INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-6805: TURBOCHARGER (TC) CONTROL VALVE, BOOST PRESSURE FAULT. PRESSURE TOO HIGH (B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION**

PRESSURE TOO HIGH

CHECKING THE HOSES AND THE TURBOCHARGER (TC) CONTROL VALVE

Check that the hoses between the pressure servo for the boost pressure control (BPC) valve and the turbocharger (TC) control valve are not trapped, blocked or damaged.

Check that the hoses between the turbocharger (TC) control valve and the charge air pipe (between the turbocharger (TC) and the charge air cooler (CAC)) are not trapped, blocked or damaged.

Check the turbocharger (TC) control valve by activating it. The turbocharger (TC) control valve must click when it is activated.

Check the setting of the waste gate valve's pressure servo as well as the waste gate valve. Check the function and check for jamming according to:**PRESSURE REGULATOR, CHECKING/ADJUSTING**

Other information:

- To access the turbocharger (TC) control valve, see **REPLACING THE TURBOCHARGER (TC) CONTROL VALVE** .

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-6806: TURBOCHARGER (TC) CONTROL VALVE, FLOW FAULT. PRESSURE TOO LOW (B5254T2; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) ECM-6806 is stored if the control module deployment of the turbocharger (TC) control valve is 100 % (the control module request maximum pressure) and the measured boost pressure (from the boost pressure sensor) is lower that a calculated desired value. The fault is diagnosed by the control module when the engine speed (RPM) and load are above a certain value.

Substitute Value

Reduced boost pressure.

Possible Source

- Air leakage in the intake system.
- Pressure servo for the boost pressure control (BPC) valve is incorrectly adjusted.
- Sticking boost pressure control (BPC) valve
- Faulty turbocharger (TC) control valve.
- Damaged turbo charger (TC).

Fault symptom[s]

- Poor performance.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-680B: ENGINE COOLING FAN (FC) CONTROL MODULES. SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-680B

Condition

Fig. 347: Identifying Engine Cooling Fan (FC) Control Modules
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the circuit from the engine cooling fan (FC) to the control module box.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the signal for the engine cooling fan (FC) to the control module box is missing.

The diagnostic trouble code (DTC) can be diagnosed at ignition on or when the engine is running.

Substitute Value

- None.

Possible Source

- Contact resistance in the terminals
- Open-circuit in the signal cable

- Open-circuit in the power supply to the engine cooling fan (FC)
- Damaged engine cooling fan (FC).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL MISSING

see **SIGNAL MISSING**

ECM-680B: ENGINE COOLING FAN (FC) CONTROL MODULES. SIGNAL MISSING (B6294T; 2005-2006)

ECM-680C: ENGINE COOLING FAN (FC) CONTROL MODULES. SIGNAL TOO HIGH (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-680C

Condition

Fig. 348: Identifying Engine Cooling Fan (FC) Control Modules
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the circuit from the engine cooling fan (FC) to the control module box.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the signal for the engine cooling fan (FC) to the control module box is too high.

The diagnostic trouble code (DTC) can be diagnosed at ignition on or when the engine is running.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the signal cable
- Damaged engine cooling fan (FC).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL TOO HIGH

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-680D

Condition

Fig. 349: Identifying Engine Cooling Fan (FC) Control Modules

Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the circuit from the engine cooling fan (FC) to the control module box.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the signal for the engine cooling fan (FC) to the control module box is too low.

The diagnostic trouble code (DTC) can be diagnosed at ignition on or when the engine is running.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the signal cable
- Damaged engine cooling fan (FC).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

SIGNAL TOO LOW

ECM-6814: TURBOCHARGER (TC) CONTROL. SIGNAL TOO HIGH (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Diagnostic trouble code (DTC) ECM-6814 is stored if the relationship between the measured pressure (from the

boost pressure sensor) and the calculated boost pressure is greater than a certain value. The fault is diagnosed by the control module when turbocharger (TC) control is active.

Substitute Value

Reduced boost pressure.

Possible Source

- Air leakage downstream of the turbocharger (TC) (between the turbocharger (TC) and the throttle unit)
- The boost pressure sensor has come loose (measures the atmospheric pressure)
- Defective boost pressure sensor.

Fault symptom[s]

- Poor performance.

SIGNAL TOO HIGH

CHECKING THE HOSES AND THE TURBOCHARGER (TC) CONTROL VALVE

Check that the boost pressure sensor is correctly installed and has not come loose.

Check the intake system for air leakage. Check in particular the hose between the turbocharger (TC) and the throttle unit.

The boost pressure sensor is defective if no fault is found in the above fault-tracing.

Other information:

- To check the intake system for air leakage, see **INTAKE AND EXHAUST SYSTEM - CLEANING, INSPECTION AND ADJUSTMENT**
- For B5xx4T, see **TEMPERATURE AND PRESSURE SENSORS, REPLACING**
- For B6xx4T, see **TEMPERATURE AND PRESSURE SENSORS, REPLACING**

- **Continue**

  Refer to **VERIFICATION**

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-6B00: MALFUNCTION INDICATOR LAMP (MIL) SIGNAL. SIGNAL MISSING. INTERMITTENT FAULT (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

If the malfunction indicator lamp (MIL) circuit has a short-circuit to ground/voltage or an open-circuit the control module interprets it as a fault and ECM-6B00 is stored.

Substitute Value

none

Possible Source

Signal too high:

- open-circuit in the ground lead

Signal too low:

- short-circuit to ground in signal cable

Signal missing:

- open-circuit in signal cable
- open-circuit in power cable

Fault symptom[s]

- malfunction indicator lamp (MIL) lit

SIGNAL MISSING. INTERMITTENT FAULT

CHECKING COMPONENT AND WIRING

Check cable between engine control module (ECM) #B46 and combined instrument panel #4 for an intermittent open-circuit according to **OPEN-CIRCUIT, INTERMITTENT FAULTS** .

Remedy as necessary.

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 2: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Start the engine and let it run at idle speed
- Activate the malfunction indicator lamp (MIL)
- Check that the function is OK.

Fig. 3: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is function OK?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-700C: ENGINE CONTROL MODULE (ECM), INTERNAL FAULT. SIGNAL TOO HIGH (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 4: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects a fault in the circuit for the internal temperature sensor in the control module. The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- None.

Possible Source

- Damaged engine control module (ECM).

Fault symptom[s]

- None.

INTERNAL FAULT

see **INTERNAL FAULT**

ECM-700C: ENGINE CONTROL MODULE (ECM), INTERNAL FAULT. SIGNAL TOO HIGH (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION**

INTERNAL FAULT

see **INTERNAL FAULT**

ECM-7010: ENGINE CONTROL MODULE (ECM), HIGH TEMPERATURE. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-7010

Condition

Fig. 5: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the temperature in the engine control module (ECM) exceeds 95 °C.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- The engine cooling fan (FC) runs at low-speed.

Possible Source

- Air supply is blocked.

Fault symptom[s]

- None.

FAULTY SIGNAL

CHECKING THE COMPONENT

HINT: The diagnostic trouble code (DTC) may due to a damaged cooling fan for the control module boxes. If diagnostic trouble code (DTC) ECM-680X is stored it must be remedied first.

Activate the cooling fan for the control module box. Check the function. There must be a buzzing noise from the cooling fan when the fan for the control module box is activated.

Check that the air ducts for the control module box are not blocked.

Remedy as necessary.

Other information

- For the location of components, see **LOCATION OF COMPONENTS, ENGINE COMPARTMENT** .

ECM-7100: IMMOBILIZER COMMUNICATION. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-7100

Condition

The engine control module (ECM) contains a code for the immobilizer which is unique to each car. Before the engine can be started, the immobilizer code is checked to ensure that it corresponds to both the central electronic module (CEM) and the engine control module (ECM). The diagnostic trouble code (DTC) is stored if the immobilizer code does not correspond.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

None

Possible Source

- The engine control module (ECM) is not programmed and has no immobilizer code
- The immobilizer code in the engine control module (ECM) is incorrect
- The immobilizer code in the central electronic module (CEM) is incorrect
- The central electronic module (CEM) is not programmed and has no immobilizer code

- Damaged central electronic module (CEM)
- Damaged engine control module (ECM).

Fault symptom[s]

- The engine does not start.

FAULTY SIGNAL. PERMANENT FAULT

INFORMATION

This diagnostic trouble code (DTC) indicates that the immobilizer code does not match between the engine control module (ECM) and the central electronic module (CEM). This may be because:

- the immobilizer code in the engine control module (ECM) is incorrect i. e. the code does not correspond to the code stored in the central electronic module (CEM)
- the engine control module (ECM) is not programmed and has no immobilizer code
- the immobilizer code in the central electronic module (CEM) is incorrect
- the central electronic module (CEM) is not programmed and has no immobilizer code
- the engine control module (ECM) is damaged
- the central electronic module (CEM) is damaged.

NOTE: A programmed engine control module (ECM) or central electronic module (CEM) cannot be moved from one vehicle to another.

HINT: Read off the diagnostic trouble codes (DTCs) for the central electronic module (CEM).

Other information:

- To access and replace the engine control module (ECM), see **ENGINE CONTROL MODULE (ECM), REPLACING**
- For -2004, see: **CENTRAL ELECTRONIC MODULE (CEM), REPLACING**
- For 2005-, see: **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** .

ECM-710B: IMMOBILIZER COMMUNICATION. SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-710B

Condition

The engine control module (ECM) contains a code for the immobilizer which is unique to each car. Before the engine can be started, the immobilizer code is checked to ensure that it corresponds to both the central electronic module (CEM) and the engine control module (ECM).

The diagnostic trouble code (DTC) will be stored if there is no communication between the central electronic module (CEM) and the engine control module (ECM) so that the immobilizer code cannot be checked.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

None

Possible Source

- Open-circuit in the communication between the central electronic module (CEM) and the engine control

module (ECM).

Fault symptom[s]

- The engine does not start.

SIGNAL MISSING. PERMANENT FAULT

CHECKING THE COMPONENT

The immobilizer function is integrated in the central electronic module (CEM).

This diagnostic trouble code (DTC) can be caused by missing CAN communication. If there is a diagnostic trouble code (DTC) stored in the central electronic module (CEM) fault trace accordingly.

If no diagnostic trouble codes (DTCs) are stored in the central electronic module (CEM), try a new central electronic module (CEM).

Other information:

ECM-720A: IMMOBILIZER COMMUNICATION. FAULTY SIGNAL. INTERMITTENT FAULT (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The engine control module (ECM) contains a code for the immobilizer which is unique to each car. Before the engine can be started, the immobilizer code is checked to ensure that it corresponds to the central electronic module (CEM) and the engine control module (ECM). Diagnostic trouble code (DTC) ECM-720A, faulty signal, will be stored if the code for the immobilizer does not match.

Diagnostic trouble code (DTC) ECM-720A, signal missing, will be stored if there is no communication between the central electronic module (CEM) and the engine control module (ECM) so that the immobilizer code cannot be checked.

The fault is diagnosed by the engine control module (ECM) when the ignition is switched on.

Substitute Value

none

Possible Source

Faulty signal:

- the engine control module (ECM) is not programmed and has no immobilizer code

- the immobilizer code in the engine control module (ECM) is incorrect
- the immobilizer code in the central electronic module (CEM) is incorrect
- the central electronic module (CEM) is not programmed and has no immobilizer code
- the central electronic module (CEM) is defective
- the engine control module (ECM) is defective.

Signal missing:

- open-circuit in the communication between the central electronic module (CEM) and the engine control module (ECM).

Fault symptom[s]

- the engine does not start.

FAULTY SIGNAL. INTERMITTENT FAULT

CHECKING COMPONENTS AND WIRING

The immobilizer function is integrated in the central electronic module (CEM).

The engine control module (ECM) has previously registered a fault in the communication between the immobilizer and the engine control module (ECM), but has detected that this fault is no longer active.

- **Continue**

ECM-800B: SYSTEM RELAY. SIGNAL TOO LOW (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-800B

Condition

Fig. 17: Identifying Main Relay
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the function of the system relay. The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the voltage from the system relay is too low when the relay is activated.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- None.

Possible Source

- Contact resistance in the terminals
- Open-circuit in the signal cable for the system relay
- Damaged system relay.

Fault symptom[s]

- The engine does not start.

SIGNAL TOO LOW

CHECKING CONNECTORS AND COMPONENTS

Check the engine control module (ECM) and the system relay connectors. Check for contact resistance. Check for oxidation.

Check the cable between system relay terminal #5 and the engine control module (ECM). Check for an open-circuit.

Remedy as necessary.

Try a new system relay if no fault is found during the above fault-tracing.

HINT: Read off the voltage from the system relay to the engine control module (ECM) using the VCT2000 (or appropriate scan tool).

Other information

- For information about signals for 5 cylinder engines: **SIGNAL SPECIFICATION**
- For information about signals for 6 cylinder engines: **SIGNAL SPECIFICATION**

SIGNAL TOO LOW

see **SIGNAL TOO LOW**

ECM-8010: BATTERY VOLTAGE. FAULTY SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 23: Identifying Battery
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) ECM-8010 is stored if the voltage from the system relay exceeds 16.5 V (high signal) under 9 V (low signal) or is less than 2.5 V (faulty signal) and that 3 minutes has passed since the engine was started and that the car has a speed.

Substitute Value

13.4 V for a faulty signal, other fault none

Possible Source

Signal too high:

- faulty charging system

Signal too low:

- faulty charging system
- poor battery
- contact resistance in terminals

Faulty signal:

- faulty system relay
- open-circuit in power cable from system relay
- system relay power cable short-circuited to ground

Fault symptom[s]

- engine cuts out
- engine does not start

FAULTY SIGNAL

CHECKING THE CONNECTORS AND COMPONENTS

Check the battery voltage.

Check the charging function of the generator (GEN).

Check the engine control module (ECM) and system relay connectors. Check for contact resistance and oxidation.

Check the cable between system relay terminal #5 and control module terminal #A17 (#A17). Check for an open-circuit. Check for a short-circuit to ground.

Remedy as necessary.

Try a new system relay if no fault is found during the above fault-tracing.

HINT: Read off the voltage from the system relay to the engine control module (ECM) using the VCT2000 (or appropriate scan tool).

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-801A: SYSTEM RELAY. FAULTY SIGNAL OR SIGNAL MISSING (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 38: Identifying Battery
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-801A is stored if the voltage from the system relay to the control module is greater than 2.5 V but lower than 3 V (signal missing) or if the power supply for the control module to the electronic throttle module is lower than 8 V (faulty signal). The fault is diagnosed when the ignition is on.

Substitute Value

None.

Possible Source

Signal missing

- Faulty charging system
- Contact resistance in the terminals
- Open-circuit in the signal cable for the system relay
- Faulty system relay.

Faulty signal

- Faulty charging system
- Contact resistance in the terminals
- Faulty system relay.

Fault symptom[s]

- The engine fails to start
- The engine runs poorly.

FAULTY SIGNAL OR SIGNAL MISSING

CHECKING THE CONNECTORS AND COMPONENTS

Check the battery voltage.

Check the charging function of the generator (GEN).

Check the fuse before the circuit. If the fuse is blown, check the circuit. Check for a short-circuit to ground.

Check the cable between system relay terminal #5 and control module terminal #A17 (#A17). Check for an open-circuit.

Check the engine control module (ECM) and system relay connectors. Check for contact resistance and oxidation.

Remedy as necessary.

Try a new system relay if no fault is found during the above fault-tracing.

HINT: Read off the voltage from the system relay to the engine control module (ECM).

Other information

- To fault-trace the charging system, see **FAULT-TRACING AND TESTING THE VOLTAGE SUPPLY SYSTEM**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-810C: 5 VOLT POWER SUPPLY. SIGNAL TOO HIGH (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-810C

Condition

The engine control module (ECM) checks the 5 volt cable which supplies components with power. The diagnostic trouble code (DTC) is stored if the voltage at the 5 volt cable is higher than a certain value.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- None.

Possible Source

- short-circuit to battery voltage in the 5 volt supply cable
- Damaged sensor connected to the 5 volt supply cable.

Fault symptom[s]

- Poor performance.

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-810C: 5 VOLT POWER SUPPLY. SIGNAL TOO HIGH (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-810C

ECM-810D: 5 VOLT POWER SUPPLY. SIGNAL TOO LOW (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-810D

Condition

The engine control module (ECM) checks the 5 volt cable which supplies components with power. If the voltage at the 5 volt cable is lower than a certain value, the engine control module (ECM) interprets this as a fault and a diagnostic trouble code (DTC) is stored.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in 5-volt supply cable
- Damaged sensor connected to the 5 volt supply cable.

Fault symptom[s]

- Poor performance.

SIGNAL TOO LOW

see **SIGNAL TOO LOW**

ECM-8200: BATTERY VOLTAGE. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-8200

Condition

Fig. 44: Identifying Battery
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the power supply from the system relay.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the voltage from the system relay is below 2.5 V.

The diagnostic trouble code (DTC) can be diagnosed at ignition on or when the engine is running.

Substitute Value

- The engine control module (ECM) assumes a voltage of 13.4 V.

Possible Source

- Damaged engine control module (ECM).

Fault symptom[s]

- The engine cuts out
- The engine does not start.

INTERNAL FAULT

ECM-8210: SYSTEM RELAY. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-8210

Condition

Fig. 47: Identifying Main Relay
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the power supply from the system relay.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the power supply from the engine control module (ECM) to the throttle unit is lower than 8 V.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- The injectors are shut off.

Possible Source

- Faulty charging system
- Contact resistance in the terminals
- Damaged system relay.

Fault symptom[s]

- The starter motor turns but the engine does not start.

FAULTY SIGNAL OR SIGNAL MISSING

ECM-821B: SYSTEM RELAY. SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-821B

Condition

Fig. 48: Identifying Main Relay
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the power supply from the system relay.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the power supply from the system relay is lower than a certain value.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- None.

Possible Source

- Faulty charging system
- Contact resistance in the terminals
- Open-circuit in the signal cable for the system relay
- Damaged system relay.

Fault symptom[s]

- The starter motor turns but the engine does not start.

FAULTY SIGNAL OR SIGNAL MISSING

see **FAULTY SIGNAL OR SIGNAL MISSING**

FAULTY SIGNAL OR SIGNAL MISSING

see **FAULTY SIGNAL OR SIGNAL MISSING**

ECM-8410: 5 VOLT POWER SUPPLY. SIGNAL TOO HIGH (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-8410

Condition

If the 5 volt supply circuit for the mass air flow (MAF) sensor, boost pressure sensor, air conditioning (A/C) pressure sensor and fuel tank pressure sensor has a voltage higher than 6 V (high signal) or lower than 4 V (low signal) the control module interprets it as a fault and ECM-8410 is stored.

Substitute Value

- None.

Possible Source

Signal too high:

- short-circuit to battery voltage in the 5 volt supply cable
- Defective mass air flow (MAF) sensor
- Defective boost pressure sensor
- Defective air conditioning (A/C) pressure sensor.

Signal too low:

- short-circuit to ground in the 5 volt supply cable
- Defective mass air flow (MAF) sensor
- Defective boost pressure sensor
- Defective air conditioning (A/C) pressure sensor.

Fault symptom[s]

- Driving/Poor performance/lacks power
- Driving/Engine stalls/Unsure when/at all times

SIGNAL TOO HIGH

CHECKING THE WIRING

Check the power supply cable between control module terminal #A39 (#A39) and mass air flow (MAF) sensor

terminal #4. Check for a short-circuit to supply voltage.

Check the power supply cable between control module terminal #A39 (#A39) and boost pressure sensor terminal #3. Check for a short-circuit to supply voltage.

Check the power supply cable between control module terminal #A39 (#A39) and air conditioning (A/C) pressure sensor terminal #3. Check for a short-circuit to supply voltage.

