
Fig. 157: Identifying A/C Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

The air conditioning (A/C) pressure sensor detects the pressure in the high-pressure side of the air conditioning (A/C) system. This is so the engine control module (ECM) can control:

- start-up of the engine cooling fan (FC) step 2

- start-up of the engine cooling fan (FC) step 3
- stopping the compressor if the pressure in the air conditioning (A/C) is too high
- constant idle speed compensation for the air conditioning (A/C) compressor load.

The sensor is linear. It is grounded in the control module and supplied with a 5 Volt current from the control module. A linear signal (between 0-5 V depending on the pressure in the air conditioning (A/C)) is transmitted to the control module. Low pressure produces low voltage, high pressure produces high voltage.

The engine control module (ECM) can diagnose the air conditioning (A/C) pressure sensor. The sensor value can be read off using VIDA (Volvo scan tool).

The air conditioning (A/C) pressure sensor is positioned on the high pressure delivery line for the air conditioning (A/C) system.

HEATED OXYGEN SENSORS (HO2S)

Front heated oxygen sensor (HO2S)

Fig. 158: Front Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The front heated oxygen sensor (HO2S) is used to provide the engine control module (ECM) with information about the remaining oxygen content of the exhaust gases in front of the three-way catalytic converter (TWC).

This information is used by the engine control module (ECM) so that it can continually check the combustion so that lambda=1. lambda=1 is the ideal fuel-air ratio, with 14.7 kg air/1 kg fuel.

The heated oxygen sensor uses current control and its signal characteristic is linear. With a linear signal characteristic, the amplitude of the signal curve is low when changing the oxygen content in the exhaust gases. The probe consists of a preheating element (see "Pre-heating heated oxygen sensors") and the actual lambda sensor. The lambda sensor is an oxygen sensitive ceramic body consisting of zirconium oxide. The control module supplies power to the ceramic body, which reacts to the oxygen content of the exhaust gases. This in turn affects the signal to the Engine Control Module (ECM). In order to determine the oxygen content in the exhaust pipe, the heated oxygen sensor needs reference air from the surrounding air. This reference air reaches the heated oxygen sensor via the cable harness.

CAUTION: The cable harness for the heated oxygen sensors (HO2S) must not be trapped or damaged in any way. The connectors for the heated oxygen sensors (HO2S) must not be greased under any circumstances. The oil in the grease would disrupt the reference air and the function of the heated oxygen sensors (HO2S).

The engine control module (ECM) can diagnose the heated oxygen sensor. For further information, see **HEATED OXYGEN SENSOR (HO2S) DIAGNOSTIC** . VIDA (Volvo scan tool) can be used to read off the calculated lambda value from the heated oxygen sensor.

Rear heated oxygen sensor (HO2S)

Fig. 159: Identifying Rear Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The rear heated oxygen sensor is used to provide the Engine Control Module (ECM) with information about the remaining oxygen content of the exhaust gases behind the three-way catalytic converter (TWC). This information is used by the Engine Control Module (ECM) to check the function of the three-way catalytic converter (TWC). This check is carried out when the conditions for the catalytic converter diagnostics have been met. The rear heated oxygen sensor has no direct effect on regulation of the fuel/air mixture. However the Engine Control Module (ECM) uses the signal to optimize the signal from the front heated oxygen sensor. For further information, see **CATALYTIC CONVERTER DIAGNOSTIC** .

The heated oxygen sensor (HO2S) uses voltage control. The signal characteristic is binary. With a binary signal characteristic, the amplitude of the signal curve changes considerably when changing the oxygen content in the exhaust gases. Otherwise its components and function are the same as the front heated oxygen sensor (HO2S).

CAUTION: The cable harness for the heated oxygen sensors (HO2S) must not be

trapped or damaged in any way. The connectors for the heated oxygen sensors (HO2S) must not be greased under any circumstances. The oil in the grease would disrupt the reference air and the function of the heated oxygen sensors (HO2S).

The engine control module (ECM) can diagnose the rear heated oxygen sensor. The signal can be read using VIDA (Volvo scan tool).

Preheating of the heated oxygen sensors (HO2S)

The heated oxygen sensor (HO2S) only functions above a certain temperature, approximately 300 °C. The normal operating temperature is between 300-900 °C. The heated oxygen sensors (HO2S) are electrically pre-heated so that operating temperature is rapidly reached. This also ensures that the heated oxygen sensors (HO2S) maintain a normal operating temperature and to prevent condensation which could damage the heated oxygen sensor (HO2S).

The heater element in the probe consists of a positive temperature coefficient (PTC) resistor. The system relay supplies the heater element with voltage. The element is grounded in the engine control module (ECM). When the control module grounds the connection a current flows through the PTC resistor. When the heated oxygen sensor (HO2S) is cold, the resistance in the PTC resistor is low and a large current will flow through the circuit. The current from the Engine Control Module (ECM) is pulsed at first to prevent condensation damage to the heated oxygen sensor (HO2S). Depending on the temperature, allowances are made for factors such as the dew point. As the temperature in the PTC resistor rises, the resistance rises, the current falls and switches in stages to a constant current. The pre-heating time for the front heated oxygen sensor (HO2S) is short, approximately 20 seconds. The rear short-term fuel trim takes longer to warm up. This is to prevent damage to the probe. The pre-heating time for the front heated oxygen sensor (HO2S) is short, approximately 20 seconds.

Probe preheating begins as soon as the engine is started. The heater element heats the heated oxygen sensors (HO2S) to approximately 350 °C. The probes maintain this as a minimum temperature.

The engine control module (ECM) can diagnose the heater element.

ENGINE COOLANT TEMPERATURE (ECT) SENSOR

Fig. 160: Identifying Engine Coolant Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

The engine coolant temperature (ECT) sensor checks the temperature of the engine coolant. The temperature of the engine coolant is required so that the engine control module (ECM) can regulate:

- the injection period
- the idle speed
- the engine cooling fan (FC)
- the ignition advance
- engagement and disengagement of the A/C compressor
- diagnostic functions.

The sensor is a negative temperature coefficient (NTC) type which is supplied with power from the control module (signal) and is grounded in the control module.

The resistance in the sensor changes according to the temperature of the engine coolant. This provides the control module with a signal of between 0.1-4.9 V. The lower the temperature the higher the voltage (high resistance). A high temperature results in low voltage (low resistance).

The engine coolant temperature (ECT) sensor is located beside the thermostat.

The engine control module (ECM) can diagnose the engine coolant temperature sensor. The sensor value can be read off using VIDA (Volvo scan tool).

ENGINE COOLING FAN (FC) / ENGINE COOLING FAN (FC) CONTROL MODULE

Fig. 161: Identifying Electronic Control Module
Courtesy of VOLVO CARS CORPORATION

The engine cooling fan (FC) has two functions. One is to cool the engine compartment, the other is to cool the condenser when the air conditioning (A/C) compressor is working.

The engine control module (ECM) transmits a pulse width modulated (PWM) signal to the engine cooling fan (FC) control module. The control module then activates the fan at one of three different speeds. The speed of the engine cooling fan (FC) is determined by the engine control module (ECM), depending on the coolant temperature (based on the signal from the engine coolant temperature (ECT) sensor) and the vehicle speed.

When the vehicle is stationary, the engine cooling fan (FC) is activated as follows:

- the first stage is activated at approximately 105 °C and shut of at approximately 100 °C

- the second stage is activated at approximately 110 °C and shut of at approximately 105 °C
- the third stage is activated at approximately 115 °C and shut of at approximately 110 °C.

NOTE: **The engine cooling fan may have a post-run of up to approx. 6 minutes after the engine has been turned off. The time for the fan's post-run depends on engine temperature, temperature in the engine compartment and pressure level in the AC-system.**

WARNING: **Be careful since the engine cooling fan may have a post-run after the engine has been turned off.**

The engine cooling fan (FC) and its control module are behind the radiator.

The engine control module (ECM) can diagnose the engine cooling fan. The fan can be activated using VIDA (Volvo scan tool).

MASS AIR FLOW (MAF) SENSOR

Fig. 162: Identifying Intake Air Temperature (IAT) Sensor
Courtesy of VOLVO CARS CORPORATION

The mass air flow (MAF) sensor gauges the air mass sucked into the engine. It continuously transmits signals to

the engine control module (ECM) about the mass of the intake air. This data is used by the engine control module (ECM) to calculate:

- the injection period
- the ignition timing
- the engine load.

The gearbox control module (TCM) also uses this data for its gear shift calculations. This data is transmitted to the gearbox control module (TCM) from the engine control module (ECM) via the high speed side of the Controller area network (CAN).

The mass air flow (MAF) sensor is a hot wire type. Unlike other hot wire types, the mass air flow sensor in the Denso system uses a hot wire which has a ceramic casing. This eliminates the need for a clean burn function.

The mass air flow (MAF) sensor is supplied with battery voltage by the system relay and is grounded in the engine control module (ECM). The signal from the sensor is analogue and varies between 0.5 - 4.5 V depending on the air mass. Low air flow (low mass) results in low voltage, high air flow (high mass) gives high voltage.

The mass air flow (MAF) sensor is positioned between the air cleaner (ACL) housing and the intake manifold.

The mass air flow (MAF) sensor also contains an intake air temperature (IAT) sensor.

The engine control module (ECM) can diagnose the mass air flow (MAF) sensor. The signal can be read using VIDA (Volvo scan tool).

OUTSIDE TEMPERATURE SENSOR

Fig. 163: Identifying Outside Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

The outside temperature sensor detects the temperature in the surrounding air. The signal is used by the engine control module (ECM) as a substitute value in the event of a fault in certain components or functions and to control certain diagnostic functions.

The sensor is a negative temperature coefficient (NTC) type which is supplied with power from the control module (signal) and is grounded in the control module.

The resistance in the sensor, which provides a signal between 0.1-4.7 V, changes depending on the outside temperature. Low temperatures produce high voltage (high resistance), high temperatures produce low voltage (low resistance).

The outside temperature sensor is positioned in the left door mirror.

The engine control module (ECM) can diagnose the outside temperature sensor. The sensor value can be read off using VIDA (Volvo scan tool).

ENGINE SPEED (RPM) SENSOR

Fig. 164: Identifying Engine Speed Sensor
Courtesy of VOLVO CARS CORPORATION

The engine speed (RPM) sensor provides the Engine Control Module (ECM) with information about the speed and position of the crankshaft. The Engine Control Module (ECM) is able to use the signal from the engine speed (RPM) sensor to determine when a piston is approaching top dead center (TDC). However it is unable to use the signal from the engine speed (RPM) sensor to determine whether the piston is in the combustion stroke or whether the exhaust valve is open (exhaust stroke). The signal from the camshaft position (CMP) sensor is also required to determine the operating cycle of the engine.

The signal from the engine speed (RPM) sensor is also used to check the engine for misfires (misfire diagnostics).

Cars with manual transmissions have a series of holes drilled in the periphery of the flywheel. Cars with automatic transmissions have a steel ring with punched holes. This steel ring is welded to the edge of the carrier plate. In both cases, there is 6° between each hole. This arrangement creates a hole for each tooth. There are 360° in one revolution. 6° between each hole means that there are 60 holes. However one hole is not drilled/punched, to create a reference position (tooth) for the crankshaft. This reference position is 72° before the top dead center (TDC) of cylinder 1 on a 5 cylinder engine.

The engine speed (RPM) sensor is at the rear of the engine above the flywheel.

The sensor is inductive with a permanent magnet. An alternating current is induced in the sensor when the flywheel/carrier plate passes the engine speed (RPM) sensor. The generated voltage and frequency increases with the engine speed (RPM).

The signal varies between 0.1 - 100 V (AC) depending on the engine speed (RPM).

The Engine Control Module (ECM) is able to determine the engine speed (RPM) by counting the number of holes per time unit. When the reference tooth passes the engine speed (RPM) sensor, the voltage and frequency drop momentarily to zero, even though the engine is still running. This allows the Engine Control Module (ECM) to determine the position of the crankshaft.

If the signal from the engine speed (RPM) sensor is incorrect or missing, the control module will use the signals from the camshaft position (CMP) sensor, on the condition that the position of the camshaft has been adapted and the car can be driven if there is no signal.

The engine control module (ECM) can diagnose the engine speed (RPM) sensor. The sensor value (engine speed (RPM)) can be read off using VIDA (Volvo scan tool).

CAMSHAFT POSITION (CMP) SENSOR

Fig. 165: Identifying Camshaft Position Sensor
Courtesy of VOLVO CARS CORPORATION

The Engine Control Module (ECM) uses the signals from the camshaft position (CMP) sensor and the engine speed (RPM) sensor to establish the operating cycle of the engine. This enables the engine control module (ECM) to:

- start the engine more quickly
- control the correct ignition coil and injector
- function as a substitute for the engine speed (RPM) sensor
- check the camshaft continuous variable valve timing (CVVT).

The pulse wheel on the camshaft has five teeth with different gaps which correspond to a specific cylinder.

For further information, also, see **KNOCK SENSOR (KS)** and **CAMSHAFT CONTROL (CVVT)**.

The sensor, which is a magnetic resistor with a permanent magnet, is grounded in the control module and supplied with current from the control module. When one of the teeth on the camshaft pulse wheel passes the camshaft position (CMP) sensor, a signal is transmitted to the control module from the camshaft position (CMP) sensor. The signal varies between 0-1 V and is low when a flank passes the camshaft position (CMP) sensor.

The camshaft position (CMP) sensor is positioned at the rear of the engine on the camshaft with continuous variable valve timing (CVVT).

The engine control module (ECM) can diagnose the camshaft position (CMP) sensor.

KNOCK SENSOR (KS)

Fig. 166: Identifying Knock Sensor
Courtesy of VOLVO CARS CORPORATION

Cars of model year 1999-2000 have a knock sensor. Cars from model year 2001 are equipped with two knock sensors (KS).

The function of the knock sensor (KS) is to monitor combustion knocking from the engine. Knocking may damage the engine and reduces the efficiency of engine combustion.

If the engine control module (ECM) registers knocking from any of the cylinders, the ignition will be retarded for that cylinder at the next combustion stage. If repeated ignition retardation does not prevent knocking, the injection period will be increased. This has a cooling effect.

The sensor is made up of a piezo electrical crystal. If there is engine knock, vibrations (sound waves) spread through the cylinder block to the knock sensor (KS). The resultant mechanical stress in the piezo electrical material in the knock sensors generates a voltage. This signal is transmitted to the Engine Control Module (ECM). The signal corresponds to the frequency and amplitude of the sound waves. This allows the Engine Control Module (ECM) to determine if the engine is knocking. The camshaft position (CMP) sensor and engine speed (RPM) sensor are used to determine the operating cycle of the engine (which cylinder is igniting) and thereby which cylinder is knocking.

The knock sensors (KS) are positioned on the cylinder block below the intake manifold.

The engine control module (ECM) can diagnose the knock sensors (KS).

ENGINE COOLANT LEVEL SENSOR

Fig. 167: Identifying Engine Coolant Level Sensor
Courtesy of VOLVO CARS CORPORATION

The function of the engine coolant level sensor is to alert the driver if the engine coolant level in the expansion tank is too low.

The sensor is a magnetic reed switch, which is enclosed in a pipe on the bottom of the expansion tank. Around the pipe, on the inside of the expansion tank is a float. This float contains a magnet. When the engine coolant level is above minimum, the float is too high in the tank to affect the switch. However if the engine coolant level falls below the minimum level, the magnetic field acts on the switch.

The sensor is supplied with voltage (signal) from the Engine Control Module (ECM) and grounded in chassis. When the engine coolant level in the expansion tank is over a certain level the circuit closes, which produces a low signal. When the engine coolant level is below a certain level the circuit is opened by the engine coolant

level sensor, which produces a high signal. When the engine control module (ECM) detects a high signal the information about low engine coolant level is transmitted via the Controller area network (CAN) to the driver information module (DIM), which warns the driver.

NOTE: There are no functions controlled by the engine which are directly connected to the low coolant level warning lamp. The Engine Control Module (ECM) only transfers the signal which is used by the Driver Information Module (DIM).

The engine control module (ECM) cannot diagnose the engine coolant level sensor.

MAIN RELAY (SYSTEM RELAY)

Fig. 168: Identifying Main Relay
Courtesy of VOLVO CARS CORPORATION

The function of the main relay (system relay) is to supply certain components with voltage.

The relay is mechanical and has a closing function. In the rest position the circuit in the relay is open.

The main relay terminals (#30 and #86) are supplied with voltage by the battery. When the ignition key has been turned and the engine control module (ECM) is powered, the terminal (#85) on the main relay is grounded by the engine control module (ECM).

When the terminal (#85) is grounded, the relay is activated and a number of components are powered via the relay terminal (#87).

The engine control module (ECM) can diagnose the main relay.

The main relay is in the relay/fusebox in the engine compartment.

AIR-CONDITIONING: (A/C) RELAY

Fig. 169: Identifying A/C Relay
Courtesy of VOLVO CARS CORPORATION

The air conditioning (A/C) relay controls the A/C compressor. When the climate control module (CCM) requests A/C control, a signal is transmitted to the engine control module (ECM) via the controller area network (CAN) to activate the relay. The engine control module (ECM) temporarily deactivates the relay in the event of:

- full load acceleration
- too high engine coolant temperature.

The relay is mechanical. It has a closing / breaking function and is supplied with power from the system relay.

In the rest position the circuit in the relay is open.

The system relay supplies the coil and the relay with power. The relay activates when the coil is grounded in the engine control module (ECM), the circuit closes and the A/C compressor is supplied with power via the relay voltage output.

The relay coil is grounded (signal) when the engine control module (ECM) receives a signal via the Controller area network (CAN) from the climate control module (CCM) to activate the relay and start the compressor.

FUEL PUMP (FP) RELAY

Fig. 170: Identifying A/C Relay
Courtesy of VOLVO CARS CORPORATION

The fuel pump (FP) relay supplies the fuel pump with power. The relay also cuts the power to the pump when the ignition is switched off or if the engine stops. The central electronic module (CEM) also cuts the power to the relay if the supplemental restraint module (SRS) transmits a message indicating that an airbag has deployed.

The central electronic module (CEM) activates and deactivates the relay when requested by the engine control module (ECM) (via the Controller area network (CAN)).

When the ignition is switched on, the engine control module (ECM) sends a signal to the central electronic

module (CEM) via the controller area network (CAN) to run the fuel pump (FP) for one seconds. This is so that the pressure increases in the fuel system, shortening the start time.

When the flywheel in the engine rotates (generating a signal from the engine speed (RPM) sensor), the engine control module (ECM) will transmit a request to the central electronic module (ECM) via the Controller area network to start the fuel pump (FP). In the event of the engine stopping, the Engine Control Module (ECM) cancels the "activated fuel pump" signal. The central electronic module (CEM) then switches off the fuel pump (FP).

There is a directly connected cable between the engine control module (ECM) and the central electronic module (CEM). In the event of a fault in the Control area network (CAN), this cable is used by the "activated fuel pump" signal.

AIR-DISTRIBUTION: VALVE

Fig. 171: Identifying Air Distribution Valve
Courtesy of VOLVO CARS CORPORATION

Cars from model year 1999-2000 have an air distribution valve. The air distribution valve supplies the injectors with air. This results in better volumetric efficiency, more effective combustion and therefore cleaner exhaust emissions. The valve is also used for idle air trim but is also slightly open at higher engine speeds.

The valve is directly mounted on the inlet hose for the electronic throttle module (ETM). The valve is connected to a hose which supplies air to the air-shrouded injectors via a distribution pipe.

The valve has its own ignition driver stage and solenoid and is supplied with 12V. The valve is controlled steplessly by the Engine Control Module (ECM) using a variable pulse ratio (duty-cycle) which opens or closes a shutter in the valve.

The valve works primarily during cold starts and when idling, to minimize the release of carbon dioxide and hydro-carbons whilst maintaining performance and driveability. This is partly because the size of fuel drops is smaller with fuel mixed with air and does not adhere as easily to the walls of the intake manifold when they are cold and damp. This also reduces fuel consumption when cold starting and cuts the warm up time for both the engine and the three-way catalytic converter (TWC).

The total calculated volume of air to be released into the combustion chamber is distributed between both the Electronic Throttle Module (ETM) and the air distribution valve. The input signals to the Engine Control Module (ECM) which affect the operation of the air distribution valve are: the position of the throttle, engine speed (RPM)/position sensor, engine coolant temperature (ECT) sensor, ambient air pressure and ambient air temperature.

The air distribution valve can be diagnosed by the Engine control module (ECM) and can be activated using VIDA (Volvo scan tool).

INJECTORS

Fig. 172: Identifying Injector
Courtesy of VOLVO CARS CORPORATION

The function of the injectors is to spray fuel into the cylinders in the correct spray patterns. This happens sequentially.

The injectors are in the intake manifold.

It is essential that the injectors are correctly installed with no air leakage around them. Fuel leakage from the top of an injector when it is not activated may lead to starting and driving problems.

The engine control module (ECM) controls the injectors using a pulse width modulation (PWM) signal.

The engine control module (ECM) can diagnose the injectors. The injectors can be activated using VIDA (Volvo scan tool).

Air-shrouded injectors

Cars from model year 1999-2000 have air-shrouded injectors.

The injectors are in the air distribution pipe which is in the intake manifold.

The lower section of the injectors has 2 openings in the side where air can enter.

When the needle in the injector starts to rise, the openings are exposed. This allows air to flow in to the center of the valve at high speed, and the fuel and air are finely distributed and mixed.

When the needle rises further, the injector nozzle opens and the air/fuel mixture is released into the combustion chamber.

EVAPORATIVE EMISSION SYSTEM (EVAP) VALVE

Fig. 173: Identifying Canister Purge (CP) Valve
Courtesy of VOLVO CARS CORPORATION

The evaporative emission system (EVAP) valve is used to open/close the connection between the EVAP canister and the intake manifold. The valve controls the flow of hydro-carbons (fuel vapor) from the EVAP canister to the engine intake manifold using the vacuum in the intake manifold. This ensures that hydro-carbons stored in the EVAP canister are used in the engine combustion process.

The valve is an electro-magnetic valve which is powered from the system relay. When the valve needs to be opened, it is grounded internally in the engine control module (ECM). The evaporative emission system (EVAP) valve is closed when in the standby position (open-circuit).

When the control module requests that the EVAP canister should be emptied (the hydrocarbons stored in the canister should be released into the engine), the control module deploys the evaporative emission system (EVAP) valve by grounding it. The valve is grounded using a pulse width modulation (PWM) signal, allowing the control module to govern the extent to which the valve opens and adapting the emptying of the canister according to how full it is, engine speed (RPM) and load etc.

The engine control module (ECM) can diagnose the evaporative emission system (EVAP) valve. The valve can be activated using VIDA (Volvo scan tool).

The evaporative emission system (EVAP) valve is close to the intake manifold.

CAMSHAFT RESET VALVE (CONTINUOUS VARIABLE VALVE TIMING (CVVT))

Fig. 174: Identifying Camshaft Reset Valve
Courtesy of VOLVO CARS CORPORATION

The camshaft reset valve controls the oil flow to the continuous variable valve timing (CVVT) unit.

The valve consists of an electro-magnetic valve with a spring-loaded piston. There are slits in the piston which channel the engine lubricating oil to different channels in the continuous variable valve timing (CVVT) unit by moving the piston in the reset valve. The continuous variable valve timing (CVVT) unit turns the camshaft (the cam timing changes). The direction in which the camshaft turns depends on the chamber in the CVVT unit which is supplied with oil (pressure).

Also, see **CAMSHAFT CONTROL (CVVT)**.

The system relay supplies the reset valve with voltage. The valve is grounded (control stage) in the engine control module (ECM). When the valve is grounded using a pulse width modulation (PWM) signal, the oil flow in the valve can be controlled to the different chambers in the continuous variable valve timing (CVVT) unit at variable rates. This allow the angle of the camshaft to be changed precisely and smoothly.

The engine control module (ECM) can diagnose the camshaft reset valve. The value of the reset valve can be read using VIDA (Volvo scan tool).

Only cars of model year 2000 and later have continuous variable valve timing (CVVT).

The valve is on the cylinder head above the camshaft with camshaft control.

IGNITION COILS

Fig. 175: Identifying Ignition Coil
Courtesy of VOLVO CARS CORPORATION

The ignition coils ignite the fuel / air mixture on command from the engine control module (ECM). The signal is re-transmitted so that the control module knows that it worked.

Each ignition coil has its own integrated power stage.

The ignition coils are in the sparkplug wells above each spark plug.

The ignition windings can be diagnosed by the Engine control module (ECM) and can be activated using VIDA (Volvo scan tool).

EMISSIONS WARNING LAMP

Fig. 176: Emissions Warning Lamp
Courtesy of VOLVO CARS CORPORATION

The emissions warning lamp in the Driver Information Module (DIM) has a warning symbol. This warning symbol varies depending on the market and model year. The warning symbols are:

- "Engine symbol" (not USA, model year 2001-)
- "CHECK ENGINE" (MIL - Malfunction Indicator Lamp, USA only).
- "Lambda symbol" (not USA, model year 1999-2000).

The warning symbol lights when the ignition key is turned to position II and goes out when the engine is started if the engine management system does not detect any faults.

The warning lamp is directly connected to the engine control module (ECM).

The warning lamp will light if there is a fault in one of the monitored parameters in the engine management system. The warning lamp will also light in response to a request transmitted via the Control area network (CAN) if there is a fault in one of the following systems which affects emissions:

- gearbox control module (TCM)
- brake control module (BCM)
- electronic throttle module (ETM).

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR

Fig. 177: Identifying MAP Sensor
Courtesy of VOLVO CARS CORPORATION

The manifold absolute pressure (MAP) sensor detects quick pressure changes in the intake manifold after the throttle. The signal from the sensor is used by the engine control module (ECM) as an addition to the mass air flow (MAF) sensor to calculate the injection period.

The semi-conductor sensor is grounded in the control module and is supplied with power from the control module.

The resistance in the sensor changes depending on the pressure in the intake manifold, giving a signal of 0.5 - 4.5 V. Low pressure results in low voltage, high pressure in high voltage.

The engine control module (ECM) can diagnose the manifold absolute pressure sensor. The sensor signal can be read using VIDA (Volvo scan tool).

The manifold absolute pressure (MAP) sensor is on top of the radiator and is connected to the intake manifold by a hose.

FUEL TANK PRESSURE SENSOR (CERTAIN MARKETS ONLY)

Fig. 178: Fuel Tank Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

The fuel tank pressure sensor detects the pressure in the fuel tank. The signal from the sensor is used by the engine control module (ECM) during diagnostics to check for leakage in the fuel tank system.

The sensor, which is a piezo resistor, is grounded in the control module and supplied with power from the control module.

The resistance in the sensor changes depending on the pressure in the fuel tank, giving a signal of 0.5 - 4.5 V. Low pressure results in low voltage, high pressure in high voltage.

The tank pressure sensor can be diagnosed by the Engine control module (ECM), and the sensor's signal can be read using VIDA (Volvo scan tool).

The fuel tank pressure sensor is positioned on top of the fuel tank on cars with leakage diagnostics for the

evaporative emission (EVAP) system.

EVAP CANISTER SHUT-OFF VALVE (CERTAIN MARKETS ONLY)

Fig. 179: Identifying EVAP Canister Shut-Off Valve
Courtesy of VOLVO CARS CORPORATION

The EVAP canister shut-off valve is used to close the connection between the EVAP canister/fuel tank system and fresh air (atmospheric pressure) when leak diagnostics are carried out on the cars with the evaporative emission (EVAP) system.

The valve is an electro-magnetic valve which is powered from the system relay. When the valve needs to be closed, it is grounded internally in the engine control module (ECM). The valve is open when in the rest position (open-circuit).

The valve can be diagnosed by the engine control module (ECM) and can be activated using VIDA (Volvo scan tool).

The valve is next to the EVAP canister on cars with leak diagnostics for the evaporative emission (EVAP) system.

IDENTIFYING UPGRADED SOFTWARE ECM/ETM

Upgraded software for the engine control module (ECM) and electronic throttle module (ETM), available during 2006 or later, can be identified. The updated software has a **diagnostic number/software number** . The diagnostic number/software number can be read using VIDA (Volvo scan tool).

CAUTION: For turbocharged and 6-cylinder normally aspirated engines the software of the engine control module (ECM) can be identified using the software number or diagnostic number , depending on the version of the software involved.

The differences between the **first version** , which is identified by the software number, and the **second**

version , which is identified by the diagnostic number, include the following:

- Improved driveability after engine control module (ECM) reset. The start values for some system adaptations are adjusted to facilitate handling of aged/worn systems/components after diagnostic trouble code deletion or when the control module has been without power.
- Increased hardiness to certain combinations of aging/wear in the system. The work areas for some adaptations are adjusted to better match the aging of certain components.
- Supplements as to which faults are to generate a message to the driver.
- Improved serviceability (diagnostic trouble code generation) for some intermittent faults that generate driveability problems.

The diagnostic number (also known as diagnostic version in VIDA (Volvo scan tool)) and the software number can be read out via VIDA (Volvo scan tool). The electronic throttle module (ETM) is identified solely by the diagnostic number.

If the diagnostic number/software number is within the following series, it is the **latest** software downloaded:

- **5-cyl non-turbo engines** ,: Engine control module (ECM) diagnostic number 30785129 - 30785132 or 30785667 and electronic throttle module (ETM) 30785387.
- **Turbocharged and 6-cylinder normally aspirated engines** :

  First version, engine control module (ECM) **software number** 30785203 - 30785240 and electronic throttle module (ETM) diagnostic number 30785388.

  Second version, engine control module (ECM) **diagnostic number** 30785372 - 30785378 and electronic throttle module (ETM) diagnostic number 30785388.

FUNCTION

CAMSHAFT CONTROL (CVVT)

Fig. 180: CVVT Function
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) controls the camshaft reset valve (CVVT) steplessly. The pressure of the engine oil is used to regulate the CVVT unit.

The CVVT is installed on the intake camshaft on all B5244 engines.

There are 30 camshaft degrees (60 crankshaft degrees) between the limit positions.

The variable camshaft is hydraulically controlled by the engine oil. The camshaft turns when the camshaft reset valve (CVVT) releases lubricating oil into the front **(A)** or rear chamber **(B)** of the CVVT unit. The chambers are separated by a piston which is secured in the camshaft. The piston is secured in the cover of the CVVT unit by splines so that it moves easily. When the oil acts on the piston, the piston twists. The pulse wheel for the timing belt is on the outer cover of the CVVT unit.

Regulation is precise and rapid.

The camshaft reset valve (CVVT) has extremely fine ducts. This allows for precise regulation. However as a result the reset valve is sensitive to contaminants.

The main role of the variable camshaft is to reduce exhaust emissions, especially during cold starting. Idle quality is also improved.

Before the engine starts, there is an internal check consisting of the following stages:

1. When the ignition is switched on, there is an electrical check of the signal cable, the power supply cable and the solenoid. This check checks for a short-circuit to supply voltage or ground and open-circuits
2. The camshaft is checked to ensure that it is in the correct position in relation to the flywheel, with the camshaft in its 0 position (mechanical resting position). This can be done by comparing the signals from the camshaft position (CMP) sensor and the engine speed (RPM) sensor. If there is too much deviation between these, the camshaft reset valve (CVVT) is not activated and a diagnostic trouble code (DTC) is stored
3. During greater control of the variable camshaft, the amount of time taken to deploy the camshaft to the desired value is measured. This time is used partly to assess how long it takes to change the angle of the camshaft and partly to disengage the variable camshaft if the time exceeds a certain maximum limit. The camshaft uses the engine oil and the oil pressure to turn itself. The rotation time varies, depending on factors such as engine speed (RPM), oil pressure and the viscosity of the oil (which depends open the temperature and quality of the oil)
4. The signal from the camshaft position (CMP) sensor is compared with the signal from the engine speed (RPM) sensor when the engine is turned over to ensure that it is correct. The check stops when the engine has started. If the check returns faulty values, a diagnostic trouble code (DTC) is stored and there is no camshaft control (CVVT).

Control

Fig. 181: CVVT Control

Courtesy of VOLVO CARS CORPORATION

Control takes place as follows when deploying the camshaft:

1. Oil is forced from the engine lubricating system to the intake port on the reset valve
2. The engine control module (ECM) grounds the valve, the position of the piston in the valve changes and the oil is guided to the continuous variable valve timing (CVVT) unit chamber (A1) via the duct (A2) in the camshaft
3. The continuous variable valve timing (CVVT) unit hub is pressed backwards by the oil pressure. The continuous variable valve timing (CVVT) unit then rotates the hub and the carriers are joined by twisted splines
4. The oil flows to the engine sump via the outer ducts on the hub and the reset valve's return hose.

Control takes place as follows when returning the camshaft:

1. Oil is forced from the engine lubricating system to the intake port on the reset valve
2. The engine control module (ECM) breaks the ground connection for the valve. The piston in the valve is then pressed back by a spring. The oil flows to the continuous variable valve timing (CVVT) unit chamber (B1) via a duct (B2) in the camshaft
3. The hub of the continuous variable valve timing (CVVT) unit is forced forward by the oil pressure that is created. The continuous variable valve timing (CVVT) unit will rotate back to the non-deployed position
4. The oil flows to the engine oil sump via the center duct on the hub and the reset valve's return duct.

The above takes place very quickly. The engine control module (ECM) controls the deployment and return of the reset valve continually at high frequency. This results in rapid and exact control.

There are diagnostics for this function.

KNOCK CONTROL

Fig. 182: Identifying Knock Control
Courtesy of VOLVO CARS CORPORATION

Knock occurs in the combustion chamber when the fuel and air mixture self ignites. This can occur either before or after the spark plug has produced an ignition spark. In both cases the gas in two or more places ignites in the combustion chamber.

This results in an extremely fast combustion process with flames from several directions. When these flames collide, the pressure in the cylinder increases rapidly and there is a mechanical knocking sound.

If any of the cylinders knock there is a specific type of vibration in the cylinder block. These vibrations are transferred to the knock sensors (KS) which are screwed into place in the cylinder block. The resultant mechanical stress in the piezo electrical material in the knock sensors generates a voltage. The engine control module (ECM) can then determine which cylinder is knocking with the help of the camshaft position (CMP) sensor and the engine speed (RPM) sensor.

The knock sensors (KS) also interpret a proportion of normal engine sound. The control module is able to recognize the vibrations which correspond to knocking by filtering, amplifying and using software to evaluate the signal.

If the knock sensors (KS) detect knocking in the engine above a certain threshold value, the ignition timing is first retarded and then the fuel / air mixture is enriched to eliminate knocking.

IGNITION CONTROL

Fig. 183: Identifying Engine Control Module (ECM) Communication System
Courtesy of VOLVO CARS CORPORATION

The following components are used for ignition control:

- engine speed sensor (7/25)
- camshaft position (CMP) sensor (7/172)

- mass air flow (MAF) sensor (7/17)
- engine coolant temperature (ECT) sensor (7/16)
- electronic throttle module (ETM) (4/50)
- knock sensor (KS) (7/23-7/24)
- transmission control module (TCM) (4/28)
- spark plugs with ignition coils (20/3-20/8)
- brake control module (BCM)/anti-lock brake system module (ABS), (4/16).

The engine control module (ECM) calculates the optimum ignition advance based on the software and information from the sensors. The engine control module (ECM) cuts the current to the ignition coil mounted on the cylinder to be ignited and produces a spark.

During the starting phase the engine control module (ECM) produces a fixed ignition setting. When the engine starts and the car is driven the engine control module (ECM) calculates the optimum ignition setting according to the engine speed (RPM), load, temperature etc.

The engine control module (ECM) analyses the signal from the knock sensors (KS) when the engine reaches operating temperature. If any of the cylinders knock, the ignition is retarded for that specific cylinder until the knocking ceases.

The ignition then advanced to the normal position or until the knock recurs.

Before the gearbox control module (TCM) changes gear, it sometimes transmits a torque limiting request to the engine control module (ECM). The engine control module (ECM) then retards the ignition momentarily to reduce the torque, resulting in smoother gear changes and reducing the load on the gearbox. There are different ignition retardation levels depending on the signals from the gearbox control module (TCM). The return signal from the engine control module (ECM) to the gearbox control module (TCM) confirms that the signal reached the engine control module (ECM). The brake control module (BCM)/ABS control module transmits information to the engine control module (ECM) about deviations in the drive line. The signal is used to stop the diagnosis.

For further information, also, see **MISFIRE DIAGNOSTIC** .

The engine misfires if the fuel does not ignite correctly. See **MISFIRE DIAGNOSTIC** .

CRUISE CONTROL

Fig. 184: Identifying Cruise Control Communication System & Components
Courtesy of VOLVO CARS CORPORATION

The cruise control function is an example of distributed functionality.

The following components are used when driving using cruise control:

- engine control module (ECM).
- electronic throttle module (ETM)
- brake control module (BCM) / anti-lock brake system module (ABS)
- accelerator pedal (AP) position sensor
- clutch pedal sensor
- brake pedal sensor
- control unit cruise control
- steering wheel module (SWM)
- central electronic module (CEM)
- gearbox control module (TCM)
- driver information module (DIM).

To activate cruise control the function must be switched on using the "CRUISE" button. A lamp lights up in the Driver Information Module (DIM).

The driver activates the function by pressing the SET+ or SET- button. A message is then transmitted via the low speed side of the Controller area network (CAN) to the central electronic module (CEM) which then transmits the message on via the high speed side of the Controller area network (CAN) to the engine control module (ECM). The engine control module (ECM) uses the vehicle speed signal from the brake control module (BCM)/ABS control module to control the throttle angle so that a constant speed is maintained. The gearbox control module (TCM) also receives a message indicating that cruise control is active via the Controller area network (CAN), so that the gearbox follows certain shifting patterns when the cruise control is active.

If the accelerator pedal (AP) is depressed the speed increases as normal and then resumes to the stored value when the driver releases the accelerator pedal (AP) again.

The engine control module (ECM) continually stores the speed. If the cruise control is disengaged, if for example the driver presses the brake pedal, the previous stored speed can be used by pressing the "RESUME" button.

Cruise control cannot be activated at speeds below 35 km/h.

Cruise control is disengaged:

- when the driver presses the clutch pedal or brake pedal
- when the driver presses the "CRUISE" button on the steering wheel
- when the driver depresses the "0" button on the steering wheel
- if "P" or "N" positions are transmitted on the Controller area network (CAN) (applies to automatic transmissions)
- if the speed deviates too much from the set value
- when certain diagnostic trouble codes (DTCs) are stored which do not allow continued activation (For further information, see diagnostic trouble code (DTC) information).

AIR-FLOW: ADAPTATION (ONLY TURBO AND 6 CYLINDER NON TURBO ENGINES)

Fig. 185: Identifying Air Flow Adaptation
Courtesy of VOLVO CARS CORPORATION

NOTE: This service information pertains to the air flow adaptation over the throttle unit, not to be confused with the control module's fuel adaptation (lambda adaptation).

There is a correction factor in the Engine control module (ECM) for adjusting the leakage flow over the throttle unit. Leakage flow means the air that does not go through the throttle unit, but goes via the crankcase ventilation, power brake booster and EVAP system. For the control module to be able to learn the adjustments needed in the different air flow areas, there are two adaptation areas. One for idling and one for part load. These values are saved when the engine is switched off.

These values can be read off using the "Air mass, correction value" and "Leakage flow over throttle unit" parameters.

AIR-LEAKAGE: FLOW VIA THROTTLE UNIT

HINT: The following measurement for diagnostic trouble code (DTC) ECM-130A can be carried out to determine the fault cause.

Air flow adaptation idling

The parameter for air flow adaptation idling is one of the parameters for determining the leakage flow over the throttle unit where the mass air flow (MAF) sensor flow determines the reference value. The adaptation value is the value that must be added or subtracted from the control module calculated air flow. The calculated air flow added or subtracted from the adaptation value should be the same as the mass air flow (MAF) sensor's flow.

The adaptation value is not used as a part of a diagnostic function and will not, in the event of a large value, result in a diagnostic trouble code (DTC). The value can be used to evaluate the air flow over the throttle unit. The adaptation value is displayed in kg/h and the normal values are 5-10 kg/h.

The engine does not only obtain air via the throttle unit, but also from the crankcase ventilation, the EVAP system and power brake booster for example. The total of this air supply should give us our normal adaptation value of 5-10 kg/h, which does not pass through the throttle unit and therefore the mass air flow (MAF) sensor.

If this air supply is removed or slightly restricted, e. g. if the crankcase ventilation becomes blocked, the adaptation value drops to less than 5 kg/h. Dirt in the throttle unit can have the same effect and generally depends on the crankcase ventilation being blocked. The crankcase ventilation should, in such cases, be checked first. If there is an air leak in the intake manifold the value would increase to above 10 kg/h.

Air flow adaptation part load

This is the part of air flow adaptation that makes it possible to compensate for the tolerance interval between different engines and for aging components. The normal value without adaptation is 1. A value below 1, e. g. 0.95 indicates that more air passes through the mass air flow (MAF) sensor than calculated. An indication of a blocked crankcase ventilation is a low adaptation value around 0.85 or less.

A value greater than 1 can indicate an air leak inside the intake manifold where, for example, a loose or defective vacuum line can give a value of 1.15 or greater.

Diagnostic trouble code (DTC) ECM-130A is stored if the value for the air flow adaptation at part load and the correction factor are extremely large. Unfortunately, the correction factor cannot be displayed in VIDA (Volvo scan tool), but if this DTC has been generated, the correction factor can be assumed to be extremely large. These adaptations should not only be used for fault-tracing, but considered to be an indication of which method should be used next time.

The fuel adaptations (lambda adaptations) should be checked first to analyze for an air leak. Thereafter check for smaller leaks than normal, for idling, less than 5 kg/h and/or for part load less than 1 kg/h. If the leakage flow is smaller, the crankcase ventilation may be blocked.

If the leakage flow is greater than normal, for idling greater than 10 kg/h and/or for part load greater than 1 kg/h, there might be an air leak in the connections to the engine after the throttle unit.

FAULTY SIGNAL

CHECKING THE INTAKE SYSTEM

Check that the hoses and hose connectors between the mass air flow (MAF) sensor and the throttle unit are not leaking or defective.

Check that the boost pressure sensor is correctly mounted. Check for air leakage around the component.

HINT: This diagnostic trouble code can be caused by a damaged mass air flow sensor.

Remedy as necessary.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-131C: INTAKE AIR TEMPERATURE (IAT) SENSOR. SIGNAL TOO HIGH (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-131C

Condition

Fig. 191: Identifying Boost Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal for the intake air temperature.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the signal for the intake air temperature corresponds to a temperature that is higher than a certain value.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- Predefined value for intake air temperature
- Three-way catalytic converter (TWC) preheating and idle air trim diagnostics are disabled.

Possible Source

- Short-circuit to ground in the signal cable
- Damaged intake air temperature (IAT) sensor.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- Poor performance.

SIGNAL TOO HIGH

ECM-131D: INTAKE AIR TEMPERATURE (IAT) SENSOR. SIGNAL TOO LOW (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-131D

Condition

Fig. 192: Identifying Boost Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal for the intake air temperature.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the signal for the intake air temperature corresponds to a temperature that is lower than a certain value.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- Predefined value for intake air temperature
- Three-way catalytic converter (TWC) preheating and idle air trim diagnostics are disabled.

Possible Source

- Contact resistance in the terminals
- Open-circuit in the signal cable
- Short-circuit to supply voltage in the signal cable
- Damaged intake air temperature (IAT) sensor.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- Poor performance.

ECM-1320: INTAKE AIR TEMPERATURE (IAT) SENSOR. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-1320

Condition

Fig. 193: Identifying Boost Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal for the intake air temperature.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the signal does not follow a certain characteristic over a period of time.

The diagnostic trouble code (DTC) can be diagnosed under specific driving conditions.

Substitute Value

- Predefined value for intake air temperature
- Three-way catalytic converter (TWC) preheating and idle air trim diagnostics are disabled.

Possible Source

- Contact resistance or oxidation in the intake air temperature (IAT) sensor terminals
- Damaged intake air temperature (IAT) sensor.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit

- Poor performance.

ECM-132C: INTAKE AIR TEMPERATURE (IAT) SENSOR. SIGNAL TOO HIGH (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-132C

Condition

Fig. 194: Identifying Boost Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal for the intake air temperature.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the signal from the intake air temperature (IAT) sensor is higher than a calculated desired value.

The diagnostic trouble code (DTC) can be diagnosed under specific driving conditions.

Substitute Value

- Predefined value for intake air temperature
- Three-way catalytic converter (TWC) preheating and idle air trim diagnostics are disabled.

Possible Source

- Contact resistance or oxidation in the intake air temperature (IAT) sensor terminals
- Damaged intake air temperature (IAT) sensor.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- Poor performance.

SIGNAL TOO HIGH / SIGNAL TOO LOW

CHECKING COMPONENTS AND CONNECTORS

Fig. 195: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the boost pressure sensor connector and terminal. Check for contact resistance and oxidation.

NOTE: The intake air temperature (IAT) sensor is integrated in the boost pressure sensor.

If no errors are found and the fault is permanent, replace the intake air temperature (IAT) sensor.

Remedy as necessary.

ECM-133C: INTAKE AIR TEMPERATURE (IAT) SENSOR INLET. SIGNAL TOO HIGH (B5254T2; 2006-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-133C

Condition

Fig. 202: Identifying Intake Air Temperature (IAT) Sensor
Courtesy of VOLVO CARS CORPORATION

Engine Control Module (ECM) checks the signal for inlet temperature at start. This is done by the control module saving the values from inlet, fuel and engine temperature sensors at the moment of start. Then the control module compares the values. If the signal from the air temperature sensor matches a temperature that exceeds a certain limit in relation to the other, the control module interprets this as a malfunction and the diagnostic trouble code (DTC) is generated.

The diagnostic trouble code (DTC) can be diagnosed after approx. 10 minutes with the engine running.

Substitute Value

- Value from the outdoor temperature sensor is used.

Possible Source

- Damaged intake air temperature (IAT) sensor.
- Contact resistance or oxidation in the intake air temperature (IAT) sensor terminals.

Fault symptom[s]

- Malfunction indicator light (MIL), on
- Engine is difficult to start

FAULT-TRACING

CHECKING THE STATUS

Fig. 203: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Check whether the fault is permanent or intermittent by reading the signals from the fuel, outside and engine temperature sensors.

NOTE: **In order for the correct values to be shown, reading of the temperatures must take place at the moment of start.**

- Start the engine.

Check that the intake temperature is reasonable. The temperature must correspond to the ambient temperature.

The fault is permanent if the signal is incorrect. The fault is intermittent if the signal is correct.

HINT: Remove the air temperature sensor, but let the connector remain connected. Let the hood remain open, the sensor should then indicate the same temperature as the outdoor temperature.

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-140D**

SIGNAL TOO LOW

see **SIGNAL TOO LOW**

ECM-1410: OUTSIDE TEMPERATURE SENSOR. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-1410

Condition

The diagnostic trouble code (DTC) is stored if the outside temperature sensor signal is higher than the calculated signal.

The diagnostic trouble code (DTC) can be diagnosed after 5 minutes driving at an engine speed above 1700 RPM and a speed above 50 km/h.

Substitute Value

- The value from the engine intake air temperature (IAT) sensor.

Possible Source

- Contact resistance in the terminals
- Damaged outside temperature sensor
- Damaged intake air temperature (IAT) sensor.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULTY SIGNAL OR SIGNAL MISSING

CHECKING COMPONENTS AND WIRING

HINT: If a diagnostic trouble code (DTC) for the intake air temperature (IAT) sensor is also stored, this code must be fault-traced first.

Check the connector for the outside temperature sensor. Check for contact resistance and oxidation.

Check the resistance of the outside temperature sensor.

HINT: With the ignition on and the outside temperature sensor connector disconnected, the voltage between terminal #2 and ground must be approximately 5 V.

Remedy as necessary.

ECM-142C: OUTSIDE TEMPERATURE SENSOR. SIGNAL TOO HIGH (B5254T2; 2006-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-142C

Condition

Fig. 221: Identifying Outside Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

The central electronic module (CEM) transmits the signal from the outside temperature sensor via CAN to the engine control module (ECM).

The diagnostic trouble code (DTC) is stored in the engine control module (ECM) if the signal from the engine control module (ECM) is determined to be above its normal range. The fault is diagnosed at ignition on or with the engine running.

Substitute Value

Value from the engine intake air temperature (IAT) sensor in the intake manifold is used.

Possible Source

- Damaged outside temperature sensor
- Short-circuit to ground in the signal cable.

Fault symptom[s]

- Starting/Engine hard to start/cranks slowly/Unsure when/at all times
- Gauges/Ambient temperature gauge not accurate/does not work

FAULT-TRACING INFORMATION

INFORMATION

No fault-tracing has been developed for this diagnostic trouble code (DTC). The diagnostic trouble code (DTC) for this fault is first stored in the Central electronic module (CEM), then in the Engine control module (ECM). This diagnostic trouble code (DTC) can not be erased before the diagnostic trouble codes (DTC) in the central electronic module (CEM) has been remedied and erased.

Therefore, first read off diagnostic trouble codes in Central electronic module (CEM), perform troubleshooting and perform actions as needed. This diagnostic trouble code (DTC) can then be erased.

For further information on this diagnostic trouble code, see Diagnostic trouble code (DTC) information.

ECM-142D: AMBIENT TEMPERATURE SENSOR. SIGNAL TOO LOW (B5254T2; 2006-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-142D

Condition

Fig. 222: Identifying Outside Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

The central electronic module (CEM) transmits the signal from the outside temperature sensor via CAN to the engine control module (ECM).

The diagnostic trouble code (DTC) is stored in the engine control module (ECM) if the signal from the engine control module (ECM) is determined to be below its normal range. The fault is diagnosed at ignition on or with the engine running.

