about signals and other values, see **SIGNAL SPECIFICATION**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access the rear electronic module (REM), see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-4A34: FUEL LEVEL SENSOR. SIGNAL TOO LOW. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If control unit registers that, with ignition on, A/D input is less than 0.4V, the diagnostic trouble code is displayed.

Substitute Value

Fuel gauge is reset.

Possible Source

- Left fuel gauge sensor short circuited to ground.

Fault symptom[s]

- Trip computer indicates too soon that fuel tank is empty
- Fuel gauge does not work.

SIGNAL TOO LOW. INTERMITTENT FAULT

CHECKING WIRING AND CONNECTORS

Check the cables between fuel level sensor connector terminal #5 and breakout box terminal #A02 (#A2). Check for an intermittent short-circuit to ground. Check for an intermittent open-circuit.

Check the ground lead between breakout box terminal #A10 (#A10) and fuel level sensor connector terminal #6. Check for an intermittent open-circuit.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-4A40: GAS TEMPERATURE SENSOR. SIGNAL TOO HIGH (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-4A40

Condition

The rear electronic module (REM) checks the signal from the gas temperature sensor.

The diagnostic trouble code (DTC) is stored if the rear electronic module (REM) registers that the signal is too high.

The diagnostic trouble code (DTC) can be diagnosed at key position II.

Substitute Value

- The fuel level is set to zero.

Possible Source

- Short-circuit to supply voltage in the signal cable
- Open-circuit in the signal cable.

Fault symptom[s]

- The trip computer displays an empty fuel tank too early
- The fuel gauge indicates zero even though there is fuel in the tank
- The gas level gauge does not work.

SIGNAL TOO HIGH

CHECKING THE WIRING

Fig. 159: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 160: Identifying Control Module Disconnected
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect connector D on the rear electronic module (REM).

  Check the signal cable. Check for an open-circuit. Check for a short-circuit to supply voltage.

  Take readings between:

  - Rear electronic module (REM) terminal #D27 (#27) and gas temperature sensor terminal #3
  - Rear electronic module (REM) terminal #D8 (#8) and gas temperature sensor terminal #4.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-4A42: GAS PRESSURE SENSOR. SIGNAL TOO HIGH (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-4A42

Condition

The rear electronic module (REM) checks the signal from the gas pressure sensor.

The diagnostic trouble code (DTC) is stored if the rear electronic module (REM) registers that the signal is too high.

The diagnostic trouble code (DTC) can be diagnosed at key position II.

Substitute Value

- The fuel level is set to zero.

Possible Source

- Short-circuit to supply voltage in the signal cable.

Fault symptom[s]

- The trip computer displays an empty fuel tank too early
- The fuel gauge indicates zero even though there is fuel in the tank
- The gas level gauge does not work.

SIGNAL TOO HIGH

CHECKING THE WIRING

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-4A43: GAS PRESSURE SENSOR. SIGNAL TOO LOW (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-4A43

Condition

The rear electronic module (REM) checks the signal from the gas pressure sensor.

The diagnostic trouble code (DTC) is stored if the rear electronic module (REM) registers that the signal is too low.

The diagnostic trouble code (DTC) can be diagnosed at key position II.

Substitute Value

- The fuel level is set to zero.

Possible Source

- Short-circuit to supply voltage in the signal cable
- Open-circuit in signal cable to the sensor.

Fault symptom[s]

- The trip computer displays an empty fuel tank too early
- The fuel gauge indicates zero even though there is fuel in the tank
- The gas level gauge does not work.

SIGNAL TOO LOW

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-4A44: FUEL LEVEL, GAS. FAULTY SIGNAL (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-4A44

Condition

Fig. 175: Identifying Fuel Level Sensor
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) checks the signal from the fuel level sensor for gas.

The diagnostic trouble code (DTC) is stored if the rear electronic module (REM) registers that the level has not changed in 100 km.

The diagnostic trouble code (DTC) can be diagnosed at key position II.

Substitute Value

- The fuel level is set to zero.

Possible Source

- Faulty sensor.

Fault symptom[s]

- The trip computer displays an empty fuel tank too early
- The fuel gauge indicates zero even though there is fuel in the tank
- The gas level gauge does not work.

FAULTY SIGNAL

CHECKING THE STATUS

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults may be due to interference at start up of the control module or may be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs.

Replace the fuel level sensor if the fault is permanent.

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-4F41: COMMUNICATION WITH PARKING ASSISTANCE MODULE (PAM). SIGNAL MISSING (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-4F41

Condition

Fig. 203: Identifying Parking Assistance Module (PAM)
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) checks communication with the parking assistance module (PAM).

Diagnostic trouble code (DTC) REM-4F41 is stored if the rear electronic module (REM) registers a fault in the communication with the parking assistance module (PAM).

Diagnostic trouble code (DTC) REM-4F41 can be detected when the ignition is on for 5 seconds.

NOTE: The fault must be corrected and the diagnostic trouble code (DTC) erased before further fault-tracing can be carried out on the parking assistance module (PAM) and its components.

Substitute Value

- None.

Possible Source

- Fault in power supply wiring/fuse for the parking assistance module (PAM)
- Fault in power supply relay for the parking assistance module (PAM)
- Fault in the cable between the parking assistance module (PAM) and rear electronic module (REM)
- Defective communication device, parking assistance module (PAM)
- Defective communication device, rear electronic module (REM).

Fault symptom[s]

- The back-up (reversing) warning system does not function.

SIGNAL MISSING

CHECKING COMPONENTS AND WIRING

NOTE: The fault must be corrected and the diagnostic trouble code (DTC) erased before further fault-tracing can be carried out on the parking assistance module (PAM) and its components.

Check the connections on the rear electronic module (REM) and parking assistance module (PAM). Check for contact resistance, oxidation and damage.

Check the fuse for the back-up warning system.

Check the relay for 15I supply in the rear electronic module (REM).

HINT: In case of a fault in the operation of relay 15I supply, a diagnostic trouble code (DTC) is stored in the rear electronic module (REM).

Check the power supply cable between the fuse for 15I supply and relay #1, between relay #3 and the fuse for the back-up (reversing) warning system, and between fuse and the parking assistance module (PAM) terminal #1. Check for an open-circuit. Check for a short-circuit to ground.

Check the ground lead between parking assistance module (PAM) terminal #8 and the ground terminal. Check for an open-circuit. Check for a short-circuit to supply voltage.

Check the cable between the rear electronic module (REM) connector terminal #8D (#B08) and the parking assistance module (PAM) terminal #12. Check for an open-circuit. Check for a short-circuit to ground.

Try a new parking assistance module (PAM) if no faults were found.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-4F42: BACK-UP WARNING SENSOR 1. FAULTY SIGNAL (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-4F42

Condition

Fig. 212: Identifying Parking Sensor
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) checks diagnosis from the parking assistance module (PAM).

Diagnostic trouble code (DTC) REM-4F42 is stored if parking assistance module (PAM) registers a fault in sensor 1.

Diagnostic trouble code (DTC) REM-4F42 can be detected when the ignition is on for 5 seconds.

Substitute Value

- None.

Possible Source

- Fault in wiring to back-up warning sensor 1
- Back-up warning sensor 1 defective.

Fault symptom[s]

- General warning lamp lit.
- The back-up (reversing) warning system does not function.

FAULTY SIGNAL

CHECKING COMPONENTS AND WIRING

Check the connections on the parking assistance module (PAM) and sensor 1 (outer left). Check for contact resistance and oxidation. Also check intermediate connector.

Check the power supply cable between the connector in the parking assistance module (PAM) terminal #6 and the connector for sensor #1. Check for a short-circuit to ground. Check for an open-circuit.

Check the signal ground cable between the connector in the parking assistance module (PAM) terminal #7 and the connector for sensor #3. Check for a short-circuit to supply voltage. Check for an open-circuit.

Check the signal cable between the connector in the parking assistance module (PAM) terminal #5 and the connector for sensor #2. Check for an open-circuit. Check for a short-circuit to supply voltage. Check for a short-circuit to ground.

Try a new sensor if no fault is found.

Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-4F42: PARKING SENSOR 1. FAULTY SIGNAL (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-4F42 (2005, 2006)

Condition

Fig. 219: Identifying Parking Sensor
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) communicates with the parking assistance module (PAM) which checks the signal from parking sensor 1.

The diagnostic trouble code (DTC) is stored if the parking assistance module (PAM) registers a faulty signal from the parking sensor (1).

The diagnostic trouble code (DTC) can be diagnosed at key position II.

Substitute Value

- None.

Possible Source

- Short-circuit to ground or supply voltage in the signal cable between the parking assistance module (PAM) and parking sensor 1
- Short-circuit to ground in the power supply cable between the parking assistance module (PAM) and parking sensor 1

- Short-circuit to supply voltage in the ground lead between the parking assistance module (PAM) and parking sensor 1.

Fault symptom[s]

- The parking assistance system does not operate
- Message in the display.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-4F42 (2007-2012)

Condition

Fig. 220: Identifying Parking Sensor
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) communicates with the parking assistance module (PAM) which checks the signal from parking sensor 1.

The diagnostic trouble code (DTC) is stored if the parking assistance module (PAM) registers a faulty signal from the parking sensor (1).

The diagnostic trouble code (DTC) can be diagnosed at key position II.

Substitute Value

- None.

Possible Source

- Short-circuit to ground or supply voltage in the signal cable between the parking assistance module (PAM) and parking sensor 1
- Short-circuit to ground in the power supply cable between the parking assistance module (PAM) and

parking sensor 1
- Short-circuit to supply voltage in the ground lead between the parking assistance module (PAM) and parking sensor 1.

Fault symptom[s]

- The parking assistance system does not operate
- Message in the display.

FAULTY SIGNAL (2005, 2006)

CHECKING COMPONENTS AND WIRING

CAUTION: Do not touch the terminal pins in the parking assistance module (PAM). There is a risk of static discharge. This could damage the parking assistance module (PAM).

Fig. 221: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 222: Identifying Connector(s) Disconnected
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check the connectors for the parking sensor and the Parking Assistance Module (PAM). Check for damage to pins and connections. Also check the other connectors, which connect the cables between the Parking Assistance Module (PAM) and the parking sensor.

  NOTE: The connections on Parking Assistance Module (PAM) that ground/supply voltage, respectively, to parking sensor may differ from vehicle to vehicle. The rear parking sensors are grounded in Parking Assistance Module (PAM) on pins #C1, #C7, #C8, #C9. The rear parking sensors are supplied with voltage by Parking Assistance Module (PAM) on pins #C6, #C10, #C11, #C12. The rear parking sensors' signal lines are connected to Parking Assistance Module (PAM) on pins #C2, #C3, #C4, #C5.

- Check the signal cable between the parking assistance module (PAM) and the parking sensor connector. Check for a short-circuit to supply voltage. Check for a short-circuit to ground.
- Check the power supply lead between the parking assistance module (PAM) and the parking sensor connector. Check for a short-circuit to ground.
- Check the ground lead between the parking assistance module (PAM) and the parking sensor connector. Check for a short-circuit to supply voltage.

Remedy as necessary.

If no fault is found, replace the parking sensor.

FAULTY SIGNAL (2007-2012)

CHECKING COMPONENTS AND WIRING

CAUTION: Do not touch the terminal pins in the parking assistance module (PAM). There is a risk of static discharge. This could damage the parking assistance module (PAM).

Fig. 227: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 228: Identifying Connector(s) Disconnected
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check the connectors for the parking sensor and the Parking Assistance Module (PAM). Check for damage to pins and connections. Also check the other connectors, which connect the cables between the Parking Assistance Module (PAM) and the parking sensor.

  NOTE: **The connections on Parking Assistance Module (PAM) that ground/supply voltage, respectively, to parking sensor may differ from vehicle to vehicle. The rear parking sensors are grounded in Parking Assistance Module (PAM) on pins #C1, #C7, #C8, #C9. The rear parking sensors are supplied with voltage by Parking Assistance Module (PAM) on pins #C6, #C10, #C11, #C12. The rear parking sensors' signal lines are connected to Parking Assistance Module (PAM) on pins #C2, #C3, #C4, #C5.**

- Check the signal cable between the parking assistance module (PAM) and the parking sensor connector. Check for a short-circuit to supply voltage. Check for a short-circuit to ground.
- Check the power supply lead between the parking assistance module (PAM) and the parking sensor connector. Check for a short-circuit to ground.
- Check the ground lead between the parking assistance module (PAM) and the parking sensor connector. Check for a short-circuit to supply voltage.

Remedy as necessary.

If no fault is found, replace the parking sensor.

Other information

- see **REVERSE (REVERSING) WARNING SENSOR (PARKING ASSISTANCE MODULE (PAM), REPLACING**
- see **CHECKING WIRING AND TERMINALS**

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 230: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 231: Identifying Connector(s) Reinstallation
Courtesy of VOLVO CARS CORPORATION

- Switch off the ignition. Wait at least 15 seconds
- Reinstall the connectors, components etc.
- Ignition on for at least 5 seconds
- Move the gear selector lever to back-up (reversing) (R).

  The parking assistance module (PAM) is activated by pressing the switch on the lower section of the climate control module (CCM). Click on the VCT2000 symbol to read off the diagnostic status from the parking assistance module (PAM).

  Check that the parking assistance module (PAM) is active. Check that the sensors are OK.

Fig. 232: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the parking assistance module (PAM) active? Are the sensors OK?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-4F43: BACK-UP WARNING SENSOR 2. FAULTY SIGNAL (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-4F43

Condition

Fig. 233: Identifying Parking Sensor
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) checks diagnosis from the parking assistance module (PAM).

Diagnostic trouble code (DTC) REM-4F43 is stored if parking assistance module (PAM) registers a fault in sensor 2.

Diagnostic trouble code (DTC) REM-4F43 can be detected when the ignition is on for 5 seconds.

Substitute Value

- None.

Possible Source

- Fault in wiring to back-up warning sensor 2
- Back-up warning sensor 2 defective.

Fault symptom[s]

- General warning lamp lit.
- The back-up (reversing) warning system does not function.

FAULTY SIGNAL

CHECKING COMPONENTS AND WIRING

Check the connections on the parking assistance module (PAM) and sensor 2 (inner left). Check for contact resistance and oxidation. Also check intermediate connector.

Check the power supply cable between the connector in the parking assistance module (PAM) terminal #6 and the connector for sensor #1. Check for a short-circuit to ground. Check for an open-circuit.

Check the signal ground cable between the connector in the parking assistance module (PAM) terminal #7 and the connector for sensor #3. Check for a short-circuit to supply voltage. Check for an open-circuit.

Check the signal cable between the connector in the parking assistance module (PAM) terminal #3 and the connector for sensor #2. Check for an open-circuit. Check for a short-circuit to supply voltage. Check for a short-circuit to ground.

Try a new sensor if no fault is found.

Remedy as necessary.

Other information:

- To access or replace the parking assistance module (PAM), see **PARKING ASSISTANCE MODULE (PAM), REPLACING**
- To access or replace the back-up warning sensor, see **REVERSE (REVERSING) WARNING SENSOR (PARKING ASSISTANCE MODULE (PAM), REPLACING**
- To fault-trace the wiring and terminals, see **CHECKING WIRING AND TERMINALS** .

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-4F43: PARKING SENSOR 2. FAULTY SIGNAL (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-4F43 (2005, 2006)

Condition

Fig. 240: Identifying Parking Sensor
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) communicates with the parking assistance module (PAM) which checks the signal from parking sensor 2.

The diagnostic trouble code (DTC) is stored if the parking assistance module (PAM) registers a faulty signal from the parking sensor (2).

The diagnostic trouble code (DTC) can be diagnosed at key position II.

Substitute Value

- None.

Possible Source

- Short-circuit to ground or supply voltage in the signal cable between the parking assistance module (PAM) and parking sensor 2
- Short-circuit to ground in the power supply cable between the parking assistance module (PAM) and parking sensor 2
- Short-circuit to supply voltage in the ground lead between the parking assistance module (PAM) and parking sensor 2.

Fault symptom[s]

- The parking assistance system does not operate
- Message in the display.

FAULTY SIGNAL (2005, 2006)

see **FAULTY SIGNAL (2005, 2006)**

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-4F43 (2007-2012)

Condition

Fig. 241: Identifying Parking Sensor
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) communicates with the parking assistance module (PAM) which checks the signal from parking sensor 2.

The diagnostic trouble code (DTC) is stored if the parking assistance module (PAM) registers a faulty signal from the parking sensor (2).

The diagnostic trouble code (DTC) can be diagnosed at key position II.

Substitute Value

- None.

Possible Source

- Short-circuit to ground or supply voltage in the signal cable between the parking assistance module (PAM) and parking sensor 2
- Short-circuit to ground in the power supply cable between the parking assistance module (PAM) and parking sensor 2
- Short-circuit to supply voltage in the ground lead between the parking assistance module (PAM) and parking sensor 2.

Fault symptom[s]

- The parking assistance system does not operate

- Message in the display.

REM-4F44: BACK-UP WARNING SENSOR 3. FAULTY SIGNAL (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-4F44

Condition

Fig. 242: Identifying Parking Sensor
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) checks diagnosis from the parking assistance module (PAM).

Diagnostic trouble code (DTC) REM-4F44 is stored if parking assistance module (PAM) registers a fault in sensor 3.

Diagnostic trouble code (DTC) REM-4F44 can be detected when the ignition is on for 5 seconds.

Substitute Value

- None.

Possible Source

- Fault in wiring to back-up warning sensor 3
- Back-up warning sensor 3 defective.

Fault symptom[s]

- General warning lamp lit.
- The back-up (reversing) warning system does not function.

FAULTY SIGNAL

CHECKING COMPONENTS AND WIRING

Check the connections on the parking assistance module (PAM) and sensor 3 (inner right). Check for contact resistance and oxidation. Also check intermediate connector.

Check the power supply cable between the connector in the parking assistance module (PAM) terminal #6 and the connector for sensor #1. Check for a short-circuit to ground. Check for an open-circuit.

Check the signal ground cable between the connector in the parking assistance module (PAM) terminal #7 and the connector for sensor #3. Check for a short-circuit to supply voltage. Check for an open-circuit.

Check the signal cable between the connector in the parking assistance module (PAM) terminal #2 and the connector for sensor #2. Check for an open-circuit. Check for a short-circuit to supply voltage. Check for a short-circuit to ground.

Try a new sensor if no fault is found.

Remedy as necessary.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-4F44: PARKING SENSOR 3. FAULTY SIGNAL (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-4F44 (2005, 2006)

Condition

Fig. 249: Identifying Parking Sensor
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) communicates with the parking assistance module (PAM) which checks the signal from parking sensor 3.

The diagnostic trouble code (DTC) is stored if the parking assistance module (PAM) registers a faulty signal from the parking sensor (3).

The diagnostic trouble code (DTC) can be diagnosed at key position II.

Substitute Value

- None.

Possible Source

- Short-circuit to ground or supply voltage in the signal cable between the parking assistance module (PAM) and parking sensor 3
- Short-circuit to ground in the power supply cable between the parking assistance module (PAM) and parking sensor 3

- Short-circuit to supply voltage in the ground lead between the parking assistance module (PAM) and parking sensor 3.

Fault symptom[s]

- The parking assistance system does not operate
- Message in the display.

FAULTY SIGNAL (2005, 2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-4F44 (2007-2012)

Condition

Fig. 250: Identifying Parking Sensor
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) communicates with the parking assistance module (PAM) which checks the signal from parking sensor 3.

The diagnostic trouble code (DTC) is stored if the parking assistance module (PAM) registers a faulty signal from the parking sensor (3).

The diagnostic trouble code (DTC) can be diagnosed at key position II.

Substitute Value

- None.

Possible Source

- Short-circuit to ground or supply voltage in the signal cable between the parking assistance module (PAM) and parking sensor 3
- Short-circuit to ground in the power supply cable between the parking assistance module (PAM) and parking sensor 3
- Short-circuit to supply voltage in the ground lead between the parking assistance module (PAM) and parking sensor 3.

Fault symptom[s]

- The parking assistance system does not operate
- Message in the display.

FAULTY SIGNAL (2007-2012)

see **FAULTY SIGNAL (2007-2012)**

REM-4F45: BACK-UP WARNING SENSOR 4. FAULTY SIGNAL (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-4F45

Condition

Fig. 251: Identifying Parking Sensor
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) checks diagnosis from the parking assistance module (PAM).

Diagnostic trouble code (DTC) REM-4F45 is stored if parking assistance module (PAM) registers a fault in sensor 4.

Diagnostic trouble code (DTC) REM-4F45 can be detected when the ignition is on for 5 seconds.

Substitute Value

- None.

Possible Source

- Fault in wiring to back-up warning sensor 4
- Back-up warning sensor 4 defective.

Fault symptom[s]

- General warning lamp lit.
- The back-up (reversing) warning system does not function.

FAULTY SIGNAL

CHECKING COMPONENTS AND WIRING

Check the connections on the parking assistance module (PAM) and sensor 4 (outer right). Check for contact resistance and oxidation. Also check intermediate connector.

Check the power supply cable between the connector in the parking assistance module (PAM) terminal #6 and the connector for sensor #1. Check for a short-circuit to ground. Check for an open-circuit.

Check the signal ground cable between the connector in the parking assistance module (PAM) terminal #7 and the connector for sensor #3. Check for a short-circuit to supply voltage. Check for an open-circuit.

Check the signal cable between the connector in the parking assistance module (PAM) terminal #4 and the connector for sensor #2. Check for an open-circuit. Check for a short-circuit to supply voltage. Check for a short-circuit to ground.

Try a new sensor if no fault is found.

Remedy as necessary.

Is the parking assistance module (PAM) active? Are the sensors OK?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-4F47 (2007-2012)

Condition

Fig. 281: Identifying Parking Sensor
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) communicates with the parking assistance module (PAM) which checks the signal from parking sensor 6.

The diagnostic trouble code (DTC) is stored if the parking assistance module (PAM) registers a faulty signal from the parking sensor (6).

The diagnostic trouble code (DTC) can be diagnosed at key position II.

Substitute Value

- None.

Possible Source

- Short-circuit to ground or supply voltage in the signal cable between the parking assistance module (PAM) and parking sensor 6
- Short-circuit to ground in the power supply cable between the parking assistance module (PAM) and parking sensor 6
- Short-circuit to supply voltage in the ground lead between the parking assistance module (PAM) and parking sensor 6.

Fault symptom[s]

- The parking assistance system does not operate
- Message in the display.

FAULTY SIGNAL (2007-2012)

CHECKING COMPONENTS AND WIRING

CAUTION: Do not touch the terminal pins in the parking assistance module (PAM). There is a risk of static discharge. This could damage the parking assistance module (PAM).

Courtesy of VOLVO CARS CORPORATION

Fig. 283: Identifying Connector(s) Disconnected
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check the connectors for parking sensor 6 (inner right front) and Parking Assistance Module (PAM). Check for damage to pins and connections. Also check the other connectors, which connect the cables between the Parking Assistance Module (PAM) and the parking sensor.

  Check the signal cable between the parking assistance module (PAM) and the parking sensor connector. Check for a short-circuit to supply voltage. Check for a short-circuit to ground.

  Check the cable between:

  - Parking assistance module (PAM) terminal #B6 and parking sensor connector terminal #2.

Check the power supply lead between the parking assistance module (PAM) and the parking sensor connector. Check for a short-circuit to ground.

Check the cable between:

- Parking assistance module (PAM) terminal #B2 and parking sensor connector terminal #1.

Check the ground lead between the parking assistance module (PAM) and the parking sensor connector. Check for a short-circuit to supply voltage.

Check the cable between:

- Parking assistance module (PAM) terminal #B1 and parking sensor connector terminal #3.

Remedy as necessary.

If no fault is found, replace the parking sensor.

Other information

- see **SIGNAL SPECIFICATION**
- For accessing/replacing the front parking assistance sensors, see Installation instructions, Accessories.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-4F4A

Condition

Fig. 316: Identifying Parking Assistance Module (PAM)
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) checks diagnosis from the parking assistance module (PAM).

Diagnostic trouble code (DTC) REM-4F4A is stored if parking assistance module (PAM) registers a fault in the control module.

Diagnostic trouble code (DTC) REM-4F4A can be detected when the ignition is on for 5 seconds.

Substitute Value

- None.

Possible Source

- Defective parking assistance module (PAM).

Fault symptom[s]

- General warning lamp lit.
- The back-up (reversing) warning system does not function.

FAULTY SIGNAL

CHECKING THE COMPONENT

An internal fault has occurred in the parking assistance module (PAM). Check whether the fault is active by activating the back-up warning with the ignition on and back-up gear selected. The fault is permanent if the back-up warning does not work.

Replace parking assistance module (PAM).

Other information:

- To access or replace the parking assistance module (PAM), see **PARKING ASSISTANCE MODULE (PAM), REPLACING** .
- **Continue**

  Refer to **VERIFICATION**

REM-4F4A: PARKING ASSISTANCE MODULE (PAM). FAULTY SIGNAL (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-4F4A

Condition

Fig. 320: Identifying Parking Assistance Module
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) communicates with the parking assistance module (PAM).

The diagnostic trouble code (DTC) is stored if the rear electronic module (REM) receives information from the parking assistance module (PAM) indicating an internal fault.

The diagnostic trouble code (DTC) can be diagnosed at key position II.

Substitute Value

- None.

Possible Source

- Internal fault in the parking assistance module (PAM).

Fault symptom[s]

- The parking assistance system does not operate
- Message in the display.

FAULTY SIGNAL

REPLACING THE COMPONENT

The parking assistance module (PAM) has registered an internal fault.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up of the parking assistance module (PAM) or may be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs. Replace the parking assistance module (PAM) if the fault recurs.

Replace the parking assistance module (PAM) in the event of a permanent fault.

Remedy as necessary.

Other information

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

REM-4F90: SENSOR, SEAT BELT REMINDER. SIGNAL TOO HIGH (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-4F90

Condition

The rear electronic module (REM) checks the signal from the sensor, seat belt reminder in the passenger seat.

Diagnostic trouble code (DTC) REM-4F90 is stored if rear electronic module (REM) registers too high a signal from the seat belt reminder sensor.

Diagnostic trouble code (DTC) REM-4F90 can be detected with ignition in positions I or II for at least 3 minutes and battery voltage > 9 volt.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the signal cable
- Defective sensor, seat belt reminder.

Fault symptom[s]

- General warning lamp lit.

SIGNAL TOO HIGH

CHECKING COMPONENTS AND WIRING

Check the rear electronic module (REM) and seat belt reminder sensor connectors. Check for contact resistance

and oxidation. Check for damage and loose connections. Also check intermediate connector.

Check the signal cable between rear electronic module (REM) terminal #B19 (terminal #A39) and seat belt reminder sensor connector terminal #9. Check for a short-circuit to supply voltage.

Check the signal cable between rear electronic module (REM) terminal #B20 (terminal #A40) and seat belt reminder sensor connector terminal #10. Check for a short-circuit to supply voltage.

Check the seat belt reminder sensor. Measure the resistance between terminals #9 and #10 in the sensor connector.

HINT: The resistance should be above 100 kohms with no passengers and below 10 kohms with passengers.

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access or replace the seat belt reminder sensor, see **VERIFICATION**
- For information about signals, see **SIGNAL SPECIFICATION**
- see **CHECKING WIRING AND TERMINALS** .

REM-4F91: SENSOR, SEAT BELT REMINDER. SIGNAL TOO LOW (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-4F91

Condition

The rear electronic module (REM) checks the signal from the sensor, seat belt reminder in the passenger seat.

Diagnostic trouble code (DTC) REM-4F91 is stored if rear electronic module (REM) registers too low a signal from the seat belt reminder sensor.

Diagnostic trouble code (DTC) REM-4F91 can be detected with ignition in positions I or II for at least 3 minutes and battery voltage > 9 volt.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the signal cable
- Defective sensor, seat belt reminder.

Fault symptom[s]

- General warning lamp lit.

SIGNAL TOO LOW

CHECKING COMPONENTS AND WIRING

Check the rear electronic module (REM) and seat belt reminder sensor connectors. Check for contact resistance and oxidation. Check for damage and loose connections. Also check intermediate connector.

Check the signal cable between rear electronic module (REM) terminal #B19 (terminal #A39) and seat belt reminder sensor connector terminal #9. Check for a short-circuit to ground.

Check the signal cable between rear electronic module (REM) terminal #B20 (terminal #A40) and seat belt reminder sensor connector terminal #10. Check for a short-circuit to ground.

Check the seat belt reminder sensor. Measure the resistance between terminals #9 and #10 in the sensor connector.

HINT: The resistance should be above 100 kohms with no passengers and below 10 kohms with passengers.

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access or replace the seat belt reminder sensor, see **HEATER PAD BACKREST AND CUSHION, REPLACING** (-2004) or **HEATER PAD BACKREST AND CUSHION, REPLACING** (2005-).
- For information about signals, see **SIGNAL SPECIFICATION**
- see **CHECKING WIRING AND TERMINALS** .

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ELECTRICAL

Cables And Fuses - Diagnostic Trouble Codes and Associated Procedures

REM-8F13: BI-XENON LAMP POSITION SENSOR. CALIBRATION FAULT (2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-8F13

Condition

The rear electrical module checks if the position sensor for the xenon lamp has been correctly calibrated.

Diagnostic trouble code (DTC) REM-8F13 is stored if the rear electronic module (REM) registers that the position sensor for the xenon lamp has not been correctly calibrated.

Diagnostic trouble code (DTC) REM-8F13 can be detected after calibration has been carried out.

Substitute Value

None.

Possible Source

- The position sensor for the Xenon lamp is incorrectly installed
- The calibration has been run with the vehicle under load or on an uneven surface.

Fault symptom[s]

- The road surface is not illuminated.

CALIBRATION FAULT

CALIBRATING THE COMPONENT

Fig. 1: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

NOTE: **If the vehicle is equipped with Four-C, calibration must be carried out via suspension module (SUM).**

Check that the position sensor for the Bi-Xenon lamps is correctly installed.

Someone must sit in the driver's seat during calibration. The person must weigh at least 75 kg. Ensure that the vehicle is unladen and is on a flat surface.

Calibrate the position sensor for the Bi-Xenon lamps again.

- Ignition on
- Calibrate the position sensor using the VCT2000 (or appropriate scan tool).

Other information

- see **POSITION SENSOR BI-XENON LAMPS, REPLACING**

REM-8F41: TAILGATE WIPER RELAY. SIGNAL TOO HIGH. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

Diagnostic trouble code (DTC) REM-8F41 is stored if the signal across the relay coil (2/16) is too high when the tailgate wiper is activated.

The fuse can blow if relays are activated in the wrong order. This can happen when the key is turned from position I to position II and the wiper arm is activated at the same time.

Substitute Value

None.

Possible Source

- Damaged tailgate wiper fuse.
- Damaged relay (short-circuit in the relay coil).

Fault symptom[s]

- The rear windscreen wiper motor does not operate.

SIGNAL TOO HIGH. INTERMITTENT FAULT

REPLACING COMPONENTS

Check the tailgate wiper fuse; replace as necessary.

Replace relay 2/16.

Other information:

- To access the relay/fuse box in the cargo compartment:**RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-8F43: TAILGATE WIPER RELAY. SIGNAL TOO LOW. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

Diagnostic trouble code (DTC) REM-8F43 is generated if the signal across relay coil (2/16) is missing or too low when the tailgate wiper relay is activated.

The fuse can blow if relays are activated in the wrong order. This can happen when the key is turned from position I to position II and the wiper arm is activated at the same time.

Substitute Value

None.

Possible Source

- Damaged fuse in the tailgate wiper.
- Oxidation in the relay base switches.
- Relay is not fit.

Fault symptom[s]

- The rear windscreen wiper motor does not operate.

SIGNAL TOO LOW. INTERMITTENT FAULT

REPLACING THE COMPONENT

Check the tailgate wiper fuse; replace as necessary.

Remove relay 2/16 and check the relay base switches for contact resistance and oxidation.

Fit the relay.

Other information:

- To access the relay/fuse box in the cargo compartment:**RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-8F61: RELAY, REAR DEMIST. SIGNAL TOO HIGH. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If control unit registers signal too high from status flag when activating relay control, the diagnostic trouble code is displayed.

Substitute Value

Nothing.

Possible Source

- Relay control to relay 2/82 short circuited to battery voltage.

Fault symptom[s]

- Rear window heating does not work.

SIGNAL TOO HIGH. INTERMITTENT FAULT

CHECKING THE WIRING AND COMPONENT

Check that the "Rear windshield defroster" relay 2/82 is correctly installed.

Check the rear electronic module connector and relay terminal 2/82. Check for contact resistance and oxidation according to **CONTACT RESISTANCE AND OXIDATION** . Check for loose connections according to **LOOSE CONNECTIONS (TERMINALS)** .

Check the cable between rear electronic module terminal #D1 (#B01) and "Rear windshield defroster" relay 2/82 terminal #2. Check for an intermittent short-circuit to supply voltage according to **SHORT-CIRCUIT TO SUPPLY VOLTAGE, INTERMITTENT FAULTS** . Check for an intermittent open-circuit according to **OPEN-CIRCUIT, INTERMITTENT FAULTS** .

Other information:

- For further information about signals and other values, see **SIGNAL SPECIFICATION** .
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX** .
- When the relay is installed and activated, the voltage at the relay guide should be 0 V.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-8F63: RELAY, REAR DEMIST. SIGNAL MISSING. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If control unit registers an open circuit from the status flag when relay control is not activated, the diagnostic trouble code is displayed.

Substitute Value

Nothing.

Possible Source

- Open circuit in relay control to relay 2/82. Relay 2/82 not installed.

Fault symptom[s]

- Heated rear window does not work.

SIGNAL MISSING. INTERMITTENT FAULT

CHECKING THE WIRING AND COMPONENT

Check that the "Rear windshield defroster" relay 2/82 is correctly installed.

Check the rear electronic module connector and relay terminal 2/82. Check for contact resistance and oxidation according to **CONTACT RESISTANCE AND OXIDATION** . Check for loose connections according to **LOOSE CONNECTIONS (TERMINALS)** .

Check the cable between main fuse 11E/5 and "Rear windshield defroster" relay 2/82 terminal #5. Check the cable between main fuse 11D/5 and "Rear windshield defroster" relay 2/82 terminal #1. Check the cable between rear electronic module terminal #D1 (#B01) and "Rear windshield defroster" relay 2/82 terminal #2. Check these cables for an intermittent short-circuit to ground according to **SHORT-CIRCUIT TO GROUND, INTERMITTENT FAULTS** . Check for an intermittent open-circuit according to **OPEN-CIRCUIT, INTERMITTENT FAULTS** .

Other information:

- For further information about signals and other values, see **SIGNAL SPECIFICATION** .
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX** .
- When the relay is installed and not activated, the voltage at the relay guide should be 12 V.

REM-9F21: CARGO COMPARTMENT LIGHTING. FAULTY SIGNAL (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-9F21

Condition

The rear electronic module (REM) checks the cargo compartment lighting in the trunk lid.

Diagnostic trouble code (DTC) REM-9F21 is stored if the rear electronic module (REM) registers that the

signal is too low.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage or ground in the cable for the cargo compartment lighting
- Open-circuit in the cable for the cargo compartment lighting
- Defective cargo compartment lighting bulb.

Fault symptom[s]

- The cargo compartment lighting does not function.

FAULTY SIGNAL

CHECKING COMPONENTS AND WIRING

Check that the bulb in the cargo compartment lighting is intact.

Check the connectors on the rear electronic module (REM) and cargo compartment lighting. Check for contact resistance and oxidation. Check for loose connections.

HINT: The voltage between terminals #2 and #4 in the connector for the cargo compartment lighting must be approximately battery voltage when the trunk lid is open.

Check the cable between rear electronic module (REM) connector terminal #2E (#B22) and cargo compartment lighting terminal #2. Check for an open-circuit. Check for a short-circuit to ground.

Check the cable between cargo compartment lighting terminal #4 and ground. Check for an open-circuit. Check for a short-circuit to supply voltage.

Remedy as necessary.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-DD00: LIN COMMUNICATION. COMMUNICATION FAULT (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-DD00

Condition

Fig. 50: Identifying Rear Electronic Module (REM)

Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) transmits and receives information via a standardized serial communication method - LIN (Local Interconnect Network). The diagnostic trouble code (DTC) is stored if the control module registers serious interference (LIN communication blocked) with the parking assistance module (PAM).

The diagnostic trouble code (DTC) can be detected when the ignition is in position II for at least 10 seconds and the battery voltage is > 10.5 volts.

NOTE: **In the event of REM-DDxx diagnostic trouble codes (DTCs), the rear electronic module (REM) must not be replaced as the diagnostic trouble code (DTC) indicates a short-circuit in one or more conductors in the LIN network. The rear electronic module (REM) is the only control module that monitors the voltage level in the LIN wiring. The rear electronic module (REM) is therefore the only control module that can store a diagnostic trouble code (DTC) for a short-circuit to ground or supply voltage in one of the cables. Do not replace the rear electronic module (REM) in the event of a LIN fault unless VIDA (Volvo scan tool) has indicated that the rear electronic module (REM) has an internal fault.**

Substitute Value

- None.

Possible Source

- Short-circuit between signal cables
- Open-circuit in one of the signal cables
- Internal fault in another control module in the same part of the network.

Fault symptom[s]

- The parking assistance system does not operate.

COMMUNICATION FAULT

CHECKING THE WIRING

Fig. 51: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 52: Identifying Control Module Disconnected
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect connector D on the rear electronic module (REM).

  The diagnostic trouble code (DTC) is stored if there is no communication between the rear electronic module (REM) and the parking assistance module (PAM). This may be due to a fault in the signal cable between the control modules or a defective communication device in one or all of the control modules.

  Check the signal cable. Check for an open-circuit. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

  Take readings between:

  - Rear electronic module (REM) terminal #D32 (#32) and parking assistance module (PAM)

terminal #A12.

Remedy as necessary.

Other information

- see **CONNECTING THE BREAKOUT BOX**
- see **SIGNAL SPECIFICATION**
- see **PARKING ASSISTANCE MODULE (PAM), REPLACING**
- see **CHECKING WIRING AND TERMINALS**

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **REPLACING THE CONTROL MODULE**

REPLACING THE CONTROL MODULE

Try a new parking assistance module (PAM).

Remedy as necessary.

Other information

- see **PARKING ASSISTANCE MODULE (PAM), REPLACING**

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 53: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-DD01: LIN COMMUNICATION. COMMUNICATION FAULT (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-DD01

Condition

Fig. 56: Identifying Rear Electronic Module (REM)
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) transmits and receives information via a standardized serial communication method - LIN (Local Interconnect Network). The diagnostic trouble code (DTC) is stored if the control module registers serious interference (LIN communication blocked) with the parking assistance module (PAM).

The diagnostic trouble code (DTC) can be detected when the ignition is in position II for at least 10 seconds and the battery voltage is > 10.5 volts.

NOTE: **In the event of REM-DDxx diagnostic trouble codes (DTCs), the rear electronic module (REM) must not be replaced as the diagnostic trouble code (DTC) indicates a short-circuit in one or more conductors in the LIN network. The rear electronic module (REM) is the only control module that monitors the voltage level in the LIN wiring. The rear electronic module (REM) is therefore the only control module that can store a diagnostic trouble code (DTC) for a short-circuit to ground or supply voltage in one of the cables. Do not replace the rear electronic module (REM) in the event of a LIN fault unless VIDA (Volvo scan tool) has indicated that the rear electronic module (REM) has an internal fault.**

Substitute Value

- None.

Possible Source

- Short-circuit between signal cables
- Open-circuit in one of the signal cables
- Internal fault in another control module in the same part of the network.

Fault symptom[s]

- The parking assistance system does not operate.

COMMUNICATION FAULT

CHECKING THE WIRING

Fig. 57: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 58: Identifying Control Module Disconnected
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect connector D on the rear electronic module (REM).

  The diagnostic trouble code (DTC) is stored if there is no communication between the rear electronic module (REM) and the parking assistance module (PAM). This may be due to a fault in the signal cable between the control modules or a defective communication device in one or all of the control modules.

  Check the signal cable. Check for an open-circuit. Check for a short-circuit to ground.

  Take readings between:

  - Rear electronic module (REM) terminal #D32 (#32) and parking assistance module (PAM) terminal #A12.

Remedy as necessary.

REM-DD20: LEVEL SENSOR ALARM. COMMUNICATION FAULT (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-DD20

Condition

Fig. 74: Identifying Rear Electronic Module (REM)
Courtesy of VOLVO CARS CORPORATION

The Rear electronic module (REM) both transmits and receives information via standard serial communication - Volcano Lite (Volvo CAN based distributed real-time Operative environment). The DTC is stored if the control module registers a serious interruption (e. g. communication blocked) by:

- Inclination Sensor Module (ISM) (for vehicles with structure week -201127)
- Siren (BBS) (for vehicles with structure week 201128-)

The diagnostic trouble code (DTC) can be detected when the ignition is in position II for at least 10 seconds and the battery voltage is > 10.5 volts.

NOTE: **In the event of REM-DDxx diagnostic trouble codes (DTCs), the rear electronic module (REM) must not be replaced as the diagnostic trouble code (DTC) indicates a short-circuit in one or more conductors in the LIN network. The rear electronic module (REM) is the only control module that monitors the voltage level in the LIN wiring. The rear electronic module (REM) is therefore the only control module that can store a diagnostic trouble code (DTC) for a short-circuit to ground or supply voltage in one of the cables. Do not replace the rear electronic module (REM) in the event of a LIN fault unless VIDA (Volvo scan**

tool) has indicated that the rear electronic module (REM) has an internal fault.

Substitute Value

- None.

Possible Source

- Short-circuit between signal cables
- Open-circuit in one of the signal cables
- Internal fault in another control module in the same part of the network.

Fault symptom[s]

- False alarm.

COMMUNICATION FAULT

CHECKING THE WIRING

Fig. 75: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 76: Identifying Control Module Disconnected
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect connector D on the rear electronic module (REM).

  The DTC means that communication does not work between the Rear electronic module (REM) and:

  - Inclination Sensor Module (ISM) (for vehicles with structure week -201127)
  - Siren (BBS) (for vehicles with structure week 201128-)

  This may be due to a fault in the signal cable between the control modules or a defective communication device in one or all of the control modules. Check the signal cable. Check for an open-circuit. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Take readings between:

- Rear electronic module (REM) terminal #D26 (#26) and the inclination sensor module (ISM) terminal #2.

Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-DD28: WRONG V-LITE / LIN_L9 CONFIGURATION (2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The Rear electronic module (REM) receives information about the current vehicle configuration from the Central electronic module (CEM).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The signal configuration in the Rear electronic module (REM) does not correspond with the car's configuration.

Substitute Value

- None.

Possible Source

- The car has been downloaded with incorrect software in the Rear electronic module (REM).

Fault symptom[s]

- None.

FAULTY CONFIGURATION

FAULTY CONFIGURATION

Fig. 85: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

The incorrect configuration is rectified by downloading new software to the Rear electronic module (REM).

- Load new software into the control module.

Has the fault been remedied?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  FAULT TRACING FAILED: The fault should have been detected and remedied. As this is not the case fault-tracing has failed. Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-E001: CONTROL MODULE COMMUNICATION. DEFECTIVE COMMUNICATION (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-E001

Condition

Fig. 86: Identifying Rear Electronic Module (REM)
Courtesy of VOLVO CARS CORPORATION

The control modules transmit and receive information via a standardized serial communication method - CAN (Control Area Network). The diagnostic trouble code (DTC) is stored if the control module registers serious interference (CAN communication blocked).

NOTE: **In the event of system communication problems, it is not possible to communicate with the control module. Therefore it will only be possible to read off the diagnostic trouble code (DTC) if the fault is intermittent.**

Substitute Value

- The control module shuts itself off ("bus-off").

  HINT: The control module will remain shut off until the power supply is broken (15, 30, X). When the power supply is connected the control module will make a new attempt to communicate.

Possible Source

- Short-circuit between the control area network (CAN) wiring
- Open-circuit in the control area network (CAN) wiring
- Internal fault in the control module

- Internal fault in another control module in the same part of the control area network (CAN).

Fault symptom[s]

- The central locking system does not function at all
- The fuel gauge indicates zero even though there is fuel in the tank.
- Rear demist does not operate.
- Retractable headrest not operating.
- Does not lock / unlock the fuel tank filler cap.
- The power window mechanism in the rear door does not operate.
- The tail lamps are not working.

SIGNAL MISSING

see **SIGNAL MISSING**

REM-E001: CONTROL MODULE COMMUNICATION. FAULTY COMMUNICATION (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-E001

Condition

Fig. 87: Central Electronic Module Control module
Courtesy of VOLVO CARS CORPORATION

The control modules transmit and receive information via a standardized serial communication method - CAN (Controller Area Network). The diagnostic trouble code (DTC) is stored if the control module registers serious interference (CAN communication blocked).

NOTE: In the event of system communication problems, it is not possible to communicate with the control module. Therefore it will only be possible to read off the fault if it is intermittent.

Substitute Value

- The control module shuts itself off ("bus-off").

  HINT: The control module will remain shut off until the power supply is broken (15, 30, X). When the power supply is connected the control module will make a new attempt to communicate.

Possible Source

- Short-circuit between the control area network (CAN) wiring
- Open-circuit in the control area network (CAN) wiring
- Internal fault in the control module
- Internal fault in another control module in the same part of the control area network (CAN).

Fault symptom[s]

- The fuel gauge indicates zero even though there is fuel in the tank
- Rear demist does not operate
- Retractable headrest not operating
- No locking/unlocking of rear doors
- No locking or unlocking of the tailgate or trunk lid
- Does not lock / unlock the fuel tank filler cap
- The power window mechanism in the rear door does not operate.

FAULTY COMMUNICATION

see **FAULTY COMMUNICATION**

REM-E003: CONFIGURATION FAULT. FAULTY CONFIGURATION (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-E003

Condition

Fig. 88: Central Electronic Module Control module
Courtesy of VOLVO CARS CORPORATION

The control module compares its configuration ID with the signal configuration transmitted on the control area network (CAN) by the central electronic module (CEM). If the configuration IDs do not correspond the fault code is stored. The diagnostic trouble code (DTC) is also stored if the communication between the control module and the central electronic module (CEM) is interrupted.