HINT: Read off the voltage on the 5 volt power supply using the VCT2000 (or appropriate scan tool).

Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-9000: BRAKE PEDAL SENSOR. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-9000

Condition

Fig. 57: Identifying Brake Pedal Position Sensor
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers a fault in the circuit for the brake pedal position sensor, the circuit for the stop lamp switch or in the CAN communication between the brake control module (BCM) and the engine control module (ECM).

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

Cruise control switched off.

Possible Source

- Fault in the brake control module (BCM) or the central electronic module (CEM)
- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the stop lamp switch
- Open-circuit in the power supply to the stop lamp switch

- Open-circuit or short-circuit to ground or supply voltage in the cable for the stop lamp switch
- Incorrectly installed stop lamp switch
- Damaged stop lamp switch.

Fault symptom[s]

- Cruise control/Does not engage
- Text window and warning symbol/Text message

SIGNAL MISSING OR FAULTY SIGNAL

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

Check whether any diagnostic trouble codes (DTCs) are stored in the brake control module (BCM) or in the central electronic module (CEM).

Any diagnostic trouble codes (DTCs) stored in the brake control module (BCM) or central electronic module (CEM) must be remedied first.

Have fault causes been traced or remedied in the brake control module (BCM) and the central electronic module (CEM)?

- **YES**

  Refer to **CHECKING THE STATUS**

- **NO**

  OKAY: Troubleshooting has been completed.

CHECKING THE STATUS

Fig. 58: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Read off the status from the stop lamp switch.

  Check the function of the stop lamp switch by carefully pressing and releasing the brake pedal.

  Check that the status changes between "OFF" when the brake pedal is unaffected and "ON" when the brake pedal is depressed.

  If the status of the stop lamp switch changes as described above when the brake pedal is depressed, the fault is intermittent at the moment.

Fig. 59: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING THE POWER SUPPLY**

CHECKING THE POWER SUPPLY

Fig. 60: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check the power supply to the stop lamp switch. Take readings between stop lamp switch terminal #1 (cable harness side) and the ground terminal. The power supply must be approximately 12 V.

  If there is no power supply:

  Check the power supply circuit for stop lamp switch terminal #1 (cable harness side). Check for an open-circuit. Check for a short-circuit to ground. Check for a blown fuse in the circuit.

  Remedy as necessary.

  Other information:

ECM-903C: THROTTLE POSITION (TP) SENSOR. FAULTY SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 82: Identifying Throttle Unit & Potentiometer
Courtesy of VOLVO CARS CORPORATION

This diagnostic trouble code (DTC) is never stored on its own.

Diagnostic trouble code (DTC) ECM-903C will also be stored if the engine control module (ECM) registers, when the ignition is switched on, that diagnostic trouble code (DTC) ECM-9150 and/or ECM-9160 is stored (fault in the throttle position (TP) sensor for the throttle unit).

Substitute Value

None.

Possible Source

Faulty signal:

- Fault in the throttle position (TP) sensor circuit for the throttle unit.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-9050: MEMORY FAULT IN RAM. INTERNAL FAULT. INTERMITTENT FAULT (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 83: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) continuously checks the internal RAM (random access memory). Diagnostic trouble code (DTC) ECM-9050 is stored in the engine control module (ECM) in the event of a fault. If this diagnostic trouble code (DTC) is stored the engine control module (ECM) will try to restart (reset) itself.

Substitute Value

None.

Possible Source

- Faulty software in the engine control module (ECM)
- Defective engine control module (ECM).

Fault symptom[s]

- The malfunction indicator lamp (MIL) flashes
- The engine cuts out
- The engine does not start.

FAULT-TRACING INFORMATION

FAULT-TRACING INFORMATION

The engine control module (ECM) previously registered a fault but has now detected that the fault is no longer present.

ECM-9100: CLUTCH PEDAL POSITION SENSOR. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-9100

Condition

Fig. 89: Identifying Clutch Pedal Push Rod & Position Sensor
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers a fault in the signal from the clutch pedal position sensor.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

Cruise control switched off.

Possible Source

- Open-circuit in the signal cable
- Incorrectly installed clutch pedal sensor
- Damaged clutch pedal sensor.

Fault symptom[s]

- Cruise control does not function at all.

SIGNAL MISSING OR FAULTY SIGNAL

CHECKING THE STATUS

Fig. 90: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Read off the clutch pedal movement by carefully pressing and releasing the clutch pedal.

  Check that the value changes with clutch pedal movement. The value must be between 60-70 % when the clutch pedal is unaffected and 10-20 % when the pedal is fully depressed.

  The fault is intermittent at the moment if the values are OK.

Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Fig. 92: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check the resistance of the clutch pedal sensor between terminals #2 and #4 (component side).

  Check the clutch pedal and engine control module (ECM) connectors. Check for contact resistance and oxidation.

  Check the signal cable between engine control module (ECM) terminal #B15 (#B25) and clutch pedal sensor terminal #2 (component side). Check for an open-circuit.

  Check the signal ground cable between engine control module (ECM) terminal #B4 (#B14) and clutch pedal sensor terminal #4 (cable harness side). Check for an open-circuit.

Check the clutch pedal sensor installation. Search for damage and check the connections visually.

HINT: With the ignition on, the power supply to the clutch pedal sensor must be approximately 5 V (measured with the clutch pedal sensor disconnected), measured between terminals #2 and #4 (cable harness side).

Remedy as necessary.

SIGNAL MISSING OR FAULTY SIGNAL

see **SIGNAL MISSING OR FAULTY SIGNAL**

ECM-9100: ENGINE CONTROL MODULE (ECM). FAULTY SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 98: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-9100 is stored if the engine control module (ECM) registers an internal fault or a fault in the circuit for the damper motor in the throttle unit when the ignition is switched on.

Substitute Value

The engine control module (ECM) shuts down the supply to the throttle unit damper motor. The throttle will set itself to the return position.

Possible Source

- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the throttle unit
- Open-circuit, short-circuit to ground or short-circuit to supply voltage in the wiring for the damper motor in the throttle unit
- Short-circuit to each other in the wiring for the damper motor in the throttle unit
- Defective throttle unit
- Defective engine control module (ECM).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- Poor performance.

FAULTY SIGNAL

FAULT-TRACING INFORMATION

FAULT-TRACING INFORMATION

CAUTION: The male and female pins on the electronic throttle unit connectors are gold plated. Great care must be taken when measuring. Damage to the gold plating can result in operating difficulties.

CHECKING DIAGNOSTIC TROUBLE CODES (DTCS)

Fig. 100: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Read off diagnostic trouble codes (DTCs).

  Check whether any of diagnostic trouble codes (DTCs) ECM-903C, ECM-9150, ECM-9160 or ECM-9170 are stored in the engine control module (ECM).

  If any of these diagnostic trouble codes (DTCs) are stored, these must be remedied first.

Fig. 101: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Are any of the above diagnostic trouble codes (DTCs) stored?

- **YES**

  Refer to **FAULT-TRACING INFORMATION**

- **NO**

  Refer to **CHECKING COMPONENTS AND WIRING**

FAULT-TRACING INFORMATION

Remedy any diagnostic trouble codes (DTCs) that are stored.

Remedy as necessary.

CHECKING COMPONENTS AND WIRING

Fig. 102: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the throttle unit and engine control module (ECM) connectors. Check for contact resistance and oxidation.

  Check the resistance value of the damper motor winding in the throttle unit. Take readings between throttle unit terminals #1 and #4 (component side). Check for an open-circuit. Check for a short-circuit.

  NOTE: The resistance of the motor winding in the damper motor is very low.

  Replace the throttle unit if necessary.

  Check the cable (+) for the damper motor between engine control module (ECM) terminal #A35 (#A35)

and throttle unit terminal #4 (wiring side). Check for an open-circuit. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Check the cable (-) for the damper motor between engine control module (ECM) terminal #A36 (#A36) and throttle unit terminal #1 (wiring side). Check for an open-circuit. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Also check the damper motor cables (+) and (-). Check for a short-circuit to each other.

If no faults are found during the checks and the diagnostic trouble code (DTC) recurs, try replacing the throttle unit.

NOTE: When replacing the throttle unit or the engine control module (ECM) the throttle unit must be adapted. See "Throttle unit adaptation" in the vehicle communication socket.

Remedy as necessary.

Refer to **ADAPTATION OF THE THROTTLE UNIT**

ADAPTATION OF THE THROTTLE UNIT

HINT: Faults which caused this diagnostic trouble code (DTC) may affect the adaptation values for the throttle unit. Carry out adaptation of the throttle unit to update the adaptation values.

NOTE: The ignition must be switched on for at least 30 seconds after the basic conditions are met in order for the adaptation to start. It takes approximately 10 seconds to run the adaptation.

Fig. 126: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 127: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the components and connectors etc.
- Ignition on
- Read off the parameters.

Check that the following basic conditions for adaptation of the throttle unit are met.

1. Ignition on / engine off
2. Battery voltage above 10 V
3. Accelerator pedal (AP) unaffected
4. The car must be stationary (no vehicle speed signal)

5. Engine coolant temperature (ECT) between 5-100 °C
6. Intake air temperature (IAT) above 5 °C.

Remedy as necessary.

Check that the adaptation is correctly run after the "Adaptation of the throttle unit running" parameter changes status from "YES" to "NO". When all basic conditions are met, the adaptation must be completed after approximately 40 seconds. When the adaptation is completed correctly, the following information will be displayed:

- Adaptation of the throttle unit: OK
- Adaptation of the throttle unit running: NO.

Fig. 135: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on
- Read off the parameters.

Check that the following basic conditions for adaptation of the throttle unit are met.

1. Ignition on / engine off
2. Battery voltage above 10 V
3. Accelerator pedal (AP) unaffected
4. The car must be stationary (no vehicle speed signal)

5. Engine coolant temperature (ECT) between 5-100 °C
6. Intake air temperature (IAT) above 5 °C.

Remedy as necessary.

Check that the adaptation is correctly run after the "Adaptation of the throttle unit running" parameter changes status from "YES" to "NO". When all basic conditions are met, the adaptation must be completed after approximately 40 seconds. When the adaptation is completed correctly, the following information will be displayed:

- Adaptation of the throttle unit: OK
- Adaptation of the throttle unit running: NO.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-913C: THROTTLE UNIT. FAULTY SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 141: Identifying Throttle Unit & Potentiometer
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-913C is stored if the engine control module (ECM) detects that the basic conditions for adaptation are not met when trying to adapt the throttle unit. If other diagnostic trouble codes (DTCs) are stored, these must be remedied first. These may have caused the adaptation to fail.

Substitute Value

- The adaptation is cancelled
- The engine control module (ECM) shuts down the supply to the throttle unit damper motor. The throttle will set itself to the return position.

Possible Source

- The throttle is sticking or is blocked (oil film, dust etc.)
- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the throttle unit
- Defective throttle unit.

Fault symptom[s]

- Poor performance.

FAULTY SIGNAL

FAULT-TRACING INFORMATION

FAULT-TRACING INFORMATION

CAUTION: The male and female pins on the electronic throttle unit connectors are gold plated. Great care must be taken when measuring. Damage to the gold plating can result in operating difficulties.

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-913F: THROTTLE UNIT. FAULTY SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 156: Identifying Throttle Unit & Potentiometer
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-913F is stored if the engine control module (ECM) is unable to run its first adaptation of the throttle unit. This is because the programmed parameter for the stop position in the throttle position (TP) sensor has been exceeded. This adaptation is normally run during manufacture of the car. However the throttle unit must be adapted again if software, the engine control module (ECM) or the throttle unit is replaced. If other diagnostic trouble codes (DTCs) are stored, these must be remedied first. These may have caused the adaptation to fail.

Substitute Value

- The engine control module (ECM) uses the nominal values for the throttle unit parameters
- The engine control module (ECM) shuts down the supply to the throttle unit damper motor. The throttle will set itself to the return position.

Possible Source

Faulty signal:

- The throttle is sticking or is blocked (oil film, dust etc.)
- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the throttle unit
- Defective throttle unit.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- Poor performance.

FAULTY SIGNAL

see **FAULTY SIGNAL**

ECM-914F: THROTTLE UNIT. FAULTY SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 157: Identifying Throttle Unit & Potentiometer

Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-914F is stored if the ignition has been left on for 30 seconds and the engine control module (ECM) has been unable to adapt the throttle unit. This is because the programmed parameter for the stop position in the throttle position (TP) sensor has been exceeded. Adaptation is usually carried out to ensure that the throttle unit parameters are within the programmed values that are stored in the engine control module (ECM). If other diagnostic trouble codes (DTCs) are stored, these must be remedied first. These may have caused the adaptation to fail.

Substitute Value

- The engine control module (ECM) uses parameters from previous successful adaptations
- The engine control module (ECM) shuts down the supply to the throttle unit damper motor. The throttle will set itself to the return position.

Possible Source

Faulty signal:

- The throttle is sticking or is blocked (oil film, dust etc.)
- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the throttle unit
- Defective throttle unit.

Fault symptom[s]

- Poor performance.

FAULTY SIGNAL

see **FAULTY SIGNAL**

ECM-9150: THROTTLE UNIT, POTENTIOMETER 1. FAULTY SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 158: Identifying Throttle Unit & Potentiometer
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-9150 is stored if the engine control module (ECM) registers a fault in the signal from the throttle position sensor (TP) for the throttle unit, potentiometer 1 (circuit 1) when the ignition is switched on

Substitute Value

The throttle angle is calculated using potentiometer 2 (circuit 2) in the throttle position (TP) sensor for the throttle unit. If diagnostic trouble codes (DTCs) ECM-9150 and ECM-9160 are stored at the same time, the supply to the damper motor in the throttle unit will be cut. The throttle will set itself to the return position.

Possible Source

Signal too high:

- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the throttle unit
- Open-circuit or short-circuit to supply voltage in the signal cable
- Open-circuit in the signal ground cable for potentiometers 1 and 2
- Defective throttle unit.

Signal too low:

- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the throttle unit
- Short-circuit to ground in the signal cable
- Open-circuit or short-circuit to ground in the power supply to potentiometers 1 and 2
- Defective throttle unit.

Faulty signal:

- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the throttle unit
- The signal cables are short-circuited to each other
- Defective throttle unit.

Fault symptom[s]

- Poor performance.

FAULTY SIGNAL

FAULT-TRACING INFORMATION

FAULT-TRACING INFORMATION

CAUTION: The male and female pins on the electronic throttle unit connectors are gold plated. Great care must be taken when measuring. Damage to the gold plating can result in operating difficulties.

Fig. 159: Identifying Throttle Unit & Potentiometer

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-9160: THROTTLE UNIT, POTENTIOMETER 2. FAULTY SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 183: Identifying Throttle Unit & Potentiometer
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-9160 is stored if the engine control module (ECM) registers a fault in the signal from the throttle position sensor (TP) for the throttle unit, potentiometer 2 (circuit 2) when the ignition is switched on

Substitute Value

The throttle angle is calculated using potentiometer 1 (circuit 1) in the throttle position (TP) sensor for the throttle unit. Diagnostic trouble code (DTC) ECM-9150 is also stored if the fault is also detected in potentiometer 1 (circuit 1). If both ECM-9160 and ECM-9150 are stored, the supply to the damper motor in the throttle unit will be shut off. The throttle will set itself to the return position.

Possible Source

Signal too high:

- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the throttle unit

- Short-circuit to supply voltage in the signal cable
- Open-circuit in the signal ground cable for potentiometers 1 and 2
- Defective throttle unit.

Signal too low:

- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the throttle unit
- Open-circuit or short-circuit to ground in the signal cable
- Open-circuit or short-circuit to ground in the power supply to potentiometers 1 and 2
- Defective throttle unit.

Faulty signal:

- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the throttle unit
- The signal cables are short-circuited to each other
- Defective throttle unit.

Fault symptom[s]

- Poor performance.

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Fig. 193: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check the throttle unit and engine control module (ECM) connectors. Check for contact resistance and oxidation.

  Check the resistance values of the potentiometers in the throttle unit.

  Check the power supply cable (5 volts) between engine control module (ECM) terminal #A59 (#A59) and throttle unit terminal #3 (wiring side). Check for an open-circuit. Check for a short-circuit to ground.

  HINT: With the ignition on, the power supply to the throttle unit potentiometers must be approximately 5 V measured between throttle unit connector terminals #2 and #3 (wiring side).

Check the signal cable (potentiometer 2) between engine control module (ECM) terminal #A20 (#A20) and throttle unit terminal #5 (wiring side). Check for an open-circuit. Check for a short-circuit to ground.

If no faults are found during the checks and the diagnostic trouble code (DTC) recurs, try replacing the throttle unit.

NOTE: When replacing the throttle unit, the throttle unit must be adapted. See Throttle unit adaptation in the vehicle communication socket.

Remedy as necessary.

Is the status of the diagnostic trouble code (DTC) intermittent?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-9170: THROTTLE UNIT. FAULTY SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 200: Identifying Throttle Unit & Potentiometer
Courtesy of VOLVO CARS CORPORATION

This diagnostic trouble code (DTC) is never stored on its own. Diagnostic trouble code (DTC) ECM-9170 is also stored if the engine control module (ECM) registers that diagnostic trouble codes (DTC) ECM-9150 and ECM-9160 (fault in the throttle position (TP) sensor in the throttle unit, potentiometer 1 and 2) are stored.

Substitute Value

The supply to the throttle unit damper motor is shut off. The throttle will set itself to the return position.

Possible Source

Faulty signal:

- Fault in the throttle position (TP) sensor circuit for the throttle unit.

Fault symptom[s]

- Driving/Poor performance/lacks power

- Idling/Uneven idle

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-918A: ENGINE CONTROL MODULE (ECM). INTERNAL FAULT. INTERMITTENT FAULT (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 201: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-918A is stored if the engine control module (ECM), when attempting to adapt the throttle unit, registers an internal fault in the integrated amplifier for the signal from potentiometer 1 in the throttle unit throttle position sensor (circuit 1).

Substitute Value

The engine control module (ECM) does not use the signal from potentiometer 1 for the throttle unit throttle

position (TP) sensor (circuit 1).

Possible Source

- Defective engine control module (ECM).

Fault symptom[s]

- None.

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-918A: ENGINE CONTROL MODULE (ECM). INTERNAL FAULT. PERMANENT FAULT (B5254T2; B6294T; 2003-2004)

The information can be displayed again or the fault-tracing for this fault can be interrupted.

ECM-919A: ENGINE CONTROL MODULE (ECM). FAULTY SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 204: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-919A is stored if the engine control module (ECM), when the engine is running, registers that the internal governor for control of the throttle angle in the throttle unit is defective or that the control signal for the governor is too low when controlling the throttle.

Substitute Value

The engine control module (ECM) shuts down the supply to the throttle unit damper motor. The throttle will set itself to the return position.

Possible Source

Faulty signal:

- The throttle is sticking or is blocked (oil film, dust etc.)
- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the throttle unit
- Open-circuit, short-circuit to ground or short-circuit to supply voltage in the wiring for the damper motor in the throttle unit
- Short-circuit to each other in the wiring for the damper motor in the throttle unit
- Defective throttle unit

- Faulty software in the engine control module (ECM).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- Poor performance.

FAULTY SIGNAL

FAULT-TRACING INFORMATION

FAULT-TRACING INFORMATION

CAUTION: The male and female pins on the electronic throttle unit connectors are gold plated. Great care must be taken when measuring. Damage to the gold plating can result in operating difficulties.

- **Continue**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Fig. 208: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the throttle unit and engine control module (ECM) connectors. Check for contact resistance and oxidation.

  Check the resistance value of the damper motor winding in the throttle unit. Take readings between throttle unit terminals #1 and #4 (component side). Check for an open-circuit. Check for a short-circuit.

  NOTE: The resistance of the motor winding in the damper motor is very low.