Substitute Value

Value from the engine intake air temperature (IAT) sensor in the intake manifold is used.

Possible Source

- Damaged outside temperature sensor
- Short-circuit to supply voltage in the signal cable
- Open-circuit in the signal cable.

Fault symptom[s]

- Starting/Engine hard to start/cranks slowly/Unsure when/at all times
- Gauges/Ambient temperature gauge not accurate/does not work

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-143C: OUTSIDE TEMPERATURE SENSOR. SIGNAL TOO HIGH (B5254T2; 2006-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-143C

Condition

Fig. 223: Identifying Outside Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

Engine Control Module (ECM) checks the signal for outdoor temperature at start. This is done by the control module saving the values from outdoor, inlet and engine temperature sensors at the moment of start. Then the control module compares the values. If the signal from the outdoor temperature sensor corresponds to a temperature that is higher than a certain limit in relation to the others, the control module interprets this as a malfunction and the diagnostic trouble code is generated.

The diagnostic trouble code (DTC) can be diagnosed after approx. 10 minutes with the engine running.

Substitute Value

- Outdoor temperature is calculated according to a model.

Possible Source

- Damaged outside temperature sensor.
- Contact resistance or oxidation in the terminals.

Fault symptom[s]

- Displays too low ambient temperature
- Displays too high outside temperature

FAULT-TRACING INFORMATION

INFORMATION

There is no fault-tracing for this diagnostic fault code (DTC).

For further information on this diagnostic trouble code, see Diagnostic trouble code (DTC) information.

ECM-143D: OUTSIDE TEMPERATURE SENSOR. SIGNAL TOO LOW (B5254T2; 2006-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-143D

Condition

Fig. 224: Identifying Outside Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

Engine Control Module (ECM) checks the signal for outdoor temperature at start. This is done by the control module saving the values from outdoor, inlet and engine temperature sensors at the moment of start. Then the control module compares the values. If the signal from the outdoor temperature sensor corresponds to a temperature that is lower than a certain limit in relation to the others, the control module interprets this as a malfunction and the diagnostic trouble code is generated.

The diagnostic trouble code (DTC) can be diagnosed after approx. 10 minutes with the engine running.

Substitute Value

- Outdoor temperature is calculated according to a model.

Possible Source

- Damaged outside temperature sensor.
- Contact resistance or oxidation in the terminals.

Fault symptom[s]

- Displays too low ambient temperature
- Displays too high outside temperature

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-1600: BOOST PRESSURE SENSOR. FAULTY SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-1600

Condition

Fig. 225: Identifying Boost Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-1600 (signal too high or too low) is stored if the signal from the boost pressure sensor is outside its normal range. The fault is diagnosed by the control module when the ignition is on / the engine is running. Diagnostic trouble code (DTC) ECM-1600 (faulty signal) is stored if the signal from the boost pressure sensor is within its normal range but deviates from the calculated boost pressure. The fault is diagnosed by the control module when the engine is running.

Substitute Value

Limited boost pressure (if the signal is too high).

Possible Source

Signal too high:

- Contact resistance or oxidation in the terminals
- Short-circuit to supply voltage in the signal cable
- Open-circuit in the signal cable
- Open-circuit on signal ground cable
- Defective boost pressure sensor.

Signal too low:

- Short-circuit to ground in the signal cable
- Defective boost pressure sensor.

Faulty signal:

- Loose boost pressure sensor
- Contact resistance or oxidation in the terminals
- Defective boost pressure sensor.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- Poor performance.

FAULTY SIGNAL

CHECKING COMPONENTS AND CONNECTORS

Fig. 226: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check the boost pressure sensor connector. Check for contact resistance and oxidation.

  Check that the boost pressure sensor is correctly installed and has not come loose.

  HINT: The fault may be due to a defective boost pressure sensor. The boost pressure sensor may be defective if the above fault tracing and corrective action does not remedy the fault.

  Remedy as necessary.

  Other information:

  - For B5xx4T, see **TEMPERATURE AND PRESSURE SENSORS, REPLACING**
  - For B6xx4T, see **TEMPERATURE AND PRESSURE SENSORS, REPLACING**
  - see **CHECKING WIRING AND TERMINALS** .

Is the fault status "NO FAULT FOUND"?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-1600: BOOST PRESSURE SENSOR. SIGNAL TOO HIGH (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-1600

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-1600**

SIGNAL TOO HIGH

CHECKING THE CONNECTOR

Fig. 233: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 234: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the boost pressure sensor connector. Check for contact resistance and oxidation
- Reinstall the components, reconnect the connectors etc.
- Ignition on
- Read off the boost pressure sensor signal.

  Check that the signal is within its permitted range. With the engine switched off, the voltage should be approximately 1.9 V.

  If the signal is now OK, the fault was caused by poor contact in the connector.

  Other information:

  - For B5xx4T, see **TEMPERATURE AND PRESSURE SENSORS, REPLACING**
  - For B6xx4T, see **TEMPERATURE AND PRESSURE SENSORS, REPLACING**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-170F: ATMOSPHERIC PRESSURE SENSOR / BOOST PRESSURE SENSOR RANGE CHECK. FAULTY SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 252: Identifying Ignition In Off Position
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-170F is stored if the boost pressure sensor's registered pressure deviates from the atmospheric pressure sensor's registered pressure. This comparison is made at engine start (at approximately 500 RPM) before the turbocharger (TC) has built up a boost pressure.

Substitute Value

Possible Source

Faulty signal

- contact resistance in terminals
- defective boost pressure sensor
- defective atmospheric pressure sensor

Fault symptom[s]

- none

FAULTY SIGNAL

CHECKING THE CONNECTOR

Fig. 253: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 254: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the boost pressure sensor connector. Check for contact resistance and oxidation
- Reinstall the components, reconnect the connectors etc.
- Ignition on.

Read off the boost pressure and the atmospheric pressure.

The difference in pressure must not be greater than 140 hPa.

If the difference is less than 140 hPa, the cause of the fault was loose connections in the connector.

Other information:

- For B5xx4T, see **TEMPERATURE AND PRESSURE SENSORS, REPLACING**
- For B6xx4T, see **TEMPERATURE AND PRESSURE SENSORS, REPLACING**

Fig. 255: Identifying 4-Bit Connector
Courtesy of VOLVO CARS CORPORATION

Fig. 256: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the difference between the pressures less than 140 hPa?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

If the difference between the pressures is greater than 140 hPa, try replacing the boost pressure sensor.

HINT: Normal atmospheric pressure is 1013 hPa. Check which of the sensors appears to display the incorrect reading.

If the fault is not in the boost pressure sensor, replace the engine control module (ECM).

NOTE: The atmospheric pressure sensor is built into the engine control module (ECM)

and therefore cannot be replaced as a separate item.

CAUTION: New engine control module (ECM)s (ECM) are supplied without software. The engine control module (ECM) must be programmed before it will function after replacement.

Remedy as necessary.

Other information:

- Normal atmospheric pressure is 1013 hPa
- For B5xx4T, see **TEMPERATURE AND PRESSURE SENSORS, REPLACING**
- For B6xx4T, see **TEMPERATURE AND PRESSURE SENSORS, REPLACING**

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-2000: ENGINE COOLANT TEMPERATURE (ECT) SENSOR. FAULTY SIGNAL (B5254T2; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-2000

Condition

Fig. 263: Identifying 2-Bit Connector Side View
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-2000 is stored If the control module receives a signal from the engine temperature sensor corresponding to a temperature lower than -47 °C or higher than +143 °C. As soon as the engine is started the temperature is calculated theoretically. Diagnostic trouble code (DTC) ECM-2000 is stored (faulty signal) if the calculated temperature exceeds the engine coolant temperature (ECT) sensor signal.

Substitute Value

- The engine coolant temperature (ECT) is calculated based on a model. Three-way catalytic converter (TWC) heating and fuel trim at start (starting trim), idle diagnostic and misfire diagnostic are disabled
- The engine cooling fan (FC) runs at low-speed.

Possible Source

Signal too high:

- Short-circuit to ground in the signal cable

- Defective temperature sensor.

Signal too low:

- Contact resistance and oxidation in the terminals
- Open-circuit in the signal cable
- Open-circuit in the signal ground cable
- Short-circuit to supply voltage in the signal cable
- Defective temperature sensor.

Faulty signal:

- Defective temperature sensor
- Faulty engine coolant thermostat.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- Engine difficult to start.

FAULTY SIGNAL

CHECKING THE WIRING

WARNING: **Before fault-tracing can begin, the engine cooling fan (FC) connector must be disconnected to prevent the engine cooling fan (FC) engaging. Diagnostic trouble code (DTC) ECM-6110 Engine cooling fan (FC) control module may be stored. After fault-tracing the connector must be reconnected.**

NOTE: **This diagnostic trouble code (DTC) is stored if the engine coolant temperature (ECT) sensor freezes. This may happen if the coolant level is low or there is too little glycol in the coolant. Check the engine coolant level and its freezing point. Remedy as necessary.**

HINT: The diagnostic trouble code (DTC) can be caused by a thermostat that doesn't open.

Fig. 264: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 265: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the ground lead between control module terminal #A60 (#A60) and engine coolant temperature (ECT) sensor terminal #2. Check for an open-circuit

- Reinstall the components, reconnect the connectors etc.

Other information

- see **CHECKING WIRING AND TERMINALS**
- To connect the breakout box / access the control module, see **CONNECTING THE BREAKOUT BOX**
- For B5xx4T, see **REPLACING THE THERMOSTAT AND/OR ENGINE COOLANT TEMPERATURE SENSOR**

Were any faults found in the cable?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING THE ENGINE COOLANT TEMPERATURE (ECT)**

CHECKING THE ENGINE COOLANT TEMPERATURE (ECT)

Fig. 269: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Fault-tracing must begin with the engine cold (+20 °C) so that the engine coolant temperature (ECT) sensor can be tested over as wide a temperature range as possible
- Switch off the climate control system
- Start the engine.

  Read off the engine coolant temperature (ECT).

  Check that the engine coolant temperature (ECT) is within its permitted range and corresponds with the engine warming up.

Fig. 270: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 271: Identifying 2-Bit Connector Side View
Courtesy of VOLVO CARS CORPORATION

Is the temperature reasonable?

- **YES**

  Refer to **CHECKING THE THERMOSTAT**

- **NO**

  Refer to **REPLACING THE COMPONENT**

CHECKING THE THERMOSTAT

Fig. 272: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start the engine. Run the engine until the engine coolant temperature (ECT) reaches approximately 100 ° C
- Activate the engine cooling fan (FC) with the engine running
- Wait approximately 90 seconds and then shut-off the engine cooling fan (FC).

  Read off the engine coolant temperature (ECT). If the temperature is 85 °C or lower when the fan stops, the thermostat is defective.

Fig. 273: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 274: Identifying 2-Bit Connector Side View
Courtesy of VOLVO CARS CORPORATION

Is the temperature lower than 86 °C?

- **YES**

  Refer to **REPLACING THE COMPONENT**

- **NO**

  FAULT TRACING FAILED: The fault should have been detected and remedied. As this is not the case fault-tracing has failed. Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REPLACING THE COMPONENT

Try a new thermostat. See **THERMOSTAT, REPLACING**.

Fig. 275: Checking Thermostat
Courtesy of VOLVO CARS CORPORATION

REPLACING THE COMPONENT

Try a new engine coolant temperature (ECT) sensor.

- For B5xx4T, see **REPLACING THE THERMOSTAT AND/OR ENGINE COOLANT TEMPERATURE SENSOR**
- For B6xx4T, see **ENGINE COOLANT TEMPERATURE (ECT) SENSOR, REPLACING** .

Is the temperature within its permitted range?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-2000: ENGINE COOLANT TEMPERATURE (ECT) SENSOR. FAULTY SIGNAL. INTERMITTENT FAULT (B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 280: Identifying Engine Coolant Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

If the control module receives a signal from the engine temperature sensor corresponding to a temperature lower

than -47°C (-52.6°F) or higher than +143°C (289.4°F) the control module interprets it as a fault and ECM-2000 is stored. As soon as the engine is started the temperature is calculated theoretically. If the calculated temperature exceeds the engine coolant temperature (ECT) sensor signal, the control module interprets as a fault and ECM-2000 is stored.

Substitute Value

- engine coolant temperature (ECT) is calculated using a model. Three-way catalytic converter (TWC) heating and fuel trim at start (starting trim), idle diagnostic and misfire diagnostic is disabled.
- engine cooling fan (FC) runs at low-speed

Possible Source

Signal too high:

- short-circuit to ground in the signal cable
- defective temperature sensor

Signal too low:

- open-circuit in the signal cable
- short-circuit to supply voltage in the signal cable
- defective temperature sensor
- contact resistance in terminals

Faulty signal:

- defective temperature sensor
- faulty engine coolant thermostat

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULTY SIGNAL. INTERMITTENT FAULT

CHECKING WIRING AND CONNECTORS

WARNING: **Before fault-tracing can begin, the engine cooling fan (FC) connector must be disconnected to prevent the engine cooling fan (FC) engaging. Diagnostic trouble code (DTC) ECM-6110 Engine cooling fan (FC) control module may be stored. After fault-tracing the connector must be reconnected.**

NOTE: This diagnostic trouble code (DTC) is stored if the engine coolant temperature

(ECT) sensor freezes. This may happen if the coolant level is low or there is too little glycol in the coolant. Check the engine coolant level and its freezing point. Remedy as necessary.

Check the connector on the engine coolant temperature (ECT) sensor. Check for contact resistance and oxidation. Check for loose connections.

Check the ground lead between control module terminal #A60 (#A60) and engine coolant temperature (ECT) sensor terminal #2. Check for an intermittent open-circuit.

HINT: The fault may have been caused by air pockets in the cooling system.

Other information

- To connect the breakout box / access the control module, see **CONNECTING THE BREAKOUT BOX**
- For B5xx4T, see **REPLACING THE THERMOSTAT AND/OR ENGINE COOLANT TEMPERATURE SENSOR**

Were any faults found in the ground cable?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING THE ENGINE COOLANT TEMPERATURE (ECT)**

CHECKING THE ENGINE COOLANT TEMPERATURE (ECT)

Fig. 289: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Fault-tracing must begin with the engine cold (+20 °C) so that the engine coolant temperature (ECT) sensor can be tested over as wide a temperature range as possible
- Switch off the climate control unit
- Start the engine.

  Read off the engine coolant temperature (ECT).

  Check that the engine coolant temperature (ECT) is within its permitted range and corresponds with the engine warming up.

Fig. 290: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 291: Identifying Engine Coolant Level Sensor
Courtesy of VOLVO CARS CORPORATION

Is the temperature within its permitted range?

- **YES**

Refer to **CHECKING THE THERMOSTAT**

- **NO**

  Refer to **REPLACING THE COMPONENT**

CHECKING THE THERMOSTAT

Fig. 292: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start the engine. Run the engine until the engine coolant temperature (ECT) reaches approximately 100°C
- Activate the engine cooling fan (FC) with the engine running
- Wait approximately 90 seconds and then shut-off the engine cooling fan (FC).

  Read off the engine coolant temperature (ECT). If it is 85°C or lower when the fan stops, the thermostat is defective.

Fig. 293: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 294: Identifying Engine Coolant Temperature Sensor

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

THERMOSTAT, REPLACING

REMOVING THE THERMOSTAT

Fig. 300: Identifying Expansion Tank
Courtesy of VOLVO CARS CORPORATION

Remove

- the clamp holding the return hose for the power steering
- the screw holding the engine stabilizer brace to the bracket on the engine

- the screws holding the engine stabilizer brace to the suspension turrets
- the engine stabilizer brace
- the expansion tank cap.

Raise the car. Remove the lower splashguard.

Position a container under the engine drain cock. Drain the coolant.

Close the cock.

Install the lower splash guard.

Lower the car.

Fig. 301: Identifying Plastic Hoses Between Turbocharger, Charge Air Cooler & Air Cleaner/Turbocharger
Courtesy of VOLVO CARS CORPORATION

- the plastic hoses between the turbocharger (TC) / charge air cooler and the air cleaner (ACL) / turbocharger (TC). **Applies only to B6xx4T engines** .

Fig. 302: Front Timing Belt Cover
Courtesy of VOLVO CARS CORPORATION

Lift up the servo reservoir and place it on top of the engine.

WARNING: Seal the cover for the servo reservoir. Check that no oil leaks out.

Servo oil is highly inflammable.

NOTE: Ensure that the timing belt cover has cleared the nipple on the thermostat housing before the cover is pulled up.

Remove:

- the screw for the front timing belt cover. **Applies only to B6xx4T** Cars with chassis number **203779-** see **TIMING COVER FRONT, REPLACING** .
- the timing belt cover. Use a weatherstrip tool.

Fig. 303: Identifying Thermostat Housing & Cable Duct
Courtesy of VOLVO CARS CORPORATION

- the thermostat housing cover
- the thermostat.

INSTALLING THE THERMOSTAT

Fig. 304: Front Timing Belt Cover
Courtesy of VOLVO CARS CORPORATION

NOTE: **Clean all mating surfaces. Ensure that no dirt enters the fluid ducts.**

NOTE: **Ensure that the timing belt cover is in position before the cover is pressed in against the rear timing belt cover to prevent damage to the nipple on the thermostat housing.**

Install

- the new thermostat
- the cover of the thermostat housing with a **new gasket** . Tighten to **17 Nm**
- the front timing belt cover. The mudguard over the right drive shaft boot may come loose. If this happens, secure it from underneath
- the screw for the front timing belt cover. Tighten to **12 Nm** . **Applies only to B6xx4T** Cars with chassis number **203779-** see **INSTALLING THE FRONT TIMING COVER** .

Fig. 305: Identifying Plastic Hoses Between Turbocharger, Charge Air Cooler & Air Cleaner/Turbocharger
Courtesy of VOLVO CARS CORPORATION

- the plastic hoses between the turbocharger (TC) / charge air cooler and the air cleaner (ACL) / turbocharger (TC). **Applies only to B6xx4T engines** .

Fig. 306: Identifying Expansion Tank
Courtesy of VOLVO CARS CORPORATION

- the servo reservoir. Check that the hoses are correctly positioned
- the engine stabilizer brace
- the screws holding the engine stabilizer brace to the suspension turrets. Tighten to **50 Nm**
- the screw holding the engine stabilizer brace to the bracket on the engine. Tighten to **80 Nm**
- the clamp holding the return hose for the power steering.

Carry out a function test

Fill with coolant.

Install the cap on the expansion tank.

Test drive the engine until the thermostat has opened.

Top up the coolant if necessary.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-200B: INJECTOR CYL 1. SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 349: Identifying Injector
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the circuit for the injectors.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the signal for one of the injector circuits is missing.

The diagnostic trouble code (DTC) indicates which injector is being referred to.

- ECM-200B: injector 1

- ECM-201B: injector 2
- ECM-202B: injector 3
- ECM-203B: injector 4
- ECM-204B: injector 5.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- None.

Possible Source

- Contact resistance in the terminals
- Open-circuit in the signal cable
- Open-circuit in the power supply to the injector
- Damaged injector.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- The engine is not firing on all cylinders.

SIGNAL MISSING

CHECKING COMPONENTS AND WIRING

Check the cable that relates to the diagnostic trouble code (DTC). Check for an open-circuit.

Check between:

- Engine control module (ECM) terminal #A16 (#A16) and injector terminal #2 (ECM-200B, injector 1)
- Engine control module (ECM) terminal #A34 (#A34) and injector terminal #2 (ECM-201B, injector 2)
- Engine control module (ECM) terminal #A15 (#A15) and injector terminal #2 (ECM-202B, injector 3)
- Engine control module (ECM) terminal #A33 (#A33) and injector terminal #2 (ECM-203B, injector 4)
- Engine control module (ECM) terminal #A14 (#A14) and injector terminal #2 (ECM-204B, injector 5).

Remedy as necessary.

Other information

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-200C: INJECTOR CYL 1. SIGNAL TOO HIGH (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 355: Identifying Injector
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the circuit for the injectors.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the signal for one of the injector circuits is too high.

The diagnostic trouble code (DTC) indicates which injector is being referred to.

- ECM-200C: injector 1
- ECM-201C: injector 2
- ECM-202C: injector 3
- ECM-203C: injector 4
- ECM-204C: injector 5.

The diagnostic trouble code (DTC) can be diagnosed at ignition on and with the engine running.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the signal cable
- Damaged injector.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit

- The engine is not firing on all cylinders.

SIGNAL TOO HIGH

CHECKING COMPONENTS AND WIRING

Check the cable that relates to the diagnostic trouble code (DTC). Check for a short-circuit to supply voltage.

Check between:

- Engine control module (ECM) terminal #A16 (#A16) and injector terminal #2 (ECM-200C, injector 1)
- Engine control module (ECM) terminal #A34 (#A34) and injector terminal #2 (ECM-201C, injector 2)
- Engine control module (ECM) terminal #A15 (#A15) and injector terminal #2 (ECM-202C, injector 3)
- Engine control module (ECM) terminal #A33 (#A33) and injector terminal #2 (ECM-203C, injector 4)
- Engine control module (ECM) terminal #A14 (#A14) and injector terminal #2 (ECM-204C, injector 5).

Remedy as necessary.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-200D: INJECTOR CYL 1. SIGNAL TOO LOW (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 361: Identifying Injector
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the circuit for the injectors.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the signal for one of the injector circuits is too low.

The diagnostic trouble code (DTC) indicates which injector is being referred to.

- ECM-200D: injector 1
- ECM-201D: injector 2
- ECM-202D: injector 3
- ECM-203D: injector 4
- ECM-204D: injector 5.

The diagnostic trouble code (DTC) can be diagnosed at ignition on and with the engine running.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the signal cable
- Damaged injector.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- The engine is not firing on all cylinders.

SIGNAL TOO LOW

CHECKING COMPONENTS AND WIRING

Check the cable that relates to the diagnostic trouble code (DTC). Check for a short-circuit to ground.

Check between:

- Engine control module (ECM) terminal #A16 (#A16) and injector terminal #2 (ECM-200D, injector 1)
- Engine control module (ECM) terminal #A34 (#A34) and injector terminal #2 (ECM-201D, injector 2)
- Engine control module (ECM) terminal #A15 (#A15) and injector terminal #2 (ECM-202D, injector 3)
- Engine control module (ECM) terminal #A33 (#A33) and injector terminal #2 (ECM-203D, injector 4)
- Engine control module (ECM) terminal #A14 (#A14) and injector terminal #2 (ECM-204D, injector 5).

Remedy as necessary.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-201A: THERMOSTAT. FAULTY SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-201A

Condition

During the engine warm up phase the way the engine temperature should increase is calculated. Factors such as engine load and the start temperature are taken into account. This test takes place during the engine warm-up phase (under "normal operation") and continues until the engine temperature has reached 84 °C. For the test to start, the starting temperature of the engine must be below 35 °C, the outside temperature must be between -7 and +35 °C and at least 15 minutes must have passed since the engine was last run.

The diagnostic trouble code (DTC) is stored if the calculated increase in temperature does not correspond to the actual increase (measured by the engine coolant temperature (ECT) sensor).

HINT: This diagnostic trouble code (DTC) can also be caused by faults that store diagnostic trouble codes (DTCs) for outside temperature sensors.

Substitute Value

- None.

Possible Source

- Damaged engine coolant temperature (ECT) sensor
- Damaged thermostat.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULTY SIGNAL

REPLACING THE THERMOSTAT

NOTE: **This diagnostic trouble code (DTC) is stored if the engine coolant temperature (ECT) sensor freezes. This may happen if the coolant level is low or there is too little glycol in the coolant. Check the engine coolant level and its freezing point. Remedy as necessary.**

The engine control module (ECM) has registered that the actual temperature increase has deviated from the calculated temperature increase. This deviation is due to a defective thermostat.

Try replacing the thermostat.

- For B5xx4T, see **REPLACING THE THERMOSTAT AND/OR ENGINE COOLANT TEMPERATURE SENSOR**
- For B6xx4T, see **ENGINE COOLANT TEMPERATURE (ECT) SENSOR, REPLACING** .

- **Continue**

Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

ECM-210C: LONG-TERM FUEL TRIM, BANK 1. SIGNAL TOO HIGH (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-210C

Condition

The engine control module (ECM) receives information from the heated oxygen sensor (HO2S) (bank 1) about the fuel / air mixture when idling and at both the upper and lower part-load range. If the fuel / air mixture deviates from lambda=1, the short-term fuel trim will compensate for this by adjusting the injection time so that lambda=1 is achieved. When the short-term fuel trim makes an adjustment, the integrator median must be adjusted by the long-term trim. The diagnostic trouble code (DTC) is stored when the long-term trim must be adjusted to almost maximum in the upper part load area.

Substitute Value

- None.

Possible Source

- Intake air leakage
- Air leakage in the exhaust system
- Low fuel pressure
- Damaged heated oxygen sensor (HO2S) (bank 1).

Fault symptom[s]

- None.

SIGNAL TOO HIGH

CHECKING THE FUEL INJECTION SYSTEM

Check the intake system for air leakage.

HINT: Air leakage in the intake system can occur through the evaporative emission system (EVAP)

valve, the secondary air solenoid valve or the power brake booster.

Check the fuel pressure.

Test drive the car for approximately 10 minutes.

Check the mass air flow (MAF) sensor. Read off its correction factor. The value must be between 0.8 and 1.2.

NOTE: There must not be any air leakage when this test is carried out.

Remedy as necessary.

Other information

- see **CHECK FOR AIR LEAKS IN THE INTAKE SYSTEM**
- see **CHECKING FUEL AND RESIDUAL PRESSURES**
- see **MASS AIR FLOW (MAF) SENSOR, REPLACING**

Is the function OK?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-212C: LONG-TERM FUEL TRIM, BANK 1. SIGNAL TOO HIGH (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-212C

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-212C**

SIGNAL TOO HIGH

see **SIGNAL TOO HIGH**

ECM-212D: LONG-TERM FUEL TRIM, BANK 1. SIGNAL TOO LOW (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-212D

Condition

The engine control module (ECM) receives information from the heated oxygen sensor (HO2S) (bank 1) about the fuel / air mixture when idling and at both the upper and lower part-load range. If the fuel / air mixture deviates from lambda=1, the short-term fuel trim will compensate for this by adjusting the injection time so that lambda=1 is achieved. When the short-term fuel trim makes an adjustment, the integrator median must be adjusted by the long-term trim. The diagnostic trouble code (DTC) is stored when the long-term trim must be adjusted to almost maximum in the lower part load area.

Substitute Value

- None.

Possible Source

- Intake air leakage
- High fuel pressure
- Leaking injectors
- Damaged mass air flow (MAF) sensor
- Contaminated engine oil
- Oil level too high

- Damaged heated oxygen sensor (HO2S) (bank 1).

Fault symptom[s]

- Fuel system/Excessive fuel consumption

SIGNAL TOO LOW

CHECKING THE FUEL INJECTION SYSTEM

Check the intake system for air leakage.

HINT: Air leakage in the intake system can occur through the evaporative emission system (EVAP) valve, the secondary air solenoid valve or the power brake booster.

Check the exhaust system for leakage.

Check the fuel pressure and residual pressure.

Check that the oil level is within the minimum and maximum markings.

Check the viscosity of the engine oil by reading off the short-term fuel trim with the engine running. Plug the crankcase ventilation and read off the short-term fuel trim again. The value must be more or less unchanged.

Remedy as necessary.

Other information:

- see **CHECK FOR AIR LEAKS IN THE INTAKE SYSTEM**
- see **CHECKING FOR AIR LEAKAGE IN THE EXHAUST SYSTEM**

see **SIGNAL TOO LOW**

ECM-2140: LONG-TERM FUEL TRIM, BANK 1 (B5254T2; 2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-2140

Condition

This diagnostic trouble code can only be stored during lambda regulation quick tests. This is a workshop test, for detecting air leaks or low fuel pressure. During the quick test, the Engine control module (ECM) receives information from the heated oxygen sensor about the fuel/air mixture with reset fuel adaptations. If the fuel/air mixture is outside certain parameters, this means that there is a fault that can cause diagnostic trouble codes

related to lambda regulation to be stored during normal operation. I. e. diagnostic trouble codes ECM-21AC, ECM-21AD, ECM-21CC or ECM-21DD.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Fuel/air mixture (lambda) deviates abnormally from the expected (lambda=1).

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Activate quick test

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Substitute Value

- None.

Possible Source

Faulty signal

- Damaged heated oxygen sensor (HO2S).
- Intake air leakage.
- Air leakage in the exhaust system.
- Damaged mass air flow (MAF) sensor.

Fault symptom[s]

- None.

FAULT-TRACING INFORMATION

INFORMATION

This diagnostic trouble code can only be stored during lambda regulation quick tests. The test is normally run as verification after faults have been rectified. If the diagnostic trouble code is stored during the test, this means that faults remain to be remedied that can cause problems with lambda regulation. Continue with/return to manual navigation for fault tracing under the diagnostic trouble code related to lambda regulation.

ECM-214C: LONG-TERM FUEL TRIM, BANK 1 (B5254T2; 2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-214C

Condition

This diagnostic trouble code can only be stored during lambda regulation quick tests. This is a workshop test, for detecting air leaks or low fuel pressure. During the quick test, the Engine control module (ECM) receives information from the heated oxygen sensor about the fuel/air mixture with reset fuel adaptations. If the fuel/air mixture is outside certain parameters, this means that there is a fault that can cause diagnostic trouble codes related to lambda regulation to be stored during normal operation. I. e. diagnostic trouble codes ECM-21AC, ECM-21AD, ECM-21CC or ECM-21DD.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Fuel/air mixture (lambda) deviates abnormally from the expected (lambda=1).

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Activate quick test

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Substitute Value

- None.

Possible Source

Signal too high:

- Air leakage in the exhaust system.
- Low fuel pressure.
- Damaged heated oxygen sensor (HO2S).

Fault symptom[s]

- None.

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-214D: LONG-TERM FUEL TRIM, BANK 1 (B5254T2; 2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-214D

Condition

This diagnostic trouble code can only be stored during lambda regulation quick tests. This is a workshop test, for detecting air leaks or low fuel pressure. During the quick test, the Engine control module (ECM) receives

information from the heated oxygen sensor about the fuel/air mixture with reset fuel adaptations. If the fuel/air mixture is outside certain parameters, this means that there is a fault that can cause diagnostic trouble codes related to lambda regulation to be stored during normal operation. I. e. diagnostic trouble codes ECM-21AC, ECM-21AD, ECM-21CC or ECM-21DD.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Fuel/air mixture (lambda) deviates abnormally from the expected (lambda=1).

SIGNAL TOO HIGH/SIGNAL TOO LOW/SIGNAL MISSING

see **SIGNAL TOO HIGH/SIGNAL TOO LOW/SIGNAL MISSING**

ECM-221C: REAR HEATED OXYGEN SENSOR (HO2S) AGING, BANK 1. SIGNAL TOO HIGH (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-221C

Condition

Fig. 1: Identifying Rear Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) monitors the operation of the rear heated oxygen sensor (HO2S) by checking its signal. The engine control module (ECM) checks that the probe has registered a rich fuel/air mixture. If this is not the case, the engine control module (ECM) changes the fuel/air mixture. The diagnostic trouble code (DTC) is stored if the rear probe has still not registered a rich fuel / air mixture.

Substitute Value

- None.

Possible Source

- Leakage in the exhaust system
- Damaged rear heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL TOO HIGH/SIGNAL TOO LOW/SIGNAL MISSING

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-221D

Condition

Fig. 2: Identifying Rear Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) monitors the operation of the rear heated oxygen sensor (HO2S) by checking its signal. The engine control module (ECM) checks that the probe has registered a lean fuel/air mixture. If this is not the case, the engine control module (ECM) changes the fuel/air mixture. The diagnostic trouble code (DTC) is stored if the rear probe has still not registered a lean fuel / air mixture.

NOTE: **At fuel shut-off, the probe must show a lean fuel/air mixture. The diagnostic trouble code (DTC) is also stored if the switch-over time to a lean fuel/air mixture is too long.**

Substitute Value

- None.

Possible Source

- Leakage in the exhaust system
- Damaged rear heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

ECM-2220: REAR HEATED OXYGEN SENSOR (HO2S), BANK 1. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-2220

Condition

Fig. 3: Identifying Rear Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) monitors the operation of the rear heated oxygen sensor (HO2S) by checking its signal. The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the signal deviates from its permitted operational range or if the voltage for the heated oxygen sensor (HO2S) preheating disrupts the heated oxygen sensor (HO2S) signal.

Substitute Value

- Rear heated oxygen sensor (HO2S) control is disabled
- Three-way catalytic converter (TWC) diagnostics are disabled.

Possible Source

- Short-circuit in the signal cable for the pre-heating circuit
- Short-circuit in the ground lead for the preheating circuit
- Damaged rear heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULTY SIGNAL

CHECKING THE COMPONENTS AND WIRING

Check the following cables for a short-circuit to each other.

- Engine control module (ECM) terminal #A61 (#B1) and heated oxygen sensor (HO2S) terminal #4
- Engine control module (ECM) terminal #A6 (#A6) and heated oxygen sensor (HO2S) terminal #2
- Heated oxygen sensor (HO2S) terminal #1 and the system relay.

Check the following cables for a short-circuit to each other.

- Engine control module (ECM) terminal #A62 (#B2) and heated oxygen sensor (HO2S) terminal #3
- Engine control module (ECM) terminal #A6 (#A6) and heated oxygen sensor (HO2S) terminal #2
- Heated oxygen sensor (HO2S) terminal #1 and the system relay.

Try a new heated oxygen sensor (HO2S) if the above fault-tracing does not remedy the fault.

Remedy as necessary.

ECM-223B: REAR HEATED OXYGEN SENSOR (HO2S), BANK 1. SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-223B

Condition

Fig. 31: Identifying Rear Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) controls the preheating of the rear heated oxygen sensor (HO2S) by pulsing the current to the positive temperature coefficient (PTC) element in the heated oxygen sensor (HO2S). Pulse lengths are dependent on the temperature of the heated oxygen sensor (H02S).

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the signal is lower than a certain value when preheating is deactivated.

Substitute Value

- The fuel trim is shut off.

Possible Source

- Contact resistance and oxidation in the terminals
- Open-circuit in the power supply from the system relay
- Damaged heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL MISSING

CHECKING THE STATUS

Fig. 32: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start the engine.

  Read off the diagnostic status and fault status for the diagnostic trouble code (DTC) by selecting the relevant diagnostic trouble code (DTC) from the list.

  Increase the engine speed to 2500 RPM until the diagnostic is "Complete".

  Check whether the fault is permanent or intermittent. Read off the diagnostic trouble code (DTC) fault status when the diagnostic status is "Completed".

  HINT: In some cases several functions of the component will be diagnosed. The affects the amount of time taken to run the diagnostic.

The fault is permanent if the fault status is "Fault found". If the fault status is "No fault found" the fault is intermittent and not presently active.

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-223C**

SIGNAL TOO HIGH

see **SIGNAL TOO HIGH**

ECM-223D: REAR HEATED OXYGEN SENSOR (HO2S), BANK 1. SIGNAL TOO LOW (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-223D

Condition

Fig. 47: Identifying Rear Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) controls the preheating of the rear heated oxygen sensor (HO2S) by pulsing the current to the positive temperature coefficient (PTC) element in the heated oxygen sensor (HO2S). Pulse lengths are dependent on the temperature of the heated oxygen sensor (H02S).

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the signal is

lower than a certain value when preheating is deactivated.

Substitute Value

- The fuel trim is shut off.

Possible Source

- Short-circuit to ground in the signal cable
- Damaged heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL TOO LOW

CHECKING THE COMPONENTS AND WIRING

Check the resistance of the heated oxygen sensor (HO2S) between terminals #1 and #2.

Check the signal cable between heated oxygen sensor (HO2S) terminal #2 and control module terminal #A6 (#A6). Check for a short-circuit to ground.

Remedy as necessary.

SIGNAL TOO LOW

see **SIGNAL TOO LOW**

ECM-2240: REAR HEATED OXYGEN SENSORS (HO2S), SWITCHED. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-2240

Condition

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the rear heated oxygen sensors (HO2S) (banks 1 and 2) have been switched.

The diagnostic trouble code (DTC) is diagnosed when the engine has been idling for 10 minutes.

Substitute Value

- The heated oxygen sensor (HO2S) control is disabled
- Three-way catalytic converter (TWC) diagnostics are disabled.

Possible Source

- The rear heated oxygen sensors (HO2S) have been installed in the wrong bank
- Both the rear heated oxygen sensors (HO2S) are damaged.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULTY SIGNAL

CHECKING THE COMPONENTS AND WIRING

Visually check that the rear heated oxygen sensors (HO2S) have not been mounted in the wrong bank on banks 1 and 2.

Read off the voltage of the probe on the rear heated oxygen sensor (HO2S) for bank 1.

Read off the voltage of the probe on the rear heated oxygen sensor (HO2S) for bank 2.

HINT: If the voltage is constantly close to 0 V on one bank and 1 V on the other bank, or vice-versa, the

rear heated oxygen sensors (HO2S) have been switched.

Try new heated oxygen sensors (HO2S) if the above fault-tracing does not remedy the fault.

Remedy as necessary.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-2300

Condition

Fig. 60: Identifying Rear Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the resistance of the rear right heated oxygen sensor (HO2S) in the pre-heating circuit is too high for a certain amount of time.

Substitute Value

None.

Possible Source

- Contact resistance or oxidation in the terminals
- Damaged rear heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULTY SIGNAL

CHECKING THE CONNECTOR

Check power cable terminal #1 in the rear heated oxygen sensor (HO2S) connector. Check for contact resistance and oxidation.

Check ground lead terminal #2 in the rear heated oxygen sensor (HO2S) connector. Check for contact resistance and oxidation.

Try a new heated oxygen sensor (HO2S) if the above fault-tracing does not remedy the fault.

Remedy as necessary.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-2310: INJECTOR 1. SIGNAL MISSING. INTERMITTENT FAULT (B5254T2; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 65: Identifying Injector
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-23X0 is stored if the signal from the injector is too high, too low or missing.

Substitute Value

None

Possible Source

Signal too high:

- short-circuit to supply voltage in the signal cable
- defective injector

Signal too low:

- short-circuit to ground in the signal cable

Signal missing:

- open-circuit in the signal cable
- open-circuit in power supply to injector
- defective injector
- contact resistance in terminals

Fault symptom[s]

- engine not firing on all cylinders
- malfunction indicator lamp (MIL) lit

SIGNAL MISSING. INTERMITTENT FAULT

CHECKING WIRING AND CONNECTORS

Check the injector connector. Check for contact resistance and oxidation. Check for loose connections.

Check the cable between injector terminal 2 and control module:

- terminal #A16 (#A16) (ECM 2310)
- terminal #A34 (#A34) (ECM 2320)
- terminal #A15 (#A15) (ECM 2330)
- terminal #A33(#A33) (ECM 2340)
- terminal #A14 (#A14) (ECM 2350).

Check the power supply between system relay terminal 3 and injector terminal 1. Check for an for an intermittent open-circuit.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-2310: INJECTOR 1. SIGNAL TO HIGH. PERMANENT FAULT (B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION**

SIGNAL TOO HIGH. PERMANENT FAULT

CHECKING COMPONENTS AND WIRING

Check the resistance of the injector between terminals 1 and 2.

Check the cable between injector terminal 2 and control module:

- terminal #A16 (#A16) (ECM 2310)
- terminal #A15 (#A15) (ECM 2320)
- terminal #A33(#A33) (ECM 2330)
- terminal #A32 (#A32) (ECM 2340)
- terminal #A34 (#A34) (ECM 2350)
- terminal #A14 (#A14) (ECM 2360).

Check for a short-circuit to supply voltage.

HINT: Use a test lamp with at least a 3 W bulb to determine whether the cable is short-circuited to supply voltage.

Remedy as necessary.

Other information

- To connect the breakout box / access the control module, see **CONNECTING THE BREAKOUT BOX**
- For B5xx4T, see **INJECTOR/PULSE DAMPER, REPLACEMENT**
- For B6xx4T, see **INJECTOR / PULSATION DAMPER, REPLACING** .
- For resistance values, see **COMPONENT SPECIFICATIONS**
- For 6 cylinder engines -2004, see **SIGNAL SPECIFICATION**
- For 6 cylinder engines 2005-, see **SIGNAL SPECIFICATION** .
- see **CHECKING WIRING AND TERMINALS**

Is the injector working?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-2310: INJECTOR 1. SIGNAL TO LOW. INTERMITTENT FAULT (B5254T2; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION**

SIGNAL TOO LOW. INTERMITTENT FAULT

CHECKING THE WIRING

Check the cable between injector terminal 2 and control module:

- terminal #A16 (#A16) (ECM 2310)
- terminal #A34 (#A34) (ECM 2320)
- terminal #A15 (#A15) (ECM 2330)
- terminal #A33(#A33) (ECM 2340)
- terminal #A14 (#A14) (ECM 2350).

Check for an intermittent short-circuit to ground.

Other information

- To connect the breakout box / access the control module, see **CONNECTING THE BREAKOUT BOX**
- For B5xx4T, see **INJECTOR/PULSE DAMPER, REPLACEMENT**
- For B6xx4T, see **INJECTOR / PULSATION DAMPER, REPLACING** .

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-231B: REAR HEATED OXYGEN SENSOR (HO2S), AGING, BANK 2. SIGNAL MISSING (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-231B

Condition

Fig. 133: Identifying Rear Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) monitors the function of the rear heated oxygen sensor (HO2S) (bank 2) by checking its signal.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) does not register a signal from the rear heated oxygen sensor (HO2S).

Substitute Value

- None.

Possible Source

- Damaged rear heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL TOO HIGH/SIGNAL TOO LOW/SIGNAL MISSING

CHECKING THE COMPONENTS AND WIRING

CAUTION: Do not apply rust solvent spray or grease to the heated oxygen sensor (HO2S) connector.

Check the exhaust system for air leakage.

If no fault is discovered, try using a new rear heated oxygen sensor (HO2S), as a damaged rear heated oxygen sensor (HO2S) can cause a diagnostic trouble code (DTC) to be stored.

Remedy as necessary

Other information

- see **CHECKING FOR AIR LEAKAGE IN THE EXHAUST SYSTEM**
- For B5xx4T, see **HEATED OXYGEN SENSOR (HO2S), REPLACING**
- For B6xx4T, see **HEATED OXYGEN SENSOR (HO2S), REPLACING** .

Fig. 135: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 136: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reconnect the connectors, reinstall components etc.
- Start the engine. Allow the engine to idle for at least 1 minute
- Test drive the car at an even speed (approximately 80 km/h for at least 5 minutes)
- Connect VCT2000 (or appropriate scan tool) to the data link connector (DLC) without switching off the engine.

NOTE: **If the engine is switched off, the stored fault status will be erased and the test drive will have to be repeated.**

Read off the diagnostic status and fault status for the diagnostic trouble code (DTC) by selecting the relevant diagnostic trouble code (DTC) from the list.

Check the fault status for the diagnostic trouble code (DTC) when the diagnostic is "Complete". If the function is correct, the fault status must be "No fault found" when the diagnostic is complete.

Fig. 137: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the function OK?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-231C: REAR HEATED OXYGEN SENSOR (HO2S) AGING, BANK 2. SIGNAL TOO HIGH (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-231C

Condition

Fig. 138: Identifying Rear Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) monitors the function of the rear heated oxygen sensor (HO2S) (bank 2) by checking its signal. The engine control module (ECM) checks that the probe has registered a rich fuel/air mixture. If this is not the case, the engine control module (ECM) changes the fuel/air mixture. The diagnostic trouble code (DTC) is stored if the rear probe has still not registered a rich fuel / air mixture.

Substitute Value

- None.

Possible Source

- Leakage in the exhaust system
- Damaged rear heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL TOO HIGH/SIGNAL TOO LOW/SIGNAL MISSING

see **SIGNAL TOO HIGH/SIGNAL TOO LOW/SIGNAL MISSING**

ECM-231D: REAR HEATED OXYGEN SENSOR (HO2S) AGING, BANK 2. SIGNAL TOO LOW (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-231D

Condition

Fig. 139: Identifying Rear Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) monitors the function of the rear heated oxygen sensor (HO2S) (bank 2) by checking its signal. The engine control module (ECM) checks that the probe has registered a lean fuel/air mixture. If this is not the case, the engine control module (ECM) changes the fuel/air mixture. The diagnostic trouble code (DTC) is stored if the rear probe has still not registered a lean fuel / air mixture.

NOTE: **At fuel shut-off, the probe must show a lean fuel/air mixture. The diagnostic trouble code (DTC) is also stored if the switch-over time to a lean fuel/air mixture is too long.**

Substitute Value

- None.

Possible Source

- Leakage in the exhaust system
- Damaged rear heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL TOO HIGH/SIGNAL TOO LOW/SIGNAL MISSING

see **SIGNAL TOO HIGH/SIGNAL TOO LOW/SIGNAL MISSING**

ECM-2320: REAR HEATED OXYGEN SENSOR (HO2S), BANK 2. FAULTY SIGNAL (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-2320

Condition

Fig. 140: Identifying Rear Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) monitors the function of the rear heated oxygen sensor (HO2S) (bank 2) by checking its signal. The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the signal deviates from its permitted operational range or if the voltage for the heated oxygen sensor (HO2S) preheating disrupts the heated oxygen sensor (HO2S) signal.

Substitute Value

- Rear heated oxygen sensor (HO2S) control is disabled
- Three-way catalytic converter (TWC) diagnostics are disabled.

Possible Source

- Short-circuit in the signal cable for the pre-heating circuit
- Short-circuit in the ground lead for the preheating circuit
- Damaged rear heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULTY SIGNAL

CHECKING THE COMPONENTS AND WIRING

Check the following cables for a short-circuit to each other.

- Engine control module (ECM) terminal #A10 (#A10) and heated oxygen sensor (HO2S) terminal #4
- Engine control module (ECM) terminal #A8 (#A8) and heated oxygen sensor (HO2S) terminal #2
- Heated oxygen sensor (HO2S) terminal #1 and the system relay.

Check the following cables for a short-circuit to each other.

- Engine control module (ECM) terminal #A11 (#A11) and heated oxygen sensor (HO2S) terminal #3
- Engine control module (ECM) terminal #A8 (#A8) and heated oxygen sensor (HO2S) terminal #2
- Heated oxygen sensor (HO2S) terminal #1 and the system relay.

Try a new heated oxygen sensor (HO2S) if the above fault-tracing does not remedy the fault.

Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-232B: REAR HEATED OXYGEN SENSOR (HO2S), BANK 2. SIGNAL MISSING (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-232B

Condition

Fig. 147: Identifying Rear Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) monitors the function of the rear heated oxygen sensor (HO2S) (bank 2) by checking its signal. The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the signal deviates from its permitted operational range or if the voltage for the heated oxygen sensor (HO2S) preheating disrupts the heated oxygen sensor (HO2S) signal.

Substitute Value

- Rear heated oxygen sensor (HO2S) control is disabled
- Three-way catalytic converter (TWC) diagnostics are disabled.

Possible Source

- Contact resistance or oxidation in the connectors
- Open-circuit in the signal cable
- Open-circuit in the ground lead
- Damaged rear heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL MISSING

CHECKING THE COMPONENTS AND WIRING

Check the rear heated oxygen sensor (HO2S) connector. Check for contact resistance and oxidation.

Check the cable between engine control module (ECM) terminal #A10 (#A10) and heated oxygen sensor (HO2S) terminal #4. Check for an open-circuit.

Check the cable between engine control module (ECM) terminal #A11 (#A11) and heated oxygen sensor (HO2S) terminal #3. Check for an open-circuit.

Try a new heated oxygen sensor (HO2S) if the above fault-tracing does not remedy the fault.

Remedy as necessary.

ECM-232D: REAR HEATED OXYGEN SENSOR (HO2S), BANK 2. SIGNAL TOO LOW (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-232D

Condition

Fig. 161: Identifying Rear Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) monitors the function of the rear heated oxygen sensor (HO2S) (bank 2) by checking its signal. The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the signal deviates from its permitted operational range or if the voltage for the heated oxygen sensor (HO2S) preheating disrupts the heated oxygen sensor (HO2S) signal.

Substitute Value

- Rear heated oxygen sensor (HO2S) control is disabled
- Three-way catalytic converter (TWC) diagnostics are disabled.

Possible Source

- Short-circuit to ground in the signal cable
- Short-circuit to ground in the ground lead
- Damaged rear heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL TOO LOW

CHECKING THE COMPONENTS AND WIRING

Check the cable between engine control module (ECM) terminal #A10 (#A10) and heated oxygen sensor (HO2S) terminal #4. Check for a short-circuit to ground.

Check the cable between engine control module (ECM) terminal #A11 (#A11) and heated oxygen sensor (HO2S) terminal #3. Check for a short-circuit to ground.

Try a new heated oxygen sensor (HO2S) if the above fault-tracing does not remedy the fault.

Remedy as necessary.

- Ignition off
- Reconnect the connectors, reinstall components etc.
- Start the engine and run it until the engine coolant temperature exceeds 60 °C
- Switch off the engine and allow it to cool (below 40 °C)
- Test drive the car on the road (engine speed (RPM) above 2000 RPM, never idling) for at least 15 minutes
- Connect VCT2000 (or appropriate scan tool) to the data link connector (DLC) without switching off the engine.

NOTE: **If the engine is switched off, the stored fault status will be erased and the test drive will have to be repeated.**

Read off the diagnostic status and fault status for the diagnostic trouble code (DTC) by selecting the relevant diagnostic trouble code (DTC) from the list.

Check the fault status for the diagnostic trouble code (DTC) when the diagnostic is "Complete". If the function is correct, the fault status must be "No fault found" when the diagnostic is complete.