NOTE: **In the event of open-circuit in both the control area network (CAN) cables, it is not possible to communicate with the control module. Therefore it will only be possible to read off the diagnostic trouble code (DTC) if this type of fault is intermittent. When the diagnostic trouble code (DTC) is stored, the control module responds to the diagnostic command, however normal control area network (CAN) communication does not work. ("Expulsion mode")**

Substitute Value

- None.

Possible Source

- Faulty control area network (CAN) configuration ID. (The node is not intended for this car, for example a used control module with different software/hardware.)
- Open-circuit in the control area network (CAN) wiring between the control module and the central electrical module (CEM).

Fault symptom[s]

- The fuel gauge indicates zero even though there is fuel in the tank
- Rear demist does not operate
- Retractable headrest not operating
- No locking/unlocking of rear doors
- No locking or unlocking of the tailgate or trunk lid
- Does not lock / unlock the fuel tank filler cap

- The power window mechanism in the rear door does not operate.

REM-E003: CONFIGURATION FAULT. FAULTY CONFIGURATION (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-E003

Condition

Fig. 89: Identifying Rear Electronic Module (REM)
Courtesy of VOLVO CARS CORPORATION

The control module compares its configuration ID with the signal configuration transmitted on the control area network (CAN) by the central electronic module (CEM). If the configuration IDs do not correspond the fault code is stored. The diagnostic trouble code (DTC) is also stored if the communication between the control

module and the central electronic module (CEM) is or has been interrupted.

NOTE: **In the event of an open-circuit in both the control area network (CAN) cables, it is not possible to communicate with the control module. Therefore it will only be possible to read off the diagnostic trouble code (DTC) if this type of fault is intermittent. When the diagnostic trouble code (DTC) is stored, the control module responds to the diagnostic command, however normal control area network (CAN) communication does not work. ("Expulsion mode")**

Substitute Value

- None.

Possible Source

- Incorrect control area network (CAN) configuration ID (the node is not intended for this car - for example a used control module with different software/hardware)
- Open-circuit in the control area network (CAN) wiring between the control module and the central electrical module (CEM).

Fault symptom[s]

- The central locking system does not function at all.
- The fuel gauge indicates zero even though there is fuel in the tank.
- Rear demist does not operate.
- Retractable headrest not operating.
- Does not lock / unlock the fuel tank filler cap.
- The power window mechanism in the rear door does not operate.
- The tail lamps are not working.

SIGNAL MISSING

see **SIGNAL MISSING**

REM-E010: POWER SUPPLY CONTROL MODULE. SIGNAL TOO LOW (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-E010

Condition

Fig. 90: Identifying Battery
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) compares its supply voltage with the information about the supply voltage to the central electronic module (CEM) transmitted on the CAN network.

The diagnostic trouble code (DTC) is stored if the rear electronic module (REM) registers that its own power supply is more than 3V below the power supply to the central electronic module (CEM).

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- None.

Possible Source

- Half-burned fuse for the rear electronic module (REM)
- Damaged power supply cable to the rear electronic module (REM)
- Loose connections in the ground lead for the rear electronic module (REM)
- Contact resistance or oxidation in the terminals.

Fault symptom[s]

- The central locking system does not function at all.
- The fuel gauge indicates zero even though there is fuel in the tank.

- Rear demist does not operate.
- Retractable headrest not operating.
- Does not lock / unlock the fuel tank filler cap.
- The power window mechanism in the rear door does not operate.
- The tail lamps are not working.

SIGNAL TOO LOW

CHECKING THE POWER SUPPLY

Fig. 91: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on

- Read off the power supply for the rear electronic module (REM) and the central electronic module (CEM).

  The voltage for the rear electronic module (REM) and the central electronic module (CEM) must be approximately the same.

  The fault is permanent if the voltage for the rear electronic module (REM) deviates by more than 3 V from the central electronic module (CEM).

  If the voltage is approximately the same, this indicates an intermittent fault, i. e. the fault was present previously but is not active at the moment.

- **Continue**

  Refer to **CHECKING CABLE AND COMPONENT**

CHECKING CABLE AND COMPONENT

Check the connectors for the rear electronic module (REM). Check for contact resistance and oxidation.

Check the terminals for the power supply (30-supply) from the battery to the rear electronic module (REM) (screw terminal). Check for contact resistance and oxidation. Also check the terminals for the fuse to the actual rear electronic module (REM).

Check the ground terminal from the rear electronic module (REM) terminal #12 (#D12) and ground terminal. Check for contact resistance and oxidation.

Remedy as necessary.

Other information

- see **CONNECTING THE BREAKOUT BOX**
- see **SIGNAL SPECIFICATION**

UEM-0004: SIREN. COMMUNICATION FAULT

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION UEM-0004

Condition

Fig. 102: Locating Siren Control Module
Courtesy of VOLVO CARS CORPORATION

The upper electronic module (UEM) receives information from the siren

If the alarm does not respond to repeated requests from the upper electronic module (UEM), the control module interprets it as a communication fault and the diagnostic trouble code (DTC) is stored.

The diagnostic trouble code (DTC) can be detected 40 seconds after the control module has been initialized.

Substitute Value

- None.

Possible Source

- Open-circuit in UEM_K3 (the serial cable between the upper electronic module (UEM), siren and sun roof)
- Short-circuit to ground in UEM_K3
- Short-circuit to supply voltage in UEM_K3
- Defective siren.

Fault symptom[s]

- Alarm/Arming does not work/No visible indication
- Alarm/Alarm will not set off/No visible and/or audible signal
- Text window and warning symbol/Text message

COMMUNICATION FAULT

CHECKING FOR PERMANENT OR INTERMITTENT FAULTS

Open the driver's door window. Lock the car using the remote control.

Wait 25 seconds until the vehicle has been alarmed. Trigger the alarm by inserting a hand through the window and unlocking the door from the inside using the internal door handle.

NOTE: On vehicles with deadlocks, these must be deactivated first. Press the button for the reduced locking position to activate deadlocks.

The function can be engaged in ignition position I and 0. It can also be engaged after the ignition has been switched off, for up to one minute after the ignition key has been removed from the ignition switch. The switch has an integrated light emitting diode for indicating that the function has been activated. A message also appears in the display in the Driver information module however, not when the key has been removed. The switches may be positioned differently than shown in the image, depending on the vehicle's configuration and equipment.

Fig. 103: Identifying Button
Courtesy of VOLVO CARS CORPORATION

Is the siren triggered?

- **YES**

  Refer to **INTERMITTENT FAULT**

- **NO**

  Refer to **CHECKING THE CONNECTORS**

CHECKING THE CONNECTORS

Fig. 104: Identifying Connector(s) Reinstallation
Courtesy of VOLVO CARS CORPORATION

- Check the connectors for the siren, upper electronic control module and cable harness. Check for contact resistance and oxidation.

  In particular, check for any damage

- Reinstall the components, reconnect the connectors etc.

  Open the driver's door window. Lock the car using the remote control.

Wait 25 seconds until the vehicle has been alarmed. Trigger the alarm by inserting a hand through the window and unlocking the door from the inside using the internal door handle.

NOTE: On vehicles with deadlocks, these must be deactivated first. Press the button for the reduced locking position to activate deadlocks.

The function can be engaged in ignition position I and 0. It can also be engaged after the ignition has been switched off, for up to one minute after the ignition key has been removed from the ignition switch. The switch has an integrated light emitting diode for indicating that the function has been activated. A message also appears in the display in the Driver information module however, not when the key has been removed. The switches may be positioned differently than shown in the image, depending on the vehicle's configuration and equipment.

  Refer to **FAULT-TRACING INFORMATION**

FAULT-TRACING INFORMATION

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.

It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

UEM-0004: SIREN. COMMUNICATION FAULT (2003)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

If control module receives no response from siren at repeated requests, this is understood as a communication fault and the diagnostic trouble code (DTC) is stored.

Substitute Value

- None.

Possible Source

- Open-circuit on UEM_K3 (serial cable between UEM, siren and sun roof).
- UEM_K3 short-circuit to ground.
- UEM_K3 short-circuit to battery voltage.
- Defect siren.

Fault symptom[s]

- Siren does not work.
- Alarm does not work.

COMMUNICATION FAULT

see **COMMUNICATION FAULT**

UEM-0005: SUN ROOF. COMMUNICATION FAULT (2004-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION UEM-0005

Condition

Fig. 127: Identifying Sun Roof
Courtesy of VOLVO CARS CORPORATION

The upper electronic module (UEM) receives information from the sun roof.

If the sun roof does not respond to repeated requests from the upper electronic module (UEM), the control module interprets it as a communication fault and the diagnostic trouble code (DTC) is stored.

The diagnostic trouble code (DTC) can be detected 20 seconds after the control module has been initialized.

Substitute Value

- None.

Possible Source

- Open-circuit in UEM_K3 (the serial cable between the upper electronic module (UEM), siren and sun roof)
- Short-circuit to ground in UEM_K3
- Short-circuit to supply voltage in UEM_K3
- Damaged Sun roof module (SRM).

Fault symptom[s]

- The power sun roof does not operate.

COMMUNICATION FAULT

CHECKING FOR PERMANENT OR INTERMITTENT FAULTS

Fig. 128: Identifying Ignition ON

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

INFORMATION

FAULT-TRACING INFORMATION

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.

It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

UEM-0005: SUNROOF. COMMUNICATION FAULT (2003)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If the control unit does not get a response from the sunroof after a repeated request, the control unit interprets this as a communication fault and a diagnostic trouble code is set.

Substitute Value

- Nothing.

Possible Source

- Open circuit on UEM_K3 (serial wire between UEM, siren and sunroof).
- UEM_K3 short circuited to ground.
- UEM_K3 short circuited to voltage supply.
- Defective sunroof.

Fault symptom[s]

- Electric sunroof does not work.

COMMUNICATION FAULT

see **COMMUNICATION FAULT**

UEM-0007: READING LAMP. SIGNAL TOO LOW (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION UEM-0007

Condition

The upper electronic module (UEM) checks the buttons for the third row reading lamps via a digital input signal. The buttons are connected in parallel and checked via the same signal cable.

Diagnostic trouble code (DTC) UEM-0007 is stored in the control module if the upper electronic module (UEM) registers too low a signal from the buttons in the third row reading lamps.

Diagnostic trouble code (DTC) UEM-0007 can be diagnosed when the ignition is on.

Substitute Value

- None.

Possible Source

- The switch in the third row of reading lamps has jammed in the depressed position
- The signal cable for buttons from the third row of reading lamps is short-circuited to ground.

Fault symptom[s]

- The interior lighting does not work.

SIGNAL TOO LOW

CHECKING FOR A SHORT-CIRCUIT

Check whether the switch for the third row reading lamps has jammed in the depressed position.

Check the signal cable for buttons between the upper electronic module (UEM) terminal #A2 and the switch which is connected to the third row reading lamps. Check for a short-circuit to ground.

Disconnect connectors for the reading lamp module and the upper electronic module (UEM). Measure the resistance over the signal cable between the connectors. If the cable is short-circuited to ground, 0 ohms will be measured.

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**

- To access or replace the reading lamp module, see **BULB, READING LAMP, REAR, REPLACING**
- For information about signals, see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)**
- To access the connector for the upper electronic module (UEM), see **UPPER ELECTRONIC MODULE (UEM)/REARVIEW MIRROR, REPLACING**
- To fault-trace wiring and terminals, see **CHECKING WIRING AND TERMINALS** .

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-0008: READING LAMP. SIGNAL TOO LOW (2003-2012)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If the control unit registers signal too low from the rear right reading lamp, the diagnostic trouble code is displayed.

Substitute Value

- Nothing.

Possible Source

- The switch for the rear right reading lamp has stuck down
- The signal wire for the rear right reading lamp is short circuited to ground.

Fault symptom[s]

- Courtesy lighting does not work.

SIGNAL TOO LOW

CHECKING FOR A SHORT-CIRCUIT

Check that the button has not jammed in its depressed position.

Check the cable from the upper electronic module (UEM) to the rear reading lamp module. Check for a short-circuit to ground.

Remove the connector from the reading lamp module and measure between the connector and the upper electronic module (UEM) as follows.

UEM-0008 Right rear reading lamp

Control module terminal #20 and reading lamp module terminal #6.

UEM-0009 Left rear reading lamp

Control module terminal #20 and reading lamp module terminal #2.

Replace the cable if a fault is found.

Other information:

- For further information about signals and other values, see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access or replace the reading lamp module, see **BULB, READING LAMP, REAR, REPLACING**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-0009: READING LAMP. SIGNAL TOO LOW (2003-2012)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If the control unit registers signal too low from the rear left reading lamp, the diagnostic trouble code is displayed.

Substitute Value

- Nothing.

Possible Source

- The switch for the rear left reading lamp has stuck down
- The signal wire for the rear left reading lamp is short circuited to ground.

Fault symptom[s]

- Courtesy lighting does not work.

SIGNAL TOO LOW

see **SIGNAL TOO LOW**

UEM-000A: MOVEMENT SENSOR. COMMUNICATION FAULT (2012)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If the upper electronic module registers that there is no signal on the mass movement sensor supply wire when the alarm is switched off and ignition in position l or ll, diagnostic trouble code UEM-000A is displayed.

Substitute Value

- Nothing.

Possible Source

- A faulty contact at sensor side and/or at control unit side.
- Open circuit on level sensor voltage supply.
- Faulty sensor.

Fault symptom[s]

- No alarm from sensor.

COMMUNICATION FAULT

CHECKING WIRING AND CONNECTORS

Check the voltage supply cable between the upper electronic module (UEM) connector terminal #10 and movement sensor (IMS) connector terminal #1. Check for an open-circuit. Check for an intermittent open-circuit.

Also check both connectors for contact resistance and oxidation.

If no fault was found, try a new sensor.

Other information:

- For further information about signals and other values, see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-000A: MOVEMENT SENSOR. COMMUNICATION FAULT (2003-2011)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If the upper electronic module registers that there is no signal on the mass movement sensor supply wire when the alarm is switched off and ignition in position l or ll, diagnostic trouble code UEM-000A is displayed.

Substitute Value

- Nothing.

Possible Source

- A faulty contact at sensor side and/or at control unit side.
- Open circuit on level sensor voltage supply.
- Faulty sensor.

Fault symptom[s]

- No alarm from sensor.

COMMUNICATION FAULT

CHECKING WIRING AND CONNECTORS

Check the power supply cable between upper electronic module (UEM) connector terminal #10 and movement sensor connector terminal #1. Check for an intermittent open-circuit. Check for an open-circuit.

Also check both connectors for contact resistance and oxidation.

If no fault was found, try a new sensor.

Other information:

- For further information about signals and other values, see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To replace the movement/rear level sensor, see **MASS MOVEMENT SENSOR MODULE (MMS) REAR, REPLACING**
- To replace the movement/front level sensor, see **MASS MOVEMENT SENSOR MODULE (MMS) FRONT, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

UEM-000B: MOVEMENT SENSOR. SIGNAL TOO LOW (2012)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If the upper electronic module registers too low a signal for the mass movement sensor supply wire when the alarm is set, diagnostic trouble code UEM-000B is displayed.

Substitute Value

- Nothing.

Possible Source

- Sensor power supply short circuited to ground
- Faulty sensor.

Fault symptom[s]

- No alarm from sensor.

SIGNAL TOO LOW

CHECKING WIRING AND CONNECTORS

Check the supply cable between the Upper electronic module (UEM) connector #10 and movement sensor (IMS) connector #1 for a short-circuit to ground and intermittent short-circuit to ground.

If no fault was found, try a new sensor.

Other information:

- For further information about signals and other values, see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**

UEM-000C: MASS MOVEMENT SENSOR. SIGNAL TOO HIGH (2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) UEM-000C is stored if the upper electronic module registers that the signal in the movement sensor power cable is high when the alarm is deactivated and the ignition is off.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the power supply cable to the sensor.

Fault symptom[s]

- Does not alarm the sensor.

SIGNAL TOO HIGH

CHECKING WIRING AND CONNECTORS

Check the supply cable between the Upper electronic module (UEM) connector #10 and movement sensor (IMS) connector #1 for a short-circuit to voltage and intermittent short-circuit to voltage.

Other information:

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-0013: MOVEMENT SENSOR. INTERNAL FAULT (2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION UEM-0013

Condition

Diagnostic trouble code (DTC) UEM-0013 is stored if diagnostic trouble codes (DTCs) UEM-000A, UEM-000B, UEM-000C, UEM-0011 and UEM-0012 are not stored and the upper electronic module (UEM) registers an internal fault in the movement sensor or registers that there is an open-circuit or high signal in the movement sensor communication cable when the alarm is active.

The DTC indicates that an error has been detected in the rear mass movement sensor (MMS) or interior motion sensor (IMS from and including MY 2012).

Diagnostic trouble code (DTC) UEM-0013 can be diagnosed when the car is locked from the outside using the remote control.

Substitute Value

- None.

Possible Source

- Contact fault on the sensor and/or control module sides
- Open-circuit in the sensor communication cable
- Short-circuit to supply voltage in the sensor communication cable
- Defective sensor.

Fault symptom[s]

- Does not alarm the sensor.

INTERNAL FAULT

CHECKING WIRING AND CONNECTORS

Check the signal cable between the upper electronic module (UEM) connector terminal #22 (22) and movement sensor terminal connector terminal #3. Check for an open-circuit. Check for an intermittent open-circuit.

Also check the relevant connectors. Check for oxidation.

- Ignition off
- Reinstall the connectors, components etc.

For checking MMS (up to and including MY 2011)

- Check that the function for reduced alarm is not activated (button on 7 in row).
- Open the driver's window and the rear window on the driver's side. Lock the vehicle using the remote control.
- Wait 25 seconds until the alarm is active. Then trigger the alarm by waving your arm through the driver's door window, inside the vehicle above the front seats. The siren or horn must sound and the hazard warning lamps flash.
- Reset the alarm by pressing the unlocking button on the remote control. Lock the vehicle again.

- Wait 25 seconds until the alarm is active. Then trigger the alarm by waving you arm, through the rear door window on the driver's side, inside the vehicle above the cargo compartment. The siren or horn must sound and the hazard warning lamps flash. Reset the alarm by pressing the unlocking button on the remote control.
- Check that the front and rear mass movement sensor (MMS) has triggered the alarm the last two times via the read out of the alarm cause in Vehicle communication.

For checking IMS (from and including MY 2012)

- Check that the function for reduced alarm is not activated (button on 7 in row).
- Open the driver's window, close all doors and hatches. Lock the vehicle using the remote control.
- Wait 25 seconds until the alarm is active. Then trigger the alarm by waving your arm inside the vehicle. The siren or horn must sound and the hazard warning lamps flash. Reset the alarm by pressing the unlocking button on the remote control.
- Check that the IMS has triggered the alarm via the read out of the alarm cause in Vehicle communication.

Is the function OK?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-0014: MOVEMENT SENSOR. INTERNAL FAULT (2003-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION UEM-0014

Condition

Diagnostic trouble code (DTC) UEM-0014 is stored if diagnostic trouble codes (DTCs) UEM-000A, UEM-000B, UEM-000C and UEM-0011 are not stored and the upper electronic module (UEM) registers an internal fault in the front movement sensor or registers that there is an open-circuit or too high a signal in the front movement sensor communication cable when the alarm is active.

Diagnostic trouble code (DTC) UEM-0014 can be diagnosed when the car is locked from the outside using the remote control.

Substitute Value

- None.

Possible Source

- Contact fault on the sensor and/or control module sides
- Open-circuit in the sensor communication cable
- Short-circuit to supply voltage in the sensor communication cable
- Defective sensor.

Fault symptom[s]

- Does not alarm the sensor.

INTERNAL FAULT

CHECKING WIRING AND CONNECTORS

(For XC90 the fault-tracing refers to the front movement sensor.)

Check the signal cable between the upper electronic module (UEM) connector terminal #22 and movement sensor terminal connector terminal #3. Check for an open-circuit. Check for an intermittent open-circuit.

Also check the relevant connectors. Check for oxidation.

Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING WIRING AND CONNECTORS**

CHECKING WIRING AND CONNECTORS

Check the ground lead between movement sensor connector terminal #5 and the ground terminal 31/83. Check for an open-circuit. Check for an intermittent open-circuit.

Check in particular intermediate connector (54/13:20) in the cable harness.

If no fault was found, try a new sensor.

Other information:

- see **CONNECTING THE BREAKOUT BOX** .
- For information about upper electronic module (UEM) signals:**SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)**
- see **MASS MOVEMENT SENSOR MODULE (MMS) FRONT, REPLACING** .
- see **CHECKING WIRING AND TERMINALS** .

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 199: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 200: Identifying Connector(s) Reinstallation
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.

For checking MMS (up to and including MY 2011)

- Check that the function for reduced alarm is not activated (button on 7 in row).
- Open the driver's window and the rear window on the driver's side. Lock the vehicle using the remote control.
- Wait 25 seconds until the alarm is active. Then trigger the alarm by waving your arm through the driver's door window, inside the vehicle above the front seats. The siren or horn must sound and the hazard warning lamps flash.
- Reset the alarm by pressing the unlocking button on the remote control. Lock the vehicle again.

- Wait 25 seconds until the alarm is active. Then trigger the alarm by waving you arm, through the rear door window on the driver's side, inside the vehicle above the cargo compartment. The siren or horn must sound and the hazard warning lamps flash. Reset the alarm by pressing the unlocking button on the remote control.
- Check that the front and rear mass movement sensor (MMS) has triggered the alarm the last two times via the read out of the alarm cause in Vehicle communication.

For checking IMS (from and including MY 2012)

- Check that the function for reduced alarm is not activated (button on 7 in row).
- Open the driver's window, close all doors and hatches. Lock the vehicle using the remote control.
- Wait 25 seconds until the alarm is active. Then trigger the alarm by waving your arm inside the vehicle. The siren or horn must sound and the hazard warning lamps flash. Reset the alarm by pressing the unlocking button on the remote control.
- Check that the MMS or IMS has triggered the alarm via the read out of the alarm cause in Vehicle communication.

Is the function OK?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-001C: GENERAL COURTESY LIGHTING. SIGNAL FAULTY (2003-2012)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If the control unit detects that the general courtesy lighting switch has been pressed down for more than 3 minutes, a diagnostic trouble code is displayed. The test is done when the ignition is on or off.

Substitute Value

- Nothing.

Possible Source

- The general courtesy lighting switch has stuck
- CFL (front left reading lamp switch signal) and CFR (front right reading lamp switch signal) short circuited to voltage supply.

Fault symptom[s]

- Courtesy lighting does not work.

FAULTY SIGNAL

CHECKING FOR PERMANENT OR INTERMITTENT FAULTS

Unlock the car using the key or remote control from outside.

Does the general interior lighting come on?

- **YES**

  Refer to **INTERMITTENT FAULT**

- **NO**

  Refer to **CHECKING FOR A SHORT-CIRCUIT**

CHECKING FOR A SHORT-CIRCUIT

Check that the button has not jammed in its depressed position.

Check the cable between control module terminal #16 and roof lamp module terminal #7A. Check for a short-circuit to supply voltage.

Check the cable between control module terminal #4 and roof lamp module terminal #8A. Check for a short-circuit to supply voltage.

Replace the cable if a fault is found.

Other information:

- For further information about signals and other values, see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access the roof lamp module switches, see **INTERIOR LIGHTING, REPLACING**

- To access the connector for the upper electronic module (UEM), see **UPPER ELECTRONIC MODULE (UEM)/REARVIEW MIRROR, REPLACING**
- With the ignition on and when the function is not activated, the voltage between terminals #7A and #8A and ground should be 0 V
- see **CHECKING WIRING AND TERMINALS** .

Fig. 201: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 202: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

Remove the housing with the buttons.

Press directly on the switch for the light button.

If the switch works, replace the lamp housing.

If the switch still does not operate, replace the printed circuit board with switches.

Other information:

- To access the interior lighting, see **INTERIOR LIGHTING, REPLACING** .
- **Continue**

  Refer to **VERIFICATION**

INTERMITTENT FAULT

Check the control module and roof lamp module connectors. Check for contact resistance and oxidation. Check for loose connections.

Check the cable between control module terminal #16 and roof lamp module terminal #7A. Check for an intermittent short-circuit to supply voltage. Check for an intermittent open-circuit.

Check the cable between control module terminal #4 and roof lamp module terminal #8A. Check for an intermittent short-circuit to supply voltage. Check for an intermittent open-circuit.

Check the roof lamp module housing.

Check the roof lamp module switches.

Other information:

- For further information about signals and other values, see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access the roof lamp module switches, see **INTERIOR LIGHTING, REPLACING**
- To access the connector for the upper electronic module (UEM), see **UPPER ELECTRONIC MODULE (UEM)/REARVIEW MIRROR, REPLACING**
- With the ignition on and when the function is not activated, the voltage between terminals #7A and #8A and ground should be 0 V
- see **CHECKING WIRING AND TERMINALS** .

  Refer to **INFORMATION**

VERIFICATION

VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 205: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 206: Identifying Connector(s) Reinstallation
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect the connectors, install the components, etc.
- Ignition on.

  Press the lamp switch and check that the lamps come on and that the switch does not stick.

Does it work?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

INFORMATION

FAULT-TRACING INFORMATION

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.

It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

UEM-001D: READING LAMP. SIGNAL TOO HIGH (2003-2012)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If the control unit registers a faulty signal from the front left reading lamp, the diagnostic trouble code is displayed.

Substitute Value

- Nothing.

Possible Source

- The switch for the front left reading lamp has stuck down
- The signal wire for the front left reading lamp is short circuited to voltage supply.

Fault symptom[s]

- Courtesy lighting does not work.

SIGNAL TOO HIGH

CHECKING FOR A SHORT-CIRCUIT

Check that the button has not jammed in its depressed position.

Check the cable between the upper electronic module (UEM) and the roof lamp module. Check for a short-circuit to supply voltage.

UEM-001D front left reading lamp

Control module terminal #4 and roof lamp module terminal #8A.

UEM-001E front right reading lamp

Control module terminal #16 and roof lamp module terminal #7A.

Replace the cable if a fault is found.

Other information:

- For further information about signals and other values, see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access the roof lamp module switches, see **INTERIOR LIGHTING, REPLACING**
- With the ignition on and when the function is not activated, the voltage between terminal #8A (UEM 001D) and terminal #7A (UEM 001E) on the roof lamp unit (control module side) and ground should be 0 V
- see **CHECKING WIRING AND TERMINALS** .

Fig. 207: Identifying Connector Terminals

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 209: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 210: Identifying Connector(s) Reinstallation
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Reinstall the connectors, components etc.
- Ignition on.

  Check that the relevant lamp button and lamp are functioning.

Does the lamp function?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-001E: READING LAMP. SIGNAL TOO HIGH (2003-2012)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If the control unit registers a faulty signal from the right front reading lamp, the diagnostic trouble code is displayed.

Substitute Value

- Nothing.

Possible Source

- The switch for the front right reading lamp has stuck down
- The signal wire for the front right reading lamp is short circuited to voltage supply.

Fault symptom[s]

- Courtesy lighting does not work.

SIGNAL TOO HIGH

see **SIGNAL TOO HIGH**

UEM-0020: REAR VIEW MIRROR. SIGNAL MISSING (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) UEM-0020 is stored if the control module registers that the actual value for rear view mirror anti-dazzle is different from the desired value.

Substitute Value

- None.

Possible Source

- Defective circuit in the rear view mirror.

Fault symptom[s]

- No anti-dazzle function
- Poor anti-dazzle function.

SIGNAL MISSING

REPLACING THE CONTROL MODULE AND PROGRAMMING

NOTE: **If possible, read off the programmed data from the control module before it is replaced.**

Fig. 211: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  The upper electronic module has registered an internal fault.

  As a result of the fault, the control module must be replaced.

- **Continue**

  Refer to **REPLACING THE CONTROL MODULE**

REPLACING THE CONTROL MODULE

READING OFF THE PROGRAMMED VALUES

NOTE: **Read off the programmed values from the upper electronic module (UEM) before replacing the control module.**

Fig. 212: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Use the VCT2000 (or appropriate scan tool) to read off the programmed values.

  The retained values are programmed customer parameters in the upper electronic module (UEM). The retained values should be noted for later use.

  Other information

  - For information about programming the customer parameters, see **DIAGNOSTIC FUNCTIONS** .

Fig. 213: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **REPLACING CONTROL MODULES AND DOWNLOADING SOFTWARE**

REPLACING CONTROL MODULES AND DOWNLOADING SOFTWARE

CAUTION: A new control module is delivered without software. In order for the control module to function new software must be programmed into the control module after it has been replaced.

Replace the control module and download the new software. See **UPPER ELECTRONIC MODULE (UEM)/REARVIEW MIRROR, REPLACING** .

HINT: When diagnostic trouble code (DTC) E001 is stored, communication with the control module cannot be established. This can be remedied in two ways.

1. Press the remote control button for local lighting
2. Remove fuse 11C/28 from the fusebox in the passenger compartment. Reinstall the fuse again.

Fig. 214: Locating Fuse Holder (Passenger Compartment)
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING THE INTERIOR LIGHTING (2)**

CHECKING THE INTERIOR LIGHTING (2)

CHECKING THE INTERIOR LIGHTING

Two times can be programmed for the interior lighting:

1. Short

The period from when the door is unlocked, or the engine stops, to when the interior lighting goes out can be changed if it is too long or too short.

2. Long

The period from when the door is opened, or a lamp is lit with a switch, to when the lamp goes out can be changed if it is too long or too short.

To program a long interior lighting, use VIDA (Volvo scan tool)

- **Continue**

  Refer to **PROGRAMMING A SHORT INTERIOR LIGHTING PERIOD**

PROGRAMMING A SHORT INTERIOR LIGHTING PERIOD

The general lighting and rear reading lamps light and remain lit for 30 seconds when:

- The door has been unlocked from outside with a key or the remote control.
- The engine has been stopped and the ignition key turned to 0.

The default period is 30 seconds. This can be changed to between 5 and 255 seconds.

Read off the programmed values.

To change the time, mark the desired value in the scrolling list and start programming.

Fig. 215: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Do you want to program any more parameters?

- **YES**

Refer to **PROGRAMMING A LONG INTERIOR LIGHTING PERIOD**

- **NO**

  Refer to **CHECKING THE ANTI-DAZZLE FUNCTION IN THE REAR VIEW MIRROR**

PROGRAMMING A LONG INTERIOR LIGHTING PERIOD

The general lighting and rear reading lamps light and remain lit for 10 minutes when:

- A door is opened after being unlocked.
- The lamp is lit with a switch.

The default period is 10 minutes. This can be changed to between 0 and 255 minutes at 10 minute intervals.

Read off the programmed values.

To change the time, mark the desired value in the scrolling list and start programming.

Fig. 216: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **CHECKING THE ANTI-DAZZLE FUNCTION IN THE REAR VIEW MIRROR**

CHECKING THE ANTI-DAZZLE FUNCTION IN THE REAR VIEW MIRROR

CHECKING THE ANTI-DAZZLE FUNCTION

NOTE: If the upper electronic module (UEM) has been replaced software, specially developed for downloading after replacing the control module, must be downloaded to the control module before the anti-dazzle function is changed. See UPPER ELECTRONIC MODULE (UEM)/REARVIEW MIRROR, REPLACING .

The rear view mirror anti-dazzle function can be adjusted:

- If the rear view mirror anti-dazzle function is too powerful or too weak, it can be adjusted.

Specific software for setting the anti-dazzle function must be installed in the car to do this.

CHECKING THE INNER REAR-VIEW MIRROR DIMMER

SYMPTOM VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 217: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 218: Identifying Connector(s) Reinstallation
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect the connectors, install the components, etc.
- Ignition on.

  Shine a strong light on the inner rear-view mirror and check that it dims (becomes darker). Remove the light and check that the mirror lightens. The mirror should also lighten when reverse is engaged.

Does the rear view mirror dimmer work?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-0030: REAR LEFT READING LAMP. SIGNAL TOO LOW (2003-2012)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

The DTC is stored if the control module registers a faulty control signal from the lamp circuit when the rear left reading lamp is lit, at the same time the front left reading lamp is out.

Substitute Value

- The lamp goes off.

Possible Source

- The signal wire for the rear left reading lamp is short circuited to ground
- Intermittent open circuit on signal wire.

Fault symptom[s]

- Passenger compartment lighting/Does not work

SIGNAL TOO LOW

CHECKING THE CONNECTORS

Check the connectors on the upper electronic module and rear reading lamp unit for contact resistance and oxidation as described in, see **CONTACT RESISTANCE AND OXIDATION** , and for a loose contact as described in **LOOSE CONNECTIONS (TERMINALS)** .

Additional information:

- For information on signals and additional values, see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)** .
- To connect the test box, see **CONNECTING THE BREAKOUT BOX** .

Fig. 219: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 220: Identifying Ohms Display
Courtesy of VOLVO CARS CORPORATION

Is there a fault?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING FOR OPEN CIRCUITS AND SHORT CIRCUITS**

CHECKING FOR OPEN CIRCUITS AND SHORT CIRCUITS

Check the wire between the upper electronic module and the control unit of the rear reading lamp unit for a

short circuit to ground, as described in, see **SHORT-CIRCUIT TO GROUND, PERMANENT FAULTS** .

Remove the connector from the roof lamp unit and measure between the connector and the UEM as described below.

UEM-0030 Rear left reading lamp

Control unit #20 and reading lamp unit #1.

UEM-0032 Rear right reading lamp

Control unit #20 and reading lamp unit #7.

Check the wire between the upper electronic module and the control unit of the rear reading lamp unit for an open circuit, as described in, see **OPEN-CIRCUIT, PERMANENT FAULTS** .

UEM-0030 Rear left reading lamp

Control unit #7 and reading lamp unit #1.

UEM-0032 Rear right reading lamp

Control unit #17 and reading lamp unit #7.

If a fault is found, replace the wire.

If the wire is OK, test with a new bulb.

Additional information:

- For information on signals and additional values, see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)** .
- To connect the test box, see **CONNECTING THE BREAKOUT BOX** .
- To replace the bulb, see **BULB, READING LAMP, REAR, REPLACING** .

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-0031: REAR LEFT READING LAMP. SIGNAL MISSING (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The DTC is stored if the control module registers a faulty control signal from the lamp circuit when the rear left reading lamp is off, at the same time the front left reading lamp is lit.

Substitute Value

- The lamp goes out.

Possible Source

- Blown bulb.
- Open circuit on the signal line for reading lamp left rear.
- Short-circuit to supply voltage in the signal cable for the left rear reading lamp.

Fault symptom[s]

- Passenger compartment lighting/Does not work

SIGNAL MISSING

CHECKING THE CONNECTORS

Check that the bulb is intact.

Check the connectors on the upper electronic module and rear reading lamp unit for contact resistance and oxidation as described in, see **CONTACT RESISTANCE AND OXIDATION** , and a loose contact as described in **LOOSE CONNECTIONS (TERMINALS)** .

Do the necessary corrective action.

Additional information:

- To access/replace the lamp, see **BULB, READING LAMP, REAR, REPLACING** .

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-0031: REAR LEFT READING LAMP. SIGNAL MISSING (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The DTC is stored if the control module registers a faulty control signal from the lamp circuit when the rear left reading lamp is lit, at the same time the front left reading lamp is out.

Substitute Value

- The lamp goes out.

Possible Source

- Blown bulb.
- Open circuit on the signal line for reading lamp left rear.
- Short-circuit to supply voltage in the signal cable for the left rear reading lamp.

Fault symptom[s]

- Passenger compartment lighting/Does not work

SIGNAL MISSING

see **SIGNAL MISSING**

UEM-0032: REAR RIGHT READING LAMP. SIGNAL TOO LOW (2003-2012)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

The DTC is stored if the control module registers a faulty control signal from the lamp circuit when the rear

right reading lamp is lit, at the same time the front right reading lamp is out.

Substitute Value

- The lamp goes off.

Possible Source

- The signal wire for the rear right reading lamp is short circuited to ground
- Intermittent open circuit on signal wire.

Fault symptom[s]

- Passenger compartment lighting/Does not work

SIGNAL TOO LOW

see **SIGNAL TOO LOW**

UEM-0033: REAR RIGHT READING LAMP. SIGNAL MISSING (2005-2012)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

The DTC is stored if the control module registers a faulty control signal from the lamp circuit when the rear right reading lamp is off, at the same time the front right reading lamp is lit.

Substitute Value

- The lamp goes off.

Possible Source

- Open circuit in signal wire for rear right reading lamp.
- Short circuit to voltage supply on signal wire for rear right reading lamp.

Fault symptom[s]

- Passenger compartment lighting/Does not work

SIGNAL MISSING

see **SIGNAL MISSING**

UEM-0033: REAR RIGHT READING LAMP. SIGNAL MISSING (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

The DTC is stored if the control module registers a faulty control signal from the lamp circuit when the rear right reading lamp is lit, at the same time the front right reading lamp is out.

Substitute Value

- The lamp goes off.

Possible Source

- Open circuit in signal wire for rear right reading lamp.
- Short circuit to voltage supply on signal wire for rear right reading lamp.

Fault symptom[s]

- Passenger compartment lighting/Does not work

SIGNAL MISSING

see **SIGNAL MISSING**

UEM-0034: FRONT LEFT READING LAMP. SIGNAL TOO LOW (2003-2012)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

The DTC is stored if the control module registers a faulty control signal from the lamp circuit when the front left reading lamp is lit, at the same time the rear left reading lamp is out.

Substitute Value

- The lamp goes off.

Possible Source

- The signal wire for the front left reading lamp is short circuited to ground
- Intermittent open circuit on signal wire.

Fault symptom[s]

- Passenger compartment lighting/Does not work

SIGNAL TOO LOW

CHECKING THE CONNECTORS

Check the control module and roof lamp module connectors. Check for contact resistance and oxidation. Check for loose connections.

Other information:

- For further information about signals and other values, see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access or replace the roof lamp module, see **INTERIOR LIGHTING, REPLACING**
- To access the connector for the upper electronic module (UEM), see **UPPER ELECTRONIC MODULE (UEM)/REARVIEW MIRROR, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING FOR OPEN-CIRCUITS AND SHORT-CIRCUITS**

CHECKING FOR OPEN-CIRCUITS AND SHORT-CIRCUITS

Check the cable between the control module and the roof lamp unit. Check for a short-circuit to ground.

Remove the connector from the roof lamp module and measure between the connector and the upper electronic module (UEM) as follows.

UEM-0034 Left front reading lamp

Control module terminal #20 and roof lamp module terminal #3A.

UEM-0036 Right front reading lamp

Control module terminal #20 and roof lamp module terminal #4A.

Check the cable between the control module and the roof lamp unit. Check for an open-circuit.

UEM-0034 Left front reading lamp

Control module terminal #18 and roof lamp module terminal #3A.

UEM-0036 Right front reading lamp

Control module terminal #6 and roof lamp module terminal #4A.

Replace the cable if a fault is found.

If the cable is OK, try a new bulb in the roof lamp module.

Other information:

- For further information about signals and other values, see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access or replace the lamp, see **INTERIOR LIGHTING, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-0035: FRONT LEFT READING LAMP. SIGNAL MISSING (2005-2012)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

The DTC is stored if the control module registers a faulty control signal from the lamp circuit when the front left reading lamp is off, at the same time the rear left reading lamp is lit.

NOTE: The DTC is stored if connector A to control unit roof lamp does not make contact correctly. DTC UEM-0037 and UEM-0039 are usually then also stored.

Substitute Value

- The lamp goes off.

Possible Source

- Faulty bulb.
- Open circuit in signal wire for front left reading lamp.
- Short circuit to voltage supply on signal wire for front left reading lamp.

Fault symptom[s]

- Passenger compartment lighting/Does not work

SIGNAL MISSING

CHECKING THE CONNECTORS

Check that the bulb is intact.

Check the connectors for the upper electronic module (UEM) and roof lamp module. Check for contact resistance and oxidation. Check for loose connections.

Remedy as necessary.

Other information:

- To access or replace the lamp, see **INTERIOR LIGHTING, REPLACING**
- To access the connector for the upper electronic module (UEM), see **UPPER ELECTRONIC MODULE (UEM)/REARVIEW MIRROR, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

- Ignition off.
- Reinstall the connectors, components etc.
- Ignition on.

  Check that the relevant lamp button and lamp are functioning.

Does the lamp function?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-0035: FRONT LEFT READING LAMP. SIGNAL MISSING (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

The DTC is stored if the control module registers a faulty control signal from the lamp circuit when the front left reading lamp is lit, at the same time the rear left reading lamp is out.

Substitute Value

- The lamp goes off.

Possible Source

- Faulty bulb.
- Open circuit in signal wire for front left reading lamp.
- Short circuit to voltage supply on signal wire for front left reading lamp.

Fault symptom[s]

- Passenger compartment lighting/Does not work

SIGNAL MISSING

see **SIGNAL MISSING**

UEM-0036: FRONT RIGHT READING LAMP. SIGNAL TOO LOW (2003-2012)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

The DTC is stored if the control module registers a faulty control signal from the lamp circuit when the front

right reading lamp is lit, at the same time the rear right reading lamp is out.

Substitute Value

- The lamp goes off.

Possible Source

- The signal wire for the front right reading lamp is short circuited to ground
- Intermittent open circuit on signal wire.

Fault symptom[s]

- Passenger compartment lighting/Does not work

SIGNAL TOO LOW

see **SIGNAL TOO LOW**

UEM-0037: FRONT RIGHT READING LAMP. SIGNAL MISSING (2005-2012)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

The DTC is stored if the control module registers a faulty control signal from the lamp circuit when the front right reading lamp is off, at the same time the rear right reading lamp is lit.

NOTE: The DTC is stored if connector A to control unit roof lamp does not make contact correctly. DTC UEM-0035 and UEM-0039 are usually then also stored.

Substitute Value

- The lamp goes off.

Possible Source

- Open circuit in signal wire for front right reading lamp.
- Short circuit to voltage supply on signal wire for front right reading lamp.

Fault symptom[s]

- Passenger compartment lighting/Does not work

SIGNAL MISSING

see **SIGNAL MISSING**

UEM-0037: FRONT RIGHT READING LAMP. SIGNAL MISSING (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

The DTC is stored if the control module registers a faulty control signal from the lamp circuit when the front right reading lamp is lit, at the same time the rear right reading lamp is out.

Substitute Value

- The lamp goes off.

Possible Source

- Open circuit in signal wire for front right reading lamp.
- Short circuit to voltage supply on signal wire for front right reading lamp.

Fault symptom[s]

- Passenger compartment lighting/Does not work

SIGNAL MISSING

see **SIGNAL MISSING**

UEM-0038: GENERAL LIGHTING. SIGNAL TOO LOW (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 243: Identifying Interior Roof Lighting Communication Links And Components
Courtesy of VOLVO CARS CORPORATION

The upper electronic module (UEM) checks the interior lighting. The diagnostic trouble code (DTC) is stored if the control module registers that there is an on signal for the interior lighting in the headlining when the control signal for the general lighting is low.

The diagnostic trouble code (DTC) can be diagnosed when the conditions are met for the interior lighting to be switched on at the same time as the lighting in the cargo compartment is off.

Substitute Value

- The lamp goes out.

Possible Source

- Short-circuit to ground in the signal cable for the general lighting.

Fault symptom[s]

- Passenger compartment lighting/Does not work

SIGNAL TOO LOW

CHECKING THE CONNECTORS

Check the control module and roof lamp module connectors. Check for contact resistance and oxidation.

Other information:

- To access the roof lamp module connector, see **INTERIOR LIGHTING, REPLACING**
- To access the connector for the upper electronic module (UEM), see **UPPER ELECTRONIC MODULE (UEM)/REARVIEW MIRROR, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

- Ignition off.
- Reinstall the connectors, components etc.
- Ignition on.

  Check that the relevant lamp button and lamp are functioning.

Does the lamp function?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-0038: GENERAL LIGHTING. SIGNAL TOO LOW (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If the control unit detects that the signal supply is off at the same time as the control signal for the general courtesy lighting is high, the diagnostic trouble code is displayed.

Substitute Value

- The lamp goes off.

Possible Source

- Open circuit or short circuit to ground on signal wire for general lighting.

Fault symptom[s]

- Courtesy lighting does not work.

SIGNAL TOO LOW

see **SIGNAL TOO LOW**

UEM-0039: GENERAL LIGHTING. SIGNAL MISSING (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If the control unit registers a faulty control signal from the general courtesy lighting, the diagnostic trouble code is displayed.

Substitute Value

- The lamp goes off.

Possible Source

- Open circuit in signal wire for the general courtesy lighting.
- Short circuit to voltage supply on signal wire for general lighting.

Fault symptom[s]

- Passenger compartment lighting/Does not work

SIGNAL MISSING

CHECKING THE CABLE AND COMPONENT

Fig. 250: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 251: Identifying Connector(s) Reinstallation
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connectors for the upper electronic module (UEM) and roof lamp module. Check for contact resistance and oxidation.

  Remedy as necessary

- Reinstall the connectors, components etc.
- Ignition on.

Activate the general lighting: Use the VCT2000 (or appropriate scan tool).

Other information:

- To access the roof lamp switch, see **INTERIOR LIGHTING, REPLACING**
- To access the connector for the upper electronic module (UEM), see **UPPER ELECTRONIC MODULE (UEM)/REARVIEW MIRROR, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-0039: GENERAL LIGHTING. SIGNAL MISSING (2005-2012)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If the control unit registers a faulty control signal from the general courtesy lighting, the diagnostic trouble code is displayed.

NOTE: The DTC is stored if connector A to control unit roof lamp does not make contact correctly. DTC UEM-0035 and UEM-0037 are usually then also stored.

Substitute Value

- The lamp goes off.

Possible Source

- Open circuit in signal wire for the general courtesy lighting.
- Short circuit to voltage supply on signal wire for general lighting.