  Check the cable (+) for the damper motor between engine control module (ECM) terminal #A35 (#A35) and throttle unit terminal #4 (wiring side). Check for an open-circuit. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Check the cable (-) for the damper motor between engine control module (ECM) terminal #A36 (#A36) and throttle unit terminal #1 (wiring side). Check for an open-circuit. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Also check the damper motor cables (+) and (-). Check for a short-circuit to each other.

Check that the shutter in the throttle unit is not blocked or sticking. Clean as necessary.

Remedy as necessary.

Refer to **ADAPTATION OF THE THROTTLE UNIT**

ADAPTATION OF THE THROTTLE UNIT

NOTE: **The ignition must be switched on for at least 30 seconds after the basic conditions are met in order for the adaptation to start. It takes approximately 10 seconds to run the adaptation.**

Fig. 212: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 213: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on
- Read off the parameters.

Check that the following basic conditions for adaptation of the throttle unit are met.

1. Ignition on / engine off
2. Battery voltage above 10 V
3. Accelerator pedal (AP) unaffected
4. The car must be stationary (no vehicle speed signal)

5. Engine coolant temperature (ECT) between 5-100 °C
6. Intake air temperature (IAT) above 5 °C.

Remedy as necessary.

Check that the adaptation is correctly run after the "Adaptation of the throttle unit running" parameter changes status from "YES" to "NO". When all basic conditions are met, the adaptation must be completed after approximately 40 seconds. When the adaptation is completed correctly, the following information will be displayed:

- Adaptation of the throttle unit: OK
- Adaptation of the throttle unit running: NO.

Is the fault status is "NO FAULT FOUND"?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-91A7: THROTTLE UNIT. FAULTY SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 227: Identifying Throttle Unit & Potentiometer
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-91A7 is stored if the engine control module (ECM) registers, when the engine is running, that the required throttle angle (desired value) does not correspond with the actual throttle angle (actual value) in the throttle unit

Substitute Value

The engine control module (ECM) shuts down the supply to the throttle unit damper motor. The throttle will set itself to the return position

Possible Source

Faulty signal:

- The throttle is sticking or is blocked (oil film, dust etc.)
- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the throttle unit

- Open-circuit, short-circuit to ground or short-circuit to supply voltage in the wiring for the damper motor in the throttle unit
- Short-circuit to each other in the wiring for the damper motor in the throttle unit
- Defective throttle unit.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- Poor performance.

FAULTY SIGNAL

FAULT-TRACING INFORMATION

Remedy stored diagnostic trouble code(s) (DTCs).

Remedy as necessary.

INFORMATION

FAULT-TRACING INFORMATION

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

ECM-91B7: THROTTLE UNIT. FAULTY SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 235: Identifying Throttle Unit & Potentiometer
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-91B7 is stored if the engine control module (ECM), when attempting to adapt the throttle unit, registers that the movements of the throttle is impeded or that the return spring in the throttle unit is not functioning correctly.

Substitute Value

Depending on the fault, the engine control module (ECM) can cut off the supply to the damper motor in the throttle unit. The throttle will then attempt to set itself to the return position.

Possible Source

Faulty signal:

- The throttle is sticking or is blocked (oil film, dust etc.)
- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the throttle unit
- Open-circuit, short-circuit to ground or short-circuit to supply voltage in the wiring for the damper motor in the throttle unit
- Short-circuit to each other in the wiring for the damper motor in the throttle unit
- Defective throttle unit.

Fault symptom[s]

- Driving/Hesitates/surges/Unsure when/at all times
- Driving/Engine stalls/During acceleration
- Driving/Engine stalls/During deceleration
- Starting/Engine does not start/Unsure when/at all times
- Driving/Engine stalls/At steady speed
- Warning lights and chimes/Malfunction Indicator Light ("Check engine" light) indication/no indication

FAULTY SIGNAL

see **FAULTY SIGNAL**

ECM-91C7: THROTTLE UNIT. FAULTY SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 236: Identifying Throttle Unit & Potentiometer
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-91C7 is stored if the engine control module (ECM), when attempting to adapt the throttle unit, registers that the movements of the throttle is impeded or that the opening spring in the throttle unit is not functioning correctly.

Substitute Value

Depending on the fault, the engine control module (ECM) can cut off the supply to the damper motor in the throttle unit. The throttle will then attempt to set itself to the return position.

Possible Source

Faulty signal:

- The throttle is sticking or is blocked (oil film, dust etc.)
- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the throttle unit
- Open-circuit, short-circuit to ground or short-circuit to supply voltage in the wiring for the damper motor in the throttle unit
- Short-circuit to each other in the wiring for the damper motor in the throttle unit
- Defective throttle unit.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- Poor performance.

FAULTY SIGNAL

see **FAULTY SIGNAL**

ECM-9200: THROTTLE POSITION (TP) SENSOR. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-9200

Condition

Fig. 237: Identifying Throttle Unit & Potentiometer
Courtesy of VOLVO CARS CORPORATION

This diagnostic trouble code (DTC) is never stored on its own. This diagnostic trouble code (DTC) will also be stored if the engine control module (ECM) registers that one of the diagnostic trouble codes (DTCs) for the throttle position sensor circuit is stored.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

None.

Possible Source

- Fault in the throttle position (TP) sensor circuit for the electronic throttle unit.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

ECM-9210: ELECTRONIC THROTTLE UNIT, POTENTIOMETER 1. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-9210

Condition

Fig. 238: Identifying Throttle Unit & Potentiometer
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers a fault in the signal from the throttle position (TP) sensor, potentiometer 1 (circuit 1) in the electronic throttle unit.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

The throttle angle is calculated using potentiometer 2 (circuit 2) in the throttle position (TP) sensor for the throttle unit. If the diagnostic trouble codes (DTCs) for both potentiometers 1 and 2 are stored at the same time, the supply to the damper motor in the throttle unit will be disabled. The throttle will set itself to the return position.

Possible Source

- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the electronic throttle unit
- The signal cables are short-circuited to each other
- Damaged throttle unit.

Fault symptom[s]

- Poor performance.

FAULTY SIGNAL

ECM-921C: ELECTRONIC THROTTLE UNIT, POTENTIOMETER 1. SIGNAL TOO HIGH (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-921C

Condition

Fig. 239: Identifying Throttle Unit & Potentiometer
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers a fault in the signal from the throttle position (TP) sensor, potentiometer 1 (circuit 1) in the electronic throttle unit.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

The throttle angle is calculated using potentiometer 2 (circuit 2) in the throttle position (TP) sensor for the throttle unit. If the diagnostic trouble codes (DTCs) for both potentiometers 1 and 2 are stored at the same time, the supply to the damper motor in the throttle unit will be disabled. The throttle will set itself to the return position.

Possible Source

- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the electronic throttle unit
- Open-circuit or short-circuit to supply voltage in the signal cable
- Open-circuit in the signal ground cable for potentiometers 1 and 2
- Damaged throttle unit.

Fault symptom[s]

- Poor performance.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-921D

Condition

Fig. 240: Identifying Throttle Unit & Potentiometer
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers a fault in the signal from the throttle position (TP) sensor, potentiometer 1 (circuit 1) in the electronic throttle unit.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

The throttle angle is calculated using potentiometer 2 (circuit 2) in the throttle position (TP) sensor for the throttle unit. If the diagnostic trouble codes (DTCs) for both potentiometers 1 and 2 are stored at the same time, the supply to the damper motor in the throttle unit will be disabled. The throttle will set itself to the return position.

Possible Source

- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the electronic throttle unit
- Short-circuit to ground in the signal cable
- Open-circuit or short-circuit to ground in the power supply to potentiometers 1 and 2
- Damaged throttle unit.

Fault symptom[s]

- Poor performance.

ECM-9220: ELECTRONIC THROTTLE UNIT, POTENTIOMETER 2. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-9220

Condition

Fig. 241: Identifying Throttle Unit & Potentiometer
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers a fault in the signal from the throttle position (TP) sensor, potentiometer 2 (circuit 2) in the electronic throttle unit.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

The throttle angle is calculated using potentiometer 1 (circuit 1) in the throttle position (TP) sensor for the throttle unit. If the diagnostic trouble codes (DTCs) for both potentiometers 1 and 2 are stored at the same time, the supply to the damper motor in the throttle unit will be disabled. The throttle will set itself to the return position.

Possible Source

- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the electronic throttle unit
- The signal cables are short-circuited to each other
- Damaged throttle unit.

Fault symptom[s]

- Poor performance.

ECM-922C: ELECTRONIC THROTTLE UNIT, POTENTIOMETER 2. SIGNAL TOO HIGH (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-922C

Condition

Fig. 242: Identifying Throttle Unit & Potentiometer
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers a fault in the signal from the throttle position (TP) sensor, potentiometer 2 (circuit 2) in the electronic throttle unit.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

The throttle angle is calculated using potentiometer 1 (circuit 1) in the throttle position (TP) sensor for the throttle unit. If the diagnostic trouble codes (DTCs) for both potentiometers 1 and 2 are stored at the same time, the supply to the damper motor in the throttle unit will be disabled. The throttle will set itself to the return position.

Possible Source

- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the electronic throttle unit
- Short-circuit to supply voltage in the signal cable
- Open-circuit in the signal ground cable for potentiometers 1 and 2
- Damaged throttle unit.

Fault symptom[s]

- Poor performance.

ECM-922D: ELECTRONIC THROTTLE UNIT, POTENTIOMETER 2. SIGNAL TOO LOW (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-922D

Condition

Fig. 243: Identifying Throttle Unit & Potentiometer
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers a fault in the signal from the throttle position (TP) sensor, potentiometer 2 (circuit 2) in the electronic throttle unit.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

The throttle angle is calculated using potentiometer 1 (circuit 1) in the throttle position (TP) sensor for the throttle unit. If a fault is also detected in potentiometer 1 (circuit 1) a diagnostic trouble code (DTC) will also be stored for this. If diagnostic trouble codes (DTCs) have been stored for both potentiometers, the supply to the damper motor for the electronic throttle unit will be disabled. The throttle will set itself to the return position.

Possible Source

- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the electronic throttle unit
- Open-circuit or short-circuit to ground in the signal cable
- Open-circuit or short-circuit to ground in the power supply to potentiometers 1 and 2
- Damaged throttle unit.

Fault symptom[s]

- Poor performance.

SIGNAL TOO LOW

ECM-9240: ENGINE CONTROL MODULE (ECM). FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-9240

Condition

Fig. 244: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers an internal fault or a fault in the circuit for the throttle unit damper motor.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

The engine control module (ECM) shuts down the supply to the damper motor for the electronic throttle unit. The throttle will set itself to the return position.

Possible Source

- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the electronic throttle unit
- Open-circuit, short-circuit to ground or short-circuit to supply voltage in the wiring for the damper motor in the throttle unit
- Short-circuit to each other in the wiring for the damper motor in the throttle unit
- Damaged throttle unit
- Damaged engine control module (ECM).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- Poor performance.

Remedy any diagnostic trouble codes (DTCs) that are stored.

Remedy as necessary.

CHECKING COMPONENTS AND WIRING

Fig. 248: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the throttle unit and engine control module (ECM) connectors. Check for contact resistance and oxidation.

  Check the resistance value of the damper motor winding in the throttle unit. Take readings between throttle unit terminals #1 and #4 (component side). Check for an open-circuit. Check for a short-circuit.

  NOTE: The resistance of the motor winding in the damper motor is very low.

  Replace the throttle unit if necessary.

  Check the cable (+) for the damper motor between engine control module (ECM) terminal #A35 (#A35)

and throttle unit terminal #4 (cable harness side). Check for an open-circuit. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Check the cable (-) for the damper motor between engine control module (ECM) terminal #A36 (#A36) and throttle unit terminal #1 (cable harness side). Check for an open-circuit. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Also check the damper motor cables (+) and (-). Check for a short-circuit to each other.

If no faults are found during the checks and the diagnostic trouble code (DTC) recurs, try replacing the throttle unit.

NOTE: When replacing the throttle unit or the engine control module (ECM) the throttle unit must be adapted. See "Throttle unit adaptation" in the vehicle communication socket.

Remedy as necessary.

SIGNAL TOO LOW

see **SIGNAL TOO LOW**

ECM-9270: THROTTLE UNIT. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-9270

Condition

Fig. 283: Identifying Throttle Unit & Potentiometer
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if, when the engine is running, the engine control module (ECM) registers that the desired throttle angle (desired value) does not correspond to the actual throttle angle (actual value) in the electronic throttle unit.

Substitute Value

The engine control module (ECM) shuts down the supply to the damper motor for the electronic throttle unit. The throttle will set itself to the return position.

Possible Source

- The throttle is sticking or is blocked (e. g. oil film, dust)

- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the electronic throttle unit
- Open-circuit, short-circuit to ground or short-circuit to supply voltage in the wiring for the damper motor in the throttle unit
- Short-circuit to each other in the wiring for the damper motor in the throttle unit
- Damaged throttle unit.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- Poor performance.

FAULTY SIGNAL

FAULT-TRACING INFORMATION

FAULT-TRACING INFORMATION

CAUTION: The male and female pins on the electronic throttle unit connectors are gold plated. Great care must be taken when measuring. Damage to the gold plating can result in operating difficulties.

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

Fig. 285: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Read off diagnostic trouble codes (DTCs).

  Check if any diagnostic trouble codes (DTCs) are stored for the electronic throttle unit, throttle position

(TP) sensor or engine control module (ECM).

If any of these diagnostic trouble codes (DTCs) are stored, these must be remedied first.

Fig. 286: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Are any of the above diagnostic trouble codes (DTCs) stored?

- **YES**

  Refer to **FAULT-TRACING INFORMATION**

- **NO**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Fig. 287: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check the throttle unit and engine control module (ECM) connectors. Check for contact resistance and oxidation.

  Check the resistance values of the potentiometers in the throttle unit and damper motor winding.

  NOTE: The resistance of the motor winding in the damper motor is very low.

  Replace the throttle unit if necessary.

  Check the cable (+) for the damper motor between engine control module (ECM) terminal #A35 (#A35) and throttle unit terminal #4 (cable harness side). Check for an open-circuit. Check for a short-circuit to

ground. Check for a short-circuit to supply voltage.

Check the cable (-) for the damper motor between engine control module (ECM) terminal #A36 (#A36) and throttle unit terminal #1 (cable harness side). Check for an open-circuit. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Also check the damper motor cables (+) and (-). Check for a short-circuit to each other.

Check that the shutter in the throttle unit is not blocked or sticking. Clean as necessary.

The throttle unit is damaged if the diagnostic trouble code (DTC) recurs.

NOTE: If the throttle unit is replaced it must be adapted.

Refer to **ADAPTATION OF THE THROTTLE UNIT**

ADAPTATION OF THE THROTTLE UNIT

HINT: Faults which caused this diagnostic trouble code (DTC) may affect the adaptation values for the throttle unit. Carry out adaptation of the throttle unit to update the adaptation values.

NOTE: The ignition must be switched on for at least 30 seconds after the basic conditions are met in order for the adaptation to start. It takes approximately 10 seconds to run the adaptation.

Fig. 295: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 296: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the components and connectors etc.
- Ignition on
- Read off the parameters.

Check that the following basic conditions for adaptation of the throttle unit are met.

1. Ignition on / engine off
2. Battery voltage above 10 V
3. Accelerator pedal (AP) unaffected
4. The vehicle must be stationary (no vehicle speed signal)

5. Engine coolant temperature (ECT) between 5-100°C
6. Intake air temperature (IAT) above 5 °C.

Remedy as necessary.

Check that the adaptation is correctly run after the "Adaptation of the throttle unit running" parameter changes status from "YES" to "NO". When all basic conditions are met, the adaptation must be completed after approximately 40 seconds. When the adaptation has been run correctly, the following information will be displayed:

- Adaptation of the throttle unit: OK
- Adaptation of the throttle unit running: NO.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-929C: ENGINE CONTROL MODULE (ECM). SIGNAL TOO HIGH (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-929C

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-929C**

SIGNAL TOO HIGH

see **SIGNAL TOO HIGH**

ECM-929D: ENGINE CONTROL MODULE (ECM). SIGNAL TOO LOW (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-929D

Condition

Fig. 355: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the internal governor for control of the throttle angle in the throttle unit is damaged or that the control signal for the governor is too low when controlling the throttle.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

The engine control module (ECM) shuts down the supply to the damper motor for the electronic throttle unit. The throttle will set itself to the return position.

Possible Source

- The throttle is sticking or is blocked (e. g. oil film, dust)
- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the electronic throttle unit
- Open-circuit, short-circuit to ground or short-circuit to supply voltage in the wiring for the damper motor in the throttle unit
- Short-circuit to each other in the wiring for the damper motor in the throttle unit
- Damaged throttle unit
- Faulty software in the engine control module (ECM).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- Poor performance.

SIGNAL TOO LOW

FAULT-TRACING INFORMATION

FAULT-TRACING INFORMATION

CAUTION: The male and female pins on the electronic throttle unit connectors are gold plated. Great care must be taken when measuring. Damage to the gold plating can result in operating difficulties.

ECM-92B0: ELECTRONIC THROTTLE UNIT. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-92B0

Condition

Fig. 377: Identifying Throttle Unit & Potentiometer
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) fails to carry out its first adaptation of the electronic throttle unit. This is because the programmed parameter for the stop position in the throttle position (TP) sensor has been exceeded. This adaptation is normally run during manufacture of the vehicle. However the electronic throttle unit must be adapted again if the software, the engine control module (ECM) or the throttle unit is replaced. If other diagnostic trouble codes (DTCs) are stored, these must be

remedied first. These may have caused the adaptation to fail.

Substitute Value

- The engine control module (ECM) uses nominal values for the throttle unit parameters
- The engine control module (ECM) shuts down the supply to the damper motor for the electronic throttle unit. The throttle will set itself to the return position.

Possible Source

- The throttle is sticking or is blocked (e. g. oil film, dust)
- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the electronic throttle unit
- Damaged throttle unit.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- Poor performance.

ECM-92CC: ELECTRONIC THROTTLE UNIT. SIGNAL TOO HIGH (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-92CC

Condition

Fig. 378: Identifying Throttle Unit & Potentiometer
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that the basic conditions for adaptation are not met when trying to adapt the electronic throttle unit. If other diagnostic trouble codes (DTCs) are stored, these must be remedied first. These may have caused the adaptation to fail.

Substitute Value

- The adaptation is cancelled
- The engine control module (ECM) shuts down the supply to the damper motor for the electronic throttle unit. The throttle will set itself to the return position.

Possible Source

Adaptation of the throttle unit is cancelled because one of the following basic requirements has not been met:

1. Ignition on / engine off
2. The battery voltage must be over 10 V
3. Accelerator pedal (AP) unaffected
4. The vehicle must be stationary (no vehicle speed signal)
5. Engine coolant temperature (ECT) between 5-100°C

6. Intake air temperature (IAT) above 5 °C.

- The throttle is sticking or is blocked (e. g. oil film, dust)
- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the electronic throttle unit
- Damaged throttle unit.

Fault symptom[s]

- Poor performance.

ECM-92D0: ELECTRONIC THROTTLE UNIT. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-92D0

Condition

Fig. 393: Identifying Throttle Unit & Potentiometer
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the ignition has been left on for 30 seconds and the engine control module (ECM) has been unable to adapt the electronic throttle unit. This is because the programmed parameter for the stop position in the throttle position (TP) sensor has been exceeded. Adaptation is usually carried out to ensure that the throttle unit parameters are within the programmed values that are stored in the engine control module (ECM). If other diagnostic trouble codes (DTCs) are stored, these must be remedied first. These may have caused the adaptation to fail.

Substitute Value

- The engine control module (ECM) uses parameters from previous successful adaptations
- The engine control module (ECM) shuts down the supply to the damper motor for the electronic throttle unit. The throttle will set itself to the return position.