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-233B: REAR HEATED OXYGEN SENSOR (HO2S), BANK 2. SIGNAL MISSING (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-233B

Condition

Fig. 168: Identifying Rear Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) controls preheating by pulsing the current to the positive temperature coefficient (PTC) element in the heated oxygen sensor (HO2S). Pulse lengths are dependent on the temperature of the heated oxygen sensor (H02S).

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the signal is lower than a certain value when preheating is deactivated.

Substitute Value

- The fuel trim is shut off.

Possible Source

- Contact resistance and oxidation in the terminals
- Open-circuit in the power supply from the system relay
- Damaged heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL MISSING

CHECKING THE STATUS

Fig. 169: Belt Routing / Engine Idling - Volvo

Courtesy of VOLVO CARS CORPORATION

- Start the engine.

  Read off the diagnostic status and fault status for the diagnostic trouble code (DTC) by selecting the relevant diagnostic trouble code (DTC) from the list.

  Increase the engine speed to 2500 RPM until the diagnostic is "Complete".

  Check whether the fault is permanent or intermittent. Read off the diagnostic trouble code (DTC) fault status when the diagnostic status is "Completed".

  HINT: In some cases several functions of the component will be diagnosed. The affects the amount of time taken to run the diagnostic.

  The fault is permanent if the fault status is "Fault found". If the fault status is "No fault found" the fault is intermittent and not presently active.

ECM-233C: REAR HEATED OXYGEN SENSOR (HO2S), BANK 2. SIGNAL TOO HIGH (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-233C

Condition

Fig. 177: Identifying Rear Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) controls preheating by pulsing the current to the positive temperature coefficient (PTC) element in the heated oxygen sensor (HO2S). Pulse lengths are dependent on the temperature of the heated oxygen sensor (H02S).

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the signal is higher than a certain value when preheating is active.

Substitute Value

- The fuel trim is shut off.

Possible Source

- Short-circuit to supply voltage in the signal cable
- Damaged heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL TOO HIGH

CHECKING THE COMPONENTS AND WIRING

Check the resistance of the heated oxygen sensor (HO2S) between terminals #1 and #2.

Check the signal cable between heated oxygen sensor (HO2S) terminal #2 and engine control module (ECM) terminal #A8 (#A8). Check for a short-circuit to supply voltage.

Remedy as necessary.

see **FAULTY SIGNAL**

ECM-2400: FUEL PUMP (FP) RELAY. SIGNAL MISSING. INTERMITTENT FAULT (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 197: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

Normally the Control area network (CAN) is used to transfer information about fuel pump control from the engine control module (ECM) to the central electronic module. The signal cable from the engine control module

(ECM) to the Central electronic module is used for a "limp home" function when there is no Controller Area Network function.

Diagnostic trouble code (DTC) ECM-2400 is stored in the engine control module (ECM) if the engine control module (ECM) registers a fault in signal cable to the central electrical unit.

Substitute Value

None.

Possible Source

Signal too high:

- Short-circuit to supply voltage in the signal cable.

Signal too low:

- Short-circuit to ground in the signal cable.

Signal missing:

- Open-circuit in the signal cable.

Fault symptom[s]

- None.

SIGNAL TOO LOW. INTERMITTENT FAULT

CHECKING COMPONENT AND WIRING

Check the cable between engine control module (ECM) #B45 (#B55) and central electronic module #14B (#A34) for an intermittent short-circuit to ground according to **SHORT-CIRCUIT TO GROUND, INTERMITTENT FAULTS** and for an intermittent open-circuit according to **OPEN-CIRCUIT, INTERMITTENT FAULTS** .

ECM-240B: FRONT HEATED OXYGEN SENSOR (HO2S), BANK 1, HEATING. SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-240B

Condition

Fig. 210: Front Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that there has been no control of the heater element for the front heated oxygen sensor (HO2S) (bank 1) for a certain amount of time.

Substitute Value

- None.

Possible Source

- Contact resistance and oxidation in the terminals
- Damaged front heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL TOO HIGH/SIGNAL TOO LOW/SIGNAL MISSING

CHECKING THE COMPONENTS AND WIRING

CAUTION: Do not apply rust solvent spray or grease to the heated oxygen sensor (HO2S) connector.

Check the heated oxygen sensor (HO2S) pre-heating circuit. Measure the resistance between terminals #3 and #4 in the probe connector.

NOTE: If possible, measure from the rear of the affected connectors in order to minimize any damage and future loose connections.

Try a new heated oxygen sensor (HO2S) if the above fault-tracing does not remedy the fault

Remedy as necessary.

ECM-240C: FRONT HEATED OXYGEN SENSOR (HO2S), BANK 1, HEATING. SIGNAL TOO HIGH (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-240C

Condition

Fig. 217: Front Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the resistance in the preheating circuit for the front heated oxygen sensor (HO2S) (bank 1) is too high.

Substitute Value

- None.

Possible Source

- Contact resistance and oxidation in the terminals
- Damaged front heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL TOO HIGH/SIGNAL TOO LOW/SIGNAL MISSING

see **SIGNAL TOO HIGH/SIGNAL TOO LOW/SIGNAL MISSING**

ECM-240C: FRONT HEATED OXYGEN SENSOR (HO2S), BANK 1, HEATING. SIGNAL TOO HIGH (B6294T; 2005-2006)

SIGNAL TOO HIGH/SIGNAL TOO LOW/SIGNAL MISSING

see **SIGNAL TOO HIGH/SIGNAL TOO LOW/SIGNAL MISSING**

ECM-242D: FRONT HEATED OXYGEN SENSOR (HO2S), BANK 1. SLOW REGULATION (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-242D

Condition

Fig. 218: Front Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) monitors the aging of the front heated oxygen sensor (HO2S) by checking its ability to react to changes in the exhaust gases. The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the heated oxygen sensor (HO2S) reacts too slowly to changes in the fuel/air mixture.

Substitute Value

- Three-way catalytic converter (TWC) diagnostics are disabled.

Possible Source

- The cables for the calibration current and the pump current are short-circuited to each other
- Open-circuit in signal cable (-)
- Open-circuit in the cable for calibration current
- Damaged front heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL TOO LOW

CHECKING COMPONENTS AND WIRING

CAUTION: Do not apply rust solvent spray or grease to the heated oxygen sensor (HO2S) connector.

- Check the heated oxygen sensor (HO2S) connector. Check for contact resistance and oxidation.

  Check the cable for calibration current between engine control module (ECM) terminal #A28 (#A28) and heated oxygen sensor (HO2S) terminal #2.

  Check the cable for pump current between heated oxygen sensor (HO2S) terminal #6 and engine control module (ECM) terminal #A24 (#A24). Check for a short-circuit to each other.

  Check the cable for an open-circuit.

  Check between:

  - Heated oxygen sensor (HO2S) terminal #5 and engine control module (ECM) terminal #A42 (#A42)
  - Heated oxygen sensor (HO2S) terminal #2 and engine control module (ECM) terminal #A28 (#A28).

  Remedy as necessary.

ECM-243B: FRONT HEATED OXYGEN SENSOR (HO2S), BANK 1. SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-243B

Condition

Fig. 225: Front Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) monitors the function of the front heated oxygen sensor (HO2S) (bank 1) by checking its signal. The diagnostic trouble code (DTC) is stored if the voltage for the heated oxygen sensor (HO2S) preheating disrupts the heated oxygen sensor (HO2S) signal.

Substitute Value

- The heated oxygen sensor (HO2S) control is disabled
- Three-way catalytic converter (TWC) diagnostics are disabled.

Possible Source

- One of the cables for heated oxygen sensor (HO2S) preheating is short-circuited to the probe's other signal cables
- Damaged front heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL MISSING

CHECKING THE COMPONENTS AND WIRING

CAUTION: Do not apply rust solvent spray or grease to the heated oxygen sensor (HO2S) connector.

Check the power cable between the engine control module (ECM) and heated oxygen sensor (HO2S) connector terminal #3. Check for a short-circuit to the other signal cables for the heated oxygen sensor (HO2S).

Check the ground lead between engine control module (ECM) terminals #A18 (#A18) and heated oxygen sensor (HO2S) connector terminal #4. Check for a short-circuit to the other signal cables for the heated oxygen sensor (HO2S).

Try a new heated oxygen sensor (HO2S) if the wiring is OK.

Remedy as necessary.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-243C

Condition

Fig. 232: Identifying Preheating Circuit In Front Lambda Probe
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) controls the resistance on the preheating circuit in the front lambda probe. The check is made by the control module measuring the current through the circuit and then converting the current to temperature. The diagnostic trouble code (DTC) is stored and it is interpreted as a fault if the control module detects that the resistance is unreasonably high, which results in a low temperature.

The diagnostic trouble code (DTC) can be diagnosed when driving.

Substitute Value

- None.

Possible Source

- Contact resistance and oxidation in the terminals.
- Damaged front heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator light (MIL), on

SIGNAL TOO HIGH/SIGNAL TOO LOW/SIGNAL MISSING

ECM-244B: FRONT HEATED OXYGEN SENSOR (HO2S), BANK 1, HEATING. SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-244B

Condition

Fig. 233: Front Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) controls preheating by pulsing the current to the positive temperature coefficient (PTC) element in the front heated oxygen sensor (HO2S). Pulse lengths are dependent on the temperature of the heated oxygen sensor (H02S).

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the signal is lower than a certain value when preheating is deactivated.

Substitute Value

- Heated oxygen sensor (HO2S) control is disabled.

Possible Source

- Contact resistance and oxidation in the terminals
- Open-circuit in the power supply from the system relay
- Damaged front heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL MISSING

CHECKING THE COMPONENTS AND WIRING

CAUTION: Do not apply rust solvent spray or grease to the heated oxygen sensor (HO2S) connector.

Check the signal cable between heated oxygen sensor (HO2S) #3 and the system relay. Check for contact resistance and oxidation.

Check the power supply between the system relay and heated oxygen sensor (HO2S) terminal #3. Check for an open-circuit.

NOTE: If possible, measure from the rear of the affected connectors in order to minimize any damage and future loose connections.

Try a new heated oxygen sensor (HO2S) if the above fault-tracing does not remedy the fault.

Remedy as necessary.

ECM-2470: FRONT HEATED OXYGEN SENSOR (HO2S), BANK 1. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-2470

Condition

Fig. 262: Front Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the pump current has ceased and the front heated oxygen sensor (HO2S) signal (bank 1) has been set to a default value.

Substitute Value

- None.

Possible Source

- Contact resistance and oxidation in the terminals
- Open-circuit in the cable for pump current
- Damaged front heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL TOO HIGH / SIGNAL MISSING / FAULTY SIGNAL

CHECKING THE COMPONENTS AND WIRING

CAUTION: Do not apply rust solvent spray or grease to the heated oxygen sensor (HO2S) connector.

Check the heated oxygen sensor (HO2S) connector. Check for contact resistance and oxidation.

Check the cable between engine control module (ECM) terminal #A28 (#A28) and heated oxygen sensor (HO2S) terminal #2. Check for an open-circuit.

NOTE: If possible, measure from the rear of the affected connectors in order to minimize any damage and future loose connections.

Try a new heated oxygen sensor (HO2S) if the above fault-tracing does not remedy the fault.

Remedy as necessary.

see **SIGNAL MISSING**

ECM-24B0: FRONT HEATED OXYGEN SENSOR (HO2S), BANK 1. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-24B0

Condition

Fig. 303: Front Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) monitors the function of the front heated oxygen sensor (HO2S) (bank 1) by checking its signal. The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers

that the signal from the heated oxygen sensor (HO2S) indicates an incorrect lean or rich fuel/air mixture compared to that anticipated by the engine control module (ECM).

NOTE: The fault may be in the front or rear heated oxygen sensor (HO2S) circuit.

Substitute Value

- Long-term fuel trim is switched off
- Three-way catalytic converter (TWC) diagnostics are disabled.

Possible Source

- Leakage in the exhaust system
- Short-circuit to supply voltage or ground in signal cable (-)
- Short-circuit to supply voltage or ground in the pump supply cable
- Short-circuit to supply voltage or ground in calibration supply cable
- Open-circuit in signal cable (+)
- Damaged heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULTY SIGNAL

CHECKING COMPONENTS

Check the exhaust system for air leakage.

Check the cable for a short-circuit to supply voltage or ground.

Check between:

- The cable between engine control module (ECM) terminal #A42 (#A42) and heated oxygen sensor (HO2S) terminal #5
- The cable for pump current between engine control module (ECM) terminal #A24 (#A24) and heated oxygen sensor (HO2S) terminal #6
- The cable for calibration current between engine control module (ECM) terminal #A28 (#A28) and heated oxygen sensor (HO2S) terminal #2.

Check the cable between engine control module (ECM) terminal #A41 (#A41) and heated oxygen sensor (HO2S) terminal #1. Check for an open-circuit.

HINT: If the above fault-tracing does not remedy the fault, try replacing the heated oxygen sensors (HO2S), as the diagnostic trouble code (DTC) can also be stored by a damaged front/rear heated oxygen

sensor (HO2S).

Remedy as necessary.

ECM-24BB: FRONT HEATED OXYGEN SENSOR (HO2S), BANK 1. SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-24BB

Condition

Fig. 307: Front Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) monitors the function of the front heated oxygen sensor (HO2S) (bank 1) by checking its signal. The engine control module (ECM) compares the adaptation values of the front and rear heated oxygen sensor (HO2S). The diagnostic trouble code (DTC) is stored when the values deviate by more

than 3%.

NOTE: The fault may be in the front or rear heated oxygen sensor (HO2S) circuit.

Substitute Value

- Long-term fuel trim is switched off
- Three-way catalytic converter (TWC) diagnostics are disabled.

Possible Source

- Leakage in the exhaust system
- Heated oxygen sensor (HO2S) indicates an incorrectly rich fuel/air mixture
- Contact resistance or oxidation in the terminals
- Damaged heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL MISSING

CHECKING COMPONENTS

Check the connectors for the heated oxygen sensors (HO2S). Check for contact resistance. Check for oxidation.

Check the exhaust system for air leakage.

HINT: If the above fault-tracing does not remedy the fault, try replacing the heated oxygen sensors (HO2S), as the diagnostic trouble code (DTC) can also be stored by a damaged front/rear heated oxygen sensor (HO2S).

Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-253B: FRONT HEATED OXYGEN SENSOR (HO2S), BANK 2. SIGNAL MISSING (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-253B

Condition

Fig. 345: Front Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) monitors the function of the front heated oxygen sensor (HO2S) (bank 2) by checking its signal. The diagnostic trouble code (DTC) is stored if the voltage for the heated oxygen sensor (HO2S) preheating disrupts the heated oxygen sensor (HO2S) signal.

Substitute Value

- The heated oxygen sensor (HO2S) control is disabled
- Three-way catalytic converter (TWC) diagnostics are disabled.

Possible Source

- One of the cables for heated oxygen sensor (HO2S) preheating is short-circuited to the probe's other signal cables
- Damaged front heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL MISSING

CHECKING THE COMPONENTS AND WIRING

CAUTION: Do not apply rust solvent spray or grease to the heated oxygen sensor (HO2S) connector.

Check the power cable between the engine control module (ECM) and heated oxygen sensor (HO2S) connector terminal #3. Check for a short-circuit to the other signal cables for the heated oxygen sensor (HO2S).

Check the ground lead between engine control module (ECM) terminals #A70 (#B10) and heated oxygen sensor (HO2S) connector terminal #4. Check for a short-circuit to the other signal cables for the heated oxygen sensor (HO2S).

Try a new heated oxygen sensor (HO2S) if the wiring is OK.

Remedy as necessary.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-254B: FRONT HEATED OXYGEN SENSOR (HO2S), BANK 2, HEATING. SIGNAL MISSING (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-254B

Condition

Fig. 352: Front Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) regulates preheating by pulsing the current to the positive temperature coefficient (PTC) element (bank 2) in the front heated oxygen sensor (HO2S). Pulse lengths are dependent on the temperature of the heated oxygen sensor (H02S).

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the signal is lower than a certain value when preheating is deactivated.

Substitute Value

- Heated oxygen sensor (HO2S) control is disabled.

Possible Source

- Contact resistance and oxidation in the terminals
- Open-circuit in the power supply from the system relay
- Damaged front heated oxygen sensor (HO2S) (bank 2).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL MISSING

CHECKING THE COMPONENTS AND WIRING

CAUTION: Do not apply rust solvent spray or grease to the heated oxygen sensor (HO2S) connector.

Check the signal cable between heated oxygen sensor (HO2S) #3 and the system relay. Check for contact resistance and oxidation.

Check the power supply between the system relay and heated oxygen sensor (HO2S) terminal #3. Check for an open-circuit.

NOTE: If possible, measure from the rear of the affected connectors in order to minimize any damage and future loose connections.

Try a new heated oxygen sensor (HO2S) if the above fault-tracing does not remedy the fault.

Remedy as necessary.

ECM-254C: FRONT HEATED OXYGEN SENSOR (HO2S), BANK 2, HEATING. SIGNAL TOO HIGH (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-254C

Condition

Fig. 358: Front Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) regulates preheating by pulsing the current to the positive temperature coefficient (PTC) element (bank 2) in the front heated oxygen sensor (HO2S). Pulse lengths are dependent on the temperature of the heated oxygen sensor (H02S).

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the signal is higher than a certain value when preheating is active.

Substitute Value

- Heated oxygen sensor (HO2S) control is disabled.

Possible Source

- Short-circuit to supply voltage in the signal cable
- Damaged front heated oxygen sensor (HO2S) (bank 2).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL TOO HIGH

CHECKING THE COMPONENTS AND WIRING

CAUTION: Do not apply rust solvent spray or grease to the heated oxygen sensor (HO2S) connector.

Check the signal cable between heated oxygen sensor (HO2S) #3 and the system relay. Check for a short-circuit to supply voltage.

NOTE: If possible, measure from the rear of the affected connectors in order to minimize any damage and future loose connections.

Try a new heated oxygen sensor (HO2S) if the above fault-tracing does not remedy the fault.

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 401: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 402: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reconnect the connectors, reinstall components etc.
- Test drive the car at an even speed (engine speed (RPM) above 2000 RPM) for at least 5 minutes
- Release the accelerator pedal (AP) quickly at least three times to simulate fuel shut-off
- Connect VCT2000 (or appropriate scan tool) to the data link connector (DLC) without switching off the engine.

NOTE: **If the engine is switched off, the stored fault status will be erased and the test drive will have to be repeated.**

Read off the diagnostic status and fault status for the diagnostic trouble code (DTC) by selecting the relevant diagnostic trouble code (DTC) from the list.

Check the fault status for the diagnostic trouble code (DTC) when the diagnostic is "Complete". If the function is correct, the fault status must be "No fault found" when the diagnostic is complete.

Fig. 403: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

Is the function OK?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-259B: FRONT HEATED OXYGEN SENSOR (HO2S), BANK 2. SIGNAL MISSING (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-259B

Condition

Fig. 404: Front Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers an open-circuit in the signal cable to the section of the front heated oxygen sensor (HO2S) (bank 2) that detects the oxygen content of the exhaust gases.

Substitute Value

- None.

Possible Source

- Contact resistance or oxidation on the signal cable
- Open-circuit in the signal cable
- Damaged front heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL MISSING

CHECKING THE COMPONENTS AND WIRING

CAUTION: Do not apply rust solvent spray or grease to the heated oxygen sensor (HO2S) connector.

Check the heated oxygen sensor (HO2S) connector. Check for contact resistance. Check for an open-circuit. Check for oxidation.

Check the cable between engine control module (ECM) terminal #A43 (#A43) and heated oxygen sensor (HO2S) terminal #1. Check for an open-circuit.

NOTE: If possible, measure from the rear of the affected connectors in order to minimize any damage and future loose connections.

Try a new heated oxygen sensor (HO2S) if the above fault-tracing does not remedy the fault.

Remedy as necessary.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-25B0: FRONT HEATED OXYGEN SENSOR (HO2S), BANK 2. FAULTY SIGNAL (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-25B0

Condition

Fig. 418: Front Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) monitors the function of the front heated oxygen sensor (HO2S) (bank 2) by checking its signal. The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the signal from the heated oxygen sensor (HO2S) indicates an incorrect lean or rich fuel/air mixture compared to that anticipated by the engine control module (ECM).

NOTE: The fault may be in the front or rear heated oxygen sensor (HO2S) circuit.

Substitute Value

- The heated oxygen sensor (HO2S) control is disabled
- Three-way catalytic converter (TWC) diagnostics are disabled.

Possible Source

- Leakage in the exhaust system
- Short-circuit to supply voltage or ground in signal cable (-)
- Short-circuit to supply voltage or ground in the pump supply cable
- Short-circuit to supply voltage or ground in calibration supply cable
- Open-circuit in signal cable (+)
- Damaged heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULTY SIGNAL

CHECKING COMPONENTS

Check the exhaust system for air leakage.

Check the cable for a short-circuit to supply voltage or ground.

Check between:

- The cable between engine control module (ECM) terminal #A44 (#A44) and heated oxygen sensor (HO2S) terminal #5
- The cable for pump current between engine control module (ECM) terminal #A25 (#A25) and heated oxygen sensor (HO2S) terminal #6
- The cable for calibration current between engine control module (ECM) terminal #A69 (#B9) and heated oxygen sensor (HO2S) terminal #2.

Check the cable between engine control module (ECM) terminal #A43 (#A43) and heated oxygen sensor (HO2S) terminal #1. Check for an open-circuit.

HINT: If the above fault-tracing does not remedy the fault, try replacing the heated oxygen sensors (HO2S), as the diagnostic trouble code (DTC) can also be stored by a damaged front/rear heated oxygen sensor (HO2S).

Remedy as necessary.

Other information

- see **CHECKING FOR AIR LEAKAGE IN THE EXHAUST SYSTEM**

ECM-25BB: FRONT HEATED OXYGEN SENSOR (HO2S), BANK 2. SIGNAL

MISSING (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-25BB

Condition

Fig. 422: Front Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) monitors the function of the front heated oxygen sensor (HO2S) (bank 2) by checking its signal. The engine control module (ECM) compares the adaptation values of the front and rear heated oxygen sensor (HO2S). The diagnostic trouble code (DTC) is stored when the values deviate by more than 3%.

NOTE: The fault may be in the front or rear heated oxygen sensor (HO2S) circuit.

Substitute Value

- The heated oxygen sensor (HO2S) control is disabled
- Three-way catalytic converter (TWC) diagnostics are disabled.

Possible Source

- Leakage in the exhaust system
- Heated oxygen sensor (HO2S) indicates an incorrectly rich fuel/air mixture
- Contact resistance or oxidation in the terminals
- Damaged heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL MISSING

CHECKING COMPONENTS

Check the connectors for the heated oxygen sensors (HO2S). Check for contact resistance. Check for oxidation.

Check the exhaust system for air leakage.

HINT: If the above fault-tracing does not remedy the fault, try replacing the heated oxygen sensors (HO2S), as the diagnostic trouble code (DTC) can also be stored by a damaged front/rear heated oxygen sensor (HO2S).

Remedy as necessary.

ECM-25BD: FRONT HEATED OXYGEN SENSOR (HO2S), BANK 2. SIGNAL

TOO LOW (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-25BD

Condition

Fig. 430: Front Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) monitors the function of the front heated oxygen sensor (HO2S) (bank 2) by checking its signal. The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the signal from the front heated oxygen sensor (HO2S) indicates a lean fuel/air mixture while the signal from the rear heated oxygen sensor (HO2S) indicates a rich fuel/air mixture.

NOTE: The fault may be in the front or rear heated oxygen sensor (HO2S) circuit.

Substitute Value

- The heated oxygen sensor (HO2S) control is disabled
- Three-way catalytic converter (TWC) diagnostics are disabled.

Possible Source

- Leakage in the exhaust system
- Heated oxygen sensor (HO2S) indicates an incorrectly rich fuel/air mixture
- Damaged heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL TOO HIGH / SIGNAL TOO LOW

see **SIGNAL TOO HIGH / SIGNAL TOO LOW**

ECM-25C0: FRONT HEATED OXYGEN SENSOR (HO2S), BANK 2. FAULTY SIGNAL (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-25C0

Condition

Fig. 431: Front Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) monitors the function of the front heated oxygen sensor (HO2S) (bank 2) by checking its signal. The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the heated oxygen sensor (HO2S) only indicates air and no fuel/air mixture.

Substitute Value

- The heated oxygen sensor (HO2S) control is disabled
- Three-way catalytic converter (TWC) diagnostics are disabled.

Possible Source

- Incorrectly installed heated oxygen sensor (HO2S)
- Damaged front heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULTY SIGNAL

CHECKING THE COMPONENTS AND WIRING

CAUTION: Do not apply rust solvent spray or grease to the heated oxygen sensor (HO2S) connector.

Check the heated oxygen sensor (HO2S) connector. Check for contact resistance. Check for an open-circuit. Check for oxidation.

Check that the heated oxygen sensor (HO2S) is correctly installed in the exhaust system.

Try a new heated oxygen sensor (HO2S) if the above fault-tracing does not remedy the fault.

Remedy as necessary.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-260A: LONG-TERM FUEL TRIM. LOWER LIMIT (B5254T2; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The control module receives information from the heated oxygen sensor (HO2S) about the fuel / air mixture when idling at both the lower and upper part-load range. If the fuel / air mixture deviates from lambda=1, the short-term fuel trim will compensate for this by adjusting the injection time so that lambda=1 is achieved. When the short-term fuel trim makes an adjustment, the integrator median must be adjusted by the long-term trim. Diagnostic trouble code (DTC) ECM-260A is stored when the long-term trim must be adjusted to almost maximum in the upper part load area

Substitute Value

none

Possible Source

Upper limit:

- intake air leakage
- exhaust system air leakage
- low fuel pressure
- defective heated oxygen sensor (HO2S)

Lower limit:

- intake air leakage
- high fuel pressure
- leaking injectors
- defective mass air flow (MAF) sensor
- contaminated engine oil
- oil level too high
- defective heated oxygen sensor (HO2S)

Fault symptom[s]

- none

LOWER LIMIT

CHECKING FUEL INJECTION SYSTEM

Check intake system for air leakage according to **CHECK FOR AIR LEAKS IN THE INTAKE SYSTEM** .

HINT: Air leakage in the intake system can occur through the canister purge (CP) valve, the secondary air solenoid valve and power brake booster.

Check the exhaust system for leakage according to **CHECKING FOR AIR LEAKAGE IN THE EXHAUST SYSTEM** .

Check fuel and residual pressure according to **CHECKING FUEL AND RESIDUAL PRESSURES** .

Check that the oil level is between the minimum and maximum markings

Check engine dilution by, reading off the short-term fuel trim with the engine running, plug the crankcase ventilation and read off the short-term fuel trim again, the value should be more or less unchanged

Remedy as necessary.

Fig. 438: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING MASS AIR FLOW (MAF) SENSOR**

CHECKING MASS AIR FLOW (MAF) SENSOR

Test drive the car for approximately 10 minutes

Read off the mass air flow (MAF) sensor correction factor. The value must be between 0.8 and 1.2

NOTE: There must not be any air leakage when this test is carried out.

Remedy as necessary.

Other information

- To replace mass air flow (MAF) sensor, see **MASS AIR FLOW (MAF) SENSOR, REPLACING** .

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

VERIFICATION

Test drive the car according to the TRIP schedule, see **VERIFYING REPAIRS** .

Do not turn off engine after test drive.

Connect the car to VIDA (Volvo scan tool) again.

Read off fuel trim status.

There should not be any faults when fuel trim is finished.

Fig. 443: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **INFORMATION**

- **NO**

  VERIFIED: Troubleshooting has been completed.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-260A: LONG-TERM FUEL TRIM. UPPER LIMIT (B5254T2; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION**

UPPER LIMIT

CHECKING FUEL INJECTION SYSTEM

Check the induction system for air leaks. See **AIR LEAKAGE IN THE INTAKE SYSTEM, CHECKING**

HINT: Air leakage in the intake system can occur through the evaporative emission system (EVAP) valve, the secondary air solenoid valve and power brake booster.

Remedy as necessary.

- **Continue**

  Refer to **CHECKING THE FUEL PRESSURE AND RESIDUAL PRESSURE IN THE WORKSHOP**

CHECKING THE FUEL INJECTION SYSTEM

Test drive the car for approximately 10 minutes

Check the mass air flow (MAF) sensor. Read off its correction factor. The value should be between 0.8 and 1.2.

NOTE: There must not be any air leakage when this test is carried out.

Remedy as necessary.

Other information

- see **MASS AIR FLOW (MAF) SENSOR, REPLACING**

  Refer to **INFORMATION**

- **NO**

  VERIFIED: Troubleshooting has been completed.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CHECKING THE FUEL PRESSURE AND RESIDUAL PRESSURE IN THE WORKSHOP

CHOOSING A METHOD FOR TAKING A READING

NOTE: For vehicles with demand activated fuel pumps (FP), perform Quick test of fuel pump (FP) using VIDA (Volvo scan tool).

The fuel pressure can be measured with the car stationary or while being driven. Residual pressure is measured with the car stationary.

When the car is being driven, see **TAKING FUEL PRESSURE READINGS WHILE DRIVING THE CAR** .

- **Continue**

  Refer to **MEASURING THE LINE PRESSURE**

MEASURING THE LINE PRESSURE

- Connect the pressure gauge according to **CONNECTING FUEL PRESSURE GAUGE**
- Remove the soundproofing panel
- Remove the fuel pump (FP) relay (CMI 12 in the passenger compartment)
- Connect a cable to the relay base as shown in the illustration.

  Read off the line pressure from the pressure gauge. The line pressure must be 375-395 kPa

  Check the residual pressure if the fuel pressure is OK.

  Remedy as necessary

  Other information

  - For -2004, see: **CENTRAL ELECTRONIC MODULE (CEM), REPLACING**
  - For 2005-, see: **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** .
  - For the location of and to replace the fuel pump (FP), see **RIGHT SIDE FUEL PUMP WITH LEVEL SENSOR**
  - see **REPLACING THE FUEL FILTER**
  - To disconnect the pressure gauge, see **DISCONNECTING FUEL PRESSURE GAUGE** .

Fig. 446: Identifying Pressure Gauge
Courtesy of VOLVO CARS CORPORATION

Is the rest pressure to be checked?

- **YES**

  Refer to **CHECKING THE RESIDUAL PRESSURE**

- **NO**

  Refer to **CHECKING THE FUEL INJECTION SYSTEM**

CHECKING THE RESIDUAL PRESSURE

- Switch off the ignition
- Disconnect the cable between the terminals on the relay base
- Reinstall the fuel pump (FP) relay.

  The line pressure must not fall below 200 kPa within 20 minutes of the fuel pump (FP) being shut-off.

  Remedy as necessary

Other information

- see **INJECTOR/PULSE DAMPER, REPLACEMENT**
- For -2004, see: **CENTRAL ELECTRONIC MODULE (CEM), REPLACING**
- For 2005-, see: **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** .
- For the location of and to replace the fuel pump (FP), see **RIGHT SIDE FUEL PUMP WITH LEVEL SENSOR**
- To disconnect the pressure gauge, see **DISCONNECTING FUEL PRESSURE GAUGE** .

Fig. 447: Identifying Pressure Gauge
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **CHECKING THE FUEL INJECTION SYSTEM**

ECM-260A: LONG-TERM FUEL TRIM. UPPER LIMIT (B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION**

UPPER LIMIT

CHECKING FUEL INJECTION SYSTEM

Check intake system for air leakage according to **INTAKE AND EXHAUST SYSTEM - CLEANING, INSPECTION AND ADJUSTMENT** .

HINT: Air leakage in the intake system can occur through the canister purge (CP) valve, the secondary air solenoid valve and power brake booster.

Check fuel pressure according to **CHECKING FUEL AND RESIDUAL PRESSURES** .

Test drive the car for approximately 10 minutes

Check the mass air flow (MAF) sensor by read off its correction factors. The value should be between 0.8 and 1.2

NOTE: There must not be any air leakage when this test is carried out.

Remedy as necessary.

Other information

- To access/replace the mass air flow (MAF) sensor, see **FUEL SYSTEM - REMOVAL, REPLACEMENT AND INSTALLATION** .

Fig. 1: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

VERIFICATION

Test drive the car according to the TRIP schedule, see **VERIFYING REPAIRS** .

Do not turn off engine after test drive.

Connect the car to VIDA (Volvo scan tool) again.

Read off fuel trim status.

There should not be any faults when fuel trim is finished.

  Refer to **INFORMATION**

- **NO**

  VERIFIED: Troubleshooting has been completed.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-261A: LONG-TERM FUEL TRIM. LOWER LIMIT (B5254T2; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The control module receives information from the heated oxygen sensor (HO2S) about the fuel / air mixture when idling at both the lower and upper part-load range. If the fuel / air mixture deviates from lambda=1, the short-term fuel trim will compensate for this by adjusting the injection time so that lambda=1 is achieved. When the short-term fuel trim makes an adjustment, the integrator median must be adjusted by the long-term trim. Diagnostic trouble code (DTC) ECM-261A will be stored when the long-term trim must be adjusted to almost maximum in the lower part load area.

Substitute Value

none

Possible Source

Upper limit:

- intake air leakage
- exhaust system air leakage
- low fuel pressure
- defective heated oxygen sensor (HO2S)

Lower limit:

- intake air leakage
- high fuel pressure
- leaking injectors
- defective mass air flow (MAF) sensor
- contaminated engine oil
- oil level too high
- defective heated oxygen sensor (HO2S)

Fault symptom[s]

- none

LOWER LIMIT

CHECKING FUEL INJECTION SYSTEM

Check intake system for air leakage according to **INTAKE AND EXHAUST SYSTEM - CLEANING, INSPECTION AND ADJUSTMENT** .

HINT: Air leakage in the intake system can occur through the canister purge (CP) valve, the secondary air solenoid valve and power brake booster.

Check the exhaust system for leakage according to **INTAKE AND EXHAUST SYSTEM - CLEANING, INSPECTION AND ADJUSTMENT**

Check fuel and residual pressure according to **CHECKING FUEL AND RESIDUAL PRESSURES**

Check that the oil level is between the minimum and maximum markings

Check engine dilution by, reading off the short-term fuel trim with the engine running, plug the crankcase ventilation and read off the short-term fuel trim again, the value should be more or less unchanged

Remedy as necessary.

Fig. 3: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

The control module receives information from the heated oxygen sensor (HO2S) about the fuel / air mixture. If the fuel / air mixture deviates from lambda=1, the short-term fuel trim will compensate for this by adjusting the injection time so that lambda=1 is achieved. Diagnostic Trouble Code (DTC) ECM-268A will be stored if the short-term fuel trim deviates too much from its central position (value) when the long-term fuel trim diagnostics are activated.

Substitute Value

none

Possible Source

Upper limit

- intake air leakage
- exhaust system air leakage
- low fuel pressure
- defective heated oxygen sensor (HO2S)

Lower limit

- intake air leakage
- high fuel pressure
- leaking injectors
- defective mass air flow (MAF) sensor
- contaminated engine oil
- oil level too high
- defective heated oxygen sensor (HO2S)

Fault symptom[s]

- none

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-270A: ADAPTIVE LAMBDA CONTROL, BANK 2. BOTTOM LIMIT (B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The control module receives information from the heated oxygen sensor (HO2S) about the fuel / air mixture when idling at both the lower and upper part-load range. If the fuel / air mixture deviates from lambda=1, the short-term fuel trim will compensate for this by adjusting the injection time so that lambda=1 is achieved. When the short-term fuel trim makes an adjustment, the integrator median must be adjusted by the long-term trim. Diagnostic trouble code (DTC) ECM-270A will be stored when the long-term trim must be adjusted almost to maximum in the upper part of the load area.

Substitute Value

none

Possible Source

Upper limit:

- intake air leakage
- exhaust system air leakage
- low fuel pressure
- defective heated oxygen sensor (HO2S)

Lower limit:

- intake air leakage
- high fuel pressure
- leaking injectors
- defective mass air flow (MAF) sensor
- contaminated engine oil
- oil level too high
- defective heated oxygen sensor (HO2S)

ECM-2720: ENGINE COOLANT TEMPERATURE (ECT) SENSOR. FAULTY SIGNAL (B5254T2; 2005)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 25: Identifying Engine Coolant Temperature (ECT) Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal for engine coolant temperature (ECT).

After the engine is started, the engine control module (ECM) calculates the theoretical engine coolant temperature (ECT) based on factors such as time since start, engine speed (RPM) and load. The diagnostic trouble code (DTC) is stored if the signal from the engine coolant temperature (ECT) sensor is static and does not correspond to the calculated temperature.

The diagnostic trouble code (DTC) is stored together with another diagnostic trouble code (DTC) for the engine coolant temperature (ECT) sensor.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- None.

Possible Source

- Contact resistance or oxidation in the connectors
- Damaged temperature sensor.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- The engine is difficult to start.

FAULT-TRACING

CHECKING THE COMPONENT

WARNING: Engine cooling fan (FC) can also operate if the ignition is switched off when this diagnostic trouble code (DTC) is stored.

HINT: To avoid injury, disconnect the power supply to the engine cooling fan (FC) during fault-tracing.

- Check the connector on the engine coolant temperature (ECT) sensor. Check for contact resistance and oxidation.

  This diagnostic trouble code (DTC) is stored if the engine coolant temperature (ECT) sensor freezes. This may happen if the coolant level is low or there is too little glycol in the coolant. Check the engine coolant level and its freezing point.

  HINT: The diagnostic trouble code (DTC) can be caused by a thermostat that doesn't open.

  Replace the engine coolant temperature (ECT) sensor if the above does not remedy the fault.

  Remedy as necessary.

  Other information

  - For B5xx4T, see **REPLACING THE THERMOSTAT AND/OR ENGINE COOLANT TEMPERATURE SENSOR**
  - For B6xx4T, see **ENGINE COOLANT TEMPERATURE (ECT) SENSOR, REPLACING** .

ECM-273C: ENGINE COOLANT TEMPERATURE (ECT) SENSOR. SIGNAL TOO HIGH (B5254T2; 2005)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-273C

Condition

Fig. 63: Identifying Engine Coolant Temperature (ECT) Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal for engine coolant temperature (ECT).

A diagnostic trouble code (DTC) is stored if the engine control module (ECM) receives a signal from the engine coolant temperature (ECT) sensor corresponding to a temperature that is higher than a certain value.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- Initial boost pressure
- The engine coolant temperature (ECT) is calculated based on a model. Three-way catalytic converter (TWC) heating and fuel trim at start (starting trim), idle diagnostic and misfire diagnostic are disabled
- The engine cooling fan (FC) runs at a predefined speed.

Possible Source

- Short-circuit to ground in the signal cable
- Damaged temperature sensor.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- The engine is difficult to start.

SIGNAL TOO HIGH

CHECKING THE WIRING AND COMPONENT

WARNING: Before fault-tracing can begin, the engine cooling fan (FC) connector must be disconnected to prevent the engine cooling fan (FC) engaging. A diagnostic trouble code (DTC) for engine cooling fan (FC) low-speed may be stored. After fault-tracing the connector must be reconnected.

Fig. 64: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check the resistance of the engine coolant temperature (ECT) sensor. Take readings between terminals #1 and #2 on the component.

  Check the signal cable between engine control module (ECM) terminal #A4 (#A4) and engine coolant temperature (ECT) sensor terminal #1. Check for a short-circuit to ground.

  If no faults are found and the fault is permanent, replace the engine coolant temperature (ECT) sensor.

  Remedy as necessary.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-273D: ENGINE COOLANT TEMPERATURE (ECT) SENSOR. SIGNAL TOO LOW (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-273D

Condition

Fig. 84: Identifying Engine Coolant Temperature (ECT) Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal for engine coolant temperature (ECT).

A diagnostic trouble code (DTC) is stored if the engine control module (ECM) receives a signal from the engine coolant temperature (ECT) sensor corresponding to a temperature that is lower than a certain value.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- Initial boost pressure
- The engine coolant temperature (ECT) is calculated based on a model. Three-way catalytic converter (TWC) heating and fuel trim at start (starting trim), idle diagnostic and misfire diagnostic are disabled
- The engine cooling fan (FC) runs at a predefined speed.

Possible Source

- Contact resistance and oxidation in the terminals
- Open-circuit in the signal cable
- Open-circuit in the signal ground cable
- Short-circuit to supply voltage in the signal cable
- Damaged temperature sensor.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- The engine is difficult to start.

SIGNAL TOO LOW

CHECKING THE CONNECTOR

WARNING: **Before fault-tracing can begin, the engine cooling fan (FC) connector must be disconnected to prevent the engine cooling fan (FC) engaging. A diagnostic trouble code (DTC) for the engine cooling fan (FC) control module may be stored. After fault-tracing the connector must be reconnected.**

Fig. 85: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 86: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connector on the engine coolant temperature (ECT) sensor. Check for contact resistance and oxidation
- Reinstall the components, reconnect the connectors etc.
- Ignition on
- Read off the engine coolant temperature (ECT) sensor.

  If the temperature is now within its permitted range, the fault was caused by poor contact in the connector.

- Ignition off.

  Check the resistance of the engine coolant temperature (ECT) sensor between terminals #1 and #2 (component side).

  NOTE: The engine coolant temperature (ECT) sensor may be damaged if there has been a short-circuit to supply voltage in the signal cable. Check this before replacing the sensor.

  Check the signal cable between engine control module (ECM) terminal #A4 (#A4) and engine coolant temperature (ECT) sensor terminal #1. Check for an open-circuit. Check for a short-circuit to supply voltage.

HINT: With the ignition on and engine coolant temperature (ECT) sensor connector disconnected the voltage between terminal #1 and ground terminal should be approximately 5 V.

Check the ground lead between control module terminal #A60 (#A60) and engine coolant temperature (ECT) sensor terminal #2. Check for an open-circuit.

If no faults are found and the fault is permanent, replace the engine coolant temperature (ECT) sensor.

Remedy as necessary.

ECM-274C: ENGINE COOLANT TEMPERATURE (ECT) SENSOR. SIGNAL TOO HIGH (B5254T2; 2006-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-274C

Condition

Fig. 108: Identifying Engine Coolant Temperature (ECT) Sensor
Courtesy of VOLVO CARS CORPORATION

Engine Control Module (ECM) checks the signal for engine temperature. If the engine temperature (signal) exceeds a certain limit, the control module checks current operating condition and compares to a calculated engine temperature. Calculations are based on, among other things, speed and load. If the signal from the engine temperature sensor matches a temperature that is higher than a certain limit value and is not reduced within a certain time, the control module interprets this as a malfunction and the diagnostic trouble code (DTC) is generated.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- The engine coolant temperature (ECT) is calculated based on a model.

Possible Source

- Damaged engine coolant temperature (ECT) sensor.
- Contact resistance or oxidation in the terminals.
- Insufficient coolant in cooling system.
- Damaged thermostat.
- Clogged radiator.

Fault symptom[s]

- Malfunction indicator light (MIL), on
- Engine is difficult to start

FAULT-TRACING

see **FAULT-TRACING**

ECM-274D: ENGINE COOLANT TEMPERATURE (ECT) SENSOR. SIGNAL TOO LOW (B5254T2; 2005-2007)

ECM-275C: ENGINE COOLANT TEMPERATURE (ECT) SENSOR. SIGNAL TOO HIGH (B5254T2; 2006-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-275C

Condition

Fig. 109: Identifying Engine Coolant Temperature (ECT) Sensor
Courtesy of VOLVO CARS CORPORATION

Engine Control Module (ECM) checks the signal for engine temperature at start. This is done by the control module saving the values from inlet, fuel and engine temperature sensors at the moment of start. Then the control module compares the values. If the signal from the engine temperature sensor matches a temperature that exceeds a certain limit in relation to the other, the control module interprets this as a malfunction and the diagnostic trouble code (DTC) is generated.

The diagnostic trouble code (DTC) can be diagnosed after approx. 10 minutes with the engine running.

Substitute Value

- The engine coolant temperature (ECT) is calculated based on a model.

Possible Source

- Damaged engine coolant temperature (ECT) sensor.
- Contact resistance or oxidation in the terminals.

Fault symptom[s]

- Malfunction indicator light (MIL), on
- Engine is difficult to start

FAULT-TRACING

CHECKING THE STATUS

Fig. 110: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Check whether the fault is permanent or intermittent by reading off the signal from the engine coolant temperature (ECT) sensor.

NOTE: **In order for the correct values to be shown, reading of the temperatures must take place at the moment of start.**

- Start the engine.

Check that the engine temperature is reasonable.

The fault is permanent if the signal is incorrect. The fault is intermittent if the signal is correct.

HINT: Remove the engine temperature sensor, but leave the connector in place. Leave the engine hood

open, then the engine temperature sensor shall show the same temperature as outdoor temperature.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-275D: ENGINE COOLANT TEMPERATURE (ECT) SENSOR. SIGNAL TOO LOW (B5254T2; 2006-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-275D

Condition

Fig. 121: Identifying Engine Coolant Temperature (ECT) Sensor
Courtesy of VOLVO CARS CORPORATION

Engine Control Module (ECM) checks the signal for engine temperature at start. This is done by the control module saving the values from inlet, fuel and engine temperature sensors at the moment of start. Then the control module compares the values. If the signal from the engine temperature sensor matches a temperature that is below a certain limit in relation to the other, the control module interprets this as a malfunction and the diagnostic trouble code (DTC) is generated.

The diagnostic trouble code (DTC) can be diagnosed after approx. 10 minutes with the engine running.

Substitute Value

- The engine coolant temperature (ECT) is calculated based on a model.

Possible Source

- Damaged engine coolant temperature (ECT) sensor.
- Contact resistance or oxidation in the terminals.

Fault symptom[s]

- Malfunction indicator light (MIL), on
- Engine is difficult to start

FAULT-TRACING

see **FAULT-TRACING**

ECM-278A: ADAPTIVE LAMBDA CONTROL, BANK 2. BOTTOM LIMIT (B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The control module receives information from the heated oxygen sensor (HO2S) about the fuel / air mixture. If the fuel / air mixture deviates from lambda=1, the short-term fuel trim will compensate for this by adjusting the injection time so that lambda=1 is achieved. Diagnostic trouble code (DTC) ECM-278A will be stored if the short-term fuel trim deviates (when long-term fuel trim diagnostics are activated) too much from the center position (value) for bank 2 (cylinders 4, 5 and 6).

Diagnostic trouble code (DTC) ECM-268A is stored for bank 1 (cylinders 1, 2 and 3).

Substitute Value

none

Possible Source

Upper limit

- intake air leakage
- exhaust system air leakage
- low fuel pressure
- defective heated oxygen sensor (HO2S).

Lower limit

- intake air leakage
- high fuel pressure
- leaking injectors
- defective mass air flow (MAF) sensor
- contaminated engine oil
- oil level too high
- defective heated oxygen sensor (HO2S).

Fault symptom[s]

- none.

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-2800: FUEL PRESSURE SENSOR. SIGNAL TOO LOW (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-2800

Condition

Fig. 122: Identifying Fuel Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal from the fuel pressure sensor.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the signal from the fuel pressure sensor is within the normal signal range of the sensor but that the signal is below a calculated desired value for the fuel pressure.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the signal cable
- Damaged fuel pressure sensor.

Fault symptom[s]

- Driving/Poor performance/lacks power
- Driving/Engine stalls/Unsure when/at all times

SIGNAL TOO LOW

CHECKING THE STATUS

Fig. 123: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check whether the fault is permanent or intermittent by reading off the signal from the fuel pressure sensor.

  With the engine at operating temperature and idling, the signal must be approximately 400 kPa.

  The fault is permanent if the signal is incorrect.

  The fault is intermittent if the signal is correct.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-2800: FUEL PRESSURE SENSOR. SIGNAL TOO LOW (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-2800

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-2800**

SIGNAL TOO LOW

see **SIGNAL TOO LOW**

ECM-280A: FRONT HEATED OXYGEN SENSOR (HO2S), BANK 1. FAULTY SIGNAL. INTERMITTENT FAULT (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 132: Front Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

Probe monitoring begins after probe preheating diagnostics are complete. Diagnostic trouble code (DTC) ECM-280A is stored if there is a fault in the front heated oxygen sensor (HO2S) or its wiring causing the signal to deviate from its permitted range

The control module registers four different types of fault:

1. Signal too high

   The control module compares the front and rear adaptation values. A diagnostic trouble code (DTC) is stored when the values deviate by more than 3%.

   NOTE: The fault may be in the front or rear heated oxygen sensor (HO2S) circuit.

   - the control module registers that the signal from the front probe is above 4.8 V for too long
   - the signal from the front probe does not deviate from lambda= 1
   - the signal from the front probe is showing a lean fuel mixture while the signal from the rear probe is showing a rich mixture
   - the signal from the front probe is showing a rich fuel mixture while the signal from the rear probe is showing a lean mixture.
2. Signal too low

   The control module monitors the aging of the probe by checking its dynamics when switching between lean and rich mixtures. The diagnostic trouble code (DTC) is stored if the control module registers that the probe is operating too slowly.

   - the control module registers that the signal from the front probe is above 4.8 V for too long
   - the signal from the front probe does not deviate from lambda= 1
   - the signal from the front probe is showing a lean fuel mixture while the signal from the rear probe is showing a rich mixture
   - the signal from the front probe is showing a rich fuel mixture while the signal from the rear probe is showing a lean mixture.
3. Signal missing

   The control module monitors cross-induction from the probe preheating. Diagnostic trouble code (DTC) is stored when cross induction exceeds the permitted value.