Fault symptom[s]

- Passenger compartment lighting/Does not work

SIGNAL MISSING

see **SIGNAL MISSING**

UEM-003A: EXTENDED X SUPPLY (EXT_X). SIGNAL TOO LOW (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION UEM-003A

Condition

The upper electronic module (UEM) supplies power to a number of functions in the car via Extended X-supply (EXT_X). These functions include the sun roof logic, mirror lamps in the sun visor, rain sensor, buttons for the headlining lighting and certain button lighting.

Diagnostic trouble code (DTC) UEM-003A is stored if the upper electronic module (UEM) registers too low a level for power supply Extended X-supply (EXT_X).

Diagnostic trouble code (DTC) UEM-003A can be diagnosed in ignition positions I or II.

Substitute Value

- Sun roof, mirror lamps in the sun visor, buttons for the headlining lighting and certain button lighting are switched off.

Possible Source

- The power supply to the sun roof, mirror lamps in the sun visor, rain sensor, buttons for the headlining lighting and certain button lighting functions is short-circuited to ground.

Fault symptom[s]

- The power sun roof does not operate
- The interior lighting does not operate
- No rain sensor function.

SIGNAL TOO LOW

CHECKING FOR A SHORT-CIRCUIT

Fig. 258: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  If all the functions that are supplied with power from the upper electronic module (UEM) via Extended X-supply (EXT_X) are not working (i. e. sun roof logic, mirror lamps in the sun visor, rain sensor or interior lighting), it can be assumed that either the cable between the upper electronic module (UEM) and the junction point 53/505 is short-circuited to ground or the wiring from the junction point to each component is short-circuited to ground.

  First check the power supply cable between the upper electronic module (UEM) and each component. If the cable is short-circuited to ground, 0 ohms will be measured.

  For mirror lamps in the sun visor, check the cable between the mirror lamp connector terminal #1 and the connector for the upper electronic module (UEM) terminal #A8. Check for a short-circuit to ground.

For sun roof and interior lighting, take readings on the cable between the connector for roof lamps terminal #A2 (and the sun roof module) and the connector for the upper electronic module (UEM) #A8. Check for a short-circuit to ground.

For rain sensor, take readings on the cable between the rain sensor connector terminal #A3 and the connector for the upper electronic module (UEM) terminal #A8. Check for a short-circuit to ground.

If all the readings result in a short-circuit to ground, it can be assumed that the fault is between the upper electronic module (UEM) #A8 and junction point 53/505.

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For information about signals, see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)**
- To access or replace the interior lighting, see **INTERIOR LIGHTING, REPLACING**
- To fault-trace wiring and terminals, see **CHECKING WIRING AND TERMINALS** .

Is each component working (sun roof, mirror lamps in sun visor, rain sensor and interior lighting)?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-003C: CARGO COMPARTMENT LIGHTING/3RD ROW READING LAMPS. SIGNAL TOO LOW (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION UEM-003C

Condition

The upper electronic module (UEM) uses the same power stages and outputs for interior lighting in several different models. Diagnostic trouble code (DTC) UEM-003C indicates faults in various units, depending on whether the car is a V70, XC70 or an XC90. In the V70 and XC70, faults are indicated by the control signal from the cargo compartment lighting. In the XC90, faults are indicated by the control signal from the 3rd row reading lamps.

Diagnostic trouble code (DTC) UEM-003C is stored if the control module registers that the control signal from the cargo compartment lighting/third row reading lamps is too low.

Diagnostic trouble code (DTC) UEM-003C can be diagnosed when the general roof lighting is lit and the cargo compartment lighting/third row reading lighting is not lit.

Substitute Value

- Cargo compartment lighting/3rd row reading lamps switched off.

Possible Source

- The cable for power supply to the cargo compartment lighting/third row reading lamps is short-circuited to ground
- Loose connections in the cable for power supply to cargo compartment lighting/third row reading lamps.

Fault symptom[s]

- The cargo compartment lighting is not working
- The interior lighting does not work.

SIGNAL TOO LOW

CHECKING THE CONNECTORS AND COMPONENTS

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-003D: CARGO COMPARTMENT LIGHTING/3RD ROW READING LAMPS. FAULTY SIGNAL (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION UEM-003D

Condition

The upper electronic module (UEM) uses the same power stages and outputs for interior lighting in several different models. Diagnostic trouble code (DTC) UEM-003D indicates faults in various units, depending on whether the car is a V70, XC70 or an XC90. In the V70 and XC70, faults are indicated by the control signal from the cargo compartment lighting. In the XC90, faults are indicated by the control signal from the 3rd row reading lamps.

Diagnostic trouble code (DTC) UEM-003D is stored if the control module registers that the control signal to the cargo compartment lighting/third row reading lamps is too high.

Diagnostic trouble code (DTC) UEM-003D can be diagnosed in ignition position II and when the general roof lighting is lit and the cargo compartment lighting/third row reading lighting is not lit.

Substitute Value

- Cargo compartment lighting/third row reading lamps switched off.

Possible Source

- The cable for power supply to the cargo compartment lighting/third row reading lamps is short-circuited to supply voltage
- Open-circuit in the cable for power supply to cargo compartment lighting/third row reading lamps.

Fault symptom[s]

- The cargo compartment lighting is not working
- The interior lighting does not work.

FAULTY SIGNAL

CHECKING THE CONNECTORS AND COMPONENTS

Fig. 269: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 270: Identifying Connector(s) Reinstallation
Courtesy of VOLVO CARS CORPORATION

- Check the lamp
- Check the connector for the upper electronic module (UEM) and cargo compartment lighting/third row reading lamps. Check for contact resistance and oxidation.

  Remedy as necessary

- Reinstall the connectors, components etc.

  Other information:

  - For further information about signals and other values, see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)**

- see **CHECKING WIRING AND TERMINALS** .

Does the lamp function?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING FOR OPEN-CIRCUITS AND SHORT-CIRCUITS TO VOLTAGE**

CHECKING FOR OPEN-CIRCUITS AND SHORT-CIRCUITS TO VOLTAGE

Check the cable between control module terminal #9 and the cargo compartment lighting/third row reading lamps. Check for an open-circuit. Check for a short-circuit to supply voltage.

Also check the ground connection of the cargo compartment lighting/third row reading lamps.

Remedy as necessary.

Other information:

- For further information about signals and other values, see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- see **CHECKING WIRING AND TERMINALS** .

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-0041: CONTROL UNIT. INTERNAL FAULT (2003-2012)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If the control unit tries to store data in its memory and the data becomes corrupted, the diagnostic trouble code is displayed.

Substitute Value

- Nothing.

Possible Source

- Fault in EEPROM.

Fault symptom[s]

- Courtesy lighting does not work
- Alarm does not work.

INTERNAL FAULT

CHECKING FOR PERMANENT OR INTERMITTENT FAULTS

Check whether any customer symptoms persist.

Do any symptoms persist?

- **YES**

  Refer to **REPLACEMENT OF CONTROL UNIT AND PROGRAMMING**

- **NO**

Refer to **FAULT-TRACING INFORMATION**

REPLACEMENT OF CONTROL UNIT AND PROGRAMMING

NOTE: Before replacing the control unit all the program data should be read from the control unit if possible.

Fig. 275: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  The upper electronic module has registered an internal fault.

  There is a design fault and the control unit should be replaced.

- **Continue**

  Refer to **REPLACING THE CONTROL MODULE**

REPLACING THE CONTROL MODULE

READING OFF THE PROGRAMMED VALUES

NOTE: Read off the programmed values from the upper electronic module (UEM) before replacing the control module.

Fig. 276: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on

- Use the VCT2000 (or appropriate scan tool) to read off the programmed values.

  The retained values are programmed customer parameters in the upper electronic module (UEM). The retained values should be noted for later use.

  Other information

  - For information about programming the customer parameters, see **DIAGNOSTIC FUNCTIONS** .

Fig. 277: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **REPLACING CONTROL MODULES AND DOWNLOADING SOFTWARE**

REPLACING CONTROL MODULES AND DOWNLOADING SOFTWARE

CAUTION: A new control module is delivered without software. In order for the control module to function new software must be programmed into the control module after it has been replaced.

Replace the control module and download the new software. See **UPPER ELECTRONIC MODULE**

(UEM)/REARVIEW MIRROR, REPLACING .

HINT: When diagnostic trouble code (DTC) E001 is stored, communication with the control module cannot be established. This can be remedied in two ways.

1. Press the remote control button for local lighting
2. Remove fuse 11C/28 from the fusebox in the passenger compartment. Reinstall the fuse again.

Fig. 278: Locating Fuse Holder (Passenger Compartment)
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING THE INTERIOR LIGHTING (2)**

CHECKING THE INTERIOR LIGHTING (2)

CHECKING THE INTERIOR LIGHTING

Two times can be programmed for the interior lighting:

1. Short

The period from when the door is unlocked, or the engine stops, to when the interior lighting goes out can

be changed if it is too long or too short.

2. Long

The period from when the door is opened, or a lamp is lit with a switch, to when the lamp goes out can be changed if it is too long or too short.

To program a long interior lighting, use VIDA (Volvo scan tool)

- **Continue**

  Refer to **PROGRAMMING A SHORT INTERIOR LIGHTING PERIOD**

PROGRAMMING A SHORT INTERIOR LIGHTING PERIOD

The general lighting and rear reading lamps light and remain lit for 30 seconds when:

- The door has been unlocked from outside with a key or the remote control.
- The engine has been stopped and the ignition key turned to 0.

The default period is 30 seconds. This can be changed to between 5 and 255 seconds.

Read off the programmed values.

To change the time, mark the desired value in the scrolling list and start programming.

Fig. 279: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Do you want to program any more parameters?

- **YES**

  Refer to **PROGRAMMING A LONG INTERIOR LIGHTING PERIOD**

- **NO**

  Refer to **CHECKING THE ANTI-DAZZLE FUNCTION IN THE REAR VIEW MIRROR**

PROGRAMMING A LONG INTERIOR LIGHTING PERIOD

The general lighting and rear reading lamps light and remain lit for 10 minutes when:

- A door is opened after being unlocked.
- The lamp is lit with a switch.

The default period is 10 minutes. This can be changed to between 0 and 255 minutes at 10 minute intervals.

Read off the programmed values.

To change the time, mark the desired value in the scrolling list and start programming.

Fig. 280: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING THE ANTI-DAZZLE FUNCTION IN THE REAR VIEW MIRROR**

CHECKING THE ANTI-DAZZLE FUNCTION IN THE REAR VIEW MIRROR

CHECKING THE ANTI-DAZZLE FUNCTION

NOTE: **If the upper electronic module (UEM) has been replaced software, specially developed for downloading after replacing the control module, must be downloaded to the control module before the anti-dazzle function is changed. See UPPER ELECTRONIC MODULE (UEM)/REARVIEW MIRROR, REPLACING .**

The rear view mirror anti-dazzle function can be adjusted:

- If the rear view mirror anti-dazzle function is too powerful or too weak, it can be adjusted.

Specific software for setting the anti-dazzle function must be installed in the car to do this.

FAULT-TRACING INFORMATION

FAULT-TRACING INFORMATION

Fault-tracing indicates that the control module had previously identified an intermittent fault, but that the fault is no longer present.

UEM-0051: SUNROOF. SIGNAL FAULTY (2003-2012)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If the control unit registers an internal fault in the sunroof module (SRM), the diagnostic trouble code is displayed.

Substitute Value

- Nothing.

Possible Source

- Unknown position of sunroof.

Fault symptom[s]

- Automatic sunroof closing does not work.

SIGNAL FAULTY

SET-UP

- The sunroof has lost its position and must be calibrated before it will work again.

  Other information

  - see **SUN ROOF MODULE (SRM), CALIBRATING**

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Courtesy of VOLVO CARS CORPORATION

Fig. 282: Identifying Connector(s) Reinstallation
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect the connectors, install the components, etc.
- Ignition on.

  Try to operate the sunroof automatically by pressing the switch down two stages.

Does the sunroof move automatically?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-0052: SUNROOF MOTOR. SIGNAL TOO HIGH (2003-2012)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If the control unit detects that SRM-0002 is given when contact is made with the sunroof control unit (SRM), the diagnostic trouble code is displayed.

Substitute Value

- Nothing.

Possible Source

- Even though the relay is switched off, the sunroof motor is fed by a current
- Faulty relay.

Fault symptom[s]

- Automatic sunroof closing does not work.

SIGNAL TOO HIGH

CHECKING FOR PERMANENT OR INTERMITTENT FAULTS

Fig. 283: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Operate the sun roof to full tilt.

  Check that the automatic operation of the sun roof works.

Was the function OK?

- **YES**

  Refer to **VERIFICATION**

- **NO**

Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

- Ignition off.
- Connect the connectors, install the components, etc.
- Ignition on.

  Check that the automatic sunroof closing works.

Does it work?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-0053: SUNROOF MOTOR. SIGNAL TOO LOW (2003-2012)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If the control unit registers an internal fault in the sunroof module (SRM), diagnostic trouble code is displayed.

Substitute Value

- Nothing.

Possible Source

- Short circuit to voltage supply on control unit ground wire.
- Open circuit/short circuit to ground on wire from the control unit to the motor.
- Contact resistance or oxidation on the connectors.
- Fuse blown (11C/34).

Fault symptom[s]

- Electric sunroof does not work.

SIGNAL TOO LOW

CHECKING FOR PERMANENT OR INTERMITTENT FAULTS

Fig. 288: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check that the sun roof can be moved to its limit positions.

Can the sun roof be operated?

- **YES**

  Refer to **INTERMITTENT FAULT**

- **NO**

  Refer to **CHECKING THE CONNECTORS**

CHECKING THE CONNECTORS

Check the connector between the sun roof module (SRM) and sun roof motor. Check for contact resistance and oxidation.

Check that fuse 11C/7 (11C/13 XC90) in the passenger compartment fuse box is intact.

Check connector 54/13. Check for contact resistance and oxidation.

Other information:

- To access the connector between the sun roof module (SRM) and motor, see **ELECTRIC MOTOR, SUN ROOF, REPLACING** .
- see **CHECKING WIRING AND TERMINALS** .

Fig. 289: Identifying Ohms Display

Courtesy of VOLVO CARS CORPORATION

Fig. 290: Locating Fuse Holder (Passenger Compartment)
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING FOR OPEN-CIRCUITS AND SHORT-CIRCUITS**

CHECKING FOR OPEN-CIRCUITS AND SHORT-CIRCUITS

Check the cable between sun roof module (SRM) terminal #10A and ground, left A-post. Check for a short-circuit to supply voltage.

Check the cable between the sun roof module (SRM) terminal #1A and fuse 11C/7 (11C/13 XC90) in the passenger compartment fuse box for a short-circuit to ground or an open-circuit.

Replace the cable if a fault is found.

After carrying out repairs, the sun roof module (SRM) should be calibrated. See **SUN ROOF MODULE (SRM), CALIBRATING** .

Other information:

- For further information about signals and other values, see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)** .
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX** .
- To access the sun roof module (SRM) connector, see **CONTROL MODULE, SUN ROOF, REPLACING** .
- see **CHECKING WIRING AND TERMINALS** .

VERIFICATION

VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 338: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 339: Identifying Connector(s) Reinstallation
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect the connectors, install the components, etc.
- Ignition on.

  Check that the sunroof can be moved to its end position.

Does the sunroof move?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

INFORMATION

FAULT-TRACING INFORMATION

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.

It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

UEM-0071: CONTROL UNIT. INTERNAL FAULT (2003-2012)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If the control unit detects that SRM-0021 is given when contact is made with the sunroof module (SRM), the diagnostic trouble code is displayed.

Substitute Value

- Nothing.

Possible Source

- Fault with voltage drop in sunroof module (SRM)
- Internal fault in sunroof module.

Fault symptom[s]

- Electric sunroof does not work
- Automatic sunroof closing does not work.

INTERNAL FAULT

CHECKING FOR PERMANENT OR INTERMITTENT FAULTS

Fig. 340: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check that the sun roof can be operated automatically by pressing the switch 2 steps.

Can the sun roof be operated automatically?

- **YES**

  Refer to **INTERMITTENT FAULT**

- **NO**

  Refer to **CHECKING FOR OPEN-CIRCUITS AND SHORT-CIRCUITS**

CHECKING FOR OPEN-CIRCUITS AND SHORT-CIRCUITS

Check the cable between the sun roof module (SRM) terminal #6A and the upper electronic module (UEM) terminal #8A. Check for an open-circuit.

Replace the cable if a fault is found.

Other information:

- For further information about signals and other values, see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access the sun roof module (SRM) connector, see **CONTROL MODULE, SUN ROOF, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 341: Identifying Sunroof Module Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 342: Identifying Ohms Display
Courtesy of VOLVO CARS CORPORATION

Fig. 343: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **REPLACING THE COMPONENT**

INTERMITTENT FAULT

Check the cable between the sun roof module (SRM) terminal #6A and the upper electronic module (UEM) terminal #8A. Check for an intermittent open-circuit.

Replace the cable if a fault is found.

If no fault was found, try replacing the sun roof module (SRM).

Other information:

- For further information about signals and other values, see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access or replace the sun roof module (SRM) connector, see **CONTROL MODULE, SUN ROOF, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Replace the sun roof control module according to **CONTROL MODULE, SUN ROOF, REPLACING** .

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 348: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 349: Identifying Connector(s) Reinstallation
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Check that the sun roof can be operated automatically by pressing the switch 2 steps.

Can the sun roof be operated automatically?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

INFORMATION

FAULT-TRACING INFORMATION

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.

It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

UEM-0072: CONTROL UNIT. INTERNAL FAULT (2003-2012)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If the control unit detects that SRM-0022 is given when contact is made with the sunroof module (SRM), the diagnostic trouble code is displayed.

Substitute Value

- Nothing.

Possible Source

- Fault in programming of or reading from EEPROM.

Fault symptom[s]

- Automatic sunroof closing does not work.

INTERNAL FAULT

CHECKING FOR PERMANENT OR INTERMITTENT FAULTS

Fig. 350: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check that the sun roof can be operated automatically by pressing the switch 2 steps.

Can the sun roof be operated automatically?

- **YES**

  Refer to **INTERMITTENT FAULT**

- **NO**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

- Ignition off.

  Replace the sun roof control module according to **CONTROL MODULE, SUN ROOF, REPLACING** .

- **Continue**

  Refer to **VERIFICATION**

INTERMITTENT FAULT

The control module has previously registered a fault. The fault is now no longer present.

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 352: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 353: Identifying Connector(s) Reinstallation
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Check that the sun roof can be operated automatically by pressing the switch 2 steps.

Can the sun roof be operated automatically?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-0078: SIREN. CONFIGURATION FAULT (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) UEM-0078 is stored if the control module registers that the configuration of the siren does not correspond to the car.

Substitute Value

- None.

Possible Source

- The siren has not been configured after replacement
- Failed configuration after replacing the siren.

Fault symptom[s]

- None.

CONFIGURATION FAULT

RE-CONFIGURATION

Fig. 354: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- The configuration of the siren does not correspond to the configuration of the car
- Ignition on
- Use the VCT2000 (or appropriate scan tool) to re-configure the siren.

Fig. 355: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

SIREN, REPLACING

REMOVAL

Fig. 360: Identifying Protective Panel In The Fender Liner, Plastic Nuts And Blind Rivets
Courtesy of VOLVO CARS CORPORATION

- Deactivate alarm
- Turn the front wheels to the right
- Knock out or drill out the blind rivets from the front edge of the fender liner
- Remove the plastic nuts from the protective panel in the fender liner. Remove the protective panel
- Disconnect the front edge of the fender liner. Move the fender lining out of the way.

Fig. 361: Locating Siren And Screw
Courtesy of VOLVO CARS CORPORATION

- Remove the screw from the siren. Remove the siren
- Disconnect the connector.

INSTALLATION

- Connect the connector. Position the siren. Tighten the screws for the siren. Tighten to:**10 ± 2.5 Nm**
- Remove any rivet shavings. Rivet the fender liner into place
- Install the splash guard.

NOTE: The siren must be configured after replacement. This is carried out using VIDA (Volvo scan tool).

CONFIGURATION FAULT

RE-CONFIGURATION

Fig. 362: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- The configuration of the siren does not correspond to the configuration of the car
- Ignition on
- Use the VCT2000 (or appropriate scan tool) to re-configure the siren.

UEM-0080: RAIN SENSOR. SIGNAL MISSING (2003-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION UEM-0080

Condition

Fig. 368: Locating Rain Sensor Module
Courtesy of VOLVO CARS CORPORATION

The upper electronic module (UEM) regularly checks the communication with the rain sensor module (RSM).

A diagnostic trouble code (DTC) is stored If the rain sensor module (RSM) does not respond to a request from the upper electronic module (UEM).

The diagnostic trouble code (DTC) can be diagnosed 20 seconds after the ignition is switched on. Diagnostic trouble code (DTC) UEM-0080 is not stored if UEM-0081 or UEM-0082 is stored.

Substitute Value

- Intermittent windshield wipers
- The windshield wipers operate at high speed.

Possible Source

- Open-circuit in the power supply cable for the rain sensor
- Short-circuit to ground in the power supply cable for the rain sensor
- Open-circuit, short-circuit to ground or supply voltage in the data cable for the rain sensor
- Open-circuit or short-circuit to supply in the ground lead for the rain sensor
- Contact fault on the sensor side and/or control module side
- Defective rain sensor
- Defective control module.

Fault symptom[s]

- No rain sensor function.

SIGNAL MISSING

CHECKING THE RAIN SENSOR

CHECKING THE FUNCTION

Fig. 369: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Activate the rain sensor.

  HINT: The wiper blades make a reference stroke to determine the cleanliness and condition of the windshield when the rain sensor is activated. The rain sensor is deactivated when the ignition is switched off. To reactivate the rain sensor with the ignition on, move the stalk to position "0" and then to intermittent wiping.

  Spray water on the windshield where the rain sensor is positioned.

  The wiper blades must now wipe the windshield clean.

  HINT: In cars equipped with the rain sensor it replaces the intermittent function. One way of

checking the function of the rain sensor is to twist the collar on the lever. This changes the sensitivity of the rain sensor. The windshield wiper should make one stroke. If the intermittent or high speed functions are activated it indicates that the rain sensor function is missing.

- **Continue**

  Refer to **CHECKING THE SUPPLY TO THE RAIN SENSOR**

CHECKING THE SUPPLY TO THE RAIN SENSOR

Fig. 370: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- A number of measurements are required to check the wiring for the rain sensor. Measurements should be carried out on the wiring connector with the rain sensor disconnected. The terminals correspond to ground, voltage and data cables. The data cable is connected to terminal #1 on the rain sensor, terminal #2

is the ground cable and terminal #3 is the power supply for the rain sensor

- Move the windshield wiper stalk to position "0".
- Ignition off
- Disconnect the rain sensor
- Ignition on.

Check the voltage level between the voltage terminal #3 and ground terminal #2 of the wiring.

HINT: The voltage must be 12V.

Other information:

- For further information about signals and other values, see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)**
- see **RAIN SENSOR**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 371: Identifying 10 Pin Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 372: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Is the voltage between the terminals 12 V?

- **YES**

  Refer to **CHECKING THE DATA CABLE**

- **NO**

  Refer to **CHECKING THE WIRING**

CHECKING THE DATA CABLE

Fig. 373: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

HINT: The wiring between upper electronic module (UEM) and the rain sensor consists of two cables.

The upper electronic module (UEM) transmits pulses to the rain sensor using the data cable.

Disconnect the rain sensor.

Check that the data is transmitted on the data cable terminal #1 by checking the voltage level between the data and ground cables for the wiring (that is terminals #1 and #2).

HINT: Use the oscilloscope function and check that a pulsed signal is transmitted. The difference between the high and low values of the pulses is approximately 12 V. In the event of an open-circuit in the data cable no pulses are transmitted and a continuous voltage is displayed.

If the difference between high and low values of the pulses is between 2 V and 10 V it indicates that the wiring is oxidized or trapped. Replace the wiring between the rain sensor and the roof wiring in the event of a fault.

If no other fault is found try replacing the rain sensor.

Remedy as necessary.

Other information:

- To access or replace the control module, see **UPPER ELECTRONIC MODULE (UEM)/REARVIEW MIRROR, REPLACING**
- see **RAIN SENSOR**
- For further information about signals and other values, see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**

Fig. 375: Identifying Oscilloscope Display
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

CHECKING THE WIRING

Fig. 376: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

There is either a fault in the supply voltage or in the ground lead. Check the power supply cable against a ground terminal (the chassis).

HINT: If the voltage is 12 V the fault is in the ground lead. Other wise the fault is in the power supply cable.

Remedy as necessary.

Other information:

- To access or replace the control module, see **UPPER ELECTRONIC MODULE (UEM)/REARVIEW MIRROR, REPLACING**
- see **RAIN SENSOR**

- For further information about signals and other values, see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To fault-trace the wiring and terminals, see **CHECKING WIRING AND TERMINALS** .

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-4F92: SENSOR, SEAT BELT REMINDER. SIGNAL MISSING (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-4F92

Condition

The rear electronic module (REM) checks the signal from the sensor, seat belt reminder in the passenger seat.

Diagnostic trouble code (DTC) REM-4F92 is stored if rear electronic module (REM) registers that there is no signal from the seat belt reminder sensor.

Diagnostic trouble code (DTC) REM-4F92 can be detected with ignition in positions I or II for at least 3 minutes and battery voltage > 9 volt.

Substitute Value

- None.

Possible Source

- Open-circuit in the signal cable
- Defective sensor, seat belt reminder.

Fault symptom[s]

- General warning lamp lit.

SIGNAL MISSING

CHECKING COMPONENTS AND WIRING

Check the rear electronic module (REM) and seat belt reminder sensor connectors. Check for contact resistance and oxidation. Check for damage and loose connections. Also check intermediate connector.

Check the signal cable between rear electronic module (REM) terminal #B19 (terminal #A39) and seat belt reminder sensor connector terminal #9. Check for an open-circuit.

Check the signal cable between rear electronic module (REM) terminal #B20 (terminal #A40) and seat belt reminder sensor connector terminal #10. Check for an open-circuit.

Check the seat belt reminder sensor. Measure the resistance between terminals #9 and #10 in the sensor connector.

HINT: The resistance should be above 100 kohms with no passengers and below 10 kohms with passengers.

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- See **HEATER PAD BACKREST AND CUSHION, REPLACING** (-2004) or **HEATER PAD BACKREST AND CUSHION, REPLACING** (2005-).
- For information about signals, see **SIGNAL SPECIFICATION**
- see **CHECKING WIRING AND TERMINALS** .

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-4F93: SENSOR, SEAT BELT REMINDER. FAULTY SIGNAL (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-4F93

Condition

The rear electronic module (REM) checks the signal from the sensor, seat belt reminder in the passenger seat.

Diagnostic trouble code (DTC) REM-4F93 is stored if rear electronic module (REM) registers too an incorrect signal from the seat belt reminder sensor.

Diagnostic trouble code (DTC) REM-4F93 can be detected with ignition in positions I or II for at least 3 minutes and battery voltage > 9 volt.

Substitute Value

- None.

Possible Source

- Short-circuit between the signal cables
- Defective sensor, seat belt reminder.

Fault symptom[s]

- General warning lamp lit.

FAULTY SIGNAL

CHECKING THE COMPONENT

Check the rear electronic module (REM) and seat belt reminder sensor connectors. Check for contact resistance and oxidation. Check for damage and loose connections. Also check intermediate connector.

Check the signal cables. Check for a short-circuit between the cables by measuring the resistance between the rear electronic module (REM) terminals #B19 (#A39) and #B20 (#A40) with the seat belt reminder sensor disconnected. The resistance must be infinite.

Check the seat belt reminder sensor. Measure the resistance between terminals #9 and #10 in the sensor connector.

HINT: The resistance should be above 100 kohms with no passengers and below 10 kohms with passengers.

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- See **HEATER PAD BACKREST AND CUSHION, REPLACING** (-2004) or **HEATER PAD BACKREST AND CUSHION, REPLACING** (2005-).

- For information about signals, see **SIGNAL SPECIFICATION**
- see **CHECKING WIRING AND TERMINALS** .

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-5A31: RELAY, REAR A/C. SIGNAL TOO HIGH (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-5A31

Condition

The rear electronic module (REM) checks the output signal to the relay coil for relay, rear air conditioning (A/C).

Diagnostic trouble code (DTC) REM-5A31 is stored if the control module registers that the output signal to the relay coil is too high.

Diagnostic trouble code (DTC) REM-5A31 can be detected when the relay is activated.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the relay circuit
- Defective relay.

Fault symptom[s]

- The rear air conditioning (A/C) system is not working.

SIGNAL TOO HIGH

CHECKING AND REPLACING THE COMPONENT

Fig. 13: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Change the relay for rear air conditioning (A/C)
- Ignition on.

  Activate the relay. The relay should click.

  If the function is OK, the cause of the fault was a defective relay (short-circuit in the relay).

  Other information

  - To access and replace the relay, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**

Fig. 14: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Was the function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE CONTROL MODULE**

CHECKING THE CONTROL MODULE

Fig. 15: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Remove the relay
- Ignition on.

Check the relay coil driver circuit for a short-circuit to supply voltage by taking a voltmeter reading at terminal #2 in the relay base.

HINT: The voltage between terminal #2 and ground should be approximately 0 V.

Remedy as necessary.

Other information

- To access and replace the relay, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-5A32: RELAY, REAR A/C. SIGNAL TOO LOW OR SIGNAL MISSING (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-5A32

Condition

The rear electronic module (REM) checks the output signal to the relay coil for relay, rear air conditioning (A/C).

Diagnostic trouble code (DTC) REM-5A32 is stored if the control module registers that the output signal to the relay coil is missing or too low.

Diagnostic trouble code (DTC) REM-5A32 can be detected when the relay driver is not activated.

Substitute Value

- None.

Possible Source

- Relay missing
- Defective relay
- Contact resistance in the relay base.

Fault symptom[s]

- The rear air conditioning (A/C) system is not working
- Rear air conditioning (A/C) cannot be switched off.

SIGNAL TOO LOW OR SIGNAL MISSING

CHECKING AND REPLACING THE COMPONENT

Fig. 21: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Remove the rear air conditioning (A/C) relay and check the relay base switches. Check for contact resistance and oxidation
- Install the relay
- Ignition on.

  Activate and deactivate the relay. The relay must click.

  If the function is now OK the fault was caused by a contact fault in the relay base.

  Other information

- see **CHECKING WIRING AND TERMINALS** .

Fig. 22: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Was the function OK?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

Fig. 23: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Change the relay for rear air conditioning (A/C)
- Ignition on.

  Activate and deactivate the relay. The relay must click.

  If the function is now OK, the cause of the fault was a defective relay (short-circuit to ground or an open-circuit in the relay coil).

Fig. 24: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Was the function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE CONTROL MODULE FOR OPEN-CIRCUITS**

CHECKING THE CONTROL MODULE FOR OPEN-CIRCUITS

Fig. 25: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Remove the relay for rear air conditioning (A/C)
- Ignition on.

Check the driver circuit for the relay coil for an open-circuit as follows: activate the relay driver. Measure the voltage between terminals #1 and #2 on the relay base.

The voltage between terminals #1 and #2 should be battery voltage.

If the value deviates excessively, check the voltage between terminal #2 and the battery and between terminal #1 and ground. Both should equal battery voltage.

NOTE: Do not forget to check that the power supply to the control module is OK.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-6A01: RELAY, CENTRAL LOCKING. SIGNAL TOO HIGH (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The rear electronic module checks the output signal to the relay coil for relay 2/158.

Diagnostic trouble code (DTC) REM-6A01 is stored if the rear electrical module detects that the output signal to the relay coil is too high.

Diagnostic trouble code (DTC) REM-6A01 can be diagnosed when relay 2/158 is activated.

Substitute Value

- None.

Possible Source

- Defective relay
- Damaged relay base.

Fault symptom[s]

- Does not lock / unlock a door
- Does not lock / unlock the fuel tank filler cap
- Does not lock or unlock the trunk lid.

SIGNAL TOO HIGH

CHECKING AND REPLACING THE COMPONENT

Fig. 33: Identifying Ignition ON

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-6A01: SWITCH, CENTRAL LOCKING MOTOR. SIGNAL TOO HIGH (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-6A01

Condition

Fig. 42: Identifying Central Locking Motor
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) controls the lock units in the rear doors via a number of relays.

The rear electronic module (REM) receives an indication from the lock units about whether the central locking motor is in the locked or unlocked position. This information is provided by a switch in each lock unit. The switch must be closed when the lock motor is in the locked position.

The diagnostic trouble code (DTC) is stored if the rear electronic module (REM) detects that the input from the switch in the **left rear door** is still high 15 seconds after the unlock command was given.

The diagnostic trouble code (DTC) can be diagnosed when locking the central locking.

Substitute Value

- None.

Possible Source

- Contact resistance and oxidation in the terminals
- Fault or short-circuit to supply voltage in the switch for indication of the lock motor position
- Open-circuit in the cable from the switch for indication of the lock motor position
- The lock motor is stuck in one position
- Open-circuit in the ground lead/ground terminal for the lock mechanism
- Open-circuit, short-circuit to ground or supply voltage in the control cable to the lock motors
- Open-circuit, short-circuit to ground or supply voltage in the control cable to the lock motors from/to the relay for the child-proof lock
- Open-circuit, short-circuit to ground or supply voltage in the wiring to the relay for the child-proof lock from the power window switch
- Damaged relay for the child-proof lock.

Fault symptom[s]

- Does not lock / unlock a door.

SIGNAL TOO HIGH

CHECKING THE SIGNAL FROM THE SWITCHES IN THE REAR DOORS

Fig. 43: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Read off the status from the control switch in both rear doors (indicates whether the doors are locked or not).

  Lock and unlock the left and right-hand rear doors. The status of each door should change when the door is locked or unlocked.

  HINT: The doors can also be locked/unlocked using the remote control.

  The fault is permanent if the status does not change.

  If the status changes, this indicates an intermittent fault, i. e. the fault was present previously but is not active at the moment.

Is the function OK?

- **YES**

  Refer to **CHECKING THE SIGNAL FROM THE SWITCHES IN THE REAR DOORS**

- **NO**

  Refer to **CHECKING CABLE AND COMPONENT**

CHECKING THE SIGNAL FROM THE SWITCHES IN THE REAR DOORS

NOTE: Only fault-trace the circuit of the door displaying the faulty value.

Check the connectors for the lock mechanism and the rear electronic module (REM). Check for contact resistance and oxidation.

Check the switch in the lock mechanism. Check for a short-circuit. Check for an open-circuit. Check by measuring the resistance between terminals #1 and #5 on the connector for the lock mechanism and ground.

Check the resistance between terminals #1 and #5 on the lock mechanism side. The resistance must be infinite or near 0 ohm depending on the position of the switch.

Left rear door

Check the signal cable between rear electronic module (REM) connector terminal #45 (#C5) and terminal #5 on the lock mechanism connector. Check for a short-circuit to supply voltage. Check for an open-circuit. The lock mechanism is jammed if no fault is found in the cable or the switch.

Right rear door

Check the signal cable between rear electronic module (REM) connector terminal #28 (#D28) and terminal #5 on the lock mechanism connector. Check for a short-circuit to supply voltage. Check for an open-circuit. The lock mechanism is jammed if no fault is found in the cable or the switch.

Remedy as necessary.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-6A02: SWITCH CENTRAL LOCKING MOTOR. SIGNAL TOO HIGH (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-6A02

Condition

Fig. 59: Identifying Central Locking Motor
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) controls the lock units in the rear doors via a number of relays.

The rear electronic module (REM) receives an indication from the lock units about whether the central locking motor is in the locked or unlocked position. This information is provided by a switch in each lock unit. The switch must be closed when the lock motor is in the locked position.

The diagnostic trouble code (DTC) is stored if the rear electronic module (REM) detects that the input from the switch in the **right rear door** is still high 15 seconds after the unlock command was given.

The diagnostic trouble code (DTC) can be diagnosed during central locking and when no further lock command has been received within 15 seconds.

Substitute Value

- None.

Possible Source

- Contact resistance and oxidation in the terminals
- Fault or short-circuit to supply voltage in the switch for indication of the lock motor position
- Open-circuit in the cable from the switch for indication of the lock motor position
- The lock motor is stuck in one position
- Open-circuit in the ground lead/ground terminal for the lock mechanism
- Open-circuit, short-circuit to ground or supply voltage in the control cable to the lock motors
- Open-circuit, short-circuit to ground or supply voltage in the control cable to the lock motors from/to the relay for the child-proof lock
- Open-circuit, short-circuit to ground or supply voltage in the wiring to the relay for the child-proof lock from the power window switch
- Damaged relay for the child-proof lock.

Fault symptom[s]

- Does not lock / unlock a door.

SIGNAL TOO HIGH

see **SIGNAL TOO HIGH**

REM-6A03: RELAY, CENTRAL LOCKING. SIGNAL TOO LOW (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The rear electronic module checks the output signal to the relay coil for relay 2/158.

Diagnostic trouble code (DTC) REM-6A03 is stored if the rear electrical module registers that the output signal to the relay coil is missing or too low.

Diagnostic trouble code (DTC) REM-6A03 can be diagnosed when relay 2/158 is not activated.

Substitute Value

- None.

Possible Source

- Oxidation on the relay base switches
- The relay is loose or missing
- Defective relay.

Fault symptom[s]

- Does not lock / unlock a door
- Does not lock / unlock the fuel tank filler cap
- Does not lock or unlock the trunk lid.

SIGNAL TOO LOW

CHECKING AND REPLACING THE COMPONENT

Fig. 60: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Remove relay 2/158. Check the relay base switches. Check for contact resistance and oxidation
- Install the relay

- Ignition on.

  Activate the relay.

  If the function is now OK the fault was caused by a contact fault in the relay base.

  Other information

  - see **CHECKING WIRING AND TERMINALS** .

REM-6A04: SWITCH CENTRAL LOCKING MOTOR. SIGNAL TOO LOW (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-6A04

Condition

Fig. 91: Identifying Central Locking Motor
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) uses a number of relays to control the lock units in the rear doors for locking and unlocking.

The rear electronic module (REM) receives an indication from the lock units when the central locking motor is in the locked or unlocked position. This information is supplied by a switch in each lock unit. The switch provides a ground when the lock motor is in the locked position.

The diagnostic trouble code (DTC) is stored if the rear electronic module (REM) detects that the input from the switch in the **right rear door** is still low 15 seconds after the unlock command was given.

The diagnostic trouble code (DTC) can be diagnosed during unlocking by the central locking and when no further lock command has been received within 15 seconds.

Substitute Value

- None.

Possible Source

- Contact resistance and oxidation in the terminals
- Fault or short-circuit to ground in the switch for indication of the lock motor position
- Short-circuit to ground in the cable from the switch for indication of the lock motor position
- The lock motor is stuck in one position
- Open-circuit in the ground lead/ground terminal for the lock mechanism
- Open-circuit, short-circuit to ground or supply voltage in the control cable to the lock motors
- Open-circuit, short-circuit to ground or supply voltage in the control cable to the lock motors from/to the relay for the child-proof lock
- Open-circuit, short-circuit to ground or supply voltage in the wiring to the relay for the child-proof lock from the power window switch
- Damaged relay for the child-proof lock.

Fault symptom[s]

- Does not lock / unlock a door.

SIGNAL TOO LOW

see **SIGNAL TOO LOW**

REM-6A04: UNLOCKING RELAY, CENTRAL LOCKING REAR LEFT DOOR. SIGNAL TOO HIGH (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If rear electronic module registers signal too high on relay coil ground circuit when unlocking, diagnostic trouble code is displayed.

Substitute Value

Nothing.

Possible Source

- Faulty relay (short circuit in relay coil).
- Defective control unit.

Fault symptom[s]

- A door does not lock/open.

SIGNAL TOO HIGH

CHECKING AND REPLACING THE COMPONENT

Replace relay 2/112.

Activate the relay.

If the function is OK, the cause of the fault was a defective relay (short-circuit in the relay).

Other information:

- For -2004, see: **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- For 2005-, see: **REAR ELECTRONIC MODULE (REM), REPLACING** .

Was the function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE CONTROL MODULE**

CHECKING THE CONTROL MODULE

- Remove the relay.

Check the relay coil driver circuit for a short-circuit to supply voltage by measuring the voltage at terminal #2 in the relay base.

HINT: The voltage between terminal #2 and ground should be approximately 0 V.

Replace the control module if the voltmeter displays an incorrect value.

Other information:

- For -2004, see: **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- For 2005-, see: **REAR ELECTRONIC MODULE (REM), REPLACING** .
- see **CHECKING WIRING AND TERMINALS** .

Was the function OK?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-6A05: SWITCH LOCKING MOTOR CHILD-PROOF LOCK. FAULTY SIGNAL (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-6A05

Condition

Fig. 99: Identifying Central Locking Motor
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) uses a number of relays to control the lock units in the rear doors for locking and unlocking.

The rear electronic module (REM) also activates the child-proof lock. A switch in the lock unit indicates that the child-proof lock is activated. The switch provides a ground when the lock motor is in the locked position.

The diagnostic trouble code (DTC) is stored if the rear electronic module (REM) detects that the input from the switch for the child-proof lock in **one of the rear doors** is still high 1 second after an activation command has been given.

The diagnostic trouble code (DTC) can be diagnosed when the child-proof lock is activated.

Substitute Value

- None.

Possible Source

- Contact resistance and oxidation in the terminals
- The lock motor in one of the rear doors is stuck in one position
- Fault or short-circuit to supply voltage in the switch for indication of the lock motor position in one of the rear doors
- Short-circuit to supply voltage in the cable from the switch for indication of the lock motor position in one of the rear doors
- Open-circuit in the cable from the switch for indication of the lock motor status in one of the rear doors
- Open-circuit, short-circuit to ground or supply voltage in the control cable to the lock motor
- Open-circuit, short-circuit to ground or supply voltage in the control cable to the lock motor from/to the relay for the child-proof lock
- Open-circuit, short-circuit to ground or supply voltage in the wiring to the relay for the child-proof lock from the power window switch
- Damaged relay for the child-proof lock.

Fault symptom[s]

- The child-proof lock does not function.

FAULTY SIGNAL

CHECKING THE SIGNAL FROM THE CONTROL SWITCH FOR THE CHILD LOCK SWITCH

Fig. 100: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Read the status of the control switch for the child lock from both rear doors.

  Activate and deactivate the power child locks.

  The status of both doors should change at the same time as the function is engaged / disengaged.

  The fault is permanent if the status does not change.

  If the status changes, this indicates an intermittent fault, i. e. the fault was present previously but is not active at the moment.

Is the function OK?

- **YES**

  Refer to **CHECKING THE SIGNAL FROM THE SWITCHES IN THE REAR DOORS**

- **NO**

  Refer to **CHECKING CABLE AND COMPONENT**

CHECKING THE SIGNAL FROM THE SWITCHES IN THE REAR DOORS

NOTE: Only fault-trace the circuit of the door displaying the faulty value.

Check the connectors for the lock mechanism and the rear electronic module (REM). Check for contact resistance and oxidation.

Check the switch in the lock mechanism. Check for a short-circuit. Check by measuring the resistance between terminals #6 and #7 on the connector for the lock mechanism.

Check the resistance between terminals #6 and #7 on the lock mechanism. The resistance must be infinite or near 0 ohm depending on the position of the switch.

Left rear door

Check the signal cable between rear electronic module (REM) connector terminal #50 (#C10) and terminal #7 on the lock mechanism connector. Check for a short-circuit to supply voltage. Check for an open-circuit. The lock mechanism is jammed if no fault is found in the cable or the switch.

Right rear door

Check the signal cable between rear electronic module (REM) connector terminal #4 (#D4) and terminal #7 on the lock mechanism connector. Check for a short-circuit to supply voltage. Check for an open-circuit. The lock mechanism is jammed if no fault is found in the cable or the switch.

Remedy as necessary.

Other information

  Refer to **VERIFICATION**

CHECKING CABLE AND COMPONENT

NOTE: Only fault-trace the circuit of the door displaying the faulty value.

Check the connectors for the lock mechanism and the rear electronic module (REM). Check for contact resistance and oxidation.

Left rear door

Check the wiring between the lock mechanism connector terminals #3 and #8 and the relay terminals #2 and #4 for the child lock. Check for an open-circuit. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Check the wiring between the lock mechanism connector terminals #3 and #5 and the power window switch. Check for an open-circuit. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Check the cable between relay terminal #1 for the child lock and rear electronic module (REM) terminal #27 (#A27). Check for an open-circuit. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

HINT: Remove the relay for power child locks while checking the lock motors. If the function is OK when the relay is removed it means that there is a fault in the relay or in the circuit for controlling the relay.

Right rear door

Check the wiring between the lock mechanism connector terminals #3 and #8 and the relay terminals #2 and #4 for the child lock. Check for an open-circuit. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Check the wiring between the lock mechanism connector terminals #3 and #5 and the power window switch. Check for an open-circuit. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Check the cable between relay terminal #1 for the child lock and rear electronic module (REM) terminal #24 (#B24). Check for an open-circuit. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

HINT: Remove the relay for power child locks while checking the lock motors. If the function is OK when the relay is removed it means that there is a fault in the relay or in the circuit for controlling the relay.

The lock mechanism is jammed if no fault is found in the wiring.

Remedy as necessary.

Was the function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE CONTROL MODULE FOR OPEN-CIRCUITS**

CHECKING THE CONTROL MODULE FOR OPEN-CIRCUITS

- Remove relay 2/112.

Check the driver circuit for the relay coil for an open-circuit as follows: activate the relay driver. Measure the voltage between terminals #1 and #2 on the relay base.

HINT: The voltage between terminals #1 and #2 should be battery voltage.

HINT: If the value deviates excessively, check the voltage between terminal #2 and the battery voltage and between terminal #1 and ground. Both should equal battery voltage.

HINT: Check for an open-circuit.