Possible Source

- The throttle is sticking or is blocked (e. g. oil film, dust)
- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the electronic throttle unit

- Damaged throttle unit.

Fault symptom[s]

- Poor performance.

ECM-9300: CLUTCH PEDAL POSITION SENSOR. FAULTY SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 395: Identifying Clutch Pedal Push Rod & Position Sensor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-9300 is stored if the engine control module (ECM) registers a fault in the PWM signal from the clutch pedal position sensor when the ignition is switched on.

Substitute Value

Cruise control switched off.

Possible Source

Signal too high:

- Short-circuit to supply voltage in the signal cable
- Defective clutch pedal sensor.

Signal too low:

- Short-circuit to ground in the signal cable
- Defective clutch pedal sensor.

Faulty signal:

- Open-circuit in the signal cable
- Incorrectly installed clutch pedal sensor
- Defective clutch pedal sensor.

Fault symptom[s]

- Cruise control does not function at all.

FAULTY SIGNAL

CHECKING THE STATUS

Fig. 396: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Read off the clutch pedal movement by carefully pressing and releasing the clutch pedal.

  Check that the value changes with clutch pedal movement. The value must be between 60-70 % when the clutch pedal is unaffected and 10-20 % when the pedal is fully depressed.

  The fault is intermittent at the moment if the values are OK.

CHECKING COMPONENTS AND WIRING

Fig. 398: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check the resistance of the clutch pedal sensor between terminals #2 and #4 (component side).

  Check the clutch pedal sensor and engine control module (ECM) connectors. Check for contact resistance and oxidation.

  Check the signal cable between engine control module (ECM) terminal #B15 (#B25) and clutch pedal sensor terminal #2 (component side). Check for an open-circuit.

  Check the signal ground cable between engine control module (ECM) terminal #B4 (#B14) and clutch pedal sensor terminal #4 (wiring side). Check for an open-circuit.

Check the clutch pedal sensor installation. Search for damage and check the connections visually.

HINT: With the ignition on, the power supply to the clutch pedal sensor must be approximately 5 V (measured with the clutch pedal sensor disconnected), measured between terminals #2 and #4 (wiring side).

Remedy as necessary.

ECM-9400: ACCELERATOR PEDAL (AP) POSITION SENSOR, ANALOG SIGNAL. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-9400

Condition

Fig. 427: Identifying Accelerator Pedal (AP) Position Sensor
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers a fault in the analog signal from the accelerator pedal (AP) position sensor.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- The accelerator pedal (AP) is disabled at the same time as the brake pedal is pressed.

Possible Source

- Open-circuit in the power supply (12 V) for the accelerator pedal (AP) position sensor
- Water in the connectors.
- Damaged accelerator pedal (AP) position sensor.

Fault symptom[s]

- Poor accelerator pedal (AP) response.
- Message in information display

FAULTY SIGNAL

CHECKING THE STATUS

Fig. 428: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Read off the movement of the accelerator pedal by carefully depressing and releasing the accelerator pedal (AP).

  Check that the value changes with accelerator pedal movement. The value must be approximately 0.4 V when the accelerator pedal (AP) is unaffected and approximately 4 V when the accelerator pedal (AP) is fully depressed.

  The fault is intermittent at the moment if the values are OK.

Fig. 429: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING THE POWER SUPPLY**

CHECKING THE POWER SUPPLY

Fig. 430: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check the connectors and terminals for water penetration.

  Check the power supply (12 V) to the accelerator pedal (AP) position sensor between accelerator pedal (AP) position sensor terminals #1 (wiring side) and #3 (wiring side).

  Check that the power supply is approximately 12 V with the ignition on.

  Remedy as necessary.

  Other information:

- see **CHECKING WIRING AND TERMINALS**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**

Is the power supply OK?

- **YES**

  Refer to **REPLACING THE COMPONENT**

- **NO**

  Refer to **CHECKING THE CONNECTORS AND CABLES**

REPLACING THE COMPONENT

Fig. 433: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Try a new accelerator pedal (AP) position sensor if no fault is found and the fault is permanent. See **ACCELERATOR PEDAL (AP), REPLACING** .

Fig. 434: Identifying Accelerator Pedal (AP) Position Sensor
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

CHECKING THE CONNECTORS AND CABLES

Fig. 435: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the accelerator pedal (AP) position sensor connector. Check for contact resistance and oxidation.

  Check the power supply cable (12 V) between accelerator pedal (AP) position sensor terminal #1 (wiring side) and the relevant fuse for the circuit. Check for a short-circuit to ground. Check for an open-circuit. Check that the fuse for the circuit has not blown.

  Check the ground lead for power supply (12 V) between accelerator pedal (AP) position sensor terminal #3 (wiring side) and the relevant ground terminal. Check for contact resistance and oxidation. Check for an open-circuit.

  HINT: With the ignition on, the power supply to the accelerator pedal (AP) position sensor must be approximately 12 V measured between accelerator pedal (AP) position sensor terminals #1 (wiring

side) and #3 (wiring side).

HINT: With the ignition on, the power supply from the engine control module (ECM) must be approximately 5 V measured between accelerator pedal (AP) position sensor terminals #6 (wiring side) and #4 (wiring side).

Remedy as necessary.

Other information:

see **FAULTY SIGNAL**

ECM-9400: BRAKE PEDAL SENSOR. FAULTY SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

If the engine control module (ECM), with engine running, registers a malfunction on the brake pedal sensor's circuit, the brake light switch circuit, or on the CAN-communication between the brake control module (BCM) and the engine control module (ECM), the diagnostic trouble code is generated.

Substitute Value

Cruise control switched off.

Possible Source

Signal too high:

- Look for the cause of the malfunction in the brake control module (BCM) and in the central electronic module (CEM).

Incorrect signal:

- Malfunction in brake control module (BCM) or in central electronic module (CEM).
- Contact resistance or oxidation in the connections between the engine control module (ECM) and the brake light switch.
- Open circuit in the voltage feed to the brake light switch.
- Open circuit or short-circuit to ground or voltage in the cable for the brake light switch.
- Incorrectly installed brake light switch.
- Incorrectly adjusted brake light switch.
- Water in the connectors.
- Damaged brake light switch.

Signal missing:

- Look for the cause of the malfunction in the brake control module (BCM) and in the central electronic

module (CEM).

Fault symptom[s]

- Cruise control does not function at all.
- Brake light constantly on.
- Message in information display

INCORRECT SIGNAL

CHECKING DIAGNOSTIC TROUBLE CODES (DTCS)

Check if any diagnostic trouble codes are stored in the brake control module (BCM) or in the central electronic module (CEM).

If diagnostic trouble codes are stored in the brake control module (BCM) or in the central electronic module (CEM), these shall be taken care of first.

Have fault causes been searched for or remedied in the above control modules?

- **YES**

  Refer to **CHECKING THE STATUS**

- **NO**

  OKAY: Troubleshooting has been completed.

CHECKING THE STATUS

Fig. 441: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Read off the status from the brake light switch.

  Check the function of the brake light switch by slowly pressing down and letting up the brake pedal.

  Check that the status changes between "OFF" when brake pedal is not pressed and "ON" when brake pedal is pressed.

  If the status from the brake light switch changes according to the above when pressing on the brake pedal, this indicates that the malfunction is intermittent at this time.

Fig. 442: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING VOLTAGE FEED**

CHECKING VOLTAGE FEED

Fig. 443: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on

  Check voltage feed to the brake light switch. Measure between the brake light switch #1 (against cable harness) and ground (frame grounding point). Voltage feed shall be approx. 12 V.

  If voltage feed is missing:

  Check the circuit for voltage feed to the brake light switch #1 (against cable harness) for open circuit, short-circuit to ground and damaged fuse for the circuit.

  Remedy as necessary.

CHECKING THE CONNECTORS AND CABLES

Fig. 460: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the accelerator pedal (AP) position sensor connector. Check for contact resistance and oxidation.

  Check the power supply cable (12 V) between accelerator pedal (AP) position sensor terminal #1 (cable harness side) and the relevant fuse for the circuit. Check for a short-circuit to ground. Check for an open-circuit. Check that the fuse for the circuit is not damaged.

  Check the ground lead for power supply (12 V) between accelerator pedal (AP) position sensor terminal #3 (cable harness side) and the relevant ground terminal. Check for contact resistance and oxidation. Check for an open-circuit.

  HINT: With the ignition on, the power supply to the accelerator pedal (AP) position sensor measured between accelerator pedal (AP) position sensor terminals #1 (cable harness side) and #3

(cable harness side) must be approximately 12 V.

HINT: With the ignition on, the power supply from the engine control module (ECM) must be approximately 5 V measured between accelerator pedal (AP) position sensor terminals #6 (cable harness side) and #4 (cable harness side).

Remedy as necessary.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-940D

Condition

Fig. 466: Identifying Accelerator Pedal (AP) Position Sensor
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers a fault in the analog signal from the accelerator pedal (AP) position sensor.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- The accelerator pedal (AP) is disabled at the same time as the brake pedal is pressed.

Possible Source

- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the accelerator pedal (AP) position sensor
- Open-circuit in the power supply (12 V) for the accelerator pedal (AP) position sensor
- Open-circuit in the power supply (5 V) for the analog signal
- Open-circuit in the signal ground cable for the analog signal
- Open-circuit or short-circuit to ground in the signal cable
- Damaged accelerator pedal (AP) position sensor.

Fault symptom[s]

- Poor accelerator pedal (AP) response.

ECM-9520: ACCELERATOR PEDAL (AP) POSITION SENSOR, ANALOG SIGNAL. FAULTY SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 21: Identifying Accelerator Pedal (AP) Position Sensor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-9520 is stored if the engine control module (ECM) registers a fault in the analog signal from the accelerator pedal (AP) position sensor with the ignition is switched on.

Substitute Value

The accelerator pedal (AP) is not working at all at the same time as the brake pedal is pressed.

Possible Source

Signal too high:

- Short-circuit to supply voltage in the signal cable
- Defective accelerator pedal (AP) position sensor.

Signal too low:

- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the accelerator pedal (AP) position sensor
- Open-circuit in the power supply (12 V) for the accelerator pedal (AP) position sensor
- Open-circuit in the power supply (5V) for the analog signal

- Open-circuit in the signal ground cable for the analog signal
- Open-circuit or short-circuit to ground in the signal cable
- Defective accelerator pedal (AP) position sensor.

Faulty signal:

- Open-circuit in the power supply (12 V) for the accelerator pedal (AP) position sensor
- Water in the connectors.
- Defective accelerator pedal (AP) position sensor.

Fault symptom[s]

- Poor accelerator pedal (AP) response.

SIGNAL TOO LOW

CHECKING THE STATUS

Fig. 39: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Read off the movement of the accelerator pedal by carefully depressing and releasing the accelerator pedal (AP).

  Check that the value changes with accelerator pedal movement. The value must be approximately 0.4 V

when the accelerator pedal (AP) is unaffected and approximately 4 V when the accelerator pedal (AP) is fully depressed.

The fault is intermittent at the moment if the values are OK.

Fig. 40: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **CHECKING THE POWER SUPPLY**

CHECKING THE POWER SUPPLY

Fig. 41: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check the power supply (12 V) to the accelerator pedal (AP) position sensor between accelerator pedal (AP) position sensor terminals #1 (wiring side) and #3 (wiring side).

  Check that the power supply is approximately 12 V with the ignition on.

  Remedy as necessary.

  Other information:

CHECKING COMPONENTS AND WIRING

Fig. 45: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the accelerator pedal position sensor and engine control module (ECM) connectors. Check for contact resistance and oxidation.

  Check the power supply cable (5 volts) between engine control module (ECM) terminal #B9 (#B19) and accelerator pedal (AP) position sensor terminal #6 (wiring side). Check for an open-circuit. Check for a short-circuit to ground.

  Check the signal ground cable between engine control module (ECM) terminal #B5 (#B15) and accelerator pedal (AP) position sensor terminal #4 (wiring side). Check for an open-circuit.

  HINT: With the ignition on, the power supply from the engine control module (ECM) must be approximately 5 V measured between accelerator pedal (AP) position sensor terminals #6 (wiring

side) and #4 (wiring side).

Check the signal cable between engine control module (ECM) terminal #B17 (#B27) and accelerator pedal (AP) position sensor terminal #5. Check for an open-circuit. Check for a short-circuit to ground.

Try a new accelerator pedal (AP) position sensor if no fault is found and the fault is permanent.

Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-9530: ACCELERATOR PEDAL (AP) POSITION SENSOR, DIGITAL SIGNAL. SIGNAL TOO HIGH (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 56: Identifying Accelerator Pedal (AP) Position Sensor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-9530 is stored if the engine control module (ECM) registers a fault in the PWM signal from the accelerator pedal (AP) position sensor when the ignition is switched on

Substitute Value

The accelerator pedal (AP) is not working at all at the same time as the brake pedal is pressed.

Possible Source

Signal too high:

- Short-circuit to supply voltage in the signal cable
- Defective accelerator pedal (AP) position sensor.

Signal too low:

- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the accelerator pedal (AP) position sensor
- Open-circuit or short-circuit to ground in the signal cable
- Open-circuit in the power supply (12V) for the accelerator pedal (AP) position sensor
- Defective accelerator pedal (AP) position sensor.

Fault symptom[s]

- Poor accelerator pedal (AP) response.

SIGNAL TOO HIGH

see **SIGNAL TOO HIGH**

ECM-9530: ACCELERATOR PEDAL (AP) POSITION SENSOR, DIGITAL SIGNAL. SIGNAL TOO LOW (B5254T2; B6294T; 2003-2004)

ECM-9540: ACCELERATOR PEDAL (AP) POSITION SENSOR, DIGITAL SIGNAL. FAULTY SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 57: Identifying Accelerator Pedal (AP) Position Sensor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-9540 is stored if the engine control module (ECM), when the ignition is on, registers that the pulse width modulation (PWM) signal for the accelerator pedal (AP) position sensor deviates from the basic frequency of 200 Hz by more than ±70 Hz.

Substitute Value

None.

Possible Source

Faulty signal:

- Contact resistance or oxidation in the terminals between the engine control module (ECM) and the accelerator pedal (AP) position sensor
- Open-circuit or short-circuit to ground or supply voltage in the signal cable
- Defective accelerator pedal (AP) position sensor.

Fault symptom[s]

- None.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-960C: ENGINE CONTROL MODULE (ECM), TORQUE SIGNAL. INTERNAL FAULT (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-960C

Condition

Fig. 65: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers an internal fault which indicates that the normal engine control functions are requesting more torque than is within the maximum permitted range.

The diagnostic trouble code (DTC) is diagnosed at ignition on or with the engine running.

Substitute Value

- Requested torque is limited to a calculated operating range.

Possible Source

- Damaged engine control module (ECM).

Fault symptom[s]

- Poor performance.

INTERNAL FAULT

ECM-9800: ENGINE CONTROL MODULE (ECM), TORQUE SIGNAL. INTERNAL FAULT (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-9800

Condition

Fig. 74: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers an internal fault which indicates that the normal engine control functions are producing a higher torque than is within the maximum permitted range.

The diagnostic trouble code (DTC) is diagnosed at ignition on or with the engine running.

Substitute Value

- The engine speed (RPM) is restricted to approximately 2200 RPM by the fuel shut-off system
- Requested torque is limited to a calculated operating range.

Possible Source

- Damaged engine control module (ECM).

Fault symptom[s]

- Maximum engine speed (RPM) too low
- Cruise control does not work at all
- Uneven idle
- Malfunction indicator lamp (MIL) lit.

INTERNAL FAULT

REPLACING THE COMPONENT

NOTE: The diagnostic trouble code (DTC) may be stored as a consequence of other faults. Check therefore if any other diagnostic trouble codes (DTCs) are stored for the engine control module (ECM). Remedy these first.

The engine control module (ECM) has registered an internal fault.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up of the engine control module (ECM) or may be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs.

see **ENGINE CONTROL MODULE (ECM), REPLACING**

Remedy as necessary.

ECM-9810: ENGINE CONTROL MODULE (ECM), ENGINE SPEED (RPM). INTERNAL FAULT (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-9810

Condition

Fig. 77: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers an internal fault indicating that the calculated engine speed (RPM) in the internal monitoring functions differs from the normal calculated engine speed (RPM) in the engine control functions.

The diagnostic trouble code (DTC) is diagnosed with the engine running and at an engine speed (RPM) above 520 RPM.

Substitute Value

- Engine speed (RPM) and torque are limited to a calculated normal operating range.

Possible Source

- Damaged engine control module (ECM).

Fault symptom[s]

- Maximum engine speed (RPM) too low
- Cruise control does not work at all
- Uneven idle

- Malfunction indicator lamp (MIL) lit.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-981A

Condition

Fig. 78: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-981A is stored if the engine control module (ECM) registers an internal fault which indicates that the normal engine control functions are producing a higher torque than is within the maximum permitted range. The diagnostic trouble code (DTC) is diagnosed at ignition on or with the engine running.

Substitute Value

The engine speed (RPM) is restricted to approximately 2200 RPM by shutting off the fuel.

The requested torque is limited to a calculated operating range.

Possible Source

- Defective engine control module (ECM).

Fault symptom[s]

- Maximum engine speed (RPM) too low
- Cruise control does not function at all
- Uneven idle

- Malfunction indicator lamp (MIL) lit.

FAULT-TRACING INFORMATION

ECM-9820: ENGINE CONTROL MODULE (ECM), LOAD SIGNAL. INTERNAL FAULT (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-9820

Condition

Fig. 79: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers a fault indicating that the calculated load signals for the normal engine control functions are lower than calculated by the internal monitoring functions.

The diagnostic trouble code (DTC) is diagnosed with the engine running and at an engine speed (RPM) of more than 1000 RPM.

Substitute Value

- Engine speed (RPM) and torque are limited to a calculated normal operating range.

Possible Source

- Dirt or contaminants in the electronic throttle unit
- Foreign objects in the intake passages
- Damaged engine control module (ECM).

Fault symptom[s]

- Maximum engine speed (RPM) too low

- Cruise control does not work at all
- Uneven idle
- Malfunction indicator lamp (MIL) lit.

INTERNAL FAULT

REPLACING THE COMPONENT

NOTE: The diagnostic trouble code (DTC) may be stored as a result of foreign objects in the intake passages or contaminants in the electronic throttle unit. Check and remedy these first.

The engine control module (ECM) has registered an internal fault.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up of the engine control module (ECM) or may be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs.

see **ENGINE CONTROL MODULE (ECM), REPLACING**

Remedy as necessary.

ECM-982A: ENGINE CONTROL MODULE (ECM). INTERNAL FAULT. INTERMITTENT FAULT (B5254T2; B6294T; 2003)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 81: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-982A is stored if the engine control module (ECM) registers an internal fault. If other diagnostic trouble codes (DTCs) are stored in the engine control module (ECM), these must be remedied first. These may have caused this diagnostic trouble code (DTC) to be stored.

Substitute Value

- Cruise control is shut off
- Throttle closure when braking
- Torque limiting through fuel shut-off.

Possible Source

- Other diagnostic trouble codes (DTCs) stored in the engine control module (ECM)
- Defective engine control module (ECM).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- Cruise control does not function at all

- The engine jerks during acceleration
- The engine judders heavily after engine braking
- Uneven idle
- Maximum engine speed (RPM) too low.

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-982A: ENGINE CONTROL MODULE (ECM). INTERNAL FAULT. INTERMITTENT FAULT (B5254T2; B6294T; 2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-982A

Condition

Fig. 82: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-982A is stored if the engine control module (ECM) registers an internal fault in one of the internal monitoring functions in the engine control module (ECM). The diagnostic trouble code (DTC) is diagnosed at ignition on or with the engine running.