   - the control module registers that the signal from the front probe is above 4.8 V for too long
   - the signal from the front probe does not deviate from lambda= 1
   - the signal from the front probe is showing a lean fuel mixture while the signal from the rear probe is showing a rich mixture
   - the signal from the front probe is showing a rich fuel mixture while the signal from the rear probe is showing a lean mixture.
4. Faulty signal

   A diagnostic trouble code (DTC) stored when:

   - the control module registers that the signal from the front probe is above 4.8 V for too long
   - the signal from the front probe does not deviate from lambda= 1
   - the signal from the front probe is showing a lean fuel mixture while the signal from the rear probe

is showing a rich mixture
- the signal from the front probe is showing a rich fuel mixture while the signal from the rear probe is showing a lean mixture.

Substitute Value

- The rear heated oxygen sensor (HO2S) control is disabled
- Three-way catalytic converter (TWC) diagnostic is disabled

Possible Source

Signal too high:

- air leakage in the exhaust system
- short-circuit to power supply or ground in the signal cable (+) or supply cable for pump current
- defective heated oxygen sensor (HO2S)

Signal too low:

- the cable for calibration current and the cable for pump current are short-circuited to each other
- open-circuit in signal cable (-)
- open-circuit in cable for calibration current
- defective heated oxygen sensor (HO2S).

Signal missing:

- signal cable (+) and signal cable (-) short-circuited to each other
- one of the cables for heated oxygen sensor (HO2S) preheating is short-circuited to the probe's other wiring
- defective heated oxygen sensor (HO2S).

Faulty signal:

- short-circuit to supply voltage or ground in signal cable (+)
- short-circuit to supply voltage or ground in signal cable (-)
- short-circuit to supply voltage or ground in pump current cable
- short-circuit to supply voltage or ground in calibration current cable
- open-circuit in signal cable (+)
- defective heated oxygen sensor (HO2S).

Fault symptom[s]

- malfunction indicator lamp (MIL) lit.

FAULTY SIGNAL. INTERMITTENT FAULT

CHECKING CONNECTORS AND WIRING

CAUTION: Do not apply rust solvent spray or grease to the heated oxygen sensor (HO2S) connector.

Check the heated oxygen sensor (HO2S) connector. Check for contact resistance and oxidation. Check for loose connections.

Check the signal cable (+) between heated oxygen sensor (HO2S) terminal #1 and control module terminal #A41 (#A41). Check the signal cable (-) between heated oxygen sensor (HO2S) terminal #5 and the control module terminal #A42 (#A42). Check the cable for calibration current between heated oxygen sensor (HO2S) terminal #2 and control module terminal #A28 (#A28). Check the cable for pump current between heated oxygen sensor (HO2S) terminal #6 and control module terminal #A24 (#A24). Check for an intermittent short-circuit to supply voltage.

Check the signal cable (+) between heated oxygen sensor (HO2S) terminal #1 and control module terminal #A41 (#A41). Check the signal cable (-) between heated oxygen sensor (HO2S) terminal #5 and control module terminal #A42 (#A42). Check the cable for calibration current between heated oxygen sensor (HO2S) terminal #2 and the control module terminal #A28 (#A28). Check the cable for pump current between heated oxygen sensor (HO2S) terminal #6 and control module terminal #A24 (#A24). Check for an intermittent short-circuit to ground.

Check the signal cable (+) between heated oxygen sensor (HO2S) terminal #1 and control module terminal #A41 (#A41). Check for an intermittent open-circuit.

INFORMATION

FAULT-TRACING INFORMATION

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.

It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

ECM-280A: FRONT HEATED OXYGEN SENSOR (HO2S), BANK 1. FAULTY SIGNAL. PERMANENT FAULT (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION**

FAULTY SIGNAL. PERMANENT FAULT

CHECKING CONNECTOR, WIRING AND COMPONENTS

CAUTION: Do not apply rust solvent spray or grease to the heated oxygen sensor (HO2S) connector.

Check the heated oxygen sensor (HO2S) connector. Check for contact resistance and oxidation.

Check the signal cable (+) between the heated oxygen sensor (HO2S) terminal #1 and control module terminal #A41 (#A41). Check the signal cable (-) between heated oxygen sensor (HO2S) terminal #5 and the control module terminal #A42 (#A42). Check the cable for calibration current between heated oxygen sensor (HO2S) terminal #2 and control module terminal #A28 (#A28). Check the cable for pump current between heated oxygen sensor (HO2S) terminal #6 and control module terminal #A24 (#A24). Check these cables for a short-circuit to supply voltage and a short-circuit to ground.

Check the signal cable (+) between heated oxygen sensor (HO2S) terminal #1 and control module terminal #A41 (#A41). Check for an open-circuit.

If the connector and cables are OK try a new heated oxygen sensor (HO2S).

Remedy as necessary.

Other information

Was there any air leakage?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

CAUTION: Do not apply rust solvent spray or grease to the heated oxygen sensor (HO2S) connector.

Front heated oxygen sensor (HO2S), bank 1:

Check the signal cable (+) between heated oxygen sensor (HO2S) terminal #1 and control module terminal #A41 (#A41). Check the cable for pump current between heated oxygen sensor (HO2S) terminal #6 and control module terminal #A24 (#A24). Check for an open-circuit. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Front heated oxygen sensor (HO2S), bank 2:

Check the signal cable (+) between heated oxygen sensor (HO2S) terminal #1 and control module terminal #A43 (#A43). Check the cable for pump current between heated oxygen sensor (HO2S) terminal #6 and control module terminal #A25 (#A25). Check for an open-circuit, short-circuit to ground and a short-circuit to supply voltage.

Replace both heated oxygen sensors (HO2S) if the wiring is OK and no faults are found.

Remedy as necessary.

HINT: If the fault remains after fault-tracing/remedying, the fault may be in the circuit for the rear heated oxygen sensor (HO2S).

Other information:

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-280B: FUEL PRESSURE SENSOR. SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-280B

Condition

Fig. 193: Identifying Fuel Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal from the fuel pressure sensor.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the signal from the fuel pressure sensor is within the normal signal range of the sensor but that the signal is below a calculated desired value for the fuel pressure.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the signal cable
- Damaged fuel pressure sensor.

Fault symptom[s]

- Driving/Poor performance/lacks power
- Driving/Engine stalls/Unsure when/at all times

SIGNAL MISSING

CHECKING THE STATUS

Fig. 194: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check whether the fault is permanent or intermittent by reading off the signal from the fuel pressure sensor.

With the engine at operating temperature and idling, the signal must be approximately 400 kPa.

The fault is permanent if the signal is incorrect.

The fault is intermittent if the signal is correct.

Fig. 195: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 196: Identifying Fuel Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Check the fuel pressure sensor connectors. Check for contact resistance and oxidation.

Check the signal cable between engine control module (ECM) terminal #A2 (#A2) and fuel pressure sensor terminal #4. Check for a short-circuit to supply voltage. Check for an open-circuit.

Check the ground lead between control module terminal #A60 (#A60) and fuel pressure sensor terminal #1. Check for an open-circuit.

Remedy as necessary.

Try a new fuel pressure sensor if no fault is found during the above fault-tracing.

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-280B: FUEL PRESSURE SENSOR. SIGNAL MISSING (B5254T2; 2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-280B

Condition

Fig. 203: Identifying Fuel Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal from the fuel pressure sensor.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the signal from the fuel pressure sensor is within the normal signal range of the sensor but that the signal is below a calculated desired value for the fuel pressure.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the signal cable
- Damaged fuel pressure sensor.

Fault symptom[s]

- Driving/Poor performance/lacks power
- Driving/Engine stalls/Unsure when/at all times

SIGNAL MISSING

CHECKING THE STATUS

Fig. 204: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check whether the fault is permanent or intermittent by reading off the signal from the fuel pressure sensor.

With the engine at operating temperature and idling, the signal must be approximately 400 kPa.

The fault is permanent if the signal is incorrect.

The fault is intermittent if the signal is correct.

Fig. 205: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 206: Identifying Fuel Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Check the fuel pressure sensor connectors. Check for contact resistance and oxidation.

Check the signal cable between engine control module (ECM) terminal #A2 (#A2) and fuel pressure sensor terminal #4. Check for a short-circuit to supply voltage. Check for an open-circuit.

Check the ground lead between control module terminal #A60 (#A60) and fuel pressure sensor terminal #1. Check for an open-circuit.

Remedy as necessary.

Try a new fuel pressure sensor if no fault is found during the above fault-tracing.

SIGNAL TOO HIGH

see **SIGNAL TOO HIGH**

ECM-280C: SWITCHED FRONT HEATED OXYGEN SENSORS (HO2S). FAULTY SIGNAL (B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-280C

Condition

Diagnostic trouble code (DTC) ECM-280C is stored if the engine control module (ECM) detects that both front heated oxygen sensors (HO2S) bank 1 and 2 have been switched (mounted in the incorrect bank of cylinders). The diagnostic trouble codes (DTCs) are diagnosed when the engine has been idling for 10 minutes

Substitute Value

- Long-term fuel trim is switched off
- Three-way catalytic converter (TWC) diagnostics are disabled.

Possible Source

Faulty signal:

- Front heated oxygen sensors (HO2S) are mounted in the incorrect cylinder banks
- Fuel injection system leakage
- Both the front heated oxygen sensors (HO2S) are defective.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULTY SIGNAL

see **FAULTY SIGNAL**

ECM-280D: FUEL PRESSURE SENSOR. SIGNAL TOO LOW (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-280D

Condition

Fig. 223: Identifying Fuel Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the signal from the fuel pressure sensor is too low.

The diagnostic trouble code (DTC) can be diagnosed at ignition on and with the engine running.

Substitute Value

- None.

Possible Source

- Contact resistance or oxidation in the terminals
- Short-circuit to supply voltage in the signal cable
- Open-circuit in the signal cable
- Open-circuit in the signal ground cable
- Damaged temperature sensor.

Fault symptom[s]

- None.

ECM-2810: FRONT HEATED OXYGEN SENSOR (HO2S), BANK 1 HEATING. FAULTY SIGNAL. INTERMITTENT FAULT (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 224: Front Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The control module controls preheating by pulsing the current to the PTC-element. Pulse lengths are dependent on heated oxygen sensor (H02S) temperature. Diagnostic trouble code (DTC) ECM-2810 is stored if the control module registers that the signal is constantly 2.5 V, higher than 3.5 V at current pulse or lower than 2.3 V at no pulse.

Diagnostic trouble code (DTC) ECM-2810 is stored if the control module registers that heated oxygen sensor pre-heating does not function within 17 seconds of dew (condensation) point in the exhaust system being reached.

Substitute Value

- fuel trim shut off.

Possible Source

Signal too high:

- short-circuit to supply voltage in the signal cable
- defective heated oxygen sensor (HO2S).

Signal too low:

- short-circuit to ground in the signal cable
- defective heated oxygen sensor (HO2S).

Signal missing:

- contact resistance and oxidation
- open-circuit in power supply from system relay.

Faulty signal:

- defective heated oxygen sensor (HO2S).

Fault symptom[s]

- MIL-lamp lights.

FAULTY SIGNAL. INTERMITTENT FAULT

FAULT-TRACING INFORMATION

ECM-281C: TEXT MESSAGE. PRESSURE TOO HIGH (B5254T2; 2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-281C

Condition

Fig. 262: Identifying Control Module
Courtesy of VOLVO CARS CORPORATION

NOTE: **If the diagnostic trouble code is generated, it is an indication that the fuel pressure has exceeded 800 kPa, there is a risk of fuel leakage.**

The engine control module (ECM) controls the fuel pressure via the fuel pump (FP) control module using a pulse width modulation (PWM) signal. The fuel pump (FP) control module then controls the fuel pump (FP) depending on the pressure requested by the engine control module (ECM). The diagnostic trouble code (DTC) is stored if the actual pressure (measured pressure from the fuel pressure sensor) rises too high in comparison with the requested pressure (target pressure) during a certain time frame.

The diagnostic trouble code (DTC) can be diagnosed when the engine is idling.

Substitute Value

- Predefined value used.

Possible Source

- Damaged fuel pump control module.
- Damaged fuel pump unit.
- The cable for voltage supply to the fuel pump is short-circuited to supply voltage.
- Damaged fuel pressure sensor

Fault symptom[s]

- Message in information display
- Malfunction indicator lamp (MIL) lit

- Deterioration in performance
- The engine stops.

FAULT-TRACING

CHECKING THE FUEL INJECTION SYSTEM

Fig. 263: Identifying Belt Routing

NOTE: **If the diagnostic trouble code is generated, it is an indication that the fuel pressure has exceeded 800 kPa, there is a risk of fuel leakage. Therefore, it may be good to perform a check of the fuel system.**

- Start the engine. Allow the engine to idle.

Check the fuel system for leaks.

Remedy as necessary.

- **Continue**

  Refer to **CHECKING THE FUEL PRESSURE SENSOR**

CHECKING THE FUEL PRESSURE SENSOR

NOTE: **If diagnostic trouble codes (DTC) for the fuel pressure sensor or atmospheric pressure sensor are stored, these diagnostic trouble codes (DTC) must be fault-traced and remedied first.**

HINT: The method below is used to check whether the diagnostic trouble code (DTC) was caused by a faulty fuel pressure sensor. This can be done by comparing the fuel pressure sensor signal (displayed in VIDA (Volvo scan tool)) with the actual fuel pressure (displayed on a manometer connected to the wiring for the fuel injection system).

- Connect the pressure gauge:**FUEL PRESSURE GAUGE**

CAUTION: **The pressure in the fuel injection system can reach approx. 800 kPa when this diagnostic trouble code is stored, use an adapted pressure gauge.**

- Run the engine to operating temperature. Allow the engine to idle.
- Air conditioning (A/C) off.

Read off the relative fuel pressure.

The relative fuel pressure is calculated from the fuel pressure sensor and the atmospheric pressure sensor signal (= absolute pressure minus atmospheric pressure).

Check that the value on the manometer and the value displayed in VIDA (Volvo scan tool) are roughly the same. If the values are different, the circuit for the fuel pressure sensor is defective.

Fig. 264: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

Is the function OK?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 271: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Run the engine to operating temperature. Allow the engine to idle.
- air conditioning (A/C) off
- Read off the fuel pressure and the fuel pressure desired value.
- Start the quick test when the engine is running at idling.

During the course of the quick test, the control module regulates the pressure for different target values in different steps (530, 490, 450, 410, 440, 490, 530 kPa). Each step takes 10 seconds. The test usually starts with the pressure momentarily going up to 650 kPa.

NOTE: **Because the by-pass valve in the fuel pump (FP) will be open at approximately 650 kPa, the pressure will not go higher than this.**

HINT: The illustration to the left shows an example of normal regulation.

- The upper digital display and the graphic display (red font color) indicate the absolute fuel pressure, calculated from the fuel pressure sensor
- The central digital display and the graphic display (blue font color) indicate the control module target value for the absolute fuel pressure
- The lower digital display indicates the relative fuel pressure (white font color), calculated from the fuel pressure sensor and the atmospheric pressure sensor (= absolute pressure minus atmospheric pressure). If a manometer is connected during the test, it must indicate this pressure.

Check that the value for absolute fuel pressure is the same as the target value for absolute fuel pressure. If the values are not the same, this indicates a fault in the pressure regulation. The values may differ during the quick test when the target value is changed. This is due to sluggishness in the fuel regulation and is normal. In some cases, it can take up to 5 seconds before the fuel pressure reaches the target value for the fuel pressure.

Fig. 272: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-2900: FUEL PRESSURE. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-2900

Condition

Fig. 274: Identifying Fuel Pump (FP) Control Module
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) controls the fuel pressure via the fuel pump (FP) control module using a pulse width modulation (PWM) signal. The fuel pump (FP) control module then controls the fuel pump (FP) depending on the pressure requested by the engine control module (ECM). The diagnostic trouble code (DTC) is stored if the control capacity of the engine control module (ECM) for fuel pressure reaches the highest or lowest value and the desired fuel pressure (target value) is not achieved.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- None.

Possible Source

- Leakage in the fuel lines
- Damaged fuel pressure sensor
- Damaged fuel pump
- Damaged fuel pump control module.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- Deterioration in performance
- The engine stops.
- Starting/Engine does not start/Engine turns

FAULTY SIGNAL

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

Check if there are diagnostic trouble codes stored for fuel pressure sensor or ambient pressure sensor, in that case troubleshoot and fix these first.

Do you want to continue with this procedure?

- **YES**

  Refer to **CHECKING THE FUEL PRESSURE SENSOR**

CHECKING THE FUEL PRESSURE SENSOR

NOTE: **If diagnostic trouble codes (DTC) for the fuel pressure sensor or atmospheric pressure sensor are stored, these diagnostic trouble codes (DTC) must be fault-traced and remedied first.**

HINT: The method below is used to check whether the diagnostic trouble code (DTC) was caused by a faulty fuel pressure sensor. This can be done by comparing the fuel pressure sensor signal (displayed in VIDA (Volvo scan tool)) with the actual fuel pressure (displayed on a manometer connected to the wiring for the fuel injection system). This method assumes that the manometer for measuring fuel pressure is correctly calibrated.

- To connect the manometer, see **FUEL PRESSURE GAUGE**
- Run the engine to operating temperature. Allow the engine to idle
- air conditioning (A/C) off
- Read off the relative fuel pressure.

  The relative fuel pressure is calculated from the fuel pressure sensor and the atmospheric pressure sensor signal (= absolute pressure minus atmospheric pressure).

  Check that the value on the manometer and the value displayed in VIDA (Volvo scan tool) are the same. If the values are different, the circuit for the fuel pressure sensor is defective.

ECM-290A: FRONT HEATED OXYGEN SENSOR (HO2S), BANK 2. SIGNAL TOO HIGH (B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 282: Identifying Front Heated Oxygen Sensor (HO2S)
Courtesy of VOLVO CARS CORPORATION

Probe monitoring begins after probe preheating diagnostics are complete. Diagnostic trouble code (DTC) ECM-290A is stored if there is a fault in the front heated oxygen sensor (HO2S) or its wiring causing the signal to deviate from its permitted range.

The control module registers four different types of fault:

1. Signal too high

The control module compares the front and rear adaptation values. A diagnostic trouble code (DTC) is stored when the values deviate by more than 3%.

NOTE: The fault may be in the front or rear heated oxygen sensor (HO2S) circuit.

- the control module registers that the signal from the front probe is above 4.8 V for too long
- - the signal from the front probe does not deviate fromlambda= 1
- the signal from the front probe is showing a lean fuel mixture while the signal from the rear probe is showing a rich mixture
- the signal from the front probe is showing a rich fuel mixture while the signal from the rear probe is showing a lean mixture.

2. Signal too low

   The control module monitors the aging of the probe by checking its dynamics when switching between lean and rich mixtures. The diagnostic trouble code (DTC) is stored if the control module registers that the probe is operating too slowly.

   - the control module registers that the signal from the front probe is above 4.8 V for too long
   - - the signal from the front probe does not deviate fromlambda= 1
   - the signal from the front probe is showing a lean fuel mixture while the signal from the rear probe is showing a rich mixture
   - the signal from the front probe is showing a rich fuel mixture while the signal from the rear probe is showing a lean mixture.

3. Signal missing

   The control module monitors cross-induction from the probe preheating. Diagnostic trouble code (DTC) is stored when cross induction exceeds the permitted value.

   - the control module registers that the signal from the front probe is above 4.8 V for too long
   - - the signal from the front probe does not deviate fromlambda= 1
   - the signal from the front probe is showing a lean fuel mixture while the signal from the rear probe is showing a rich mixture
   - the signal from the front probe is showing a rich fuel mixture while the signal from the rear probe is showing a lean mixture.

4. Faulty signal

   A diagnostic trouble code (DTC) stored when:

   - the control module registers that the signal from the front probe is above 4.8 V for too long
   - - the signal from the front probe does not deviate fromlambda= 1
   - the signal from the front probe is showing a lean fuel mixture while the signal from the rear probe is showing a rich mixture
   - the signal from the front probe is showing a rich fuel mixture while the signal from the rear probe is

showing a lean mixture.

Substitute Value

- The rear heated oxygen sensor (HO2S) control is disabled
- Three-way catalytic converter (TWC) diagnostic is disabled

Possible Source

Signal too high:

- air leakage in the exhaust system
- short-circuit to power supply or ground in the signal cable (+) or supply cable for pump current
- defective heated oxygen sensor (HO2S)

Signal too low:

- the cable for calibration current and the cable for pump current are short-circuited to each other
- open-circuit in signal cable (-)
- open-circuit in cable for calibration current
- defective heated oxygen sensor (HO2S).

Signal missing:

- Signal cable (+) and signal cable (-) short-circuited to each other
- one of the cables for heated oxygen sensor (HO2S) preheating is short-circuited to the probe's other wiring
- defective heated oxygen sensor (HO2S).

Faulty signal:

- short-circuit to supply voltage or ground in signal cable (+)
- short-circuit to supply voltage or ground in signal cable (-)
- short-circuit to supply voltage or ground in pump current cable
- short-circuit to supply voltage or ground in calibration current cable
- open-circuit in signal cable (+)
- defective heated oxygen sensor (HO2S).

Fault symptom[s]

- malfunction indicator lamp (MIL) lit.

SIGNAL TOO HIGH

CHECKING FOR AIR LEAKAGE IN THE EXHAUST SYSTEM

Check for air leakage. See **INTAKE AND EXHAUST SYSTEM - CLEANING, INSPECTION AND ADJUSTMENT** .

Remedy as necessary.

Fig. 283: Checking For Air Leakage In Exhaust System
Courtesy of VOLVO CARS CORPORATION

Was there any air leakage?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

CAUTION: Do not apply rust solvent spray or grease to the heated oxygen sensor (HO2S) connector.

Front heated oxygen sensor (HO2S), bank 1:

Check the signal cable (+) between heated oxygen sensor (HO2S) terminal #1 and control module terminal #A41 (#A41). Check the cable for pump current between heated oxygen sensor (HO2S) terminal #6 and control module terminal #A24 (#A24). Check for an open-circuit. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Front heated oxygen sensor (HO2S), bank 2:

Check the signal cable (+) between heated oxygen sensor (HO2S) terminal #1 and control module terminal #A43 (#A43). Check the cable for pump current between heated oxygen sensor (HO2S) terminal #6 and control module terminal #A25 (#A25). Check for an open-circuit, short-circuit to ground and a short-circuit to supply voltage.

Replace both heated oxygen sensors (HO2S) if the wiring is OK and no faults are found.

Remedy as necessary.

HINT: If the fault remains after fault-tracing/remedying, the fault may be in the circuit for the rear heated oxygen sensor (HO2S).

Other information:

- To connect the breakout box / access the control module, see **CONNECTING THE BREAKOUT BOX**

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-290B: FUEL PRESSURE. SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-290B

Condition

Fig. 328: Identifying Fuel Pump (FP) Control Module
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) controls the fuel pressure via the fuel pump (FP) control module using a pulse width modulation (PWM) signal. The fuel pump (FP) control module then controls the fuel pump (FP) depending on the pressure requested by the engine control module (ECM). The diagnostic trouble code (DTC) is stored if the actual pressure (measured pressure from the fuel pressure sensor) pulses too much.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- None.

Possible Source

- Air in the fuel lines
- Blocked fuel lines
- Damaged fuel pressure sensor
- Damaged fuel pump
- Damaged fuel pump control module.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- Deterioration in performance
- The engine stops.

SIGNAL MISSING (2005)

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

Check if there are diagnostic trouble codes stored for fuel pressure sensor or ambient pressure sensor, in that case troubleshoot and fix these first.

Do you want to continue with this procedure?

- **YES**

  Refer to **CHECKING THE FUEL PRESSURE SENSOR**

CHECKING THE FUEL PRESSURE SENSOR

NOTE: **If diagnostic trouble codes (DTC) for the fuel pressure sensor or atmospheric pressure sensor are stored, these diagnostic trouble codes (DTC) must be fault-traced and remedied first.**

HINT: The method below is used to check whether the diagnostic trouble code (DTC) was caused by a faulty fuel pressure sensor. This can be done by checking whether the fuel pressure sensor signal (displayed in VIDA (Volvo scan tool)) is unstable, while the actual fuel pressure (displayed on a manometer connected to the wiring for the fuel injection system) is stable.

- To connect the manometer, see **FUEL PRESSURE GAUGE**
- Run the engine to operating temperature. Allow the engine to idle
- air conditioning (A/C) off
- Read off the relative fuel pressure.

  The relative fuel pressure is calculated from the fuel pressure sensor and the atmospheric pressure sensor signal (= absolute pressure minus atmospheric pressure).

  Check the value on the manometer and the value displayed in VIDA (Volvo scan tool). If the fuel pressure sensor signal (displayed in VIDA) is unstable while the actual fuel pressure (displayed on the manometer connected to the wiring for the fuel injection system) is stable, this indicates that the circuit for the fuel pressure sensor is defective.

Fig. 329: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 330: Identifying Fuel Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

Are the values equal?

- **YES**

  Refer to **CHECKING COMPONENTS**

- **NO**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS

Check that the fuel level in the tank is not too low (almost no fuel).

Check the connectors between the pump control module and the fuel pump (FP). Check for contact resistance and oxidation.

Check the fuel lines and fuel filter for blockage and leaks.

Remedy as necessary.

Try a new fuel pump (FP) if no fault is found during the above fault-tracing.

HINT: The diagnostic trouble code (DTC) can also be caused by a defective pump control module.

Other information

- see **CHECKING WIRING AND TERMINALS**
- see **LEVEL SENSOR, FUEL TANK, RIGHT-HAND/FUEL TANK, REPLACING**
- see **FUEL PUMP DRIVER MODULE**

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-290C: FUEL PRESSURE. SIGNAL TOO HIGH (B5254T2; B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-290C

Condition

Fig. 357: Identifying Fuel Pump (FP) Control Module
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) controls the fuel pressure via the fuel pump (FP) control module using a pulse width modulation (PWM) signal. The fuel pump (FP) control module then controls the fuel pump (FP) depending on the pressure requested by the engine control module (ECM). The diagnostic trouble code (DTC) is stored if the actual pressure (measured pressure from the fuel pressure sensor) rises too high in comparison with the requested pressure (target pressure) during a certain time frame.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- None.

Possible Source

- Damaged fuel pressure sensor
- Damaged fuel pump control module.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- Deterioration in performance
- The engine stops.

SIGNAL TOO HIGH

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

Check if there are diagnostic trouble codes stored for fuel pressure sensor or ambient pressure sensor, in that case troubleshoot and fix these first.

Do you want to continue with this procedure?

- **YES**

  Refer to **CHECKING THE FUEL PRESSURE SENSOR**

CHECKING THE FUEL PRESSURE SENSOR

NOTE: **If diagnostic trouble codes (DTC) for the fuel pressure sensor or atmospheric pressure sensor are stored, these diagnostic trouble codes (DTC) must be fault-traced and remedied first.**

HINT: The method below is used to check whether the diagnostic trouble code (DTC) was caused by a faulty fuel pressure sensor. This can be done by comparing the fuel pressure sensor signal (displayed in VIDA (Volvo scan tool)) with the actual fuel pressure (displayed on a manometer connected to the wiring for the fuel injection system).

- Connect the manometer, see **FUEL PRESSURE GAUGE** .

  NOTE: **The pressure in the fuel injection system can reach approximately 650 kPa when this diagnostic trouble code (DTC) is stored. Use an adapted manometer.**

- Run the engine to operating temperature. Allow the engine to idle
- air conditioning (A/C) off
- Read off the relative fuel pressure.

  The relative fuel pressure is calculated from the fuel pressure sensor and the atmospheric pressure sensor signal (= absolute pressure minus atmospheric pressure).

  Check that the value on the manometer and the value displayed in VIDA (Volvo scan tool) are roughly the same. If the values are different, the circuit for the fuel pressure sensor is defective.

Fig. 358: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 362: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Connect the manometer, see **FUEL PRESSURE GAUGE**
- Run the engine to operating temperature. Allow the engine to idle
- air conditioning (A/C) off
- Read off the relative fuel pressure.

  The relative fuel pressure is calculated from the fuel pressure sensor and the atmospheric pressure sensor signal (= absolute pressure minus atmospheric pressure).

  Check that the value on the manometer and the value displayed in VIDA (Volvo scan tool) are the same. If the values are different, this indicates incorrect function.

Fig. 363: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

Is the function OK?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 365: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Run the engine to operating temperature. Allow the engine to idle
- air conditioning (A/C) off
- Read off the fuel pressure and the fuel pressure desired value
- Start the quick test when the engine is running at idling.

During the course of the quick test, the control module will steer the pressure to different target values in different stages (400, 500, 600 and finally 700 kPa), after which the pressure will be decreased in stages to the same pressure. Each stage lasts for approximately 5 seconds.

NOTE: **Because the by-pass valve in the fuel pump (FP) will be open at approximately 650 kPa, the pressure will not go higher than this.**

HINT: The illustration to the left shows an example of normal regulation.

- The upper digital display and the graphic display (red font color) indicate the absolute fuel pressure, calculated from the fuel pressure sensor
- The lower digital display and the graphic display (yellow font color) indicate the control module target value for the absolute fuel pressure
- The lower digital display indicates the relative fuel pressure (white font color), calculated from the fuel pressure sensor and the atmospheric pressure sensor (= absolute pressure minus atmospheric pressure). If a manometer is connected during the test, it should indicate this pressure.

Check that the value for absolute fuel pressure is the same as the target value for absolute fuel pressure. If the values are not the same, this indicates a fault in the pressure regulation. The values may differ during the quick test when the target value is changed. This is due to sluggishness in the fuel regulation and is normal. In some cases, it can take up to 5 seconds before the fuel pressure reaches the target value for the fuel pressure.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-290C: FUEL PRESSURE. SIGNAL TOO HIGH (B5254T2; 2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-290C

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-290C**

SIGNAL TOO HIGH

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

Check if there are diagnostic trouble codes stored for fuel pressure sensor or ambient pressure sensor, in that case troubleshoot and fix these first.

Do you want to continue with this procedure?

- **YES**

  Refer to **CHECKING THE FUEL PRESSURE SENSOR**

CHECKING THE FUEL PRESSURE SENSOR

NOTE: If diagnostic trouble codes (DTC) for the fuel pressure sensor or atmospheric pressure sensor are stored, these diagnostic trouble codes (DTC) must be fault-traced and remedied first.

HINT: The method below is used to check whether the diagnostic trouble code (DTC) was caused by a faulty fuel pressure sensor. This can be done by comparing the fuel pressure sensor signal (displayed in VIDA (Volvo scan tool)) with the actual fuel pressure (displayed on a manometer connected to the wiring for the fuel injection system).

- Connect the manometer, see **FUEL PRESSURE GAUGE** .

  NOTE: The pressure in the fuel injection system can reach approximately 650 kPa when this diagnostic trouble code (DTC) is stored. Use an adapted manometer.

- Run the engine to operating temperature. Allow the engine to idle
- air conditioning (A/C) off
- Read off the relative fuel pressure.

  The relative fuel pressure is calculated from the fuel pressure sensor and the atmospheric pressure sensor signal (= absolute pressure minus atmospheric pressure).

  Check that the value on the manometer and the value displayed in VIDA (Volvo scan tool) are roughly the same. If the values are different, the circuit for the fuel pressure sensor is defective.

Fig. 368: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-290D: FUEL PRESSURE. SIGNAL TOO LOW (B5254T2; 2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-290D

Condition

Fig. 378: Identifying Fuel Pump (FP) Control Module
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) controls the fuel pressure via the fuel pump (FP) control module using a pulse width modulation (PWM) signal. The fuel pump (FP) control module then controls the fuel pump (FP) depending on the pressure requested by the engine control module (ECM). The diagnostic trouble code (DTC) is stored if the actual pressure (measured pressure from the fuel pressure sensor) is too low in comparison with the requested pressure (target pressure) during a certain time frame.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- None.

Possible Source

- Leakage at the fuel lines
- Damaged fuel pressure sensor
- Damaged fuel pump
- Damaged fuel pump control module.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- Deterioration in performance
- The engine stops.
- Starting/Engine does not start/Engine turns

SIGNAL TOO LOW

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

Check if there are diagnostic trouble codes stored for fuel pressure sensor or ambient pressure sensor, in that case troubleshoot and fix these first.

Do you want to continue with this procedure?

- **YES**

  Refer to **CHECKING THE FUEL PRESSURE SENSOR**

- **NO**

  OKAY: Troubleshooting has been completed.

CHECKING THE FUEL PRESSURE SENSOR

NOTE: **If diagnostic trouble codes (DTC) for the fuel pressure sensor or atmospheric pressure sensor are stored, these diagnostic trouble codes (DTC) must be fault-traced and remedied first.**

HINT: The method below is used to check whether the diagnostic trouble code (DTC) was caused by a faulty fuel pressure sensor. This can be done by comparing the fuel pressure sensor signal (displayed in VIDA (Volvo scan tool)) with the actual fuel pressure (displayed on a manometer connected to the wiring for the fuel injection system). This method assumes that the manometer for measuring fuel pressure is correctly calibrated.

- To connect the manometer, see **FUEL PRESSURE GAUGE**
- Run the engine to operating temperature. Allow the engine to idle
- air conditioning (A/C) off
- Read off the relative fuel pressure.

  The relative fuel pressure is calculated from the fuel pressure sensor and the atmospheric pressure sensor signal (= absolute pressure minus atmospheric pressure).

  Check that the value on the manometer and the value displayed in VIDA (Volvo scan tool) are the same. If the values are different, the circuit for the fuel pressure sensor is defective.

Is the fuel pressure sensor correct?

- **YES**

  Refer to **CHECKING REGULATION OF THE FUEL PRESSURE**

- **NO**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING REGULATION OF THE FUEL PRESSURE

WARNING: **In this test, the pressure in the fuel injection system will reach approximately 650 kPa. Disconnect the pressure gauge, as it is not intended to be used at such high pressures.**

HINT: The method described below is used to check the control of the pressure in the fuel injection system by activating the quick test for the fuel pump (FP). If the pressure gauge for pressures up to 650 kPa is connected, the fuel pressure sensor can also be checked during this test.

NOTE: In this test, the complete flow capacity of the system is not tested.

- Disconnect the manometer unless it is adapted for pressures higher than 650 kPa
- Run the engine to operating temperature. Allow the engine to idle
- air conditioning (A/C) off
- Read off the fuel pressure and the fuel pressure desired value
- Start the quick test when the engine is running at idling.

During the course of the quick test, the control module regulates the pressure for different target values in different steps (530, 490, 450, 410, 440, 490, 530 kPa). Each step takes 10 seconds. The test usually starts with the pressure momentarily going up to 650 kPa.

NOTE: Because the by-pass valve in the fuel pump (FP) will be open at approximately 650 kPa, the pressure will not go higher than this.

HINT: The illustration to the left shows an example of normal regulation.

- The upper digital display and the graphic display (red font color) indicate the absolute fuel pressure, calculated from the fuel pressure sensor
- The lower digital display and the graphic display (yellow font color) indicate the control module target value for the absolute fuel pressure
- The lower digital display indicates the relative fuel pressure (white font color), calculated from the fuel pressure sensor and the atmospheric pressure sensor (= absolute pressure minus atmospheric pressure). If a manometer is connected during the test, it should indicate this pressure.

Check that the value for absolute fuel pressure is the same as the target value for absolute fuel pressure. If the values are not the same, this indicates a fault in the pressure regulation. The values may differ during the quick test when the target value is changed. This is due to sluggishness in the fuel regulation and is normal. In some cases, it can take up to 5 seconds before the fuel pressure reaches the target value for the fuel pressure.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-2910: FRONT HEATED OXYGEN SENSOR (HO2S) PREHEATING, BANK 2. SIGNAL MISSING (B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The control module controls preheating by pulsing the current to the PTC-element. The length of the pulses depend on the temperature of the heated oxygen sensor (H02S). Diagnostic trouble code (DTC) ECM-2910 is stored if the control module registers that the signal is a constant 2.5 V, higher than 3.5 V at current pulse or lower than 2.3 V at no current pulse.

Diagnostic trouble code (DTC) ECM-2910 is stored if the control module registers that heated oxygen sensor pre-heating does not function within 17 seconds of dew (condensation) point in the exhaust system being reached.

Substitute Value

- fuel trim is shut off.

Possible Source

Signal too high:

- short-circuit to supply voltage in the signal cable
- defective heated oxygen sensor (HO2S).

Signal too low:

- short-circuit to ground in the signal cable
- defective heated oxygen sensor (HO2S).

Signal missing:

- contact resistance and oxidation
- open-circuit in the power supply from the system relay.

Faulty signal:

- defective heated oxygen sensor (HO2S).

Fault symptom[s]

- The malfunction indicator lamp (MIL) lights.

SIGNAL MISSING

CHECKING THE CONNECTOR

Fig. 13: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the heated oxygen sensor (HO2S) connector. Check for contact resistance and oxidation
- Reinstall the components, reconnect the connectors etc.
- Start the engine. Allow the engine to idle.

Read off the diagnostic trouble code (DTC) status for the front heated oxygen sensor (HO2S).

The text "NOT READY" is displayed if the diagnosis is running.

Other information

- For 6 cylinder engines -2004, see **SIGNAL SPECIFICATION**

- For 6 cylinder engines 2005-, see **SIGNAL SPECIFICATION** .
- To access or replace the heated oxygen sensor (HO2S), see **HEATED OXYGEN SENSOR (HO2S), REPLACING**
- see **CHECKING WIRING AND TERMINALS**

Is "FAULT NOT DETECTED" displayed?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Check the resistance of the heated oxygen sensor (HO2S) between terminals #3 and #4.

Check the signal cable between heated oxygen sensor (HO2S) terminal #4 and control module terminal #A70 (#B10). Check the power supply between system relay terminal #5 and heated oxygen sensor (HO2S) terminal #3. Check for an open-circuit.

Remedy as necessary.

Other information

- For 6 cylinder engines -2004, see **SIGNAL SPECIFICATION**
- For 6 cylinder engines 2005-, see **SIGNAL SPECIFICATION** .
- To connect the breakout box / access the control module, see **CONNECTING THE BREAKOUT BOX**
- To access or replace the heated oxygen sensor (HO2S), see **HEATED OXYGEN SENSOR (HO2S), REPLACING**
- For resistance values, see **COMPONENT SPECIFICATIONS**
- see **CHECKING WIRING AND TERMINALS** .

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-291B: FUEL PUMP CONTROL MODULE. SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-291B

Condition

Fig. 45: Identifying Fuel Pump (FP) Control Module
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) controls the fuel pressure via the fuel pump (FP) control module using a pulse width modulation (PWM) signal. The fuel pump (FP) control module then controls the fuel pump (FP) depending on the pressure requested by the engine control module (ECM). The diagnostic trouble code (DTC) is stored if there is no PWM signal between the engine control module (ECM) and the fuel pump (FP) control module.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the signal cable
- Damaged fuel pump control module.

Fault symptom[s]

- The starter motor turns but the engine does not start
- The engine stops.

SIGNAL TOO HIGH/SIGNAL TOO LOW/SIGNAL MISSING (2005)

CHECKING THE STATUS

Fig. 46: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start the engine and run it to normal operating temperature
- Read off the fuel pump (FP) load.

Check whether the fault is permanent or intermittent by checking the value of the fuel pump (FP) load (signal from the engine control module (ECM) to the fuel pump (FP) control module).

Check that the signal is approximately 35% (±5%) with the engine idling at operating temperature.

The fault is permanent if the signal is incorrect or the engine will not start.

The fault is intermittent if the signal is correct.

Fig. 47: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 48: Identifying Fuel Pump (FP) Control Module
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Check the pump control module connector. Check for contact resistance and oxidation.

Check the cable between Engine Control Module (ECM) terminal #B47 (#B57) and pump control module terminal #1. Check for an open circuit, short circuit to ground and supply voltage.

Remedy as necessary.

HINT: The diagnostic trouble code (DTC) may be caused by a defective pump control module.

ECM-2A00: FUEL TEMPERATURE SENSOR. FAULTY SIGNAL (B5254T2; 2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-2A00

Condition

Fig. 75: Identifying Fuel Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal from the fuel temperature sensor. The fuel temperature sensor is integrated in the fuel pressure sensor. The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the signal from the fuel temperature sensor is incorrect.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- None.

Possible Source

- Contact resistance or oxidation in the terminals
- Short-circuit to supply voltage in the signal cable
- Short-circuit to ground in the signal cable.
- Open-circuit in the signal cable
- Open-circuit in the signal ground cable
- Damaged fuel temperature sensor.

Fault symptom[s]

- None.

FAULT-TRACING

CHECKING THE STATUS

Fig. 76: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check whether the fault is permanent or intermittent by reading off the signal from the fuel pressure sensor.

Check that the signal is within its permitted range. The signal is measured in the fuel rail for the injectors.

The fault is permanent if the signal is incorrect.

The fault is intermittent if the signal is correct.

Fig. 85: Identifying Rear Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks that there are no faults in the probe or the wiring. Diagnostic trouble code (DTC) ECM-2A0A is stored if the control module registers that the signal deviates from the permitted operating range.

Substitute Value

- twin heated oxygen sensor (HO2S) control is disabled
- Three-way catalytic converter (TWC) diagnostics are disabled.

Possible Source

Signal too high:

- Short-circuit to supply voltage in the signal cable
- Short-circuit to supply voltage in the ground lead
- Defective heated oxygen sensor (HO2S).

Signal too low:

- Short-circuit to ground in the signal cable
- Short-circuit to ground in the ground lead
- Defective heated oxygen sensor (HO2S).

Faulty signal:

- Short-circuit in the signal cable for the pre-heating circuit
- Short-circuit in the ground lead for the preheating circuit
- Defective heated oxygen sensor (HO2S).

Signal missing:

- Contact resistance or oxidation in the connectors
- Open-circuit in the signal cable
- Open-circuit in the ground lead
- Defective heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULTY SIGNAL

CHECKING COMPONENTS AND WIRING

CAUTION: Do not apply rust solvent spray or grease to the heated oxygen sensor (HO2S) connector.

Fig. 86: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check the signal cable (+) for the heated oxygen sensor (HO2S) between control module terminal #A61 and preheating cable terminal #A6. Check for a short-circuit to each other.

  Check the signal cable (-) for the heated oxygen sensor (HO2S) between control module terminal #A62 and preheating cable terminal #A6. Check for a short-circuit to each other.

  Try a new heated oxygen sensor (HO2S) if the wiring is OK.

  Remedy as necessary.

  Other information:

- To connect the breakout box / access the control module, see **CONNECTING THE BREAKOUT BOX**

SIGNAL MISSING

CHECKING THE CONNECTOR

CAUTION: Do not apply rust solvent spray or grease to the heated oxygen sensor (HO2S) connector.

Fig. 94: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 95: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the heated oxygen sensor (HO2S) connector. Check for contact resistance and oxidation
- Reinstall the components, reconnect the connectors etc.
- Start the engine. Allow the engine to idle.

Read off the signal for the rear heated oxygen sensor (HO2S).

NOTE: It may take up to approximately 3 minutes before fuel trim has begun and the signal can be read off.

Check that the signal is within its permitted range. The signal must be free of interference and between 0.6 - 0.3 V.

If the signal is now OK this indicates that the fault was caused by a poor connection in the connector.

Other information:

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-2A0B: FUEL TEMPERATURE SENSOR. SIGNAL MISSING (B5254T2; 2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-2A0B

Condition

Fig. 121: Identifying Fuel Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal from the fuel temperature sensor. The fuel temperature sensor is integrated in the fuel pressure sensor. The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that there is no signal from the fuel temperature sensor.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- None.

Possible Source

- Contact resistance or oxidation in the terminals
- Short-circuit to supply voltage in the signal cable
- Short-circuit to ground in the signal cable.
- Open-circuit in the signal cable

- Open-circuit in the signal ground cable
- Damaged fuel temperature sensor.

Fault symptom[s]

- None.

FAULT-TRACING

see **FAULT-TRACING**

ECM-2A0C: FUEL TEMPERATURE SENSOR. SIGNAL TOO HIGH (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-2A0C

Condition

Fig. 122: Identifying Fuel Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal from the fuel temperature sensor. The fuel temperature sensor is integrated in the fuel pressure sensor. The diagnostic trouble code (DTC) is stored if the engine control

module (ECM) registers that the signal from the fuel temperature sensor is too high.

The diagnostic trouble code (DTC) can be diagnosed at ignition on and with the engine running.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the signal cable
- Damaged temperature sensor.

Fault symptom[s]

- None.

SIGNAL TOO HIGH

CHECKING THE STATUS

Fig. 123: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check whether the fault is permanent or intermittent by reading off the signal from the fuel pressure sensor.

  Check that the signal is within its permitted range. The signal is measured in the fuel rail for the injectors.

  The fault is permanent if the signal is incorrect.

  The fault is intermittent if the signal is correct.

SIGNAL TOO HIGH

see **SIGNAL TOO HIGH**

ECM-2A0D: FUEL TEMPERATURE SENSOR. SIGNAL TOO LOW (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-2A0D

Condition

Fig. 132: Identifying Fuel Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal from the fuel temperature sensor. The fuel temperature sensor is integrated in the fuel pressure sensor. The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the signal from the engine coolant temperature (ECT) sensor is too low.

The diagnostic trouble code (DTC) can be diagnosed at ignition on and with the engine running.

Substitute Value

- None.

Possible Source

- Contact resistance or oxidation in the terminals
- Short-circuit to supply voltage in the signal cable
- Open-circuit in the signal cable
- Open-circuit in the signal ground cable
- Damaged temperature sensor.

Fault symptom[s]

- None.

ECM-2A10: FUEL TEMPERATURE SENSOR. SIGNAL TOO HIGH (B5254T2; 2006-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-2A10

Condition

Fig. 133: Identifying Fuel Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) controls the fuel temperature signal while driving. This is done through the control module comparing values from the intake, fuel and engine temperature sensors. If the signal from the fuel temperature sensor matches a temperature that exceeds a certain limit in relation to the other, the control module interprets this as a malfunction and the diagnostic trouble code (DTC) is generated.

The diagnostic trouble code (DTC) can be diagnosed when the engine is idling.

Substitute Value

- Predefined value for fuel temperature.

Possible Source

- Contact resistance or oxidation in the terminals
- Damaged fuel temperature sensor.

Fault symptom[s]

- Malfunction indicator light (MIL), on

FAULT-TRACING

CHECKING THE STATUS

Fig. 134: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Check whether the fault is permanent or intermittent by reading the signals from the fuel, outside and engine temperature sensors.

- Start the engine.

Check that the fuel temperature is within its permitted range. The fuel temperature should not be lower than the outdoor temperature and a maximum of 40 °C above the engine temperature.

The fault is permanent if the signal is incorrect. The fault is intermittent if the signal is correct.

HINT: Remove the fuel temperature sensor, but let the connector remain connected. The fuel temperature sensor is integrated in the fuel pressure sensor. The sensor should then show the same temperature as the outdoor temperature.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-2A1A: REAR HEATED OXYGEN SENSOR (HO2S) AGING FAULTY SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 145: Identifying Rear Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The control module checks the rear heated oxygen sensor (HO2S) dynamics. The control module checks that the probe has registered both lean and rich fuel mixtures. If this is not the case, the control module alters the fuel mixture. Diagnostic trouble code (DTC) ECM-2A1A (bank 1) is stored if the rear probe is still not registering lean (signal too low) or rich (signal too high) fuel mixture. At fuel shut-off, the probe must show lean fuel mixture. Diagnostic trouble code (DTC) ECM-2A1A (bank 1), signal missing, is stored if the switch over time from lean to rich fuel mixture is too long.

Substitute Value

- None.

Possible Source

- Leakage in the exhaust system
- Defective heated oxygen sensor (HO2S).

Fault symptom[s]

- The malfunction indicator lamp (MIL) lights.

PERMANENT FAULT

CHECKING FOR AIR LEAKAGE IN THE EXHAUST SYSTEM

Check for air leakage. See **CHECKING FOR AIR LEAKAGE IN THE EXHAUST SYSTEM** .

Remedy as necessary.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-2A1C

Condition

Fig. 153: Identifying Fuel Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

Engine Control Module (ECM) checks the signal for fuel temperature at start. This is done by the control module saving the values from inlet, fuel and engine temperature sensors at the moment of start. Then the control module compares the values. If the signal from the fuel temperature sensor matches a temperature that exceeds a certain limit in relation to the other, the control module interprets this as a malfunction and the diagnostic trouble code (DTC) is generated.

The diagnostic trouble code (DTC) can be diagnosed after approx. 10 minutes with the engine running.

Substitute Value

- Predefined value for fuel temperature.

Possible Source

- Damaged fuel temperature sensor.

- Contact resistance or oxidation in the terminals.

Fault symptom[s]

- Malfunction indicator light (MIL), on

FAULT-TRACING

CHECKING THE STATUS

Fig. 154: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Check whether the problem is permanent or intermittent by reading the signals from the fuel, inlet and engine temperature sensors.

NOTE: **In order for the correct values to be shown, reading of the temperatures must take place at the moment of start.**

- Start the engine.

Check that the fuel temperature is within its permitted range. The fuel temperature should not be lower than the outdoor temperature and a maximum of 10 °C above the engine temperature.

The fault is permanent if the signal is incorrect. The fault is intermittent if the signal is correct.

HINT: Remove the fuel temperature sensor, but let the connector remain connected. The fuel temperature sensor is integrated in the fuel pressure sensor. The sensor should then show the same temperature as the outdoor temperature.

  Refer to **CHECKING THE COMPONENT AND WIRING**

CHECKING THE COMPONENT AND WIRING

Fig. 157: Identifying Ignition In Off Position
Courtesy of VOLVO CARS CORPORATION

Fig. 158: Identifying Connectors
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Disconnect the fuel temperature sensor connector.
- Check the connectors. Check for loose connections. Check for contact resistance. Check for oxidation.

  Check the resistance of the sensor between #1 and #2 (to the sensor).

  Remedy as necessary.