HINT: Do not forget to check that the power supply to the control module is OK.

Other information:

- For -2004, see: **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- For 2005-, see: **REAR ELECTRONIC MODULE (REM), REPLACING** .

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-6A06: RELAY, DEADLOCK. SIGNAL TOO HIGH (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If rear electronic module registers signal too high on relay coil ground circuit when locking to deadlock position, diagnostic trouble code is displayed.

Substitute Value

Nothing.

Possible Source

- Faulty relay (short circuit in relay coil).
- Defective control unit.

Fault symptom[s]

- Does not lock to the deadlock position BLL.
- Does not open from the deadlock position BLL.

SIGNAL TOO HIGH

CHECKING AND REPLACING THE COMPONENT

Replace the relay, 2/115.

Activate the relay.

If the function is OK, the cause of the fault was a defective relay (short-circuit in the relay).

Other information:

- For -2004, see: **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If the rear electronic module registers no signal/signal too low on relay coil ground circuit diagnostic trouble code is displayed.

Substitute Value

Nothing.

Possible Source

- Oxidation of relay socket contacts.
- Relay is loose or missing.
- Faulty relay (open circuit/short circuit to ground in relay coil).
- Defective control unit.

Fault symptom[s]

- Does not lock to the deadlock position BLL.
- Does not open from the deadlock position BLL.

SIGNAL MISSING

CHECKING AND REPLACING THE COMPONENT

Remove relay RMI 3 (2/115). Check the relay base switches. Check for contact resistance and oxidation.

Install the relay.

Activate the relay.

If the function is now OK the fault was caused by a contact fault in the relay base.

Other information:

- For -2004, see: **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- For 2005-, see: **REAR ELECTRONIC MODULE (REM), REPLACING** .
- see **CHECKING WIRING AND TERMINALS** .

Fig. 152: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 153: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Was the function OK?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

Replace the relay, 2/115.

Activate the relay.

If the function is now OK, the cause of the fault was a defective relay (short-circuit to ground or an open-circuit in the relay coil).

Other information:

- For -2004, see: **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- For 2005-, see: **REAR ELECTRONIC MODULE (REM), REPLACING** .

Fig. 154: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 155: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Was the function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE CONTROL MODULE FOR OPEN-CIRCUITS**

CHECKING THE CONTROL MODULE FOR OPEN-CIRCUITS

- Remove relay 2/115.

Check the driver circuit for the relay coil for an open-circuit as follows: activate the relay driver. Measure the voltage between terminals #1 and #2 on the relay base.

HINT: The voltage between terminals #1 and #2 should be battery voltage.

HINT: If the value deviates excessively, check the voltage between terminal #2 and the battery voltage and between terminal #1 and ground. Both should equal battery voltage.

HINT: Check for an open-circuit.

HINT: Do not forget to check that the power supply to the control module is OK.

Other information:

- For -2004, see: **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- For 2005-, see: **REAR ELECTRONIC MODULE (REM), REPLACING** .
- see **CHECKING WIRING AND TERMINALS** .

Fig. 156: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 157: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING THE CONTROL MODULE FOR SHORT-CIRCUITS**

CHECKING THE CONTROL MODULE FOR SHORT-CIRCUITS

Measure the resistance between terminal #2 and ground when the relay driver is active.

The resistance should be high when the relay driver is active.

Replace the control module if the resistance is low.

Other information:

- For -2004, see: **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- For 2005-, see: **REAR ELECTRONIC MODULE (REM), REPLACING** .

Was the function OK?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-6A09: POWER CHILD LOCK MOTOR SWITCH. FAULTY SIGNAL (2007-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-6A09

Condition

Fig. 162: Identifying Central Locking Motor
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) uses a number of relays to control the lock units in the rear doors for locking and unlocking.

The rear electronic module (REM) also activates the child-proof lock. A switch in the lock unit indicates that the child-proof lock is activated. The switch provides a ground when the lock motor is in the locked position.

A diagnostic trouble code (DTC) is stored if the Rear electronic module (REM) detects that the status of the child-proof lock in any of the rear doors changes from locked to unlocked without the control being activated.

The diagnostic trouble code (DTC) can be diagnosed in ignition position I and II and when the child-proof locks are activated.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the switch for indication of the lock motor position in one of the rear doors
- Short-circuit to ground in the cable from the switch for indication of the lock motor position in one of the rear doors
- Open-circuit, short-circuit to ground or supply voltage in the wiring to the relay for the child-proof lock from the power window switch
- Damaged relay for the child-proof lock.

Fault symptom[s]

- The child-proof lock does not function.

FAULTY SIGNAL

see **FAULTY SIGNAL**

REM-6A0A: POWER CHILD LOCK MOTOR SWITCH. FAULTY SIGNAL (2006-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-6A0A

Condition

Fig. 163: Identifying Central Locking Motor
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) uses a number of relays to control the lock units in the rear doors for locking and unlocking.

The rear electronic module (REM) also activates the child-proof lock. A switch in the lock unit indicates that the child-proof lock is activated. The switch provides a ground when the lock motor is in the locked position.

A diagnostic trouble code (DTC) is stored if the Rear electronic module (REM) detects that the status of the child-proof lock in any of the rear doors changes from unlocked to locked without the control being activated.

The diagnostic trouble code (DTC) can be diagnosed in ignition position I and II and when the child-proof locks are deactivated.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the switch for indication of the lock motor position in one of the rear doors
- Short-circuit to ground in the cable from the switch for indication of the lock motor position in one of the rear doors
- Open-circuit, short-circuit to ground or supply voltage in the wiring to the relay for the child-proof lock from the power window switch
- Damaged relay for the child-proof lock.

Fault symptom[s]

- The child-proof lock does not function.

FAULTY SIGNAL

see **FAULTY SIGNAL**

REM-6A0C: UNLOCKING RELAY, CENTRAL LOCKING REAR RIGHT DOOR. SIGNAL TOO HIGH (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If rear electronic module (REM) registers signal too high on relay coil ground circuit when unlocking, diagnostic trouble code is displayed.

Substitute Value

Nothing.

Possible Source

- Faulty relay.
- Defective control unit.

Fault symptom[s]

- A door does not lock/open.

SIGNAL TOO HIGH

CHECKING AND REPLACING THE COMPONENT

Replace the relay, 2/114.

Activate the relay.

If the function is OK, the cause of the fault was a defective relay (short-circuit in the relay).

Other information:

- For -2004, see: **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- For 2005-, see: **REAR ELECTRONIC MODULE (REM), REPLACING** .

Fig. 164: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 165: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Was the function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE CONTROL MODULE**

CHECKING THE CONTROL MODULE

- Remove the relay.

  Check the relay coil driver circuit for a short-circuit to supply voltage by measuring the voltage at terminal #2 in the relay base.

  HINT: The voltage between terminal #2 and ground should be approximately 0 V.

  Replace the control module if the voltmeter displays an incorrect value.

Other information:

- For -2004, see: **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- For 2005-, see: **REAR ELECTRONIC MODULE (REM), REPLACING** .

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-6A0E: UNLOCKING RELAY, CENTRAL LOCKING REAR RIGHT DOOR. SIGNAL MISSING (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If the rear electronic module registers no signal/signal too low on relay coil ground circuit diagnostic trouble code is displayed.

Substitute Value

Nothing.

Possible Source

- Oxidation of relay socket contacts.
- Relay is loose or missing.
- Faulty relay (open circuit/short circuit to ground in relay coil).
- Defective control unit.

Fault symptom[s]

- A door does not lock/open.

SIGNAL MISSING

CHECKING AND REPLACING THE COMPONENT

Remove the relay (2/114). Check the relay base switches. Check for contact resistance and oxidation.

Install the relay.

Activate the relay.

If the function is now OK the fault was caused by a contact fault in the relay base.

Other information:

- For -2004, see: **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- For 2005-, see: **REAR ELECTRONIC MODULE (REM), REPLACING** .

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-6A10: DOOR SWITCH. SIGNAL TOO HIGH (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-6A10

Condition

Fig. 181: Identifying Central Locking Motor
Courtesy of VOLVO CARS CORPORATION

The rear electrical module (REM) checks if the doors are open or closed using the switches in the lock units. The switches provide a ground to the rear electronic module (REM) when the doors are shut.

The rear electronic module (REM) checks the status of the switches by powering them for a short period ("polling").

The diagnostic trouble code (DTC) is stored if the rear electronic module (REM) receives a high signal from the **driver's door** switch when the control module has not polled that switch. This is seen as a short-circuit to supply voltage in the switch or the cable to the switch.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the switch for indicating a closed door.

Fault symptom[s]

- General warning lamp lit.
- Message in the display.
- Does not alarm the door.

SIGNAL TOO HIGH

CHECKING THE SIGNAL FROM THE SWITCH IN THE FRONT DOOR

Fig. 182: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Read off the status from the control switch in both front doors (indicates whether the doors are open or closed).

Open and close the left and right-hand front door. The status for each door must change when the door is opened/closed.

The fault is permanent if the status does not change.

If the status changes, this indicates an intermittent fault, i. e. the fault was present previously but is not active at the moment.

REM-6A15: SWITCH, TAILGATE. SIGNAL TOO HIGH (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-6A15

Condition

Fig. 216: Identifying Tailgate Switch
Courtesy of VOLVO CARS CORPORATION

The rear electrical module (REM) checks if the tailgate is open or closed using a switch in the lock unit of the tailgate. The switch provides a ground to the rear electronic module (REM) when the tailgate is shut.

The rear electronic module (REM) checks the status of the switch by powering it for a short period ("polling").

The diagnostic trouble code (DTC) is stored if the rear electronic module (REM) receives a high signal from the **tailgate** switch when the control module has not polled that switch. This is seen as a short-circuit to supply voltage in the switch or the cable to the switch.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the switch for indicating a closed tailgate.

Fault symptom[s]

- General warning lamp lit.
- Message in the display.
- Does not alarm the tailgate.

SIGNAL TOO HIGH

CHECKING THE SIGNAL FROM THE SWITCH IN THE TAILGATE/TRUNK LID

Fig. 217: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Read off the status from the switch in tailgate/trunk lid (indicates whether the tailgate/trunk lid is open or closed).

Open and close the trunk lid / tailgate. The status should change when the tailgate/trunk lid is opened/closed.

The fault is permanent if the status does not change.

If the status changes, this indicates an intermittent fault, i. e. the fault was present previously but is not active at the moment.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-6C11: TILT SENSOR, POWER SUPPLY. SIGNAL TOO HIGH. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) REM-6C11 is stored if the rear electronic module registers that the signal in the tilt sensor communication cable is too high when the alarm is deactivated.

Substitute Value

None.

Possible Source

- Short-circuit to supply voltage in the power supply cable to the tilt sensor.

Fault symptom[s]

- Does not alarm the sensor.

SIGNAL TOO HIGH. INTERMITTENT FAULT

CHECKING THE WIRING

Check the power supply cable between rear electronic module connector #B20 (#D20) and tilt sensor connector terminal #1 for an intermittent short-circuit to supply voltage according to **SHORT-CIRCUIT TO SUPPLY VOLTAGE, INTERMITTENT FAULTS** .

Other information

- For further information about signals and other values, see **SIGNAL SPECIFICATION** .
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX** .
- To access the rear electronic module, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .

REM-6C15: COMMUNICATION WITH THE TILT SENSOR. SIGNAL MISSING. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) REM-6C15 is stored if the rear electronic module registers that the signal in the tilt sensor communication cable is missing.

Substitute Value

None.

Possible Source

- Contact fault on the sensor and/or control module sides.
- Open-circuit, short-circuit to supply voltage or short-circuit to ground in tilt sensor communication cable.
- Open-circuit in sensor supply cable or ground lead.
- Defective sensor.

Fault symptom[s]

- Does not alarm sensor

SIGNAL MISSING. INTERMITTENT FAULT

CHECKING THE WIRING

Check the signal cable between rear electronic module (REM) connector #B06 (#D6) and tilt sensor connector terminal #2. Check for an intermittent short-circuit to ground.

Also check both connectors for intermittent contact resistance and oxidation.

If no fault was found, try a new sensor.

Other information

- For further information about signals and other values, see **SIGNAL SPECIFICATION**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access the rear electronic module (REM), see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**

REM-6C15: TILT SENSOR. COMMUNICATION FAULT (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-6C15

Condition

Fig. 256: Identifying Inclination Sensor Module
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) receives signals from the inclination sensor module (ISM) when the alarm is

activated. Before the rear electronic module (REM) accepts signals from the inclination sensor module (ISM) a communication test is carried out after the alarm is activated.

The diagnostic trouble code (DTC) is stored if the rear electronic module (REM) registers that communication with the inclination sensor module (ISM) is not working.

The diagnostic trouble code (DTC) can be diagnosed when the rear electronic module (REM) is in alert mode.

Substitute Value

- None.

Possible Source

- Contact resistance or oxidation in the connectors
- Open-circuit in the communication cable to the inclination sensor module (ISM)
- Open-circuit in the power supply to the inclination sensor module (ISM)
- Open-circuit in the ground cable to the inclination sensor module (ISM).

Fault symptom[s]

- Does not alarm the sensor.

COMMUNICATION FAULT

CHECKING CABLE AND COMPONENT

Check connector D for the rear electronic module (REM) and the connector for the inclination sensor module (ISM). Check for contact resistance and oxidation.

Check the communication cable between rear electronic module (REM) connector terminal #26 (#D26) and inclination sensor module (ISM) connector terminal #2. Check for an open-circuit.

Check the cable between inclination sensor module (ISM) connector terminal #5 and the ground terminal. Check for open-circuit.

Remedy as necessary.

REM-6C16: TILT SENSOR. INTERNAL FAULT (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-6C16

Condition

Fig. 262: Identifying Inclination Sensor Module
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) receives signals from the inclination sensor module (ISM) when the alarm is activated. Before the rear electronic module (REM) accepts signals from the inclination sensor module (ISM) a communication test is carried out after the alarm is activated.

The diagnostic trouble code (DTC) is stored if the rear electronic module (REM) receives information from the inclination sensor module (ISM) indicating an internal fault.

The diagnostic trouble code (DTC) can be diagnosed when the rear electronic module (REM) is in alert mode.

Substitute Value

- None.

Possible Source

- Contact resistance or oxidation in the connectors
- Open-circuit in the communication cable to the inclination sensor module (ISM)
- Open-circuit in the power supply to the inclination sensor module (ISM)

- Open-circuit in the ground cable to the inclination sensor module (ISM)
- Internal fault in the inclination sensor module (ISM).

Fault symptom[s]

- Does not alarm the sensor.

INTERNAL FAULT

CHECKING CABLE AND COMPONENT

Check connector D for the rear electronic module (REM) and the connector for the inclination sensor module (ISM). Check for contact resistance and oxidation.

Check the power cable between rear electronic module (REM) connector terminal #31 (#D31) and inclination sensor module (ISM) connector terminal #1. Check for an open-circuit.

Check the communication cable between rear electronic module (REM) connector terminal #26 (#D26) and inclination sensor module (ISM) connector terminal #2. Check for an open-circuit.

Check the cable between inclination sensor module (ISM) connector terminal #5 and the ground terminal. Check for open-circuit.

Try a new inclination sensor module (ISM) if no fault is found.

Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-6C17: GLASS BREAK WIRE. SIGNAL MISSING (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-6C17

Condition

When the alarm is activated, the central electronic module (CEM) checks the glass breakage loops in the rear side windows at regular intervals. A diagnostic trouble code (DTC) is stored if the control module detects an open-circuit in any of the glass breakage loops.

The diagnostic trouble code (DTC) can be diagnosed when the alarm is activated.

Substitute Value

- The alarm sounds.

Possible Source

- Open-circuit in one of the glass breakage loops in the rear side windows
- Contact resistance in the terminals.

Fault symptom[s]

- Text window and warning symbol/Text message
- Alarm/False alarm
- Alarm/Other alarm problems

SIGNAL MISSING

CHECKING CABLE AND COMPONENT

- Disconnect connector C from the rear electronic module (REM).

HINT: The signal loop runs from rear electronic module (REM) terminal #48 (#C8) to the glass breakage loop in the right-hand rear window, to the glass breakage loop in the left-hand rear window and then to the ground terminal.

Check connector C for the rear electronic module (REM) and the terminals for the glass breakage loop. Check for contact resistance and oxidation.

Check the glass breakage loop and the intermediate cable between rear electronic module (REM) terminal #48 (#C8) and the ground terminal. Check for an open-circuit.

Remedy as necessary.

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 274: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 275: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on
- Shut all the doors. Activate the alarm. Wait 25 seconds until the car is alarmed
- Then deactivate the alarm
- Read off diagnostic trouble codes (DTCs).

Check if the status of the diagnostic trouble code (DTC) is intermittent.

Fig. 276: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the status intermittent?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-6C18: GLASS BREAK WIRE. SIGNAL TOO HIGH (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-6C18

Condition

When the alarm is activated, the central electronic module (CEM) checks the glass breakage loops in the rear side windows at regular intervals. The diagnostic trouble code (DTC) is stored if the control module registers a short-circuit to supply voltage in any of the glass breakage loops.

The diagnostic trouble code (DTC) can be diagnosed when the alarm is activated.

Substitute Value

- The alarm sounds.

Possible Source

- Short-circuit to supply voltage in one of the glass breakage loops in the rear side windows.

Fault symptom[s]

- False alarm.

SIGNAL TOO HIGH

CHECKING CABLE AND COMPONENT

- Disconnect connector C from the rear electronic module (REM).

  HINT: The signal loop runs from rear electronic module (REM) terminal #48 (#C8) to the glass breakage loop in the right-hand rear window, to the glass breakage loop in the left-hand rear window and then to the ground terminal.

  Check the glass breakage loop and the intermediate cable between rear electronic module (REM) terminal #48 (#C8) and the ground terminal. Check for a short-circuit to supply voltage.

  Remedy as necessary.

  Other information

  - see **CONNECTING THE BREAKOUT BOX**
  - see **SIGNAL SPECIFICATION**
  - For -2004, see: **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
  - For 2005-, see: **REAR ELECTRONIC MODULE (REM), REPLACING** .
  - see **CHECKING WIRING AND TERMINALS**

- **Continue**

Refer to **VERIFICATION**

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 278: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on
- Shut all the doors. Activate the alarm. Wait 25 seconds until the car is alarmed
- Then deactivate the alarm
- Read off diagnostic trouble codes (DTCs).

Check if the status of the diagnostic trouble code (DTC) is intermittent.

Fig. 279: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the status intermittent?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-6C19: SIREN COMMUNICATION FAULT (2012)

DTC-INFORMATION: REM-6C19

Condition

The Rear electronic module (REM) checks the function of the siren (BBS) via check messages.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Communication with siren (BBS) is lost.
- The siren responds with incorrect information.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Communication between the Rear electronic module (REM) and siren (BBS), for example during siren activation.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 280: Locating Siren (BBS)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Open-circuit in the signal cable to the siren (BBS).
- Fault on the connector in the Rear electronic module (REM), Central electronic module (CEM) or siren (BBS).
- Leaking battery acid in siren (BBS) causes interference in the LIN-net.
- Internal fault in the siren (BBS).

Fault symptom[s]

- False alarm
- The vehicle angle sensor does not activate, on the condition that the siren is equipped with vehicle angle sensor.

FAULT-TRACING

CHECKING THE WIRING

Fig. 281: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 282: Disconnecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect connector D on the rear electronic module (REM).
- Check the connectors for loose connections, damaged or bent terminal pins and oxidation.
- Check the signal line for open circuit, short-circuit to ground and short-circuit to voltage.

  Take readings between:

  - Rear electronic module (REM) #D26 (#26) and siren (BBS).

  Remedy as necessary.

  Other information

- see **CONNECTING THE BREAKOUT BOX**
- see **SIGNAL SPECIFICATION**
- see **CHECKING WIRING AND TERMINALS**
- see **ANTI-THEFT PROTECTION SIREN**

- **Continue**

  Refer to **COMMUNICATION TEST**

REPLACING THE CONTROL MODULE

Replace siren (BBS).

Other information

- see **ANTI-THEFT PROTECTION SIREN**
- see **CONNECTING THE BREAKOUT BOX**
- see **CHECKING WIRING AND TERMINALS**
- see **SIGNAL SPECIFICATION**

- **Continue**

  Refer to **VERIFICATION**

COMMUNICATION TEST

Fig. 283: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

Check whether the siren responds with incorrect information by:

- Erase diagnostic trouble codes
- Close all vehicle doors.
- Wait 5 seconds.
- Read off diagnostic trouble codes (DTCs).
- Check for any DTCs.

Are any DTCs stored?

- **YES**

  Refer to **REPLACING THE CONTROL MODULE**

- **NO**

  Refer to **VERIFICATION**

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 285: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Activate the alarm.

  Check that the functions are OK.

Are the functions OK?

- **YES**

VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-6C20: SIREN INTERNAL FAULT (2012)

DTC-INFORMATION: REM-6C20

Condition

The Rear electronic module (REM) checks the function of the siren (BBS) via check messages.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Siren (BBS) has registered an internal error.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Activation of the alarm function.

NOTE: **The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.**

Fig. 286: Locating Siren (BBS)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Internal fault in the siren (BBS).

Fault symptom[s]

- No audible signal when alarm is triggered

INTERNAL FAULT

REPLACING A COMPONENT

Siren (BBS) has registered an internal error.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent problem may be due to interference at start of the component or may be another type of problem that can return at different times. The fault is evaluated depending on how it occurs. If the fault recurs, replace the siren (BBS).

In the event of a permanent fault, replace the siren (BBS).

- **Continue**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

REM-6F51: TAILGATE HANDLE. SIGNAL TOO LOW (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-6F51

Condition

Fig. 287: Identifying Tailgate Switch
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) is grounded when a switch on the tailgate is pushed in.

The diagnostic trouble code (DTC) is stored if the rear electronic module (REM) registers that the switch on the tailgate has been activated for more than 20 seconds.

Substitute Value

- None.

Possible Source

- The switch for the tailgate has stuck in the activated position
- Short-circuit to ground in the cable for the tailgate switch.

Fault symptom[s]

- No locking/unlocking of the tailgate.

SIGNAL TOO LOW

CHECKING THE SIGNAL FROM THE TRUNK LID HANDLE

NOTE: Only applies to 4-door cars.

Fig. 288: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Read off the status from the trunk lid handle. Open and close the trunk lid using the handle.

The status should alternate as the handle is affected.

The fault is permanent if the status does not change.

If the status changes, this indicates an intermittent fault, i. e. the fault was present previously but is not active at the moment.

Fig. 289: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 290: Identifying Tailgate Switch
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING CABLE AND COMPONENT**

CHECKING CABLE AND COMPONENT

Disconnect the connector from the lamp housing for the license plate lighting. Check that the button has not stuck in the pressed in position. Check that there is not a short-circuit in the contact breaker for the switch by taking a reading between terminal #1 and ground.

Check the resistance between terminals #1 and #3 on the switch. The resistance must be infinite or near 0 ohm depending on the position of the switch.

Check the signal cable between terminal #43 (#F3) on the connector for the rear electronic module (REM) and terminal #1 on the connector for the lamp housing for the license plate lighting. Check for a short-circuit to ground.

Remedy as necessary.

Other information

- see **CONNECTING THE BREAKOUT BOX**
- see **SIGNAL SPECIFICATION**
- For -2004, see: **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- For 2005-, see: **REAR ELECTRONIC MODULE (REM), REPLACING** .

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-6F51: TAILGATE HANDLE. SIGNAL TOO LOW. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If rear electronic module registers signal too low from boot lid handle for more than 20 seconds, diagnostic trouble code is displayed.

Substitute Value

Nothing.

Possible Source

- Handle push button has stuck in an activated position.
- Signal wire short circuited to ground.

Fault symptom[s]

- Boot lid will not open/lock.

SIGNAL TOO LOW. INTERMITTENT FAULT

CHECKING THE WIRING

Disconnect the connector from the lamp housing for the license plate lighting.

Check that the button has not stuck in the pressed in position. Check that there is not a short-circuit in the contact breaker for the switch: Take a reading between terminal #1 and ground.

Check the signal cable between rear electronic module connector terminal #B07 (#D7) and lamp housing connector terminal #1 for the license plate lighting for an intermittent short-circuit to ground according to **SHORT-CIRCUIT TO GROUND, INTERMITTENT FAULTS** .

Other information

- For further information about signals and other values, see **SIGNAL SPECIFICATION** .
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX** .
- To access the rear electronic module, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .
- To access and replace the license plate lighting, see **BULB, NUMBER PLATE LIGHTING, REPLACING** .

Fig. 297: Identifying Ohm Meter

VERIFICATION

VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 300: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 301: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Install the components, connect the connectors, etc.

  Close the boot lid.

  Lock the car by remote control.

  Make sure that the boot lid is correctly locked and that opening works.

Is function OK?

- **YES**

VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-6F52: UNLOCKING RELAY, CENTRAL LOCKING TAILGATE. SIGNAL TOO HIGH (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If rear electronic module registers signal too high on relay coil ground circuit when unlocking, diagnostic trouble code is displayed.

Substitute Value

Nothing.

Possible Source

- Faulty relay (short circuit in relay coil).
- Defective control unit.

Fault symptom[s]

- The boot lid will not lock/open.

SIGNAL TOO HIGH

REPLACING THE COMPONENT

Replace the relay, 2/67 (2/87 5DRS).

Activate the relay.

If the function is OK, the cause of the fault was a defective relay (short-circuit in the relay).

Fig. 302: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 303: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Was the function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE WIRING**

CHECKING THE WIRING

- Remove the relay.

  Check the relay coil driver circuit for a short-circuit to supply voltage by measuring the voltage at terminal #2 in the relay base.

  HINT: The voltage between terminal #2 and ground should be approximately 0 V.

  Replace the control module if the voltmeter displays an incorrect value.

Other information

- see **CHECKING WIRING AND TERMINALS** .

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-6F54: UNLOCKING RELAY, CENTRAL LOCKING TAILGATE. SIGNAL MISSING (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If the rear electronic module registers no signal/signal too low on relay coil ground circuit diagnostic trouble code is displayed.

Substitute Value

Nothing.

Possible Source

- Oxidation of relay socket contacts.
- Relay is loose or missing.
- Faulty relay (open circuit/short circuit to ground in relay coil).
- Defective control unit.

Fault symptom[s]

- The boot lid will not lock/open.

SIGNAL MISSING

CHECKING THE COMPONENT

Remove the relay 2/67 (2/87 5DRS). Check the relay base switches. Check for contact resistance and oxidation.

Install the relay.

Activate the relay.

If the function is now OK the fault was caused by a contact fault in the relay base.

Fig. 309: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 310: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Was the function OK?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

Replace the relay, 2/67 (2/87 5DRS).

Activate the relay.

If the function is now OK, the cause of the fault was a defective relay (short-circuit to ground or an open-circuit in the relay coil).

Fig. 311: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 312: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Was the function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE CONTROL MODULE FOR OPEN-CIRCUITS**

CHECKING THE CONTROL MODULE FOR OPEN-CIRCUITS

- Remove the relay, 2/67 (2/87 5DRS).

Check the driver circuit for the relay coil for an open-circuit as follows: activate the relay driver. Measure the voltage between terminals #1 and #2 on the relay base.

HINT: The voltage between terminals #1 and #2 should be battery voltage.

HINT: If the value deviates excessively, check the voltage between terminal #2 and battery voltage and between terminal #1 and ground. Both should equal battery voltage.

HINT: Check for an open-circuit.

HINT: Do not forget to check that the power supply to the control module is OK.

Other information

- see **CHECKING WIRING AND TERMINALS** .

Fig. 313: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 314: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING THE CONTROL MODULE FOR SHORT-CIRCUITS**

CHECKING THE CONTROL MODULE FOR SHORT-CIRCUITS

Measure the resistance between terminal #2 and ground when the relay driver is active.

The resistance should be high when the relay driver is active.

Replace the control module if the resistance is low.

Was the function OK?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-6F73: UNLOCKING RELAY, CENTRAL LOCKING, FUEL TANK FILLER COVER. SIGNAL MISSING (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If the rear electronic module registers no signal/signal too low on relay coil ground circuit diagnostic trouble code is displayed.

Substitute Value

Nothing.

Possible Source

- Oxidation of relay socket contacts.
- Relay is loose or missing.
- Faulty relay (open circuit/short circuit to ground in relay coil).
- Defective control unit.

Fault symptom[s]

- Tank hatch will not open/lock.

SIGNAL MISSING

CHECKING THE COMPONENT

Remove the relay (2/59). Check the relay base switches. Check for contact resistance and oxidation.

Install the relay.

Activate the relay.

If the function is now OK the fault was caused by a contact fault in the relay base.

Other information:

- For -2004, see: **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- For 2005-, see: **REAR ELECTRONIC MODULE (REM), REPLACING** .
- see **CHECKING WIRING AND TERMINALS** .

Was the function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE WIRING**

CHECKING THE WIRING

- Remove relay RMI 21, 2/59.

Check the driver circuit for the relay coil for an open-circuit as follows: activate the relay driver. Measure the voltage between terminals #1 and #2 on the relay base.

HINT: The voltage between terminals #1 and #2 should be battery voltage.

HINT: If the value deviates excessively, check the voltage between terminal #2 and the battery voltage and between terminal #1 and ground. Both should equal battery voltage.

HINT: Check for an open-circuit.

HINT: Do not forget to check that the power supply to the control module is OK.

Other information:

- For -2004, see: **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- For 2005-, see: **REAR ELECTRONIC MODULE (REM), REPLACING** .
- see **CHECKING WIRING AND TERMINALS** .

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-6F74: UNLOCKING RELAY, CENTRAL LOCKING, FUEL TANK FILLER COVER. SIGNAL TOO HIGH. INTERMITTENT FAULT (2003)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If rear electronic module registers signal too high on relay coil ground circuit when unlocking, diagnostic trouble code is displayed.

Substitute Value

Nothing.

Possible Source

- Faulty relay (short circuit in relay coil).
- Defective control unit.

Fault symptom[s]

- Tank hatch will not open/lock.

SIGNAL TOO HIGH. INTERMITTENT FAULT

CHECKING THE WIRING

Check the relay coil driver circuit for an intermittent short-circuit to supply voltage: Measure the voltage between terminal #2 in the relay base and relay 2/58.

For further information about a short-circuit to supply voltage, see **SHORT-CIRCUIT TO SUPPLY VOLTAGE, INTERMITTENT FAULTS** .

HINT: The voltage between terminal #2 and ground should be approximately 0 V.

Fig. 346: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

Fig. 347: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

If the voltmeter displays an incorrect value replace the control module.

Other information:

- To access and replace the integrated relay / fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .

- **Continue**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-7A20: SUBWOOFER X-FEED, SIGNAL OR TEMPERATURE TOO HIGH (2006-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-7A20

Condition

The Rear electronic module (REM) checks the voltage supply to the Subwoofer module (SUB) via a driver stage.

The diagnostic trouble code (DTC) is stored if the control module detects that the output has a short-circuit to supply voltage or if the driver stage has a too high a temperature.

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I or II.

Fig. 368: Identifying Rear Electronic Module (REM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- The control module deactivates the output.
- If the fault has been detected in 100 ignition cycles, the output is closed permanently until the diagnostic trouble code is erased (applies from structure week 200539).

Possible Source

- Short-circuit to supply voltage in the signal cable.
- Internal fault in Rear electronic module (REM).

Fault symptom[s]

- Subwoofer sound reproduction. Doesn't correspond to set position.
- No sound from subwoofer

SIGNAL TOO HIGH OR TEMPERATURE TOO HIGH

CHECKING THE WIRING

Fig. 369: Identifying Ignition In Off Position
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Erase diagnostic trouble codes using the VCT2000 (or appropriate scan tool).

  NOTE: Note any other diagnostic trouble codes (DTCs) that are in the control module, before the diagnostic trouble codes (DTCs) are erased, in order to carry out other fault-traces.

  - Ignition off.

  Check the wiring for power supply between the Rear electronic module (REM) and the Subwoofer module (SUB). Check for a short-circuit to supply voltage. Any damage to the cable insulation can also cause intermittent or permanent short-circuits.

  Remedy as necessary.

  Other information

  - see **CHECKING WIRING AND TERMINALS**

Fig. 370: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

Refer to **INFORMATION**

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Courtesy of VOLVO CARS CORPORATION

- Switch off the ignition. Wait at least 15 seconds
- Reinstall the connectors, components etc.
- Read off the diagnostic trouble codes (DTCs) using the VCT2000 (or appropriate scan tool).

  Check that the diagnostic trouble code (DTC) for too high voltage is not stored again.

Fig. 373: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Does the diagnostic trouble code (DTC) recur?

- **YES**

  Refer to **INFORMATION**

- **NO**

  VERIFIED: Troubleshooting has been completed.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-8B01: PARKING LAMPS RIGHT. SIGNAL TOO LOW (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-8B01

Condition

The rear electronic module (REM) powers the right-hand parking lamp directly via an output.

The diagnostic trouble code (DTC) is stored if the rear electronic module (REM) registers that the signal at the output is too low.

The diagnostic trouble code (DTC) can be diagnosed at key position II.

Substitute Value

- If the fault has been detected in 100 ignition cycles, the output is closed permanently until the diagnostic trouble code is erased (applies from structure week 200539).

Possible Source

- Short-circuit to ground in the signal cable.

Fault symptom[s]

- The parking lamps do not operate.

SIGNAL TOO LOW

CHECKING THE WIRING

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-8C21: RELAY, REAR FOG LAMP. SIGNAL TOO HIGH. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If control unit registers signal too high from status flag when activating relay control, the diagnostic trouble code is displayed.

Substitute Value

Nothing.

Possible Source

- Relay control to relay 2/49 short circuited to battery voltage.

Fault symptom[s]

- Rear fog lamp does not work.

SIGNAL TOO HIGH. INTERMITTENT FAULT

CHECKING THE WIRING AND COMPONENT

Check that the rear fog lamp relay (position 2/49) is correctly installed.

Check the relay terminal (2/49). Check for an intermittent short-circuit to supply voltage according to **SHORT-CIRCUIT TO SUPPLY VOLTAGE. PERMANENT FAULTS** . Check for contact resistance and oxidation according to **CONTACT RESISTANCE AND OXIDATION** . Check for loose connections according to **LOOSE CONNECTIONS (TERMINALS)** .

Other information:

- For further information about signals and other values, see **SIGNAL SPECIFICATION** .
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX** .
- To access the control module, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .
- When the relay is installed and activated, the voltage at the relay guide (terminal #2) should be 0 V.

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.

It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

REM-8C21: RELAY, REAR FOG LAMP. SIGNAL TOO HIGH. PERMANENT

FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

see **DIAGNOSTIC TROUBLE CODE INFORMATION**

SIGNAL TOO HIGH. PERMANENT FAULT

REPLACING THE COMPONENT

Replace the Rear fog lamp relay (position 2/49). Check the relay terminal, in particular the relay guide (2/49 terminal #2), for a short-circuit to supply voltage according to **SHORT-CIRCUIT TO SUPPLY VOLTAGE. PERMANENT FAULTS** .

Remedy as necessary

Other information:

- For further information about signals and other values, see **SIGNAL SPECIFICATION** .
- To access and replace the relay, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .
- When the relay is installed and activated, the voltage at the relay guide (terminal #2) should be 0 V.

Do the rear fog lamps work?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-8C23: RELAY, REAR FOG LAMP. SIGNAL MISSING. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If control unit registers an open circuit from the status flag when relay control is not activated, the diagnostic trouble code is displayed.

Substitute Value

Nothing.

Possible Source

- Open circuit in relay control to relay 2/49. Relay 2/49 not installed.

Fault symptom[s]

- Rear fog lamp does not work.

SIGNAL MISSING. INTERMITTENT FAULT

CHECKING THE WIRING AND COMPONENT

Check that the rear fog lamp relay (position 2/49) is correctly installed.

Check the relay terminal (2/49). Check for contact resistance and oxidation according to **CONTACT RESISTANCE AND OXIDATION** . Check for loose connections according to **LOOSE CONNECTIONS (TERMINALS)** .

Other information:

- For further information about signals and other values, see **SIGNAL SPECIFICATION** .
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX** .
- To access the rear electronic module, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .
- When the relay is installed and activated, the voltage at the relay guide (terminal #2) should be 0 V.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-8D11: HIGH LEVEL STOP LAMP. SIGNAL TOO LOW (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-8D11

Condition

Fig. 410: Identifying High Level Stop Lamp
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) powers the high level stop lamps directly via an output.

The diagnostic trouble code (DTC) is stored if the rear electronic module (REM) registers that the signal at the output is too low.

The diagnostic trouble code (DTC) can be diagnosed at key position II.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the signal cable.

Fault symptom[s]

- The stop lamp does not light when the brake pedal is depressed.

SIGNAL TOO LOW

CHECKING THE WIRING

Fig. 411: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 412: Disconnecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect connectors A and F on the rear electronic module (REM).

  Check the signal cable. Check for a short-circuit to ground.

  Take readings between:

  - Rear electronic module (REM) terminal #F4 (#44) and terminal #1 on the connector for the high level stop lamp.

  Remedy as necessary.

  Other information

- see **CONNECTING THE BREAKOUT BOX**
- see **SIGNAL SPECIFICATION**
- see **CHECKING WIRING AND TERMINALS**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-8D11: STOP LAMP. FAULTY SIGNAL (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-8D11

Condition

Diagnostic trouble code (DTC) REM-8D11 is stored if the rear electrical module (REM) registers that the signal for the high mounted stop lamp is too high, too low or missing.

NOTE: The diagnostic trouble code (DTC) may be stored if the incorrect roof spoiler is installed. Do not replace the spoiler if the stop lamp is working.

Substitute Value

None.

Possible Source

- Short-circuit or open-circuit in the wiring for the high mounted stop lamp
- Defective stop lamp
- Incorrect roof spoiler installed.

Fault symptom[s]

- The stop lamp does not light when the brake pedal is depressed.

FAULTY SIGNAL

CHECKING COMPONENTS AND WIRING

NOTE: The diagnostic trouble code (DTC) may be stored if the incorrect roof spoiler is installed. Do not replace the roof spoiler if the stop lamp is working.

Check the rear electronic module (REM) and the high-mounted stop lamp connectors. Check for contact resistance and oxidation. Check for loose connections. Check for damage carefully.

HINT: When the stop lamp is activated, the voltage between #1 and #5 in the connector for the stop lamp must be battery voltage.

Check the power supply cable between rear electronic module (REM) terminal #4D (#B04) and brake light connector terminal #1. Check for an open-circuit. Check for a short-circuit to ground.

Check the ground lead between brake light connector terminal #5 and the ground terminal. Check for an open-circuit. Check for a short-circuit to supply voltage.

Try a new brake light if no faults were found.

Remedy as necessary.

Other information:

- To access / replace the high mounted stop lamp, see **HIGH LEVEL STOP LAMP, REPLACING**
- To access the rear electronic module (REM), see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- For information about signals, see **SIGNAL SPECIFICATION**
- see **CHECKING WIRING AND TERMINALS** .

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Check that the high mounted stop light comes on when the brake pedal is pressed.

Is the high-level stop lamp working?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-8D12: HIGH LEVEL STOP LAMP. SIGNAL TOO HIGH (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-8D12

Condition

Fig. 421: Identifying High Level Stop Lamp
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) powers the high level stop lamps directly via an output.

The diagnostic trouble code (DTC) is stored if the rear electronic module (REM) registers that the signal at the output is too high.

The diagnostic trouble code (DTC) can be diagnosed at key position II.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the signal cable
- High brake light not installed/damaged.

Fault symptom[s]

- The stop lamp lights constantly.
- Message in display

SIGNAL TOO HIGH

CHECKING THE WIRING

Fig. 422: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 423: Disconnecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect connectors A and F on the rear electronic module (REM).

  Check the signal cable. Check for an open-circuit. Check for a short-circuit to supply voltage.

  Take readings between:

  - Rear electronic module (REM) terminal #F4 (#44) and terminal #1 on the connector for the high level stop lamp.

  Remedy as necessary.

VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-8E11: RELAY, BACK-UP (REVERSING) LAMP. SIGNAL TOO HIGH. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

If control unit registers signal too high from status flag when activating relay control, the diagnostic trouble code is displayed.

Substitute Value

Nothing.

Possible Source

- Relay control to relay 2/80 short circuited to battery voltage.

Fault symptom[s]

- Reversing light not working.

SIGNAL TOO HIGH. INTERMITTENT FAULT

CHECKING THE WIRING AND COMPONENT

Check that the back-up (reversing) lamp relay (position 2/80) is correctly installed.

Check the relay terminal (2/80). Check for a short-circuit to supply voltage according to **SHORT-CIRCUIT TO SUPPLY VOLTAGE, INTERMITTENT FAULTS** . Check for loose connections according to **LOOSE CONNECTIONS (TERMINALS)** .

Other information:

- For further information about signals and other values, see **SIGNAL SPECIFICATION** .
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX** .
- To access the rear electronic module, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .
- When the relay is installed and activated, the voltage at the relay guide should be 0 V.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-8F10: POSITION SENSOR XENON LAMP. SIGNAL TOO HIGH (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The rear electronic module checks the signal from the Xenon lamp position sensor.

Diagnostic trouble code (DTC) REM-8F10 is stored in the rear electrical module if the rear electrical module registers too high a signal from the Xenon lamp position sensor.

Diagnostic trouble code (DTC) REM-8F10 can be detected at ignition on.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the signal cable
- The position sensor for the Xenon lamp is incorrectly installed.

Fault symptom[s]

- The road surface is not illuminated.

SIGNAL TOO HIGH

CHECKING COMPONENTS AND WIRING

Check that the position sensor for the xenon lamp is correctly installed.

Check the cable between rear electronic module (REM) terminal #B8 (terminal #A28) and position sensor terminal #4. Check for a short-circuit to supply voltage.

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For information about signals, see **SIGNAL SPECIFICATION**
- To access or replace the position sensor for the Xenon lamp, see **POSITION SENSOR BI-XENON LAMPS, REPLACING**

REM-8F10: POSITION SENSOR XENON LAMP. SIGNAL TOO HIGH (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION REM-8F10

Condition

Fig. 447: Identifying Position Sensor For Headlamp
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) checks the signal from the rear position sensor.

The diagnostic trouble code (DTC) is stored if the rear electronic module (REM) registers a faulty signal from the position sensor.

The diagnostic trouble code (DTC) can be diagnosed at key position II.

Substitute Value

- The shortest headlamp range will be used.

Possible Source

- Short-circuit to supply voltage in the signal cable
- Defective position sensor.

Fault symptom[s]

- Automatic headlamp range control is not functioning.

SIGNAL TOO HIGH

CHECKING THE WIRING

Fig. 448: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 449: Disconnecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector on the rear electronic module (REM).

  Check that the position sensor for the Xenon lamp is correctly installed.

  Check the signal cable. Check for a short-circuit to supply voltage.

  Take readings between:

  - Rear electronic module (REM) terminal #C6 (#46) and terminal #4 on the position sensor for the Xenon lamp.

  Check the power supply and the ground connection for the position sensor.

Remedy as necessary.

- Disconnect the connector on the rear electronic module (REM).

  Check that the position sensor for the Xenon lamp is correctly installed.

  Check the signal cable. Check for an open-circuit. Check for a short-circuit to ground.

  Take readings between:

  - Rear electronic module (REM) terminal #C6 (#46) and terminal #4 on the position sensor for the Xenon lamp.

  Check the power supply and the ground connection for the position sensor.

Remedy as necessary.

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REM-8F12: XENON LAMP POSITION SENSOR. FAULTY SIGNAL (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The rear electrical module checks if the position sensor for the xenon lamp is calibrated.

Diagnostic trouble code (DTC)REM-8F12 is stored in the rear electrical module if the rear electrical module registers that the Xenon lamp position sensor is not calibrated.

Diagnostic trouble code (DTC) REM-8F12 can be detected at ignition on.

Substitute Value

- None.

Possible Source

- Calibration sequence not carried out.

Fault symptom[s]

- The road surface is not illuminated.

FAULTY SIGNAL

CALIBRATING THE COMPONENT

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ELECTRICAL

Cables And Fuses - Diagnostic Trouble Codes And Associated Procedures

UEM-0081: RAIN SENSOR. SIGNAL TOO LOW (2003-2012)

DIAGNOSTIC TROUBLE CODE INFORMATION UEM-0081

Condition

Fig. 1: Locating Rain Sensor Module
Courtesy of VOLVO CARS CORPORATION

The upper electronic module (UEM) regularly compares a communication test with the rain sensor.

The diagnostic trouble code (DTC) is generated if the upper electronic module (UEM) registers that the signal cable of the rain sensor is short-circuited to ground.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Intermittent windshield wiping.
- High speed windshield wiping.

Possible Source

- The rain sensor's signal cable is short-circuited to ground.
- Faulty rain sensor.

Fault symptom[s]

- No rain sensor function.

SIGNAL TOO LOW

CHECKING THE RAIN SENSOR

CHECKING THE FUNCTION

Fig. 2: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Activate the rain sensor.

  HINT: The wiper blades make a reference stroke to determine the cleanliness and condition of the windshield when the rain sensor is activated. The rain sensor is deactivated when the ignition is switched off. To reactivate the rain sensor with the ignition on, move the stalk to position "0" and then to intermittent wiping.

Spray water on the windshield where the rain sensor is positioned.

The wiper blades must now wipe the windshield clean.

HINT: In cars equipped with the rain sensor it replaces the intermittent function. One way of checking the function of the rain sensor is to twist the collar on the lever. This changes the sensitivity of the rain sensor. The windshield wiper should make one stroke. If the intermittent or high speed functions are activated it indicates that the rain sensor function is missing.

- **Continue**

  Refer to **CHECKING THE WIRING**

CHECKING THE WIRING

Fig. 3: Identifying Ignition OFF

Courtesy of VOLVO CARS CORPORATION

- **HINT: The wiring between the upper electronic module (UEM) and the rain sensor consists of two cables.**
- Windshield wiper stalk in position "0".