This diagnostic trouble code (DTC) is normally always stored when one of diagnostic trouble codes (DTC) ECM-983A, ECM-984A, ECM-985A, ECM-986A or ECM-988A is stored in the engine control module (ECM).

Substitute Value

None.

Possible Source

- One of diagnostic trouble codes (DTC) ECM-983A, ECM-984A, ECM-985A, ECM-986A or ECM-988A is stored in the engine control module (ECM)
- Defective engine control module (ECM).

Fault symptom[s]

- Driving/Poor performance/lacks power
- Idling/Uneven idle
- Driving/Hesitates/surges/During acceleration
- Driving/Hesitates/surges/During deceleration
- Cruise control/Does not engage
- Warning lights and chimes/Electronic Throttle System (ETS) indication/no indication

INTERNAL FAULT. PERMANENT FAULT

CHECKING DIAGNOSTIC TROUBLE CODES (DTCS)

Fig. 83: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Read off diagnostic trouble codes (DTCs).

  Check to, see if any other diagnostic trouble codes (DTCs) are stored.

  Any other diagnostic trouble codes (DTCs) that are stored must be remedied first.

Fig. 84: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Are any other diagnostic trouble codes (DTCs) stored?

- **YES**

  Refer to **FAULT-TRACING INFORMATION**

- **NO**

  Refer to **PROGRAMMING OR REPLACING THE ENGINE CONTROL MODULE (ECM)**

FAULT-TRACING INFORMATION

Remedy any diagnostic trouble codes (DTCs) that are stored.

Remedy as necessary.

PROGRAMMING OR REPLACING THE ENGINE CONTROL MODULE (ECM)

Fig. 85: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  The engine control module (ECM) has registered an internal fault. Replace the engine control module (ECM). See **ENGINE CONTROL MODULE (ECM), REPLACING** .

  NOTE: After replacing the engine control module (ECM), the throttle unit must be adapted using the vehicle communication input: "Throttle unit adaptation".

  Remedy as necessary.

see **INTERNAL FAULT. PERMANENT FAULT**

ECM-9830: ENGINE CONTROL MODULE (ECM). INTERNAL FAULT (B5254T2; 2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-9830

Condition

Fig. 87: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers a fault indicating that the internal monitoring functions have registered one or more present values that do not correspond with the complement value.

The diagnostic trouble code (DTC) is diagnosed at ignition on or with the engine running.

Substitute Value

- Engine speed (RPM) and torque are limited to a calculated normal operating range.

Possible Source

- Damaged engine control module (ECM).

Fault symptom[s]

- Maximum engine speed (RPM) too low
- Cruise control does not work at all
- Uneven idle
- Malfunction indicator lamp (MIL) lit.

INTERNAL FAULT

REPLACING THE COMPONENT

The engine control module (ECM) has registered an internal fault.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up of the engine control module (ECM) or may be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs. Replace the engine control module (ECM) if the fault recurs.

Replace the engine control module (ECM) in the event of a permanent fault.

Remedy as necessary.

Other information

- see **ENGINE CONTROL MODULE (ECM), REPLACING**

FAULT-TRACING INFORMATION

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

ECM-983A: ENGINE CONTROL MODULE (ECM). INTERNAL FAULT. INTERMITTENT FAULT (B5254T2; B6294T; 2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-983A

Condition

Fig. 89: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-983A is stored if the engine control module (ECM) registers an internal fault indicating that the calculated engine speed (RPM) in the internal monitoring functions differs from the normal calculated engine speed (RPM) in the engine control functions. The diagnostic trouble code (DTC) is diagnosed with the engine running and at an engine speed (RPM) of more than 520 RPM.

Substitute Value

The engine speed (RPM) and torque are limited to a calculated normal operating range.

Possible Source

- Defective engine control module (ECM).

Fault symptom[s]

- Maximum engine speed (RPM) too low
- Cruise control does not function at all
- Uneven idle
- Malfunction indicator lamp (MIL) lit.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-983B

Condition

Fig. 90: Engine Control Module

Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers a fault indicating that the internal monitoring functions have registered one or more present values that do not correspond with the complement value.

The diagnostic trouble code (DTC) is diagnosed at ignition on or with the engine running.

Substitute Value

- Engine speed (RPM) and torque are limited to a calculated normal operating range.

Possible Source

- Damaged engine control module (ECM).

Fault symptom[s]

- Maximum engine speed (RPM) too low
- Cruise control does not work at all
- Uneven idle
- Malfunction indicator lamp (MIL) lit.

ECM-9840: ENGINE CONTROL MODULE (ECM). INTERNAL FAULT (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-9840

Condition

Fig. 93: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) stored if the engine control module (ECM) registers a fault where the input signals from the throttle unit position sensor are interpreted by the normal engine control functions as having exceeded their minimum or maximum limits, while the internal monitoring function interprets the input signals from the electronic throttle unit position sensor differently.

The diagnostic trouble code (DTC) is diagnosed at ignition on or with the engine running.

Substitute Value

- Engine speed (RPM) and torque are limited to a calculated normal operating range.

Possible Source

- Damaged engine control module (ECM).

Fault symptom[s]

- Maximum engine speed (RPM) too low
- Cruise control does not work at all
- Uneven idle

- Malfunction indicator lamp (MIL) lit.

ECM-984A: ENGINE CONTROL MODULE (ECM), LOAD SIGNAL. INTERNAL FAULT (B5254T2; B6294T; 2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-984A

Condition

Fig. 94: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-984A is stored if the engine control module (ECM) registers an internal fault indicating that the calculated load signals for the normal engine control functions are lower than calculated by the internal monitoring functions. The diagnostic trouble code (DTC) is diagnosed with the engine running and at an engine speed (RPM) of more than 1000 RPM.

Substitute Value

The engine speed (RPM) and torque are limited to a calculated normal operating range.

Possible Source

- Blocked exhaust system.
- Blocked intake system.
- Air leakage in the intake system.
- Defective engine control module (ECM).

Fault symptom[s]

- Maximum engine speed (RPM) too low
- Cruise control does not function at all

- Uneven idle
- Malfunction indicator lamp (MIL) lit.

ECM-9850: ENGINE CONTROL MODULE (ECM). INTERNAL FAULT (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-9850

Condition

Fig. 99: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers an internal fault in one of the internal monitoring functions in the engine control module (ECM). This diagnostic trouble code (DTC) is normally always stored with one of the other diagnostic trouble codes (DTCs) which affect the internal monitoring functions.

The diagnostic trouble code (DTC) is diagnosed at ignition on or with the engine running.

Substitute Value

None.

Possible Source

- One of the diagnostic trouble codes (DTCs) which affect the internal monitoring functions is stored in the engine control module (ECM)
- Damaged engine control module (ECM).

Fault symptom[s]

- Driving/Poor performance/lacks power

- Idling/Uneven idle

ECM-985A: ENGINE CONTROL MODULE (ECM). INTERNAL FAULT. INTERMITTENT FAULT (B5254T2; B6294T; 2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-985A

Condition

Fig. 100: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-985A is stored if the engine control module (ECM) registers an internal fault indicating that the internal monitoring functions in the engine control module (ECM) have registered one or more present values that do not correspond with the complement value. The diagnostic trouble code (DTC) is diagnosed at ignition on or engine running.

Substitute Value

The engine speed (RPM) and torque are limited to a calculated normal operating range.

Possible Source

- Defective engine control module (ECM).

Fault symptom[s]

- Maximum engine speed (RPM) too low
- Cruise control does not function at all
- Uneven idle
- Malfunction indicator lamp (MIL) lit.

ECM-9860: ENGINE CONTROL MODULE (ECM). INTERNAL FAULT (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-9860

Condition

Fig. 101: Engine Control Module

Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers a fault indicating that the normal engine control functions have not discovered a fault in the signals from the accelerator pedal (AP) position sensor, but that the internal monitoring function has detected a difference between the two signals.

The diagnostic trouble code (DTC) is diagnosed at ignition on or with the engine running.

Substitute Value

- Engine speed (RPM) and torque are limited to a calculated normal operating range.

Possible Source

- Damaged engine control module (ECM).

Fault symptom[s]

- Maximum engine speed (RPM) too low
- Cruise control does not work at all
- Uneven idle
- Malfunction indicator lamp (MIL) lit.

ECM-986A: ENGINE CONTROL MODULE (ECM). INTERNAL FAULT. INTERMITTENT FAULT (B5254T2; B6294T; 2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-986A

Condition

Fig. 102: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM 986A is stored if the engine control module (ECM) registers an internal fault where the input signals from the throttle unit position sensor are interpreted by the normal engine control functions as having exceeded their minimum or maximum limits, while the internal monitoring function interprets the input signals from the electronic throttle unit position sensor differently.

Substitute Value

The engine speed (RPM) and torque are limited to a calculated normal operating range.

Possible Source

- Defective engine control module (ECM).

Fault symptom[s]

- Maximum engine speed (RPM) too low
- Cruise control does not function at all
- Uneven idle
- Malfunction indicator lamp (MIL) lit.

ECM-988A: ENGINE CONTROL MODULE (ECM). INTERNAL FAULT. INTERMITTENT FAULT (B5254T2; B6294T; 2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-988A

Condition

Fig. 103: Engine Control Module

Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-988A is stored if the engine control module (ECM) registers an internal fault indicating that the normal engine control functions have not discovered a fault in the accelerator pedal (AP) position sensor signals, but that the internal monitoring function has detected a difference between the two signals. The diagnostic trouble code (DTC) is diagnosed at ignition on or with the engine running.

Substitute Value

The engine speed (RPM) and torque are limited to a calculated normal operating range.

Possible Source

- Defective engine control module (ECM).

Fault symptom[s]

- Maximum engine speed (RPM) too low
- Cruise control switched off
- Uneven idle
- Malfunction indicator lamp (MIL) lit.

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-990A: IDLE AIR TRIM. FAULTY SIGNAL (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 104: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) ECM-990A is stored if the engine control module (ECM) registers that the nominal idle speed (engine coolant temperature (ECT) above 60°C) deviates, either in being 200 RPM over or 100 RPM below the nominal idle speed.

Substitute Value

None.

Possible Source

Faulty signal:

- Search the air and fuel supplies in the fuel system for the fault cause (air leakage, blockages etc).
- Incorrectly adapted electronic throttle unit.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- High idling speed
- Low idling speed

FAULT-TRACING INFORMATION

FAULT-TRACING INFORMATION

When this trouble code is stored, it indicates that Engine control module (ECM) has failed to control the idle RPM. Normally there are also trouble codes related to the air and fuel system stored together with this trouble code. Any diagnostic trouble codes that are stored should be fault traced first. If the cause is found with this troubleshooting, you can ignore this trouble code.

HINT: Incorrectly adapted throttle module may cause this trouble code to be stored alone. Carry out adaptation of the throttle unit to update the adaptation values using VIDA (Volvo scan tool)

ECM-9970: MEMORY FAULT IN RAM. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-9970

Condition

Fig. 105: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) continuously checks the internal RAM (random access memory)

functionality. The diagnostic trouble code (DTC) is stored if there is a fault in the RAM.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- The engine control module (ECM) attempts to reset itself.

Possible Source

- Faulty software in the engine control module (ECM)
- Damaged engine control module (ECM).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- The malfunction indicator lamp (MIL) flashes
- The engine cuts out
- The starter motor turns but the engine does not start.

ECM-9980: MEMORY FAULT IN ROM. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-9980

Condition

Fig. 106: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) continuously checks the internal ROM (read only memory) functionality. The diagnostic trouble code (DTC) is stored if there is a fault in the ROM.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- The engine control module (ECM) attempts to reset itself.

Possible Source

- Faulty software in the engine control module (ECM)
- Damaged engine control module (ECM).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- The malfunction indicator lamp (MIL) flashes
- The engine cuts out
- The starter motor turns but the engine does not start.

ECM-A12B: SPEED SIGNAL. SIGNAL MISSING (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-A12B

Condition

A fault message is transmitted to the engine control module (ECM) and the diagnostic trouble code (DTC) is stored if a fault is detected in the brake control module (BCM). Diagnostic trouble codes (DTCs) for the vehicle speed sensor (VSS) signal are also stored in the brake control module (BCM).

Substitute Value

- The speed signal from the brake control module (BCM) is set at 0 km/h.

Possible Source

- Contact resistance in the control area network (CAN) terminals
- Open-circuit in one or both CAN cables
- Short-circuit to ground, voltage or each other in one or both signal cables
- Damaged brake control module (BCM)
- Damaged engine control module (ECM).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULT-TRACING INFORMATION

ECM-A12C: SPEED SIGNAL. SIGNAL TOO HIGH (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-A12C

Condition

A fault message is transmitted to the engine control module (ECM) and the diagnostic trouble code (DTC) is stored if a fault is detected in the brake control module (BCM). Diagnostic trouble codes (DTCs) for the vehicle speed sensor (VSS) signal are also stored in the brake control module (BCM).

Substitute Value

- The speed signal from the brake control module (BCM) is set at 0 km/h.

Possible Source

- Faulty speed signal to the brake control module (BCM).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULT-TRACING INFORMATION

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-A130: CONTROL MODULE COMMUNICATION (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-A130

Condition

The control modules transmit and receive information via a standardized serial communication method - CAN (Control Area Network). The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers serious interference (CAN communication blocked).

NOTE: **In the event of system communication problems, it is not possible to communicate with the engine control module (ECM). Therefore it will only be possible to read off the diagnostic trouble code (DTC) if the fault is intermittent.**

Substitute Value

- The engine control module (ECM) shuts itself off "bus-off".

HINT: The engine control module (ECM) will then be shut off until the supply voltage is interrupted (15-, 30-, X supply). When the power supply is switched on, the engine control module (ECM) will make a new attempt to communicate.

Possible Source

- Contact resistance or oxidation in the terminals
- Open-circuit in the control area network (CAN) wiring

- Short-circuit between the control area network (CAN) wiring
- Internal fault in the engine control module (ECM)
- Internal fault in another control module in the same part of the control area network (CAN).

Fault symptom[s]

- General warning lamp lit
- The cruise control does not function at all
- The engine judders under acceleration
- The engine judders heavily after engine braking
- Uneven idle.

FAULTY COMMUNICATION

GENERAL INFORMATION

In order to check the control area network (CAN) cables, the resistance in the network must be measured. The resistance between the two controller area network (CAN) wiring, with the network connected 60 ohms. The resistance can differ depending on the configuration of the car. Permitted values are 55-65 ohms. This applies to both the high speed side network and the low speed side network.

HINT: Take a copy of the data communication side for each model. Note which diagnostic trouble codes (DTCs) are stored in each control module. This facilitates fault-tracing considerably.

Check if the diagnostic trouble codes (DTCs) for failed communication are stored in the central electronic module (CEM). If this is the case, first fault-trace according to these diagnostic trouble codes (DTCs).

Other information

- For general information about fault-tracing the control area network (CAN), see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK (2005-2012)**

- **Continue**

  Refer to **CHECKING THE RESISTANCE OF THE CONTROL AREA NETWORK (CAN) CABLES**

CHECKING THE RESISTANCE OF THE CONTROL AREA NETWORK (CAN) CABLES

Fig. 108: Identifying Ignition In Off Position And Disconnecting Negative Cable From Battery
Courtesy of VOLVO CARS CORPORATION

- Disconnect the battery negative lead. The power to the network must be cut when taking resistance readings. The reading may otherwise be incorrect.

  NOTE: Also read: BATTERY, DISCONNECTING

- Connect the adapter wiring to the central electronic module (CEM).

  HINT: Where a breakout box cannot be used, take readings from the rear of the affected connectors if possible. This prevents terminal pins and socket housings being damaged.

  When taking readings on the low speed network

  - When taking readings on the low speed network, the adapter wiring should be connected to the central electronic module (CEM) and the readings taken from there. The readings can also be taken in the connector for the power seat module (PSM). The advantage of using the adapter wiring connected to the central electronic module (CEM) is that all control modules can be connected to the network when taking readings and there is access to both the high speed and the low speed networks.

    This resistance reading only measures main arteries in the low speed network, not the junctions for the road traffic information module (RTI), accessory electronic module (AEM), power seat module (PSM), phone module (PHM), audio module (AUM), driver's door module (DDM) and passenger door module (PDM).

  When taking readings on the high speed network

  - When taking readings on the high speed network, the readings should be taken at the engine control module (ECM) using adapter wiring. The engine control module (ECM) must be connected. This

resistance reading only takes readings from the main arteries in the high speed network.

Connect the ohmmeter to the terminals for CAN-L and CAN-H on the relevant network. Work the connectors and twist the cable harness. The resistance must be approximately 60 ohms. Permitted values are 55-65 ohms.

Other information

- see **CONNECTING THE BREAKOUT BOX**
- see **CHECKING WIRING AND TERMINALS**

Fig. 109: Identifying Ohm Meter

Is the value OK?

- **YES**

  Refer to **CHECKING A SHORT-CIRCUIT IN CAN CABLES**

- **NO**

  Refer to **IDENTIFYING FAULT CAUSES IN THE CAN NETWORK**

CHECKING A SHORT-CIRCUIT IN CAN CABLES

Connect an ohmmeter between the relevant CAN cable (CAN-L and CAN-H) and the power supply, and between the CAN cable and ground. Twist the connectors and turn the cable harness to different positions at each reading to determine any intermittent short-circuits.

Take the following readings:

- The resistance between CAN-L and ground
- The resistance between CAN-L and voltage

- The resistance between CAN-H and ground
- The resistance between CAN-H and voltage.

The resistance must be infinite or very high in all cases (greater than 1 Mohms).

HINT: The reading can be taken from the same connector if the CAN cables, power supply and ground are exposed. If possible, take readings on the rear of the connector to prevent damage to the terminals in the connector. If this is not possible, use the adapter wiring or loose terminal pins to obtain a good contact.

Fig. 111: Identifying Ohm Meter

Was a fault detected?

- **YES**

  Refer to **IDENTIFYING FAULT CAUSES IN THE CAN NETWORK**

- **NO**

  Refer to **CHECKING THE TRAFFIC LOAD ON THE CAN CABLES**

CHECKING THE TRAFFIC LOAD ON THE CAN CABLES

Fig. 112: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Connect the battery
- Ignition on

Also read: **BATTERY, DISCONNECTING**

Faults in the CAN network may be due to a control module sending faulty messages that disrupt "normal" communication. When messages are sent incorrectly, this results in a considerable increase in the amount of traffic on the CAN network. Check the load by measuring the average voltage value on the CAN cables in relation to ground.

Connect a voltmeter between CAN-L and ground. The voltage must be approximately 2.3 V.

Then connect a voltmeter between CAN-H and ground. The voltage must be approximately 2.8 V.

HINT: If possible measure from the rear of the affected connectors so that they are not damaged.

Fig. 113: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

Is the value OK?

- **YES**

  Refer to **INFORMATION**

- **NO**

  Refer to **IDENTIFYING A CONTROL MODULE IN THE CAN NETWORK**

IDENTIFYING FAULT CAUSES IN THE CAN NETWORK

- Disconnect a control module that disconnects the CAN network (a control module that has four terminals to the CAN network).

  HINT: For the low speed network, suitable places for disconnecting the network are at the steering wheel module (SWM), the driver information module (DIM) or the climate control module (CCM).

  In the event of a short-circuit between one of the CAN cables and voltage or ground, the fault can be located by disconnecting a control module that disconnects the CAN network. Readings can then be taken to determine on which side of the disconnected control module the fault is located.

  Connect an ohmmeter between the CAN cable and supply voltage or ground. Take readings at both ends of the CAN network where the network is disconnected. Twist and bend the cable harness to locate any intermittent short-circuits. The resistance must be infinite or very high (greater than 1Mohms).

  If a fault can be localized in one direction, disconnect the network at a point further down on the CAN network in the direction in which the fault was discovered and repeat the reading. In this way, try to identify where in the network the fault might be located.