  NOTE: Verifying is started with cold engine (+20 °C).

  Other information

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-2A1D: FUEL TEMPERATURE SENSOR. SIGNAL TOO LOW (B5254T2; 2006-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-2A1D

Condition

Fig. 165: Identifying Fuel Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

Engine Control Module (ECM) checks the signal for fuel temperature at start. This is done by the control module saving the values from inlet, fuel and engine temperature sensors at the moment of start. Then the control module compares the values. If the signal from the fuel temperature sensor matches a temperature that is below a certain limit in relation to the other, the control module interprets this as a malfunction and the diagnostic trouble code (DTC) is generated.

The diagnostic trouble code (DTC) can be diagnosed after approx. 10 minutes with the engine running.

Substitute Value

- Predefined value for fuel temperature.

Possible Source

- Damaged fuel temperature sensor.
- Contact resistance or oxidation in the terminals.

Fault symptom[s]

- Malfunction indicator light (MIL), on

FAULT-TRACING

see **FAULT-TRACING**

ECM-2A20: HEATED OXYGEN SENSOR (HO2S) BANK 1, PREHEATING.

SIGNAL MISSING (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 166: Identifying Rear Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The control module controls rear heated oxygen sensor (HO2S) preheating by pulsing the current to the positive temperature coefficient (PTC) element in the heated oxygen sensor (HO2S). Pulse lengths are dependent on the temperature of the heated oxygen sensor (H02S).

Diagnostic trouble code (DTC) ECM-2A20 (bank 1) is stored if the control module registers that the signal is higher than a particular value when preheating is activate (signal too high) or lower than a certain value when preheating is deactivated (signal too low or signal missing).

Substitute Value

- The fuel trim is shut off.

Possible Source

Signal too high:

- Short-circuit to supply voltage in the signal cable
- Defective heated oxygen sensor (HO2S).

Signal too low:

- Short-circuit to ground in the signal cable
- Defective heated oxygen sensor (HO2S).

Signal missing:

- Contact resistance and oxidation
- Open-circuit in the power supply from the system relay
- Defective heated oxygen sensor (HO2S).

Fault symptom[s]

- The malfunction indicator lamp (MIL) lights.

SIGNAL MISSING

CHECKING THE CONNECTOR

Fig. 167: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 168: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the heated oxygen sensor (HO2S) connector. Check for contact resistance and oxidation
- Reinstall the components, reconnect the connectors etc.
- Start the engine. Allow the engine to idle.

Read off the status of the diagnostic trouble code (DTC) for the rear heated oxygen sensor (HO2S).

The text "NOT READY" is displayed if the diagnosis is running.

Other information

ECM-2A2A: REAR HEATED OXYGEN SENSOR (HO2S) PREHEATING. FAULTY SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 193: Identifying Rear Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-2A2A (bank 1) is stored if the control module registers that the resistance of the rear heated oxygen sensor (HO2S) in the pre-heating circuit is too high for a certain amount of time.

Substitute Value

- None.

Possible Source

Faulty signal:

- Contact resistance and oxidation
- Defective heated oxygen sensor (HO2S).

Fault symptom[s]

- The malfunction indicator lamp (MIL) lights.

FAULTY SIGNAL

CHECKING THE CONNECTOR

Check the connector for the rear heated oxygen sensor (HO2S). Check for contact resistance and oxidation. Remedy if necessary.

Try a new rear heated oxygen sensor (HO2S) if the above corrective action does not remedy the fault.

Other information

- For B5xx4T, see **HEATED OXYGEN SENSOR (HO2S), REPLACING**

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-2B00: THERMOSTAT. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-2B00

Condition

During the engine warm up phase the way the engine temperature should increase is calculated. Factors such as engine load and the start temperature are taken into account. This test takes place during the engine warm-up phase (under "normal operation") and continues until the engine temperature has reached 84 °C. For the test to start, the starting temperature of the engine must be below 35 °C, the outside temperature must be -7 to +35 °C and at least 15 minutes must have passed since the engine was last run.

The diagnostic trouble code (DTC) is stored if the calculated increase in temperature does not correspond to the actual increase (measured by the engine coolant temperature (ECT) sensor).

HINT: This diagnostic trouble code (DTC) can also be caused by faults that store diagnostic trouble codes (DTCs) for outside temperature sensors.

Substitute Value

- None.

Possible Source

- Damaged engine coolant temperature (ECT) sensor
- Damaged thermostat.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULTY SIGNAL

see **FAULTY SIGNAL**

ECM-2B00: THERMOSTAT. FAULTY SIGNAL (B6294T; 2005-2006)

ECM-2C0B: INJECTOR CYL 1. SIGNAL MISSING (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 198: Identifying Injector
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the circuit for the injectors.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the signal for one of the injector circuits is missing.

The diagnostic trouble code (DTC) indicates which injector is being referred to.

- ECM-2C0B: injector 1
- ECM-2C1B: injector 2
- ECM-2C2B: injector 3
- ECM-2C3B: injector 4
- ECM-2C4B: injector 5
- ECM-2C5B: injector 6.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- None.

Possible Source

- Contact resistance in the terminals
- Open-circuit in the signal cable
- Open-circuit in the power supply to the injector
- Damaged injector
- Damaged mass air flow (MAF) sensor.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- The engine is not firing on all cylinders.

SIGNAL MISSING

CHECKING COMPONENTS AND WIRING

Check the cable that relates to the diagnostic trouble code (DTC). Check for an open-circuit.

Check between:

- Engine control module (ECM) terminal #A16 (#A16) and injector terminal #2 (ECM-2C0B, injector 1)
- Engine control module (ECM) terminal #A15 (#A15) and injector terminal #2 (ECM-2C1B, injector 2)
- Engine control module (ECM) terminal #A33 (#A33) and injector terminal #2 (ECM-2C2B, injector 3)
- Engine control module (ECM) terminal #A32 (#A32) and injector terminal #2 (ECM-2C3B, injector 4)
- Engine control module (ECM) terminal #A34 (#A34) and injector terminal #2 (ECM-2C4B, injector 5)
- Engine control module (ECM) terminal #A52 (#A52) and injector terminal #2 (ECM-2C5B, injector 6).

Remedy as necessary.

ECM-2C0C: INJECTOR CYL 1. SIGNAL TOO HIGH (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 204: Identifying Injector
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the circuit for the injectors.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the signal for one of the injector circuits is too high.

The diagnostic trouble code (DTC) indicates which injector is being referred to.

- ECM-2C0C: injector 1
- ECM-2C1C: injector 2
- ECM-2C2C: injector 3
- ECM-2C3C: injector 4
- ECM-2C4C: injector 5
- ECM-2C5C: injector 6.

The diagnostic trouble code (DTC) can be diagnosed at ignition on and with the engine running.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the signal cable
- Damaged injector.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- The engine is not firing on all cylinders.

SIGNAL TOO HIGH

CHECKING COMPONENTS AND WIRING

Check the cable that relates to the diagnostic trouble code (DTC). Check for a short-circuit to supply voltage.

Check between:

- Engine control module (ECM) terminal #A16 (#A16) and injector terminal #2 (ECM-2C0C, injector 1)
- Engine control module (ECM) terminal #A15 (#A15) and injector terminal #2 (ECM-2C1C, injector 2)
- Engine control module (ECM) terminal #A33 (#A33) and injector terminal #2 (ECM-2C2C, injector 3)
- Engine control module (ECM) terminal #A32 (#A32) and injector terminal #2 (ECM-2C3C, injector 4)
- Engine control module (ECM) terminal #A34 (#A34) and injector terminal #2 (ECM-2C4C, injector 5)
- Engine control module (ECM) terminal #A52 (#A52) and injector terminal #2 (ECM-2C5C, injector 6).

Remedy as necessary.

ECM-2C0D: INJECTOR CYL 1. SIGNAL TOO LOW (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 210: Identifying Injector
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the circuit for the injectors.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the signal for one of the injector circuits is too low.

The diagnostic trouble code (DTC) indicates which injector is being referred to.

- ECM-2C0D: injector 1
- ECM-2C1D: injector 2
- ECM-2C2D: injector 3
- ECM-2C3D: injector 4
- ECM-2C4D: injector 5
- ECM-2C5D: injector 6.

The diagnostic trouble code (DTC) can be diagnosed at ignition on and with the engine running.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the signal cable
- Damaged injector.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- The engine is not firing on all cylinders.

SIGNAL TOO LOW

CHECKING COMPONENTS AND WIRING

Check the cable that relates to the diagnostic trouble code (DTC). Check for a short-circuit to ground.

Check between:

- Engine control module (ECM) terminal #A16 (#A16) and injector terminal #2 (ECM-2C0D, injector 1)
- Engine control module (ECM) terminal #A15 (#A15) and injector terminal #2 (ECM-2C1D, injector 2)

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-3000: CAMSHAFT POSITION (CMP) SENSOR, INTAKE. FAULTY SIGNAL OR SIGNAL MISSING (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 216: Identifying Camshaft Position (CMP) Sensor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-3000 covers camshaft position (CMP) sensor, intake.

Diagnostic trouble code (DTC) ECM-3010 covers camshaft position (CMP) sensor, exhaust.

Diagnostic trouble code (DTC) is stored ECM-3000 or ECM-3010 is stored if the pulse width modulation signal from the camshaft position (CMP) sensor is constantly high (signal too high) or low (signal too low).

Diagnostic trouble code (DTC) ECM-3000 or ECM-3010 is stored if the pulse width modulation signal from the camshaft position (CMP) sensor is missing but returns sporadically (missing signal).

Diagnostic trouble code (DTC) ECM-3000 or ECM-3010 is stored if the pulse width modulation signal from the camshaft position (CMP) sensor is sporadically missing (faulty signal).

The fault is diagnosed by the control module when the engine is running.

Possible Source

Signal too high:

- Open-circuit in the signal cable
- Short-circuit to supply voltage in the signal cable
- Short-circuit to ground in the power cable
- Open-circuit in the ground lead
- Defective camshaft position (CMP) sensor.

Signal too low:

- Short-circuit to ground in the signal cable
- Open-circuit in the power cable
- Loose connections.

Signal missing:

- The camshaft position (CMP) sensor is in the wrong position
- Defective camshaft position (CMP) sensor
- Loose connections.
- Incorrectly installed camshaft.

Faulty signal:

- The camshaft position (CMP) sensor is in the wrong position
- Defective camshaft position (CMP) sensor
- Loose connections.
- Incorrectly installed camshaft.

Fault symptom[s]

- The engine is difficult to start.

FAULTY SIGNAL OR SIGNAL MISSING

CHECKING THE STATUS

Fig. 217: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start the engine.

  Read off the fault status of the camshaft position (CMP) sensor. "DIAGNOSIS COMPLETE" must be displayed when the camshaft position (CMP) sensor has been tested. If the fault status is "NO FAULT FOUND" when the diagnostic is complete there is an intermittent fault.

Fig. 218: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 219: Identifying Camshaft Position (CMP) Sensor
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING COMPONENTS AND CONNECTORS**

CHECKING COMPONENTS AND CONNECTORS

Check the camshaft position (CMP) sensor and control module connectors. Check for contact resistance and oxidation.

Check that the camshaft position (CMP) sensor is correctly installed and that neither the sensor or the housing is damaged. Damage may affect the position of the sensor in relation to the camshaft rotor.

Try a new camshaft position (CMP) sensor if no fault is found during the above fault-tracing.

Remedy as necessary.

- Ignition off.

  Check the connector for the camshaft position (CMP) sensor. Check for contact resistance and oxidation. Check for loose connections. Check for damage carefully.

  Check the signal cable between control module terminal #A47 (#A47) and camshaft position (CMP) sensor connector terminal #3. Check for an open-circuit. Check for a short-circuit to supply voltage.

  HINT: Use a test lamp with at least a 3 W bulb to determine whether the cable is short-circuited to supply voltage. Check the ground lead between control module terminal #A65 (#A65) and camshaft position (CMP) sensor connector terminal #2. Check for an open-circuit.

  Check the power cable between control module terminal #A29 (#A29) and camshaft position (CMP)

sensor connector terminal #1. Check for a short-circuit to ground. Try a new camshaft position (CMP) sensor if no fault is found during the above fault-tracing.

Remedy as necessary.

ECM-303C: FRONT KNOCK SENSOR (KS). SIGNAL TOO HIGH (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-303C

Condition

Fig. 275: Identifying Knock Sensor
Courtesy of VOLVO CARS CORPORATION

In certain operating conditions the engine control module (ECM) checks the signal from the front knock sensor (KS). The diagnostic trouble code (DTC) is stored if the signal from the front knock sensor (KS) is too high.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- Safety retardation of ignition advance
- Reduced boost pressure.

Possible Source

- Short-circuit to supply voltage in the signal cable
- Noise from the engine.

Fault symptom[s]

- Poor performance.

SIGNAL TOO HIGH. PERMANENT FAULT

CHECKING COMPONENTS AND WIRING

Check the signal cable between knock sensor (KS) terminal #1 and control module terminal #A46 (#A46). Check the ground lead between knock sensor (KS) terminal #2 and control module terminal #A64 (#B4). Check for a short-circuit to supply voltage.

Check that the knock sensor (KS) is tightened to the correct torque.

HINT: The diagnostic trouble code (DTC) may be caused by a worn engine. Start the engine and listen for noise.

Remedy as necessary.

CHECKING THE KNOCK SENSOR (KS) SIGNAL

Fig. 287: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 288: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the components, reconnect the connectors etc.
- Start the engine and run it to normal operating temperature
- Rev the engine to 3500 RPM. Read off the value of the knock sensor (KS) signal.

  The value must be between 2 and 6.

  If the value is now OK it means that the cause of the fault was loose connections in connector.

  Other information

  - To access or replace the knock sensor (KS), see **KNOCK SENSOR (KS), REPLACING**

- For 5 cylinder turbocharged engines -2004, see **SIGNAL DESCRIPTION**
- For 5 cylinder turbocharged engines 2005-, see **SIGNAL SPECIFICATION** .

Is the value between 2-6?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-303D: FRONT KNOCK SENSOR (KS). SIGNAL TOO LOW (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-303D

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-303D**

SIGNAL TOO LOW. PERMANENT FAULT

see **SIGNAL TOO LOW. PERMANENT FAULT**

ECM-304C: REAR KNOCK SENSOR (KS). SIGNAL TOO HIGH (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-304C

Condition

Fig. 297: Identifying Knock Sensor
Courtesy of VOLVO CARS CORPORATION

In certain operating conditions the engine control module (ECM) checks the signal from the rear knock sensor (KS). The diagnostic trouble code (DTC) is stored if the signal from the rear knock sensor (KS) is too high.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- Safety retardation of ignition advance
- Reduced boost pressure.

Possible Source

- Short-circuit to supply voltage in the signal cable
- Noise from the engine.

Fault symptom[s]

- Poor performance.

SIGNAL TOO HIGH. PERMANENT FAULT

CHECKING COMPONENTS AND WIRING

Check the signal cable between knock sensor (KS) terminal #3 and control module terminal #A45 (#A45). Check the ground lead between knock sensor (KS) terminal #4 and control module #A67 (#B7). Check for a short-circuit to supply voltage.

Check that the knock sensor (KS) is tightened to the correct torque.

HINT: The diagnostic trouble code (DTC) may be caused by a worn engine. Start the engine and listen for noise.

Remedy as necessary.

Other information

ECM-304D: REAR KNOCK SENSOR (KS). SIGNAL TOO LOW (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-304D

Condition

Fig. 305: Identifying Knock Sensor
Courtesy of VOLVO CARS CORPORATION

In certain operating conditions the engine control module (ECM) checks the signal from the rear knock sensor (KS). The diagnostic trouble code (DTC) is stored if the signal from the rear knock sensor (KS) is too low.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- Safety retardation of ignition advance
- Reduced boost pressure.

Possible Source

- Contact resistance in the knock sensor (KS) terminals
- Open-circuit in the signal cable
- Short-circuit between the knock sensor (KS) signal cables
- Damaged knock sensor (KS).

Fault symptom[s]

- Poor performance.

SIGNAL TOO LOW. PERMANENT FAULT

CHECKING WIRING AND CONNECTORS

Check the knock sensor (KS) connector. Check for contact resistance and oxidation.

Check the signal cable between knock sensor (KS) terminal #3 and control module terminal #A45 (#A45). Check the ground lead between knock sensor (KS) terminal #4 and control module terminal #A67 (#B7). Check for an open-circuit. Check for a short-circuit to ground.

Check that the knock sensor (KS) is tightened to the correct torque.

Remedy as necessary.

SIGNAL TOO LOW. PERMANENT FAULT

see **SIGNAL TOO LOW. PERMANENT FAULT**

ECM-3100: ENGINE SPEED (RPM) SENSOR. SIGNAL MISSING (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) ECM-3100 is stored if the signal from the engine speed (RPM) sensor is missing or if it gives an engine speed (RPM) signal which is too low in relation to the signal from the camshaft position (CMP) sensor and the control module interprets it as a fault.

Substitute Value

The control module uses the signal from the camshaft position (CMP) sensor if the camshaft position (CMP) sensor has been adapted.

Possible Source

- open-circuit in the signal cable or ground lead
- short-circuit to supply voltage or ground in the signal cable
- contact resistance in the terminals
- faulty engine speed (RPM) sensor
- damaged carrier plate.

Fault symptom[s]

- the engine does not start
- the engine cuts out.

SIGNAL MISSING

CHECKING CONNECTORS AND WIRING

Fig. 319: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check the engine speed (RPM) sensor connector. Check for contact resistance and oxidation.

  Check the signal cable between:

  - engine speed (RPM) sensor terminal #1 and engine control module (ECM) terminal #A48 (#A48)
  - engine speed (RPM) sensor terminal #2 and engine control module (ECM) terminal #A66 (#B6).

  Check for an open-circuit. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

  Check the carrier plate, search for damage and other defects.

Remedy as necessary.

Other information:

- To connect the breakout box / access the control module, see **CONNECTING THE BREAKOUT BOX**

Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Start the engine.

  The car will not start if there is a fault in the engine speed (RPM) sensor signal.

Does the car start?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-3100: MISFIRE, AT LEAST ONE CYLINDER. START UP (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-3100

Condition

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects a certain number of misfires during the first 1000 engine revolutions after the engine is started.

This diagnostic trouble code (DTC) is stored together with other diagnostic trouble codes (DTCs) which indicate which cylinders are misfiring.

Substitute Value

- Rear heated oxygen sensor control shut off
- Fuel trim switched off.

Possible Source

- Low fuel level
- Engine does not reach normal operating temperature between several cold starts
- Water in the spark plug wells
- Damaged spark plug
- Contaminated or incorrect fuel
- Poor fuel quality (summer fuel in winter).
- Blocked / leaking injector
- Air leakage
- Blocked crankcase ventilation.
- Damaged VVT-unit.
- Faulty fuel pressure
- Uneven compression

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- The engine misfires
- The engine is difficult to start
- Deterioration in performance
- Uneven idle
- The engine is not firing on all cylinders.

EMISSIONS IMPACT / CATALYTIC CONVERTER DAMAGE / START UP

CHECKING THE FUEL INJECTION SYSTEM, IGNITION SYSTEM AND COMPONENTS

NOTE: In the event of diagnostic trouble codes (DTCs), that affect camshaft control or camshaft reset valve, these must be fault-traced first.

HINT: In certain cases, the engine control module (ECM) can determine which cylinder has misfired.

Check the fuel level in the fuel tank.

Check that the engine oil level is correct.

Look for moisture in the electrical terminals for the ignition coils and in the spark plug wells.

Check the spark plugs. Check for damage in the insulation and for any other damage.

Check the engine intake system for leakage.

Check the crankcase ventilation. Check for blockage.

Check the fuel pressure and residual pressure.

Check the compression of the engine.

Remedy as necessary.

Other information

- see **INTAKE AND EXHAUST SYSTEM - CLEANING, INSPECTION AND ADJUSTMENT**
- see **FUEL SYSTEM PRESSURE, CHECKING**
- see **CYLINDER LEAKAGE TEST**

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 325: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 326: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Start the engine.

Check that the misfire counter is not counting upwards. Check that the engine is firing on all cylinders.

NOTE: Misfire can occur at different engine speeds and loads.

Fig. 327: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the function OK?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

AIR-LEAKS: IN THE INTAKE SYSTEM, CHECKING

Special tools:

see **9995545**

see **9995544**

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVAL

PREPARATIONS

Check that all hoses are undamaged. Check that all hoses are in place with their hose clips tightened.

CONNECT THE TEST PRESSURIZATION EQUIPMENT

Fig. 328: Identifying Hose Clap & Turbocharger (TC)
Courtesy of VOLVO CARS CORPORATION

Remove:

- the hose clamp (2) between the mass air flow (MAF) sensor and the intake manifold for the turbocharger (TC)

- the screws for the intake manifold. Fold the pipe up. Connect tool see **9995545** and pressure regulator see **9995544** to the intake manifold. Tighten the hose clamp.

CHECK

Fig. 329: Gentle Hissing Sound Heard From Oil Filler Opening
Courtesy of VOLVO CARS CORPORATION

Remove the oil filler cap. Connect the compressed air hose. Adjust the regulator to obtain a maximum pressure of **0.3 bar** .

There may be a gentle hissing sound from the oil filler opening. This is due to the opening of an intake valve and the leakage of cylinder pressure past the piston rings. If a leak is suspected, spray a soap solution onto the area. Remedy any leakage.

INSTALLATION

INSTALLING COMPONENTS

Fig. 330: Identifying Hose Clap & Turbocharger (TC)
Courtesy of VOLVO CARS CORPORATION

Install:

- the intake manifold between the mass air flow (MAF) sensor and the turbocharger (TC)
- the screws for the intake manifold. Tighten
- the hose clamp (2) at the mass air flow (MAF) sensor.

ECM-3100: MISFIRE, AT LEAST ONE CYLINDER. START UP (B6294T; 2005-2006)

ECM-310C: MISFIRE, AT LEAST ONE CYLINDER. CATALYTIC CONVERTER DAMAGE (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-310C

Condition

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects misfires in more than one cylinder which could damage the catalytic converter. The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

This diagnostic trouble code (DTC) is stored together with other diagnostic trouble codes (DTCs) which indicate which cylinders are misfiring.

Substitute Value

- Three-way catalytic converter (TWC) diagnosis shut off
- Leak diagnostic shut off
- Rear heated oxygen sensor control shut off
- Fuel trim switched off.

Possible Source

- Low fuel level
- Engine does not reach normal operating temperature between several cold starts
- Water in the spark plug wells
- Damaged spark plug
- Contaminated or incorrect fuel
- Poor fuel quality (summer fuel in winter).
- Blocked / leaking injector
- Air leakage
- Blocked crankcase ventilation.
- Damaged VVT-unit.
- Faulty fuel pressure
- Uneven compression

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- The engine misfires
- The engine is difficult to start
- Deterioration in performance
- Uneven idle
- The engine is not firing on all cylinders.

ECM-321C: MISFIRE CYLINDER 1, THREE-WAY CATALYTIC CONVERTER (TWC) DAMAGE. CATALYTIC CONVERTER DAMAGE (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects misfiring which could damage the catalytic converter after the first 1000 engine revolutions after the engine is started. The diagnostic trouble code (DTC) indicates which cylinder is misfiring. The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

- ECM-3110: cylinder 1
- ECM-3120: cylinder 2
- ECM-3130: cylinder 3
- ECM-3140: cylinder 4
- ECM-3150: cylinder 5
- ECM-3160: cylinder 6.

Substitute Value

- Rear heated oxygen sensor control shut off

- Fuel trim switched off.

Possible Source

- Damaged spark plug
- Blocked / leaking injector
- Uneven compression
- Air leakage
- Faulty fuel pressure
- Low fuel level
- Water in the spark plug wells
- Contaminated or incorrect fuel
- The engine does not reach normal operating temperature between several cold starts
- Poor fuel quality (summer fuel in winter).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- The engine misfires
- The engine is difficult to start
- Deterioration in performance
- Uneven idle
- The engine is not firing on all cylinders.

EMISSIONS IMPACT / CATALYTIC CONVERTER DAMAGE / START UP

see **EMISSIONS IMPACT / CATALYTIC CONVERTER DAMAGE / START UP**

ECM-321D: MISFIRE CYLINDER 1, EMISSIONS IMPACT. EMISSIONS IMPACT (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects misfiring which affect emissions after the first 1000 engine revolutions after the engine is started. The diagnostic trouble code (DTC) indicates which cylinder is misfiring. The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

- ECM-3110: cylinder 1
- ECM-3120: cylinder 2

- ECM-3130: cylinder 3
- ECM-3140: cylinder 4
- ECM-3150: cylinder 5
- ECM-3160: cylinder 6.

Substitute Value

- Rear heated oxygen sensor control shut off
- Fuel trim switched off.

Possible Source

- Damaged spark plug
- Blocked / leaking injector
- Uneven compression
- Air leakage
- Faulty fuel pressure
- Low fuel level
- Water in the spark plug wells
- Contaminated or incorrect fuel
- The engine does not reach normal operating temperature between several cold starts
- Poor fuel quality (summer fuel in winter).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- The engine misfires
- The engine is difficult to start
- Deterioration in performance
- Uneven idle
- The engine is not firing on all cylinders.

EMISSIONS IMPACT / CATALYTIC CONVERTER DAMAGE / START UP

see **EMISSIONS IMPACT / CATALYTIC CONVERTER DAMAGE / START UP**

ECM-3300: IGNITION COIL CYLINDER 1, SIGNAL. SIGNAL MISSING. INTERMITTENT FAULT (B5254T2; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 331: Identifying Ignition Coil
Courtesy of VOLVO CARS CORPORATION

If there is an open-circuit or short-circuit to ground in the ignition coil primary winding circuit and engine speed (RPM) exceeds 1500 RPM, the control module interprets it as a fault and diagnostic trouble code (DTC) ECM-33X0 is stored.

Substitute Value

None

Possible Source

Signal too high:

- short-circuit to supply voltage in the signal cable

Signal too low:

- short-circuit to ground in the signal cable

Signal missing:

- open-circuit in the signal cable
- contact resistance in terminals.

Fault symptom[s]

- engine not firing on all cylinders
- malfunction indicator lamp (MIL) lit

SIGNAL MISSING. INTERMITTENT FAULT

CHECKING CABLES AND CONNECTORS

Check ignition coil connector for contact resistance and oxidation, see **CONTACT RESISTANCE AND OXIDATION** , and check for and loose connections according to **LOOSE CONNECTIONS (TERMINALS)**

Check signal cable between ignition coil #1 and control module:

- #A31 (#A31) (ECM 3300)
- #A30 (#A30) (ECM 3310)
- #A50 (#A50) (ECM 3320)
- #A52 (#A52) (ECM 3330)
- #A51 (#A51) (ECM 3340)

and power supply between system relay #3 and ignition coil #4 for an intermittent open-circuit according to **OPEN-CIRCUIT, INTERMITTENT FAULTS** .

Other information

- Connecting the breakout box/accessing the control module, see **CONNECTING THE BREAKOUT BOX** .
- To access/replace the ignition coil, see **REPLACING IGNITION COILS** .
- For 5 cylinder turbocharged engines -2004, see **SIGNAL DESCRIPTION**
- For 5 cylinder turbocharged engines 2005-, see **SIGNAL SPECIFICATION** .

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION**

SIGNAL MISSING. INTERMITTENT FAULT

CHECKING CABLES AND CONNECTORS

Check ignition coil connector for contact resistance and oxidation, see **CONTACT RESISTANCE AND OXIDATION** and check for loose connections according to **LOOSE CONNECTIONS (TERMINALS)**

Check signal cable between ignition coil #1 and control module:

- #A31 (#A31) (ECM 3300)
- #A50 (#A50) (ECM 3310)
- #A52 (#A52) (ECM 3320)
- #A49 (#A49) (ECM 3330)
- #A30 (#A30) (ECM 3340)
- #A51 (#A51) (ECM 3350)

and power supply between system relay #3 and ignition coil #4 for an intermittent open-circuit according to **OPEN-CIRCUIT, INTERMITTENT FAULTS** .

Other information

- Connecting the breakout box/accessing the control module, see **CONNECTING THE BREAKOUT BOX** .
- To access/replace the ignition coil, see **REPLACING IGNITION COIL** .
- For 6 cylinder engines -2004, see **SIGNAL SPECIFICATION**
- For 6 cylinder engines 2005-, see **SIGNAL SPECIFICATION** .

SIGNAL MISSING. PERMANENT FAULT

CHECKING CONNECTOR

Fig. 338: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 339: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check ignition coil connector for contact resistance and oxidation according to **CONTACT RESISTANCE AND OXIDATION** .
- Reinstall components, reconnect connectors etc.
- Start the engine and let it idle.

  Engine should fire on all cylinders.

  If the engine is OK it means that the cause of the fault has been loose connections in the connector.

  Other information

- To access/replace the ignition coil, see **REPLACING IGNITION COILS** .
- For 5 cylinder turbocharged engines -2004, see **SIGNAL DESCRIPTION**
- For 5 cylinder turbocharged engines 2005-, see **SIGNAL SPECIFICATION** .

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-330B

Condition

If there is no signal from the engine speed (RPM) sensor or if its signal is lower than the engine speed signal from the camshaft position (CMP) sensor, the engine control module (ECM) interprets this as a fault and the diagnostic trouble code (DTC) is stored.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

The engine control module (ECM) uses the signal from the camshaft position (CMP) sensor if the camshaft position (CMP) sensor has been adapted.

Possible Source

- Open-circuit in the signal cable or ground lead
- Short-circuit to ground or supply voltage in the signal cable
- Contact resistance in the terminals
- Damaged engine speed (RPM) sensor
- Damaged carrier plate.

Fault symptom[s]

- The engine does not start
- The engine stops.

ECM-330B: ENGINE SPEED (RPM) SENSOR. SIGNAL MISSING (B6294T; 2005-2006)

SIGNAL MISSING

see **SIGNAL MISSING**

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-330B

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-330B**

ECM-3400: CAMSHAFT POSITION (CMP) SENSOR, INTAKE. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 400: Detecting Camshaft Flanks On Sensor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-3400 covers camshaft position (CMP) sensor, intake.

Diagnostic trouble code (DTC) ECM-3410 covers camshaft position (CMP) sensor, exhaust.

The engine control module (ECM) checks the pulse width modulation (PWM) signal from the camshaft position (CMP) sensor.

The diagnostic trouble code (DTC) is stored if the signal from the camshaft position (CMP) sensor is missing sporadically. This is interpreted by the engine control module (ECM) as a fault. The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- None.

Possible Source

- The camshaft position (CMP) sensor is in the wrong position
- Damaged camshaft position (CMP) sensor
- Loose connections.

Fault symptom[s]

- The engine is difficult to start.

FAULTY SIGNAL OR SIGNAL MISSING

CHECKING THE STATUS

Fig. 401: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start the engine.

  Read off the diagnostic status and fault status for the diagnostic trouble code (DTC) by selecting the relevant diagnostic trouble code (DTC) from the list.

Increase the engine speed a number of times until the diagnostic is "Complete".

Check whether the fault is permanent or intermittent. Read off the diagnostic trouble code (DTC) fault status when the diagnostic status is "Completed".

HINT: In some cases several functions of the component will be diagnosed. This affects the amount of time taken to run the diagnostic.

The fault is permanent if the fault status is "Fault found". If the fault status is "No fault found" the fault is intermittent and not presently active.

FAULT-TRACING INFORMATION

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

ECM-340B: CAMSHAFT POSITION (CMP) SENSOR, INTAKE. SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 413: Detecting Camshaft Flanks On Sensor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-340B is for the camshaft position (CMP) sensor, intake.

Diagnostic trouble code (DTC) ECM-341B is for the camshaft position (CMP) sensor, exhaust.

The engine control module (ECM) checks the pulse width modulation (PWM) signal from the camshaft position (CMP) sensor.

If there is no signal from the camshaft position (CMP) sensor although it appears sporadically, the engine control module (ECM) interprets this as a fault and the diagnostic trouble code (DTC) is stored. The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- None.

Possible Source

- The camshaft position (CMP) sensor is in the wrong position
- Damaged camshaft position (CMP) sensor
- Loose connections.

Fault symptom[s]

- The engine is difficult to start.

ECM-340C: CAMSHAFT POSITION SENSOR, INTAKE. SIGNAL TOO HIGH (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 414: Detecting Camshaft Flanks On Sensor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-340C is for the camshaft position (CMP) sensor, intake.

Diagnostic trouble code (DTC) ECM-341C is for the camshaft position (CMP) sensor, exhaust.

The engine control module (ECM) checks the pulse width modulation (PWM) signal from the camshaft position (CMP) sensor.

The diagnostic trouble code (DTC) is stored if the signal from the camshaft position (CMP) sensor is constantly high. This is interpreted by the engine control module (ECM) as a fault. The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- None.

Possible Source

- Open-circuit in the signal cable
- Short-circuit to supply voltage in the signal cable
- Short-circuit to ground in the power cable

- Open-circuit in the ground lead
- Damaged camshaft position (CMP) sensor.

Fault symptom[s]

- The engine is difficult to start.

SIGNAL TOO HIGH

CHECKING THE STATUS

Fig. 415: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start the engine.

Read off the diagnostic status and fault status for the diagnostic trouble code (DTC) by selecting the relevant diagnostic trouble code (DTC) from the list.

Increase the engine speed a number of times until the diagnostic is "Complete".

Check whether the fault is permanent or intermittent. Read off the diagnostic trouble code (DTC) fault status when the diagnostic status is "Completed".

HINT: In some cases several functions of the component will be diagnosed. This affects the amount of time taken to run the diagnostic.

The fault is permanent if the fault status is "Fault found". If the fault status is "No fault found" the fault is intermittent and not presently active.

ECM-3410: KNOCK SENSOR (KS) FRONT. SIGNAL TOO HIGH. INTERMITTENT FAULT (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 443: Identifying Knock Sensor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-3410 is stored if the engine speed (RPM) is over 3000 RPM, the engine coolant temperature (ECT) is above 40°C (104°F) and the signal from the front knock sensor (KS) is too high or too low.

Substitute Value

- ignition retarded for safety reasons
- reduced boost pressure

Possible Source

Signal too high:

- short-circuit to supply voltage in the signal cable
- worn engine

Signal too low:

- open-circuit in signal cable
- contact resistance in terminals
- defective knock sensor (KS)
- short-circuit between knock sensor (KS) signal cables

Fault symptom[s]

- none

SIGNAL TOO HIGH. INTERMITTENT FAULT

CHECKING CONNECTORS AND WIRING

Check the signal cable between knock sensor (KS) terminal #1 and control module #A46 (#A46). Check the ground lead between knock sensor (KS) terminal #2 and control module terminal #A64 (#B4). Check for an intermittent short-circuit to supply voltage.

Check that the knock sensor (KS) is tightened to the correct torque.

HINT: The diagnostic trouble code (DTC) may be caused by a worn engine. Start the engine and listen for noise.

CHECKING WIRING AND CONNECTORS

Check the knock sensor (KS) connector. Check for contact resistance and oxidation. Check for loose connections.

Check the signal cable between knock sensor (KS) terminal #1 and control module terminal #A46 (#A46). Check the ground lead between knock sensor (KS) terminal #2 and control module terminal #A64 (#B4). Check for an intermittent open-circuit. Check for an intermittent short-circuit to ground.

Check that the knock sensor (KS) is tightened to the correct torque.

CHECKING THE STATUS

Fig. 450: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start the engine.

  Read off the diagnostic status and fault status for the diagnostic trouble code (DTC) by selecting the relevant diagnostic trouble code (DTC) from the list.

  Increase the engine speed a number of times until the diagnostic is "Complete".

  Check whether the fault is permanent or intermittent. Read off the diagnostic trouble code (DTC) fault status when the diagnostic status is "Completed".

  HINT: In some cases several functions of the component will be diagnosed. The affects the amount of time taken to run the diagnostic.

The fault is permanent if the fault status is "Fault found". If the fault status is "No fault found" the fault is intermittent and not presently active.

- **Continue**

Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

- Check the connector for the camshaft position (CMP) sensor. Check for contact resistance and oxidation.

  Check the signal cable between engine control module (ECM) terminal #A27 (#A27) and camshaft position (CMP) sensor connector terminal #3. Check for an open-circuit. Check for a short-circuit to supply voltage.

  Check the ground lead between engine control module (ECM) terminal #A65 (#B5) and camshaft position (CMP) sensor connector terminal #2. Check for an open-circuit.

  Check the power cable between engine control module (ECM) terminal #A29 (#A29) and camshaft position (CMP) sensor connector terminal #1. Check for a short-circuit to ground.

  Remedy as necessary.

see **SIGNAL TOO LOW**

ECM-3420: KNOCK SENSOR (KS) REAR. SIGNAL TOO HIGH. INTERMITTENT FAULT (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 468: Identifying Knock Sensor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-3420 is stored if the engine speed (RPM) is over 3000 RPM, the engine coolant temperature (ECT) is above 40°C (104°F) and the signal from the rear knock sensor (KS) is too high or too low.

Substitute Value

- ignition retarded for safety reasons
- reduced boost pressure

Possible Source

Signal too high:

- short-circuit to supply voltage in the signal cable
- worn engine

Signal too low:

- open-circuit in signal cable
- contact resistance in terminals
- defective knock sensor (KS)
- short-circuit between knock sensor (KS) signal cables

Fault symptom[s]

- none

SIGNAL TOO HIGH. INTERMITTENT FAULT

CHECKING CONNECTORS AND WIRING

Check the signal cable between knock sensor (KS) terminal #3 and control module terminal #A45 (#A45). Check the ground lead between knock sensor (KS) terminal #4 and control module terminal #A67 (#B7). Check for an intermittent short-circuit to supply voltage.

Check that the knock sensor (KS) is tightened to the correct torque.

HINT: The diagnostic trouble code (DTC) may be caused by a worn engine. Start the engine and listen for noise.

ECM-3503: MISFIRE, AT LEAST ONE CYLINDER. EMISSIONS IMPACT / CATALYTIC CONVERTER DAMAGE (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 477: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-3503 is stored at start up if the engine control module (ECM) detects misfiring during the first 1000 revs after engine start up.

Diagnostic trouble code (DTC) ECM-3503 emission effect or ECM-3503 three-way catalytic converter (TWC) damage is stored (depending on the seriousness of the misfire) if the engine control module (ECM) detects misfiring after the first 1000 revs after engine start up.

The diagnostic trouble code (DTC) is always stored together with a diagnostic trouble code (DTC) which indicates the cylinder which is misfiring (ECM-35X3).

Substitute Value

- Three-way catalytic converter (TWC) diagnosis shut off
- Leakage diagnosis shut off
- Rear heated oxygen sensor control shut off
- Fuel trim switched off.

Possible Source

- Low fuel level
- Repeated cold starting where the engine coolant temperature (ECT) has reached normal operating temperature between starts
- Water in the spark plug wells
- Defective spark plug
- Contaminated or incorrect fuel
- Poor fuel quality (summer fuel in winter).
- Blocked / leaking injector
- Air leakage
- Blocked crankcase ventilation.
- Damaged VVT-unit.
- Faulty fuel pressure
- Uneven compression

Fault symptom[s]

- The malfunction indicator lamp (MIL) flashes
- The engine misfires
- The engine is difficult to start
- Deterioration in performance
- Uneven idle
- The engine is not firing on all cylinders.

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-350B: IGNITION COIL CYLINDER 1, SIGNAL. SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 478: Identifying Ignition Coil
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal cable for the ignition coil primary winding.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the signal for the primary winding for the ignition coil is missing.

The diagnostic trouble code (DTC) indicates which ignition coil is being referred to.

- ECM-350B: ignition coil 1
- ECM-351B: ignition coil 2

- ECM-352B: ignition coil 3
- ECM-353B: ignition coil 4
- ECM-354B: ignition coil 5.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- None.

Possible Source

- Contact resistance in the terminals
- Open-circuit in the signal cable
- Damaged ignition coil.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- The engine is not firing on all cylinders.

SIGNAL MISSING

CHECKING COMPONENTS AND WIRING

- Check the connector for the ignition coil. Check for contact resistance. Check for oxidation.

  Check the cable that relates to the diagnostic trouble code (DTC). Check for an open-circuit.

  Check between:

  - Engine control module (ECM) #A50 (#A50) and ignition coil pin #2 (ECM-350B: ignition coil A, cylinder 1).
  - Engine control module (ECM) #A31 (#A31) and ignition coil pin #2 (ECM-351B: ignition coil B, cylinder 2).
  - Engine control module (ECM) #A51 (#A51) and ignition coil pin #2 (ECM-352B: ignition coil E, cylinder 3).
  - Engine control module (ECM) #A30 (#A30) and ignition coil pin #2 (ECM-353B: ignition coil C, cylinder 4).
  - Engine control module (ECM) #A52 (#A52) and ignition coil pin #2 (ECM-354B: ignition coil D, cylinder 5).

  Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-350C: IGNITION COIL CYLINDER 1, SIGNAL. SIGNAL TOO HIGH (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 484: Identifying Ignition Coil
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal cable for the ignition coil primary winding.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the signal for the primary winding for the ignition coil is too high.

The diagnostic trouble code (DTC) indicates which ignition coil is being referred to.

- ECM-350C: ignition coil 1
- ECM-351C: ignition coil 2
- ECM-352C: ignition coil 3
- ECM-353C: ignition coil 4
- ECM-354C: ignition coil 5.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the signal cable
- Damaged ignition coil.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- The engine is not firing on all cylinders.

SIGNAL TOO HIGH

CHECKING COMPONENTS AND WIRING

Check the cable that relates to the diagnostic trouble code (DTC). Check for a short-circuit to supply voltage.

Check between:

- Engine control module (ECM) #A50 (#A50) and ignition coil pin #2 (ECM-350C: ignition coil A, cylinder 1).
- Engine control module (ECM) #A31 (#A31) and ignition coil pin #2 (ECM-351C: ignition coil B, cylinder 2).
- Engine control module (ECM) #A51 (#A51) and ignition coil pin #2 (ECM-352C: ignition coil E, cylinder 3).
- Engine control module (ECM) #A30 (#A30) and ignition coil pin #2 (ECM-353C: ignition coil C, cylinder 4).
- Engine control module (ECM) #A52 (#A52) and ignition coil pin #2 (ECM-354C: ignition coil D, cylinder 5).

ECM-350D: IGNITION COIL CYLINDER 1, SIGNAL. SIGNAL TOO LOW (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 490: Identifying Ignition Coil
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal cable for the ignition coil primary winding.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the signal for the primary winding for the ignition coil is too low.

The diagnostic trouble code (DTC) indicates which ignition coil is being referred to.

- ECM-350D: ignition coil 1
- ECM-351D: ignition coil 2
- ECM-352D: ignition coil 3
- ECM-353D: ignition coil 4
- ECM-354D: ignition coil 5.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the signal cable
- Damaged ignition coil.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- The engine is not firing on all cylinders.

SIGNAL TOO LOW

CHECKING COMPONENTS AND WIRING

- Check the connector for the ignition coil. Check for contact resistance. Check for oxidation.

  Check the cable that relates to the diagnostic trouble code (DTC). Check for a short-circuit to ground.

  Check between:

  - Engine control module (ECM) #A50 (#A50) and ignition coil pin #2 (ECM-350D: ignition coil A, cylinder 1).

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-3513: MISFIRE CYLINDER 1. EMISSIONS IMPACT / CATALYTIC CONVERTER DAMAGE (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 496: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-35x3 is stored at start up if the engine control module (ECM) detects that a cylinder misfires during the first 1000 revs of the engine.

Diagnostic trouble code (DTC) ECM-35x3 emission effect or ECM-35x3 three-way catalytic converter (TWC) damage is stored (depending of the seriousness of the misfire) if the engine control module (ECM) detects misfiring after the first 1000 revs after engine start up.

The diagnostic trouble code (DTC) indicates which cylinder is misfiring.

Substitute Value

- Three-way catalytic converter (TWC) diagnosis shut off
- Leakage diagnosis shut off
- Rear heated oxygen sensor control shut off
- Fuel trim switched off.

Possible Source

- Low fuel level
- Repeated cold starting where the engine coolant temperature (ECT) has reached normal operating temperature between starts
- Water in the spark plug wells
- Defective spark plug
- Contaminated or incorrect fuel
- Incorrect oil grade (summer fuel in winter, certain markets).
- Blocked / leaking injector
- Air leakage
- Blocked crankcase ventilation.
- Damaged VVT-unit.
- Faulty fuel pressure
- Uneven compression

Fault symptom[s]

- The malfunction indicator lamp (MIL) flashes
- The engine misfires
- The engine is difficult to start
- Deterioration in performance
- Uneven idle
- The engine is not firing on all cylinders.

EMISSIONS IMPACT / CATALYTIC CONVERTER DAMAGE

CHECKING THE FUEL INJECTION SYSTEM, IGNITION SYSTEM AND COMPONENTS

NOTE: In the event of diagnostic trouble codes (DTCs), that affect camshaft control or camshaft reset valve, these must be fault-traced first.

The diagnostic trouble code (DTC) indicates which cylinder has misfired:

Diagnostic Trouble Code (DTC)	Misfiring cylinder
ECM-3513	1
ECM-3523	2
ECM-3533	3
ECM-3543	4
ECM-3553	5
ECM-3563	6

Check that the engine oil level is correct.

Check the spark plugs. Search for damage in the insulation and other damage.

Check the ignition spark.

Check the function of the crankcase ventilation.

Check the fuel pressure and residual pressure. See **CHECKING FUEL AND RESIDUAL PRESSURES**

Check if there is any air leakage. See **INTAKE AND EXHAUST SYSTEM - CLEANING, INSPECTION AND ADJUSTMENT**

Check that the engine seals tight. See **COMPRESSION TEST**

Check the flywheel for damage.

Other information:

- for information about the misfire diagnostic:
  - see **MISFIRE DIAGNOSTICS** .

Fig. 497: Identifying Ignition Coil

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 498: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 499: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Reinstall the connectors, components etc.
- Start the engine.

  Check that the misfire counter is not counting upwards. Check that the engine is firing on all cylinders. Also check if the misfire diagnosis is active, if not, check the conditions according to:
  - see **MISFIRE DIAGNOSTICS** .

Fig. 500: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Does the misfire counter count up?

- **YES**

  Refer to **INFORMATION**

- **NO**

  VERIFIED: Troubleshooting has been completed.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

COMPRESSION TEST

Special tools:

see **9999689**

see **1158540**

IGNITION SYSTEM

A check for cylinder leakage (also called "leak down") can be carried out instead of a compression test. See **CYLINDER LEAKAGE TEST**

Fig. 501: Identifying Low & High Voltage Circuit Caution
Courtesy of VOLVO CARS CORPORATION

CAUTION: The ignition system operates at high ignition charges and produces dangerous voltages in both the low and high voltage circuits.

There is dangerous voltage throughout the entire ignition system including connectors etc.

CONDITIONS

NOTE: The engine compression must always be checked with wide open throttle (WOT) and engine at operating temperature.

PREPARATIONS

Remove:

- the charge air pipe over the engine to improve accessibility.
- the upper timing belt cover.
- the cover over the ignition coils.
- the ignition coils.

Mark up and put to one side without disconnecting the connectors.

- the spark plugs.

NOTE: Separate the connector for the engine speed (RPM) sensor.

COMPRESSION TESTING

Fig. 502: Compression Testing
Courtesy of VOLVO CARS CORPORATION

NOTE: Compression testing should always be carried out at wide open throttle (WOT) and with the engine at operating temperature.

Diagnostic trouble codes (DTCs) will be stored because the engine speed (RPM) sensor and (where applicable) the camshaft position (CMP) sensor have been disconnected.

Have an assistant hold the accelerator pedal (AP) depressed at wide open throttle (WOT) during the compression test.

The starter motor is activated with the ignition key.

The ignition must be switched off after each cylinder has been compression tested.

NOTE: **It will no longer be possible to control the throttle if the ignition is on for longer than 2 minutes.**

The throttle function is controlled by the control module.

Use compression meter see **9999689**

with extension sleeve see **1158540** .

Engine type:	Normal value MPa:
Turbo	1.1 - 1.3
Turbo type LT	1.2 - 1.4
Normally aspirated engine	1.3 - 1.5

INSTALL

Install:

- the spark plugs.

  Tighten to **25 Nm** .

- the ignition coils according to the earlier markings.

  Tighten to **10 Nm** .

- the cover over the ignition coils.
- the upper timing belt cover.
- the disassembled connectors.
- charge air pipe.

  Remove the seals.

  Tighten the mountings and hose clamps.

ERASE DIAGNOSTIC TROUBLE CODES (DTCS) AND CHECK

Fig. 503: Connecting VIDA Station
Courtesy of VOLVO CARS CORPORATION

Erase diagnostic trouble codes (DTCs):

Start the engine. Check that the engine is functioning normally.

Use VIDA (Volvo scan tool) to check which diagnostic trouble codes (DTCs) have been stored.

Erase the diagnostic trouble codes (DTCs).

Check the engine compartment. Wipe the engine compartment clean.

ENGINE PERFORMANCE

Ignition And Control Systems - Diagnostic Trouble Codes and Associated Procedures

ECM-353C: IGNITION COIL CYLINDER 4, SIGNAL. SIGNAL TOO HIGH (B5254T2; 2005-2007)

SIGNAL TOO HIGH

see **SIGNAL TOO HIGH**

ECM-360B: IGNITION COIL CYLINDER 1, SIGNAL. SIGNAL MISSING (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 1: Identifying Ignition Coil

Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal cable for the ignition coil primary winding.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the signal for the primary winding for the ignition coil is missing.

The diagnostic trouble code (DTC) indicates which ignition coil is being referred to.