  Check the cable between upper electronic module (UEM) terminal #13 (#A13) and rain sensor terminal #1. Check for a short-circuit to ground.

  HINT: The upper electronic module (UEM) terminal #20 (#A20) is signal ground.

  Remedy as necessary.

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on
- Activate the rain sensor.

  HINT: The wiper blades make a reference stroke to determine the cleanliness and condition of the windshield when the rain sensor is activated. The rain sensor is deactivated when the ignition is switched off. To reactivate the rain sensor with the ignition on, move the lever to position 0 and then to intermittent wiping.

  Spray water on the windshield where the rain sensor is positioned.

The wiper blades must now wipe the windshield clean.

Is the rain sensor functioning?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-0082: RAIN SENSOR. SIGNAL TOO HIGH (2003-12)

DIAGNOSTIC TROUBLE CODE INFORMATION UEM-0082

Condition

Fig. 9: Locating Rain Sensor Module
Courtesy of VOLVO CARS CORPORATION

The upper electronic module (UEM) regularly compares a communication test with the rain sensor.

The diagnostic trouble code (DTC) is generated if the upper electronic module (UEM) registers that the signal cable of the rain sensor is short-circuited to supply voltage. The diagnostic trouble code (DTC) is not generated if UEM-0081 is stored.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Intermittent windshield wiping.
- High speed windshield wiping.

Possible Source

- Short-circuit to supply voltage in the signal cable for the rain sensor
- Faulty rain sensor.

Fault symptom[s]

- No rain sensor function.

SIGNAL TOO HIGH

CHECKING THE RAIN SENSOR

CHECKING THE FUNCTION

Fig. 10: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Activate the rain sensor.

  HINT: The wiper blades make a reference stroke to determine the cleanliness and condition of the windshield when the rain sensor is activated. The rain sensor is deactivated when the ignition is switched off. To reactivate the rain sensor with the ignition on, move the stalk to position "0" and then to intermittent wiping.

  Spray water on the windshield where the rain sensor is positioned.

  The wiper blades must now wipe the windshield clean.

  HINT: In cars equipped with the rain sensor it replaces the intermittent function. One way of

checking the function of the rain sensor is to twist the collar on the lever. This changes the sensitivity of the rain sensor. The windshield wiper should make one stroke. If the intermittent or high speed functions are activated it indicates that the rain sensor function is missing.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-0083: RAIN SENSOR. INTERNAL FAULT (2003-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION UEM-0083

Condition

Fig. 17: Locating Rain Sensor Module
Courtesy of VOLVO CARS CORPORATION

The rain sensor checks itself at start.

The rain sensor checks factors such as reflections on the windshield.

The diagnostic trouble code (DTC) is stored if the rain sensor registers incorrect function.

The diagnostic trouble code (DTC) can be diagnosed with the ignition on and with an outside temperature above + 5°C (41°F).

NOTE: **On early model years, this diagnostic trouble code (DTC) may be stored if for example there was frost on the window when the check was run. In this case, it does not help to replace any components. Fault-trace the function of the rain sensor before replacing any components.**

Substitute Value

- Intermittent windshield wipers
- The windshield wipers operate at high speed.

Possible Source

- Frost on the windshield during the check
- Crack in the windshield by the rain sensor
- Stone chip on the windshield close to the rain sensor
- The rain sensor is not properly secured to the windshield
- Defective rain sensor.

Fault symptom[s]

- No rain sensor function.

INTERNAL FAULT

CHECKING THE RAIN SENSOR

CHECKING THE FUNCTION

Fig. 18: Identifying Ignition ON

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-0090: PAD LAMP. SIGNAL TOO LOW (2005-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION UEM-0090

Condition

Fig. 31: Identifying Rear View Mirror
Courtesy of VOLVO CARS CORPORATION

The upper electronic module (UEM) checks the power supply to the LED for the PAD lamp (Passenger Airbag Deactivated). The LED is integrated in the rear view mirror.

The diagnostic trouble code (DTC) is stored if the upper electronic module (UEM) registers that the power supply signal to the PAD lamp is too low.

The diagnostic trouble code (DTC) can be diagnosed when the LEDs in the rear view mirror are supplied with power, i. e. when the LEDs in the display satisfy conditions for lighting.

Substitute Value

- None.

Possible Source

- Defective upper electronic module (UEM) (internal fault).

Fault symptom[s]

- The SRS indicator lamp is lit.
- Message in the display.

SIGNAL TOO LOW

CHECKING THE PAD-LIGHT

Fig. 32: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
  - Read off using the VCT2000 (or appropriate scan tool).
  - Turn the ignition key to position I.
  - Check that the requested status from the Supplemental restraint system module (SRS) is ON and that the status of the PAD lamp in the Upper electronic module (UEM) is ON when the lamp is lit. Also check if the Passenger airbag warning lamp (PAD) comes on after the ignition is switched on.

  If the requested status from the Supplemental restraint system module (SRS) is ON, the Upper electronic module (UEM) has activated the lamp (status is ON) but the lamp does not come on, the lamp is probably broken. Replace the upper electronic module (UEM). Check that new hardware has the correct P/N.

  If the requested status from the Supplemental restraint system module (SRS) is ON, but the Upper electronic module (UEM) has not activated the lamp (status is OFF), check DTCs for errors in CAN communication in the Central electronic module (CEM). Also check the CAN cables between the Upper electronic module (UEM) and the Supplemental restraint system module (SRS). Remedy as necessary.

  Other information

- see **CHECKING WIRING AND TERMINALS**

Fig. 33: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

Fig. 34: Identifying Rear View Mirror
Courtesy of VOLVO CARS CORPORATION

Is the function OK?

- **YES**

  FAULT NOT FOUND: Troubleshooting has been completed.

- **NO**

  Refer to **REPLACING CONTROL MODULE AND PROGRAMMING**

REPLACING CONTROL MODULE AND PROGRAMMING

Fig. 35: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  The LED for the PAD lamp is mounted internally in the rear view mirror and cannot be replaced. Check there are no indications that the power supply to the upper electronic module (UEM) is faulty. Check that the fault in the LED remains after the power is switched off and on again. If the fault remains, the upper electronic module (UEM) must be replaced.

  NOTE: **If possible, read off the programmed data from the control module before it is replaced. This should be done as this information is not stored in Volvo's central database. Switch off the ignition before replacing the control module.**

- **Continue**

Refer to **REPLACING THE CONTROL MODULE**

REPLACING THE CONTROL MODULE

READING OFF THE PROGRAMMED VALUES

NOTE: Read off the programmed values from the upper electronic module (UEM) before replacing the control module.

Fig. 36: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Use the VCT2000 (or appropriate scan tool) to read off the programmed values.

The retained values are programmed customer parameters in the upper electronic module (UEM). The

retained values should be noted for later use.

Other information

- For information about programming the customer parameters, see **DIAGNOSTIC FUNCTIONS** .

Fig. 37: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **REPLACING CONTROL MODULES AND DOWNLOADING SOFTWARE**

REPLACING CONTROL MODULES AND DOWNLOADING SOFTWARE

CAUTION: A new control module is delivered without software. In order for the control module to function new software must be programmed into the control module after it has been replaced.

Replace the control module and download the new software. See **UPPER ELECTRONIC MODULE (UEM)/REARVIEW MIRROR, REPLACING** .

HINT: When diagnostic trouble code (DTC) E001 is stored, communication with the control module cannot be established. This can be remedied in two ways.

1. Press the remote control button for local lighting
2. Remove fuse 11C/28 from the fusebox in the passenger compartment. Reinstall the fuse again.

Fig. 38: Fuse Holder (Passenger Compartment)
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING THE INTERIOR LIGHTING (2)**

CHECKING THE INTERIOR LIGHTING

Two times can be programmed for the interior lighting:

1. **Short**

   The period from when the door is unlocked, or the engine stops, to when the interior lighting goes out can be changed if it is too long or too short.

2. **Long**

   The period from when the door is opened, or a lamp is lit with a switch, to when the lamp goes out can be changed if it is too long or too short.

To program a long interior lighting period, use VIDA (Volvo scan tool).

- **Continue**

  Refer to **PROGRAMMING A SHORT INTERIOR LIGHTING PERIOD**

PROGRAMMING A SHORT INTERIOR LIGHTING PERIOD

The general lighting and rear reading lamps light and remain lit for 30 seconds when:

- The door has been unlocked from outside with a key or the remote control.
- The engine has been stopped and the ignition key turned to 0.

The default period is 30 seconds. This can be changed to between 5 and 255 seconds.

Read off the programmed values.

To change the time, mark the desired value in the scrolling list and start programming.

Fig. 39: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Do you want to program any more parameters?

- **YES**

  Refer to **PROGRAMMING A LONG INTERIOR LIGHTING PERIOD**

- **NO**

  Refer to **CHECKING THE ANTI-DAZZLE FUNCTION IN THE REAR VIEW MIRROR**

PROGRAMMING A LONG INTERIOR LIGHTING PERIOD

The general lighting and rear reading lamps light and remain lit for 10 minutes when:

- A door is opened after being unlocked.
- The lamp is lit with a switch.

The default period is 10 minutes. This can be changed to between 0 and 255 minutes at 10 minute intervals.

Read off the programmed values.

To change the time, mark the desired value in the scrolling list and start programming.

Fig. 40: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING THE ANTI-DAZZLE FUNCTION IN THE REAR VIEW MIRROR**

CHECKING THE ANTI-DAZZLE FUNCTION IN THE REAR VIEW MIRROR

CHECKING THE ANTI-DAZZLE FUNCTION

NOTE: If the upper electronic module (UEM) has been replaced software, specially developed for downloading after replacing the control module, must be downloaded to the control module before the anti-dazzle function is changed. See UPPER ELECTRONIC MODULE (UEM)/REARVIEW MIRROR, REPLACING .

The rear view mirror anti-dazzle function can be adjusted:

- If the rear view mirror anti-dazzle function is too powerful or too weak, it can be adjusted.

Specific software for setting the anti-dazzle function must be installed in the car to do this.

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 41: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 42: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Check that the LEDs in the display in the rear view mirror light.

Are the LEDs in the display working?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-0090: REAR VIEW MIRROR, DISPLAY. SIGNAL TOO LOW (2003-04)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION UEM-0090

Condition

The upper electronic module (UEM) checks the power supply to the LEDs in the display in the rear view mirror. The five LEDs are supplied with power via the same cable and are internally mounted in the rear view mirror.

Diagnostic trouble code (DTC) UEM-0090 is stored in the control module if the upper electronic module (UEM) registers too low a signal for the power supply to the LEDs in the display in the rear view mirror.

Diagnostic trouble code (DTC) UEM-0090 can be diagnosed when the LEDs in the rear view mirror are supplied with power, i. e. when the LEDs in the display satisfy conditions for lighting.

Substitute Value

- None.

Possible Source

- The power supply cable to LEDs in the display in the rear view mirror is short-circuited to ground.

Fault symptom[s]

- The SRS indicator lamp is lit.

SIGNAL TOO LOW

REPLACING THE CONTROL MODULE AND PROGRAMMING

Fig. 43: Identifying Ignition OFF

Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING THE INTERIOR LIGHTING**

CHECKING THE INTERIOR LIGHTING

Two times can be programmed for the interior lighting:

1. **Short**

   The period from when the door is unlocked, or the engine stops, to when the interior lighting goes out can be changed if it is too long or too short.

2. **Long**

   The period from when the door is opened, or a lamp is lit with a switch, to when the lamp goes out can be changed if it is too long or too short.

To program a long interior lighting period, use VIDA (Volvo scan tool).

- **Continue**

  Refer to **PROGRAMMING A SHORT INTERIOR LIGHTING PERIOD**

PROGRAMMING A SHORT INTERIOR LIGHTING PERIOD

The general lighting and rear reading lamps light and remain lit for 30 seconds when:

- The door has been unlocked from outside with a key or the remote control.
- The engine has been stopped and the ignition key turned to 0.

The default period is 30 seconds. This can be changed to between 5 and 255 seconds.

Read off the programmed values.

To change the time, mark the desired value in the scrolling list and start programming.

Fig. 47: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Do you want to program any more parameters?

- **YES**

  Refer to **PROGRAMMING A LONG INTERIOR LIGHTING PERIOD**

- **NO**

  Refer to **CHECKING THE ANTI-DAZZLE FUNCTION IN THE REAR VIEW MIRROR**

PROGRAMMING A LONG INTERIOR LIGHTING PERIOD

The general lighting and rear reading lamps light and remain lit for 10 minutes when:

- A door is opened after being unlocked.
- The lamp is lit with a switch.

The default period is 10 minutes. This can be changed to between 0 and 255 minutes at 10 minute intervals.

Read off the programmed values.

To change the time, mark the desired value in the scrolling list and start programming.

Fig. 48: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

  Check that the LEDs in the display in the rear view mirror light.

Are the LEDs in the display working?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-0091: PAD LAMP. SIGNAL TOO HIGH (2005-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION UEM-0091

Condition

Fig. 51: Identifying Rear View Mirror
Courtesy of VOLVO CARS CORPORATION

The upper electronic module (UEM) checks the power supply to the LED for the PAD lamp (Passenger Airbag Deactivated) in the rear view mirror. The LED is integrated in the rear view mirror.

The diagnostic trouble code (DTC) is stored if the upper electronic module (UEM) registers that the power supply signal to the PAD lamp is too high.

The diagnostic trouble code (DTC) can be diagnosed when the LEDs in the rear view mirror are not supplied with power, i. e. when the LEDs in the display do not satisfy conditions for lighting.

Substitute Value

- None.

Possible Source

- Defective upper electronic module (UEM) (internal fault).

Fault symptom[s]

- The SRS indicator lamp is lit.
- Message in the display.

SIGNAL TOO HIGH

CHECKING THE FUNCTION

Fig. 52: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  The light-emitting diode for indicating disconnected passenger airbag is located internally in the interior rearview mirror and cannot be replaced. Check that the fault in the LED remains after the power is switched off and on again.

  - Read off using the VCT2000 (or appropriate scan tool).
  - Turn the ignition key to position I.
  - Check that the requested status from the Supplemental restraint system module (SRS) is ON and that the status of the PAD lamp in the Upper electronic module (UEM) is ON when the lamp is lit. Check visually in the vehicle that the status of the PAD-light matches the read-out value.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-0091: REAR VIEW MIRROR, DISPLAY. SIGNAL TOO HIGH (2003-04)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION UEM-0091

Condition

The upper electronic module (UEM) checks the power supply to the LEDs in the display in the rear view mirror. The five LEDs are supplied with power via the same cable and are internally mounted in the rear view mirror.

Diagnostic trouble code (DTC) UEM-0091 is stored in the control module if the upper electronic module (UEM) registers too high a signal for the power supply to the LEDs in the display in the rear view mirror.

Diagnostic trouble code (DTC) UEM-0091 can be diagnosed when the LEDs in the rear view mirror are not supplied with power, i. e. when the LEDs in the display do not satisfy conditions for lighting.

Substitute Value

- None.

Possible Source

- The power supply cable to LEDs in the display in the rear view mirror is short-circuited to supply voltage.

Fault symptom[s]

- The SRS indicator lamp is lit.

SIGNAL TOO HIGH

REPLACING THE CONTROL MODULE AND PROGRAMMING

UEM-0092: REAR VIEW MIRROR, DISPLAY. FAULTY HARDWARE (2003-04)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION UEM-0092

Condition

The display in the rear view mirror can indicate signals for two different functions, seat belt reminder or AOS. The different functions require different hardware. The upper electronic module (UEM) checks the hardware identity number on the installed rear view mirror and compares this with the software installed in the control module.

Diagnostic trouble code (DTC) UEM-0092 is stored in the control module if the upper electronic module (UEM) registers an identity number which is not compatible with the installed function.

Diagnostic trouble code (DTC) UEM-0092 can be diagnosed in ignition position II.

Substitute Value

- None.

Possible Source

- Read off identity number not compatible with installed function.

Fault symptom[s]

- The SRS indicator lamp is lit.

FAULTY HARDWARE

REPLACING THE CONTROL MODULE AND PROGRAMMING

Fig. 72: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Identity number for hardware does not correspond to the installed software. Replace the upper electronic module (UEM), check that new hardware has the correct P/N.

  NOTE: **If possible, read off the programmed data from the control module before it is replaced. This should be done as this information is not stored in Volvo's central database. Switch off the ignition before replacing the control module.**

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-0093: SEAT BELT REMINDER. FAULTY SIGNAL (2005-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION UEM-0093

Condition

Fig. 80: Identifying Rear View Mirror
Courtesy of VOLVO CARS CORPORATION

The upper electronic module (UEM) receives information via the controller area network (CAN) indicating whether the seat belt reminder lamp should be on or off. The diagnostic trouble code (DTC) is stored if the upper electronic module (UEM) is notified that there is a short-circuit to ground or open-circuit in the power supply for the seat belt reminder lamp when it should be lit.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- None.

Possible Source

- Defective upper electronic module (UEM) (internal fault).

Fault symptom[s]

- The seat belt lamp does not light.

FAULTY SIGNAL

REPLACING CONTROL MODULE AND PROGRAMMING

Fig. 81: Identifying Ignition OFF

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Check that the LEDs in the display in the rear view mirror light.

Are the LEDs in the display working?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-0094: SEAT BELT REMINDER. SIGNAL TOO HIGH (2005-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION UEM-0094

Condition

Fig. 89: Identifying Rear View Mirror
Courtesy of VOLVO CARS CORPORATION

The upper electronic module (UEM) receives information via the controller area network (CAN) indicating whether the seat belt reminder lamp should be on or off. The diagnostic trouble code (DTC) is stored if the upper electronic module (UEM) receives an indication that the seat belt reminder lamp should not be lit but the lamp is lit anyway.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- None.

Possible Source

- Defective upper electronic module (UEM) (internal fault).

Fault symptom[s]

- The seat belt reminder lamp is constantly on.
- The seat belt reminder lamp shines weakly

SIGNAL TOO HIGH

REPLACING CONTROL MODULE AND PROGRAMMING

Fig. 90: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  The LED for the seat belt reminder is mounted internally in the rear view mirror and cannot be replaced. Check there are no indications that the power supply to the upper electronic module (UEM) is faulty.

Check that the fault in the LED remains after the power is switched off and on again. If the fault remains, the upper electronic module (UEM) must be replaced.

NOTE: **If possible, read off the programmed data from the control module before it is replaced. This should be done as this information is not stored in Volvo's central database. Switch off the ignition before replacing the control module.**

- **Continue**

Refer to **REPLACING THE CONTROL MODULE**

REPLACING THE CONTROL MODULE

READING OFF THE PROGRAMMED VALUES

NOTE: **Read off the programmed values from the upper electronic module (UEM) before replacing the control module.**

Fig. 91: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Use the VCT2000 (or appropriate scan tool) to read off the programmed values.

  The retained values are programmed customer parameters in the upper electronic module (UEM). The retained values should be noted for later use.

  Other information

  - For information about programming the customer parameters, see **DIAGNOSTIC FUNCTIONS** .

Fig. 92: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **REPLACING CONTROL MODULES AND DOWNLOADING SOFTWARE**

REPLACING CONTROL MODULES AND DOWNLOADING SOFTWARE

CAUTION: A new control module is delivered without software. In order for the control module to function new software must be programmed into the control module after it has been replaced.

Replace the control module and download the new software. See **UPPER ELECTRONIC MODULE (UEM)/REARVIEW MIRROR, REPLACING** .

HINT: When diagnostic trouble code (DTC) E001 is stored, communication with the control module cannot be established. This can be remedied in two ways.

1. Press the remote control button for local lighting
2. Remove fuse 11C/28 from the fusebox in the passenger compartment. Reinstall the fuse again.

Fig. 93: Fuse Holder (Passenger Compartment)
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING THE INTERIOR LIGHTING**

CHECKING THE INTERIOR LIGHTING

Two times can be programmed for the interior lighting:

1. **Short**

   The period from when the door is unlocked, or the engine stops, to when the interior lighting goes out can be changed if it is too long or too short.

2. **Long**

   The period from when the door is opened, or a lamp is lit with a switch, to when the lamp goes out can be changed if it is too long or too short.

To program a long interior lighting period, use VIDA (Volvo scan tool).

- **Continue**

Refer to **PROGRAMMING A SHORT INTERIOR LIGHTING PERIOD**

PROGRAMMING A SHORT INTERIOR LIGHTING PERIOD

The general lighting and rear reading lamps light and remain lit for 30 seconds when:

- The door has been unlocked from outside with a key or the remote control.
- The engine has been stopped and the ignition key turned to 0.

The default period is 30 seconds. This can be changed to between 5 and 255 seconds.

Read off the programmed values.

To change the time, mark the desired value in the scrolling list and start programming.

Fig. 94: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Do you want to program any more parameters?

- **YES**

  Refer to **PROGRAMMING A LONG INTERIOR LIGHTING PERIOD**

- **NO**

  Refer to **CHECKING THE ANTI-DAZZLE FUNCTION IN THE REAR VIEW MIRROR**

PROGRAMMING A LONG INTERIOR LIGHTING PERIOD

The general lighting and rear reading lamps light and remain lit for 10 minutes when:

- A door is opened after being unlocked.
- The lamp is lit with a switch.

The default period is 10 minutes. This can be changed to between 0 and 255 minutes at 10 minute intervals.

Read off the programmed values.

To change the time, mark the desired value in the scrolling list and start programming.

Fig. 95: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING THE ANTI-DAZZLE FUNCTION IN THE REAR VIEW MIRROR**

CHECKING THE ANTI-DAZZLE FUNCTION IN THE REAR VIEW MIRROR

CHECKING THE ANTI-DAZZLE FUNCTION

NOTE: **If the upper electronic module (UEM) has been replaced software, specially developed for downloading after replacing the control module, must be downloaded to the control module before the anti-dazzle function is changed. See UPPER ELECTRONIC MODULE (UEM)/REARVIEW MIRROR, REPLACING .**

The rear view mirror anti-dazzle function can be adjusted:

- If the rear view mirror anti-dazzle function is too powerful or too weak, it can be adjusted.

Specific software for setting the anti-dazzle function must be installed in the car to do this.

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 96: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 97: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Check that the LEDs in the display in the rear view mirror light.

Are the LEDs in the display working?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

UEM-00A0: TIRE PRESSURE SENSOR. SIGNAL MISSING (2003-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION UEM-00A0

Condition

Fig. 98: Identifying Special Tool
Courtesy of VOLVO CARS CORPORATION

The upper electronic module (UEM) receives information transmitted by the tire pressure sensors in the wheels, irrespective of the car. The sensors which are registered in the vehicle can be checked by running a statistical selection. A list can then be stored internally in the upper electronic module (UEM).

The diagnostic trouble code (DTC) is stored if the upper electronic module (UEM) registers that the signal from the first of the four accepted sensors disappears whilst the vehicle is being driven.

The diagnostic trouble code (DTC) can be diagnosed after 10 minutes when the tire pressure warning system is active (vehicle speed is above 40 km/h (25 mph)).

Substitute Value

- None.

Possible Source

- Defective tire pressure sensor
- The receiver is not functioning.

Fault symptom[s]

- Message in the display.
- Warning lights and chimes/Tire pressure monitoring indication/no indication

SIGNAL MISSING

CHECKING THE REMOTE RECEIVER

The remote receiver is located in the inner rear view mirror, and receives signals from both the remote control and the tire pressure sensors. The function of the remote receiver can be checked using the remote control.

Check that the remote receiver works by pressing the lock and unlock button on the remote control. The vehicle should be locked and unlocked.

NOTE: Fault-trace the symptoms first, if the remote control and receiver are not working.

Fig. 99: Identifying Ignition Key
Courtesy of VOLVO CARS CORPORATION

Fig. 100: Identifying Rear View Mirror
Courtesy of VOLVO CARS CORPORATION

Does the remote control and remote receiver work?

- **YES**

  Refer to **CHECKING TIRE PRESSURE SENSORS**

- **NO**

  OKAY: Troubleshooting has been completed.

CHECKING TIRE PRESSURE SENSORS

Fig. 101: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Each tire pressure sensor has its own ID number and battery voltage status, which are sent to and stored in the Upper electronic module (UEM). Read out the ID numbers for the tire pressure sensors using the VCT2000 (or appropriate scan tool).

  Use the following special tools to activate the sensor.

  - see **9512987**

  The TPMS special tool activates the sensor, which then starts to send information to the Upper Electronic Module (UEM). After activating a sensor, press the "Show data" button for the relevant wheel. Repeat activation for all wheels. Different ID numbers should appear. If the same ID number is displayed as for

the previous wheel, activation has failed. Then activate the relevant wheel again and press the "Show data" button again.

NOTE: Do not forget to press the correct button after each wheel has been activated.

NOTE: Make sure no special tools lie under the edge of the rim against the tire where the sensor is installed. Activation will not happen if the tool is placed next to the rim. The tool must then be kept in position for 5 seconds for the signals to be received correctly. Use only one special tool at a time in the vicinity of the vehicle.

NOTE: Avoid positioning the vehicle close to other moving vehicles, the receiver may then receive signals from the sensors of these vehicles. The incorrect ID number may then appear.

Then read off the ID number that is stored for the relevant diagnostic trouble code, by clicking on the diagnostic trouble code in the list. The ID number is then displayed in the window above the list.

Compare the read-out ID number for the relevant wheel with the ID number that is stored with the DTC.

If a sensor does not respond during the test:

- Replace the tire pressure sensor for the relevant wheel. It is probably the sensor that caused the DTC to be stored.

If all sensors respond:

- The sensor that caused the diagnostic trouble code to be stored has probably had an intermittent malfunction. Replace the tire pressure sensor for the relevant wheel.

Other information

- see **TIRE PRESSURE SENSOR, REPLACEMENT**

Fig. 102: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

SENSOR MISSING

CHECKING THE RECEIVER

The receiver is in the rear view mirror. It receives signals from both the remote control and tire pressure sensors. The remote control can be used to check that the receiver is working.

Check the function of the receiver by pressing the locking and unlocking button on the remote control. The vehicle must lock and unlock.

NOTE: Fault-trace the symptoms if the remote control and receiver are not working.

Fig. 125: Identifying Ignition Key
Courtesy of VOLVO CARS CORPORATION

Fig. 126: Identifying Rear View Mirror
Courtesy of VOLVO CARS CORPORATION

Are the remote control and receiver working?

- **YES**

  Refer to **CHECKING THE TIRE PRESSURE SENSORS**

- **NO**

  OKAY: Troubleshooting has been completed.

CHECKING THE TIRE PRESSURE SENSORS

Fig. 127: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Each tire pressure sensor has its own ID number which is transmitted to and stored in the upper electronic module (UEM). Read off the last stored ID number using the VCT2000 (or appropriate scan tool). The last stored ID number is displayed until a new ID number is received and stored.

  NOTE: The last stored value is erased when the ignition is switched off and on again.

  Activate one of the sensors by using the special tool: see **9512987** The special tool activates the sensor which then starts to send information to the Upper electronic module (UEM) and the sensor's id-number

can then be read in the character window.

NOTE: **Ensure that the special tool is positioned under the edge of the rim against the tire where the sensor is installed. The sensor will not be activated if the tool is against the rim. The sensor must then be held in place for approximately 5 seconds for the signals to be correctly received. Use only one special tool at a time in the vicinity of the car.**

NOTE: **Carry out the above in an area away from where other cars are being driven. The receiver can pick up signals from sensors on other cars. An incorrect ID number would then be displayed.**

Repeat this procedure for each wheel. Different ID numbers must be displayed.

If a sensor does not respond during the test:

Check that a tire pressure sensor is installed on the rim. Install a new sensor if there is no sensor installed. If the sensor is installed but is still not working, it may be defective or be a sensor intended for another make or model. Replace the tire pressure sensor.

If all sensors respond:

Intermittent fault. The control module has previously detected that one or more sensors are not communicating. This may be because the vehicle previously had a wheel mounted without a functioning sensor.

  Refer to **INFORMATION**

UEM-00A9: CONTROL MODULE. CONFIGURATION FAULT (2003-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION UEM-00A9

Condition

Fig. 134: Identifying Rear View Mirror
Courtesy of VOLVO CARS CORPORATION

The upper electronic module (UEM) has a configuration file which controls certain internal settings. The upper

electronic module (UEM) checks that the configuration file is correct.

The diagnostic trouble code (DTC) is stored if the upper electronic module (UEM) registers that the configuration file is incorrect or missing.

The diagnostic trouble code (DTC) can be detected when the control module is initialized after being reset or when diagnostic trouble codes (DTCs) are erased.

Substitute Value

- Factory settings are used.

Possible Source

- Incorrect or missing configuration file.

Fault symptom[s]

- None.

CONFIGURATION FAULT

REPLACING SOFTWARE

NOTE: If possible, read off the programmed data before replacing software.

Fig. 135: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  The upper electronic module (UEM) has registered a fault in the configuration file.

  The fault may be due to a program fault. The software must be replaced.

- **Continue**

  Refer to **READING OFF PROGRAMMED VALUES**

READING OFF PROGRAMMED VALUES

NOTE: Read off the programmed values from the upper electronic module (UEM)

before re-programming.

Fig. 136: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Use the VCT2000 (or appropriate scan tool) to read off the programmed values.

  The obtained values are programmed customer parameters in the upper electronic module (UEM). These values should be noted for later use.

  Other information

  - For information about programming the customer parameters, see **DIAGNOSTIC FUNCTIONS** .

Fig. 137: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **DOWNLOADING SOFTWARE**

DOWNLOADING SOFTWARE

Download new software. See **UPPER ELECTRONIC MODULE (UEM)/REARVIEW MIRROR, REPLACING** .

Do not replace the control module.

HINT: If diagnostic trouble code (DTC) UEM-E001 is stored, communication with the control module cannot be established. This can be remedied in two ways.

1. Press the remote control button for local lighting
2. Remove fuse 11C/28 from the fusebox in the passenger compartment. Reinstall the fuse again.

Fig. 138: Fuse Holder (Passenger Compartment)
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING THE INTERIOR LIGHTING**

CHECKING THE INTERIOR LIGHTING

Two times can be programmed for the interior lighting:

1. **Short**

   The period from when the door is unlocked, or the engine stops, to when the interior lighting goes out can be changed if it is too long or too short.

2. **Long**

   The period from when the door is opened, or a lamp is lit with a switch, to when the lamp goes out can be changed if it is too long or too short.

To program a long interior lighting period, use VIDA (Volvo scan tool).

- **Continue**

Refer to **PROGRAMMING A SHORT INTERIOR LIGHTING PERIOD**

PROGRAMMING A SHORT INTERIOR LIGHTING PERIOD

The general lighting and rear reading lamps light and remain lit for 30 seconds when:

- The door has been unlocked from outside with a key or the remote control.
- The engine has been stopped and the ignition key turned to 0.

The default period is 30 seconds. This can be changed to between 5 and 255 seconds.

Read off the programmed values.

To change the time, mark the desired value in the scrolling list and start programming.

Fig. 139: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Do you want to program any more parameters?

- **YES**

Refer to **PROGRAMMING A LONG INTERIOR LIGHTING PERIOD**

- **NO**

  Refer to **CHECKING THE ANTI-DAZZLE FUNCTION IN THE REAR VIEW MIRROR**

PROGRAMMING A LONG INTERIOR LIGHTING PERIOD

The general lighting and rear reading lamps light and remain lit for 10 minutes when:

- A door is opened after being unlocked.
- The lamp is lit with a switch.

The default period is 10 minutes. This can be changed to between 0 and 255 minutes at 10 minute intervals.

Read off the programmed values.

To change the time, mark the desired value in the scrolling list and start programming.

Fig. 140: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING THE ANTI-DAZZLE FUNCTION IN THE REAR VIEW MIRROR**

CHECKING THE ANTI-DAZZLE FUNCTION IN THE REAR VIEW MIRROR

CHECKING THE ANTI-DAZZLE FUNCTION

NOTE: If the upper electronic module (UEM) has been replaced software, specially developed for downloading after replacing the control module, must be downloaded to the control module before the anti-dazzle function is changed. See UPPER ELECTRONIC MODULE (UEM)/REARVIEW MIRROR, REPLACING .

The rear view mirror anti-dazzle function can be adjusted:

- If the rear view mirror anti-dazzle function is too powerful or too weak, it can be adjusted.

Specific software for setting the anti-dazzle function must be installed in the car to do this.

UEM-E001: CONTROL MODULE COMMUNICATION. FAULTY COMMUNICATION (2003-04)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION UEM-E001

Condition

Fig. 141: Identifying Rear View Mirror
Courtesy of VOLVO CARS CORPORATION

The control modules transmit and receive information via a standardized serial communication method - CAN (Controller Area Network). The diagnostic trouble code (DTC) is stored if the control module registers serious interference (CAN communication blocked).

NOTE: In the event of system communication problems, it is not possible to communicate with the control module. Therefore it will only be possible to read off the fault if it is intermittent.

Substitute Value

- The control module shuts itself off ("bus-off").

  HINT: The control module will remain shut off until the power supply is broken (15, 30, X). When the power supply is connected the control module will make a new attempt to communicate.

Possible Source

- Short-circuit between the control area network (CAN) wiring
- Open-circuit in the control area network (CAN) wiring
- Internal fault in the control module
- Internal fault in another control module in the same part of the control area network (CAN).

Fault symptom[s]

- Cannot be controlled with the remote control
- The interior lighting does not operate
- The power sun roof does not operate
- The alarm does not function at all
- No rain sensor function.

FAULTY COMMUNICATION

SIGNAL MISSING

see **SIGNAL MISSING**

UEM-E003: CONFIGURATION FAULT. FAULTY CONFIGURATION (2005-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION UEM-E003

Condition

Fig. 142: Identifying Rear View Mirror
Courtesy of VOLVO CARS CORPORATION

The control module compares its configuration ID with the signal configuration transmitted on the control area network (CAN) by the central electronic module (CEM). If the configuration IDs do not correspond the fault code is stored. The diagnostic trouble code (DTC) is also stored if the communication between the control module and the central electronic module (CEM) is interrupted.

NOTE: **In the event of open-circuit in both the control area network (CAN) cables, it is not possible to communicate with the control module. Therefore it will only be possible to read off the diagnostic trouble code (DTC) if this type of fault is intermittent. When the diagnostic trouble code (DTC) is stored, the control module responds to the diagnostic command, however normal control area network (CAN) communication does not work. ("Expulsion mode")**

Substitute Value

- None.

Possible Source

- Faulty control area network (CAN) configuration ID. (The node is not intended for this car, for example a used control module with different software/hardware.)
- Open-circuit in the control area network (CAN) wiring between the control module and the central electrical module (CEM).

Fault symptom[s]

- Cannot be controlled with the remote control
- The interior lighting does not operate
- The power sun roof does not operate
- The alarm does not function at all
- No rain sensor function.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CHECKING THE SUPPLY VOLTAGE/GROUND TERMINAL, REAR ELECTRONIC MODULE (REM) (2005-12)

CHECKING THE SUPPLY VOLTAGE/GROUND TERMINAL

Power supply, rear electronic module (REM)

The rear electronic module (REM) is supplied with power directly from the battery via a voltage input on the control module.

The rear electronic module (REM) is also supplied with power via an input from the ignition switch.

Power supply directly from battery

1. Power input #K1 is supplied with power via a fuse from the battery. This power input is used to power the memory in the rear electronic module (REM). In the event of an open-circuit, the rear electronic module (REM) will be reset and adaptation values and diagnostic trouble codes (DTCs) will disappear.

Power supply from the ignition switch

1. Power input terminal #A29 (#29). 15i-supply. The power supply is activated when the ignition key is in position II.

Checking the power supply

Check the power supply cable from the battery to rear electronic module (REM) terminal #K1. Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. Check the fuse. The voltage must be approximately battery voltage when the ignition is on.

Check the power supply cable from the ignition switch to rear electronic module (REM) terminal #A29. Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. The voltage must be approximately battery voltage when the ignition is on.

Ground terminal, rear electronic module (REM)

The rear electronic module (REM) has two ground terminals. The ground inputs from the control module are connected via two separate ground leads to the same ground terminal in the car body.

1. Ground input 1 (terminal #A32 (#32) is power ground and is connected to the ground terminal in the car body
2. Ground input terminal 2 #D12 (#12) is signal ground and is connected to the ground terminal in the car body.

Checking the ground terminal

Check the ground lead between rear electronic module (REM) terminal #A32 (32) and ground terminal 31/47. Check for an open-circuit. Check for loose connections. Check for contact resistance. Check for oxidation. With the ignition on, the drop in voltage between the ground connections for the rear electronic module (REM) must not be greater than 0.5 V.

Check the ground lead between rear electronic module (REM) terminal #D12 (12) and ground terminal 31/72. Check for an open-circuit. Check for loose connections. Check for contact resistance. Check for oxidation. With the ignition on, the drop in voltage between the ground connections for the rear electronic module (REM) must not be greater than 0.5 V.

Remedy as necessary.

Other information

- see **CONNECTING THE BREAKOUT BOX**
- see **SIGNAL SPECIFICATION**
- see **CONTENTS**

CHECKING THE VOLTAGE/GROUND TERMINAL, CENTRAL ELECTRONIC MODULE (CEM) (2005-12)

CHECKING THE SUPPLY VOLTAGE/GROUND TERMINAL LHD

Power supply, central electronic module (CEM)

The central electronic module (CEM) is powered directly from the rear electronic module (REM) via two power inputs on the control module.

The central electronic module (CEM) is also powered via four inputs from the ignition switch. These inputs are active on different occasions, depending on the position of the ignition key.

Power supply from the rear electronic module (REM)

1. Voltage input 1 terminal #EA is powered via a fuse from rear electronic module (REM) terminal #IA.

This power input is used, for example, to power the motherboard in the central electronic module (CEM)

2. Voltage input 2 terminal #EB is powered via a fuse from rear electronic module (REM) terminal #IB. This power input is used for example to power the internal electronics in the central electronic module (CEM).

Power supply from ignition switch

1. Power input terminal #D15 (#15). S-supply. The power supply is activated when the ignition key is in position 0
2. Power input terminal #D8 (#8). X-supply. The power supply is activated when the ignition key is in position I
3. Power input terminal #D16 (#16). 15 supply. The power supply is activated when the ignition key is in position II
4. Power input terminal #D60 (#60). 50 supply. The power supply is activated when the ignition key is in position III.

Checking the power supply

Check the power supply cable from rear electronic module (REM) terminal #IA to central electronic module (CEM) terminal #EA. Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. Check the fuse. Voltage should be approximately battery voltage.

Check the power supply cable from rear electronic module (REM) terminal #IB to central electronic module (CEM) terminal #EB. Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. Check the fuse. Voltage should be approximately battery voltage.

NOTE: Also check the power supply cable from the battery to rear electronic module (REM) terminal #K1. Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. Check the fuse.

Ground terminal, central electronic module (CEM)

The central electronic module (CEM) has a ground input.

1. Ground input terminal #D6 (#6) is power ground and is connected to the ground terminal in the car body.

Checking the ground terminal

Check the ground lead between central electronic module (CEM) terminal #D6 (#6) and the ground terminal 31/6. Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. With the ignition on, the drop in voltage between the ground connection for the central electronic module (CEM) and the ground terminal must not be greater than 0.5 V.

Remedy as necessary.

Other information

- see **CONNECTING THE BREAKOUT BOX**
- see **SIGNAL SPECIFICATION**
- see **CONTENTS**

CHECKING THE SUPPLY VOLTAGE/GROUND TERMINAL

Power supply, central electronic module (CEM)

The central electronic module (CEM) is powered directly from the rear electronic module (REM) via two power inputs on the control module.

The central electronic module (CEM) is also powered via four inputs from the ignition switch. These inputs are active on different occasions, depending on the position of the ignition key.

Power supply from the rear electronic module (REM)

1. Voltage input 1 terminal #EA is powered via a fuse from rear electronic module (REM) terminal #IA. This power input is used, for example, to power the motherboard in the central electronic module (CEM)
2. Voltage input 2 terminal #EB is powered via a fuse from rear electronic module (REM) terminal #IB. This power input is used for example to power the internal electronics in the central electronic module (CEM).

Power supply from ignition switch

1. Power input terminal #D15 (#15). S-supply. The power supply is activated when the ignition key is in position 0
2. Power input terminal #D8 (#8). X-supply. The power supply is activated when the ignition key is in position I
3. Power input terminal #D16 (#16). 15 supply. The power supply is activated when the ignition key is in position II
4. Power input terminal #D60 (#60). 50 supply. The power supply is activated when the ignition key is in position III.

Checking the power supply

Check the power supply cable from rear electronic module (REM) terminal #IA to central electronic module (CEM) terminal #EA. Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. Check the fuse. Voltage should be approximately battery voltage.

Check the power supply cable from rear electronic module (REM) terminal #IB to central electronic module (CEM) terminal #EB. Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. Check the fuse. Voltage should be approximately battery voltage.

NOTE: Also check the power supply cable from the battery to rear electronic module (REM) terminal #K1. Check for an open-circuit. Check for loose connections.

Check for contact resistance and oxidation. Check the fuse.

Ground terminal, central electronic module (CEM)

The central electronic module (CEM) has a ground input.

1. Ground input terminal #D6 (#6) is power ground and is connected to the ground terminal in the car body.

Checking the ground terminal

Check the ground lead between central electronic module (CEM) terminal #D6 (#6) and the ground terminal 31/10. Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. With the ignition on, the drop in voltage between the ground connection for the central electronic module (CEM) and the ground terminal must not be greater than 0.5 V.

Remedy as necessary.

Other information

- see **CONNECTING THE BREAKOUT BOX**
- see **SIGNAL SPECIFICATION**
- see **CONTENTS**

CHECKING VOLTAGE/GROUND CONNECTION, ACCESSORY USB UNIT (AUU) (2007-12)

CHECKING THE SUPPLY VOLTAGE/GROUND TERMINAL

VOLTAGE FEED ACCESSORY USB UNIT (AUU)

Accessory USB Unit (AUU) is supplied with voltage via a voltage input on the control module. When the ignition is on, the power input is powered and the control module is in active mode.

1. Power input #A C1:1 is supplied with voltage via a fuse from the battery. This power input is used to power the memory in the control module. In the event of an open-circuit, the control module will be reset and adaptation values and diagnostic trouble codes (DTCs) will disappear.

Checking the power supply

Check the voltage feed cable from the battery to the Accessory USB Unit (AUU) #C1-1 for open circuit, loose connections, contact resistance, and oxidation. Check the fuse. The voltage must be approximately battery voltage.

Ground connection Accessory USB Unit (AUU)

Accessory USB Unit (AUU) has a ground input.

Checking the ground terminal

Check the ground cable. Check for loose connections, contact resistance and oxidation. Check for an open-circuit. With the ignition on, the drop in voltage between the ground connection for the control module and the ground terminal must not be greater than 0.5 V.

Remedy as necessary.

Other information

- see **SIGNAL SPECIFICATION**
- see **CHECKING WIRING AND TERMINALS**

CONNECTING BREAKOUT BOX, REAR ELECTRONIC MODULE (REM) (2005-12)

CONNECTING THE BREAKOUT BOX

Special tools:

see **9511428**

see **9512971**

GENERAL INFORMATION

Check that the male and female terminals on the connectors are undamaged and secure (cannot be pressed in). Check that the cables to the female terminals are secured to the terminal pins.

The breakout box is designed to facilitate reading off the control module input and output signals when the control module is connected; and the cable and component resistance when the control module is disconnected. The use of a breakout box reduces the risk of accidental short-circuited cables and damage to the connector pins.

CONNECTING THE BREAKOUT BOX

- Ignition off
- Remove the fuses
- To expose the rear electronic module (REM) connectors:
  - For -2004, see: **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
  - For 2005-, see: **REAR ELECTRONIC MODULE (REM), REPLACING** .

Connect breakout box see **9511428** to the adapter.

Fig. 25: Identifying Rear Electronic Module (REM) Connectors A And B
Courtesy of VOLVO CARS CORPORATION

Rear electronic module (REM)

- Connect adapter see **9512971** to the control module connectors A, B, C, D and F.

  HINT: Connectors A, B and D cannot be plugged in simultaneously. Neither can connectors C and F be plugged in simultaneously.

- For connector A, terminals #A1-#A32 correspond to terminals #1-#32 on the breakout box
- For connector B, terminals #B1-#B32 correspond to terminals #1-#32 on the breakout box
- For connector C, terminals #C1-#C14 correspond to terminals #41-#54 on the breakout box
- For connector D terminals #D1-#D36 correspond to terminals #1-#36 on the breakout box
- For connector F, terminals #F1-#F10 correspond to terminals #41-#50 on the breakout box.

NOTE: The removed fuses must be reinstalled before the control module can be checked and measurements taken.

Other information

- see **SIGNAL SPECIFICATION**

CONNECTING BREAKOUT BOX, REAR ELECTRONIC MODULE (REM) (2003-04)

CONNECTING THE BREAKOUT BOX

Fig. 26: Identifying Ignition In Off Position
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Expose the integrated relay/fusebox in the cargo compartment
- Remove fuses 11D/1 and 11D/2 from the integrated relay/fusebox in the cargo compartment
- Release the locking hooks on the top of the integrated relay/fusebox in the cargo compartment
- Fold the integrated relay/fusebox in the cargo compartment downwards/inwards. The integrated relay/fusebox in the cargo compartment can now be removed
- Slacken off the screw holding the rear electronic module (REM) connector so that it can hang free
- Disconnect the rear electronic module (REM) connector. The connector may be stiff.

Connect the adapter between the rear electronic module (REM) and its connector. Connect the breakout box to the adapter. Breakout box wiring see **9511503** .

Disconnect the breakout box in reverse order.

NOTE: Before the rear electronic control module can be checked and measurements taken, the removed fuses must first be installed.

Other information

- For the location of the components, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- For further information about signals and other values, see **SIGNAL SPECIFICATION** .

CONNECTING BREAKOUT BOX. AUXILIARY HEATER (COMBUSTION PREHEATER MODULE (CPM)) (2005-12)

CONNECTING THE BREAKOUT BOX

Special tools:

see **9511373**

see **9511428**

CONNECTING THE BREAKOUT BOX

Fig. 27: Breakout Box
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Expose the heater.