  HINT: A short-circuit between the CAN cables and supply voltage or ground may be in either the wiring or in a control module.

  Rectify the wiring as necessary. Replace the control module if the fault has been localized to a control module.

- **Continue**

  Refer to **VERIFICATION**

IDENTIFYING A CONTROL MODULE IN THE CAN NETWORK

Fig. 114: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Connect the battery

  Also read: **BATTERY, DISCONNECTING**

- Ignition on

  If the load on the CAN network is too high, this may be due to a control module sending faulty messages on the CAN network (known as a disruptive control module). The fault may also be due to an intermittent short-circuit to supply voltage or ground in one of the CAN cables. This results in the control modules on the CAN network starting to send faulty messages. The faults can occur without a diagnostic trouble code (DTC) being stored by the control modules. The voltage can be measured between the CAN cables in order to check the load on the CAN network.

Connect a voltmeter between the CAN cables. If the communication on the network is correct, the average voltage value should be approximately 0.5 V (0.4 V to 0.6 V). If there is a fault in the communication, the voltage reading will be approximately 0.7 V or higher.

In order to identify from which control module the faulty communication is being transmitted, cut the supply voltage to one control module at a time and check the voltage in the CAN cables again. The easiest way to cut the supply voltage is to remove a fuse. Repeat until the voltage between the CAN cables drops to approximately 0.5 V.

HINT: When the probable faulty control module has been identified, connect and disconnect the supply voltage to the control module a number of times to verify that the fault appears and disappears.

NOTE: Do not cut the power to the central electronic module (CEM) unless it is the last control module left to check.

The control module that is communicating incorrectly must be replaced. Remedy as necessary.

NOTE: Following a fault involving "disruptive" control modules, other modules may remain in "Limp-Home mode" even after switching the ignition off and on a number of times. To remedy this, disconnect and reconnect the battery negative terminal to restore the control modules to normal function.

- **Continue**

Refer to **VERIFICATION**

IDENTIFYING FAULT CAUSES IN THE CAN NETWORK

- Disconnect a control module that disconnects the CAN network (a control module that has four terminals to the CAN network).

HINT: For the low speed network, suitable places for disconnecting the network are at the steering wheel module (SWM), the driver information module (DIM) or the climate control module (CCM).

In the event of an open-circuit or a short-circuit between the CAN cables, the fault can be localized by disconnecting a control module that disconnects the CAN network. Readings can then be taken to determine on which side of the disconnected control module the fault is located.

Connect an ohmmeter between the CAN cables. Take readings at both ends of the CAN network where the network is disconnected. Twist and bend the cable harness to locate any intermittent short-circuits. The resistance must be 120 ohm.

If a fault can be localized in one direction, disconnect the network at a point further down on the CAN network in the direction in which the fault was discovered and repeat the reading. In this way, try to identify where in the network the fault might be located.

Remedy the cables as necessary.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-B102400

Condition

Fig. 118: Identifying Main Relay
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) regulates the starter motor via the starter relay and checks its function. The diagnostic trouble code is generated if the control module detects that the start signal from the ignition switch is lost when engine speed exceeds a certain value and no vehicle speed has been registered or if the control module detects a start signal from the ignition switch during driving conditions when there should not be a start signal.

Substitute Value

- Nothing.

Possible Source

- The signal cable from the ignition switch is short-circuited to supply voltage.
- The signal cable from the ignition switch is short-circuited to ground.
- Open-circuit on the signal cable from the ignition switch.
- Damaged starter relay.

Fault symptom[s]

- None.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-B102482

Condition

Engine control module (ECM) checks that the signal indicating engine start is sent (via CAN) from Central electronic module

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The signal coming via CAN is missing.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Engine running.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Substitute Value

- The signal on the direct-connected cable to Engine control module (ECM) is used.

Possible Source

- Open-circuit in the communication cable.
- Short-circuit to ground in the communication cable.
- Short-circuit to supply voltage in the communication cable.
- Contact resistance or oxidation in the terminals.
- Open-circuit in terminals.
- Short-circuit in connections.

Fault symptom[s]

- Autostart; No Functionality

FAULT-TRACING

GENERAL INFORMATION

The diagnostic trouble code (DTC) is stored in the event of communication faults on the high speed side of the control area network (CAN). There can be a number of causes for faults in the communication:

- Intermittent open-circuit in one or both CAN cables in part of the network
- Intermittent short-circuits between the CAN cables
- Intermittent short-circuits between one of the CAN cables and ground or supply voltage
- Fault in the communication circuit in one or more control modules
- Internal fault in a control module on the CAN network that results in the control module transmitting faulty messages on the CAN network.

In the event of a diagnostic trouble code (DTC) for a communication fault in the relevant control module, any diagnostic trouble codes (DTCs) in the central electronic module (CEM) must also be checked. The central electronic module (CEM) monitors the voltage level in the CAN cables. The central electronic module (CEM) is the only control module that can directly store a diagnostic trouble code (DTC) for a short-circuit in one of the cables for ground or supply voltage. Do not replace the central electronic module (CEM) in the event of a CAN fault unless fault-tracing has indicated that the central electronic module (CEM) has an internal fault.

In order to check the control area network (CAN) cables, the resistance in the network must be measured.

Other information

- see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK**

- **Continue**

  Refer to **TAKING READING ON CABLE IN THE CAN NETWORK (HS-CAN)**

TAKING READING ON CABLE IN THE CAN NETWORK (HS-CAN)

Fig. 125: Identifying Ignition In Off Position And Disconnecting Negative Cable From Battery
Courtesy of VOLVO CARS CORPORATION

- Disconnect the battery negative lead.

- Connect the breakout box with the engine control module (ECM) connected.

  HINT: Where a breakout box cannot be used, take readings from the rear of the affected connectors if possible. This prevents terminal pins and socket housings being damaged.

  Take resistance readings across the following terminals. Various readings will be obtained due to the structure of the network. Twist the cable harness and work the connectors at accessible points along the cable harness in order to check whether the resistance changes during each measurement. This method can be used to detect intermittent short-circuits or open-circuits.

  NOTE: The following resistance readings only measure the main arteries in the high speed network, not the junctions that exist for some control modules. If an open-circuit is suspected in a cable, or a short-circuit is suspected in one of its junctions, the connector at the control module for this junction must be disconnected and the reading taken from there.

  Take the following readings

  - Measure the resistance between the terminals for HS CAN on the Engine control module (ECM). Resistance must be approximately 60 ohms. Permitted values are approximately 55 - 65 ohms.

    NOTE: If there is a short-circuit somewhere in the CAN-net the resistance will be 0 ohms.

  - Also measure the resistance between each terminal and supply voltage and ground. The resistance shall be very high.

  HINT: Any short-circuit detected on the CAN-net may be on the main circuit or on any branching running out to some control modules. If a fault is found, try to disconnect the junction with the fault at a point further forward. Try to locate the fault in this way.

  Remedy as necessary.

  Other information

  - see **BATTERY, DISCONNECTING**
  - see **CONNECTING THE BREAKOUT BOX**
  - see **SIGNAL SPECIFICATION**
  - see **CHECKING WIRING AND TERMINALS**

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING THE TRAFFIC LOAD ON THE CAN CABLES**

CHECKING THE TRAFFIC LOAD ON THE CAN CABLES

Fig. 126: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Connect the battery.
- Ignition on.

  Faults in the CAN network may be due to a control module sending faulty messages that disrupt normal communication. When messages are sent incorrectly, this results in a considerable increase in the amount of traffic on the CAN network. Check the load by measuring the average voltage value on the CAN cables in relation to ground.

Check as follows:

- Connect a voltmeter between CAN-L and ground. The voltage should be approx: V
- Connect a voltmeter between CAN-H and ground. The voltage should be approx: V

Other information

- see **BATTERY, DISCONNECTING**

Is the value OK?

- **YES**

  Refer to **INFORMATION**

- **NO**

  Refer to **IDENTIFYING A CONTROL MODULE IN THE CAN NETWORK**

IDENTIFYING A CONTROL MODULE IN THE CAN NETWORK

If the load on the CAN network is too high, this may be due to a control module sending faulty messages on the CAN network (known as a disruptive control module). The fault may also be due to an intermittent short-circuit to supply voltage or ground in one of the CAN cables. This results in the control modules on the CAN network starting to send faulty messages. The faults can occur without a diagnostic trouble code (DTC) being stored by the control modules. The voltage can be measured between the CAN cables in order to check the load on the CAN network.

Take the following readings

- Connect a voltmeter between the CAN cables. The average value of the voltage must be approximately 0.6-1.4 V. In case of a problem with communication the voltage is considerably higher.
- In order to identify which control module has faulty communication, cut the power supply to one control module at a time. Check the voltage in the CAN cables again. The easiest way to cut the power supply is to remove the fuse(s) for the relevant control module. Repeat until the voltage between the CAN wiring drops to the normal level.

NOTE: When connecting and disconnecting certain control modules, diagnostic trouble codes (DTCs) may be stored in other control modules.

HINT: When the suspected control module has been identified, connect and disconnect the supply voltage to the control module a number of times to verify that the fault appears and disappears. Ignition off between each check.

NOTE: Do not cut the power to the central electronic module (CEM) unless it is the last control module left to check.

A control module that is communicating incorrectly must be replaced. Remedy as necessary.

NOTE: **Following a fault involving control modules that disrupt communication, other control modules may operate in Limp-Home mode (i. e. they work but with limited functionality) even after switching the ignition off and on a number of times. To remedy this, disconnect and reconnect the battery negative terminal to restore the control modules to normal function.**

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: Once a fault has been repaired, conduct a verification to check that the fault has been remedied.

Fig. 127: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Reinstall the connectors, components etc.
- Ignition on
- Erase diagnostic trouble codes (DTCs) in all control modules
- Start the vehicle. Allow the vehicle to run for 10 minutes.

  Read out the diagnostic trouble codes in the vehicle via the DIAGNOSTICS tab.

Does the diagnostic trouble code (DTC) for faulty communication return?

- **YES**

  Refer to **INFORMATION**

- **NO**

  OKAY: Troubleshooting has been completed.

ECM-B102486: START CONTROL UNIT. BUS SIGNAL / MESSAGE FAILURES. SIGNAL INVALID (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-B102486

Condition

Central electronic module (CEM) has the overall function for monitoring the signals from Start control module (SCU).

The control module checks that the direct-connected signal via LIN-communication and the signal via CAN-communication are reliable.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The quality of the signal coming via CAN is too low.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Start of engine.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Substitute Value

- The signal on the direct-connected cable to Engine control module (ECM) is used.

Possible Source

- Open-circuit in the communication cable.
- Short-circuit to ground in the communication cable.
- Short-circuit to supply voltage in the communication cable.
- Contact resistance or oxidation in the terminals.
- Open-circuit in terminals.
- Short-circuit in connections.

Fault symptom[s]

- Autostart; No Functionality

FAULT-TRACING

INFORMATION

No fault-tracing has been developed for this diagnostic trouble code (DTC).

The diagnostic trouble code (DTC) for this fault is first stored in the Central electronic module (CEM), then in the Engine control module (ECM). This diagnostic trouble code (DTC) can first be erased when the root fault has been remedied and the diagnostic trouble code (DTC) for the root fault has been erased.

For further information on this diagnostic trouble code, see Diagnostic trouble code (DTC) information.

ECM-C004082: BRAKE PEDAL SWITCH "A". BUS SIGNAL / MESSAGE FAILURES. ALIVE / SEQUENCE COUNTER INCORRECT / NOT UPDATED (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-C004082

Condition

The control module is continuously supplied with information about the position and status of the brake pedal switch from the brake control module (BCM) via CAN communication.

The control module checks the communication with the Brake control module (BCM).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- No communication with the Brake control module (BCM).
- The brake light switch position and brake position switch position (via CAN) do not match.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Engine running.

NOTE: **The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.**

Substitute Value

- Cruise control is disengaged when the fault is active.

Possible Source

- Open-circuit in the communication cable.
- Short-circuit to ground in the communication cable.
- Short-circuit to supply voltage in the communication cable.
- Contact resistance or oxidation in the terminals.
- Open-circuit in terminals.
- Short-circuit in connections.

Fault symptom[s]

ECM-E000: CONTROL MODULE COMMUNICATION. FAULTY COMMUNICATION (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-E000

Condition

Fig. 128: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

The control modules communicate with each other for exchange of information in a network via a standardized serial communication procedure - CAN (Controller Area Network). The diagnostic trouble code is stored if the engine control module (ECM) detects a malfunction in CAN communication.

Substitute Value

- CAN communication is disabled.
- Cruise control shut off.
- Fuel cut-off that follows accelerator pedal position.
- Closing of throttle during braking.

Possible Source

- Contact resistance in the terminals.
- Short-circuit between Control area network (CAN) wiring
- Open-circuit in the control area network (CAN) wiring

Fault symptom[s]

- General warning lamp lit
- ETS warning lamp lit
- The cruise control does not function at all
- The engine judders under acceleration
- The engine judders heavily after engine braking
- Uneven idle.

FAULTY COMMUNICATION

see **FAULTY COMMUNICATION**

ECM-E000: CONTROL MODULE COMMUNICATION. INTERNAL FAULT (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-E000

Condition

The control modules transmit and receive information via a standardized serial communication method - CAN (Control Area Network). The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers serious interference (CAN communication blocked).

NOTE: In the event of system communication problems, it is not possible to communicate with the engine control module (ECM). Therefore it will only be possible to read off the diagnostic trouble code (DTC) if the fault is intermittent.

Substitute Value

- The engine control module (ECM) shuts itself off "bus-off".

HINT: The engine control module (ECM) will then be shut off until the supply voltage is interrupted (15-, 30-, X supply). When the power supply is switched on, the engine control module (ECM) will make a new attempt to communicate.

Possible Source

- Contact resistance or oxidation in the terminals
- Open-circuit in the control area network (CAN) wiring

- Short-circuit between the control area network (CAN) wiring
- Internal fault in the engine control module (ECM)
- Internal fault in another control module in the same part of the control area network (CAN).

Fault symptom[s]

- General warning lamp lit
- The cruise control does not function at all
- The engine judders under acceleration
- The engine judders heavily after engine braking
- Uneven idle.

ECM-E000: CONTROL MODULE COMMUNICATION. INTERNAL FAULT (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-E000

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-E000**

ECM-E003: CONFIGURATION FAULT. FAULTY CONFIGURATION (B5254T2; B6294T; 2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The control modules communicate with each other in a network via a standardized serial communication procedure - CAN (Controller Area Network) - for exchange of information. Diagnostic trouble code (DTC) ECM-E003 is stored if the engine control module (ECM) registers a software fault where the software does not correspond to the car's other configuration does not communicate with the engine control modules.

Substitute Value

- CAN communication is disabled
- cruise control shut off
- fuel shut-off system which follows accelerator pedal (AP) position
- throttle closure when braking.

Possible Source

- faulty software in engine control module (ECM)
- defective control module
- This diagnostic trouble code is generated in combination with other trouble codes. Information on the

possible root cause is described.

For turbo engines and 6-cylinder aspirated engines, see **INFORMATION ABOUT COMBINED DIAGNOSTIC TROUBLE CODES (DTCS)**

For 5-cyl. normally aspirated engines, see **INFORMATION ABOUT COMBINED DIAGNOSTIC TROUBLE CODES (DTCS)**

Fault symptom[s]

- General orange warning lamp lit
- cruise control does not function at all
- engine judders under acceleration
- engine judders heavily after engine braking
- uneven idle.

INFORMATION ABOUT COMBINED DIAGNOSTIC TROUBLE CODES (DTCS)

Combined diagnostic trouble codes (DTCs)

The following table is available to facilitate fault-tracing of ETM related diagnostic trouble codes (DTCs).

NOTE: Probable root diagnostic trouble codes (DTCs) are in bold and listed at the top of each cell.

Example of how to read table: If the codes 902A 903F 912A 980F are set, then **902A** is the likely root trouble code.

The diagnostic trouble codes (DTCs) can also be stored individually or together with other diagnostic trouble codes (DTCs) that do not affect ETM.

NOTE: There are two different tables, one for cars with upgraded software released during 2006 or later (see, see), and one for cars that are not upgraded with this software (see).

For more information on identifying upgraded software, see IDENTIFYING UPGRADED SOFTWARE ECM/ETM

ECM-E003: CONFIGURATION FAULT. FAULTY SIGNAL (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-E003

Condition

The engine control module (ECM) compares its configuration ID with the signal configuration transmitted by the central electronic module (CEM) on the control area network (CAN). If the configuration IDs do not correspond the fault code is stored. The diagnostic trouble code (DTC) is also stored if the communication between the engine control module (ECM) and the central electronic module (CEM) is interrupted.

NOTE: **In the event of an open-circuit in both the control area network (CAN) cables, it is not possible to communicate with the engine control module (ECM). Therefore it will only be possible to read off the diagnostic trouble code (DTC) if this type of fault is intermittent. When the diagnostic trouble code (DTC) is stored, the engine control module (ECM) responds to the diagnostic commands. However normal control area network (CAN) communication "Expulsion mode" does not work.**

Substitute Value

- None.

Possible Source

- Incorrect CAN configuration ID (present engine control module (ECM) is not intended for the vehicle, for example a used control module with other software/hardware)
- Open-circuit in the control area network (CAN) wiring between the engine control module (ECM) and the central electrical module (CEM).

Fault symptom[s]

- General warning lamp lit
- The cruise control does not function at all
- The engine judders under acceleration
- The engine judders heavily after engine braking

- Uneven idle.

ECM-E003: CONFIGURATION FAULT. FAULTY SIGNAL (B6294T; 2005-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-E003

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-E003**

ECM-P001100: INTAKE CAMSHAFT POSITION TIMING - OVER-ADVANCED (BANK 1). GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P001100

Condition

The Engine control module (ECM) regulates the camshaft position (angle).

If the control module detects a difference between the requested position and the actual position, the speed is measured as the camshaft moves to the requested position.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The cam shaft moves too slowly (to the late position).

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Hot engine.
- Engine speed above 1000 RPM.
- Camshaft control is active.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Substitute Value

- None.

Possible Source

- Dirty or damaged shift valve camshaft (VVT).
- Poor engine oil quality.
- Low oil pressure.
- Damaged camshaft reset valve.

Fault symptom[s]

- Uneven idle
- High emissions
- Engine stalls when driving

FAULT-TRACING

CHECKING COMPONENTS

NOTE: If the diagnostic trouble code (DTC) for correlation between the crankshaft position and camshaft position is stored, it must be fault-traced first.

HINT: Contaminants in the engine oil can damage components in the variable valve timing (VVT) unit which can cause function faults. In most cases the solenoid does not have to be replaced, cleaning is enough.

Check the engine oil grade. Check especially for contaminants.

Activate automatic cleaning function using the VCT2000 (or appropriate scan tool).

Remove the camshaft reset valve, check the reset valve and the oil ducts in the cylinder head. Check for contaminants and blockages.

Try a new camshaft reset valve if no fault is found or if the above remedies do not rectify the fault.

HINT: The fault can also be caused by an internal fault in the variable valve timing (VVT) unit. If the above fault-tracing/remedies do not rectify the fault, the variable valve timing (VVT) unit may be damaged.

Remedy as necessary.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

VERIFICATION

VERIFICATION, PART 1

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 131: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 132: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Verification consists of 2 parts. Part 1 is carried out via a test in the workshop. Part 2 is carried out on the road.

  If the function is determined as **incorrect** in part 1, then part 2 does **not** need to be carried out. If the function is determined as being correct in part 1 and the vehicle can be tested on the road, part 2 must be carried out. This is because in certain cases the function can be difficult the check in a workshop environment.

- Ignition off
- Reconnect the connectors, components, etc.
- Start and run the engine to operating temperature.
- Read off the shift angle of the camshaft and the desired shift angle of the camshaft to check the function.