- ECM-360B: ignition coil 1
- ECM-361B: ignition coil 2
- ECM-362B: ignition coil 3
- ECM-363B: ignition coil 4
- ECM-364B: ignition coil 5
- ECM-365B: ignition coil 6.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- None.

Possible Source

- Contact resistance in the terminals
- Open-circuit in the signal cable
- Damaged ignition coil.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- The engine is not firing on all cylinders.

SIGNAL MISSING

CHECKING COMPONENTS AND WIRING

- Check the connector for the ignition coil. Check for contact resistance. Check for oxidation.

  Check the cable that relates to the diagnostic trouble code (DTC). Check for an open-circuit.

  Check between:

  - Engine control module (ECM) terminal #A50 (#A50) and ignition coil terminal #2 (ECM-360D, ignition coil 1)

- Engine control module (ECM) terminal #A51 (#A51) and ignition coil terminal #2 (ECM-361D, ignition coil 2)
- Engine control module (ECM) terminal #A30 (#A30) and ignition coil terminal #2 (ECM-362D, ignition coil 3)
- Engine control module (ECM) terminal #A49 (#A49) and ignition coil terminal #2 (ECM-363D, ignition coil 4)
- Engine control module (ECM) terminal #A31 (#A31) and ignition coil terminal #2 (ECM-364D, ignition coil 5)
- Engine control module (ECM) terminal #A52 (#A52) and ignition coil terminal #2 (ECM-365D, ignition coil 6).

Remedy as necessary.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-360C: IGNITION COIL CYLINDER 1, SIGNAL. SIGNAL TOO HIGH (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 7: Identifying Ignition Coil
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal cable for the ignition coil primary winding.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the signal for the primary winding for the ignition coil is too high.

The diagnostic trouble code (DTC) indicates which ignition coil is being referred to.

- ECM-360C: ignition coil 1
- ECM-361C: ignition coil 2
- ECM-362C: ignition coil 3
- ECM-363C: ignition coil 4
- ECM-364C: ignition coil 5
- ECM-365C: ignition coil 6.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the signal cable
- Damaged ignition coil.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- The engine is not firing on all cylinders.

SIGNAL TOO HIGH

CHECKING COMPONENTS AND WIRING

Check the cable that relates to the diagnostic trouble code (DTC). Check for a short-circuit to supply voltage.

Check between:

- Engine control module (ECM) terminal #A50 (#A50) and ignition coil terminal #2 (ECM-360C, ignition coil 1)
- Engine control module (ECM) terminal #A51 (#A51) and ignition coil terminal #2 (ECM-361C, ignition coil 2)
- Engine control module (ECM) terminal #A30 (#A30) and ignition coil terminal #2 (ECM-362C, ignition coil 3)
- Engine control module (ECM) terminal #A49 (#A49) and ignition coil terminal #2 (ECM-363C, ignition coil 4)
- Engine control module (ECM) terminal #A31 (#A31) and ignition coil terminal #2 (ECM-364C, ignition coil 5)
- Engine control module (ECM) terminal #A52 (#A52) and ignition coil terminal #2 (ECM-365C, ignition coil 6).

Remedy as necessary.

ECM-360D: IGNITION COIL CYLINDER 1, SIGNAL. SIGNAL TOO LOW (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 13: Identifying Ignition Coil
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal cable for the ignition coil primary winding.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the signal for the primary winding for the ignition coil is too low.

The diagnostic trouble code (DTC) indicates which ignition coil is being referred to.

- ECM-360D: ignition coil 1
- ECM-361D: ignition coil 2
- ECM-362D: ignition coil 3
- ECM-363D: ignition coil 4
- ECM-364D: ignition coil 5
- ECM-365D: ignition coil 6.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the signal cable
- Damaged ignition coil.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- The engine is not firing on all cylinders.

SIGNAL TOO LOW

CHECKING COMPONENTS AND WIRING

- Check the connector for the ignition coil. Check for contact resistance. Check for oxidation.

  Check the cable that relates to the diagnostic trouble code (DTC). Check for a short-circuit to ground.

  Check between:

  - Engine control module (ECM) terminal #A50 (#A50) and ignition coil terminal #2 (ECM-360D, ignition coil 1)
  - Engine control module (ECM) terminal #A51 (#A51) and ignition coil terminal #2 (ECM-361D, ignition coil 2)
  - Engine control module (ECM) terminal #A30 (#A30) and ignition coil terminal #2 (ECM-362D, ignition coil 3)
  - Engine control module (ECM) terminal #A49 (#A49) and ignition coil terminal #2 (ECM-363D, ignition coil 4)
  - Engine control module (ECM) terminal #A31 (#A31) and ignition coil terminal #2 (ECM-364D, ignition coil 5)
  - Engine control module (ECM) terminal #A52 (#A52) and ignition coil terminal #2 (ECM-355D, ignition coil 6).

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-4000: CANISTER PURGE (CP) VALVE. SIGNAL MISSING. INTERMITTENT FAULT (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 19: Identifying Canister Purge (CP) Valve
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-4000 is stored if the signal from the canister purge (CP) valve is too high, too low or missing.

Substitute Value

twin heated oxygen sensor (HO2S) control disabled.

Possible Source

Signal too high:

- short-circuit to supply voltage in the signal cable
- defective canister purge (CP) valve

Signal too low:

- short-circuit to ground in the signal cable

Signal missing:

- open-circuit in the signal cable
- defective canister purge (CP) valve
- contact resistance in terminals
- open-circuit in power cable

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL MISSING. INTERMITTENT FAULT

CHECKING WIRING AND CONNECTORS

Check the evaporative emission system (EVAP) valve connector. Check for contact resistance and oxidation. Check for loose connections.

Check the signal cable between control module terminal #A9 (#A9) and evaporative emission system (EVAP) valve terminal 2. Check the power supply between system relay terminal 3 and evaporative emission system (EVAP) valve terminal 1. Check for an intermittent open-circuit.

Other information:

SIGNAL MISSING. PERMANENT FAULT

CHECKING THE CONNECTOR

Fig. 23: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 24: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the evaporative emission system (EVAP) valve connector. Check for contact resistance and oxidation
- Reinstall the components, reconnect the connectors etc.
- Ignition on
- Activate the evaporative emission system (EVAP) valve.

  A click should be heard when the evaporative emission system (EVAP) valve is activated.

  If the evaporative emission system (EVAP) valve is now OK this indicates that the fault was caused by poor contact in the connector.

Other information:

Is the canister purge (CP) valve working?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-4007: EVAPORATIVE EMISSION (EVAP) SYSTEM. SIGNAL TOO HIGH (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 55: Identifying EVAP Canister Purge Valve
Courtesy of VOLVO CARS CORPORATION

When the control module activates evaporative emission system (EVAP) control, the idle air trim or short-term fuel trim will change. Diagnostic trouble code (DTC) ECM-4007 is stored if the engine control module (ECM) does not detect any change in the idle air trim or in the long term fuel trim when evaporative emission (EVAP) control is active. The engine control module (ECM) interprets this as a faulty evaporative emission (EVAP) system.

Substitute Value

None.

Possible Source

Open:

- Faulty EVAP canister purge valve.

Closed:

- Blocked hose between the EVAP canister and the EVAP canister purge valve
- Blocked hose between the EVAP canister purge valve and the intake manifold
- Faulty EVAP canister purge valve.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL TOO HIGH

CHECKING THE COMPONENT

- Slacken off the EVAP canister purge valve
- Connect a vacuum pump to the EVAP canister purge valve terminal (B). Pump a vacuum. Check that there is no leakage through the EVAP canister purge valve by listening to and checking via the pump gauge that the pressure is stable
- Connect the EVAP canister purge valve connector
- Ignition on
- Activate the evaporative emission system (EVAP) valve. When the EVAP canister purge valve is activated, the valve opens and clicks. Check on the pump gauge that the vacuum drops (the pressure evens out) when the EVAP valve opens.

  If the function is OK, there must be no leakage when the EVAP canister purge valve is closed (stable pressure on the pump gauge) and the vacuum must drop when the EVAP canister purge valve opens (the pressure evens out).

  The EVAP canister purge valve is defective if the function is faulty.

  If the function of the EVAP canister purge valve is correct, check the hose and hose connections between the EVAP canister purge valve for leakage.

  Remedy as necessary.

  Other information:

  - For the location of components on 5 cylinder engines, see **LOCATION OF COMPONENTS, ENGINE COMPARTMENT**
  - For the location of components on 6 cylinder turbocharged engines, see **LOCATION OF COMPONENTS, ENGINE COMPARTMENT** .

Fig. 56: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

ECM-4007: EVAPORATIVE EMISSION (EVAP) SYSTEM. SIGNAL TOO LOW (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION**

SIGNAL TOO LOW

CHECKING THE COMPONENT

- Slacken off the EVAP canister purge valve
- Connect a vacuum pump to the EVAP canister purge valve terminal (B). Pump a vacuum. Check that there is no leakage through the EVAP canister purge valve by listening to and checking via the pump gauge that the pressure is stable
- Connect the EVAP canister purge valve connector
- Ignition on
- Activate the evaporative emission system (EVAP) valve. When the EVAP canister purge valve is activated, the valve opens and clicks. Check on the pump gauge that the vacuum drops (the pressure evens out) when the EVAP valve opens.

  If the function is OK, there must be no leakage when the EVAP canister purge valve is closed (stable pressure on the pump gauge) and the vacuum must drop when the EVAP canister purge valve opens (the pressure evens out).

  The EVAP canister purge valve is defective if the function is faulty.

  If the function of the EVAP canister purge valve is OK, check:

  - The hose and hose terminals between the EVAP canister purge valve and the intake manifold. Check for leakage and blockages
  - The hose and hose terminals between the EVAP canister and the EVAP canister purge valve. Check for leakage and blockages.

  Remedy as necessary.

  Other information:

  - For the location of components on 5 cylinder engines, see **LOCATION OF COMPONENTS, ENGINE COMPARTMENT**
  - For the location of components on 6 cylinder turbocharged engines, see **LOCATION OF COMPONENTS, ENGINE COMPARTMENT**
  - To access or replace the hoses and/or EVAP canister, see **CARBON FILTER CONTAINER, REPLACING** .

The information can be displayed again or the fault-tracing for this fault can be interrupted.

ECM-400C: FUEL TANK SYSTEM, LEAKAGE (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 60: Identifying Leak Diagnostic Pump
Courtesy of VOLVO CARS CORPORATION

If no fault is detected in the leak diagnostic unit, the control module runs a leak diagnostic of the fuel tank system. Diagnostic trouble code (DTC) ECM-400C is stored if the engine control module (ECM) detects a leak of 0.5-1.0 mm (minor leak) or a leak that is >1.0 mm (major leak). For more information about the leak diagnostics, see **LEAK DIAGNOSTICS (CERTAIN MARKETS ONLY)** .

Substitute Value

None.

Possible Source

Major leak:

- Fuel tank filler cap missing or not tightened
- Leakage that is 1 mm or greater in the fuel tank, fuel filler pipe, fuel tank filler cap, EVAP canister, canister purge (CP) valve, or in the hoses between these components
- The fuel gauge does not function (This fault is detected by the rear electrical module).

Minor leak:

- Leakage that is 0.5-1.0 mm or smaller in the fuel tank, fuel filler pipe, fuel tank filler cap, EVAP canister, canister purge (CP) valve, or in the hoses between these components
- The fuel gauge does not function (This fault is detected by the rear electrical module).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

LEAKAGE

CHECKING SOFTWARE

HINT: For vehicles of model year 2003-2005, the software in engine control module (ECM) should be checked before fault tracing of the fault relating to the leak from the tank system is carried out.

Fig. 61: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Use the VCT2000 (or appropriate scan tool) to read out and check the software version in the Engine control module (ECM).

  NOTE: More instructions follow together with the read out.

Fig. 62: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Has the latest software been downloaded to the control module?

- **YES**

  Refer to **PERFORM QUICK-TEST TANK SYSTEM**

PERFORM QUICK-TEST TANK SYSTEM

Fig. 63: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

- Activate the test using the VCT2000.
- Read off initial parameters and check them according to start conditions for performing the test.
- Check that the test has started. Parameters run status shall go to "In progress" and the test phase shall go to "Reference".

NOTE: If the test does not start, check that the start conditions are fulfilled.

When the reference phase is finished, check of the tank system starts. The pressure in the tank starts to increase, see graph. Within 15 minutes the Engine control module makes a decision as to whether there is leakage in the tank system or not. The test is finished.

- Check parameters for test result and follow relevant instructions below.

NOTE: In the event of a the results from the estimated leakage must be entered in

NOTE: Estimated leakage shall be used to get an idea of the proximity to the diagnostic trouble code limit.

NOTE: If the estimated leakage is very near the diagnostic trouble code limit (greater than 0.3mm), troubleshooting should probably be performed despite the Tank system, test result shows "No leakage found", especially if a diagnostic trouble code for leakage has been stored earlier. If the estimated leakage is very near the diagnostic trouble code limit (greater than 0.3mm), troubleshooting should probably be performed despite the Tank system, test result shows "No leakage found", especially if a diagnostic trouble code for leakage has been stored earlier.

NOTE: Use diagnostic trouble code counter to, see the frequency of the problem. Also use frozen values to get an idea if external conditions may have affected the result. Compare with current conditions in the workshop.

Conditions for starting the quick test of the fuel tank system

- No DTCs related to EVAP purge valve or ambient air pressure sensor set.
- Battery voltage 11-15 V.
- Atmospheric pressure higher than 750 hPa, approx. 2500 m (8200 ft).

- Fuel level 0-85 %.
- Ambient air temperature 4-35 °C.

NOTE: **The battery voltage must be correct throughout the entire test. The test can take up to 15 minutes, depending on the quantity of fuel in the fuel tank. It is highly recommended to use the constant voltage charger, Midtronics PSC-550, during the test. For more information, see 30-04 (USA/CDN).**

Other information

- see **DESCRIPTION OF PARAMETERS, QUICK TEST OF THE FUEL TANK SYSTEM**
- see **TEST PHASES, QUICK TEST FUEL TANK SYSTEM**
- see **FUEL TANK SYSTEM, CHECK**
- see **TEST PRESSURIZING THE TANK SYSTEM**

Select alternative according to relevant test results:

1. DMTL, test result = "Problem found"

   Refer to **DMTL, TEST RESULT = "PROBLEM FOUND"**

2. Tank system, test result = "No leakage found"

   Refer to **TANK SYSTEM, TEST RESULT = "NO LEAKAGE FOUND"**

3. Tank system, test result = "Minor leakage found"

   Refer to **TANK SYSTEM, TEST RESULT = "MINOR LEAKAGE FOUND"**

4. Tank system, test result = "Major leakage found"

   Refer to **TANK SYSTEM, TEST RESULT = "MAJOR LEAKAGE FOUND"**

5. DMTL, test result and Tank system, test result = "Unknown"

   Refer to **DMTL, TEST RESULT AND TANK SYSTEM, TEST RESULT = "UNKNOWN"**

6. Cancel fault-tracing.

   FAULT NOT FOUND: Troubleshooting has been completed.

Fig. 64: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 65: Identifying Leak Diagnostic Pump
Courtesy of VOLVO CARS CORPORATION

DMTL, TEST RESULT = "PROBLEM FOUND"

If a problem is detected on the leakage diagnostics unit (DMTL), this may have been caused during the test itself. Checks on DMTL are normal electric checks of leakage diagnostics unit and cabling and is no indication of if there is leakage or not.

- Cancel troubleshooting for this problem.
- Read off diagnostic trouble codes again and start troubleshooting for the new diagnostic trouble code.

NOTE: The tank system's status is unknown since the test was interrupted.

TANK SYSTEM, TEST RESULT = "NO LEAKAGE FOUND"

Diagnostic trouble code limit (minor leakage):Estimated leakage = 0.40 mm

If no leakage was found, the Engine control module (ECM) has detected leakage in the tank system earlier, but the problem is not active at this time. The fault could be caused by leakage in the tank, filler pipe, fuel tank filler cap, canister, EVAP valve, leakage diagnosis unit or hoses between these components.

NOTE: Problems caused by a loose tank cap or loose hose connections may be difficult to find. If no leakage was found in the quick-test of the tank system

after completed checks and actions according to the above, the problem has likely been repaired.

NOTE: The parameter estimated leakage does not necessarily have to show 0 mm for a sealed system.

TANK SYSTEM, TEST RESULT = "MINOR LEAKAGE FOUND"

Diagnostic trouble code limit:Estimated leakage = 0.40 mm

- Check that the tank cap is properly fitted and that its seal is undamaged.
- Check the hoses and connections on the leak diagnostic unit, the canister, EVAP-valve and the fuel filler pipe visually. Check for damage or incorrect/loose installation.
- Remedy as necessary.
- Restart the test.

NOTE: Problems caused by a loose tank cap or loose hose connections may be difficult to find. If no leakage was found in the quick-test of the tank system after completed checks and actions according to the above, the problem has likely been repaired.

NOTE: By blocking the hose between canister and EVAP-valve and then repeating quick-test tank system, leakage through the EVAP-valve can be detected. If leakage was detected in a previous quick test of the fuel tank system but is not now detected when the hose between the canister and the EVAP valve is blocked, the leakage may be through the EVAP valve.

- Disconnect the hose between the EVAP canister purge valve and the EVAP canister from the connection to the EVAP canister purge valve.
- Block the hose while running the quick test of the fuel tank system.

- **Continue**

  Refer to **PERFORM QUICK-TEST TANK SYSTEM**

DMTL, TEST RESULT AND TANK SYSTEM, TEST RESULT = "UNKNOWN"

Engine control module (ECM) cannot perform check of tank system. This may be due to the conditions for start of the quick-test not being fulfilled, that they have changed during the course of the test, or that a problem has occurred during troubleshooting.

- Check that all conditions for start of the quick-test are fulfilled.
- Visually check hoses and connections on leakage diagnostics unit, canister, EVAP-valve, and filler pipe. Check for damage or incorrect/loose installation.
- Remedy as necessary.

- Restart the test.
- **Continue**

  Refer to **PERFORM QUICK-TEST TANK SYSTEM**

TANK SYSTEM, TEST RESULT = "MAJOR LEAKAGE FOUND"

Diagnostic trouble code limit:Tank pressure lower than 1500 Pa after 450 seconds in test phase "Major leakage".

- Check that the tank cap is properly fitted and that its seal is undamaged.
- Check the hoses and connections on the leak diagnostic unit, the canister, EVAP-valve and the fuel filler pipe visually. Check for damage or incorrect/loose installation.
- Remedy as necessary.
- Restart the test.

NOTE: **Problems caused by a loose tank cap or loose hose connections may be difficult to find. If no leakage was found in the quick-test of the tank system after completed checks and actions according to the above, the problem has likely been repaired.**

- **Continue**

  Refer to **PERFORM QUICK-TEST TANK SYSTEM**

ECM-400C: THREE-WAY CATALYTIC CONVERTER (TWC) EFFICIENCY, BANK 1. SIGNAL TOO HIGH (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-400C

Condition

The engine control module (ECM) continuously checks three-way catalytic converter (TWC) efficiency (bank 1) by comparing signals from the rear heated oxygen sensor (HO2S) with the signal from the front heated oxygen sensor (HO2S). The diagnostic trouble code (DTC) is stored if the efficiency of the three-way catalytic converter (TWC) deviates too much.

The diagnostic trouble code (DTC) is diagnosed when driving under specific driving conditions.

Substitute Value

- The rear long-term fuel trim is disabled.

Possible Source

- Misfiring
- Leakage in the intake system
- Leakage in the exhaust system
- Faulty fuel pressure
- Uneven compression
- Damaged catalytic converter.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL TOO HIGH

CHECKING THE COMPONENTS AND WIRING

Check the intake system for air leakage.

Check the exhaust system for air leakage.

Checking fuel and residual pressure.

Check the compression of the engine.

Remedy as necessary.

NOTE: Try a new heated oxygen sensor (HO2S) if the above fault-tracing does not remedy the fault.

Other information

- see **INTAKE AND EXHAUST SYSTEM - CLEANING, INSPECTION AND ADJUSTMENT**
- see **CHECKING FOR AIR LEAKAGE IN THE EXHAUST SYSTEM**

ECM-4010: LEAK DIAGNOSTIC UNIT, VALVE. SIGNAL MISSING (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 70: Identifying Leak Diagnostic Pump
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-4010 is stored if the control module registers that the signal from the leak diagnostic pump valve is too high when the valve is activated or too low or missing when the valve is

deactivated.

The control module diagnoses the fault when the engine has been off for 8 hours and is then driven for 20 minutes.

Substitute Value

Leak diagnosis is blocked.

Possible Source

Signal too high:

- Short-circuit to supply voltage in the signal cable
- Defective valve.

Signal too low:

- Short-circuit to ground in the signal cable.

Signal missing:

- Contact resistance in the terminals
- Open-circuit in the signal cable
- Open-circuit in the power cable
- Defective valve.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL MISSING

CHECKING THE STATUS

Fig. 71: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Activate the valve in the leak diagnostic unit to check whether the fault is permanent or intermittent.

  The valve clicks when it is activated.

  The fault is permanent if the valve does not activate.

  The fault is intermittent if the valve activates.

- Reconnect the connectors, reinstall components etc.
- Test drive the vehicle on the road. Run a TRIP schedule so that the engine control module (ECM) compares the diagnostics. To run a TRIP schedule, see: **VERIFYING REPAIRS**
- Connect VCT2000 (or appropriate scan tool) to the data link connector (DLC) without switching off the engine.

NOTE: **If the engine is switched off, the stored fault status will be erased and the test drive will have to be repeated.**

Read off the diagnostic status and fault status for the diagnostic trouble code (DTC) by selecting the relevant diagnostic trouble code (DTC) from the list.

Check the fault status for the diagnostic trouble code (DTC) when the diagnostic is "Complete". If the function is correct, the fault status must be "No fault found" when the diagnostic is complete.

Fig. 98: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the function OK?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-401C: THREE-WAY CATALYTIC CONVERTER (TWC) EFFICIENCY, BANK 2. SIGNAL TOO HIGH (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-401C

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-401C**

SIGNAL TOO HIGH

see **SIGNAL TOO HIGH**

ECM-4024: LEAK DIAGNOSTIC UNIT, PUMP. SIGNAL MISSING (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 99: Identifying Leak Diagnostic Pump
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-4024 is stored if the control module registers that the signal from the leak diagnostic unit pump is too high, too low or missing.

Substitute Value

The leak diagnostic is shut off.

Possible Source

Signal too high:

- Short-circuit to supply voltage in the signal cable
- Defective pump.

Signal too low:

- Short-circuit to ground in the signal cable.

Signal missing:

- Contact resistance in the terminals
- Open-circuit in the signal cable
- Open-circuit in the power cable
- Defective pump.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL MISSING

CHECKING COMPONENTS AND WIRING

Check the leak diagnostic unit connectors. Check for contact resistance and oxidation.

Check the resistance of the pump motor between the leak diagnostic unit connector terminals #1 and #4 (leak diagnostic pump side).

Check the signal cable between engine control module (ECM) terminal #B7 (#B17) and leak diagnostic pump terminal #1. Check for an open-circuit.

Check the power supply cable between system relay terminal #5 and leak diagnostic unit terminal #4. Check for an open-circuit.

Remedy as necessary.

Other information:

- see **CHECKING WIRING AND TERMINALS**

- For resistance values, see **COMPONENT SPECIFICATIONS**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**

INFORMATION

FAULT-TRACING INFORMATION

Fault-tracing is not followed by verification for this fault.

HINT: After the diagnostic trouble codes (DTCs) are erased, the function of the leak diagnostic unit can be checked by running a quick test of the fuel tank system in the vehicle communication socket. If there is a fault, the fault status will be "FAULT FOUND" on the leak diagnostic unit.

The information can be displayed again or fault-tracing this fault can be interrupted.

ECM-4024: LEAK DIAGNOSTIC UNIT, PUMP. SIGNAL TOO HIGH (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION**

SIGNAL TOO HIGH

CHECKING COMPONENTS AND WIRING

Check the resistance of the pump motor between the leak diagnostic unit connector terminals #1 and #4 (leak diagnostic pump side).

Check the signal cable between engine control module (ECM) terminal #B7 (#B17) and leak diagnostic unit terminal #1. Check for a short-circuit to supply voltage.

Try a new leak diagnostic unit if no fault is found during the above fault-tracing.

Remedy as necessary.

Other information:

- see **CHECKING WIRING AND TERMINALS**
- For resistance values, see **COMPONENT SPECIFICATIONS**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**

FAULT-TRACING INFORMATION

Fault-tracing is not followed by verification for this fault.

HINT: After the diagnostic trouble codes (DTCs) are erased, the function of the leak diagnostic unit can be checked by running a quick test of the fuel tank system in the vehicle communication socket. If there is a fault, the fault status will be "FAULT FOUND" on the leak diagnostic unit.

The information can be displayed again or fault-tracing this fault can be interrupted.

ECM-4050: FUEL LEVEL SENSOR. FAULTY SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 109: Fuel Level Sensor Connector
Courtesy of VOLVO CARS CORPORATION

NOTE: For certain versions of model year 1999, diagnostic trouble code ECM-0023 is shown instead. Troubleshooting shall be performed according to ECM-4050.

The rear electronic module transmits information about the fuel level and the fault status of the fuel level sensor to the central electronic module (CEM). The central electronic module (CEM) transmits this information to the engine control module (ECM).

Diagnostic trouble code (DTC) REM-4A31, REM-4A33, REM-4A34, REM-4A37 or REM-4A38 is stored in the rear electronic module and diagnostic trouble code (DTC) ECM-4050 is stored in the engine control module

(ECM) (signal too high / low) if the rear electronic module has registered an electrical fault in the fuel level sensor.

Diagnostic trouble code (DTC) ECM-4050 (signal missing) is stored if the engine control module (ECM) registers a communication problem with the central electronic module (CEM).

Diagnostic trouble code (DTC) ECM-4050 is stored in the engine control module (ECM) (faulty signal) if the engine control module (ECM) has registered a fuel consumption of more that 12 liters while the rear electronic module has registered that the fuel level has fallen by less than 2 liters.

Substitute Value

None.

Possible Source

Signal too high:

- electrical fault in the right fuel level sensor

Signal too low:

- electrical fault in the left fuel level sensor

Signal missing:

- communication fault

Faulty signal:

- defective fuel level sensor

Fault symptom[s]

- Gauges/Fuel level not accurate/Value too high
- Gauges/Fuel level not accurate/Value too low

FAULT-TRACING INFORMATION

INFORMATION

No fault-tracing has been developed for this diagnostic trouble code (DTC).

That this trouble code is stored indicates a fault in another control module. Therefore, troubleshoot from the sending control module. This diagnostic trouble code (DTC) can first be erased when the root fault has been remedied and the diagnostic trouble code (DTC) for the root fault has been erased.

For further information on this diagnostic trouble code, see Diagnostic trouble code (DTC) information.

ECM-405C, FUEL LEVEL SENSOR (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Information about the fuel level in the fuel tank is used to determine whether there are leaks during leak diagnosis.

If the control module detects diagnostic trouble code (DTC) ECM-4050 (fault in the fuel level sensor) and ECM-400C (leakage in the fuel tank system), diagnostic trouble code (DTC) ECM-405C is also stored. The diagnostic trouble code (DTC) for the fault is stored in the rear electrical module.

Substitute Value

None.

Possible Source

Faulty signal:

- Fault in the circuit for the fuel level sensor or faulty function (rear electrical module).

Fault symptom[s]

- Gauges/Fuel level not accurate/Value too low
- Gauges/Fuel level not accurate/Value too high

FAULT-TRACING INFORMATION

INFORMATION

No fault-tracing has been developed for the diagnostic trouble code (DTC) for this fault. The diagnostic trouble code (DTC) may also be stored in another system for which there are fault-tracing procedures. Read off diagnostic trouble codes (DTCs) from the affected system. Fault-trace the system.

ECM-406C: FUEL TANK SYSTEM, LEAKAGE. FUEL TANK FILLER CAP MISSING (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-406C

Condition

If the engine control module (ECM) registers that fuel filling has been carried out through the fuel level being

changed, the position and installation of the fuel tank filler cap is checked. This is carried out by quicker leak diagnostics.

The check is carried out a few minutes after start if the vehicle speed is constant and exceeds 30 km/h and only if no fault is detected on the leak diagnostic unit.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects a leak after filling. This is interpreted as fuel tank filler cap missing or loosely installed.

Substitute Value

None.

Possible Source

- The fuel tank filler cap is missing or not properly tightened.

Fault symptom[s]

- None.

FUEL TANK FILLER CAP MISSING

CHECKING OTHER DIAGNOSTIC TROUBLE CODES (DTCS), ENGINE CONTROL MODULE (ECM)

HINT: This diagnostic trouble code (DTC) can only be stored after a refueling. The diagnostic detects major leaks in the fuel tank system. The most likely cause is that the fuel tank filler cap has not been installed correctly.

HINT: In the event of a permanent fault, a diagnostic trouble code (DTC) for a "Major leak" will also be stored after the major leak diagnostic is complete.

- Check if the diagnostic trouble code (DTC) for "Major leak" is stored in the engine control module (ECM), if so, fault-trace from it instead.
- If no diagnostic trouble code for "Major leak" is stored, perform a quick test of the tank system via VEHICLE COMMUNICATION to ensure that the fault was intermittent and probably caused by the fuel tank filler cap?

ECM-420C: EVAPORATIVE EMISSION SYSTEM (EVAP) VALVE. OPEN (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-420C

Condition

Fig. 110: Identifying Canister Purge (CP) Valve
Courtesy of VOLVO CARS CORPORATION

When the control module activates evaporative emission system (EVAP) control, the idle air trim or short-term fuel trim will change. The diagnostic trouble code (DTC) is stored if the engine control module (ECM) does not detect any change in the idle air trim or the long term fuel trim when evaporative emission (EVAP) control is active. The engine control module (ECM) interprets this as a damaged evaporative emission (EVAP) system.

Substitute Value

- None.

Possible Source

- Damaged evaporative emission system (EVAP) valve.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

OPEN

CHECKING THE COMPONENT

- Slacken off the evaporative emission system (EVAP) valve
- Connect a vacuum pump to the evaporative emission system (EVAP) valve terminal (B). Pump a vacuum. Check that there is no leakage through the evaporative emission system (EVAP) valve by listening to and checking via the pump gauge that the pressure is stable
- Connect the Evaporative emission system (EVAP) valve connector
- Ignition on
- Activate the evaporative emission system (EVAP) valve. When the Evaporative emission system (EVAP) valve is activated, the valve opens and clicks. Check on the pump gauge that the vacuum drops (the pressure evens out) when the evaporative emission system (EVAP) valve opens.

  If the function is OK, there must be no leakage when the evaporative emission system (EVAP) valve is closed (stable pressure on the pump gauge) and the vacuum must drop when the evaporative emission system (EVAP) valve opens (the pressure evens out).

  The evaporative emission system (EVAP) valve is damaged if the function is faulty.

  If the function of the evaporative emission system (EVAP) valve is correct, check the hose and hose connections between the evaporative emission system (EVAP) valve for leakage.

  Remedy as necessary.

OPEN

see **OPEN**

ECM-420D: EVAPORATIVE EMISSION SYSTEM (EVAP). CLOSED (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-420D

Condition

Fig. 113: Identifying Canister Purge (CP) Valve
Courtesy of VOLVO CARS CORPORATION

When the control module activates evaporative emission system (EVAP) control, the idle air trim or short-term fuel trim will change. The diagnostic trouble code (DTC) is stored if the engine control module (ECM) does not detect any change in the idle air trim or the long term fuel trim when evaporative emission (EVAP) control is active. The engine control module (ECM) interprets this as a damaged evaporative emission (EVAP) system.

Substitute Value

- None.

Possible Source

- Blocked hose between the EVAP canister and the evaporative emission system (EVAP) valve
- Blocked hose between the evaporative emission system (EVAP) valve and the intake manifold
- Damaged evaporative emission system (EVAP) valve.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

CLOSED

CHECKING THE COMPONENT

- Slacken off the evaporative emission system (EVAP) valve
- Connect a vacuum pump to the evaporative emission system (EVAP) valve terminal (B). Pump a vacuum. Check that there is no leakage through the evaporative emission system (EVAP) valve by listening to and checking via the pump gauge that the pressure is stable
- Connect the Evaporative emission system (EVAP) valve connector
- Ignition on
- Activate the evaporative emission system (EVAP) valve. When the Evaporative emission system (EVAP) valve is activated, the valve opens and clicks. Check on the pump gauge that the vacuum drops (the pressure evens out) when the evaporative emission system (EVAP) valve opens.

  If the function is OK, there must be no leakage when the evaporative emission system (EVAP) valve is closed (stable pressure on the pump gauge) and the vacuum must drop when the evaporative emission system (EVAP) valve opens (the pressure evens out).

  The evaporative emission system (EVAP) valve is damaged if the function is faulty.

  If the function of the Evaporative emission system (EVAP) valve is OK, check:

  - The hose and hose terminals between the Evaporative emission system (EVAP) valve and the intake manifold. Check for leakage and blockages
  - Check the hose and hose terminals between the EVAP canister and the Evaporative emission system (EVAP) valve. Check for leakage and blockages.

  Remedy as necessary.

  Other information

ECM-421B: CANISTER PURGE (CP) VALVE. SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-421B

Condition

Fig. 116: Identifying Canister Purge (CP) Valve
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that there is no signal from the evaporative emission system (EVAP) valve.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- twin heated oxygen sensor (HO2S) control disabled.

Possible Source

- Open-circuit in the signal cable
- Damaged evaporative emission system (EVAP) valve
- Contact resistance in the terminals
- Open-circuit in the power cable.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL MISSING

CHECKING THE CONNECTOR

Fig. 117: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 118: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the evaporative emission system (EVAP) valve connector. Check for contact resistance and oxidation
- Reinstall the components, reconnect the connectors etc.
- Ignition on
- Activate the evaporative emission system (EVAP) valve.

  A click should be heard when the evaporative emission system (EVAP) valve is activated.

  If the evaporative emission system (EVAP) valve is now OK this indicates that the fault was caused by poor contact in the connector.

Other information

ECM-421C: EVAPORATIVE EMISSION SYSTEM (EVAP) VALVE. SIGNAL TOO HIGH (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-421C

Condition

Fig. 127: Identifying Canister Purge (CP) Valve
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the signal from the evaporative emission system (EVAP) valve is too high.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- twin heated oxygen sensor (HO2S) control disabled.

Possible Source

- Short-circuit to supply voltage in the signal cable
- Damaged evaporative emission system (EVAP) valve.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL TOO HIGH

CHECKING THE COMPONENTS AND WIRING

Check the resistance of the evaporative emission system (EVAP) valve.

Check the signal cable between engine control module (ECM) terminal #A9 (#A9) and evaporative emission system (EVAP) valve terminal #2. Check for a short-circuit to supply voltage.

HINT: Use an electrician's screwdriver with at least a 3 W bulb to determine whether there is a short-circuit to supply voltage in the cable.

Remedy as necessary.

ECM-430C: FUEL TANK SYSTEM, LEAKAGE. FUEL TANK FILLER CAP MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-430C

Condition

If the engine control module (ECM) registers that fuel filling has been carried out through the fuel level being changed, the position and installation of the fuel tank filler cap is checked. This is carried out by quicker leak diagnostics.

The check is carried out a few minutes after start if the vehicle speed is constant and exceeds 30 km/h and only if no fault is detected on the leak diagnostic unit.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects a leak after filling. This is interpreted as fuel tank filler cap missing or loosely installed.

Substitute Value

None.

Possible Source

- The fuel tank filler cap is missing or not properly tightened.

Fault symptom[s]

- None.

FUEL TANK FILLER CAP MISSING

CHECKING OTHER DIAGNOSTIC TROUBLE CODES (DTCS), ENGINE CONTROL MODULE (ECM)

HINT: This diagnostic trouble code (DTC) can only be stored after a refueling. The diagnostic detects major leaks in the fuel tank system. The most likely cause is that the fuel tank filler cap has not been installed correctly.

HINT: In the event of a permanent fault, a diagnostic trouble code (DTC) for a "Major leak" will also be stored after the major leak diagnostic is complete.

- Check if the diagnostic trouble code (DTC) for "Major leak" is stored in the engine control module (ECM), if so, fault-trace from it instead.
- If no diagnostic trouble code for "Major leak" is stored, perform a quick test of the tank system via VEHICLE COMMUNICATION to ensure that the fault was intermittent and probably caused by the fuel tank filler cap?

ECM-430C: FUEL TANK SYSTEM, LEAKAGE. FUEL TANK FILLER CAP MISSING (B6294T; 2005-2006)

ECM-431B: LEAK DIAGNOSTIC UNIT, PREHEATING. SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-431B

Condition

Fig. 139: Identifying Leak Diagnostic Pump
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the control signal to the heater element in the leak diagnostic unit.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the signal is too high.

The diagnostic trouble code (DTC) can be diagnosed when the leak diagnostic system is run.

Substitute Value

- None.

Possible Source

- Open-circuit in the signal cable.
- Damaged leak diagnostic pump.

Fault symptom[s]

- None.

SIGNAL MISSING

CHECKING THE WIRING

Check the cable between engine control module (ECM) terminal #B34 (#B44) and leak diagnostic unit terminal #2. Check for an open-circuit.

Remedy as necessary.

INFORMATION

FAULT-TRACING INFORMATION

Fault-tracing is not followed by verification for this fault.

HINT: After the diagnostic trouble codes (DTCs) are erased, the function of the leak diagnostic unit can be checked by running a quick test of the fuel tank system in the vehicle communication socket. If there is a fault, the fault status will be "FAULT FOUND" on the leak diagnostic unit.

The information can be displayed again or fault-tracing this fault can be interrupted.

ECM-431C: LEAK DIAGNOSTIC UNIT, PREHEATING. SIGNAL TOO HIGH (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-431C

Condition

Fig. 142: Identifying Leak Diagnostic Pump
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the control signal to the heater element (PTC resistor) for the leak diagnostic unit is too high.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running and the control module activates or deactivates preheating for the heater element for the leak diagnostic unit.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the signal cable
- Damaged leak diagnostic unit.

Fault symptom[s]

- None.

SIGNAL TOO HIGH

CHECKING THE WIRING

Check the signal cable. Check for a short-circuit to supply voltage.

Take readings between:

- Engine control module (ECM) #B34 (#C44) and leakage diagnostic unit #2.

Remedy as necessary.

Other information

- see **CONNECTING THE BREAKOUT BOX**

SIGNAL TOO LOW

see **SIGNAL TOO LOW**

ECM-431D: LEAK DIAGNOSTIC UNIT. FAULTY SIGNAL (B5254T2; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 148: Identifying Leak Diagnostic Pump
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-431D (signal too high or too low) is stored if the power consumption of the pump in the leak diagnostic unit is higher or lower than a particular value during the reference phase.

Diagnostic trouble code (DTC) ECM-431D (faulty signal) is stored if the power consumption for the pump in the leak diagnostic unit fluctuates too much during the reference phase.

The power consumption of the pump must drop when the leak diagnostic pump valve moves from the reference check to pressurizing the fuel tank system. Diagnostic trouble code (DTC) ECM-431D (signal missing) is stored if the value for the power consumption of the pump drops too quickly, slowly or not at all.

The diagnosis is carried out when the ignition is switched off.

For more information about the leak diagnostics, see **LEAK DIAGNOSTICS (CERTAIN MARKETS ONLY)** .

Substitute Value

The leak diagnostic is disabled.

Possible Source

Signal too high:

- Contact resistance in the terminals
- Blocked filter in the leak diagnostic unit
- Blocked hose between the filter and the leak diagnostic unit
- Defective leak diagnostic unit.

Signal too low:

- Contact resistance in the terminals
- Defective leak diagnostic unit.

Faulty signal:

- Contact resistance in the terminals
- Defective leak diagnostic unit
- Defective control of the heater element (This fault is detected by the central electronic module).

Signal missing:

- Contact resistance in the terminals
- Blocked hose between the leak diagnostic pump and the EVAP canister
- Defective leak diagnostic unit.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULT-TRACING

CHECKING SOFTWARE

HINT: For vehicles of model year 2003-2005, the software in engine control module (ECM) should be checked before fault tracing of the fault relating to the leak from the tank system is carried out.

Fig. 149: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

Use the VCT2000 (or appropriate scan tool) to read out and check the software version in the Engine control module (ECM).

NOTE: More instructions follow together with the read out.

Fig. 150: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Has the latest software been downloaded to the control module?

- **YES**

  Refer to **PERFORM QUICK-TEST TANK SYSTEM**

PERFORM QUICK-TEST TANK SYSTEM

Fig. 151: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

- Activate the test using the VCT2000.
- Read off initial parameters and check them according to start conditions for performing the test.
- Check that the test has started. Parameters run status shall go to "In progress" and the test phase shall go to "Reference".

NOTE: If the test does not start, check that the start conditions are fulfilled.

When the reference phase is finished, check of the tank system starts. The pressure in the tank starts to increase, see graph. Within 15 minutes the Engine control module makes a decision as to whether there is leakage in the tank system or not. The test is finished.

- Check parameters for test result and follow relevant instructions below.

NOTE: In the event of a the results from the estimated leakage must be entered in

NOTE: **Estimated leakage shall be used to get an idea of the proximity to the diagnostic trouble code limit. If the estimated leakage is very near the diagnostic trouble code limit (greater than 0.3mm), troubleshooting should probably be performed despite the Tank system, test result shows "No leakage found", especially if a diagnostic trouble code for leakage has been stored earlier.**

NOTE: **Use diagnostic trouble code counter to, see the frequency of the problem. Also use frozen values to get an idea if external conditions may have affected the result. Compare with current conditions in the workshop.**

Conditions for starting the quick test of the fuel tank system

- No DTCs related to EVAP purge valve or ambient air pressure sensor set.
- Battery voltage 11-15 V.
- Atmospheric pressure higher than 750 hPa, approx. 2500 m (8200 ft).
- Fuel level 0-85 %.
- Ambient air temperature 4-35 °C.

NOTE: **The battery voltage must be correct throughout the entire test. The test can take up to 15 minutes, depending on the quantity of fuel in the fuel tank. It is highly recommended to use the constant voltage charger, Midtronics PSC-550, during the test. For more information, see 30-04 (USA/CDN).**

Other information

- see **DESCRIPTION OF PARAMETERS, QUICK TEST OF THE FUEL TANK SYSTEM**
- see **TEST PHASES, QUICK TEST FUEL TANK SYSTEM**
- see **CONNECTING THE BREAKOUT BOX**
- see **SIGNAL DESCRIPTION**
- see **LEAK DIAGNOSTIC PUMP, REPLACING**

Select alternative according to relevant test results:

1. DMTL, test result = "Problem found"

   Refer to **DMTL, TEST RESULT = "PROBLEM FOUND"**

2. Tank system, test result = "No leakage found"

   Refer to **TANK SYSTEM, TEST RESULT = "NO LEAKAGE FOUND"**

3. Tank system, test result = "Major leakage found" or "Minor leakage found"

Refer to **TANK SYSTEM, TEST RESULT = "MAJOR LEAKAGE FOUND" OR "MINOR LEAKAGE FOUND"**

4. DMTL, test result and Tank system, test result = "Unknown"

   Refer to **DMTL, TEST RESULT AND TANK SYSTEM, TEST RESULT = "UNKNOWN"**

5. Cancel fault-tracing.

   FAULT NOT FOUND: Troubleshooting has been completed.

Fig. 152: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 153: Identifying Leak Diagnostic Pump
Courtesy of VOLVO CARS CORPORATION

DMTL, TEST RESULT = "PROBLEM FOUND"

Check the leak diagnostic unit connectors. Check for contact resistance and oxidation.

Check the hose between the leak diagnostic unit and the EVAP canister. Check for blockages.

Try a new leak diagnostic unit if no fault is found during the above fault-tracing.

- Perform "Quick-test tank system" again to verify that the problem has been solved.

NOTE: The tank system's status is unknown since the test was interrupted.

- **Continue**

  Refer to **PERFORM QUICK-TEST TANK SYSTEM**

TANK SYSTEM, TEST RESULT = "NO LEAKAGE FOUND"

Diagnostic trouble code limit (minor leakage):Estimated leakage = 0.40 mm

No problem has been detected on leakage diagnostics unit and fuel tank system is OK. The vehicle is ready to be delivered back to customer.

NOTE: The parameter estimated leakage does not necessarily have to show 0 mm for a sealed system.

TANK SYSTEM, TEST RESULT = "MAJOR LEAKAGE FOUND" OR "MINOR LEAKAGE FOUND"

If a leakage is detected during this test, it indicates that the problem with the leakage diagnostics unit (DMTL) is solved. Now the Engine control module (ECM) has the possibility to check the fuel tank system. A leakage has been found.

- Cancel troubleshooting for this problem.
- Read off diagnostic trouble codes again and start troubleshooting for the new diagnostic trouble code.

DMTL, TEST RESULT AND TANK SYSTEM, TEST RESULT = "UNKNOWN"

Engine control module (ECM) cannot perform check of tank system. This may be due to the conditions for start of the quick-test not being fulfilled, that they have changed during the course of the test, or that a problem has occurred during troubleshooting.

- Check that all conditions for start of the quick-test are fulfilled.
- Visually check hoses and connections on leakage diagnostics unit, canister, EVAP-valve, and filler pipe. Check for damage or incorrect/loose installation.
- Remedy as necessary.
- Restart the test.

- **Continue**

  Refer to **PERFORM QUICK-TEST TANK SYSTEM**

ECM-432B: LEAK DIAGNOSTIC UNIT, VALVE. SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-432B

Condition

Fig. 159: Identifying Leak Diagnostic Pump
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that there is no signal from the valve in the pump for the leak diagnostic when the valve is activated.

The diagnostic trouble code (DTC) can be diagnosed when the leak diagnostic system is run.

Substitute Value

- The leak diagnostic is disabled.

Possible Source

- Contact resistance in the terminals
- Open-circuit in the signal cable
- Open-circuit in the power cable
- Damaged valve.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL MISSING

see **SIGNAL MISSING**

ECM-432B: LEAK DIAGNOSTIC UNIT, VALVE. SIGNAL MISSING (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-432D

Condition

Fig. 161: Identifying Leak Diagnostic Pump
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the signal from the valve in the pump for the leak diagnostic is too low when the valve is activated.

The diagnostic trouble code (DTC) can be diagnosed when the leak diagnostic system is run.

Substitute Value

- The leak diagnostic is disabled.

Possible Source

- Short-circuit to ground in the signal cable.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL TOO LOW

CHECKING THE STATUS

Fig. 162: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Activate the valve in the leak diagnostic unit to check whether the fault is permanent or intermittent.

  The valve clicks when it is activated.

  The fault is permanent if the valve does not activate.

  The fault is intermittent if the valve activates.

Fig. 163: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Check the resistance of the valve between the leak diagnostic unit connector terminals #3 and #4 (leak diagnostic pump side).

Check the signal cable between engine control module (ECM) terminal #B40 (#B50) and leak diagnostic unit terminal #3. Check for a short-circuit to supply voltage.

Try a new leak diagnostic unit if no fault is found during the above fault-tracing.

Remedy as necessary.

ECM-4338: FUEL TANK FILLER CAP MISSING (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

If no fault is detected in the leak diagnostic unit, the control module runs a leak diagnostic of the fuel tank system. If the control module detects a leakage that is 1 mm or larger after refueling, the control module interprets this as the fuel tank filler cap missing or loosely installed. Diagnostic trouble code (DTC) ECM-4338 is then stored. For more information about the leak diagnostics, see **LEAK DIAGNOSTICS (CERTAIN MARKETS ONLY)** .

Substitute Value

None.

Possible Source

Fuel tank filler cap missing:

- Fuel tank filler cap missing or not tightened
- Leakage that is 1 mm or greater in the fuel tank, fuel filler pipe, fuel tank filler cap, evaporative emission system (EVAP) canister, EVAP canister purge valve, or in the hoses between these components
- The fuel gauge does not function (This fault is detected by the rear electrical module).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-433B: LEAK DIAGNOSTIC UNIT, PUMP. SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-433B

Condition

Fig. 169: Identifying Leak Diagnostic Pump
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that there is no signal from the leak diagnostic pump.

The diagnostic trouble code (DTC) can be diagnosed when leak diagnostics is run.

Substitute Value

- The leak diagnostic is disabled.

Possible Source

- Contact resistance in the terminals
- Open-circuit in the signal cable
- Open-circuit in the power cable
- Damaged pump.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

ECM-433D: LEAK DIAGNOSTIC UNIT, PUMP. SIGNAL TOO LOW (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-433D

Condition

Fig. 171: Identifying Leak Diagnostic Pump
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the signal from the pump for the leak diagnostic unit is too low.

The diagnostic trouble code (DTC) can be diagnosed when leak diagnostics is run.

Substitute Value

- The leak diagnostic is disabled.

Possible Source

- Short-circuit to ground in the signal cable.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL TOO LOW

see **SIGNAL TOO LOW**

ECM-433D: LEAK DIAGNOSTIC UNIT, PUMP. SIGNAL TOO LOW (B6294T; 2005-2006)

ECM-434C: FUEL TANK SYSTEM, LEAKAGE. MINOR LEAK (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-434C

Condition

Fig. 172: Identifying Leak Diagnostic Pump
Courtesy of VOLVO CARS CORPORATION

If no fault has been detected in the leak diagnostic unit, the engine control module (ECM) carries out a leak diagnostic of the fuel tank system. The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects a leak which is 0.5-1.0 mm.

Substitute Value

None.