Fig. 28: Releasing Catch Using Screwdriver
Courtesy of VOLVO CARS CORPORATION

Position a screwdriver between the control module connector and its locking handle.

Turn the screwdriver to release the catch.

Continue pulling the locking handle outwards until the connector comes away from the control module.

Connect adapter see **9511373** to the control module connector. Connect breakout box see **9511428** to the adapter.

Disconnect the breakout box in reverse order.

For the location of the components, see **ENGINE COOLANT HEATER, COMPONENT LOCATION**.

ENGINE COOLANT HEATER, COMPONENT LOCATION

- See **ENGINE COOLANT HEATER, COMPONENT LOCATION** .

CONNECTING THE BREAKOUT BOX, ACCESSORY ELECTRONIC MODULE (AEM) (2003-12)

CONNECTING THE BREAKOUT BOX. ACCESSORY ELECTRONIC MODULE

CONNECTING THE BREAKOUT BOX

Fig. 29: Breakout Box. Accessory Electronic Module
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Expose the accessory electronic module.

Connect adapter see **9512843** to the control module connector. Connect breakout box see **9511428** to the adapter.

Disconnect the breakout box in reverse order.

NOTE: **Before the central electronic control module can be checked and measurements taken, the removed fuses must first be installed.**

  - For 2005-, see: **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** .

Connect adapter see **9511503** to the control module connector. Connect breakout box see **9511428** to the adapter.

Disconnect the breakout box in reverse order.

NOTE: Before the control module can be checked and measurements taken, the

removed fuses must first be installed.

For further information about signals and other values, see **SIGNAL SPECIFICATION** .

CONNECTING THE BREAKOUT BOX, CENTRAL ELECTRONIC MODULE (CEM) (2005-12)

CONNECTING THE BREAKOUT BOX

Special tools:

see **9511428**

see **9512971**

GENERAL INFORMATION

Check that the male and female terminals on the connectors are undamaged and secure (cannot be pressed in). Check that the cables to the female terminals are secured to the terminal pins.

The breakout box is designed to facilitate reading off the control module input and output signals when the control module is connected. The breakout box is designed to facilitate reading off the cable and component resistance when the control module is disconnected. The use of a breakout box reduces the risk of accidental short-circuited cables and damage to the connector pins.

CONNECTING THE BREAKOUT BOX

- Ignition off
- Remove the fuses
- see **CENTRAL ELECTRONIC MODULE (CEM), REPLACING**

Connect breakout box see **9511428** to the adapter.

Central electronic module (CEM)

- Connect adapter see **9512971** to the control module connectors A, B, C and D
- For connector A, terminals #A1-#A32 correspond to terminals #1-#32 on the breakout box
- For connector B, terminals #B1-#B32 correspond to terminals #1-#32 on the breakout box
- For connector C, terminals #C1-#C36 correspond to terminals #1-#36 on the breakout box
- For connector D terminals #D1-#D60 correspond to terminals #1-#60 on the breakout box.

NOTE: Before the control module can be checked and measurements taken, the removed fuses must first be installed.

GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK (2004-12)

GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK (2005-2012)

The CAN network is a pure communications network and contains no fuses or sensors. The network is divided

into two parts: the low speed network (LS-CAN, Low Speed CAN) and the high speed network (HS-CAN, High Speed CAN). The differences between the networks are their physical position in the car and the transfer rates. In general terms, HS-CAN is restricted to the engine compartment and LS-CAN to the passenger compartment and the cargo compartment.

Both the low speed and the high speed networks house two network resistors in two of the control modules. Each resistor has resistance of 120 ohms. If resistance between the two CAN cables is measured, a normal value is approximately 60 ohms. The value may vary between vehicles. Permissible values are approximately 55-65 ohms.

NOTE: Resistance 60 ohms can only be measured if the main artery is intact and connected in the part of the CAN network in which the reading is taken. If there is an open circuit anywhere along the main artery or if any control module through which the main artery passes (a control module with four CAN connections) is not connected, resistance will be 120 ohms when the reading is taken.

NOTE: Troubleshoot each CAN-net, see troubleshooting for CAN-related fault codes for Central electronic module (CEM). For example, choose one of CEM-DF01-DF17 depending on CAN-net.

Diagnostic trouble code (DTC) types

Diagnostic trouble codes (DTCs) which can be stored by control modules connected to the controller area network (CAN) can be split into two categories:

Electrical fault

These diagnostic trouble codes (DTC) can only be stored in the central electronic module (CEM). This type of diagnostic trouble code (DTC) is stored when the central electronic module (CEM) has detected an electrical fault in the controller area network (CAN) wiring. For example a short-circuit between the controller area network (CAN) wiring or a short-circuit between the controller area network (CAN) wiring and voltage or ground. The fault may be due to an open-circuit in the CAN-H on the network. These diagnostic trouble codes (DTCs) do not normally indicate that a fault has occurred in any control module.

Communication error, CEM

These diagnostic trouble codes (DTC) can only be stored in the central electronic module (CEM). The diagnostic trouble code (DTC) indicates that a control module, with which the central electronic module (CEM) expects to communicate, is not responding for one reason or another. This can be due to an open-circuit on one or both the controller area network (CAN) cables to one control module or the control module not being supplied with power, for example.

Communication error, control module

These diagnostic trouble codes (DTC) can be stored by all control modules. A control module that has stored this diagnostic trouble code (DTC) has discovered that some sort of interference has occurred with

communication. The diagnostic trouble code (DTC) does not point out a specific fault source. Examples of fault causes can be intermittent short-circuits between the controller area network (CAN) wiring, intermittent short-circuits in the controller area network (CAN) wiring to supply/ground or a control module which transmits incorrect messages via the controller area network (CAN).

NOTE: The diagnostic trouble codes (DTC) for communication errors can thus be stored in one or more control modules and stem from the same causes as the diagnostic trouble codes for electrical faults in the Central Electronic Module (CEM), that is to say "short-circuit" of one or both CAN cables to supply voltage or ground. It is only the Central Electronic Module (CEM), however, that can store a diagnostic trouble code (DTC) that is generated due to the short-circuit itself.

Configuration fault

The diagnostic trouble codes (DTC) can be stored by all control modules in both the HS-CAN and LS-CAN except for the central electronic module (CEM). The diagnostic trouble code (DTC) indicates that a control module could not receive anticipated communication from the central electronic module (CEM). Examples of fault causes could be incorrect software configuration in the control module which stored the diagnostic trouble code (DTC) or an open-circuit in the controller area network (CAN) wiring to the control module which stored the diagnostic trouble code (DTC). This diagnostic trouble code (DTC) can also be stored if there is play in the connectors or bent terminal pins in a connector on one of the CAN cables.

NOTE: Software in one control module cannot "malfunction". If the control module which stored the diagnostic trouble code (DTC) once has functioned in the vehicle, the fault cannot be remedied by downloading new software. The only instance when downloading new software to a control module is of use is if the customer or workshop replace a control module with a control module from another vehicle without downloading software after replacement.

- see **THE NETWORK**
- see **CONSTRUCTION OF THE NETWORK**
- see **CAN-NETWORK (CONTROLLER AREA NETWORK)**
- see **ERROR MANAGEMENT IN THE CONTROLLER AREA NETWORK (CAN)**

Diagnostic functions in the central electronic module (CEM)

The central electronic module (CEM) acts as a hub between the two networks. This operates as an exchange and can distribute traffic between the high speed network (HS-CAN) and the low speed network (LS-CAN) and vice versa. The central electronic module (CEM) also contains diagnostic functions for monitoring the traffic on the CAN network and the voltage levels in the CAN cables.

NOTE: The central electronic module (CEM) contains more functions for monitoring the

CAN network than other control modules. For example, the central electronic module (CEM) is the only control module that can store diagnostic trouble codes (DTC) for short-circuits between the CAN cables, between a CAN cable and ground and between a CAN cable and supply voltage. The fact that the central electronic module (CEM) can do this does not mean that the central electronic module (CEM) is the cause of all faults in the CAN network. On the other hand, other control modules can store diagnostic trouble codes (DTC) as a result of the short-circuit. This is a small, but very important difference.

Example:

The information applies initially to the S60/S80/V70/XC70 because of the designations of units and the use of points in the vehicle where fault tracing may be appropriate. Despite most of the information being model specific, certain methods can also be used on other models.

Diagnostic trouble codes (DTC) in pairs between the central electronic module (CEM) and a particular control module (CEM-1AXX and XXX-E003)

Fault-tracing of the relevant control module begins if the central electronic module (CEM) has stored diagnostic trouble code (DTC) CEM-1A5X or CEM-1A6X for an open-circuit in communication with a control module and if the control module stored XXX-E003. There is an open-circuit at some point in the path between the central electronic module (CEM) and the control module.

NOTE: **If diagnostic trouble codes can be read out from the relevant control module, the fault is probably intermittent. In case of a fault in the low-speed network, it is especially important to investigate the junctions behind the central electronic module (CEM) and the audio module (AUM) as well as the cable harness behind the audio module (AUM).**

Single diagnostic trouble codes (DTC) in the central electronic module (CEM), CEM-1AXX

If the central electronic module (CEM) has stored diagnostic trouble code (DTC) 1AXX for an open-circuit in communication with a control module and there is no diagnostic trouble code (DTC) stored in the corresponding control module it indicates an intermittent fault in the power supply to the indicated control module. The diagnostic trouble code (DTC) cannot be stored if the control module which could not communicate with the engine module (CEM) is not powered.

General procedure

- Check the supply voltage to the relevant control module
- Check the ground terminal for the control module
- Check the CAN cables for the control module.

Checking the power supply

A simple way to check the supply voltage and ground is to check if there is any functionality remaining in the

control module. Examples of corrective action:

- Audio module (AUM): Check whether the radio plays
- Upper electronic module (UEM): Check whether the seat belt reminder lights or whether the sun roof works
- Power seat module (PSM): Check whether the seat can be moved manually
- Road traffic information module (RTI): Check whether the display for the road traffic information module (RTI) can be folded up or whether a disc can be inserted and fed out
- Climate control module (CCM): Check the function. The blower fan must blow. However, the air conditioning (A/C) will not work in the event of interrupted CAN communication.

In the event of difficulty, check as follows: Measure the supply voltage and ground terminal in the connector directly adjacent to the control module that has stored the diagnostic trouble code (DTC).

NOTE: The terminals could be damaged when if readings are taken using measurement cables directly in the connector. If possible, take readings on the rear of the connector. If this is not possible, use a loose terminal strip to insert in the connector.

Diagnostic testing of main arteries in the low speed network (LS-CAN)

Take readings at the connector to the power seat module (PSM) (if applicable). Otherwise connect the breakout box at the central electronic module (CEM). The advantage of using the breakout box is that it is possible to check the functionality of the entire network with all control modules connected.

The resistance reading only checks the main path in the LS-CAN. The resistance reading does not check the divergence paths such as the road traffic information module (RTI), accessory electronic module (AEM), power seat module (PSM), phone module (PHM), audio module (AUM), driver door module (DDM) and passenger door module (PDM). However, resistance readings between the two CAN cables can show if there is a short-circuit between the two cables (or their junctions). A normal value, measured somewhere in the middle of the network, is between 55 and 65 ohms if both terminating resistors are connected (120 ohms parallel connected). Twist and bend the cable harness at suitable points to detect any intermittent fault causes.

NOTE: Resistance 60 ohms can only be measured if the main artery is intact and connected in the part of the CAN network in which the reading is taken. If there is an open circuit anywhere along the main artery or if any control module through which the main artery passes (a control module with four CAN connections) is not connected, resistance will be 120 ohms when the reading is taken.

Also measure the resistance between each CAN-lead and voltage feed and ground. Twist and bend the cable harness in suitable places to detect any intermittent fault sources. The resistance should be over 1 kohms. If resistance is less than 1 kohms, this indicates short-circuiting between the CAN-lead and ground/voltage.

HINT: Both readings can be taken in the same connector if the CAN cables, power supply and ground are exposed. If possible, take readings on the rear of the connector to prevent damage to the terminals in

the connector. If this is not possible, use the adapter wiring or loose terminal pins to obtain a good contact. The resistance must be over 1 kohms. If the resistance is less than 1 kohms, this indicates short-circuiting between the CAN-lead and ground/voltage.

If the main artery is OK (i. e. approximately 60 ohms measured in the power seat module (PSM), for example), measure the resistance in the CAN cables from the relevant control module.

Diagnostic testing of main arteries in the high speed network (HS-CAN)

In principle it is only possible to measure the resistance in the high speed network (HS-CAN) using adapter wiring. It is easiest to connect the adapter wiring at the engine control module (ECM). Connect the engine control module (ECM) again to the adapter wiring to obtain the correct values when taking readings. The resistance must be approximately 60 ohms.

NOTE: **Resistance 60 ohms can only be measured if the main artery is intact and connected in the part of the CAN network in which the reading is taken. If there is an open circuit anywhere along the main artery or if any control module through which the main artery passes (a control module with four CAN connections) is not connected, resistance will be 120 ohms when the reading is taken.**

Abbreviations and terms

- CAN. Controller Area Network
- LS-CAN (Low Speed CAN). Low speed network in the car. In practice this is restricted to the passenger compartment and the cargo compartment
- HS-CAN (High Speed CAN). High speed network in the car. In practice this is restricted to the engine compartment
- CAN-H. CAN cable with the higher voltage. The voltage oscillates between 2.5 V and approximately 3.5 V when there is traffic on the CAN network
- CAN-L. CAN cable with the lower voltage. The voltage oscillates between 2.5 V and approximately 1.5 V when there is traffic on the CAN network.

GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK (2004)

The CAN network is a pure communications network and contains no fuses or sensors. The network is divided into two parts: the low speed network (LS-CAN, Low Speed CAN) and the high speed network (HS-CAN, High Speed CAN). The differences between the networks are their physical position in the car and the transfer rates. In general terms, HS-CAN is restricted to the engine compartment and LS-CAN to the passenger compartment and the cargo compartment.

Both the low speed and the high speed networks house two network resistors in two of the control modules. Each resistor has resistance of 120 ohms. If resistance between the two CAN cables is measured, a normal value is approximately 60 ohms. The value may vary between vehicles. Permissible values are approximately 55-65 ohms.

NOTE: **Resistance 60 ohms can only be measured if the main artery is intact and connected in the part of the CAN network in which the reading is taken. If there is an open circuit anywhere along the main artery or if any control module through which the main artery passes (a control module with four CAN connections) is not connected, resistance will be 120 ohms when the reading is taken.**

NOTE: **Troubleshoot each CAN-net, see troubleshooting for CAN-related fault codes for Central electronic module (CEM). For example, choose one of CEM-DF01-DF17 depending on CAN-net.**

Diagnostic trouble code (DTC) types

Diagnostic trouble codes (DTCs) which can be stored by control modules connected to the controller area network (CAN) can be split into two categories:

Electrical fault

These diagnostic trouble codes (DTC) can only be stored in the central electronic module (CEM). This type of diagnostic trouble code (DTC) is stored when the central electronic module (CEM) has detected an electrical fault in the controller area network (CAN) wiring. For example a short-circuit between the controller area network (CAN) wiring or a short-circuit between the controller area network (CAN) wiring and voltage or ground. The fault may be due to an open-circuit in the CAN-H on the network. These diagnostic trouble codes (DTCs) do not normally indicate that a fault has occurred in any control module.

Communication error, CEM

These diagnostic trouble codes (DTC) can only be stored in the central electronic module (CEM). The diagnostic trouble code (DTC) indicates that a control module, with which the central electronic module (CEM) expects to communicate, is not responding for one reason or another. This can be due to an open-circuit on one or both the controller area network (CAN) cables to one control module or the control module not being supplied with power, for example.

Communication error, control module

These diagnostic trouble codes (DTC) can be stored by all control modules. A control module that has stored this diagnostic trouble code (DTC) has discovered that some sort of interference has occurred with communication. The diagnostic trouble code (DTC) does not point out a specific fault source. Examples of fault causes can be intermittent short-circuits between the controller area network (CAN) wiring, intermittent short-circuits in the controller area network (CAN) wiring to supply/ground or a control module which transmits incorrect messages via the controller area network (CAN).

NOTE: **The diagnostic trouble codes (DTC) for communication errors can thus be stored in one or more control modules and stem from the same causes as the diagnostic trouble codes for electrical faults in the Central Electronic Module (CEM), that is to say "short-circuit" of one or both CAN cables to supply voltage or ground. It is only the Central Electronic Module (CEM), however, that can**

store a diagnostic trouble code (DTC) that is generated due to the short-circuit itself.

Configuration fault

The diagnostic trouble codes (DTC) can be stored by all control modules in both the HS-CAN and LS-CAN except for the central electronic module (CEM). The diagnostic trouble code (DTC) indicates that a control module could not receive anticipated communication from the central electronic module (CEM). Examples of fault causes could be incorrect software configuration in the control module which stored the diagnostic trouble code (DTC) or an open-circuit in the controller area network (CAN) wiring to the control module which stored the diagnostic trouble code (DTC). This diagnostic trouble code (DTC) can also be stored if there is play in the connectors or bent terminal pins in a connector on one of the CAN cables.

NOTE: **Software in one control module cannot "malfunction". If the control module which stored the diagnostic trouble code (DTC) once has functioned in the vehicle, the fault cannot be remedied by downloading new software. The only instance when downloading new software to a control module is of use is if the customer or workshop replace a control module with a control module from another vehicle without downloading software after replacement.**

Diagnostic functions in the central electronic module (CEM)

The central electronic module (CEM) acts as a hub between the two networks. This operates as an exchange and can distribute traffic between the high speed network (HS-CAN) and the low speed network (LS-CAN) and vice versa. The central electronic module (CEM) also contains diagnostic functions for monitoring the traffic on the CAN network and the voltage levels in the CAN cables.

NOTE: **The central electronic module (CEM) contains more functions for monitoring the CAN network than other control modules. For example, the central electronic module (CEM) is the only control module that can store diagnostic trouble codes (DTC) for short-circuits between the CAN cables, between a CAN cable and ground and between a CAN cable and supply voltage. The fact that the central electronic module (CEM) can do this does not mean that the central electronic module (CEM) is the cause of all faults in the CAN network. On the other hand, other control modules can store diagnostic trouble codes (DTC) as a result of the short-circuit. This is a small, but very important difference.**

Example:

The information applies initially to the S60/S80/V70/XC70 because of the designations of units and the use of points in the vehicle where fault tracing may be appropriate. Despite most of the information being model specific, certain methods can also be used on other models.

Diagnostic trouble codes (DTC) in pairs between the central electronic module (CEM) and a particular control module (CEM-1AXX and XXX-E003)

Fault-tracing of the relevant control module begins if the central electronic module (CEM) has stored diagnostic trouble code (DTC) CEM-1A5X or CEM-1A6X for an open-circuit in communication with a control module and if the control module stored XXX-E003. There is an open-circuit at some point in the path between the central electronic module (CEM) and the control module.

NOTE: **If diagnostic trouble codes can be read out from the relevant control module, the fault is probably intermittent. In case of a fault in the low-speed network, it is especially important to investigate the junctions behind the central electronic module (CEM) and the audio module (AUM) as well as the cable harness behind the audio module (AUM).**

Single diagnostic trouble codes (DTC) in the central electronic module (CEM), CEM-1AXX

If the central electronic module (CEM) has stored diagnostic trouble code (DTC) 1AXX for an open-circuit in communication with a control module and there is no diagnostic trouble code (DTC) stored in the corresponding control module it indicates an intermittent fault in the power supply to the indicated control module. The diagnostic trouble code (DTC) cannot be stored if the control module which could not communicate with the engine module (CEM) is not powered.

General procedure

- Check the supply voltage to the relevant control module
- Check the ground terminal for the control module
- Check the CAN cables for the control module.

Checking the power supply

A simple way to check the supply voltage and ground is to check if there is any functionality remaining in the control module. Examples of corrective action:

- Audio module (AUM): Check whether the radio plays
- Upper electronic module (UEM): Check whether the seat belt reminder lights or whether the sun roof works
- Power seat module (PSM): Check whether the seat can be moved manually
- Road traffic information module (RTI): Check whether the display for the road traffic information module (RTI) can be folded up or whether a disc can be inserted and fed out
- Climate control module (CCM): Check the function. The blower fan must blow. However, the air

conditioning (A/C) will not work in the event of interrupted CAN communication.

In the event of difficulty, check as follows: Measure the supply voltage and ground terminal in the connector directly adjacent to the control module that has stored the diagnostic trouble code (DTC).

NOTE: The terminals could be damaged when if readings are taken using measurement cables directly in the connector. If possible, take readings on the rear of the connector. If this is not possible, use a loose terminal strip to insert in the connector.

Diagnostic testing of main arteries in the low speed network (LS-CAN)

Take readings at the connector to the power seat module (PSM) (if applicable). Otherwise connect the breakout box at the central electronic module (CEM). The advantage of using the breakout box is that it is possible to check the functionality of the entire network with all control modules connected.

The resistance reading only checks the main path in the LS-CAN. The resistance reading does not check the divergence paths such as the road traffic information module (RTI), accessory electronic module (AEM), power seat module (PSM), phone module (PHM), audio module (AUM), driver door module (DDM) and passenger door module (PDM). However, resistance readings between the two CAN cables can show if there is a short-circuit between the two cables (or their junctions). A normal value, measured somewhere in the middle of the network, is between 55 and 65 ohms if both terminating resistors are connected (120 ohms parallel connected). Twist and bend the cable harness at suitable points to detect any intermittent fault causes.

NOTE: Resistance 60 ohms can only be measured if the main artery is intact and connected in the part of the CAN network in which the reading is taken. If there is an open circuit anywhere along the main artery or if any control module through which the main artery passes (a control module with four CAN connections) is not connected, resistance will be 120 ohms when the reading is taken.

Also measure the resistance between each CAN-lead and voltage feed and ground. Twist and bend the cable harness in suitable places to detect any intermittent fault sources. The resistance should be over 1 kohms. If resistance is less than 1 kohms, this indicates short-circuiting between the CAN-lead and ground/voltage.

HINT: Both readings can be taken in the same connector if the CAN cables, power supply and ground are exposed. If possible, take readings on the rear of the connector to prevent damage to the terminals in the connector. If this is not possible, use the adapter wiring or loose terminal pins to obtain a good contact. The resistance must be over 1 kohms. If the resistance is less than 1 kohms, this indicates short-circuiting between the CAN-lead and ground/voltage.

If the main artery is OK (i. e. approximately 60 ohms measured in the power seat module (PSM), for example), measure the resistance in the CAN cables from the relevant control module.

Diagnostic testing of main arteries in the high speed network (HS-CAN)

In principle it is only possible to measure the resistance in the high speed network (HS-CAN) using adapter

wiring. It is easiest to connect the adapter wiring at the engine control module (ECM). Connect the engine control module (ECM) again to the adapter wiring to obtain the correct values when taking readings. The resistance must be approximately 60 ohms.

NOTE: **Resistance 60 ohms can only be measured if the main artery is intact and connected in the part of the CAN network in which the reading is taken. If there is an open circuit anywhere along the main artery or if any control module through which the main artery passes (a control module with four CAN connections) is not connected, resistance will be 120 ohms when the reading is taken.**

Abbreviations and terms

- CAN. Controller Area Network
- LS-CAN (Low Speed CAN). Low speed network in the car. In practice this is restricted to the passenger compartment and the cargo compartment
- HS-CAN (High Speed CAN). High speed network in the car. In practice this is restricted to the engine compartment
- CAN-H. CAN cable with the higher voltage. The voltage oscillates between 2.5 V and approximately 3.5 V when there is traffic on the CAN network
- CAN-L. CAN cable with the lower voltage. The voltage oscillates between 2.5 V and approximately 1.5 V when there is traffic on the CAN network.

ELECTRICAL

Cables And Fuses - General Information

CABLES

CABLE TERMINALS SURFACE TREATMENT

GENERAL INFORMATION

Fig. 1: Identifying Terminal With Integrated Cable
Courtesy of VOLVO CARS CORPORATION

Terminal with integrated cable designated "cable terminal", certain cases "service terminal".

Fig. 2: Identifying Terminal With Integrated Cable
Courtesy of VOLVO CARS CORPORATION

Black marking = terminal's surface treatment is gold. Marking introduced running from second quarter 2008.

CAUTION: If new components are supplied with a section of new wiring, the equivalent wiring section in the vehicle must be substituted with the new section.

Due to oxidation and galvanic currents, female and male connections with the same surface treatment should be used.

Example of different surface treatments: Gold (Au), Silver (Ag), Tin (Sn)

- Silver + Tin = Permitted
- Tin + Gold = Not permitted
- Silver + Gold = Permitted

Fig. 3: Identifying Terminal With Integrated Cable Designated "Cable Terminal" (Black Mark)
Courtesy of VOLVO CARS CORPORATION

The type of surface treatment on the connector can only be determined by inspection the male connector's pins with a magnifying glass.

ELECTRICAL

Cables And Fuses - Removal, Replacement And Installation

CENTRAL ELECTRICAL UNIT, FUSEBOX (2003-04)

CENTRAL ELECTRONIC MODULE (CEM), REPLACING

EXPOSING AND REMOVING RELAY BOX IN PASSENGER COMPARTMENT

CAUTION: The customer-programmed data must be read off before the control module is replaced. The information must then be entered into the new control module after it has been installed. This is performed via VIDA vehicle communication.

NOTE: Applies to vehicles -2003, All ignition keys are needed when programming a new control module.

NOTE: For vehicles equipped with Volvo On Call (see phone's keypad) the battery's minus lead shall be removed first. Otherwise the automatic alarm for emergency services may be triggered. See BATTERY, DISCONNECTING

NOTE: The driver information module (DIM) must not be replaced at the same time. This would erase the mileage.

For further information, see **DOWNLOADING SOFTWARE AND REPLACING THE CONTROL MODULE**

REMOVING SOUNDPROOFING PANEL ON DRIVER'S SIDE

Fig. 1: Identifying Driver Side Soundproofing Panel
Courtesy of VOLVO CARS CORPORATION

The central electronic module (CEM) is located as a separate unit in the relay box.

- Loosen the screws, 2 pcs.

  HINT: The soundproofing panel is located in grooves by the pedal box.

- Pull the soundproofing panel straight down by the instrument panel.
- Pull back the soundproofing panel.
- Lift out the soundproofing panel.
- Remove the side panel for the fuses on the dashboard's left side (a part of the console is visible).

REMOVING RELAY BOX

Fig. 2: Removing Relay Box
Courtesy of VOLVO CARS CORPORATION

- Insert a screwdriver up between the bracket and the relay box. Turn the screwdriver so that the bracket expands and, at the same time, pull the relay box from the bracket towards the underside of the dashboard.
- Lift away the relay box from the bracket and pull it downward under the dashboard.

REPLACING RELAY/SHUNT

Fig. 3: Identifying Relay Locations
Courtesy of VOLVO CARS CORPORATION

- Expose the relay box for better access.
- Replace relay/shunt.

RELAY POSITION

For position of relays, see

1. Decals by respective relay and fuse box in the vehicle
2. Pocket Data booklet
3. Driver's manual

INSTALLING THE RELAY BOX IN THE PASSENGER COMPARTMENT

- Install the relay box on the bracket
- Press the relay box forward so that the catches engage in the bracket and "click".
- Install the soundproofing panel on the driver's side.

REMOVING THE CONTROL MODULE

PREPARATIONS

CAUTION: The customer-programmed data must be read off before the control module is replaced. The information must then be entered into the new control module after it has been installed. This is performed via VIDA vehicle communication.

NOTE: The driver information module (DIM) must not be replaced at the same time. This would erase the mileage.

NOTE: Before disconnecting the control module's connector, remove fuses 11C/32, 11C/25 and 11C/21.

REMOVING THE CONNECTOR AND THE COVER

Fig. 4: Disconnecting Connector Using Pliers
Courtesy of VOLVO CARS CORPORATION

- Slacken off the screw holding the connector so that it releases from the threads. Check that the screw is free with your fingers.

NOTE: Do not damage the terminal pins.

- Use pliers to disconnect the connector. Grip the screw and pull it straight outwards so that the connector and cover follow.

Fig. 5: Identifying Relay Box In Passenger Compartment/Cargo Compartment
Courtesy of VOLVO CARS CORPORATION

- Remove all relays and shunts bridged to the control module. Note the locations.

Fig. 6: Identifying Control Module Removal
Courtesy of VOLVO CARS CORPORATION

- Release the catch on the rear. Use a screwdriver
- Lift and pull out the control module.

Fig. 7: Control Module Terminals (1 Of 2)
Courtesy of VOLVO CARS CORPORATION

Check that the control module connector is intact.

Fig. 8: Control Module Terminals (2 Of 2)
Courtesy of VOLVO CARS CORPORATION

INSTALLING THE CONTROL MODULE

- Press the control module into place so that the catch on the rear engages
- Position the connector. **Carefully** press the connector down.

NOTE: The pins are fragile. Check that the connector goes straight down into the control module.

- Tighten the screw for the connector
- Check that the connector cover is correctly positioned. Remedy if necessary.
- Install relays and shunts.
- Install the relay box.
- Install the soundproofing panel on the driver's side.

ORDERING AND PROGRAMMING SOFTWARE

Order and program software following the table below.

XC90	94382739438273

FINISHING

- Program in the data read off from the old control module (customer-programmed data for example). This is performed via VIDA vehicle communication.
- Reset the service reminder indicator (SRI). Otherwise the lamp will receive incorrect reference data. (Global time is reset when the central electronic module (CEM) is replaced.) Reset the service reminder indicator (SRI) according to **RESETTING THE SERVICE REMINDER INDICATOR (SRI)**
- Check that the control area network (CAN) is functioning. This is done by reading off the control module ID for the central electronic module (CEM), rear electronic module (REM) and engine control module (ECM) via VIDA vehicle communication.

OTHER INFORMATION

For the location of other relay and fuse boxes, see **RELAYS, FUSE BOXES AND WIRING**

CENTRAL ELECTRICAL UNIT, FUSEBOX (B5254T2; B6294T; 2003-04)

ACCESSORY ELECTRONIC MODULE (AEM), REPLACING

REMOVAL

NOTE: The graphics in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the graphics is always correct.

PREPARATORY WORK

Fig. 9: Identifying Ignition In OFF Position
Courtesy of VOLVO CARS CORPORATION

Ignition off.

Fig. 10: Identifying Floor Hatch And Floor Piece
Courtesy of VOLVO CARS CORPORATION

Fold up the floor hatch (1) in the cargo compartment.

Remove the floor piece (2).

REMOVING THE ACCESSORY ELECTRONIC MODULE (AEM)

Fig. 11: Identifying Control Module, Bracket And Screws
Courtesy of VOLVO CARS CORPORATION

Remove the screws. Disconnect the connectors.

Fig. 12: Identifying Accessory Electronic Module (AEM) And Bracket
Courtesy of VOLVO CARS CORPORATION

Remove:

- the accessory electronic module (AEM) and the bracket
- the bracket.

INSTALLATION

INSTALLING THE ACCESSORY ELECTRONIC MODULE (AEM)

Fig. 13: Identifying Control Module, Bracket And Screws
Courtesy of VOLVO CARS CORPORATION

Install:

- the control module in the bracket. Connect the connectors
- the control module and the bracket
- the screws.

ORDERING SOFTWARE

NOTE: After replacing the accessory electronic module (AEM), new software must be ordered and the module programmed.

Order the software. See 8637230 .

CENTRAL ELECTRICAL UNIT ENGINE COMPARTMENT, REPLACING

REMOVAL

PREPARATORY WORK

NOTE: As the graphics in this service information are used for different model years

and/or models, some variation may occur. However, the essential information in the graphics is always correct.

Fig. 14: Disconnecting Battery Negative Cable
Courtesy of VOLVO CARS CORPORATION

- Disconnect the battery negative lead. See **BATTERY, REPLACING** and **BATTERY, DISCONNECTING**
- Remove the power steering fluid and coolant reservoirs. Lift up and move to one side
- Remove the cover from the central electrical unit
- Remove, see **ENGINE CONTROL MODULE (ECM), REPLACING** and **TRANSMISSION CONTROL MODULE (TCM), REPLACING** .

REMOVING THE CENTRAL ELECTRICAL UNIT

Fig. 15: Identifying Central Electrical Unit And Clips
Courtesy of VOLVO CARS CORPORATION

Release the 3 clips.

Remove:

- intermediate section
- the engine cooling fan (FC) if applicable
- the 2 screws for the connector holder at the front edge. Disconnect the retaining clips for the connector holder using a screwdriver. Pull up the contact holder and the rubber grommet
- the screw at the rear edge of the bottom piece
- the tie straps for the cables
- the bottom section by pulling it backwards until the hook releases.

REMOVING THE CONNECTOR

Fig. 16: Disconnecting Connector By Releasing Catches At Front Edge
Courtesy of VOLVO CARS CORPORATION

- Remove the tie straps from the cables
- Disconnect the connector by releasing the locks on the front edge
- Pull out and remove the connector.

INSTALLATION

NOTE: For tightening torques, see TIGHTENING TORQUE .

INSTALLING THE CONNECTOR

Press the connector into the holder.

CENTRAL ELECTRICAL UNIT, INSTALLING

Install:

- the tie straps for the cables
- the bottom section. Hook into place at the front edge
- the screw in the rear edge. Tighten

- the connector holder. Press into the catch.

NOTE: The rubber grommet

- the screws
- the engine cooling fan (FC) if applicable
- the intermediate section. Check that all 3 clips have engaged.

FINISHING WORK

Install:

- see **ENGINE CONTROL MODULE (ECM), REPLACING** and **TRANSMISSION CONTROL MODULE (TCM), REPLACING**
- the cover for the central electrical unit
- the battery negative pole. Also, see **BATTERY, DISCONNECTING** .

INTEGRATED RELAY/FUSEBOX IN ENGINE COMPARTMENT

REMOVAL

PREPARATORY WORK

NOTE: As the graphics in this service information are used for different model years and/or models, some variation may occur. However, the essential information in the graphics is always correct.

Fig. 17: Disconnecting Battery Negative Cable
Courtesy of VOLVO CARS CORPORATION

Disconnect the battery negative lead. Also, see **BATTERY, DISCONNECTING** .

Fig. 18: Identifying Fusebox Cover
Courtesy of VOLVO CARS CORPORATION

Remove the cover for the integrated relay/fusebox.

REMOVING THE INTEGRATED RELAY/FUSEBOX

Fig. 19: Identifying Fuse Nuts
Courtesy of VOLVO CARS CORPORATION

- Remove the nut for the battery leads. Push the cables to one side
- Remove the screws for the rely/fuse holder. Push the lock at the front of the fusebox to one side. Lift the relay/fuse holder straight up
- Disconnect the connectors
- Remove the cable terminals for the main fuse.

REMOVING THE MAIN FUSE

- The main fuse is on the underneath of the relay/fuse holder
- Release the relay/fuse holder. See **REMOVING THE INTEGRATED RELAY/FUSEBOX**. The connectors do not need to be disconnected
- Remove the nuts for the main fuse
- Replace the fuse
- Install the nuts.

REMOVING THE CAPACITOR

Fig. 20: Disconnecting Capacitor From Lower Section/Mounting Hooks
Courtesy of VOLVO CARS CORPORATION

- The capacitor is at the bottom of the integrated relay/fusebox
- Disconnect the cable terminals, making a note of their locations
- Replace the capacitor
- Connect the cable terminals, making a note of their locations.

REMOVING THE BOTTOM SECTION

Fig. 21: Identifying Battery Leads, Screws And Nut
Courtesy of VOLVO CARS CORPORATION

Remove:

- the relay/fuse holder as above
- the air cleaner (ACL) housing
- the screws.

Fig. 22: Disconnecting Electrical Box From Spring Strut Housing
Courtesy of VOLVO CARS CORPORATION

Detach the bottom section from its mounting by the spring strut housing by pressing it in towards the engine compartment.

INSTALLATION

NOTE: For tightening torques, see TIGHTENING TORQUE .

INSTALLING THE BOTTOM SECTION

Install:

- bottom section
- the screws
- the air cleaner (ACL) housing.

INSTALLING THE RELAY/FUSE HOLDER

Fig. 23: Identifying Fuse Nuts
Courtesy of VOLVO CARS CORPORATION

Install:

- the cable terminals for the main terminals
- the relay/fuse holder. Check that the rubber seals are correctly positioned
- the screws as shown. Tighten screw **4** . Tighten to **2 Nm**
- the battery leads
- the nut for the battery leads.

FINISHING WORK

Install:

- the cover for the fusebox
- the battery negative pole. Tighten according to **TIGHTENING TORQUE** . Also, see **BATTERY, DISCONNECTING** .

MAIN FUSE CARGO COMPARTMENT, REPLACING

REMOVAL

MAIN FUSE

Fig. 24: Battery And Cargo Compartment Main Fuse
Courtesy of VOLVO CARS CORPORATION

- Remove the battery. See **BATTERY, REPLACING** .

CAUTION: When removing and installing the battery leads. See BATTERY, DISCONNECTING .

- Remove the panel. Use a screwdriver
- Remove the nut
- Remove the main fuse.

LOCATION OF MAIN FUSE, 11E

1. Decals at respective integrated relay/fusebox in the car,
2. Pocket data book,
3. Owner's Manual.

INSTALLATION

MAIN FUSE

In reverse order.

CAUTION: When removing and installing the battery leads. See BATTERY, DISCONNECTING .

RELAY ELECTRICAL ENGINE BLOCK HEATER, REPLACING

NOTE: As the graphics in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the graphics is always correct.

REMOVAL

PREPARATORY WORK

Fig. 25: Pulling Locking Plate Straight Up
Courtesy of VOLVO CARS CORPORATION

Remove the locking plate for the headlamp as shown.

Disconnect the connector.

Remove the headlamp.

REMOVING THE RELAY FOR THE ELECTRIC ENGINE BLOCK HEATER

Fig. 26: Removing Relay For Electric Engine Block Heater
Courtesy of VOLVO CARS CORPORATION

Remove:

- the tie straps
- 2 screws. Pull out the engine block heater relay
- the locking sleeves for the cable splices. Disconnect the wiring
- the engine block heater relay.

INSTALLATION

INSTALLING THE RELAY FOR THE ELECTRIC ENGINE BLOCK HEATER

Fig. 27: Installing Relay For Electric Engine Block Heater (1 Of 2)
Courtesy of VOLVO CARS CORPORATION

Connect the wiring:

- front engine block heater socket (1)
- engine block heater (2)
- passenger compartment socket (3) if applicable.

Fig. 28: Installing Relay For Electric Engine Block Heater (2 Of 2)
Courtesy of VOLVO CARS CORPORATION

Connect the ground lead (4).

Install locking sleeves for the cable splices.

Position the engine block heater relay under the plate (1).

Install the screws (2). Clamp the cables (3, 4).

FINISHING WORK

Connect the connector for the headlamp.

Install the headlamp.

Install the locking plate for the headlamp.

Test the function.

RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING

NOTE: **The graphics in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the graphics is always correct.**

EXPOSING THE INTEGRATED RELAY/FUSEBOX IN THE CARGO COMPARTMENT

Switch off the ignition.

Fig. 29: Lifting Cargo Compartment/Rear Relay/Fusebox Catch
Courtesy of VOLVO CARS CORPORATION

Remove the left side panel in the cargo compartment.

Release the integrated relay/fusebox. Lift the catch by the upper edge and angle out the integrated relay/fusebox.

Fig. 30: Cargo Compartment/Rear Relay/Fusebox Fuse Locations
Courtesy of VOLVO CARS CORPORATION

HINT: The rear panel in the side panel of the cargo compartment can be removed to change fuses.

RELAY AND FUSE LOCATION, 11D

For the location of the relays and fuses, see

1. Decals at both the integrated relay box and fusebox in the car
2. Pocket data book
3. Owner's Manual.

INSTALLING THE INTEGRATED RELAY/FUSEBOX IN THE CARGO COMPARTMENT

Align the integrated relay/fusebox in the grooves in the bracket and press into place.

Install the left side panel in the cargo compartment.

REPLACING THE REAR ELECTRONIC MODULE (REM)

The rear electronic module (REM) is a separate unit in the relay box in the cargo compartment.

CAUTION: New software can only be ordered when the control module is installed in the car. VIDA reads off the new control module identity which is required to order the correct software.

Release the relay and fuse box. See **EXPOSING THE INTEGRATED RELAY/FUSEBOX IN THE CARGO COMPARTMENT**.

REMOVING THE CONTROL MODULE

Fig. 31: Disconnecting Control Module Connector
Courtesy of VOLVO CARS CORPORATION

Unscrew the screw holding the connector so that it is free of its threads. Check that the screw is free with your fingers.

Disconnect the connector. Use an open spanner and a support.

NOTE: Do not damage the terminal pins. Always check that the control module and control module box connectors do not have bent or damaged terminals or socket/sleeves. This may have been the cause of the fault.

Fig. 32: Identifying Relay Box In Passenger Compartment/Cargo Compartment
Courtesy of VOLVO CARS CORPORATION

Remove all relays and shunts bridged to the control module. Note the locations.

Fig. 33: Identifying Control Module Removal
Courtesy of VOLVO CARS CORPORATION

Release the catch on the rear. Use a screwdriver.

Lift and pull out the control module.

CHECK

Check that the control module connectors are intact.

INSTALLING THE CONTROL MODULE

- Press the control module into place so that the catch on the rear engages
- Position the connector. **Carefully** press the connector down.

NOTE: The pins are fragile. Check that the connector goes straight down into the control module.

- Tighten the screw for the connector
- Check that the connector cover is correctly positioned. Remedy if necessary
- Install the relays and shunts. Note their locations
- Install the integrated relay/fusebox. See **INSTALLING THE INTEGRATED RELAY/FUSEBOX IN**

THE CARGO COMPARTMENT.

ORDERING SOFTWARE

Order software according to the table below.

XC90	9438285

CENTRAL ELECTRICAL UNIT, FUSEBOX (B5254T2; 2005-07)

ACCESSORY ELECTRONIC MODULE (AEM), REPLACING

see **ACCESSORY ELECTRONIC MODULE (AEM), REPLACING**

CENTRAL ELECTRICAL UNIT ENGINE COMPARTMENT, REPLACING

see **CENTRAL ELECTRICAL UNIT ENGINE COMPARTMENT, REPLACING**

CENTRAL ELECTRONIC MODULE (CEM), REPLACING

NOTE: The graphics in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the graphics is always correct.

For further information, see **DOWNLOADING SOFTWARE AND REPLACING THE CONTROL MODULE**

PREPARATORY WORK

DISCONNECTING THE BATTERY LEAD

CAUTION: The customer-programmed data must be read off before the control module is replaced. The relevant data must then be programmed into the new control module, via VIDA vehicle communication, after it has been installed.

Fig. 34: Disconnecting Battery Negative Cable
Courtesy of VOLVO CARS CORPORATION

Ignition off

Disconnect the battery negative cable. See **BATTERY, DISCONNECTING** .

NOTE: **For vehicles equipped with Volvo On Call Plus, the automatic alarm for the emergency services may deploy.**

NOTE: **The driver information module (DIM) must not be replaced at the same time. This would erase the mileage.**

REMOVAL

REMOVING THE WIPER MECHANISM AND COVER

Fig. 35: Identifying Wiper Mechanism Mounting Bolts
Courtesy of VOLVO CARS CORPORATION

Remove the wiper mechanism according to **WIPER MECHANISM WINDSHIELD, REPLACING**

Fig. 36: Identifying Wiper Mechanism Connectors
Courtesy of VOLVO CARS CORPORATION

REMOVING THE SOUNDPROOFING PANEL ON THE DRIVER'S SIDE

Fig. 37: Identifying Driver Side Soundproofing Panel
Courtesy of VOLVO CARS CORPORATION

Remove the 2 screws.

HINT: The soundproofing panel sits in a groove at the pedal box.

Remove the soundproofing panel by pulling it straight down and back.

REMOVING THE CENTRAL ELECTRONIC MODULE (CEM)

Fig. 38: Removing Central Electronic Module (CEM)
Courtesy of VOLVO CARS CORPORATION

Remove:

- the connectors
- the control module by inserting a screwdriver up between the bracket and the relay box. Twist the screwdriver so that the bracket opens out. At the same time, pull the control module out of the bracket towards the underside of the dashboard
- the control module from the bracket and pull downwards under the dashboard.

Remove the fuses from the central electronic module (CEM).

HINT: For the location of the fuses, see

- The decals by the relevant fuse box in the vehicle
- The Pocket Data booklet
- The Owner's manual.

INSTALLATION

INSTALLING THE CENTRAL ELECTRONIC MODULE (CEM)

CAUTION: The pins are fragile. Check that the connectors go straight down into the control module.

Install:

- the control module on the bracket. Press the control module forward so that the catches enter the bracket
- the connectors
- the soundproofing panel on the driver's side
- the 2 screws on top of the control module
- the 2 connectors on top of the control module.

NOTE: Ensure that the rubber seal is correctly positioned in the groove.

Install:

- the cover
- the wiper arm mechanism. See **WIPER MECHANISM WINDSHIELD, REPLACING**
- the battery negative lead. See **BATTERY, DISCONNECTING** .

FINISHING

ORDERING SOFTWARE

Order software. See 9438273 .

PROGRAMMING DATA

Program in the data read off from the old control module (customer-programmed data for example). This is performed via VIDA vehicle communication.

Reset the service reminder indicator (SRI). Otherwise the lamp will receive incorrect reference data. (Global time is reset when the central electronic module (CEM) is replaced.) Reset the service reminder indicator (SRI). See **RESETTING THE SERVICE REMINDER INDICATOR (SRI)** .

Check that the CAN-communication is functioning. This is done by reading off the control module ID for the central electronic module (CEM), rear electronic module (REM) and engine control module (ECM) via VIDA vehicle communication.

OTHER INFORMATION

For the location of other relay and fuse boxes, see **RELAYS, FUSE BOXES AND WIRING** .