Check that the camshaft shift angle corresponds to the desired value for the camshaft shift angle with an accuracy of approximately 8° CA (camshaft angle). The difference between the values can be read off in the lower digital display.

Fig. 133: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 136: Identifying Camshaft Reset Valve
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) regulates the camshaft position (angle position) and checks that the requested position has been achieved. If the control module detects a difference between the requested position and the actual position, the time taken for regulation to achieve the requested position is measured. The length of time permitted to achieve the requested position varies depending on how much the camshaft is to be deflected at that moment. The diagnostic trouble code is generated if the control module detects that regulation is too slow during intake camshaft return.

The diagnostic trouble code can be diagnosed when the engine is at operating temperature, engine speed exceeds a certain value and camshaft regulation is active.

Substitute Value

- Nothing.

Possible Source

- Poor engine oil quality
- Damaged camshaft reset valve
- Damaged VVT unit.

Fault symptom[s]

- Uneven idle.
- Increased emissions.
- The engine stops while running.

FAULT TRACING ECM-P001100

CHECKING COMPONENTS

- Verification consists of 2 parts. Part 1 is carried out via a test in the workshop. Part 2 is carried out on the road.

  If the function is determined as **incorrect** in part 1, then part 2 does **not** need to be carried out. If the function is determined as being correct in part 1 and the vehicle can be tested on the road, part 2 must be carried out. This is because in certain cases the function can be difficult the check in a workshop environment.

- Ignition off
- Reconnect the connectors, components, etc.
- Start and run the engine to operating temperature.
- Read off the shift angle of the camshaft and the desired shift angle of the camshaft to check the function.

Check that the camshaft shift angle corresponds to the desired value for the camshaft shift angle with an accuracy of approximately 8° CA (camshaft angle). The difference between the values can be read off in the lower digital display.

Fig. 154: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P001268: INTAKE CAMSHAFT POSITION TIMING - OVER-RETARDED (BANK 1). ALGORITHM BASED FAILURES. EVENT INFORMATION (B6324S;

2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P001268

Condition

NOTE: **This diagnostic trouble code (DTC) status is an event controlled diagnostic trouble code (DTC). An event controlled diagnostic trouble code (DTC) does not mean that there is a fault in the control module when it is active, but is designed as information.**

Engine control module (ECM) monitors the induction side's VVT-valve (bank 1). If the control module detects that the induction side's VVT-valve is too far from desired target value for a certain time, the diagnostic trouble code is generated.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- Nothing.

Possible Source

- This diagnostic trouble code (DTC) is not caused by a fault that needs to be remedied.

Fault symptom[s]

- None.

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

MUCH CONTROL- (BANK 1). GENERAL FAULT INFORMATION. NO INFORMATION ABOUT FAULT TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 157: Identifying Camshaft Reset Valve
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) controls the position of the camshaft (angle). The engine control module (ECM) checks that the requested position is reached. If the control module detects a difference between the requested position and the actual position, the time taken for control to reach the requested position is measured. The maximum permitted time to reach the requested position varies depending on how much the camshaft is controlled outwards. The diagnostic trouble code (DTC) is stored if the control module detects that control is too slow during the return phase of the exhaust camshaft.

The diagnostic trouble code (DTC) can be diagnosed when the engine is at operating temperature, the engine speed (RPM) is above a certain value and when camshaft control is active.

Substitute Value

- Nothing.

Possible Source

- Poor engine oil quality
- Low oil pressure.
- Damaged camshaft reset valve
- Damaged variable valve timing (VVT) unit.

Fault symptom[s]

- Uneven idle.
- Increased emissions.
- The engines cuts out whilst driving.

FAULT TRACING ECM-P001400

CHECKING COMPONENTS

NOTE: If the diagnostic trouble code (DTC) for correlation between the crankshaft position and camshaft position is stored, it must be fault-traced first.

HINT: Incorrect oil grade can cause malfunctions in the variable valve timing (VVT) unit. Contaminants in the engine oil can cause damage to components in the variable valve timing (VVT) unit.

Check the engine oil grade. Check especially for contaminants.

HINT: The variable valve timing (VVT) unit for the exhaust camshaft has a spring which turns the camshaft at control. This means that if the oil pressure becomes too low for the continuous variable valve timing unit, the spring controls the camshaft out too much.

Remove the camshaft reset valve, check the reset valve and the oil ducts in the cylinder head. Check for contaminants and blockages.

Check the engine oil pressure.

Try a new camshaft reset valve if no fault is found or if the above remedies do not rectify the fault.

HINT: The fault can also be caused by an internal fault in the variable valve timing (VVT) unit. If the above fault-tracing/remedies do not rectify the fault, the variable valve timing (VVT) unit may be damaged.

Remedy as necessary.

ECM-P001500: EXHAUST CAMSHAFT POSITION CONTROL - RETURNED TOO FAR - (BANK 1). GENERAL FAULT INFORMATION. TYPE OF FAULT

NOT SPECIFIED. (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 164: Identifying Camshaft Reset Valve
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) regulates the camshaft position (angle position) and checks that the requested position has been achieved. If the control module detects a difference between the requested position and the actual position, the time taken for regulation to achieve the requested position is measured. The length of time permitted to achieve the requested position varies depending on how much the camshaft is to be deflected at that moment. The diagnostic trouble code is generated if the control module detects that regulation is too slow during exhaust camshaft deflection.

The diagnostic trouble code can be diagnosed when the engine is at operating temperature, engine speed exceeds a certain value and camshaft regulation is active.

Substitute Value

- Nothing.

Possible Source

- Poor engine oil quality
- Damaged camshaft reset valve
- Damaged VVT unit.

Fault symptom[s]

- Uneven idle.
- Increased emissions.
- The engine stops while running.

ECM-P001600: CRANKSHAFT POSITION - CAMSHAFT POSITION CORRELATION - BANK 1 SENSOR A. GENERAL FAILURE INFORMATION.

NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P001600

Condition

Fig. 171: Identifying Camshaft Reset Valve
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks that the camshaft is in the correct position (angle) in relation to the position (angle) of the crankshaft using signals from the camshaft sensor and engine speed (RPM) sensor. If the camshaft position does not correspond to the crankshaft position, the control module adjusts the adaption for the camshaft position. The adaption value corresponds to the difference in position between the camshaft and crankshaft when the crankshaft is in its default position. The diagnostic trouble code (DTC) is stored when adaption is greater or less than a certain value.

The diagnostic trouble code (DTC) can be diagnosed when adaption of the camshaft is carried out (adaption occurs during engine braking).

Substitute Value

- Nothing.

Possible Source

- Poor engine oil quality
- Incorrectly adjusted camshafts
- Damaged camshaft reset valve
- Damaged variable valve timing (VVT) unit.
- Damaged (worn) timing chain.

Fault symptom[s]

- Uneven idle.
- High emissions
- The engines cuts out whilst driving.

FAULT-TRACING

CHECKING THE STATUS

Fig. 172: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Read off the adaption for the camshaft, the camshaft shift angle and desired value for the camshaft shift angle.

  Check that the read off values correspond to the guide values below. The difference between the camshaft shift angle and the desired value for camshaft shift angle can be read off from the lower digital display. Note the read off values as a basis for continuing fault-tracing.

  Adaption camshaft

  - Intake camshaft: 75 degrees CA (camshaft angle) (+/-8 degrees CA)

  Camshaft shift angle

- The difference from the desired value of the camshaft shift angle (intake): approximately 8 degrees CA

The fault is permanent if the values are not correct. If the values are correct, this indicates that the fault is intermittent and not presently active.

Fig. 173: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING COMPONENTS**

CHECKING COMPONENTS

HINT: Incorrect function on the camshaft reset valve is probably the cause of this diagnostic trouble code (DTC) if:

- The adaption value and camshaft shift angle are correct in the previous check (intermittent fault).
- The adaption value is correct but the camshaft shift angle is incorrect in the previous check.

HINT: Contaminants in the engine oil can damage components in the camshaft control which can cause function faults.

Check the engine oil grade. Check especially for contaminants.

Check the default settings of the camshafts.

Remove the camshaft reset valve, check the reset valve and the oil ducts in the cylinder head. Check for contaminants and blockages.

Try a new camshaft reset valve if no fault is found or if the above remedies do not rectify the fault.

HINT: The fault can also be caused by a damaged variable valve timing (VVT) unit.

Remedy as necessary.

Other information

- To check the camshaft settings:

  see **VVT UNIT**

- Cleaning:**VARIABLE CAMSHAFT TIMING OIL CONTROL SOLENOID**
- see **LOCATION OF COMPONENTS**

Fig. 174: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

Fig. 175: Identifying Camshaft Reset Valve
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

VERIFICATION

VERIFICATION, PART 1

HINT: After carrying out the repair, check that the fault has been remedied.

HINT: In order to verify this diagnostic trouble code (DTC), adaptation of the camshaft must be

completed. Adaptation of the camshaft is carried out by the engine control module (ECM) when the engine is at operating temperature, during engine braking (fuel shut-off) above 1500 RPM for at least 10 seconds.

CAUTION: Test driving on the road must be carried out on a road with minimal traffic. Follow the highway code.

Fig. 176: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 177: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reconnect the connectors, components, etc.
- Start and run the engine to operating temperature.
- Drive the vehicle on the road. Ensure that the conditions for camshaft adaptation are met: engine braking (fuel shut-off) above 1500 RPM for at least 10 seconds. The conditions can be satisfied for example by driving the vehicle with a high engine load (accelerating) up to approximately 90 km/h and then releasing the accelerator pedal for 10 seconds.

NOTE: **In order for the adaptation to be carried out, the accelerator pedal must not be touched during engine braking.**

- Repeat the schedule to ensure that the diagnosis and adaptation are carried out.

- Connect VCT2000 (or appropriate scan tool) to the data link connector **without switching off the engine.**
- Read the diagnostic status and fault status for the diagnostic trouble code by selecting the diagnostic trouble code in the list.

NOTE: If the engine is switched off, the stored fault status will be erased and the test drive will have to be repeated.

Check that the diagnostic status for the diagnostic trouble code (DTC) is "Completed". When the diagnostic status for the diagnostic trouble code (DTC) is "Completed", the engine control module (ECM) has carried out camshaft adaption. If the status is "Not completed" the test drive must be carried out again.

If the function is correct, the fault status must be "No fault found" when the diagnostic is complete.

Check that the value for camshaft adaption is correct when the diagnostic status for the diagnostic trouble code (DTC) is "Completed".

- Inlet camshaft: 75° CA (camshaft angle) (+/-8° CA)

- Damaged variable valve timing (VVT) unit.
- Damaged (worn) timing chain.

Fault symptom[s]

- Uneven idle.
- Increased emissions.
- The engines cuts out whilst driving.

FAULT TRACING ECM-P001600

CHECKING THE STATUS

HINT: The diagnostic trouble code (DTC) specifies the relevant camshaft.

- ECM-P001600: Camshaft inlet, bank 1.
  - Bank 1 (cylinder row nearest the front): cylinders 1, 3, 5 and 7.
  - Bank 2 (cylinder row furthest to the rear, nearest the passenger compartment): cylinders 2, 4, 6, and 8.
- ECM-P001700: Camshaft exhaust, bank 1.
  - Bank 1 (cylinder row nearest the front): cylinders 1, 3, 5 and 7.
  - Bank 2 (cylinder row furthest to the rear, nearest the passenger compartment): cylinders 2, 4, 6, and 8.
- ECM-P001800: Camshaft inlet, bank 2.

  - Bank 1 (cylinder row nearest the front): cylinders 1, 3, 5 and 7.
  - Bank 2 (cylinder row furthest to the rear, nearest the passenger compartment): cylinders 2, 4, 6, and 8.
- ECM-P001900: Camshaft exhaust, bank 2.
  - Bank 1 (cylinder row nearest the front): cylinders 1, 3, 5 and 7.
  - Bank 2 (cylinder row furthest to the rear, nearest the passenger compartment): cylinders 2, 4, 6, and 8.

Fig. 182: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start the engine.
- Read off the adaption for the camshaft, the camshaft shift angle and desired value for the camshaft shift angle.

Check that the read off values correspond to the guide values below. The difference between the camshaft shift angle and the desired value for camshaft shift angle can be read off from the lower digital display. Note the read off values as a basis for continuing fault-tracing.

Adaption camshaft

- Inlet camshaft: 75° CA (camshaft angle) (+/-8° CA)
- Exhaust camshaft: 120° CA (+/-8° CA)

Camshaft shift angle

- The difference from the desired value of the camshaft shift angle (inlet and exhaust): approximately 8° CA

The fault is permanent if the values are not correct. If the values are correct, this indicates that the fault is intermittent and not presently active.

Fig. 183: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **CHECKING COMPONENTS**

CHECKING COMPONENTS

HINT: Incorrect function on the camshaft reset valve is probably the cause of this diagnostic trouble code (DTC) if:

- The adaption value and camshaft shift angle are correct in the previous check (intermittent fault).
- The adaption value is correct but the camshaft shift angle is incorrect in the previous check.

HINT: Contaminants in the engine oil can damage components in the camshaft control which can cause function faults.

Check the engine oil grade. Check especially for contaminants.

Check the default settings of the camshafts.

Remove the camshaft reset valve, check the reset valve and the oil ducts in the cylinder head. Check for contaminants and blockages.

Try a new camshaft reset valve if no fault is found or if the above remedies do not rectify the fault.

HINT: The fault can also be caused by a damaged variable valve timing (VVT) unit.

Remedy as necessary.

Other information

- see **VVT UNIT, RIGHT CYLINDER HEAD**

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

VERIFICATION, PART 1

HINT: After carrying out the repair, check that the fault has been remedied.

HINT: In order to verify this diagnostic trouble code (DTC), adaptation of the camshaft must be completed. Adaptation of the camshaft is carried out by the engine control module (ECM) when the engine is at operating temperature, during engine braking (fuel shut-off) above 1500 RPM for at least 10 seconds.

CAUTION: Test driving on the road must be carried out on a road with minimal traffic. Follow the highway code.

Fig. 186: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 187: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reconnect the connectors, components, etc.
- Start and run the engine to operating temperature.
- Drive the vehicle on the road. Ensure that the conditions for camshaft adaptation are met: engine braking (fuel shut-off) above 1500 RPM for at least 10 seconds. The conditions can be satisfied for example by driving the vehicle with a high engine load (accelerating) up to approximately 90 km/h and then releasing the accelerator pedal for 10 seconds.

NOTE: **In order for the adaptation to be carried out, the accelerator pedal must not be touched during engine braking.**

- Repeat the schedule to ensure that the diagnosis and adaptation are carried out.

- Connect VCT2000 (or appropriate scan tool) to the data link connector **without switching off the engine.**
- Read the diagnostic status and fault status for the diagnostic trouble code by selecting the diagnostic trouble code in the list.

NOTE: If the engine is switched off, the stored fault status will be erased and the test drive will have to be repeated.

Check that the diagnostic status for the diagnostic trouble code (DTC) is "Completed". When the diagnostic status for the diagnostic trouble code (DTC) is "Completed", the engine control module (ECM) has carried out camshaft adaption. If the status is "Not completed" the test drive must be carried out again.

If the function is correct, the fault status must be "No fault found" when the diagnostic is complete.

Check that the value for camshaft adaption is correct when the diagnostic status for the diagnostic trouble code (DTC) is "Completed".

- Inlet camshaft: 75° CA (camshaft angle) (+/-8° CA)
- Exhaust camshaft: 120° CA (+/-8° CA)

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P001600: CRANKSHAFT POSITION - CAMSHAFT POSITION CORRELATION - BANK 1 SENSOR A. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B8444S; 2008-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The engine control module (ECM) checks that the camshaft is in the correct position in relation to the position of the crankshaft. If the camshaft position does not match the crankshaft position, the control module will adjust the adaptation for the camshaft position. The adaptation value corresponds to the difference between the camshaft and crankshaft.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The fuel trim value change is greater than 16 degrees.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Hot engine.
- During engine start-up.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Substitute Value

- The control module assumes a fixed value for fuel trim.

Possible Source

- Incorrectly adjusted camshafts.
- Damaged VVT-unit.

Fault symptom[s]

- Uneven idle
- Engine misfires
- Engine is difficult to start
- Malfunction indicator light (MIL), on

FAULT-TRACING

CHECKING THE STATUS

HINT: Sensor A covers the intake camshaft. Sensor B covers the exhaust camshaft.

Fig. 191: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start the engine.
- Read off the adaption for the camshaft, the camshaft shift angle and desired value for the camshaft shift angle.

  Check that the read off values correspond to the guide values below. The difference between the camshaft shift angle and the desired value for camshaft shift angle can be read off from the lower digital display. Note the read off values as a basis for continuing fault-tracing.

  Adaption camshaft

- Inlet camshaft: 75° CA (camshaft angle) (+/-8° CA)
- Exhaust camshaft: 120° CA (+/-8° CA)

Camshaft shift angle

- The difference from the desired value of the camshaft shift angle (inlet and exhaust): approximately 8° CA

The fault is permanent if the values are not correct. If the values are correct, this indicates that the fault is intermittent and not presently active.

Fig. 192: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING COMPONENTS**

CHECKING COMPONENTS

HINT: Incorrect function on the camshaft reset valve is probably the cause of this diagnostic trouble code (DTC) if:

- The adaption value and camshaft shift angle are correct in the previous check (intermittent fault).
- The adaption value is correct but the camshaft shift angle is incorrect in the previous check.

HINT: Contaminants in the engine oil can damage components in the camshaft control which can cause function faults.

Check the engine oil grade. Check especially for contaminants.

Remove the camshaft reset valve, check the reset valve and the oil ducts in the cylinder head. Check for contaminants and blockages.

Try a new camshaft reset valve if no fault is found or if the above remedies do not rectify the fault.

HINT: The fault can also be caused by a damaged variable valve timing (VVT) unit.

Remedy as necessary.

Other information

  Refer to **VERIFICATION**

VERIFICATION

VERIFICATION, PART 1

HINT: After carrying out the repair, check that the fault has been remedied.

HINT: In order to verify this diagnostic trouble code (DTC), adaptation of the camshaft must be completed. Adaptation of the camshaft is carried out by the engine control module (ECM) when the engine is at operating temperature, during engine braking (fuel shut-off) above 1500 RPM for at least 10 seconds.

CAUTION: Test driving on the road must be carried out on a road with minimal traffic. Follow the highway code.

Fig. 195: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 196: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reconnect the connectors, components, etc.
- Start and run the engine to operating temperature.
- Drive the vehicle on the road. Ensure that the conditions for camshaft adaptation are met: engine braking (fuel shut-off) above 1500 RPM for at least 10 seconds. The conditions can be satisfied for example by driving the vehicle with a high engine load (accelerating) up to approximately 90 km/h and then releasing the accelerator pedal for 10 seconds.

NOTE: **In order for the adaptation to be carried out, the accelerator pedal must not be touched during engine braking.**

- Repeat the schedule to ensure that the diagnosis and adaptation are carried out.

- Connect VCT2000 (or appropriate scan tool) to the data link connector **without switching off the engine.**
- Read the diagnostic status and fault status for the diagnostic trouble code by selecting the diagnostic trouble code in the list.

NOTE: If the engine is switched off, the stored fault status will be erased and the test drive will have to be repeated.

Check that the diagnostic status for the diagnostic trouble code (DTC) is "Completed". When the diagnostic status for the diagnostic trouble code (DTC) is "Completed", the engine control module (ECM) has carried out camshaft adaption. If the status is "Not completed" the test drive must be carried out again.

If the function is correct, the fault status must be "No fault found" when the diagnostic is complete.

Check that the value for camshaft adaption is correct when the diagnostic status for the diagnostic trouble code (DTC) is "Completed".