Possible Source

- A leak that is 0.5-1.0 mm or smaller in the fuel tank, fuel filler pipe, fuel tank filler cap, EVAP canister, evaporative emission system (EVAP) valve, or in the hoses between these components.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

LEAKAGE

CHECKING SOFTWARE

HINT: For vehicles of model year 2003-2008, the software in engine control module (ECM) should be checked before fault tracing of the fault relating to the leak from the tank system is carried out.

Fig. 173: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Use the VCT2000 (or appropriate scan tool) to read out and check the software version in the Engine control module (ECM).

  NOTE: More instructions follow together with the read out.

Fig. 174: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Has the latest software been downloaded to the control module?

- **YES**

  Refer to **PERFORM QUICK-TEST TANK SYSTEM**

PERFORM QUICK-TEST TANK SYSTEM

Fig. 175: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

- Activate the test using the VCT2000.
- Read off initial parameters and check them according to start conditions for performing the test.

- Check that the test has started. Parameters run status shall go to "In progress" and the test phase shall go to "Reference".

NOTE: If the test does not start, check that the start conditions are fulfilled.

When the reference phase is finished, check of the tank system starts. The pressure in the tank starts to increase, see graph. Within 15 minutes the Engine control module makes a decision as to whether there is leakage in the tank system or not. The test is finished.

- Check parameters for test result and follow relevant instructions below.

NOTE: In the event of a the results from the estimated leakage must be entered in

NOTE: Estimated leakage shall be used to get an idea of the proximity to the diagnostic trouble code limit. If the estimated leakage is very near the diagnostic trouble code limit (greater than 0.3mm), troubleshooting should probably be performed despite the Tank system, test result shows "No leakage found", especially if a diagnostic trouble code for leakage has been stored earlier.

NOTE: Use diagnostic trouble code counter to, see the frequency of the problem. Also use frozen values to get an idea if external conditions may have affected the result. Compare with current conditions in the workshop.

Conditions for starting the quick test of the fuel tank system

- No DTCs related to EVAP purge valve or ambient air pressure sensor set.
- Battery voltage 11-15 V.
- Atmospheric pressure higher than 750 hPa, approx. 2500 m (8200 ft).
- Fuel level 0-85 %.
- Ambient air temperature 4-35 °C.

NOTE: The battery voltage must be correct throughout the entire test. The test can take up to 15 minutes, depending on the quantity of fuel in the fuel tank. It is highly recommended to use the constant voltage charger, Midtronics PSC-550, during the test. For more information, see 30-04 (USA/CDN).

Other information

- see **TEST PRESSURIZING THE TANK SYSTEM**

Select alternative according to relevant test results:

1. DMTL, test result = "Problem found"

   Refer to **DMTL, TEST RESULT = "PROBLEM FOUND"**

2. Tank system, test result = "No leakage found"

   Refer to **TANK SYSTEM, TEST RESULT = "NO LEAKAGE FOUND"**

3. Tank system, test result = "Minor leakage found"

   Refer to **TANK SYSTEM, TEST RESULT = "MINOR LEAKAGE FOUND"**

4. Tank system, test result = "Major leakage found"

   Refer to **TANK SYSTEM, TEST RESULT = "MAJOR LEAKAGE FOUND"**

5. DMTL, test result and Tank system, test result = "Unknown"

   Refer to **DMTL, TEST RESULT AND TANK SYSTEM, TEST RESULT = "UNKNOWN"**

6. Cancel fault-tracing.

   FAULT NOT FOUND: Troubleshooting has been completed.

Fig. 176: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 177: Identifying Leak Diagnostic Pump
Courtesy of VOLVO CARS CORPORATION

DMTL, TEST RESULT = "PROBLEM FOUND"

If a problem is detected on the leakage diagnostics unit (DMTL), this may have been caused during the test itself. Checks on DMTL are normal electric checks of leakage diagnostics unit and cabling and is no indication of if there is leakage or not.

- Cancel troubleshooting for this problem.
- Read off diagnostic trouble codes again and start troubleshooting for the new diagnostic trouble code.

NOTE: The tank system's status is unknown since the test was interrupted.

TANK SYSTEM, TEST RESULT = "NO LEAKAGE FOUND"

Diagnostic trouble code limit (minor leakage):Estimated leakage = 0.40 mm

If no leakage was found, the Engine control module (ECM) has detected leakage in the tank system earlier, but the problem is not active at this time. The fault could be caused by leakage in the tank, filler pipe, fuel tank filler cap, canister, EVAP valve, leakage diagnosis unit or hoses between these components.

NOTE: Problems caused by a loose tank cap or loose hose connections may be difficult to find. If no leakage was found in the quick-test of the tank system after completed checks and actions according to the above, the problem has likely been repaired.

NOTE: The parameter estimated leakage does not necessarily have to show 0 mm for a sealed system.

TANK SYSTEM, TEST RESULT = "MINOR LEAKAGE FOUND"

Diagnostic trouble code limit:Estimated leakage = 0.40 mm

- Check that the tank cap is properly fitted and that its seal is undamaged.
- Check the hoses and connections on the leak diagnostic unit, the canister, EVAP-valve and the fuel filler pipe visually. Check for damage or incorrect/loose installation.
- Remedy as necessary.
- Restart the test.

NOTE: **Problems caused by a loose tank cap or loose hose connections may be difficult to find. If no leakage was found in the quick-test of the tank system after completed checks and actions according to the above, the problem has likely been repaired.**

NOTE: **By blocking the hose between canister and EVAP-valve and then repeating quick-test tank system, leakage through the EVAP-valve can be detected. If leakage was detected in a previous quick test of the fuel tank system but is not now detected when the hose between the canister and the EVAP valve is blocked, the leakage may be through the EVAP valve.**

- Disconnect the hose between the EVAP canister purge valve and the EVAP canister from the connection to the EVAP canister purge valve.
- Block the hose while running the quick test of the fuel tank system.

- **Continue**

  Refer to **PERFORM QUICK-TEST TANK SYSTEM**

DMTL, TEST RESULT AND TANK SYSTEM, TEST RESULT = "UNKNOWN"

Engine control module (ECM) cannot perform check of tank system. This may be due to the conditions for start of the quick-test not being fulfilled, that they have changed during the course of the test, or that a problem has occurred during troubleshooting.

- Check that all conditions for start of the quick-test are fulfilled.
- Visually check hoses and connections on leakage diagnostics unit, canister, EVAP-valve, and filler pipe. Check for damage or incorrect/loose installation.
- Remedy as necessary.
- Restart the test.

- **Continue**

  Refer to **PERFORM QUICK-TEST TANK SYSTEM**

TANK SYSTEM, TEST RESULT = "MAJOR LEAKAGE FOUND"

Diagnostic trouble code limit:Tank pressure lower than 1500 Pa after 450 seconds in test phase "Major leakage".

- Check that the tank cap is properly fitted and that its seal is undamaged.
- Check the hoses and connections on the leak diagnostic unit, the canister, EVAP-valve and the fuel filler pipe visually. Check for damage or incorrect/loose installation.
- Remedy as necessary.
- Restart the test.

NOTE: **Problems caused by a loose tank cap or loose hose connections may be difficult to find. If no leakage was found in the quick-test of the tank system after completed checks and actions according to the above, the problem has likely been repaired.**

- **Continue**

  Refer to **PERFORM QUICK-TEST TANK SYSTEM**

ECM-436B: LEAK DIAGNOSTIC UNIT. SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-436B

Condition

Fig. 189: Identifying Leak Diagnostic Pump
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks power consumption on the leak diagnostic unit pump.

A diagnostic trouble code is stored if the current consumption of the pump in the leak diagnostic unit varies too much during the reference phase.

The diagnostic trouble code (DTC) can be diagnosed when the leak diagnostic system is run.

Substitute Value

The leak diagnostic is disabled.

Possible Source

- Contact resistance in the terminals
- Blocked hose between the filter and the leak diagnostic unit
- Damaged leak diagnostic unit.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

ECM-4380: FUEL TANK FILLER CAP. MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-4380

Condition

If the engine control module (ECM) registers that fuel filling has been carried out through the fuel level being changed, the position and installation of the fuel tank filler cap is checked. This is carried out by quicker leak diagnostics.

The check is carried out a few minutes after start if the vehicle speed is constant and exceeds 30 km/h and only

if no fault is detected on the leak diagnostic unit.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects a leak after filling. This is interpreted as fuel tank filler cap missing or loosely installed.

This diagnostic trouble code (DTC) cannot occur alone but follows another stored diagnostic trouble code (DTC) for the fuel tank filler cap. The diagnostic trouble code (DTC) only remains during one operating cycle and lights a message in the display indicating that the fuel tank filler cap is not correctly positioned.

Substitute Value

- None.

Possible Source

- The diagnostic trouble code (DTC) is caused by another diagnostic trouble code (DTC) being stored in the engine control module (ECM).

Fault symptom[s]

- Message in the display.

ECM-439C: FUEL TANK SYSTEM, LEAKAGE. MAJOR LEAK (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-439C

Condition

Fig. 192: Identifying Leak Diagnostic Pump
Courtesy of VOLVO CARS CORPORATION

If no fault has been detected in the leak diagnostic unit, the engine control module (ECM) carries out a leak diagnostic of the fuel tank system. The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects a leak which is larger than 1.0 mm.

Substitute Value

None.

Possible Source

- The fuel tank filler cap is missing or not properly tightened
- Leakage that is 1.0 mm or greater in the fuel tank, fuel filler pipe, fuel tank filler cap, EVAP canister, canister purge (CP) valve, or in the hoses between these components.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

ECM-4400: FUEL LEVEL SENSOR. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-4400

Condition

Fig. 193: Fuel Level Sensor Connector
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) transmits information about the fuel level and fault status of the fuel level sensor to the central electronic module (CEM). The central electronic module (CEM) then transmits this information on to the engine control module (ECM).

The engine control module (ECM) compares the engine fuel consumption with the change in fuel level over a set period of time. The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers an implausibly small reduction in the fuel level compared with calculated fuel consumption.

Substitute Value

- None.

Possible Source

- Fault trace the rear electronic module (REM)
- Damaged fuel level sensor.

Fault symptom[s]

- Gauges/Fuel level not accurate/Value too low

ECM-440B: FUEL LEVEL SENSOR. SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-440B

Condition

Fig. 194: Fuel Level Sensor Connector
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) transmits information about the fuel level and fault status of the fuel level sensor to the central electronic module (CEM). The central electronic module (CEM) then transmits this information on to the engine control module (ECM).

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers a communication problem with the central electronic module (CEM).

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- None.

Possible Source

- Open-circuit in the control area network (CAN) wiring
- Short-circuit between the control area network (CAN) wiring
- Internal fault in another control module in the same part of the control area network (CAN).

Fault symptom[s]

- Gauges/Fuel level not accurate/Value too low

FAULT-TRACING INFORMATION

INFORMATION

No fault-tracing has been developed for this diagnostic trouble code (DTC). A diagnostic trouble code for CAN communication can also be generated in the Central Electronic Module (CEM). This diagnostic trouble code shall not be cleared until the trouble code in the central electronic module (CEM) and in other affected control modules has been remedied and cleared. Therefore, first read the diagnostic trouble codes in the Central Electronic Module (CEM) and other affected control modules, perform fault tracing and remedy as necessary. This diagnostic trouble code (DTC) can then be erased. For further information on this diagnostic trouble code, see Diagnostic trouble code (DTC) information.

Other information

- see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK (2005-2012)**

GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK

General

The CAN network is a pure communications network and contains no fuses or sensors. The network is divided into two parts: the low speed network (LS-CAN, Low Speed CAN) and the high speed network (HS-CAN, High Speed CAN). The differences between the networks are their physical position in the car and the transfer rates. In general terms, HS-CAN is restricted to the engine compartment and LS-CAN to the passenger compartment and the cargo compartment.

Both the low speed and the high speed network house two network resistors in tow of the control modules. Each resistor has resistance of 120 ohms. If resistance between the two CAN cables is measured, a normal value is approximately 60 ohms as measured from about the center of the network. The value may vary between vehicles. Permissible values are approximately 55-65 ohms.

NOTE: Troubleshoot each CAN-net, see troubleshooting for CAN-related fault codes for Central electronic module (CEM). For example, choose one of CEM-DF01 - DF17 depending on CAN-net.

Diagnostic trouble code (DTC) types

Diagnostic trouble codes (DTCs) which can be stored by control modules connected to the controller area network (CAN) can be split into two categories:

Electrical fault

These diagnostic trouble codes (DTCs) can only be stored in the central electronic module (CEM). This type of diagnostic trouble code (DTC) is stored when the central electronic module (CEM) has detected an electrical fault in the controller area network (CAN) wiring. For example a short-circuit between the controller area network (CAN) wiring or a short-circuit between the controller area network (CAN) wiring and voltage or ground. The fault may be due to an open-circuit in the CAN-H on the network. These diagnostic trouble codes (DTCs) do not normally indicate that a fault has occurred in any control module.

Communication error, CEM

These diagnostic trouble codes (DTCs) can only be stored in the central electronic module (CEM). The diagnostic trouble code (DTC) indicates that a control module, with which the central electronic module (CEM) expects to communicate, is not responding for one reason or another. This can be due to an open-circuit on one or both the controller area network (CAN) cables to one control module or the control module not being supplied with power, for example.

Communication error, control module

These diagnostic trouble codes (DTCs) can be stored by all control modules. A control module that has stored this diagnostic trouble code (DTC) has detected that some sort of interference has occurred with communication. The diagnostic trouble code (DTC) does not point out a specific fault source. Examples of fault causes can be intermittent short-circuits between the CAN cables, intermittent short-circuits on a CAN cable to supply voltage/ground or a control module that transmits incorrect messages on the CAN network.

NOTE: **The diagnostic trouble codes (DTC) for communication errors can thus be stored in one or more control modules and stem from the same causes as the diagnostic trouble codes for electrical faults in the Central Electronic Module (CEM), that is to say "short-circuit" of one or both CAN cables to supply voltage or ground. It is only the Central Electronic Module (CEM), however, that can store a diagnostic trouble code (DTC) that is generated due to the short-circuit itself.**

Configuration fault

The diagnostic trouble code (DTC) can be stored by all control modules in both the HS-CAN and LS-CAN except the central electronic module (CEM). The diagnostic trouble code (DTC) indicates that a control module could not receive anticipated communication from the central electronic module (CEM). Examples of fault causes could be incorrect software configuration in the control module that generated the diagnostic trouble code (DTC) or an open-circuit on the CAN cables to the control module that generated the diagnostic trouble code (DTC). This diagnostic trouble code (DTC) can also be stored if there is play in the connectors or bent terminal pins in a connector on one of the CAN cables.

NOTE: **Software in one control module cannot "break". If the control module that**

generated the diagnostic trouble code once has functioned in the vehicle, the malfunction cannot be remedied by downloading new software. The only time when downloading new software to a control module is of help is if the customer or workshop has replaced a control module with a control module from another vehicle without downloading software after replacement.

Diagnostic functions in the central electronic module (CEM)

The central electronic module (CEM) acts as a hub between the two networks. This operates as an exchange and can distribute traffic between the high speed network (HS-CAN) and the low speed network (LS-CAN) and vice versa. The central electronic module (CEM) also contains diagnostic functions for monitoring the traffic on the CAN network and the voltage levels in the CAN cables.

NOTE: **The central electronic module (CEM) contains more functions for monitoring the CAN network than other control modules. For example, the central electronic module (CEM) is the only control module that can store diagnostic trouble codes (DTCs) for short-circuits between the CAN cables, between a CAN cable and ground and between a CAN cable and supply voltage. The fact that the central electronic module (CEM) can do this does not mean that the central electronic module (CEM) is the cause of all faults in the CAN network. On the other hand, other control modules can store diagnostic trouble codes (DTCs) as a result of the short-circuit. This is a small, but very important difference.**

Example:

Diagnostic trouble codes in pairs between the central electronic module (CEM) and a single control module

If central electronic module (CEM) has generated a diagnostic trouble code for open circuit in communication with a control module and this control module has generated a diagnostic trouble code configuration error, start troubleshooting at the indicated control module. An open circuit has occurred at some point somewhere between the central electronic module (CEM) and this control module.

NOTE: **If the diagnostic trouble code can be read out from the control module in question, the fault is probably intermittent. Check the junctions and connectors along the wiring harness from the central electronic module (CEM) and to the control module that generated the code. Check the connectors especially for retracting pins or oxidation.**

Individual diagnostic trouble codes in the central electronic module (CEM)

If the central electronic module (CEM) has generated diagnostic trouble code for an open circuit in communication with a control module and there is no diagnostic trouble code (DTC) stored in the corresponding control module, it indicates an suspected malfunction in the voltage supply to the indicated control module. The diagnostic trouble code (DTC) cannot be generated if the control module which could not communicate with the engine module (CEM) is not powered.

General procedure

- Check the supply voltage to the relevant control module
- Check the ground terminal for the control module
- Check the CAN cables for the control module.

Checking the power supply

A simple way to check the supply voltage and ground is to check if there is any functionality remaining in the control module. Examples of corrective action:

- Driver door module (DDM)/passenger door module (PDM): Check that the power window of each door can be operated "locally.
- Power seat module (PSM): Check whether the seat can be moved manually
- Road traffic information module (RTI): Check whether the display for the road traffic information module (RTI) can be folded up or whether a disc can be inserted and fed out
- Climate control module (CCM): Check the function. The blower fan must blow. However, the air conditioning (A/C) will not work in the event of interrupted CAN communication.

In the event of difficulty, check as follows: Measure the supply voltage and ground terminal in the connector directly adjacent to the control module that has stored the diagnostic trouble code (DTC).

NOTE: The terminals could be damaged when if readings are taken using measurement cables directly in the connector. If possible, take readings on the rear of the connector. If this is not possible, use a loose terminal strip to insert in the connector.

Diagnostic testing of main arteries in the low speed network (LS-CAN)

Measure the resistance in the connectors of the power seat module (PSM) if such is fitted (easy to access and sits in about the middle of the network). Otherwise connect a breakout box at the central electronic module (CEM). The advantage of using a breakout box is that the functionality of the entire network can be controlled without disconnecting control modules.

This resistance measurement only controls main paths in LS-CAN, not the branching paths to certain control modules. However, a resistance measurement between the two CAN-lines can show if there is a short-circuit between the two lines, even on these branching paths. A normal value, measured somewhere in the middle of the net, is between 55 ohms and 65 ohms when the net is connected (both terminating resistors connected, 120 ohms in parallel). Twist and bend the cable harness at suitable points to detect any intermittent malfunction sources.

Also measure the resistance between each CAN-lead and voltage feed and ground. Twist and bend the cable harness in suitable places to detect any intermittent fault sources. The resistance should be over 1 kohms. If resistance is less than 1 kohms, this indicates short-circuiting between the CAN-lead and ground/voltage.

HINT: Both measurements can be taken in the same connector if the CAN-cables, voltage feed, and ground are exposed. If possible, take measurements on the rear of the connector to prevent damage to the terminals in the connector. If this is not possible, use the adapter wiring or loose terminal pins to obtain a

good contact. The resistance must be over 1 kohms. If the resistance is less than 1 kohms, this indicates short-circuiting between the CAN-lead and ground/voltage.

If the main artery is OK (i. e. approximately 60 ohms measured in the power seat module (PSM), for example), measure the resistance in the CAN cables from the relevant control module.

Diagnostic testing of main arteries in the high speed network (HS-CAN)

In principle it is only possible to measure the resistance in the high speed network (HS-CAN) using adapter wiring. It is easiest to connect the adapter wiring at the engine control module (ECM). Connect the engine control module (ECM) again to the adapter wiring to obtain the correct values when taking readings. The resistance must be approximately 60 ohms.

Abbreviations and terms

- CAN. Controller Area Network
- LS-CAN (Low Speed CAN). Low speed network in the car. In practice this is restricted to the passenger compartment and the cargo compartment
- HS-CAN (High Speed CAN). High speed network in the car. In practice this is restricted to the engine compartment
- CAN-H. CAN cable with the higher voltage. The voltage oscillates between 2.5 V and approximately 4 V when there is traffic on the CAN network
- CAN-L. CAN cable with the lower voltage. The voltage oscillates between 2.5 V and approximately 1 V when there is traffic on the CAN network.

ECM-440C: FUEL LEVEL SENSOR. SIGNAL TOO HIGH (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-440C

Condition

Fig. 195: Fuel Level Sensor Connector
Courtesy of VOLVO CARS CORPORATION

The rear electronic module (REM) transmits information about the fuel level and fault status of the fuel level sensor to the central electronic module (CEM). The central electronic module (CEM) then transmits this information on to the engine control module (ECM).

A diagnostic trouble code (DTC) is stored in the rear electronic module (REM) if it registers an electrical fault with the fuel level sensor. A diagnostic trouble code (DTC) will be stored in the engine control module (ECM) at the same time.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- None.

Possible Source

- Fault trace the rear electronic module (REM).

Fault symptom[s]

- Gauges/Fuel level not accurate/Value too low

ECM-4801: THREE-WAY CATALYTIC CONVERTER (TWC) EFFICIENCY, BANK 1. INTERMITTENT FAULT (B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The control module continuously checks three-way catalytic converter (TWC) efficiency by comparing signals from the rear heated oxygen sensor (HO2S) with the front heated oxygen sensor (HO2S). Diagnostic trouble code (DTC) ECM-4801 will be stored if the efficiency of the three-way catalytic converter (TWC) deviates too much.

Substitute Value

Rear heated oxygen sensor (HO2S) control is disabled.

Possible Source

- misfiring
- air leakage in the intake system
- air leakage in the exhaust system
- faulty fuel pressure
- uneven compression
- defective three-way catalytic converter (TWC).

Fault symptom[s]

- malfunction indicator lamp (MIL) lit.

INTERMITTENT FAULT

FAULT-TRACING INFORMATION

Control module previously registered a fault. The fault is now no longer present.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-5000: AIR CONDITIONING (A/C) PRESSURE SENSOR. SIGNAL MISSING. INTERMITTENT FAULT (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 218: Identifying A/C Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-5000 is stored if the engine control module (ECM) registers a fault in the signal cable from the air conditioning (A/C) pressure sensor.

Diagnostic trouble code (DTC) ECM-5000 is stored when the air conditioning (A/C) pressure is too low and it is registered by the engine control module (ECM) as a fault.

Substitute Value

none

Possible Source

Signal too high:

- short-circuit to supply voltage in the signal cable
- open-circuit in power supply
- open-circuit in ground lead
- defective air conditioning (A/C) pressure sensor

Signal too low:

- short-circuit to ground in the signal cable
- open-circuit in signal cable
- contact resistance in connectors
- defective air conditioning (A/C) pressure sensor

Signal missing:

- defective air conditioning (A/C) pressure sensor
- low pressure in the air conditioning (A/C) system
- leakage in the air conditioning (A/C) system

Fault symptom[s]

- Air conditioning (A/C) system does not work

SIGNAL MISSING. INTERMITTENT FAULT

When the fault is no longer present, no fault-tracing for an intermittent fault is required.

Fig. 219: Identifying A/C Pressure Sensor

ECM-5000: ENGINE SPEED (RPM) SENSOR SIGNAL. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-5000

Condition

Fig. 245: Detecting The Reference Positions Of The Camshaft
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) detects the flywheel position for TDC using the signal from the engine speed (RPM) sensor. The diagnostic trouble code (DTC) is stored if the position for TDC is missing sporadically. The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- The engine control module (ECM) uses the signal from the camshaft position (CMP) sensor if the camshaft position (CMP) sensor has been adapted
- Variable valve timing control is blocked.

Possible Source

- Signal interference
- Contact resistance and oxidation
- Intermittent fault causes in the engine speed (RPM) sensor wiring.

Fault symptom[s]

- The engine is difficult to start
- Poor performance.

FAULTY SIGNAL

CHECKING COMPONENTS

Check that the engine speed (RPM) sensor is correctly installed.

Check the engine speed (RPM) sensor. Check that it is not damaged or dirty.

HINT: The diagnostic trouble code (DTC) can be caused by damage in the flywheel / carrier plate. Look for damage to the flywheel / carrier plate.

Other information

- For B5xx4T, see **REPLACING THE ENGINE SPEED (RPM) SENSOR**
- For B6xx4T, see **ENGINE SPEED (RPM) SENSOR, REPLACING** .

Fig. 246: Detecting The Reference Positions Of The Camshaft

ECM-500B: ENGINE SPEED (RPM) SENSOR SIGNAL. SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-500B

Condition

Fig. 250: Detecting The Reference Positions Of The Camshaft
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) detects the flywheel position for TDC using the signal from the engine speed (RPM) sensor. The diagnostic trouble code (DTC) is stored if the engine control module (ECM) is unable to detect TDC at the flywheel. The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- The control module uses the signal from the camshaft position (CMP) sensor if the camshaft position (CMP) sensor has been adapted
- Variable valve timing control is blocked.

Possible Source

- Signal interference
- Contact resistance in the terminals
- Incorrectly installed engine speed (RPM) sensor
- Intermittent fault causes in the engine speed (RPM) sensor wiring.

Fault symptom[s]

- The engine is difficult to start
- Poor performance.

SIGNAL MISSING

CHECKING COMPONENTS AND WIRING

Check the engine speed (RPM) sensor connector. Check for intermittent contact resistance and oxidation.

HINT: The engine speed (RPM) sensor and its wiring are sensitive to interference from surrounding cables, the starter motor cable for example, or similar high amperage cables.

Interference can cause difficulty in starting the engine, prevent the engine starting at all, or cause intermittent operation of the tachometer, etc.

Check whether any cables with high power consumption are incorrectly installed, i. e. too close to the engine speed (RPM) sensor or its wiring.

Remedy as necessary.

Other information

- For B5xx4T, see **REPLACING THE ENGINE SPEED (RPM) SENSOR**
- For B6xx4T, see **ENGINE SPEED (RPM) SENSOR, REPLACING** .

see **SIGNAL MISSING**

ECM-500C: ENGINE SPEED (RPM) SENSOR SIGNAL. SIGNAL TOO HIGH (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-500C

Condition

Fig. 255: Detecting The Reference Positions Of The Camshaft
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) counts the number of teeth on the flywheel using the signal for the engine speed (RPM) sensor. The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects at least one tooth too many during a certain number of engine revolutions. The diagnostic trouble code (DTC) can

be diagnosed when the engine is running.

Substitute Value

- The engine control module (ECM) uses the signal from the camshaft position (CMP) sensor if the camshaft position (CMP) sensor has been adapted
- Variable valve timing control is blocked.

Possible Source

- Signal interference
- Damaged flywheel or ring gear.

Fault symptom[s]

- The engine is difficult to start
- Poor performance.

SIGNAL TOO HIGH

CHECKING THE COMPONENT AND WIRING

- Check the engine speed (RPM) sensor connector. Check for intermittent contact resistance and oxidation.

  HINT: The engine speed (RPM) sensor and its wiring are sensitive to interference from surrounding cables, the starter motor cable for example, or similar high amperage cables.

  Interference can cause difficulty in starting the engine, prevent the engine starting at all, or cause intermittent operation of the tachometer, etc.

  Check whether any cables with high power consumption are incorrectly installed, i. e. too close to the engine speed (RPM) sensor or its wiring.

ECM-500D: ENGINE SPEED (RPM) SENSOR SIGNAL. SIGNAL TOO LOW (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-500D

Condition

Fig. 260: Detecting The Reference Positions Of The Camshaft
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) counts the number of teeth on the flywheel using the signal for the engine speed (RPM) sensor. The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects at least one tooth too few during a certain number of engine revolutions. The diagnostic trouble code (DTC) can

be diagnosed when the engine is running.

Substitute Value

- The control module uses the signal from the camshaft position (CMP) sensor if the camshaft position (CMP) sensor has been adapted
- Variable valve timing control is blocked.

Possible Source

- Signal interference
- Incorrectly installed engine speed (RPM) sensor
- Damaged flywheel or ring gear.

Fault symptom[s]

- The engine is difficult to start
- Poor performance.

SIGNAL TOO LOW

CHECKING COMPONENTS

Check that the engine speed (RPM) sensor is correctly installed.

Check the engine speed (RPM) sensor connector. Check for intermittent contact resistance and oxidation.

HINT: The engine speed (RPM) sensor and its wiring are sensitive to interference from surrounding cables, the starter motor cable for example, or similar high amperage cables.

Interference can cause difficulty in starting the engine, prevent the engine from starting at all or cause the tachometer to flicker during start attempts etc.

Causes of interference can be:

- nearby cables, such as an incorrectly routed cable for the starter motor
- incorrectly tightened bolted joints securing the transmission to the engine.

Checking power cable

Check for incorrectly routed cables (routed too close to the engine speed (RPM) sensor).

Checking bolted joints

When removing and installing the transmission it is important that all the bolts for the engine are correctly tightened. Incorrectly tightened bolts can cause poor ground connection and interfere with the engine speed

(RPM) sensor. Check that all the bolts from the transmission to the engine are correctly tightened.

Checking the wiring

Check the signal cable between the engine speed (RPM) sensor terminal #1 and engine control module (ECM) terminal #A48 (#A48) and between the engine speed (RPM) sensor terminal #2 and engine control module (ECM) terminal #A66 (#B6). Check for an intermittent short-circuit to supply voltage. Check for an intermittent short-circuit to ground. Check for an intermittent open-circuit.

Other information:

- see **CHECKING WIRING AND TERMINALS**
- For B5xx4T, see **REPLACING THE ENGINE SPEED (RPM) SENSOR**
- For B6xx4T, see **ENGINE SPEED (RPM) SENSOR, REPLACING** .

Remedy as necessary.

ECM-5100: MALFUNCTION INDICATOR LAMP (MIL), TCM. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-5100

Condition

One or more diagnostic trouble codes (DTCs) which affect emissions are stored in the transmission control module (TMC).

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the transmission control module (TCM) has transmitted a request to light the malfunction indicator lamp (MIL).

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- None.

Possible Source

- Fault trace the transmission control module (TCM).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULT-TRACING INFORMATION

INFORMATION

No fault-tracing has been developed for this diagnostic trouble code (DTC). A diagnostic trouble code (DTC) for this fault is stored in the transmission control module (TCM) first and then in the engine control module (ECM). This diagnostic trouble code (DTC) can not be erased before the diagnostic trouble code (DTC) in the transmission control module (TCM) has been erased and remedied.

First read off the diagnostic trouble codes (DTCs) in the transmission control module (TCM). Fault-trace and

remedy as required. This diagnostic trouble code (DTC) can then be erased.

ECM-510F: VEHICLE SPEED SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) ECM-510F (no signal) is stored if there is no communication between the ABS/brake control module (BCM) and the engine control module (ECM) or if the communication is distorted. An error message is sent to the engine control module (ECM) and diagnostic trouble code (DTC) ECM-510F (signal too high / too low) is stored in the engine control module (ECM). Diagnostic trouble codes (DTCs) for the vehicle speed sensor (VSS) signal are stored in the ABS / brake control module (BCM).

Substitute Value

The vehicle speed signal from the ABS / brake control module (BCM) is set to 0 km/h

Possible Source

Signal too high / low:

- defective vehicle speed signal to the ABS / brake control module (BCM) A diagnostic trouble code (DTC) is stored in the ABS / brake control module (BCM).

Signal missing:

- contact resistance in the Controller area network (CAN) terminals
- open-circuit in one or both CAN cables
- one or both signal cables short-circuited to ground, voltage or each other
- defective ABS / brake control module (BCM)
- defective engine control module (ECM).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULT-TRACING INFORMATION

ECM-512B: MALFUNCTION INDICATOR LAMP (MIL) COMMUNICATION. SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-512B

Condition

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers a fault in the CAN communication between the transmission control module (TCM) and the engine control module (ECM).

The diagnostic trouble code (DTC) is diagnosed with the engine running and with battery voltage above 10.5 V.

Substitute Value

- None.

Possible Source

- Open-circuit in the control area network (CAN) wiring
- Short-circuit between the control area network (CAN) wiring

- Internal fault in the engine control module (ECM)
- Internal fault in the transmission control module (TCM)
- Internal fault in another control module in the same part of the control area network (CAN).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- No accelerator pedal (AP) response.

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-5130**

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-513B: MALFUNCTION INDICATOR LAMP (MIL), TRANSMISSION CONTROL MODULE (TCM). SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-513B

Condition

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the transmission control module (TCM) has transmitted a request to save the frozen values.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- None.

Possible Source

- Fault trace the transmission control module (TCM).

Fault symptom[s]

- Varies depending on the diagnostic trouble code (DTC) stored in the transmission control module (TCM).

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-513B: MALFUNCTION INDICATOR LAMP (MIL), TRANSMISSION

CONTROL MODULE (TCM). SIGNAL MISSING (B6294T; 2005-2006)

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-5200: ENGINE SPEED (RPM) SENSOR. FAULTY SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The control module calculates the number of teeth on the flywheel using the engine speed (RPM) sensor. Diagnostic trouble code (DTC) ECM-5200 is stored if the control module detects at least one tooth too many (Signal too high) or one tooth too few (Signal too low).

The control module detects the position of the flywheel for top dead center (TDC) using the signal from the speed sensor. Diagnostic trouble code (DTC) ECM-5200 is stored if the control module is unable to detect top dead center (TDC) on the flywheel (Faulty signal) or if the reference position for TDC is missing sporadically (Signal missing).

Substitute Value

- The control module uses the signal from the camshaft position (CMP) sensor if the camshaft position (CMP) sensor has been adapted
- Variable valve timing control is blocked
- Engine speed (RPM) is limited.

Possible Source

Signal too high:

- Signal interference.

Signal too low:

- Incorrectly installed engine speed (RPM) sensor
- Defective flywheel or ring gear.

Faulty signal:

- Signal interference
- Contact resistance in the terminals
- Incorrectly installed engine speed (RPM) sensor
- Intermittent faults in the wiring for the engine speed (RPM) sensor.

Signal missing:

- Signal interference
- Contact resistance and oxidation.

Fault symptom[s]

- Engine difficult to start
- Poor driveability.

FAULTY SIGNAL

CHECKING COMPONENTS

Check that the engine speed (RPM) sensor is correctly installed.

Check the engine speed (RPM) sensor connector. Check for intermittent contact resistance and oxidation.

The engine speed (RPM) sensor is sensitive to interference from surrounding power cables, the starter motor cable for example, or similar high amperage cables. This occurs when starting the engine for example.

Interference can cause difficulty in starting the engine, the engine does not start at all, the tachometer flickers at start attempts etc.

Causes of interference can be:

- surrounding power cables, for example an incorrectly routed starter motor cable
- incorrectly routed transmission bolted joints for the engine.

Checking the power cable

Check for incorrectly routed power cables (routed too close to the engine speed (RPM) sensor).

Checking the bolted joints

When removing and installing the transmission it is important that all the bolts for the engine are correctly tightened. Incorrectly tightened bolts can cause poor ground connection and interfere with the engine speed (RPM) sensor. Check that all the bolts from the transmission to the engine are correctly tightened.

Checking the wiring

Check the signal cable between the engine speed (RPM) sensor terminal #1 and engine control module (ECM) terminal #A48 (#A48) and between the engine speed (RPM) sensor terminal #2 and engine control module (ECM) terminal #A66 (#B6). Check for an intermittent short-circuit to supply voltage. Check for an intermittent short-circuit to ground. Check for an intermittent open-circuit.

Other information:

- see **CHECKING WIRING AND TERMINALS**
- For B5xx4T, see **REPLACING THE ENGINE SPEED (RPM) SENSOR**
- For B6xx4T, see **ENGINE SPEED (RPM) SENSOR, REPLACING** .

Remedy as necessary

SIGNAL MISSING

CHECKING INTERFERENCE TO THE ENGINE SPEED (RPM) SENSOR

Check the engine speed (RPM) sensor connector. Check for contact resistance and oxidation.

The engine speed (RPM) sensor is sensitive to interference from surrounding power cables, the starter motor cable for example, or similar high amperage cables. This occurs when starting the engine for example.

Interference can cause difficulty in starting the engine, the engine does not start at all, the tachometer flickers at start attempts etc.

Causes of interference can be:

- surrounding power cables, for example an incorrectly routed starter motor cable
- incorrectly routed transmission bolted joints for the engine.

Checking the power cable

Check for incorrectly routed power cables (routed too close to the engine speed (RPM) sensor).

Checking the bolted joints

When removing and installing the transmission it is important that all the bolts for the engine are correctly tightened. Incorrectly tightened bolts can cause poor ground connection and interfere with the engine speed (RPM) sensor. Check that all the bolts from the transmission to the engine are correctly tightened.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-5200: AIR CONDITIONING (A/C) PRESSURE SENSOR. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-5200

Condition

Fig. 278: Identifying Air Conditioning (A/C) Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the pressure in the air conditioning (A/C) system has not increased for a certain time following activation of the air conditioning (A/C) compressor.

The diagnostic trouble code (DTC) can be diagnosed while the engine is running and air conditioning (A/C) control is active.

Substitute Value

- None.

Possible Source

- Damaged A/C pressure sensor
- Low pressure in the air conditioning (A/C) system.

Fault symptom[s]

- The air conditioning (A/C) system does not operate.

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-5200: AIR CONDITIONING (A/C) PRESSURE SENSOR. FAULTY SIGNAL (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-5200

ECM-520B: AIR CONDITIONING (A/C) PRESSURE SENSOR. SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-520B

Condition

Fig. 279: Identifying Air Conditioning (A/C) Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that there is no signal from the air conditioning (A/C) pressure sensor.

The diagnostic trouble code (DTC) can be diagnosed while the engine is running and while air conditioning (A/C) control is active.

Substitute Value

- Predefined value for the air conditioning pressure.

Possible Source

- Open-circuit in the signal cable
- Damaged A/C pressure sensor.

Fault symptom[s]

- The air conditioning (A/C) system does not operate.

SIGNAL MISSING. PERMANENT FAULT

see **SIGNAL MISSING. PERMANENT FAULT**

ECM-520C: AIR CONDITIONING (A/C) PRESSURE SENSOR. SIGNAL TOO HIGH (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-520C

Condition

Fig. 280: Identifying Air Conditioning (A/C) Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the signal from the air conditioning (A/C) pressure sensor is higher than the normal operating range.

The diagnostic trouble code (DTC) can be diagnosed while the engine is running and while air conditioning (A/C) control is active.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the signal cable
- Open-circuit in the power supply
- Open-circuit in the ground lead
- Damaged A/C pressure sensor.

Fault symptom[s]

- The air conditioning (A/C) system does not operate.

ECM-5300: VEHICLE SPEED SIGNAL. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-5300

Condition

Internal functions in the engine control module (ECM) check important parameters.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects an incorrect parameter.

The diagnostic trouble code (DTC) can be diagnosed when driving under specific driving conditions.

Substitute Value

- None.

Possible Source

- Damaged engine control module (ECM).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULTY SIGNAL

PROGRAMMING/REPLACING THE ENGINE CONTROL MODULE (ECM)

Fig. 282: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  The engine control module (ECM) has registered an internal fault or a fault in the software. Try downloading new software into the control module. To download new software or replace the engine control module (ECM).

  see **ENGINE CONTROL MODULE (ECM), REPLACING** .

  If software cannot be downloaded or new software does not solve the problem, replace the engine control module (ECM) and download the relevant software to the new control module.

  NOTE: After downloading new software or replacing the engine control module (ECM), the throttle unit must be adapted by performing "Throttle unit

adaptation" using VIDA (Volvo scan tool).

Remedy as necessary.

ECM-530B: CONTROL MODULE COMMUNICATION (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) ECM-530B is stored if a communication fault between the engine control module (ECM) and the transmission control module (TCM) is detected

Substitute Value

none

Possible Source

- communication problems in the CAN network
- defective transmission control module (TCM)
- defective engine control module (ECM).

Fault symptom[s]

- No response from the accelerator pedal (AP).

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-530B: VEHICLE SPEED SIGNAL. SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-530B

Condition

ECM-530D: DIAGNOSTIC TROUBLE CODE (DTC) IN ANOTHER CONTROL MODULE (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 284: Identifying Ignition In Off Position
Courtesy of VOLVO CARS CORPORATION

This diagnostic trouble code (DTC) indicates whether there are one or more emission related diagnostic trouble codes (DTCs) stored in the automatic transmission control module (TCM). Diagnostic trouble code (DTC) ECM-530D is stored if this control module requests that the engine management system lights the malfunction indicator lamp (MIL)

Substitute Value

none

Possible Source

- one or more diagnostic trouble codes (DTCs) stored in automatic transmission control module (TCM).

Fault symptom[s]

- varies depending on which diagnostic trouble code (DTC) has been stored.

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-530D: SPEED SIGNAL. SIGNAL TOO LOW (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-530D

Condition

Internal functions in the engine control module (ECM) check important parameters.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the speed has not changed over a certain number of seconds.

Substitute Value

- None.

Possible Source

- Faulty speed signal from the brake control module (BCM)
- Faulty speed signal from the transmission control module (TCM).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-530D: SPEED SIGNAL. SIGNAL TOO LOW (B6294T; 2005-2006)

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 298: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 299: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reconnect the connectors, reinstall components etc.
- Ignition on
- Read off the oil level sensor signal.

  Check that all three values for oil level, oil temperature and oil grade are between 17-83%. The fault has been remedied if all the values are OK.

Fig. 300: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Are these values OK?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-540C: OIL GRADE, LEVEL AND TEMPERATURE SENSOR. SIGNAL TOO HIGH (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-540C

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-540C**

SIGNAL TOO HIGH

see **SIGNAL TOO HIGH**

ECM-540D: OIL GRADE, LEVEL AND TEMPERATURE SENSOR. SIGNAL TOO LOW (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-540D

Condition

Fig. 301: Identifying Oil Level Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal from the oil level sensor. The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the signal from the oil level sensor is too low.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the signal cable
- Damaged oil level sensor.

Fault symptom[s]

- None.

SIGNAL TOO LOW

CHECKING THE STATUS

Fig. 302: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Read off the oil level sensor signal.

  Check that all three values for oil level, oil temperature and oil grade are between 17-83%. The fault is intermittent at the moment if all the values are OK.

Fig. 303: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING THE WIRING**

CHECKING THE WIRING

Check the signal cable between engine control module (ECM) terminal #A40 and oil level sensor terminal #1. Check for a short-circuit to ground.

HINT: With the ignition on, the voltage between terminals #2 and #3 must be 5 V, with the reading taken at the oil level sensor connector.

Try a new oil level sensor if no fault is found and the fault is permanent.

Remedy as necessary.

Other information:

- see **CHECKING WIRING AND TERMINALS**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**

- For 5 cylinder turbocharged engines 2005-, see **SIGNAL SPECIFICATION** .
- To access or replace the oil level sensor, see **OIL LEVEL SENSOR, REPLACING** .

ECM-5500: OIL LEVEL. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-5500

Condition

Fig. 309: Identifying Oil Level Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal from the oil level sensor. The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the signal from the oil level sensor is outside a reasonable operating range.

The diagnostic trouble code (DTC) can diagnosed after a number of different criteria (engine speed (RPM), vehicle speed, etc.) have been reached.

Substitute Value

- None.

Possible Source

- Engine oil leak
- Loose connections, contact resistance or oxidation in the terminals
- Damaged oil level sensor.

Fault symptom[s]

- Warning lights and chimes/Oil pressure indication/no indication

FAULTY SIGNAL

CHECKING FOR OIL LEAKAGE AND REPLACING THE COMPONENT

NOTE: If diagnostic trouble codes (DTCs) ECM-540X and ECM-550X are stored at the same time, codes ECM-540X must be remedied first.

- Checking the engine for oil leakage
- Also check the oil level sensor connector. Check for loose connections, contact resistance or oxidation.

  HINT: This diagnostic trouble code (DTC) may be stored if the engine oil is significantly mixed with fuel or coolant for example.

  Try a new oil level sensor if no fault is found and the fault is permanent.

  Remedy as necessary.

  Other information:

  - To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
  - For 5 cylinder turbocharged engines 2005-, see **SIGNAL SPECIFICATION** .
  - For 6 cylinder engines 2005-, see **SIGNAL SPECIFICATION** .

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-550D

Condition

Fig. 314: Identifying Oil Level Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal from the oil level sensor. The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the signal from the oil level sensor is outside a reasonable operating range.

The diagnostic trouble code (DTC) is diagnosed when the engine is idling.

Substitute Value

- None.

Possible Source

- Extremely low oil level
- Damaged oil level sensor.

Fault symptom[s]

- Warning lights and chimes/Oil pressure indication/no indication

SIGNAL TOO LOW

CHECKING THE OIL LEVEL AND REPLACING THE COMPONENT

NOTE: If diagnostic trouble codes (DTCs) ECM-540X and ECM-550X are stored at the same time, codes ECM-540X must be remedied first.

- Check that the oil level in the engine is not too low. Ensure that the level is correct.

  HINT: This diagnostic trouble code (DTC) may be stored if the engine oil is significantly mixed with fuel or coolant for example.

  Try a new oil level sensor if no fault is found and the fault is permanent.

  Remedy as necessary.

  Other information:

ECM-6000: AIR CONDITIONING (A/C) RELAY SIGNAL. SIGNAL MISSING. INTERMITTENT FAULT (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 319: Identifying A/C Relay
Courtesy of VOLVO CARS CORPORATION

- Diagnostic trouble code (DTC) ECM-6000 is stored if the signal from the A/C relay is too high, too low or missing.

Substitute Value

- None

Possible Source

Signal too high:

- short-circuit to supply voltage in the signal cable
- defective air conditioning (A/C) relay.

Signal too low:

- short-circuit to ground in the signal cable

Signal missing:

- open-circuit in signal cable
- open-circuit in air conditioning (A/C) relay supply
- defective air conditioning (A/C) relay.
- contact resistance in terminals

Fault symptom[s]

- Air conditioning (A/C) system does not operate

SIGNAL MISSING. INTERMITTENT FAULT

CHECKING WIRING AND CONNECTORS

Check the connector for the air conditioning (A/C) relay. Check for contact resistance and oxidation. Check for loose connections.

Check the signal cable between control module terminal #B44 and air conditioning (A/C) relay terminal #4. Check the power supply between system relay terminal #3 and A/C relay terminal #2. Check for an intermittent open-circuit.

Other information

- To connect the breakout box / access the control module, see **CONNECTING THE BREAKOUT BOX**
- For 5 cylinder turbocharged engines -2004, see **SIGNAL DESCRIPTION**
- For 6 cylinder engines 2005-, see **SIGNAL SPECIFICATION** .

SIGNAL MISSING. PERMANENT FAULT

CHECKING THE CONNECTOR

Fig. 323: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 324: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the air conditioning (A/C) relay connector. Check for contact resistance and oxidation
- Reinstall the components, reconnect the connectors etc.
- Ignition on
- Activate the air conditioning (A/C) relay.

  A " clicking sound" should be heard when the air conditioning (A/C) relay is activated.

  If the air conditioning (A/C) relay is now OK, the cause of the fault was loose connections in the connector.

  Other information

- For 5 cylinder turbocharged engines -2004, see **SIGNAL DESCRIPTION**
- For 6 cylinder engines -2004, see **SIGNAL SPECIFICATION**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 327: Identifying A/C Relay
Courtesy of VOLVO CARS CORPORATION

Does the air conditioning (A/C) relay function?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Check the resistance of the air conditioning (A/C) relay. At +20°C the resistance must be approximately 96 ohms between terminals #2 and #4. For the resistance values, see **COMPONENT SPECIFICATIONS** .

Check the signal cable between control module terminal #B44 and air conditioning (A/C) relay terminal #4. Check the power supply between system relay terminal #3 and A/C relay terminal #2. Check for an open-circuit. Check for a short-circuit to ground.

Remedy as necessary.

Other information

ECM-600B: TURBOCHARGER (TC) CONTROL VALVE. SIGNAL MISSING. INTERMITTENT FAULT (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-600B

Condition

Fig. 11: Identifying Turbocharger Control Valve
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal cable for the turbocharger (TC) control valve.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects an open-circuit in the signal cable for the turbocharger (TC) control valve.

The diagnostic trouble code (DTC) can be diagnosed during control of the boost pressure.

Substitute Value

- None.

Possible Source

- Open-circuit in the signal cable
- Open-circuit in the power cable
- Damaged turbocharger (TC) control valve.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL MISSING. INTERMITTENT FAULT

CHECKING THE COMPONENT, WIRING AND CONNECTOR

Check turbocharger (TC) control valve connector for intermittent contact resistance or oxidation according to **CONTACT RESISTANCE AND OXIDATION** and intermittent loose connections according to **CONTACT RESISTANCE AND OXIDATION** .

Check signal cable between engine control module (ECM) #A38 (#A38) and turbocharger (TC) control valve #2 for an intermittent open-circuit according to **OPEN-CIRCUIT, INTERMITTENT FAULTS** .

Check power supply turbocharger (TC) control valve between turbocharger (TC) control valve #1 and system relay for an intermittent open-circuit according to **OPEN-CIRCUIT, INTERMITTENT FAULTS** .

Remedy as necessary

Other information

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX** .
- To access/replace the turbocharger (TC) control valve, see **REPLACING THE TURBOCHARGER (TC) CONTROL VALVE** .
- Turbocharger (TC) control valve #1 has power supply via the system relay.

ECM-600C: TURBOCHARGER (TC) CONTROL VALVE. SIGNAL TOO HIGH. INTERMITTENT FAULT (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-600C

Condition

Fig. 25: Identifying Turbocharger Control Valve
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal cable for the turbocharger (TC) control valve.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the voltage in the signal cable from the turbocharger (TC) control valve is too high.

The diagnostic trouble code (DTC) can be diagnosed during control of the boost pressure.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the signal cable
- Damaged turbocharger (TC) control valve.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL TOO HIGH. INTERMITTENT FAULT

CHECKING COMPONENT AND WIRING

Check cables between engine control module (ECM) #A38 (#A38) and turbocharger (TC) control valve #2 for an intermittent short-circuit to supply voltage according to **SHORT-CIRCUIT TO SUPPLY VOLTAGE, INTERMITTENT FAULTS** .