INTEGRATED RELAY/FUSEBOX IN ENGINE COMPARTMENT

see **INTEGRATED RELAY/FUSEBOX IN ENGINE COMPARTMENT**

MAIN FUSE CARGO COMPARTMENT, REPLACING

see **MAIN FUSE CARGO COMPARTMENT, REPLACING**

REAR ELECTRONIC MODULE (REM), REPLACING

NOTE: **The graphics in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the graphics is always correct.**

PREPARATORY WORK

IGNITION OFF

Fig. 39: Identifying Ignition In OFF Position
Courtesy of VOLVO CARS CORPORATION

Ignition off.

REMOVAL

REMOVING THE LEFT CARGO COMPARTMENT SIDE PANEL

HINT: The rear panel in the side panel of the cargo compartment can be removed to change fuses.

Fig. 40: Locating Rear Electronic Module (REM) Behind Left-Hand Side Panel In Cargo Compartment
Courtesy of VOLVO CARS CORPORATION

Remove the left-hand side panel in the cargo compartment. See **SIDE PANEL CARGO COMPARTMENT, REPLACEMENT** .

REMOVING THE REAR ELECTRONIC MODULE (REM)

Fig. 41: Removing Rear Electronic Module (REM)
Courtesy of VOLVO CARS CORPORATION

Remove:

- the control module by lifting the catches at the upper edge and angle out
- the connectors.

NOTE: **Always check that the terminals or pins/sockets of the control module and control module box connectors are not bent or damaged. This may have been the cause of the fault.**

HINT: For the location of relays, see

- Decals at both the integrated relay box and fusebox in the car
- The Pocket Data book
- The Owner's manual.

INSTALLATION

INSTALLING THE REAR ELECTRONIC MODULE (REM)

CAUTION: The pins are fragile. Check that the connector goes straight down into the

control module.

Install:

- the connectors
- the control module in the bracket groove. Press the control module into place.

INSTALLING THE LEFT CARGO COMPARTMENT SIDE PANEL

Install the left-hand side panel in the cargo compartment. See **SIDE PANEL CARGO COMPARTMENT, REPLACEMENT** .

FINISHING

ORDERING SOFTWARE

CAUTION: New software can only be ordered when the new control module is installed in the vehicle. The new control module identity is read off by VIDA with ordering, which is required for ordering the correct software.

Order software. See 9438285 .

WIRING (2003-12)

CABLE HARNESS SRS SYSTEM, REPAIR

Special tools: see **9512785** , see **9512620** , see **9512777**

Materials: SRS system repair kit for the selected car.

NOTE: The graphics in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the graphics is always correct.

CAUTION: As the SRS system is a safety system, it is extremely important that these instructions are carefully followed when carrying out repairs in the cable harness.

CAUTION: Ensure that the new pin has the same type of surface treatment as the old.

Only special tools and materials from the SRS system repair kit for the selected car must be used. Choose a repair location where there is plenty of room to guarantee that work is of the highest quality.

The cables should always be connected color to color. In the cases where the repair terminals have a completely orange cable then this is always fitted to terminal No. 1. In the cases where the repair terminals have a blue and a brown cable, then blue is No. 1 and brown is No. 2.

WARNING: Do not carry out any work on the SRS cable until the connector has been disconnected from the relevant airbag or seat belt tensioner. There is otherwise a risk of static electricity deploying the component.

BEFORE WORK IN THE CABLE HARNESS

Always disconnect the battery. See **BATTERY, DISCONNECTING**

Disconnect the relevant ignition cable. See **IGNITER WIRE CONNECTOR**

CUT AND STRIP THE CABLES

Fig. 42: Cables Cut With Approximately 40 mm Between Splices
Courtesy of VOLVO CARS CORPORATION

Release the cable from the cable harness so that you have plenty of room in which to work.

NOTE: **The maximum permitted twinned length after splicing is 100 mm. This is to prevent interference problems.**

Cut the cables so that there is approximately 40 mm between the splices (center to center) (A).

Fig. 43: Identifying Cable Strip Length
Courtesy of VOLVO CARS CORPORATION

Strip the insulation on the 4 cable ends by 5.0 mm. Use pliers see **9512620** .

Twin the cable cores on the stripped ends of the cables.

CAUTION: Ensure that all the cores are twinned.

CRIMPING THE SLEEVE

Fig. 44: Crimping Examples
Courtesy of VOLVO CARS CORPORATION

Install a crimp sleeve from the repair kit in the press tool: see **9512785**

Squeeze the crimping tool a little to secure the crimping sleeve in the tool.

Insert the cable as far into the crimp sleeve as it will go.

Ensure that the cable insulation does not get into the crimping area or that stripped cable does not extend outside the sleeve.

Press the pliers' handles as far as they will go to ensure a proper joint. The pliers release automatically.

Check by hand that the crimping sleeve is secure.

Prepare the remaining cable ends in the same way.

Fig. 45: Crimping Cable Terminal
Courtesy of VOLVO CARS CORPORATION

Fig. 46: Crimped Wire
Courtesy of VOLVO CARS CORPORATION

HEAT THE HEAT-SHRINK TUBING

Fig. 47: Heating Heat-Shrink Tubing
Courtesy of VOLVO CARS CORPORATION

Hold a putty knife or other suitable protection behind the heat-shrink tubing to shield the surrounding components from heat.

Heat the sleeve using the hot air gun see **9512777** and a suitable nozzle. It is very important that the heat-shrink tubing is thoroughly shrunk around the cable. It should be possible to, see some adhesive that has squeezed out around the cable.

Fig. 48: Checking Shrinking Results
Courtesy of VOLVO CARS CORPORATION

REINSTALLING AND CHECKING

Secure the new SRS cable next to the old cable using a tie strap or similar. Reinstall the connectors.

Reconnect the battery. See **BATTERY, DISCONNECTING**

Turn the ignition to position 2.

Check the SRS system to ensure that the warning lamp comes on and stays on while the SRS system performs a self-test. The lamp must go out after a few seconds. If not, perform fault-tracing according to VIDA vehicle communication.

If everything is working, reinstall other components.

Test drive the vehicle.

CABLE SHOE

NOTE: The graphics in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in

the graphics is always correct.

INFORMATION

Fig. 49: Identifying Pre-Crimped Cables
Courtesy of VOLVO CARS CORPORATION

NOTE: **In 2003 the cable terminal with a pre-crimped cable section was introduced to the Volvo range as shown. This method applies for repairs with this type of cable terminal.**

CAUTION: Ensure that the new pin has the same type of surface treatment as the old.

CAUTION: For repairing SRS wiring, see CABLE HARNESS SRS SYSTEM, REPAIR.

PREPARATORY WORK

Fig. 50: Disconnecting Battery Negative Cable
Courtesy of VOLVO CARS CORPORATION

Disconnect the battery negative cable. See **BATTERY, DISCONNECTING** .

REMOVAL

CAUTION: Disconnect and work with only one cable at a time to minimize the risk of mixing them up.

Fig. 51: Spreading Out Splice Points
Courtesy of VOLVO CARS CORPORATION

Disconnect the cable terminal that is to be replaced. See **CONNECTORS, REPAIR**.

HINT: If several cable terminals are to be replaced at the same time, spread out the splice points, as shown.

Cut the cable at a suitable point. Note the length of the new cable terminal cable.

INSTALLATION

Fig. 52: Cable Cut
Courtesy of VOLVO CARS CORPORATION

Select a cable terminal with the same area as the old one.

Select a butt connector that corresponds to the cable area. The butt connector is the same color as the cable terminal cable.

Cut the new cable terminal cable to a suitable length.

Splice the cables. See **JOINING THE CABLES**.

FINISHING WORK

Reinstall the cable harness. If necessary use a crimping sleeve and tie straps.

Connect the battery negative lead. See **BATTERY, DISCONNECTING** .

Test the function.

CONNECTORS, REPAIR

NOTE: **As the graphics in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the graphics is always correct.**

CONNECTOR

The commonest types of connector and central electrical unit in the vehicle are listed here.

For more information about secondary locking, primary locking, terminal removal tools, etc., see the link by each type of connector.

NOTE: **Before working in the connector, disconnect the battery negative terminal, see BATTERY, DISCONNECTING .**

Fig. 53: Disconnecting Battery Negative Cable
Courtesy of VOLVO CARS CORPORATION

NOTE: **When several tools are recommended for the same type of connector, choose the correct tool according to the size of the lock.**

Fig. 54: Connector (1 Of 10)

Slide the catch in the direction of the arrow, as shown.

CONNECTOR CENTRAL ELECTRICAL UNIT ENGINE/TRANSMISSION CONTROL MODULE (ECM/TCM), REPAIR

Special tools: see **9512812** , see **9512637** .

NOTE: **As the graphics in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the graphics is always correct.**

CENTRAL ELECTRICAL UNIT (ECM/TCM)

REPLACING CABLE TERMINALS

Expose the central electrical unit.

EXTRACT THE CABLE TERMINAL, 70 PIN SWITCH

Fig. 93: Identifying Insulating Plate From Central Electrical Unit
Courtesy of VOLVO CARS CORPORATION

Remove the insulating plate from the central electrical unit by releasing the catch at the same time as the insulating plate is slid out.

HINT: Use a radio screwdriver.

CONNECTOR WITH LOCK MECHANISM

Fig. 94: Identifying Lock Mechanism Removal
Courtesy of VOLVO CARS CORPORATION

Release the catch and slide out the lock mechanism.

HINT: Use a radio screwdriver.

CONNECTOR WITH PASSIVE LOCKING

Fig. 95: Identifying Cable And Cable Terminal Removal
Courtesy of VOLVO CARS CORPORATION

Separate the connector.

HINT: Use a radio screwdriver.

Press in the locking tab on the cable terminal and carefully pull out the cable and the cable terminal.

HINT: Use tool see 9512812 or see 9512637 .

EXTRACT THE CABLE TERMINAL, 6 PIN SWITCH

Fig. 96: Identifying Connector Removed From Central Electrical Unit
Courtesy of VOLVO CARS CORPORATION

Remove the connector from the central electrical unit by releasing the catches at the same time the connector is slid out on the cable side.

HINT: Use a radio screwdriver.

Open the secondary lock.

Remove the cable terminal.

HINT: Use tool see 9512631 .

Fig. 97: Identifying Cable Terminal Insertion
Courtesy of VOLVO CARS CORPORATION

INSTALLATION

INSERT THE NEW CABLE TERMINAL

Insert the new cable terminal in the receptacle housing from the cable side (in the correct position). A click is heard when it hooks into place.

Carefully pull on the cable to check that it is firmly attached.

REASSEMBLE THE CONNECTOR

Assemble the secondary locks and slide the connector into the central electrical unit.

CONNECTOR RELAY BOX, REPAIR

Special tools: see **9512633** , see **9512639** , see **9512852** .

NOTE: **As the graphics in this service information are used for different model years and/or models, some variation may occur. However, the essential information in the graphics is always correct.**

PREPARATORY WORK

Fig. 98: Identifying Relay Box In Passenger Compartment/Cargo Compartment
Courtesy of VOLVO CARS CORPORATION

Expose the relevant relay box.

Remove the relevant relays, noting their position.

DISMANTLING

SECONDARY LOCK

Fig. 99: Identifying Relevant Secondary Lock Released By Adjusting Locks With An Electrician's Screwdriver
Courtesy of VOLVO CARS CORPORATION

Release the relevant secondary lock by adjusting the locks with an electrician's screwdriver, as shown.

PRIMARY LOCK

Fig. 100: Identifying Cable Pulled Backwards
Courtesy of VOLVO CARS CORPORATION

Use tools see **9512633** , see **9512639** to remove the primary lock, as shown.

At the same time pull the cable carefully backwards.

Fig. 101: Alternatively Using Tool 951 2852
Courtesy of VOLVO CARS CORPORATION

Alternatively use tool see **9512852** as shown.

INSTALLATION

PRIMARY LOCK

Check that the cable terminal is undamaged.

Press the cable terminal into the housing.

Check that the cable terminal is properly locked by pulling carefully on the cable.

THE SECONDARY LOCK

Press the secondary lock into place.

FINISHING WORK

Install the relays.

NOTE: Take care with the positioning.

Install the relevant relay box.

CONNECTOR SEALED, REPAIR

Special tools: see **9512631** .

NOTE: **As the graphics in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the graphics is always correct.**

CONNECTOR, DISMANTLING

The connector has no secondary lock.

PRIMARY LOCK

Fig. 102: Identifying Tool 951 2631 To Remove Primary Lock
Courtesy of VOLVO CARS CORPORATION

Use tool see **9512631** to remove the primary lock, as shown.

At the same time pull the cable carefully backwards.

Fig. 103: Identifying Cable Terminal Insertion
Courtesy of VOLVO CARS CORPORATION

CONNECTOR, ASSEMBLING

PRIMARY LOCKING

Check that the cable terminal is undamaged.

Press the cable terminal into the housing.

Check that the seal is correctly positioned and that the cable terminal is properly locked by pulling carefully on the cable.

CONNECTOR FUSE HOLDER, REPAIR

Special tools: see **9512633** , see **9512639** , see **9512852** .

NOTE: **As the graphics in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the graphics is always correct.**

PREPARATORY WORK

Expose the relevant fusebox.

Remove the fuses. Note the positions of the fuses.

DISMANTLING

SECONDARY LOCK

Releases the catches for the secondary lock.

Slide the secondary lock to one side to access the primary lock, as shown.

Fig. 104: Identifying Removal Of Fuse Holder From Cargo Compartment
Courtesy of VOLVO CARS CORPORATION

Fuse holder cargo compartment.

Fig. 107: Identifying Cable Pulled Backwards
Courtesy of VOLVO CARS CORPORATION

Use tools see **9512633** , see **9512639** to remove the primary lock, as shown.

NOTE: **The relay holders can be connected and several locks may need to be adjusted at the same time.**

At the same time pull the cable carefully backwards.

Fig. 108: Alternatively Using Tool 951 2852
Courtesy of VOLVO CARS CORPORATION

Alternatively use tool see **9512852** as shown.

INSTALLATION

PRIMARY LOCK

Check that the cable terminal is undamaged.

Press the cable terminal into the housing.

Check that the cable terminal is properly locked by pulling carefully on the cable.

SECONDARY LOCK

Slide back the secondary lock.

FINISHING WORK

Install the relays.

NOTE: Take care with the positioning.

Reinstall the central relay box.

CONNECTOR SUPPLEMENTAL RESTRAINT SYSTEM MODULE (SRS), REPAIR

Special tools: see **9512812** , see **9512637** .

NOTE: As the graphics in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the graphics is always correct.

CONNECTOR, DISMANTLING

SECONDARY LOCK

Fig. 109: Identifying Receptacle Housings Removal
Courtesy of VOLVO CARS CORPORATION

Press in the active catches on both sides of the socket housing and slide out the receptacle housings.

CAUTION: Disconnect and work with only one cable at a time to minimize the risk of mixing them up.

PRIMARY LOCK

Fig. 110: Identifying Locking Tab Pressed In On Cable Terminal Using Special Tool 9512812
Courtesy of VOLVO CARS CORPORATION

Press in the locking tab on the cable terminal and carefully pull out the cable and the cable terminal. Use tool see **9512812** or tool see **9512637** , as shown.

CONNECTOR, ASSEMBLING

PRIMARY LOCKING

Check that the cable terminal is undamaged.

Press the cable terminal into the housing.

Check that the cable terminal is properly locked by pulling carefully on the cable.

SECONDARY LOCKING

Press the secondary lock into place.

CONNECTOR BRAKE CONTROL MODULE (BCM), REPAIR

Special tools: see **9512636** , see **9512639**

NOTE: **As the graphics in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the graphics is always correct.**

CONNECTOR, DISMANTLING

SECONDARY LOCK

Fig. 111: Identifying Secondary Lock Released Using Electrician's Screwdriver
Courtesy of VOLVO CARS CORPORATION

Release the secondary lock. Use electrician's screwdriver as shown.

CAUTION: **Disconnect and work with only one cable at a time to minimize the risk of mixing them up.**

PRIMARY LOCK

Fig. 112: Identifying Tools 951 2636 Or 951 2639 To Remove Primary Lock
Courtesy of VOLVO CARS CORPORATION

Use tools see **9512636** or see **9512639** to remove the primary lock, as shown.

At the same time pull the cable carefully backwards.

CONNECTOR, ASSEMBLING

NOTE: **Wheel sensor cables are twisted pair (positive and negative signal) cables for each wheel. It is important that paired cables are twinned in the same way when they are reinstalled in the connector. The cables must be twisted approximately 3 times per 100 mm.**

PRIMARY LOCK

Check that the cable terminal is undamaged.

Press the cable terminal into the housing.

Check that the cable terminal is properly locked by pulling carefully on the cable.

SECONDARY LOCK

Press the secondary lock into place.

CONNECTOR SEALED, REPAIR

Special tools: see **9512632** , see **9512639** , see **9512852** , see **9512853** .

NOTE: **As the graphics in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the graphics is always correct.**

CONNECTOR, DISMANTLING

SECONDARY LOCK

Fig. 113: Identifying Secondary Lock Pulled Out Using Tool 951 2853
Courtesy of VOLVO CARS CORPORATION

Open the catches and pull out the secondary lock, use tool see **9512853** or an electrician's screwdriver, as shown.

PRIMARY LOCK

Fig. 114: Identifying Cable Pulled Backwards
Courtesy of VOLVO CARS CORPORATION

Use tools see **9512632** , see **9512639** to remove the primary lock, as shown.

At the same time pull the cable carefully backwards.

Alternatively use tool see **9512852** as shown.

NOTE: Tool see 9512852 can only be used for socket housings.

CONNECTOR, ASSEMBLING

PRIMARY LOCKING

Fig. 115: Alternatively Using Tool 951 2852
Courtesy of VOLVO CARS CORPORATION

Check that the cable terminal is undamaged.

Press the cable terminal into the housing.

Check that the seal is correctly positioned and that the cable terminal is properly locked by pulling carefully on the cable.

CONNECTOR DATA LINK CONNECTOR (DLC), REPAIR

Special tools: see **9512636**

NOTE: **As the graphics in this service information are used for different model years and/or models, some variation may occur. However, the essential information in the graphics is always correct.**

DATA LINK CONNECTOR (DLC), DISMANTLING

Expose the data link connector (DLC).

SECONDARY LOCK

Fig. 116: Identifying Secondary Lock Pulled Out To Side
Courtesy of VOLVO CARS CORPORATION

Pull the secondary lock out to the side. Use an electrician's screwdriver, as shown.

Fig. 117: Identifying Two Sizes Of Cavity Opening
Courtesy of VOLVO CARS CORPORATION

Use tool see **9512636** to remove the cable terminal lock, as shown.

At the same time pull the cable carefully backwards.

DATA LINK CONNECTOR, ASSEMBLING

PRIMARY LOCK

Fig. 118: Identifying Cable Pulled Backwards
Courtesy of VOLVO CARS CORPORATION

Check that the cable terminal is undamaged.

Press the cable terminal into the housing.

Check that the cable terminal is properly locked by pulling carefully on the cable.

SECONDARY LOCK

Press the secondary lock into place.

FIBER OPTIC CABLE HARNESS, REPAIRING

REMOVAL AND INSTALLATION

NOTE: **As the graphics in this service information are used for different model years and/or models, some variation may occur. However, the essential information in the graphics is always correct.**

Fig. 119: MOST Bus (Media Oriented System Transportation) Communication Diagram
Courtesy of VOLVO CARS CORPORATION

The components in the infotainment system are part of an optical network, known as the MOST bus. (Media Oriented System Transportation). The network consists of fiber optics (POF = Polymer Optical Fibers), special connectors for fiber optics and MOST nodes, i. e. control modules which are connected to the MOST bus.

Data is transmitted via the fiber optics, for example music, in the form of light signals. The MOST bus is a ring which must be unbroken for it to work. None of the infotainment system will work if an optical fiber breaks or if a connector is disconnected. The ends of the fibers must also be clean to allow the light to pass.

Fig. 120: Identifying Maximum Bend Radius Of Optic Cable
Courtesy of VOLVO CARS CORPORATION

A fiber requires a larger bend radius than a copper cable. The bend radius must not be less than **25 mm** . If the fiber bends too much, not enough light will be let through.

NOTE: **Fiber optics must not be spliced. Damaged fiber optics can be repaired if there is sufficient length remaining to install a new ferrule (4). If the remaining fiber is not long enough, a new fiber optic must be routed parallel to the damaged fiber.**

NOTE: **Fiber optics are sensitive to bending and pinching. Be careful when routing and securing.**

DISASSEMBLING THE CONNECTOR (2)

Fig. 121: Identifying Catch Pressed Out With Screwdriver
Courtesy of VOLVO CARS CORPORATION

NOTE: **There is one fiber for the input and one for the output signal. The system will not work if the are interchanged.**

Press out the catch (1) using a screwdriver.

Fig. 122: Identifying Catches Opened With Screwdriver To Pull Out Ferrule
Courtesy of VOLVO CARS CORPORATION

Open the catches (3) using a screwdriver.

Pull out the ferrule (1). Make a note of its location.

DISASSEMBLING THE COMBINED CONNECTOR (OPTIC AND ELECTRICAL CONDUCTOR) (1)

Fig. 123: Disassembling Combined Connector
Courtesy of VOLVO CARS CORPORATION

Release the lock using a screwdriver. Remove the inner section (2).

Remove the ferrule. See **DISASSEMBLING THE CONNECTOR (2)**

INSTALLING THE FERRULE

Fig. 124: Identifying Fiber Optic Cable Stripped With Tool 9512868 (1 Of 2)
Courtesy of VOLVO CARS CORPORATION

Cut the required length (+10 mm) of fiber optic.

Strip the fiber optic. Use tool see **9512868** as shown.

Fig. 125: Identifying Fiber Optic Cable Stripped With Tool 9512868 (2 Of 2)
Courtesy of VOLVO CARS CORPORATION

Strip the fiber optic. Use tool see **9512868** as shown.

Fig. 126: Aligning Ferrule Using Tool 9512869
Courtesy of VOLVO CARS CORPORATION

Align the ferrule. Use tool see **9512869** as shown.

Fig. 127: Ensuring Ferrule Is Edge To Edge With Fiber
Courtesy of VOLVO CARS CORPORATION

Check that the ferrule is secure and is edge to edge with the fiber.

ASSEMBLING THE CONNECTOR

Fig. 128: Identifying Ferrule Pressed Into Place In Connector
Courtesy of VOLVO CARS CORPORATION

NOTE: **There is one fiber for the input and one for the output signal. If they are mixed up the system will not work.**

Press the ferrule (1) into place in the connector (2).

Fig. 129: Identifying Installation Of Catch
Courtesy of VOLVO CARS CORPORATION

Install the catch (1).

ASSEMBLING THE COMBINED CONNECTOR (2 OPTIC AND 4 ELECTRICAL CONDUCTORS)

Install the ferrule. See **ASSEMBLING THE CONNECTOR**.

Fig. 130: Identifying Inner Section Pressed Into Place In Combined Connector
Courtesy of VOLVO CARS CORPORATION

Press the inner section into place in the combined connector.

FINISHING WORK

Check the repair. See **DIAGNOSTIC INSTRUCTIONS - FIBER OPTIC CABLE**.

DIAGNOSTIC INSTRUCTIONS - FIBER OPTIC CABLE

CHECK

NOTE: Check that special tool see 9512867 is working before using it. This is carried out as follows.

- Select the desired socket for connection by setting the SELECTOR SWITCH to position 2+0 or 2+4
- Connect a suitable optical test cable, with the instrument supplied, to the selected socket
- Select visual indication (green lamp - LED) or sound indication (buzzer - BEEP) by setting the right-hand BEEP/LED switch to the desired position
- Set the OFF/ON switch on the special tool to **ON** . The red POWER ON lamp must light.
- Press the red button (2+0 TEST or 2+4 TEST) on the lower section of the special tool which corresponds to a connected test cable. The unit now transmits a light signal through the test cable

- The transmitted signal will be received as long as there is now a complete optical loop. If visual indication is selected, the green lamp (Rx) will light to indicate that the signal has been received. If sound indication is selected the buzzer will sound to indicate that the signal has been received
- When the check is complete, set the OFF/ON switch on the special tool to **OFF** .

The following must be carried out after repairs, checks or replacement of fibre optic wiring.

- Connect the desired connector on the MOST cable to the relevant socket on the special tool
- Select the socket which is connected by setting the SELECTOR SWITCH to position 2+0 or 2+4
- Set the OFF/ON switch on the special tool to **ON** . The red POWER ON lamp must light
- Activate the Infotainment system.

HINT: If the infotainment system has been activated and there is not an open-circuit in the fibre optic network, the display on the infotainment control module (ICM) must be lit.

HINT: It is also possible to check visually if there is a light signal in the MOST cable from a control module in the network to the connector for the next control module without switching on the ignition. This is done by connecting the special tool to the connector on the MOST cable at the relevant control module.

- Select the socket which is connected on the special tool by setting the SELECTOR SWITCH to position 2+0 or 2+4
- Disconnect the MOST cable from the next control module
- Set the OFF/ON switch on the special tool to **ON** . The red POWER ON lamp must light.
- Press the red button (2+0 TEST or 2+4 TEST) on the lower section of the special tool which corresponds to a connected MOST cable. The special tool now transmits a light signal through the cable. Check that there is a red light at the next connector on the MOST cable
- When the check is complete, set the OFF/ON switch on the special tool to **OFF** .

NOTE: The visual check is not a verification of the function of the system. However the strength of the light signal must exceed a certain level for there to be full functionality in the system.

JOINING THE CABLES

CONNECTING

See information about SRS cables: **CABLE HARNESS SRS SYSTEM, REPAIR**

Perform battery disconnection. See **BATTERY, DISCONNECTING**

see information about cable terminals surface treatment. See **CABLE TERMINALS SURFACE TREATMENT**

WIRING (B5254T2, AW50/51 AWD; 2003-07)

CONNECTORS, TRANSMISSION, DISCONNECTING/CONNECTING

NOTE: **As the graphics in this service information are used for different model years and/or models, some variation may occur. However, the essential information is always correct.**

DISASSEMBLY

Fig. 140: Identifying Connectors For Transmission Sensors And Solenoids
Courtesy of VOLVO CARS CORPORATION

Transmission input and output speed sensors.

Gear-shift position sensor.

Oil temperature sensor solenoids: SLU, SLT and SLS.

Solenoids S1 - S5.

Unhook the mounting with the connectors for the transmission from the bracket for the air cleaner (ACL) housing.

Separate the connectors.

REASSEMBLY

Connect the connectors. Ensure that the catches for the connectors are in their positions

Install the mounting on the bracket for the air cleaner (ACL) housing.

TEMPERATURE SENSOR FLUID, TRANSAXLE, (TFT)

Special tools:

see **9985972**

see **9995185**

see **9995460**

see **9995477**

see **9995562**

see **9995716**

see **9995972**

see **9997070**

see **9997077**

NOTE: **As the graphics in this service information are used for different model years and/or models, some variation may occur. However, the essential information is always correct.**

REMOVAL

PREPARATIONS

Fig. 141: Air Cleaner (ACL) Housing
Courtesy of VOLVO CARS CORPORATION

Switch off the ignition.

Removing the air cleaner (ACL) housing

Remove the air cleaner housing ACL assembly with the intake pipe.

REMOVING THE GEAR SELECTOR CABLE FROM THE LEVER ON THE GEARBOX

Fig. 142: Detaching Cable From Lever Using Special Tool
Courtesy of VOLVO CARS CORPORATION

Remove the mechanical transmission cable from the lever on the transmission. Use jimmy bar see **9997077** .

Unhook the mounting with the connectors for the gearbox from the bracket for the air cleaner (ACL) housing.

REMOVING THE LEVER ON THE GEAR SHIFT LINKAGE ROD

Fig. 143: Identifying Lever On Gear Shift Linkage Rod
Courtesy of VOLVO CARS CORPORATION

Remove:

- the lever on the gear shift linkage rod
- the screw for the gear selector sensor and cable harness.

Twist out the tab on the cable harness holder.

INSTALLING THE LIFTING BEAMS AND LIFTING HOOKS ON THE ENGINE LIFTING LUGS

Fig. 144: Identifying Fixture Kit, Lifting Beam And Lifting Hooks
Courtesy of VOLVO CARS CORPORATION

NOTE: The front lifting beam must be equipped with fixture kit see 9997070 as shown.

Position lifting beam see **9995716** on the wheel arch and directly above the engine lifting eyelets on the left and right-hand sides.

Fasten lifting hooks see **9995460** and see **9995185** to the engine lifting lugs. Tighten to light contact.

Raise the car

REMOVING THE SUB-FRAME

Remove the sub-frame. See **SUB-FRAME FRONT, REPLACING (2003-06)** .

DRAINING GEARBOX FLUID

Fig. 145: Control System Cover, Harness Clamp, Cooler Return Line And Screws
Courtesy of VOLVO CARS CORPORATION

Place a container underneath the gearbox. Drain the oil. Measure and note the volume of oil.

Then tighten the plug. Tighten to 40 Nm. Remove the cable harness clamp on the control system cover.

Disconnect the ground lead from the gearbox. Tie up the cable harness and ground lead.

Disconnect the oil cooler return line from the control system cover. Disconnect the oil cooler pipe and hose from the gearbox. Move the pipe to one side. Seal the hole in the gearbox with a plastic plug.

REMOVING THE CONTROL SYSTEM COVER

Fig. 146: Cleaning Sealing Compound From Threads Using A Tap
Courtesy of VOLVO CARS CORPORATION

Remove the Torx TX40 screws for the control system cover.

Clean the sealing compound from the threads.

Use tap M8 x 1.25.

Remove the cover. Use joint wedge see **9995477** .

Carefully tap it in between the cover and gearbox so as not to bend the seal flange on the cover.

Clean the gasket residue from the cover and the gearbox.

REMOVING THE CABLE HARNESS

Fig. 147: Identifying Oil Temperature Sensor And Holder Screw
Courtesy of VOLVO CARS CORPORATION

Remove:

- the connectors for the solenoid valves
- the screw for the oil temperature sensor holder.

Remove the sensor from the control system.

Remove:

- the cable harness from the holders on the control system
- the cable harness.

INSTALLATION

NOTE: For tightening torques, see TIGHTENING TORQUE .

CONNECTING THE CABLE HARNESS

Fig. 148: Identifying Oil Temperature Sensor And Holder Screw
Courtesy of VOLVO CARS CORPORATION

Lubricate the O-rings for the cable harness grommet and the oil temperature sensor with automatic gearbox fluid.

Install:

- the cable harness. Connect the connectors to the solenoids
- the oil temperature sensor with the holder and screw. Tighten to **10 Nm**
- the cable harness on the holder. Check that the cable harness is correctly positioned.

SEALING THE COVER

Fig. 149: Applying Sealant To Cover
Courtesy of VOLVO CARS CORPORATION

Check that the mating surface for the cover is level.

Wipe the cleaned mating surfaces on the cover and gearbox. Use methylated spirit.

NOTE: Ensure that no dirt gets into the gearbox.

Apply a bead of sealing compound, approximately 3 mm thick, to the cover. P/N 1161409-6. Apply the compound around the screw holes.

INSTALLING THE CONTROL SYSTEM COVER

Fig. 150: Control System Cover, Harness Clamp, Cooler Return Line And Screws
Courtesy of VOLVO CARS CORPORATION

Reinstall the control system cover on the gearbox. Tighten the screws alternately. Tighten to **12 Nm** . Torx TX 40.

Install:

- the oil pipe on the gearbox with a new O-ring
- the return line to the control system cover
- the cable harness to the holder on the cover
- the ground lead for the gearbox.

INSTALLING THE SUB-FRAME

Fig. 151: Gear-Shift Position Sensor Screw And Gear Shift Linkage Rod
Courtesy of VOLVO CARS CORPORATION

Install the sub-frame. See **SUB-FRAME FRONT, REPLACING (2003-06)** .

Remove the lifting beams and lifting hooks

Twist in the tab on the cable harness holder.

Install:

- the screw for the gear-shift position sensor and holder. Tighten to **25 Nm**
- the lever for the gear shift linkage rod. Tighten the nut. Tighten to **16 Nm**
- the mechanical gearbox cable on the lever.

INSTALLING THE AIR CLEANER (ACL) HOUSING

Fig. 152: Air Cleaner (ACL) Housing
Courtesy of VOLVO CARS CORPORATION

Install the air cleaner (ACL) housing, including all hoses and electrical terminals. See **GEAR SELECTOR CABLES, REPLACING** .

Top up with new oil, part no. 116 1540-8, using the same quantity that was drained earlier. See **TRANSMISSION FLUID, REPLACING** . Top up and check the oil level. See **OIL LEVEL, CHECKING** .

NOTE: After replacing the transmission oil, the "Transmission oil change" counter must be reset. See TRANSMISSION FLUID, REPLACING .

DIAGNOSTIC TROUBLE CODES (DTCS)

Check any diagnostic trouble codes (DTCs).

WIRING (B5254T2, AW55-50/51SN; 2004-07)

SIDE COVER, GEARBOX, REMOVING

See **SIDE COVER TRANSMISSION, REMOVING** .

REMOVING THE CABLE HARNESS

Fig. 153: Identifying Removing/Installing Cable Harness
Courtesy of VOLVO CARS CORPORATION

Remove:

- the connectors. No marking is necessary. Each connector is designed for only one component
- the cable harness from its clips and holder
- the large connector. Bend it down slightly and pull it straight out.

INSTALLING THE CABLE HARNESS

Fig. 154: Identifying Removing/Installing Cable Harness
Courtesy of VOLVO CARS CORPORATION

Install:

- the large connector
- the connectors on the relevant switches
- the cable harness in the clips and holder
- the temperature sensor in the clip.

INSTALLING THE SIDE COVER ON THE GEARBOX

See **SIDE COVER TRANSMISSION, INSTALLING** .

WIRING (B8444S, TF-80SC AWD; 2005-11)

#29	#D29	Twilight sensor	U_{low} /U_{low}	U=0.25-4.75V	-
#30	#D30	Sun sensor	U_{low} /U_{low}	U=0.25-4.75V	-
#31	#D31	Communication CAN_H high speed network	The voltage is 2.0-3.5 V during communication		-
#32	#D32	Communication CAN_H high speed network	The voltage is 2.0-3.5 V during communication		-
#33	#D33	Communication CAN_H high speed network	The voltage is 2.0-3.5 V during communication		OBD out
#34	#D34	Communication CAN_H low speed network	The voltage is 2.0-3.5 V during communication		-
#35	#D35	Communication CAN_H low speed network	The voltage is 2.0-3.5 V during communication		-
#36	#D36	Communication CAN_H low speed network	The voltage is 2.0-3.5 V during communication		-

#37	#D37	Communication CAN_H low speed network	The voltage is 2.0-3.5 V during communication		Via SRS
#38	#D38	Communication CAN_H low speed network	The voltage is 2.0-3.5 V during communication		Via UEM
#39	#D39	Communication CAN_H low speed network	The voltage is 2.0-3.5 V during communication		Via DDM
#40	#D40	Communication CAN_H low speed network	The voltage is 2.0-3.5 V during communication		OBD out
#41	#D41	Volcano Lite CAN H	The voltage is 8.5-9.5 V during communication		-
#42	#D42	The sun sensor, twilight sensor and alarm LED share a common ground	U_{low} /U_{low}	U_{low} /U_{low}	-
#43	#D43	Fuel level sensor, left-hand side (+). Switched signal, 5/35 ms.	U~U_{low}	U=0.54-3.96 V	Full: 0.54 V Empty: 3.96 V
#44	#D44	Fuel level sensor, right-hand side (+). Switched signal, 5/35 ms.	U~U_{low}	U=0.54-3.96 V	Full: 0.54 V Empty: 3.96 V
#45	#D45	Fuel level sensor common ground	U_{low} /U_{low}	U_{low} /U_{low}	-
#46	#D46	Communication CAN_L high speed network	The voltage is 1.5-2.5 V during communication		-
#47	#D47	Communication CAN_L high speed network	The voltage is 1.5-2.5 V during communication		-
#48	#D48	Communication CAN_L high speed network	The voltage is 1.5-2.5 V during communication		OBD
#49	#D49	Communication CAN L low speed network	The voltage is 1.5-2.5 V during communication		-
#50	#D50	Communication CAN L low speed network	The voltage is 1.5-2.5 V during communication		-
#51	#D51	Communication CAN L low speed network	The voltage is 1.5-2.5 V during communication		-

#52	#D52	Communication CAN L low speed network	The voltage is 1.5-2.5 V during communication		Via SRS
#53	#D53	Communication CAN L low speed network	The voltage is 1.5-2.5 V during communication		Via UEM
#54	#D54	Communication CAN L low speed network	The voltage is 1.5-2.5 V during communication		Via DDM
#55	#D55	Communication CAN L low speed network	The voltage is 1.5-2.5 V during communication		OBD out
#56	#D56	IMMO Data	U_{low} /U_{low}	The voltage is 0.5-2.5 V during communication	Antenna ring/lighting ignition switch
#57	#D57	IMMO Clock	U_{low} /U_{low}	The voltage is 0.5-2.5 V during communication	Antenna ring/lighting ignition switch
#58	#D58	LIN bus 2	During communication the voltage is 0 V - U_{bat}		SWM/SAS
#59	#D59	Speed signal	U_{low}	U_{low} -U_{bat}	Output signal Frequency signal, increases with speed
#60	#D60	50-supply (Power supply from ignition switch)	U_{bat} (Key in position III); U_{low} otherwise		-

SIGNAL DESCRIPTION, COMBUSTION PREHEATER MODULE (CPM) (2005-12)

SIGNAL SPECIFICATION

All values given below are between the respective terminal in column 1 and terminal #3 (power ground) unless otherwise stated in brackets after the entry. Control module terminals #1-#16 correspond to terminals #1-#16 on the breakout box.

NOTE: **It is important to connect the breakout box and check the ground terminals before taking readings.**

U=	DC voltage in volts (V)	U_{AC} =	AC voltage in volts (V)
U_{bat} =	Battery voltage (V)	f =	Frequency in Hertz (Hz)
U_{low} =	Voltage approximately 0 V	% duty =	Duty cycle (pulse ratio) as a percentage (%)
t =	Time in milliseconds (ms)	-	-

Terminal	Signal type	Ignition on	Engine idling	Other
#1	Glow plug signal	Glow plug off: $U=U_{low}$ Glow plug on: Pulse ratio (% duty) > 0%		Pulse ratio (% duty) increases with glow plug intensity.
#2	-	-		-
#3	Power ground (Measured to the battery negative terminal)	U_{low}		-
#4	Signal ground, engine coolant temperature sensor and flame sensor	U_{low}		-
#5	-	-		-
#6	Communication cable for the central electrical module (CEM)	-	Digital signal	-
#7	-	-	-	-
#8	Flame sensor signal	Flame not lit: Uapprox.5 V Flame lit: U<1.5 V		-
#9	30-supply (Power supply from battery)	U_{bat}		-
#10	Combustion fan control signal	Combustion fan off and power supply off: U_{low} Combustion fan off and power supply on: U_{bat} Fan on: Pulse ratio (% duty) > 0%		The pulse ratio (% duty) increases with fan speed.
#11 Model year - 2001	Power supply, combustion fan, fuel pump (FP) and water pump	Power supply off: U_{low} Power supply on: U_{bat}		-
#11 Model year 2002-	Power supply, combustion fan and water pump	Power supply off: U_{low} Power supply on: U_{bat}		-
#12	Water pump control signal	Water pump off and power supply off: U_{low} Water pump off and power supply on: U_{bat} Water pump on and power supply on: U_{low}		-
#13	Fuel pump control signal	Fuel pump off: f=0 Hz Fuel pump on: f>0 Hz		The frequency increases with pump speed
#14	-	-		-
#15	Extended X-supply	U_{bat}	U_{bat}	-
#16	Coolant temperature sensor	+20°C: U approx. 3.5 V		The voltage

	signal	+75°C= 2.02 V +90°C= 0.78 V	decreases with increasing temperature

SIGNAL SPECIFICATION, ACCESSORY USB UNIT (AUU) (2007-12)

SIGNAL SPECIFICATION

U=	DC voltage in volts (V)	U_{AC} =	AC voltage in volts (V)
U_{bat} =	Battery voltage (V)	f =	Frequency in Hertz (Hz)
U_{low} =	Voltage approximately 0 V	t =	Time in seconds
PWM =	Pulse width modulated signal as a %	-	-

SIGNAL SPECIFICATION, CENTRAL ELECTRONIC MODULE (CEM) (2003-04)

SIGNAL SPECIFICATION

Fig. 9: Ground Terminals
Courtesy of VOLVO CARS CORPORATION

NOTE: **It is important to connect the breakout box and check the ground terminals before taking readings.**

Other information

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To check ground terminals, see **CHECKING THE GROUND TERMINAL** .

U=	DC voltage in volts (V)	U_{AC} =	AC voltage in volts (V)
U_{bat} =	Battery voltage (V)	f =	Frequency in Hertz (Hz)

U_{low} =	Voltage approximately 0 V	% duty =	Duty cycle (pulse ratio) as a percentage (%)
t =	Time in milliseconds (ms)	-	-

Connector A, terminals #A1-#A20
The following values are measured between the relevant terminal in column 1 and terminal #E1 (power ground) unless otherwise stated.

NOTE:
Check the ground terminals before starting to take readings with the breakout box.

U = DC in volts (V)
Ubat = battery voltage in volts (V)
Ulow = Voltage close to 0 V

Breakout box terminal	Terminal in connector	Signal type	Ignition off		Ignition on		Other
-	-	-	Activated	Not activated	Activated	Not activated	-
#A1	#A1	Signal (-) back-up (reversing) lamp	Ulow	Ubat	Ulow	Ubat	-
#A2	#A2	Signal, for fault-tracing the actuator motor for the left-hand xenon lamp	Ulow	Ulow	Ulow-Ubat if active, Ulow otherwise in pulse ratio (%duty) = 0-100%		A fault is detected at 65% > pulse ratio (% duty) > 90%
#A3	#A3	Control signal, starter motor relay	-		0 V	0 V	Activated with key in position III
#A4	#A4	Signal, Hood switch	Ulow with the hood closed Ulow-Ubat with the hood open				Pulsed signal, f=100 Hz
#A5	#A5	Signal (-) L-signal	Ulow	Ulow	Ubat	U~0.3-0.7*Ubat	-
#A6	#A6	Stepper motor speed related power steering (channel B)	Ulow		Ulow-Ubat	Ulow	signal for 12 ms
#A7	#A7	Stepper motor speed related power steering (channel A)	Ulow		Ulow-Ubat	Ulow	signal for 12 ms
#A8	#A8	Control signal relay for	Ulow	Ubat	Ulow	Ubat	-

		headlamp washing					
#A9	#A9	Pulse width modulated signal (+) to beam adjustment unit	Ulow		Ulow-Ubat if active, Ulow otherwise Pulse ratio (% duty) > 0%		Pulse ratio increases with increased beam width

SIGNAL SPECIFICATION, REAR ELECTRONIC MODULE (REM) (2003-04)

SIGNAL SPECIFICATION

REAR ELECTRONIC MODULE (REM) CONNECTORS A-E

Fig. 10: Identifying Rear Electronic Module (REM) And Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Connector A, terminals #A1-#A20

The following values are measured between the relevant terminal and terminal #E1 (power ground) unless otherwise stated.

The values are measured with the control module in "Active mode".

NOTE: **It is important to connect the breakout box and check the ground terminals before taking readings.**

U = DC in volts (V).

Ubat = battery voltage in volts (V).

Ulow = Voltage close to 0 V.

NC = Not connected

NC* = grounded via capacitor (C=22nF)

Terminal, breakout box	Terminal, control module	Signal type	Ignition off Active/not active	Ignition on Active/not active	Other
#A01	#A1	Spare input (30)	U~Ubat	U~Ubat	At no input

#B28	#E8	Reserve	U~Ulow	U~Ulow	NC

RESISTANCE VALUES, FUEL LEVEL SENSOR

Fig. 11: Fuel Level Sensor Terminals
Courtesy of VOLVO CARS CORPORATION

Readings for the left fuel level sensor are taken between terminals #5 and #6.

Readings for the right fuel level sensor are taken between terminals #7 and #6.

The following table lists the fuel level sensor resistance and the corresponding fuel volume.

Resistance (ohm)	Fuel volume (liters)
12	40
38	35
66	30
96	25

130	20
171	15
223	10
297	5
383	1

SIGNAL SPECIFICATION, REAR ELECTRONIC MODULE (REM) (2005-12)

SIGNAL SPECIFICATION

All the values given below are between the terminals stated in column 1 and terminal #D12 in column 2 (power ground). This applies unless otherwise indicated in the last column.

NOTE: It is important to connect the breakout box and check the ground connections before starting to measure.

Fig. 12: Identifying Rear Electronic Module (REM) Connectors
Courtesy of VOLVO CARS CORPORATION

U=	DC voltage in volts (V)	t =	Time in milliseconds (ms)
U_{bat} =	Battery voltage (V)	f =	Frequency in Hertz (Hz)
U_{low} =	Voltage approximately 0 V	% duty	Duty cycle (pulse ratio) as a percentage (%)

SIGNAL SPECIFICATION, UPPER ELECTRONIC MODULE (UEM) (2003-12)

SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)

UPPER ELECTRONIC MODULE (UEM)

Fig. 20: Identifying Connector (F) Terminals
Courtesy of VOLVO CARS CORPORATION

Connector A, terminals #A1-#A22

The following values are measured between the relevant terminal in column 1 and terminal #A20 (signal ground) unless otherwise stated.

NOTE: Check the ground terminals before starting to take readings with the breakout box.

U = DC in volts (V).

U_{bat} = battery voltage in volts (V).

U_{low} = voltage near 0 V.

Terminal, breakout box	Terminal, control module	Signal type	Ignition off Active/not active	Ignition on Active/not active	Miscellaneous
#1	#A1	Power supply	U_{bat}	U_{bat}	-
#2	#A2	Third row reading lamps, control signal (XC90 only)	U_{bat} /0 V	U_{bat} /0 V	-
#3	#A3	Communication cable control modules (HS-CAN)	2.5-3.5 V	2.5-3.5 V	During communication.
#4	#A4	The front right reading lamp and general lighting, control signal	7-9 V/0 V	7-9 V/0 V	Active when the right front reading lamp or the general lighting is activated.

#5	#A5	Communication cable control modules (MS-CAN)	1.5-2.5 V	1.5-2.5 V	-
#6	#A6	The front right reading lamp, signal supply	U_{bat} /0 V	U_{bat} /0 V	Pulse width modulation (PWM) signal.
#7	#A7	Rear left reading lamp, signal supply	U_{bat} /0 V	U_{bat} /0 V	Active when the left rear reading lamp or the general lighting is activated. Pulse width modulation (PWM) signal.
#8	#A8	Extended X-supply	U_{bat} /0 V	U_{bat} /0 V	The power supply to the sun roof logic, mirror lamps in the sun visor, rain sensor, buttons for the headlining lighting and certain button lighting.
#9	#A9	Cargo compartment lighting (V70, V70 XC) / Third row reading lamps (XC90), power supply	U_{bat} /0 V	U_{bat} /0 V	Pulse width modulation (PWM) signal.
#10	#A10	Movement sensor (MMS) or movement sensor (IMS), power supply, (IMS replaces MMS for XC90 from and incl. model year 2012)	U_{bat} /0 V	U_{bat} /0 V	Supplies power to both MMS or movement sensor (IMS), (IMS replaces MMS for XC90 from and incl. model year 2012).
#11	#A11	Control module power supply	U_{bat}	U_{bat}	-
#12	#A12	Control module power supply	U_{bat}	U_{bat}	-
#13	#A13	Rain sensor, data signal	-	-	-
#14	#A14	Rear right reading lamp, signal supply	U_{bat} /0 V	U_{bat} /0 V	The signal is active when the button for the lamp is not pressed in.
#15	#A15	Rear left reading lamp, control signal	U_{bat} /0 V	U_{bat} /0 V	The signal is active when the button for the lamp is not

					pressed in.
#16	#A16	The front left reading lamp and general lighting, control signal	7-9 V/0 V	7-9 V/0 V	Active when the left front reading lamp or the general lighting is activated.
#17	#A17	The rear right reading lamp, signal supply	U_{bat} /0 V	U_{bat} /0 V	Active when the right rear reading lamp or the general lighting is activated. Pulse width modulation (PWM) signal.
#18	#A18	The front left reading lamp, signal supply	U_{bat} /0 V	U_{bat} /0 V	Pulse width modulation (PWM) signal.
#19	#A19	General lighting, signal supply	U_{bat} /0 V	U_{bat} /0 V	Pulse width modulation (PWM) signal.
#20	#A20	Signal ground	$U{\sim}U{=}_{low}$	$U{\sim}U{=}_{low}$	-
#21	#A21	Serial communication (Volcano lite)	0 V-U_{bat}	0 V-U_{bat}	The voltage is 0 V - Ubat during communication. Ubat is the default.
#22	#A22	Movement sensor (MMS) or movement sensor (IMS), (IMS replaces MMS for XC90 from and incl. model year 2012), data signal	U_{bat}	U_{bat}	Communication with both MMS or movement sensor (IMS) in XC90, (IMS replaces MMS in XC90 from and incl. model year 2012).

SUN ROOF (SUN ROOF MODULE (SRM))

Fig. 21: Identifying Sunroof Module Connector A Terminals
Courtesy of VOLVO CARS CORPORATION

Connector A, terminals #A1-#A10

The following values are measured between the relevant terminal in column 1 and terminal #A5 (signal ground) unless otherwise stated.

U = DC in volts (V).

U_{bat} = battery voltage in volts (V).

U_{low} = voltage near 0 V.

Terminal, control module	Signal type	Ignition off Active/not active	Ignition on Active/not active	Miscellaneous
#A1	Power supply to the sun roof motor	U_{bat}	U_{bat}	-
#A2	Sun roof forward, control signal	U_{bat} /0 V	U_{bat} /0 V	Pulsed signal when active.
#A3	Sun roof tilt, control signal	U_{bat} /0 V	U_{bat} /0 V	Pulsed signal when active.
#A4	Serial communication (Volcano lite)	U_{bat}	U_{bat}	The voltage is 0 V - Ubat during communication. Ubat is the default.
#A5	Signal ground	U_{low}	U_{low}	-
#A6	Power supply to the electronics in the sun roof module (SRM)	U_{bat} (only for 5 minutes according to conditions on the right)	U_{bat}	Active when the ignition is off and neither of the front doors have been opened.
#A7	Sun roof auto, control signal	U_{bat} /0 V	U_{bat} /0 V	Pulsed signal. Active when switching.
#A8	Sun roof backward, control signal	U_{bat} /0 V	U_{bat} /0 V	Pulsed signal when active.
#A9	Power supply to sun roof switch	U_{bat} /U_{bat}	U_{bat} /U_{bat}	Pulsed signal when active.
#A10	Power ground	U_{low}	U_{low}	-

RAIN SENSOR

Fig. 22: 10 CD Changer Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Connector A, terminals #A1-#A5

U = DC in volts (V).

U_{bat} = battery voltage in volts (V).

U_{low} = voltage near 0 V.

Terminal, control module	Signal type	Ignition off	Ignition on	Miscellaneous
#A1	Serial communication	-	-	Data signal
#A2	Ground	U_{low}	U_{low}	-
#A3	Power supply	U_{bat} /0 V	U_{bat} /0 V	-
#A4	Windscreen wiper position signal	-	U_{bat} /0V	When the windscreen wipers are in the parked position, U must be U_{bat} . When the windscreen wipers are operating U must be 0 V (grounded).
#A5	Not used	-	-	-

ELECTRICAL

Cables And Fuses - Specifications, Other

PROGRAMMABLE CUSTOMER PARAMETERS (2003-04)

PROGRAMMABLE CUSTOMER PARAMETERS

SEAT TEMPERATURE, FRONT SEATS

Cars with electrically heated front seats have two switches on the climate control panel, left and right front seats. There are two temperature levels for the front seats, high and low (two LEDs lit or one LED lit).

The temperature values for the front seats can be programmed/changed to different values and can also be set individually.

Both the high and low temperature settings can be programmed.

The factory settings are:

- +36°C/97°F for the high temperature setting (both LEDs lit)
- +32°C/90°F for the low temperature setting (one LED lit).

The parameters can be programmed between off and +43°C/109°F.

APPROACH LIGHTS

The approach lights are activated via the high beam flash when the engine is off and the key is out of the ignition. The length of time that low beam will be on can be programmed. The values that can be selected are 0, 30, 60 or 90 s.

DAYTIME RUNNING LAMPS

The way in which low beam will be switched on can be programmed in three ways:

- Low beam on in all switch positions except the parking light position (Flexnoll).
- The light switch has three positions: off, parking light and low beam (Flexstd).
- Low beam always on regardless of the position of the light switch (Flexlgt).

TIME DELAY, LOCKING THE FUEL TANK FILLER COVER

The time delay between the car being locked using a remote control or the key until the fuel tank filler cover locks can be programmed. There are two alternatives:

- 10 minute time delay
- 0 minute time delay.

SERVICE INTERVALS

NOTE: From and including model year 2002, the service reminder indicator (SRI) has been replaced with a text message display.

There are three parameters which can be programmed for the service interval. These parameters govern when the service reminder indicator (SRI) lights:

- Distance, indicates the mileage between service intervals
- Time, indicates the number of months between service interval
- Engine time, indicates the number of engine hours between service intervals.

The service reminder indicator (SRI) is lit by the parameter that is reached first.

All parameters are programmed at the factory. The values are market dependent.

The mileage can be set to miles or km.

ZEROS

The mileage display can be programmed to display zeros in the reading or not.

For example, the mileage of the car is 5000 km

With zeros selected this will be displayed as 005000.

If zeros are not selected this will be displayed as 5000.

OUTSIDE TEMPERATURE DISPLAY (UNIT FOR THE TEMPERATURE DISPLAY)

The combined instrument panel can be programmed for two temperature units, Celsius or Fahrenheit.

CLOCK, 12 OR 24 HOUR DISPLAY

The clock in the combined instrument panel can be set to display using the 12 or 24 hour clock

TRIP COMPUTER

Only applies to cars with trip computers.

The trip computer can be programmed with different units.

Mileage:

- miles

- km

Volume:

- liter

- US gallons

- GB gallons

Fuel consumption:

- l/km

- km/l (structure week 9950 onwards)

- miles/ US gallon

- miles/ GB gallon

INTERIOR LIGHTING PERIOD

The period of time after which the interior lighting will go out can be programmed.

The interior lighting can be set to light in three ways:

- When the car is unlocked with the remote control
- When shutting off the engine
- When switched on manually in the passenger compartment.

The programming parameters for unlocking the car with a remote control and switching off the engine are the same. The interval is between 5-255 s.

If the passenger compartment lighting is switched on manually, the lighting will go out after a set period. This period can be programmed from 5-255 minutes.

The lighting time is programmed via the vehicle communication socket under function group 3, upper electronic module (UEM), Programming the control module.

DEGREE OF ANTI-GLARE, REAR VIEW MIRROR

The rear view mirror has an automatic anti-glare function which can be adjusted to three levels:

- Light
- Normal
- Dark

Software is required for these settings.

The anti-dazzle setting is programmed via the vehicle communication socket under function group 3, upper electronic module (UEM), Programming the control module.

SETTING THE DRIVER'S SEAT USING THE REMOTE CONTROL

This only applies to cars with power driver's seats with memory.

When this function is activated, the position of the seat and door mirrors will be stored when the car is locked with the remote control. When the same remote control is used to unlock the car, the driver's seat and door mirrors will be set to the positions stored for that specific remote control. Up to three remote controls can be stored.

The parameters that can be programmed are:

- Seat operation via remote control, active
- Seat operation via remote control, not active

The setting for automatic adjustment of the front seats will remote control is programmed via the vehicle communication socket under function group 8, Power seat (power seat module (PSM)), Programming remote control settings.

PASSENGER COMPARTMENT VENTILATION FILTER COMPENSATION

Only applies to cars with passenger compartment ventilation filters.

This function compensates the fan speed according to the air resistance in the ventilation filter.

Available parameters:

- Activating compensation for the passenger compartment ventilation filter, On
- Activating compensation for the passenger compartment ventilation filter, Off

THE BLOWER FAN SPEED IN THE AUTO POSITION (ECC)

This only applies to cars with electronic climate control (climate control with temperature display).

This function allows the fan speed to be adjusted for the AUTO position. An increase in voltage increases the fan speed.

The air flow in AUTO position can be increased or reduced.

Available parameters:

- Fan speed, setting +1.0 V
- Fan speed, setting +0.5 V
- Fan speed, setting 0 V (factory setting)

- Fan speed, setting -0.5 V
- Fan speed, setting -1.0 V.

BLOWER FAN RUN-ON (ECC, MCC)

Only applies to cars with air conditioning (electronic or manual climate control).

This function is used to disable or enable blower fan run-on. Blower fan run-on dries out the evaporator and prevents bad smells.

Available parameters:

- Blower fan run-on = On
- Blower fan run-on = Off

FLOOR/DEFROSTER AIR DISTRIBUTION, PARKING HEATER (ECC)

This only applies to cars with electronic climate control (climate control with temperature display) and parking heaters.

This function is used to change the distribution of air between the floor and defroster when the parking heater is running.

Available parameters:

- 90/10 (90% floor, 10% defroster)
- 80/20 (80% floor, 20% defroster)
- 70/30 (70% floor, 30% defroster)
- 60/40 (60% floor, 40% defroster)
- 50/50 (50% floor, 50% defroster)
- 30/70 (30% floor, 70% defroster)
- 10/90 (10% floor, 90% defroster)

FLOOR/DEFROSTER AIR DISTRIBUTION, RESIDUAL HEATER (ECC)

This only applies to cars with electronic climate control (climate control with temperature display) and an electric water pump or parking heater.

This function is used to change the distribution of air between the floor and defroster when the residual heater is running.

Available parameters:

- 90/10 (90% floor, 10% defroster)
- 80/20 (80% floor, 20% defroster)

- 70/30 (70% floor, 30% defroster)
- 60/40 (60% floor, 40% defroster)
- 50/50 (50% floor, 50% defroster)
- 30/70 (30% floor, 70% defroster)
- 10/90 (10% floor, 90% defroster)

PASSENGER COMPARTMENT TEMPERATURE

The passenger compartment temperature in relation to the passenger compartment temperature switch position can be adjusted by programming a compensation value.

The passenger compartment temperature can be raised or lowered by a maximum of ±2°C (±4°F) from the normal value. This allows the temperature to be adjusted in accordance with the driver's wishes.

- 0 = -1.0°C/-2.0°F
- 1 = -0.5°C/-1.0°F
- 2 = 0.0°C/0.0°F (default value)
- 3 = +0.5°C/+1.0°F
- 4 = +1.0°C/+2.0°F.

VEHICLE COMMUNICATION INFORMATION, ACCESSORY ELECTRONIC MODULE (2003-12)

DESCRIPTION OF VEHICLE COMMUNICATION, ACCESSORY ELECTRONIC MODULE

CONTENTS

Select type of description.

- see **DESCRIPTION OF FROZEN VALUES. ACCESSORY ELECTRONIC MODULE (AEM)**
- see **STATUS IDENTIFIER, DESCRIPTION**
- see **COUNTERS, DESCRIPTION**

DESCRIPTION OF FROZEN VALUES. ACCESSORY ELECTRONIC MODULE (AEM)

EXPLANATION

Not all described parameters are implemented in the accessory electronic module (AEM). Parameters vary from system to system.

Frozen values are parameter values that are stored when a diagnostic trouble code (DTC) is stored.

BATTERY VOLTAGE, VALUE

Measurement range: 8-16 V.

Normal value when the alternator is charging: 13.0-14.5 V.

DISTANCE, VALUE

Measurement range: 0-1048575 km.

The value indicates the total mileage of the vehicle at the time the diagnostic trouble code (DTC) was generated.

PASSENGER COMPARTMENT TEMPERATURE, VALUE

Measurement range: -60 to 195°C.

OUTSIDE TEMPERATURE, VALUE

Measurement range: -128 to 127.75°C.

ENGINE RUNNING, STATUS

The status displays whether the engine was running when the diagnostic trouble code (DTC) was stored.

No = the engine was not running

Yes = the engine was running

TIME, VALUE

The value displays the time that has passed since the diagnostic trouble code (DTC) was stored.

POWER SUPPLY FOR THE REVERSE (REVERSING) WARNING SYSTEM, STATUS

NOTE: Does not apply to XC90 2003-.

Indicates the status of the power supply for the reverse (reversing) warning system when the diagnostic trouble code (DTC) was stored.

The status is listed at four different levels: Active, Not active, High or Low.

SOUND SIGNAL FOR THE REVERSE (REVERSING) WARNING SYSTEM, STATUS

NOTE: Does not apply to XC90 2003-.

Indicates the status of the sound signal (buzzer) from the reverse (reversing) warning system to the accessory electronic module (AEM) at the time the diagnostic trouble code (DTC) was generated.

The status is listed at three different levels: Sound constantly on, Sound off or Number of milliseconds the signal sounds.

POWER SUPPLY TO THE BUZZER CABLE FOR THE REVERSE (REVERSING) WARNING SYSTEM, STATUS

NOTE: Does not apply to XC90 2003-.

Indicates the status of the voltage on the buzzer cable from the reverse (reversing) warning system to the accessory electronic module (AEM) at the time the diagnostic trouble code (DTC) was generated.

The status is listed at two different levels: High or Low.

POWER SUPPLY TO THE RELAY FOR THE ENGINE BLOCK HEATER, STATUS

Indicates the status of the power supply to the relay for the engine block heater when the diagnostic trouble code (DTC) was stored.

The status is listed at four different levels: Active, Not active, High or Low.

POWER SUPPLY FOR REMOTE START, STATUS

Indicates the status of the power supply for the for the remote start when the diagnostic trouble code (DTC) was stored.

The status is listed at four different levels: Active, Not active, High or Low.

VOLTAGE ON THE SIGNAL CABLE FOR REMOTE START, STATUS

Indicates the status of the voltage on the signal cable from the remote start unit to the accessory electronic module (AEM) at the time the diagnostic trouble code (DTC) was generated.

The status is listed at two different levels: High or Low.

POWER SUPPLY FOR ALARM CABLE P0 OR P1, STATUS

Indicates the status of the power supply to alarm cable P0 or P1 when the diagnostic trouble code (DTC) was stored.

The status is listed according to four different levels for P0 and P1 respectively: Active, Not active, High or Low.

POWER SUPPLY FOR ALARM CABLE S0 OR S1, STATUS

Indicates the status of the power supply to alarm cable S0 or S1 when the diagnostic trouble code (DTC) was stored.

The status is listed according to four different levels for S0 and S1 respectively: Active, Not active, High or Low.

POWER SUPPLY FOR CARPHONE MUTE, STATUS

Indicates the status of the carphone mute signal from the accessory electronic module (AEM) at the time the diagnostic trouble code (DTC) was generated.

The status is listed at four different levels: Active, Not active, High or Low.

VOLTAGE ON THE CARPHONE MUTE CABLE, STATUS

Indicates the status of the voltage on the carphone mute cable to the accessory electronic module (AEM) at the time the diagnostic trouble code (DTC) was generated.

The status is listed at two different levels: High or Low.

RHEOSTAT SIGNAL, VALUE

Indicates the percentage value of the rheostat signal from the accessory electronic module (AEM) to the radio.

The value is between 0-100%.

SPEED SIGNAL, VALUE

Indicates a frequency based on the speed and wheel circumference using the formula: frequency = speed x 12/wheel circumference. The frequency signal is used to determine the volume of the radio.

The value is between 0-512 Hz.

POWER SUPPLY FOR AERIAL AMPLIFIER, STATUS

Indicates the status of the power supply for the aerial amplifier when the diagnostic trouble code (DTC) was stored.

The status is listed at four different levels: Active, Not active, High or Low.

VEHICLE COMMUNICATION INFORMATION, ACCESSORY USB UNIT (AUU) (2007-12)

DESCRIPTION OF PARAMETERS

PARAMETERS, STATUS

STATUS, FAULT COUNTER ON USB/MEDIA PORT

The parameter counts the number of times there has been a fault in the media port (USB and iPod connection). As no DTC is generated from a media port fault, this parameter can be used to indicated any fault related to this connection. Media port faults can be user-related, such as an inoperable USB accessory.

DESCRIPTION OF READING EXTENDED DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

see **DESCRIPTION OF FROZEN VALUES**

see **DESCRIPTION OF STATUS IDENTIFIER**

see **DESCRIPTION OF COUNTER**

DESCRIPTION OF FROZEN VALUES

EXPLANATION

Frozen values are parameter values that are stored when a diagnostic trouble code (DTC) is stored.

Not all parameters can be read off for all diagnostic trouble codes (DTCs). The parameter values can only be read off where they can provide more information about the prevailing circumstances when the diagnostic trouble code (DTC) was stored.

PARAMETERS, VALUE

TOTAL MILEAGE

Measurement range: 0 - 1, 000, 000 km.

The value indicates the vehicle's total mileage when the Diagnostic Trouble Code (DTC) was generated.

BATTERY VOLTAGE, CENTRAL ELECTRONIC MODULE (CEM)

Measurement range 0 - 63 V.

Normal range: 12.0 - 14.5 V.

The value indicates the supply voltage to the central electronic module (CEM) when the diagnostic trouble code (DTC) was stored.

PASSENGER COMPARTMENT TEMPERATURE

Measurement range: -40 to +215°C.

The value indicates the passenger compartment temperature when the diagnostic trouble code (DTC) was stored.

ENGINE RUNNING

The status displays whether the engine was running when the diagnostic trouble code (DTC) was stored.

Yes = the engine was running

No = the engine was not running

VEHICLE COMMUNICATION INFORMATION, CENTRAL ELECTRONIC MODULE (CEM) (2005-11)

DESCRIPTION OF ACTIVATIONS

PARAMETERS

LEFT LOW BEAM, ACTIVATED

Activates left low beam.

RIGHT LOW BEAM, ACTIVATED

Activates right low beam.

DAYTIME RUNNING LAMPS LEFT, ACTIVATED

Activates the daytime running lamps on the left-hand side of the vehicle.

DAYTIME RUNNING LAMPS RIGHT, ACTIVATED

Activate the daytime running lamps on the right-hand side of the vehicle.

PARKING LAMPS LEFT, ACTIVATED

Activates the parking lamps on the left-hand side of the vehicle.

FOG LAMPS FRONT, ACTIVATED

Activates the front fog lamps.

BRAKE LIGHTS, ACTIVATED

Activates the brake lights.

WINDSHIELD WASHERS, ACTIVATED

Activates the windshield washer.

TAILGATE WASHER, ACTIVATED

Activates the tailgate washer.

HEADLAMP WASHERS, ACTIVATED

Activates the headlamp washers.

FUEL PUMP RELAY, ACTIVATED

Activates the fuel pump relay that starts the fuel pump.

DESCRIPTION OF PARAMETERS

PARAMETERS

KEY POSITION, STATUS

Indicates the position of the ignition key.

Key not in = No key in the ignition switch.

POS0 = Position 0.

POSI = Position 1.

POSII = Position 2.

POSIII = Position 3.

STATUS S-SUPPLY, STATUS

Displays the status for S-supply.

Activated = The S-supply is activated

Not activated = The S-supply is not activated.

STATUS X-SUPPLY, STATUS 3

Displays the status for X-supply.

Activated = The X-supply is activated

Not activated = The X-supply is not activated.

STATUS 15-SUPPLY, STATUS

Displays the status for 15-supply.

Activated = The 15-supply is activated.

Not activated = The 15-supply is not activated.

STATUS 30-SUPPLY, STATUS

Displays the status for 30-supply.

Activated = The 30-supply is activated.

Not activated = The 30-supply is not activated.

STATUS 50-SUPPLY, STATUS

Displays the status for 50-supply.

Activated = The 50-supply is activated.

Not activated = The 50-supply is not activated.

EXTENDED X-SUPPLY (1), STATUS

Displays the status of the relay for extended X-supply (1). The extended X-supply (1) supplies power to:

Parking heater.

Certain climate control functions.

Activated = The extended X-supply (1) is activated.

Not activated = The extended X-supply (1) is not activated.

EXTENDED X-SUPPLY (2), STATUS

Displays the status of the relay for extended X-supply (2). The extended X-supply (2) supplies power to:

Transmission control module (TCM).

Activated = The extended X-supply (2) is activated.

Not activated = The extended X-supply (2) is not activated.

EXTENDED X-SUPPLY (3), STATUS

Displays the status of the relay for extended X-supply (3). The extended X-supply (3) supplies power to:

Infotainment.

Activated = The extended X-supply (3) is activated.

Not activated = The extended X-supply (3) is not activated.

EXTENDED X-SUPPLY (4), STATUS

Displays the status of the relay for extended X-supply (4). The extended X-supply (4) supplies power to:

TBD.

Activated = The extended X-supply is activated.

Not activated = The extended X-supply is not activated.

PARK NEUTRAL POSITION (PNP) RELAY, STATUS

Displays the status of relay for the park neutral position (PNP) switch.

Activated = The relay for the park neutral position (PNP) switch is activated. The gear selector CANNOT be moved from position P.

Not activated = The relay for the park neutral position (PNP) switch is not activated. The gear selector can be moved from position P.

PARK NEUTRAL POSITION (PNP) SOLENOID, STATUS

Displays the status of the solenoid for the park neutral position (PNP) switch.

Activated = The solenoid for the park neutral position (PNP) switch is activated. The gear selector cannot be moved from position P.

Not activated = The solenoid for the park neutral position (PNP) switch is not activated. The gear selector can be moved from position P.

STARTER MOTOR RELAY, STATUS

Displays the status of the relay for the starter motor.

Activated = The relay for the starter motor is activated, the starter motor is activated.

Not activated = The relay for the starter motor is not activated, the starter motor is not activated.

FUEL PUMP (FP) RELAY, STATUS

Displays the status of the fuel pump (FP) relay.

Activated = The relay for the fuel pump (FP) is activated.

Not activated = The relay for the fuel pump (FP) is not activated.

PASSENGER SEAT BELT REMINDER, STATUS

Displays the status of the passenger seat belt reminder.

Activated = The seat belt reminder is activated.

Not activated = The seat belt reminder is not activated.

HAZARD WARNING SIGNAL FLASHERS, STATUS

Displays the status of the hazard warning signal flasher switch.

Activated = The switch for the hazard warning signal flashers is activated.

Not activated = The switch for the hazard warning signal flashers is not activated.

WINDSHIELD WASHER FLUID LEVEL, STATUS

Displays the status of the windshield washer fluid level.

Above 1 liter = There is more than 1 liter of windshield washer fluid remaining in the reservoir.

Below 1 liter = There is less than 1 liter of windshield washer fluid remaining in the reservoir.

FRONT WASHER SWITCH, STATUS

Displays the status of the switch for the front washers.

Activated = The switch for the front washers is activated.

Not activated = The switch for the front washers is not activated.

FULL-SPEED, STATUS

Displays the status of the windshield wiper switch for full-speed.

Activated = The windshield wiper switch for full-speed is activated.

Not activated = The windshield wiper switch for full-speed is not activated.

LOW-SPEED, STATUS

Displays the status of the windshield wiper switch for low-speed.

Activated = The windshield wiper switch for low-speed is activated.

Not activated = The windshield wiper switch for low-speed is not activated.

INTERMITTENT WIPING SWITCH, STATUS

Displays the status of the switch for intermittent windshield wiping.

Activated = The switch for intermittent windshield wiping is activated.

Not activated = The switch for intermittent windshield wiping is not activated.

SINGLE WIPER SWEEP, STATUS

Displays the status of the switch for single wiper sweep.

Activated = The switch for a single wiper sweep is activated.

Not activated = The switch for a single wiper sweep is not activated.

RELAY FOR HIGH SPEED WINDSHIELD WIPING, STATUS

Displays the status of the relay for high-speed windshield wiping.

Activated = The relay for high speed windshield wiping is activated.

Not activated = The relay for high speed windshield wiping is not activated.

WINDSHIELD WIPER, STATUS

Displays the status of the windshield wiper.

Activated = The windshield wipers are activated.

Not activated = The windshield wipers are not activated.

WINDSHIELD WASHER, STATUS

Displays the status of the windshield washers.

Activated = The windshield washers are activated.

Not activated = The windshield washers are not activated.

TAILGATE WASHER, STATUS

Displays the status of the tailgate washer.

Activated = The tailgate washer is activated.

Not activated = The tailgate washer is not activated.

HEADLAMP WASHERS, STATUS

Displays the status of the headlamp washers.

Activated = The headlamp washers are activated.

Not activated = The headlamp washers are not activated.

RELAY, HORN, STATUS

Displays the status of the relay for the horn.

Activated = The horn relay is activated.

Not activated = The horn relay is not activated.

30 SUPPLY, VALUE

Measurement range 0 to +18 V.

Normal value when the generator (GEN) is charging: 13.0 - 14.5 V.

VEHICLE SPEED (KM/H), VALUE

Displays the vehicle speed in km/h.

Measurement range 0 to 255 km/h.

VEHICLE SPEED MPH, VALUE

Displays the vehicle speed in mph.

Measurement range 0 to 159 mph.

LAMP GROUP A, VALUE

Measurement range 0 to 100% of supply voltage.

The normal value when the supply voltage is 13.5 V is approximately 98%.

When the supply voltage exceeds 13 V, the voltage level is regulated using pulse width modulation. The value indicates what proportion of the voltage level is being used.

Lamp group A consists of:

- Daytime running lamps
- Low beam.

LAMP GROUP B, VALUE

Measurement range 0 to 100% of supply voltage.

The normal value when the supply voltage is 13.5 V is approximately 98%.

When the supply voltage exceeds 13 V, the voltage level is regulated using pulse width modulation. The value indicates what proportion of the voltage level is being used.

Lamp group B consists of:

- High beam
- Turn signal lamps
- Front fog lamps
- Parking lamps
- Stop lamps.

HEADLAMP RANGE ADJUSTMENT, VALUE

Measurement range 0 to 100%.

The normal value when the control for headlamp range adjustment is in the middle is approximately 55%.

The value controls the beam range for low beam.

FUEL LEVEL, LEFT-HAND SIDE, VALUE

Measurement range 0 to 40 liters.

Displays the remaining quantity of fuel in the left-hand side of the fuel tank.

FUEL LEVEL, RIGHT-HAND SIDE, VALUE

Measurement range 0 to 40 liters.

Displays the quantity of fuel remaining in the right-hand side of the fuel tank.

TWILIGHT SENSOR, VOLTAGE, VALUE

Measurement range 0 to 5 Volts.

Shows the current light intensity.

Increased light intensity reduces the voltage over the photodiode.

SOLAR SENSOR, VOLTAGE, VALUE

Measurement range 0 to 5 Volts.

Shows the current light intensity.

Increased light intensity reduces the voltage over the photodiode.

IMMOBILIZER

ID CODE RECEIVED

Shows if Central electronic module (CEM) has received any key code (Transponder ID-code). This applies regardless of if the key is stored as an approved key or not.

YES = central electronic module has received key code.

NO = central electronic module has not received key code.

HINT: However, a condition is that the key is of the right type, that is, that it is intended for this type of Volvo.

ID CODE STORED

Shows if the latest received key code (Transponder ID-code) is stored as an approved key code in the Central Electronic module's memory.

OK = latest received key code is stored.

Wrong=latest received key code is not stored.

RANDOM CODE TO TP

Shows if Central electronic module (CEM) sends a random code to the transponder in the key, which requires that the key code is stored.

YES = Central electronic module (CEM) sends random code to the transponder.

NO = Central electronic module (CEM) does not send random code to the transponder.

RESPONSE FROM TP

Shows if Central electronic module (CEM) receives any response from the key (via IAU), which requires that the key code is stored.

YES = Central electronic module (CEM) receives response from key.

NO = Central electronic module (CEM) does not receive any response from key.

HINT: YES, also shown with a key belonging to another vehicle of the same type, with the same key-ID but with another security code than the own vehicle's keys.

TP STATUS OK

Shows if all of the following conditions are fulfilled: 1) Key code (transponder ID-code) is stored. 2) The key has the own vehicle's security code (the key belongs to the vehicle). 3) Communication (random code and

response) is OK.

YES = all above conditions are fulfilled.

NO = any of the above conditions is not fulfilled.

KEY TYPE

Indicates whether the ignition key used is a MASTER KEY or a SERVICE KEY.

MAIN KEY = main key used as ignition key.

SERVICE KEY = service key used as ignition key.

KEY NUMBER

Shows which of the vehicle's keys is in the ignition. Each key programmed into the central electronic module (CEM) is given a running number from 1 to 6. NO. 1 - NO. 6.

NUMBER OF KEYS

Shows how many keys (key codes) are stored in Central Electronic module's memory, 1-6. Max. 6 keys can be stored.

IMMOBILIZER, CHECKING CONTROL MODULE

Shows if the CAN-signal containing Immo ECM data transmitted is received within a given (maximum) time. This signal is transmitted by the engine control module (ECM) to the central electronic module (CEM) on the high speed network, when the ignition is switched on.

OK= CAN-signal arrives within given time.

Wrong status= CAN-signal does not arrive within given time.

IMMOBILIZER, START PERMITTED

Shows if the CAN-signal that the Engine control module (ECM) sends on the high-speed network to Central electronic module (CEM) after finished IMMO CHECK, after ignition on, shows that Engine control module (ECM) allows start (POS) or not (NEG).

The condition for Engine control module (ECM) to allow start is that:

- the so-called transponder check was performed okay (transponder-ID is stored and the key's and Central electronic module (CEM) security code match).
- the so-called Immobilizer check was performed okay (codes in Central electronic module (CEM) and engine control module (ECM) match).

Start allowed = Engine control module (ECM) allows start.

Start not allowed = Engine control module (ECM) does not allow start.

VEHICLE COMMUNICATION, REAR ELECTRONIC MODULE (REM) (2005-12)

DESCRIPTION OF ACTIVATIONS

ACTIVATIONS

FOG LAMP, TRAILER

Activates the fog lamp on the trailer.

RELAY, GAS TANK VALVE

Activates the relay for the gas tank valve.

LICENSE PLATE LIGHTING

Activates the license plate lighting.

FOG LAMPS

Activates the rear fog lamps.

STOP (BRAKE) LAMPS

Activates the stop lamps.

BACK-UP (REVERSING) LAMPS

Activates the back-up (reversing) lamps.

RELAY, TAILGATE WIPER, HEAD RESTRAINT

Activates the relay for the tailgate wiper/head restraint.

LOCK MOTOR LEFT AND RIGHT REAR DOOR

Activating the lock motors for locking or unlocking the rear side doors.

There is a noise from the lock mechanism in the door and the door locks/unlocks.

NOTE: Activation is not permitted when normal locking/unlocking is carried out using the remote control for example.

LOCK MOTOR TRUNK LID/TAILGATE

Activating the lock motor for the trunk lid/tailgate.

There is noise from the lock mechanism and the trunk lid/tailgate locks/unlocks.

NOTE: Activation is not permitted when normal locking/unlocking is carried out using the remote control for example.

LOCK MOTOR FUEL TANK FILLER CAP

Activating the lock motor for the fuel tank filler cap.

There is noise from the lock mechanism and the fuel tank filler cap locks/unlocks.

NOTE: Activation is not permitted when normal locking/unlocking is carried out using the remote control for example

LOCK MOTOR CHILD-PROOF LOCK

Activating the child-proof lock in the rear doors.

There is noise from the lock mechanism and the rear doors cannot be opened from the inside.

NOTE: Activation is not permitted when normal locking/unlocking is carried out using the remote control for example.

DESCRIPTION OF PARAMETERS

PARAMETERS

RELAY EXTENDED X-SUPPLY (1), STATUS

Displays the status of the extended X-supply (1).

Activated = the extended X-supply is activated.

Not activated = the extended X-supply is not activated.

RELAY EXTENDED X-SUPPLY (2), STATUS

Displays the status of the extended X-supply (2).

Activated = the extended X-supply is activated.

Not activated = the extended X-supply is not activated.

RELAY EXTENDED X-SUPPLY (3), STATUS

Displays the status of the extended X-supply (3).

Activated = the extended X-supply is activated.

Not activated = the extended X-supply is not activated.

RELAY EXTENDED X-SUPPLY (4), STATUS

Displays the status of the extended X-supply (4).

Activated = the extended X-supply is activated.

Not activated = the extended X-supply is not activated.

FOG LAMP, TRAILER, STATUS

Display the status of the fog lamp on the trailer.

Activated = the fog lamp is activated.

Not activated = the fog lamp is not activated.

RELAY, GAS TANK VALVE, STATUS

Displays the status of the gas tank valve.

Activated = the valve is open.

Not activated = the valve is closed.

CAUSE OF UNLOCKING, STATUS

Displays the cause of unlocking:

- Unlocked using a key
- Unlocked using remote control
- Unlocked using a central locking switch
- Unlocked by the phone module (PHM)
- Airbag deployed.

SWITCH DRIVER'S DOOR, STATUS

Displays the status of driver's door switch.

Closed = the driver's door is closed.

Open = the driver's door is open.

SWITCH PASSENGER DOOR, STATUS

Displays the status of passenger door switch.

Closed = the passenger door is closed.

Open = the passenger door is open.

SWITCH LEFT-HAND REAR DOOR, STATUS

Displays the status of switch for the left-hand rear door.

Closed = the left-hand rear door is closed.

Open = the left-hand rear door is open.

SWITCH RIGHT-HAND REAR DOOR, STATUS

Displays the status of switch for the right-hand rear door.

Closed = the right-hand rear door is closed.

Open = the right-hand rear door is open.

SWITCH TRUNK LID/TAILGATE, STATUS

Displays the status of trunk lid/tailgate switch.

Closed = the trunk lid/tailgate is closed.

Open = the trunk lid/tailgate is open.

SWITCH HOOD, STATUS

Displays the status of the hood switch.

Closed = the hood is closed.

Open = the hood is open.

SWITCH HANDLE TRUNK LID (4 DOOR CARS), STATUS

Displays the status of the switch in the trunk lid handle.

Activated = handle affected.

Not active = handle not affected.

LOCK SWITCH, DRIVER'S DOOR, STATUS

Displays the status of the lock switch, driver's side. The rear electronic module (REM) receives the value from the driver door module (DDM) via the Control area network (CAN).

Locked = the lock switch on the driver's side is locked.

Unlocked = the lock switch on the driver's side is unlocked.

LOCK SWITCH, PASSENGER DOOR, STATUS

Displays the status of the lock switch on the passenger side. The rear electronic module (REM) receives the value from the passenger door module (PDM) via the Control area network (CAN).

Locked = the lock switch on the passenger side is locked.

Unlocked = the lock switch on the passenger side is unlocked.

LOCK SWITCH, LEFT-HAND REAR DOOR, STATUS

Displays the status of lock switch for the left-hand rear door.

Locked = the lock switch for the left-hand rear door is locked.

Unlocked = lock switch for the left-hand rear door is unlocked.

LOCK SWITCH, RIGHT-HAND REAR DOOR, STATUS

Displays the status of the lock switch for the right-hand rear door.

Locked = the lock switch for the right-hand rear door is locked.

Unlocked = lock switch for the right-hand rear door is unlocked.

LOCK SWITCH, TRUNK LID/TAILGATE, STATUS

Displays the status of the lock switch for the trunk lid/tailgate.

Locked = the lock switch for the trunk lid/tailgate is locked.

Unlocked = the lock switch for the trunk lid/tailgate is unlocked.

LOCK SWITCH CHILD-PROOF LOCK, LEFT-HAND/RIGHT-HAND REAR DOOR, STATUS

Displays the status of the lock switch for the child-proof lock.

Displays the status of the lock switch for the child-proof lock.

Locked = the lock switch for the child-proof lock is engaged (rear door is locked).

Unlocked = the lock switch for the child-proof lock is engaged (rear door is unlocked).

ALARM CAUSE, STATUS

Displays the status of the last alarm cause:

- Front door right
- Front door left
- Rear door right
- Rear door left
- Hood
- Luggage Compartment Lid
- Ignition switch
- Mass movement sensor, front (MMS) alternatively movement sensor (IMS)
- Vehicle tilt sensor
- Voltage drop siren
- Glass breakage sensor activated
- Mass movement sensor, rear (MMS)

GLASS BREAKAGE SENSOR, STATUS

Displays the status of the glass breakage sensor.

OK = the glass breakage wire is intact.

Glass breakage wire broken = the glass breakage wire is broken.

LICENSE PLATE LIGHTING, STATUS

Displays the status of the license plate lighting.

Activated = the license plate lighting is activated.

Not activated = the license plate lighting is not activated.

FOG LAMP, STATUS

Displays the status of the rear fog lamps.

Activated = The rear fog lamps are activated.

Not activated = The rear fog lamps are not activated.

STOP LAMP, STATUS

Displays the status of the stop lamp.

Activated = the stop lamp is activated.

Not activated = the stop lamp is not activated.

BACK-UP (REVERSING) LAMP, STATUS

Displays the status of the back-up (reversing) lamp.

Activated = the back-up (reversing) lamp is activated.

Not activated = the back-up (reversing) lamp is not activated.

POSITION SENSOR XENON LAMP, STATUS

Displays the status of the xenon lamp position sensor.

Not calibrated = the position sensors is not calibrated.

Calibrated = the position sensor is calibrated.

CALIBRATION RESULT POSITION SENSOR, STATUS

Displays the calibration result of the position sensor.

OK = Calibration is successful.

Not OK = Calibration is not successful.

RELAY, TAILGATE WASHER/HEAD RESTRAINT, STATUS

Displays the status of the windshield wiper/head restraint relay.

Activated = the relay is activated.

Not activated = the relay is not activated.

RELAY, REAR WINDSHIELD HEATING, STATUS

Displays the status of the rear windshield heating.

Activated = the relay is activated.

Not activated = the relay is not activated.

PARKING ASSISTANCE REAR, STATUS

Indicates if the rear electronic module (REM) detects that the rear parking assistance system is active or not.

On = The system for rear parking assistance is active.

Off = The system for rear parking assistance is not active.

PARKING ASSISTANCE FRONT, STATUS

Indicates if the rear electronic module (REM) detects that the front parking assistance system is active or not.

On = The system for front parking assistance is active.

Off = The system for front parking assistance is not active.

PARKING SENSOR 1-8, STATUS

Indicates whether the rear electronic module (REM) receives a status signal from the parking assistance module (PAM), indicating a fault in the parking sensor or its terminals.

OK = no fault was found in the parking sensor or its terminals.

Faulty = a fault was found in the parking sensor or its terminals.

NOTE: Sensor 5 - 8 only installed in the vehicle if the vehicle is equipped with front park assist. The control module will always respond OK if the status of sensors 5 - 8 is read off despite them not being installed in the vehicle.

DISTANCE TO THE REAR, VALUE

Displays the distance to objects which can been detected. The value of the read off parameter is the value transmitted by the rear electrical module on the control area network (CAN). The distance is presented as a number between 1 and 32.

1 = the distance from the rear bumper to the detected object is approximately 1.5 m or more.

2 - 31 = the distance from the rear bumper to the detected object is between approximately 1.5 m and approximately 0.3 m.

32 = the distance from the rear bumper to the detected object is approximately 0.3 m or less.

DISTANCE TO THE FRONT, VALUE

Displays the distance to objects which can been detected. The value of the read off parameter is the value transmitted by the rear electrical module on the control area network (CAN). The distance is presented as a number between 1 and 32.

1 = the distance from the front bumper to the detected object is approximately 0.8 m or more.

2 - 31 = the distance from the front bumper to the detected object is between approximately 0.8 m and approximately 0.3 m.

32 = the distance from the front bumper to the detected object is approximately 0.3 m or less.

INPUT SIGNAL FROM THE TEMPERATURE SENSOR (CNG), VALUE

Measurement range 0 to 5 V.

At 0°C ~ 4.5 V

At 25°C ~ 3.6 V

INPUT SIGNAL FROM THE PRESSURE SENSOR (CNG), VALUE

Measurement range 0 to 5 V.

Full (200 bar): 4.5 V.

Empty (0 bar): 0.5 V.

BATTERY VOLTAGE, REAR ELECTRONIC MODULE (REM)

Displays the power supply to the rear electronic module (REM).

Measurement range 0 to 25 V.

BATTERY VOLTAGE, CENTRAL ELECTRONIC MODULE (CEM)

The value indicates the battery voltage at the central electronic module (CEM). The rear electronic module (REM) receives the value from the central electronic module (CEM) via the Control area network (CAN).

Measurement range 5 to 30 V.

ELECTRICAL SYSTEM

Electrical System - Removal, Replacement And Installation

ELECTRICAL EQUIPMENT (EXECUTIVE; PREMIER; 2004)

CONTROL MODULE REAR SOUND SEPARATION, REPLACING

See **CONTROL MODULE REAR SOUND SEPARATION, REPLACING**

COOL BOX/ARMREST COMPONENTS, REPLACING

See **COOL BOX/ARMREST COMPONENTS, REPLACING**

DVD PLAYER, REPLACING

ENGINE MECHANICAL

Electrical system

ENGINE MECHANICAL

OIL LEVEL SENSOR, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVAL AND INSTALLATION

REMOVING THE OIL LEVEL SENSOR

WARNING: **Hot oil can scald. Avoid skin contact with engine oil, particularly if the engine oil is dirty. Immediately wash hands and any skin that has been in contact with oil. Use a suitable cleaning agent and warm water. Wear protective gloves when working with engine oil.**

Remove the splash guard under the engine. Only applies to cars with automatic transmissions.

Position the container under the engine oil trough.

Remove the oil plug.

Drain the engine oil. It is easier to drain the oil if the engine is at operating temperature.

Fig. 1: Identifying Engine Oil Level Sensor
Courtesy of VOLVO CARS CORPORATION

Remove:

- the screws for the sensor. Disconnect the connector for the sensor
- the sensor.

INSTALLING THE OIL LEVEL SENSOR

NOTE: For tightening torques, see TIGHTENING TORQUE .

Fig. 2: Identifying Engine Oil Level Sensor
Courtesy of VOLVO CARS CORPORATION

Install:

- the sensor
- screws for the sensor. Tighten. Connect the connector to the sensor
- the oil plug.

FINISHING

Fill with engine oil. Run the engine to operating temperature. Check for any oil leakage.

Install the splashguard under the engine. Only applies to cars with automatic transmissions.

Check the oil level. Top up if required.

PULSE WHEEL, DRIVE SHAFT, REPLACING

Special tools:

see **9995695**

NOTE: As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATION

Remove the drive shaft. See **REPLACING THE FRONT RIGHT DRIVE SHAFT** or **REPLACING THE FRONT LEFT DRIVE SHAFT** .

REMOVING THE PULSE WHEEL

Fig. 3: Tapping Off Pulse Wheel Using A Hammer And Cold Chisel
Courtesy of VOLVO CARS CORPORATION

Secure the drive shaft in a vise with soft jaws.

Tap off the pulse wheel using a hammer and a cold chisel.

INSTALLING THE PULSE WHEEL

Fig. 4: Pressing Pulse Wheel Into Place
Courtesy of VOLVO CARS CORPORATION

Press the pulse wheel into place. Use tool see **9995695** and the screw for the drive shaft.

Install the drive shaft. See **REPLACING THE FRONT RIGHT DRIVE SHAFT** or **REPLACING THE FRONT LEFT DRIVE SHAFT** .

REPLACING THE OIL PRESSURE SENSOR

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information is always correct.**

REMOVING THE OIL PRESSURE SENSOR

Fig. 5: Identifying Engine Oil Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

Remove the hose from the charge air pipe.

Remove:

- the screw for the charge air pipe in the cylinder block
- the connector from the oil pressure sensor