Remedy as necessary

Other information

ECM-601C: TURBOCHARGER (TC) CONTROL SYSTEM, BOOST PRESSURE FAULT. SIGNAL TOO HIGH (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-601C

Condition

Fig. 45: Identifying Turbocharger Control Valve
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the function of the turbocharger (TC) control system.

The diagnostic trouble code (DTC) is stored if the pressure measured by the boost pressure sensor is higher than a calculated desired value. This is interpreted as a fault by the control module.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- Reduced throttle angle.

Possible Source

- Damaged turbocharger (TC) control valve
- The hoses between the pressure servo for the boost pressure control (BPC) valve and the turbocharger (TC) control valve have come loose or are blocked or damaged
- The hoses between the turbocharger (TC) control valve and the charge air pipe (between the turbocharger (TC) and the charge air cooler (CAC)) are blocked or damaged
- Pressure servo for the boost pressure control (BPC) valve is incorrectly adjusted
- Damaged boost pressure control (BPC) valve pressure servo
- Sticking boost pressure control (BPC) valve.

Fault symptom[s]

- Poor performance.

SIGNAL TOO HIGH

CHECKING HOSES AND THE TURBOCHARGER (TC) CONTROL VALVE

Check the hoses between the pressure servo for the boost pressure control (BPC) valve and the turbocharger (TC) control valve. Check that the hoses are not trapped, blocked or damaged.

Check the hoses between the turbocharger (TC) control valve and the charge air pipe (between the turbocharger (TC) and the charge air cooler (CAC)). Check that the hoses are not trapped, blocked or damaged.

Check the turbocharger (TC) control valve by activating it. The turbocharger (TC) control valve must click when it is activated.

5 cylinder engines:

Check the setting of the pressure servo for the boost pressure control (BPC) valve. Check the boost pressure control (BPC) valve. Check that the pressure servo and the boost pressure control (BPC) valve are functioning correctly and are not sticking:

see **WASTEGATE VALVE, ADJUSTING**

6 cylinder engines:

Check the setting of the pressure servo for the boost pressure control (BPC) valve. Check the boost pressure control (BPC) valve. Check that the pressure servo and the boost pressure control (BPC) valve are functioning

correctly and are not sticking:

see **PRESSURE REGULATOR, CHECKING/ADJUSTING**

Other information:

- see **REPLACING THE TURBOCHARGER (TC) CONTROL VALVE** .

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-602D

Condition

Fig. 50: Identifying Turbocharger Control Valve
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the function of the turbocharger (TC) control system.

The diagnostic trouble code (DTC) is stored if the control module deployment of the turbocharger (TC) control valve is high (the control module requests maximum boost pressure) and the measured boost pressure (from the boost pressure sensor) is lower than a calculated desired value.

The diagnostic trouble code (DTC) can be diagnosed when the engine speed (RPM) and load are above a certain value.

Substitute Value

- Reduced boost pressure.

Possible Source

- Air leakage in the intake system.
- Damaged turbocharger (TC) control valve.
- Incorrect adjustment of the pressure servo for the boost pressure control (BPC) valve
- Sticking boost pressure control (BPC) valve.
- Damaged turbo charger (TC).

Fault symptom[s]

- Poor performance.

SIGNAL TOO LOW

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-6100: ENGINE COOLING FAN (FC) CONTROL MODULE. FAULTY SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-6100

Condition

Fig. 61: Identifying Electronic Control Module
Courtesy of VOLVO CARS CORPORATION

Diagnostic Trouble Code (DTC) ECM-6100 is stored in the engine control module (ECM) if the engine cooling fan (FC) control module registers that the fan blades are obstructed or that there is no power supply. The diagnostic trouble code (DTC) is also stored if an internal fault in the engine cooling fan (FC) control module is registered. The diagnostic trouble code (DTC) is diagnosed when the engine is idling.

NOTE: **The electric cooling fan may have a post-running time of up to approx. 6 minutes after the engine has been shut off. The time for the electric cooling fan's post-running depends on the engine's temperature, temperature in the engine compartment as well as the pressure level in the AC system.**

Substitute Value

- Engine cooling fan (FC) switched off.

Possible Source

Signal too low:

- Contact resistance or oxidation in the connectors
- Supply voltage missing to the engine cooling fan (FC) control module
- Open-circuit or short-circuit to ground in the wiring
- Defective engine fan control module.

Signal too high:

- Obstructed fan blade
- Defective engine fan control module.

Signal missing:

- Defective engine fan control module.

Faulty signal:

- Defective engine fan control module.

Fault symptom[s]

- Overheating engine.
- Electric cooling fan does not operate

FAULTY SIGNAL

CHECKING THE COMPONENT

Fig. 62: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Check that the engine cooling fan (FC) blade rotates easily. Check that nothing is obstructing the engine cooling fan (FC) blade.
- Remedy as necessary.
- Ignition on.

- Check all speeds of the engine cooling fan (FC).

  Activate the engine cooling fan (FC) using the VCT2000 (or appropriate scan tool).

Fig. 63: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 64: Identifying Engine Fan Control Module

- Ignition off.

CAUTION: Avoid touching the pins in the control module and the corresponding connector on the cable harness. There is a risk of static discharge which could damage the control module. Discharge yourself and tools to be used by holding the tool's metal part and touching a body part on the car just before starting to work.

If the engine cooling fan (FC) cannot be activated at any speed:

- Check the fuse, power supply cable and ground lead for the engine cooling fan (FC).
- Check the connector and wiring between the engine control module (ECM) and engine cooling fan (FC) module. Check for damage. Check for an open circuit. Check for a short circuit.

If the engine cooling fan (FC) can be activated at one or more speeds:

- Check the connectors to the engine cooling fan (FC) control module and Engine Control Module (ECM). Check for damage to pins and connections.
- Also check other connectors and connections that connect cables between Engine Control Module (ECM) and the control module for electric cooling fan.
- Check the wiring between the engine control module (ECM) and the engine cooling fan (FC) module. Check for damage.

Remedy as necessary.

- Ignition off.

CAUTION: Avoid touching the pins in the control module and the corresponding connector on the cable harness. There is a risk of static discharge which could damage the control module. Discharge yourself and tools to be used by holding the tool's metal part and touching a body

part on the car just before starting to work.

If the engine cooling fan (FC) cannot be activated at any speed:

- Check the fuse, power supply cable and ground lead for the engine cooling fan (FC).
- Check the connector and wiring between the engine control module (ECM) and engine cooling fan (FC) module. Check for damage. Check for an open circuit. Check for a short circuit.

If the engine cooling fan (FC) can be activated at one or more speeds:

- Check the connectors to the engine cooling fan (FC) control module and Engine Control Module (ECM). Check for damage to pins and connections.
- Also check other connectors and connections that connect cables between Engine Control Module (ECM) and the control module for electric cooling fan.
- Check the wiring between the engine control module (ECM) and the engine cooling fan (FC) module. Check for damage.

Remedy as necessary.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-6110: CAMSHAFT POSITION CONTROL, INTAKE. SLOW (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-6110

Condition

Fig. 110: Identifying Camshaft Position Control
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks that control of the intake camshaft is quick enough. This means that the intake camshaft (actual value) reaches the position requested by the engine control module (ECM) quickly enough. The diagnostic trouble code (DTC) is stored if the requested position is not reached within a certain time.

The diagnostic trouble code (DTC) can be diagnosed by the engine control module (ECM) when the engine is running and the camshaft control is active.

Substitute Value

- None.

Possible Source

- Low oil pressure
- Poor oil quality

- Damaged reset valve
- Mechanical fault in the variable valve timing (VVT) unit.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SLOW/FAULTY

CHECKING THE STATUS

HINT: Diagnostic trouble code (DTC) may be caused by a damaged fuse. If the engine does not start, check the fuse for the power supply to the camshaft reset valve.

Fig. 111: Belt Routing / Engine Idling - Volvo

Courtesy of VOLVO CARS CORPORATION

- Start the engine
- Read off the value for the camshaft shift angle and the desired value for the camshaft shift angle
- Active the quick test of camshaft control by clicking the start button
- Increase the engine speed (RPM) to approximately 2500 RPM and keep the engine running at this speed.

  When the engine speed (RPM) increases, the control module will start the quick test to control the shift angle of the camshaft to the different target values. There is a fault if the control module does not operate the camshaft shift angle to the different target values.

  During the quick test, check that the shift angle of the camshaft (actual value) corresponds to the target values to an accuracy of ±10°. If the shift angle of the camshaft (target value) does not change, or if the actual value does not correspond to the target value, the function is faulty.

  Deviation between the values can be read off in the lower display.

  Carry out the check for approximately 15 seconds at an engine speed (RPM) of 2500 RPM. The test is completed when the shift angle of the camshaft returns to 0°. To restart the test, let the engine return to idle speed, then increase the engine speed to approximately 2500 RPM.

  The fault is intermittent if the function is OK.

  NOTE: The test is active until the ignition is switched off. Switch off the ignition before the vehicle is delivered to the customer.

Fig. 112: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING COMPONENTS**

CHECKING COMPONENTS

Check the level and quality of the engine oil. Check for contaminants in particular.

Check the engine oil pressure.

Remove the camshaft reset valve. Check the oil ducts for the cylinder head for the camshaft reset valve (intake) for blockages and dirt.

HINT: The fault can be caused by contaminants in the camshaft reset valve. Try cleaning the valve.

Remedy as necessary.

Try a new intake camshaft reset valve if the above remedy does not solve the fault.

HINT: The fault may also have been caused by an internal fault in the variable valve timing unit. The variable valve timing unit may be damaged if the above fault-tracing and corrective action do not remedy

the fault.

ECM-6110: ENGINE COOLING FAN (FC) RELAY. SIGNAL MISSING (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 116: Identifying Electronic Control Module
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-6110 is stored if the engine control module (ECM) registers a fault in the signal cable from the engine cooling fan (FC) control module.

NOTE: **The electric cooling fan may have a post-running time of up to approx. 6 minutes after the engine has been shut off. The time for the electric cooling fan's post-running depends on the engine's temperature, temperature in the engine compartment as well as the pressure level in the AC system.**

Substitute Value

- None.

Possible Source

Signal too high:

- Short-circuit to supply voltage in the signal cable
- Defective engine fan control module.

Signal too low:

- Short-circuit to ground in the signal cable
- Short-circuit to ground in the power supply cable
- Defective engine fan control module.

Signal missing:

- Contact resistance or oxidation in the connector
- Open-circuit in the signal cable
- Defective engine fan control module.

Fault symptom[s]

- Electric cooling fan does not operate
- The engine cooling fan (FC) runs continuously even when the ignition is switched off.

SIGNAL MISSING

CHECKING THE COMPONENT

Fig. 117: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Check that the engine cooling fan (FC) blade rotates easily. Check that nothing is obstructing the engine cooling fan (FC) blade.
- Remedy as necessary.
- Ignition on.
- Check all speeds of the engine cooling fan (FC).

  Activate the engine cooling fan (FC) using the VCT2000 (or appropriate scan tool).

- Check the connector and wiring between the engine control module (ECM) and engine cooling fan (FC) module. Check for damage. Check for an open circuit. Check for a short circuit.

If the engine cooling fan (FC) can be activated at one or more speeds:

- Check the connectors to the engine cooling fan (FC) control module and Engine Control Module (ECM). Check for damage to pins and connections.
- Also check other connectors and connections that connect cables between Engine Control Module (ECM) and the control module for electric cooling fan.
- Check the wiring between the engine control module (ECM) and the engine cooling fan (FC) module. Check for damage.

Remedy as necessary.

- Ignition off.

  CAUTION: Avoid touching the pins in the control module and the corresponding connector on the cable harness. There is a risk of static discharge which could damage the control module. Discharge yourself and tools to be used by holding the tool's metal part and touching a body part on the car just before starting to work.

  Replace the engine cooling fan (FC) control module if the engine cooling fan (FC) cannot be activated at all speeds and no faults have been found on wiring and connections.

  Remedy as necessary.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-611B: CAMSHAFT CONTROL, INTAKE. FAULTY (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-611B

Condition

Fig. 153: Identifying Camshaft Position Control
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks that the position of the intake camshaft (actual value) corresponds to the requested position (desired value).

The diagnostic trouble code (DTC) is stored if the requested position is not reached.

The diagnostic trouble code (DTC) is diagnosed by the engine control module (ECM) when the engine is running and the camshaft control is active.

Substitute Value

- None.

Possible Source

- Low oil pressure
- Poor oil quality
- Damaged reset valve
- Mechanical fault in the variable valve timing (VVT) unit.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SLOW/FAULTY

see **SLOW/FAULTY**

ECM-611B: CAMSHAFT CONTROL, INTAKE. FAULTY (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-611B

SLOW/FAULTY

see **SLOW/FAULTY**

ECM-612B: CAMSHAFT RESET VALVE, INTAKE. SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-612B

Condition

Fig. 154: Identifying Camshaft Position Control
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal cable for the reset valve for the intake camshaft.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects an open-circuit in the signal cable for the reset valve.

The diagnostic trouble code (DTC) can be diagnosed at ignition on and with the engine running.

Substitute Value

- None.

Possible Source

- Open-circuit in the signal cable
- Open-circuit in the power cable
- Damaged camshaft reset valve.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL TOO LOW OR SIGNAL MISSING

CHECKING THE STATUS

HINT: The diagnostic trouble code (DTC) may be caused by a defective fuse. If the engine does not start, check the fuse for the power supply to the camshaft reset valve.

Fig. 155: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start the engine
- Read off the value for the camshaft shift angle and the desired value for the camshaft shift angle
- Active the quick test of camshaft control by clicking the start button
- Increase the engine speed (RPM) to approximately 2500 RPM and keep the engine running at this speed.

When the engine speed (RPM) increases, the control module will start the quick test to control the shift angle of the camshaft to the different target values. There is a fault if the control module does not operate the camshaft shift angle to the different target values.

During the quick test, check that the shift angle of the camshaft (actual value) corresponds to the target values to an accuracy of ±10°. If the shift angle of the camshaft (target value) does not change, or if the actual value does not correspond to the target value, the function is faulty.

Deviation between the values can be read off in the lower display.

Carry out the check for approximately 15 seconds at an engine speed (RPM) of 2500 RPM. The test is completed when the shift angle of the camshaft returns to 0°. To restart the test, let the engine return to idle speed, then increase the engine speed to approximately 2500 RPM.

The fault is intermittent if the function is OK.

NOTE: **The test is active until the ignition is switched off. Switch off the ignition before the car is delivered to the customer.**

Fig. 156: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **CHECKING THE WIRING**

CHECKING THE WIRING

Check the fuse before the circuit. If the fuse is blown, check the circuit for a short-circuit to ground.

Check the resistance of the camshaft reset valve between terminals #1 and #2.

The resistance must be approximately 3.7 ohms.

Check the signal cable between engine control module (ECM) terminal #A13 (#A13) and camshaft reset valve terminal #2. Check for an open-circuit. Check for a short-circuit to ground.

Check the power supply cable between system relay terminal #5 and camshaft reset valve terminal #1. Check for an open-circuit.

HINT: With the ignition on and the reset valve and camshaft connector disconnected, the voltage at connector terminal #1 must be approximately $U_{bat.}$

Remedy as necessary.

ECM-6140: CAMSHAFT CONTROL, EXHAUST. SLOW (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-6140

Condition

Fig. 171: Identifying Camshaft Position Control
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks that control of the exhaust camshaft is quick enough. This means that the exhaust camshaft (actual value) reaches the position requested by the engine control module (ECM) quickly enough. The diagnostic trouble code (DTC) is stored if the requested position is not reached within a certain time.

The diagnostic trouble code (DTC) can be diagnosed while the engine is running and while camshaft control is active.

Substitute Value

- None.

Possible Source

- Low oil pressure
- Poor oil quality
- Damaged reset valve
- Mechanical fault in the variable valve timing (VVT) unit.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SLOW/FAULTY

CHECKING THE STATUS

HINT: Diagnostic trouble code (DTC) may be caused by a damaged fuse. If the engine does not start, check the fuse for the power supply to the camshaft reset valve.

Fig. 172: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start the engine
- Read off the value for the camshaft shift angle and the desired value for the camshaft shift angle
- Active the quick test of camshaft control by clicking the start button
- Increase the engine speed (RPM) to approximately 2500 RPM and keep the engine running at this speed.

  When the engine speed (RPM) increases, the control module will start the quick test to control the shift angle of the camshaft to the different target values. There is a fault if the control module does not operate the camshaft shift angle to the different target values.

  During the quick test, check that the shift angle of the camshaft (actual value) corresponds to the target values to an accuracy of ±10°. If the shift angle of the camshaft (target value) does not change, or if the actual value does not correspond to the target value, the function is faulty.

Deviation between the values can be read off in the lower display.

Carry out the check for approximately 15 seconds at an engine speed (RPM) of 2500 RPM. The test is completed when the shift angle of the camshaft returns to 0°. Let the engine return to idle speed to start the test again. Then increase the engine speed to approximately 2500 RPM.

The fault is intermittent if the function is OK.

NOTE: The test is active until the ignition is switched off. Switch off the ignition before the vehicle is delivered to the customer.

Fig. 173: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **CHECKING COMPONENTS**

CHECKING COMPONENTS

Check the level and quality of the engine oil. Check for contaminants in particular.

Check the engine oil pressure.

Remove the camshaft reset valve. Check the oil ducts for the cylinder head for the camshaft reset valve (exhaust) for blockages and dirt.

HINT: The fault can be caused by contaminants in the camshaft reset valve. Try cleaning the valve.

Remedy as necessary.

Try a new intake camshaft reset valve if the above remedy does not solve the fault.

HINT: The fault may also have been caused by an internal fault in the variable valve timing unit. The variable valve timing unit may be damaged if the above fault-tracing and corrective action do not remedy the fault.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-616B: CAMSHAFT RESET VALVE, EXHAUST. SIGNAL MISSING (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-616B

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-616B**

SIGNAL TOO LOW OR SIGNAL MISSING

see **SIGNAL TOO LOW OR SIGNAL MISSING**

ECM-616C: CAMSHAFT RESET VALVE, EXHAUST. SIGNAL TOO HIGH (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-616C

Condition

Fig. 186: Identifying Camshaft Position Control
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal cable for the reset valve for the exhaust camshaft.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the signal from the signal cable for the reset valve is too high.

The diagnostic trouble code (DTC) can be diagnosed at ignition on and with the engine running.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the signal cable
- Open-circuit in the power supply
- Damaged camshaft reset valve.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL TOO HIGH

CHECKING THE STATUS

Fig. 187: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start the engine
- Read off the value for the camshaft shift angle and the desired value for the camshaft shift angle
- Active the quick test of camshaft control by clicking the start button
- Increase the engine speed (RPM) to approximately 2500 RPM and keep the engine running at this speed.

  When the engine speed (RPM) increases, the control module will start the quick test to control the shift angle of the camshaft to the different target values. There is a fault if the control module does not operate the camshaft shift angle to the different target values.

During the quick test, check that the shift angle of the camshaft (actual value) corresponds to the target values to an accuracy of ±10°. If the shift angle of the camshaft (target value) does not change, or if the actual value does not correspond to the target value, the function is faulty.

Deviation between the values can be read off in the lower display.

Carry out the check for approximately 15 seconds at an engine speed (RPM) of 2500 RPM. The test is completed when the shift angle of the camshaft returns to 0°. To restart the test, let the engine return to idle speed, then increase the engine speed to approximately 2500 RPM.

The fault is intermittent if the function is OK.

NOTE: The test is active until the ignition is switched off. Switch off the ignition before the car is delivered to the customer.

Fig. 188: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **CHECKING THE WIRING**

CHECKING THE WIRING

Check the resistance of the camshaft reset valve between terminals #1 and #2.

The resistance must be approximately 3.7 ohms.

Check the signal cable between engine control module (ECM) terminal #A21 (#A21) and camshaft reset valve terminal #2. Check for a short-circuit to supply voltage.

Remedy as necessary.

ECM-6200: ENGINE COOLING FAN (FC) CONTROL MODULE. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-6200

Condition

Fig. 195: Engine Cooling Fan And Control Module
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the function of the engine cooling fan (FC). The diagnostic trouble code (DTC) is stored if an internal fault in the engine cooling fan (FC) is registered.

The diagnostic trouble code (DTC) can be diagnosed at ignition on or when the engine is running.

NOTE: **The electric cooling fan may have a post-running time of up to approx. 6 minutes after the engine has been shut off. The time for the electric cooling fan's post-running depends on the engine's temperature, temperature in the engine compartment as well as the pressure level in the AC system.**

Substitute Value

- Engine cooling fan (FC) switched off.

Possible Source

- Damaged engine cooling fan (FC).

Fault symptom[s]

- The engine cooling fan (FC) does not function.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-620D

Condition

Fig. 198: Engine Cooling Fan And Control Module
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the function of the engine cooling fan (FC). The diagnostic trouble code (DTC) is stored if an internal fault in the engine cooling fan (FC) is registered.

The diagnostic trouble code (DTC) can be diagnosed at ignition on or when the engine is running.

NOTE: **The electric cooling fan may have a post-running time of up to approx. 6 minutes after the engine has been shut off. The time for the electric cooling fan's post-running depends on the engine's temperature, temperature in the engine compartment as well as the pressure level in the AC system.**

Substitute Value

- Engine cooling fan (FC) switched off.

Possible Source

- Contact resistance or oxidation in the connectors
- No supply voltage to the engine cooling fan (FC) control module
- Open-circuit or short-circuit to ground in the wiring
- Damaged engine cooling fan (FC).

Fault symptom[s]

- The engine cooling fan (FC) does not function.

SIGNAL TOO LOW

see **SIGNAL TOO LOW**

SIGNAL TOO LOW

see **SIGNAL TOO LOW**

ECM-6220: ECU-BOX COOLING FAN. SIGNAL MISSING (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 199: Identifying Engine Cooling Fan (FC) Control Modules
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the control module detects a fault on the signal to the cooling fan motor for the control modules.

The signal is diagnosed at ignition on or engine running.

Substitute Value

None.

Possible Source

Signal too high:

- Short-circuit to supply voltage in the signal cable
- Damaged control module cooling fan.

Signal too low:

- Short-circuit to ground in the signal cable
- Damaged control module cooling fan.

Signal missing:

- Contact resistance in the terminals
- Open-circuit in the signal cable
- Open-circuit in the power cable
- Damaged control module cooling fan.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL MISSING

CHECKING THE WIRING

Check the fuse before the circuit. If the fuse is blown, check the circuit for a short-circuit to ground.

Check the power cable between the fuse of the circuit and terminal #1 of the control module cooling fan for open circuit.

Check the signal cable with regard to open circuit.

Take readings between:

- Engine Control Module (ECM) terminal #B48 (#B58) and terminal #2 of control module cooling fan.

If no faults are found via the aforementioned fault tracing, replace the control module cooling fan.

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**

ECM-6220: ENGINE COOLING FAN (FC). FAULTY SIGNAL (B5254T2; 2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-6220

Condition

Fig. 205: Identifying Engine Coolant Temperature (ECT) Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) monitors the engine temperature under different running conditions. If the signal from the engine temperature sensor corresponds to a temperature that is higher than a specific limit value despite a low engine load and speed, the control module interprets this as a fault and the diagnostic trouble code is stored.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- None.

Possible Source

- Insufficient coolant in cooling system.
- Clogged radiator.
- Damaged engine cooling fan (FC) control module.
- Contact resistance or oxidation in the connectors.
- Damaged engine coolant temperature (ECT) sensor.

Fault symptom[s]

- Malfunction indicator light (MIL), on
- Engine is difficult to start

FAULTY SIGNAL

INFORMATION

The diagnostic trouble code (DTC) may for example be stored when:

- Insufficient coolant in cooling system.
- Clogged radiator.

These should therefore be checked and rectified first.

Refer to **VERIFICATION**

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 214: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 215: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Verification should begin with a cold engine (+20 °C) so that the engine coolant temperature (ECT) sensor can be tested over as wide a temperature range as possible
- Ignition off
- Reconnect the connectors, reinstall components etc.
- Start the engine.

  Read off the engine coolant temperature (ECT) sensor signal.

  Check that the engine coolant temperature (ECT) is within its permitted range and corresponds with the engine warming up.

Fig. 216: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the temperature within its permitted range?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

ECM-630C: A/C RELAY. SIGNAL TOO HIGH. INTERMITTENT FAULT (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-630C

Condition

Fig. 218: Identifying A/C Relay
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal cable for controlling the air conditioning (A/C) relay.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the signal from the signal cable for the air conditioning (A/C) relay is too high.

The diagnostic trouble code (DTC) can be diagnosed at ignition on and with the engine running.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the signal cable
- Open-circuit in the power supply
- Damaged air conditioning (A/C) relay.

Fault symptom[s]

- The air conditioning (A/C) system does not operate.

ECM-6400: CAMSHAFT RESET VALVE, INTAKE SIGNAL TOO HIGH (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 220: Identifying Camshaft Position Control
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-6400 (camshaft intake) or ECM-6410 (camshaft exhaust) is stored if the engine control module (ECM) registers that the signal from the camshaft reset valve is too low or missing or is too high.

Substitute Value

- Shutting off the variable camshaft.

Possible Source

Signal too high

- Short-circuit to supply voltage in the signal cable

- Defective camshaft reset valve.

Signal too low or signal missing

- Contact resistance in the terminals
- Open-circuit in the signal cable
- Short-circuit to ground in the signal cable
- Open-circuit in the voltage supply cable
- Defective camshaft reset valve.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- The engine does not start.

SIGNAL TOO HIGH

see **SIGNAL TOO HIGH**

ECM-6400: CAMSHAFT RESET VALVE, INTAKE SIGNAL TOO LOW OR SIGNAL MISSING (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

SIGNAL TOO LOW OR SIGNAL MISSING

see **SIGNAL TOO LOW OR SIGNAL MISSING**

ECM-640A: CAMSHAFT CONTROL, INTAKE. FAULTY SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 221: Identifying Camshaft Position Control
Courtesy of VOLVO CARS CORPORATION

When camshaft control is active, the control module checks the position of the camshaft in relation to the position of the crankshaft.

Diagnostic trouble code (DTC) ECM-640A (camshaft intake) or ECM-641A (camshaft exhaust) is stored if the position of the camshaft deviates from the requested position in relation to the crankshaft over a certain amount of time.

Substitute Value

None.

Possible Source

Faulty control:

- Low oil pressure
- Poor oil quality
- Defective reset valve
- Mechanical fault in the variable valve timing (VVT) unit.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULTY SIGNAL

CHECKING THE STATUS

HINT: The diagnostic trouble code (DTC) may be caused by a defective fuse. If the engine does not start, check the fuse for the power supply to the camshaft reset valve.

Fig. 222: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start the engine
- Read off the value for the camshaft shift angle and the desired value for the camshaft shift angle

- Active the quick test of camshaft control by clicking the start button
- Increase the engine speed (RPM) to approximately 2500 RPM and keep the engine running at this speed.

When the engine speed (RPM) increases, the control module will start the quick test to control the shift angle of the camshaft to the different target values. There is a fault if the control module does not operate the camshaft shift angle to the different target values.

During the quick test, check that the shift angle of the camshaft (actual value) corresponds to the target values to an accuracy of ±10°. If the shift angle of the camshaft (target value) does not change, or if the actual value does not correspond to the target value, the function is faulty.

Deviation between the values can be read off in the lower display.

Carry out the check for approximately 15 seconds at an engine speed (RPM) of 2500 RPM. The test is completed when the shift angle of the camshaft returns to 0°. To restart the test, let the engine return to idle speed, then increase the engine speed to approximately 2500 RPM.

The fault is intermittent if the function is OK.

NOTE: **The test is active until the ignition is switched off. Switch off the ignition before the car is delivered to the customer.**

Fig. 223: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING COMPONENTS**

CHECKING COMPONENTS

Check the engine oil level and quality. Check for contaminants in particular.

Check the engine oil pressure.

Remove the camshaft reset valve. Check the oil ducts for the cylinder head for the camshaft reset valve (intake) for blockages and dirt.

HINT: Faults may result from dirt in the camshaft reset valve. Try cleaning the valve.

Remedy as necessary.

Try a new intake camshaft reset valve if the above remedy does not solve the fault.

HINT: The fault may also have been caused by an internal fault in the variable valve timing unit. The variable valve timing unit may be defective if the above fault tracing and corrective action does not remedy the fault.

Other information:

- To check the oil pressure, see **CHECKING OIL PRESSURE**
- To clean the camshaft reset valve, see **VVT SOLENOID, INSPECTION AND CLEANING**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-640C: TURBOCHARGER (TC) CONTROL SYSTEM. SIGNAL TOO HIGH (B5254T2; 2003-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-640C

Condition

The engine control module (ECM) checks the boost pressure.

The diagnostic trouble code (DTC) is stored if the ratio between the measured boost pressure (measured value from the boost pressure sensor before the throttle) and the calculated boost pressure (calculated value after the throttle) is incorrect.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- Reduced boost pressure.

Possible Source

- Damaged boost pressure sensor
- Loose boost pressure sensor (the engine control module (ECM) measures the atmospheric pressure)
- Air leakage downstream of the turbocharger (TC) (between the turbocharger (TC) and the electronic throttle unit)
- Large air leak at the intake manifold (after the electronic throttle unit).

Fault symptom[s]

- Poor performance.

SIGNAL TOO HIGH / SIGNAL TOO LOW

CHECKING HOSES AND THE TURBOCHARGER (TC) CONTROL VALVE

Check particularly that the boost pressure sensor is correctly installed and has not come loose.

Check the intake system for air leakage. Check in particular the hose between the turbocharger (TC) and the throttle unit.

The boost pressure sensor is damaged if no fault is found in the above fault-tracing.

Other information:

- see **INTAKE AND EXHAUST SYSTEM - CLEANING, INSPECTION AND ADJUSTMENT**
- For B5xx4T, see **TEMPERATURE AND PRESSURE SENSORS, REPLACING**
- For B6xx4T, see **TEMPERATURE AND PRESSURE SENSORS, REPLACING**

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 227: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 228: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reconnect the connectors, reinstall components etc.
- Test drive the vehicle on the road. Ensure that high boost pressure is reached (high load) so that the engine control module (ECM) can run the diagnostic
- Connect VCT2000 (or appropriate scan tool) to the data link connector (DLC) without switching off the engine.

NOTE: **If the engine is switched off, the stored fault status will be erased and the test drive will have to be repeated.**

Read off the diagnostic status and fault status for the diagnostic trouble code (DTC) by selecting the relevant diagnostic trouble code (DTC) from the list.

Check the fault status for the diagnostic trouble code (DTC) when the diagnostic is "Complete". If the function is correct, the fault status must be "No fault found" when the diagnostic is complete.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-643A: CAMSHAFT POSITION, INTAKE. SIGNAL TOO HIGH (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 235: Identifying Camshaft Position Angle
Courtesy of VOLVO CARS CORPORATION

The control module checks that the camshaft is in the correct position in relation to the position of the crankshaft. If the position of the camshaft is incorrect, the control module will adjust the adaptation for the camshaft. Diagnostic trouble code (DTC) ECM-643A or ECM-644A is stored if the adaptation becomes too great.

Substitute Value

None.

Possible Source

Signal too high

- Poor oil quality
- Incorrectly adjusted camshafts
- The timing gear belt has jumped off the cogs
- Defective reset valve
- Mechanical fault in the variable valve timing (VVT) unit.

Signal too low

- Poor oil quality
- Incorrectly adjusted camshafts
- The timing gear belt has jumped off the cogs.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL TOO HIGH

CHECKING THE STATUS

Fig. 236: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start the engine and run it to normal operating temperature
- Read off and note the adaptation value for the camshaft at idle speed. The value must be between -8° and +8°.

  If the adaptation value is correct (between -8° and +8°) the fault is intermittent. If the adaptation value is incorrect (lower than -8° or higher than +8°), the fault is permanent.

Fig. 237: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 238: Identifying Camshaft Position Angle
Courtesy of VOLVO CARS CORPORATION

Is the adaptation value correct?

- **YES**

  Refer to **INTERMITTENT FAULT**

- **NO**

  Refer to **CHECKING COMPONENTS**

CHECKING COMPONENTS

For variable valve timing control to operate correctly the engine oil must be at the correct level, of the correct

quality and not contaminated.

Check the engine oil level and quality. Check for contaminants in particular.

If the adaptation value is too high (higher than +8°) when the engine is at operating temperature, the cause of the fault is probably one of the following:

- the timing belt is incorrectly seated
- incorrect base setting of the timing belt
- faulty camshaft reset valve (the slide in the valve has stuck).

HINT: First try adjusting the basic set up of the camshaft. Then read off the adaptation value for the camshaft at idle speed with the engine at operating temperature. The value must be between -8° and +8°. If the adaptation value is incorrect when the basic setting of the camshaft is correct, try cleaning the camshaft reset valve.

NOTE: The camshafts must be adjusted using the adjustment tool for the camshafts and crankshaft in the prescribed manner.

Try a new camshaft reset valve if the above fault-tracing does not solve the fault.

Remedy as necessary.

HINT: The fault can also be caused by a defective variable valve timing unit. The variable valve timing unit may be defective if the above fault tracing and corrective action does not remedy the fault.

Other information:

- To clean the camshaft reset valve, see **VVT SOLENOID, INSPECTION AND CLEANING**
- For B5xx4T, see **CAMSHAFT SEAL/VARIABLE VALVE TIMING (VVT) UNIT, REPLACING**
- For B6xx4T, see **CAMSHAFT SEAL/VARIABLE VALVE TIMING (VVT) UNIT, REPLACING** .

- **Continue**

  Refer to **VERIFICATION**

INTERMITTENT FAULT

If the diagnostic trouble code (DTC) for this fault is stored but the adaptation value is correct, the fault is intermittent. The cause of the intermittent fault is probably a defective camshaft reset valve.

HINT: Faults may result from dirt in the camshaft reset valve. Try cleaning the valve.

Other information:

- To clean the camshaft reset valve, see **VVT SOLENOID, INSPECTION AND CLEANING**
- For B5xx4T, see **VARIABLE VALVE TIMING SOLENOID, REPLACING**
- For B6xx4T, see **REPLACING THE VARIABLE VALVE TIMING SOLENOID** .

CHECKING THE STATUS

Fig. 250: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start the engine and run it to normal operating temperature
- Read off and note the adaptation value for the camshaft at idle speed. The value must be between -8° and +8°.

  If the adaptation value is correct (between -8° and +8°) the fault is intermittent. If the adaptation value is

incorrect (lower than -8° or higher than +8°), the fault is permanent.

Fig. 251: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 252: Identifying Camshaft Position Angle
Courtesy of VOLVO CARS CORPORATION

Is the adaptation value correct?

- **YES**

  Refer to **INTERMITTENT FAULT**

- **NO**

  Refer to **CHECKING COMPONENTS**

CHECKING COMPONENTS

For variable valve timing control to operate correctly the engine oil must be at the correct level, of the correct

quality and not contaminated.

Check the engine oil level and quality. Check for contaminants in particular.

If the adaptation value is too high (higher than +8°) when the engine is at operating temperature, the cause of the fault is probably one of the following:

- the timing belt is incorrectly seated
- the basic setting of the camshaft is incorrect
- faulty camshaft reset valve (the slide in the valve has stuck).

HINT: First try adjusting the basic set up of the camshaft. Then read off the adaptation value for the camshaft at idle speed with the engine at operating temperature. The value must be between -8° and +8°. If the adaptation value is incorrect when the basic setting of the camshaft is correct, try cleaning the camshaft reset valve.

NOTE: The camshafts must be adjusted using the adjustment tool for the camshafts and crankshaft in the prescribed manner.

Try a new camshaft reset valve if the above fault-tracing does not solve the fault.

Remedy as necessary.

HINT: The fault can also be caused by a defective variable valve timing unit. The variable valve timing unit may be defective if the above fault tracing and corrective action does not remedy the fault.

Other information:

- To clean the camshaft reset valve, see **VVT SOLENOID, INSPECTION AND CLEANING**
- For B5xx4T, see **CAMSHAFT SEAL/VARIABLE VALVE TIMING (VVT) UNIT, REPLACING**
- For B6xx4T, see **CAMSHAFT SEAL/VARIABLE VALVE TIMING (VVT) UNIT, REPLACING** .

  Refer to **VERIFICATION**

INTERMITTENT FAULT

If the diagnostic trouble code (DTC) for this fault is stored but the adaptation value is correct, the fault is intermittent. The cause of the intermittent fault is probably a defective camshaft reset valve.

HINT: Faults may result from dirt in the camshaft reset valve. Try cleaning the valve.

Other information:

- To clean the camshaft reset valve, see **VVT SOLENOID, INSPECTION AND CLEANING**
- For B5xx4T, see **VARIABLE VALVE TIMING SOLENOID, REPLACING**
- For B6xx4T, see **REPLACING THE VARIABLE VALVE TIMING SOLENOID** .

Fig. 259: Identifying Camshaft Position Angle
Courtesy of VOLVO CARS CORPORATION

Is the adaptation value correct?

- **YES**

  Refer to **INTERMITTENT FAULT**

- **NO**

  Refer to **CHECKING COMPONENTS**

CHECKING COMPONENTS

In order for the variable valve timing control to function correctly, the correct grade of engine oil must be used.

The oil must be clean and the oil pressure must be correct.

Check the engine oil level and quality. Check for contaminants in particular.

Check the engine oil pressure.

Remedy as necessary.

If no fault is found in the above fault tracing and the adaptation value is too low (lower than -8°) when the engine is at operating temperature, the cause of the fault is probably one of the following:

- the timing belt is incorrectly seated
- incorrect base setting of the timing belt
- faulty camshaft reset valve (the slide in the valve has stuck).

HINT: If no fault is found in the above fault tracing, first try adjusting the basic set up of the camshaft. Then read off the adaptation value for the camshaft at idle speed with the engine at operating temperature. The value must be between -8° and +8°. If the adaptation value is incorrect when the basic setting of the camshaft is correct, try cleaning the camshaft reset valve.

NOTE: The camshafts must be adjusted using the adjustment tool for the camshafts and crankshaft in the prescribed manner.

Try a new camshaft reset valve if the above fault-tracing does not solve the fault.

Remedy as necessary.

HINT: The fault may also be caused by a defective variable valve timing unit. The variable valve timing unit may be defective if the above fault tracing and corrective action does not remedy the fault.

ECM-650B: ENGINE COOLING FAN (FC). SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-650B

Condition

Fig. 264: Identifying Engine Cooling Fan (FC) Control Module
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal cable for the engine cooling fan (FC).

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the signal for the engine cooling fan (FC) is missing.

The diagnostic trouble code (DTC) can be diagnosed at ignition on or when the engine is running.

NOTE: **The electric cooling fan may have a post-running time of up to approx. 6 minutes after the engine has been shut off. The time for the electric cooling fan's post-running depends on the engine's temperature, temperature in the engine compartment as well as the pressure level in the AC system.**

Substitute Value

- None.

Possible Source

- Open-circuit in the signal cable
- Damaged engine cooling fan (FC).

Fault symptom[s]

- Electric cooling fan does not operate
- The engine cooling fan (FC) operates constantly.

SIGNAL MISSING

SIGNAL TOO LOW. PERMANENT FAULT

see **SIGNAL TOO LOW. PERMANENT FAULT**

ECM-6700: CAMSHAFT POSITION, INLET. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-6700

Condition

Fig. 275: Identifying Camshaft Control (CVVT)
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the angle of the camshaft (its position in relation to the crankshaft).

If the Engine control module (ECM) detects that the intake camshaft's angle position changes dramatically when idling, the Engine control module (ECM) interprets this as a fault and stores a DTC.

The diagnostic trouble code (DTC) can be diagnosed when the engine is hot and the camshaft is in position 0.

Substitute Value

- The Engine control module (ECM) switches off camshaft control.

Possible Source

- Incorrectly adjusted camshafts
- The timing gear belt has jumped off the cogs
- Damaged camshaft reset valve
- Mechanical fault in the variable valve timing (VVT) unit.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULT-TRACING

CHECKING THE STATUS

Fig. 276: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start the engine and run it to normal operating temperature
- Read off and note the adaptation value for the camshaft at idle speed. The value must be between -8° and +8°.

  The fault is intermittent if the adaptation value is between -8° and +8°. The fault is permanent if the adaptation value is lower than -8° or higher than +8°.

Fig. 277: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 278: Identifying Camshaft Position Angle
Courtesy of VOLVO CARS CORPORATION

Is the adaptation value correct?

- **YES**

  Refer to **INTERMITTENT FAULT**

- **NO**

  Refer to **CHECKING COMPONENTS**

CHECKING COMPONENTS

For the variable valve timing control to work, the engine oil must be at the correct level, of the correct grade

and free of contaminants.

Check the level and quality of the engine oil. Check for contaminants in particular.

If the adaptation value is too high (higher than +8°) when the engine is at operating temperature, the cause of the fault is probably one of the following:

- Camshaft belt incorrectly seated
- Incorrect basic setting of the timing belt
- Faulty camshaft reset valve (the slide in the valve has stuck).

Try to adjust the basic setting of the camshaft. Then read off the adaptation value for the camshaft with the engine idling and at operating temperature. The value must be between -8° and +8°. If the adaptation value is incorrect when the basic setting of the camshaft is correct, try cleaning the camshaft reset valve.

NOTE: The camshafts must be adjusted using the adjustment tool for the camshafts and crankshaft in the prescribed manner.

Try a new camshaft reset valve if the above fault-tracing does not solve the fault.

Remedy as necessary.

HINT: The fault can also be caused by a damaged variable valve timing unit. The variable valve timing unit may be damaged if the above fault-tracing and corrective action do not remedy the fault.

Other information:

- see **VVT SOLENOID, INSPECTION AND CLEANING**
- For B5xx4T, see **CAMSHAFT SEAL/VARIABLE VALVE TIMING (VVT) UNIT, REPLACING**
- For B6xx4T, see **CAMSHAFT SEAL/VARIABLE VALVE TIMING (VVT) UNIT, REPLACING** .

ECM-670C: CAMSHAFT POSITION, INTAKE. HIGH (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-670C

Condition

Fig. 283: Identifying Camshaft Control (CVVT)
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the angle of the camshaft (its position in relation to the crankshaft).

If the inlet camshaft's angle position deviates and is too high during adaption (camshaft is ahead of crankshaft), the Engine control module (ECM) will interpret this as a failure and store a diagnostic trouble code.

The diagnostic trouble code (DTC) can be diagnosed when the engine is hot and the camshaft is in position 0.

Substitute Value

- The Engine control module (ECM) switches off camshaft control.

Possible Source

- Poor engine oil quality

- Incorrectly adjusted camshafts
- The timing gear belt has jumped off the cogs
- Damaged camshaft reset valve
- Mechanical fault in the variable valve timing (VVT) unit.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

HIGH

CHECKING THE STATUS

Fig. 284: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start the engine and run it to normal operating temperature
- Read off and note the adaptation value for the camshaft at idle speed. The value must be between -8° and +8°.

  The fault is intermittent if the adaptation value is between -8° and +8°. The fault is permanent if the adaptation value is lower than -8° or higher than +8°.

Fig. 285: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 286: Identifying Camshaft Position Angle
Courtesy of VOLVO CARS CORPORATION

Is the adaptation value correct?

- **YES**

  Refer to **INTERMITTENT FAULT**

- **NO**

  Refer to **CHECKING COMPONENTS**

CHECKING COMPONENTS

For the variable valve timing control to work, the engine oil must be at the correct level, of the correct grade

and free of contaminants.

Check the level and quality of the engine oil. Check for contaminants in particular.

If the adaptation value is too high (higher than +8°) when the engine is at operating temperature, the cause of the fault is probably one of the following:

- Camshaft belt incorrectly seated
- Incorrect basic setting of the timing belt
- Faulty camshaft reset valve (the slide in the valve has stuck).

Try to adjust the basic setting of the camshaft. Then read off the adaptation value for the camshaft with the engine idling and at operating temperature. The value must be between -8° and +8°. If the adaptation value is incorrect when the basic setting of the camshaft is correct, try cleaning the camshaft reset valve.

NOTE: The camshafts must be adjusted using the adjustment tool for the camshafts and crankshaft in the prescribed manner.

Try a new camshaft reset valve if the above fault-tracing does not solve the fault.

Remedy as necessary.

HINT: The fault can also be caused by a damaged variable valve timing unit. The variable valve timing unit may be damaged if the above fault-tracing and corrective action do not remedy the fault.

  Refer to **VERIFICATION**

INTERMITTENT FAULT

If the diagnostic trouble code (DTC) for this fault is stored but the adaptation value is correct, the fault is intermittent. Cause of the intermittent fault is probably a damaged camshaft reset valve.

HINT: The fault can be caused by contaminants in the camshaft reset valve. Try cleaning the valve.

Other information:

- see **VVT SOLENOID, INSPECTION AND CLEANING**
- For B5xx4T, see **VARIABLE VALVE TIMING SOLENOID, REPLACING**
- For B6xx4T, see **REPLACING THE VARIABLE VALVE TIMING SOLENOID** .

ECM-670D: CAMSHAFT POSITION, INTAKE. LOW (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-670D

Condition

Fig. 291: Identifying Camshaft Control (CVVT)
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the angle of the camshaft (its position in relation to the crankshaft).

If the intake camshaft's angle position deviates and is too low (the camshaft is "after" the crankshaft) during fuel trim, the Engine control module (ECM) interprets this as a fault and stores a DTC.

The diagnostic trouble code (DTC) can be diagnosed when the engine is hot and the camshaft is in position 0.

Substitute Value

- None. The Engine control module (ECM) switches off camshaft control.

Possible Source

- Poor engine oil quality
- Incorrectly adjusted camshafts
- The timing gear belt has jumped off the cogs.

- Air conditioning (A/C) compressor. Damaged camshaft reset valve.
- Mechanical fault in the variable valve timing (VVT) unit.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

LOW

CHECKING THE STATUS

Is the adaptation value correct?

- **YES**

  Refer to **INTERMITTENT FAULT**

- **NO**

  Refer to **CHECKING COMPONENTS**

CHECKING COMPONENTS

In order for the variable valve timing control to function correctly, the correct grade of engine oil must be used.

The oil must be clean and the oil pressure must be correct.

Check the level and quality of the engine oil. Check for contaminants in particular.

Check the engine oil pressure.

Remedy as necessary.

If no fault is found in the above fault tracing and the adaptation value is too low (lower than -8°) when the engine is at operating temperature, the cause of the fault is probably one of the following:

- Camshaft belt incorrectly seated
- Incorrect basic setting of the timing belt
- Faulty camshaft reset valve (the slide in the valve has stuck).

HINT: Try adjusting the basic setting of the camshaft if no fault is found during the above fault-tracing. Then read off the adaptation value for the camshaft with the engine idling and at operating temperature. The value must be between -8° and +8°. If the adaptation value is incorrect when the basic setting of the camshaft is correct, try cleaning the camshaft reset valve.

NOTE: The camshafts must be adjusted using the adjustment tool for the camshafts and crankshaft in the prescribed manner.

Try a new camshaft reset valve if the above fault-tracing does not solve the fault.

Remedy as necessary.

HINT: The fault may also be caused by a defective variable valve timing unit. The variable valve timing unit may be damaged if the above fault-tracing and corrective action do not remedy the fault.

ECM-6805: TURBOCHARGER (TC) CONTROL VALVE, BOOST PRESSURE FAULT. PRESSURE TOO HIGH (B5254T2; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) ECM-6805 is stored if the pressure measured by the boost pressure sensor is higher than a calculated desired value. This is interpreted as a fault by the control module. The fault is diagnosed by the control module at high engine loads.

Substitute Value

Reduced throttle angle.

Possible Source

- The hoses between the pressure servo for the boost pressure control (BPC) valve and the turbocharger (TC) control valve have come loose or are blocked or damaged
- The hoses between the turbocharger (TC) control valve and the charge air pipe (between the turbocharger (TC) and the charge air cooler (CAC)) are blocked or damaged
- The pressure servo for the boost pressure control (BPC) valve is incorrectly adjusted
- Faulty pressure servo for the boost pressure control (BPC) valve
- Sticking boost pressure control (BPC) valve
- Faulty turbocharger (TC) control valve.

Fault symptom[s]

- Poor performance.

PRESSURE TOO HIGH

CHECKING THE HOSES AND THE TURBOCHARGER (TC) CONTROL VALVE

Check that the hoses between the pressure servo for the boost pressure control (BPC) valve and the turbocharger (TC) control valve are not trapped, blocked or damaged.

Check that the hoses between the turbocharger (TC) control valve and the charge air pipe (between the turbocharger (TC) and the charge air cooler (CAC)) are not trapped, blocked or damaged.

Check the turbocharger (TC) control valve by activating it. The turbocharger (TC) control valve must click when it is activated.

Check the setting of the waste gate valve's pressure servo as well as the waste gate valve. Check the function and check for jamming according to:**WASTEGATE VALVE, ADJUSTING**

Other information:

- To access the turbocharger (TC) control valve, see **REPLACING THE TURBOCHARGER (TC) CONTROL VALVE** .

  Refer to **VERIFICATION**

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

- Ignition off.
- Reinstall connectors, components etc.
- Disconnect the VCT 2000 from the data link connector (DLC).
- Test drive the car and check that high boost pressure is obtained.
- Connect the VCT 2000 to the data link connector (DLC).

NOTE: **Do not switch off the ignition before the VCT 2000 has been connected and the boost pressure has been tested with the smart tool.**

Read off the boost pressure fault status

When the boost pressure has been tested the display should show that the diagnostic is complete.