- Inlet camshaft: 75° CA (camshaft angle) (+/-8° CA)
- Exhaust camshaft: 120° CA (+/-8° CA)

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P001621: CRANKSHAFT POSITION - CAMSHAFT POSITION CORRELATION - BANK 1 SENSOR A. GENERAL SIGNAL FAILURES. SIGNAL TOO LOW (B6324S5; 2011-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 200: Identifying Camshaft Reset Valve
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks that the camshaft is in the correct position (angle) in relation to the position (angle) of the crankshaft using signals from the camshaft sensor and engine speed (RPM) sensor. If the camshaft position does not correspond to the crankshaft position, the control module adjusts the adaption for the camshaft position. The adaption value corresponds to the difference in position between the camshaft and crankshaft when the crankshaft is in its default position. The diagnostic trouble code (DTC) is stored when adaption is greater or less than a certain value.

The diagnostic trouble code (DTC) can be diagnosed when adaption of the camshaft is carried out (adaption occurs during engine braking).

Substitute Value

- Nothing.

Possible Source

- Poor engine oil quality
- Incorrectly adjusted camshafts
- Damaged camshaft reset valve
- Damaged variable valve timing (VVT) unit.
- Damaged (worn) timing chain.

Fault symptom[s]

- Driving/Poor performance/lacks power/At take off
- Driving/Poor performance/lacks power

ECM-P001692: CRANKSHAFT POSITION - CAMSHAFT POSITION CORRELATION - BANK 1 SENSOR A. COMPONENT FAILURES. PERFORMANCE OR INCORRECT OPERATION (B6324S5; 2011-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P001692

Condition

The engine control module (ECM) checks that the camshaft is in the correct position in relation to the position of the crankshaft. If the camshaft position does not match the crankshaft position, the control module will adjust the adaptation for the camshaft position. The adaptation value corresponds to the difference between the camshaft and crankshaft.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Change in the adaptation value is larger than what corresponds to a tooth.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Hot engine.
- During engine start-up.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Substitute Value

- None.

Possible Source

- Incorrectly adjusted camshafts.
- Damaged VVT-unit.
- Over cogging in the camshaft transmission.

Fault symptom[s]

- Driving/Poor performance/lacks power/At take off
- Starting/Engine does not start/Engine turns
- Starting/Engine hard to start/cranks slowly/Unsure when/at all times

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P001800: CRANKSHAFT POSITION - CAMSHAFT POSITION CORRELATION - BANK 2 SENSOR A. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P001800

Condition

The engine control module (ECM) checks that the camshaft is in the correct position in relation to the position of the crankshaft. If the camshaft position does not match the crankshaft position, the control module will adjust the adaptation for the camshaft position. The adaptation value corresponds to the difference between the camshaft and crankshaft.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Change in the adaptation value is larger than what corresponds to a tooth.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Hot engine.
- During engine start-up.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Substitute Value

- None.

Possible Source

- Incorrectly adjusted camshafts.
- Damaged VVT-unit.
- Over cogging in the camshaft transmission.

Fault symptom[s]

- Uneven idle
- Engine is difficult to start

FAULT-TRACING

CHECKING THE STATUS

HINT: Sensor A covers the intake camshaft. Sensor B covers the exhaust camshaft.

Fig. 228: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start the engine.
- Read off the adaption for the camshaft, the camshaft shift angle and desired value for the camshaft shift angle.

  Check that the read off values correspond to the guide values below. The difference between the camshaft shift angle and desired value for camshaft shift angle can be read off from the lower digital display. Note the read off values as a basis for continuing fault-tracing.

  Adaption camshaft

  - Inlet camshaft: 75° CA (camshaft angle) (+/-8° CA)
  - Exhaust camshaft: 120° CA (+/-8° CA)

Camshaft shift angle

- The difference from the desired value of the camshaft shift angle (inlet and exhaust): approximately 8° CA

The fault is permanent if the values are not correct. If the values are correct, this indicates that the fault is intermittent and not presently active.

- **Continue**

  Refer to **CHECKING COMPONENTS**

CHECKING COMPONENTS

HINT: Incorrect function on the camshaft reset valve is probably the cause of this diagnostic trouble code (DTC) if:

- The adaption value and camshaft shift angle are correct in the previous check (intermittent fault).
- The adaption value is correct but the camshaft shift angle is incorrect in the previous check.

HINT: Contaminants in the engine oil can damage components in the camshaft control which can cause

function faults.

Check the engine oil grade. Check especially for contaminants.

Remove the camshaft reset valve, check the reset valve and the oil ducts in the cylinder head. Check for contaminants and blockages.

Try a new camshaft reset valve if no fault is found or if the above remedies do not rectify the fault.

HINT: The fault can also be caused by a damaged variable valve timing (VVT) unit.

Remedy as necessary.

  Refer to **VERIFICATION**

VERIFICATION

VERIFICATION, PART 1

HINT: After carrying out the repair, check that the fault has been remedied.

HINT: In order to verify this diagnostic trouble code (DTC), adaptation of the camshaft must be completed. Adaptation of the camshaft is carried out by the engine control module (ECM) when the engine is at operating temperature, during engine braking (fuel shut-off) above 1500 RPM for at least 10 seconds.

CAUTION: Test driving on the road must be carried out on a road with minimal traffic. Follow the highway code.

Fig. 232: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 233: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reconnect the connectors, components, etc.
- Start and run the engine to operating temperature.
- Drive the vehicle on the road. Ensure that the conditions for camshaft adaptation are met: engine braking (fuel shut-off) above 1500 RPM for at least 10 seconds. The conditions can be satisfied for example by driving the vehicle with a high engine load (accelerating) up to approximately 90 km/h and then releasing the accelerator pedal for 10 seconds.

NOTE: **In order for the adaptation to be carried out, the accelerator pedal must not be touched during engine braking.**

- Repeat the schedule to ensure that the diagnosis and adaptation are carried out.

- Connect VCT2000 (or appropriate scan tool) to the data link connector **without switching off the engine.**
- Read the diagnostic status and fault status for the diagnostic trouble code by selecting the diagnostic trouble code in the list.

NOTE: If the engine is switched off, the stored fault status will be erased and the test drive will have to be repeated.

Check that the diagnostic status for the diagnostic trouble code (DTC) is "Completed". When the diagnostic status for the diagnostic trouble code (DTC) is "Completed", the engine control module (ECM) has carried out camshaft adaption. If the status is "Not completed" the test drive must be carried out again.

If the function is correct, the fault status must be "No fault found" when the diagnostic is complete.

Check that the value for camshaft adaption is correct when the diagnostic status for the diagnostic trouble code (DTC) is "Completed".

- Inlet camshaft: 75° CA (camshaft angle) (+/-8° CA)
- Exhaust camshaft: 120° CA (+/-8° CA)

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P001A00 INTAKE (A) CAM PROFILE CONTROL CIRCUIT / OPEN (BANK 1). GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The engine control module (ECM) regulates the variable cam profiles. The engine control module (ECM) checks the control signal for the cam profile valves.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Signal missing.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.
- Battery voltage higher than 10.5 V.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

HINT: For this function, bank 1 consists of cylinders 1, 2 and 4. Bank 2 consists of cylinders 3, 5 and 6.

Substitute Value

- Both banks for variable cam profile in low lift.

Possible Source

- Dirty or damaged cam profile solenoid (CPS).
- Contact resistance or oxidation in the terminals.
- Open-circuit in the power supply cable.
- Open circuit on signal cable.

Fault symptom[s]

- Malfunction indicator light (MIL), on
- Uneven idle
- Engine is difficult to start
- High fuel consumption

- Poor performance

FAULT-TRACING

FAULT-TRACING INFORMATION

Use the following information and general checks during fault-tracing.

NOTE: Check that the fuses are intact. For locations, see the owner's manual or the cover for fuse box.

1. Check, if possible, relevant functions in the vehicle using buttons/controls/test drives to determine the status of the fault.

   NOTE: If the vehicle does not show any of the given symptoms in the diagnostic trouble code information (DTC), this may mean that the fault is intermittent or that the control module is not detecting the fault at this moment.

2. Use the diagnostic trouble code's **frozen values** , **status identifiers** and **counter** to determine the operating conditions when the fault was detected, the fault's current status and any degree of intermittence of the fault.
3. Check and fault-trace according to **the fault causes** that are specified in the **diagnostic trouble code (DTC) information** .
4. Use **VIDA (Volvo scan tool)** . Read off the parameters, activate components and functions, carry out quick tests and checking routines for the diagnostic trouble codes to identify the fault.
5. Check relevant components according to **Component specifications** .
6. Check relevant signals using the appropriate **signal specification** and **breakout box** service information.

NOTE: Impurities in the oil, such as cast material and cast burrs, may cause the cam profile solenoid (CPS) to jam. In most cases the solenoid does not have to be replaced, cleaning is enough. Replace the solenoid if it still has malfunctions after two cleanings.

Remedy as necessary.

ECM-P001B00 INTAKE (A) CAM PROFILE CONTROL CIRCUIT LOW (BANK 1). GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The engine control module (ECM) regulates the variable cam profiles. The engine control module (ECM) checks the control signal for the cam profile valves.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Control signal is too low.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.
- Battery voltage higher than 10.5 V.

NOTE: **The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.**

HINT: For this function, bank 1 consists of cylinders 1, 2 and 4. Bank 2 consists of cylinders 3, 5 and 6.

Substitute Value

- Both banks for variable cam profile in low lift.

Possible Source

- Dirty or damaged cam profile solenoid (CPS).
- The signal cable (-) is short-circuited to ground.

Fault symptom[s]

- Malfunction indicator light (MIL), on
- Uneven idle
- Engine is difficult to start
- High fuel consumption
- Poor performance

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION**

FAULT TRACING ECM-P002100

CHECKING COMPONENTS

NOTE: **If the diagnostic trouble code (DTC) for correlation between the crankshaft position and camshaft position is stored, it must be fault-traced first.**

HINT: Contaminants in the engine oil can damage components in the variable valve timing (VVT) unit which can cause function faults.

Check the engine oil grade. Check especially for contaminants.

Remove the camshaft reset valve, check the reset valve and the oil ducts in the cylinder head. Check for contaminants and blockages.

Try a new camshaft reset valve if no fault is found or if the above remedies do not rectify the fault.

HINT: The fault can also be caused by an internal fault in the variable valve timing (VVT) unit. If the above fault-tracing/remedies do not rectify the fault, the variable valve timing (VVT) unit may be damaged.

Remedy as necessary.

Fig. 270: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Verification consists of 2 parts. Part 1 is carried out via a test in the workshop. Part 2 is carried out on the road.

  If the function is determined as **incorrect** in part 1, then part 2 does **not** need to be carried out. If the function is determined as being correct in part 1 and the vehicle can be tested on the road, part 2 must be carried out. This is because the function can be difficult the check in a workshop environment in certain cases.

- Ignition off
- Reconnect the connectors, components, etc.
- Start and run the engine to operating temperature.
- Read off the shift angle of the camshaft and the desired shift angle of the camshaft to check the function.

Check that the camshaft shift angle corresponds to the desired value for the camshaft shift angle with an accuracy of approximately 8° CA (camshaft angle). The difference between the values can be read off in the lower digital display.

FAULT TRACING ECM-P002400

CHECKING COMPONENTS

NOTE: **If the diagnostic trouble code (DTC) for correlation between the crankshaft position and camshaft position is stored, it must be fault-traced first.**

HINT: Incorrect oil grade can cause malfunctions in the variable valve timing (VVT) unit. Contaminants in the engine oil can cause damage to components in the variable valve timing (VVT) unit.

Check the engine oil grade. Check especially for contaminants.

HINT: The VVT unit for the exhaust camshaft has a spring which turns the camshaft at control. This means that if the oil pressure becomes too low for the VVT unit, the spring controls the camshaft out too much.

Remove the camshaft reset valve, check the reset valve and the oil ducts in the cylinder head. Check for contaminants and blockages.

Check the engine oil pressure.

Try a new camshaft reset valve if no fault is found or if the above remedies do not rectify the fault.

HINT: The fault can also be caused by an internal fault in the variable valve timing (VVT) unit. If the above fault-tracing/remedies do not rectify the fault, the variable valve timing (VVT) unit may be damaged.

Remedy as necessary.

ECM-P003100: HO2S HEATER CONTROL CIRCUIT LOW (BANK 1, SENSOR 1). GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION

(B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P003100

Condition

Fig. 292: Identifying Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the Engine Control Module (ECM) registers that the front heated oxygen sensor (HO2S) preheating circuit (bank 1)has a short-circuit to ground, or if there is an open-circuit.

The engine cylinders are counted from the cylinder furthest away from the flywheel.

- Bank 1 (cylinder row nearest the front): cylinders 1, 3, 5 and 7.
- Bank 2 (cylinder row furthest to the rear, nearest the passenger compartment): cylinders 2, 4, 6, and 8.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Fuel trim switched off.
- Front heated oxygen sensor (HO2S) preheating switched off.

Possible Source

- Open-circuit in the power supply cable.
- Short-circuit to ground in the power cable.
- Damaged front heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULT-TRACING

FAULT-TRACING INFORMATION

Use the following information and general checks during fault-tracing.

NOTE: Check that the fuses are intact. For locations, see the owner's manual or the cover for fuse box.

1. Check, if possible, relevant functions in the vehicle using buttons/controls/test drives to determine the status of the fault.

   NOTE: If the vehicle does not show any of the given symptoms in the diagnostic trouble code information (DTC), this may mean that the fault is intermittent or that the control module is not detecting the fault at this moment.

2. Use the diagnostic trouble code's **frozen values** , **status identifiers** and **counter** to determine the operating conditions when the fault was detected, the fault's current status and any degree of intermittence of the fault.
3. Check and fault-trace according to **the fault causes** that are specified in the **diagnostic trouble code (DTC) information** .
4. Use **VIDA (Volvo scan tool)** . Read off the parameters, activate components and functions, carry out quick tests and checking routines for the diagnostic trouble codes to identify the fault.
5. Check relevant components according to **Component specifications** .
6. Check relevant signals using the appropriate **signal specification** and **breakout box** service information.

Remedy as necessary.

ECM-P003200: HEATED OXYGEN SENSOR (HO2S) CONTROL CIRCUIT HIGH (BANK 1, SENSOR 1). GENERAL FAULT INFORMATION. NO INFORMATION ABOUT FAULT TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P003200

Condition

Fig. 308: Identifying Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the Engine Control Module (ECM) registers that the front heated oxygen sensor (HO2S) preheating circuit (bank 1) has a short-circuit to supply voltage.

The engine cylinders are counted from the cylinder furthest away from the flywheel.

- Bank 1 (cylinder row nearest the front): cylinders 1, 3, 5 and 7.
- Bank 2 (cylinder row furthest to the rear, nearest the passenger compartment): cylinders 2, 4, 6, and 8.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Fuel trim switched off.
- Front heated oxygen sensor (HO2S) preheating switched off.

Possible Source

- Short-circuit to supply in the power cable.
- Damaged front heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULT TRACING ECM-P003200

CHECKING THE STATUS

Fig. 309: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- The ignition must be on to perform the diagnostic.

  Check whether the fault is permanent or intermittent. Read off the diagnostic trouble code (DTC) fault status when the diagnostic status is "Completed".

The fault is permanent if the fault status is "Fault found". The fault is intermittent if the fault status is "No fault found".

- **Continue**

  Refer to **CHECKING COMPONENTS**

CHECKING COMPONENTS

CAUTION: Do not apply rust solvent spray or grease to the heated oxygen sensor (HO2S) connector.

Check the cable between front heated oxygen sensor (HO2S) terminal #1 (bank 1) and voltage supply from the system relay. Check for a short-circuit to supply voltage.

Try a new rear heated oxygen sensor if the above measure does not remedy the fault.

Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P003600: HO2S HEATER CONTROL CIRCUIT (BANK 1, SENSOR 2). GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION

(B6324S5; 2011-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 318: Identifying Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the rear heated oxygen sensor (HO2S) signal (bank 2). The Engine control module (ECM) actively regulates between rich and lean fuel/air mixture and registers how well the rear heated oxygen sensor (HO2S) signal follows these changes.

The engine cylinders are counted from the cylinder furthest away from the flywheel.

- Bank 1 (cylinder row nearest the front): cylinders 1, 3, 5 and 7.
- Bank 2 (cylinder row furthest to the rear, nearest the passenger compartment): cylinders 2, 4, 6, and 8.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The heated oxygen sensor reacts too slowly at switch from rich to lean.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Special driving cases with fuel shut-offs.

Substitute Value

- None.

Possible Source

- Contact resistance or oxidation in the terminals.
- Damaged rear heated oxygen sensor (HO2S).

Fault symptom[s]

- Warning lights and chimes/Malfunction Indicator Light ("Check engine" light) indication/no indication

FAULT-TRACING

see **FAULT-TRACING**

ECM-P003600: HO2S HEATER CONTROL CIRCUIT (BANK 1, SENSOR 2). GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B8444S; 2010-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 319: Identifying Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

Engine control module (ECM) monitors the rear heated oxygen sensor's heating coil and its ability to preheat the oxygen sensor. This is done to measure impedance across the heater circuit during the preheating sequence for the oxygen sensor.

The engine cylinders are counted from the cylinder furthest away from the flywheel.

- Bank 1 (cylinder row nearest the front): cylinders 1, 3, 5 and 7.
- Bank 2 (cylinder row furthest to the rear, nearest the passenger compartment): cylinders 2, 4, 6, and 8.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Impedance in the heater circuit exceeds 63.7 ohms.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition position II or engine running.

Substitute Value

- None.

Possible Source

- Contact resistance or oxidation in the terminals.
- Damaged rear heated oxygen sensor (HO2S).

Fault symptom[s]

- Warning lights and chimes/Malfunction Indicator Light ("Check engine" light) indication/no indication

FAULT-TRACING

FAULT-TRACING INFORMATION

Use the following information and general checks during fault-tracing.

NOTE: Check that the fuses are intact. For locations, see the owner's manual or the cover for fuse box.

1. Check, if possible, relevant functions in the vehicle using buttons/controls/test drives to determine the status of the fault.

   NOTE: If the vehicle does not show any of the given symptoms in the diagnostic trouble code information (DTC), this may mean that the fault is intermittent or that the control module is not detecting the fault at this moment.

2. Use the diagnostic trouble code's **frozen values** , **status identifiers** and **counter** to determine the operating conditions when the fault was detected, the fault's current status and any degree of intermittence of the fault.
3. Check and fault-trace according to **the fault causes** that are specified in the **diagnostic trouble code (DTC) information** .
4. Use **VIDA (Volvo scan tool)** . Read off the parameters, activate components and functions, carry out quick tests and checking routines for the diagnostic trouble codes to identify the fault.
5. Check relevant components according to **Component specifications** .

6. Check relevant signals using the appropriate **signal specification** and **breakout box** service information.

Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P003C00 INTAKE (A) CAMSHAFT PROFILE CONTROL PERFORMANCE OR STUCK OFF (BANK 1). GENERAL FAILURE

INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The Engine control module (ECM) checks the function for Camshaft Position (CMP) Sensor control.

Cam profile control is carried out on two banks that are controlled by a valve for each bank.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The pressure in the intake manifold (during intake) differs between banks.
- Higher pressure than expected in the intake manifold (during intake) for the bank that the diagnostic trouble code refers to.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- 30 seconds after engine start-up.
- Driving in high load range.
- Engine speed 3400-5400 RPM.
- Oil temperature between 40°C and 120°C.

HINT: For this function, Bank 1 cylinders 1, 2 and 4 apply. Bank 2 regards cylinders 3, 5 and 6.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Substitute Value

- Both banks for variable cam profile in low lift.

Possible Source

- Dirty or damaged cam profile solenoid (CPS).
- Blocked oil ducts for variable cam profile.

Fault symptom[s]

- Malfunction indicator light (MIL), on
- Uneven idle
- Engine is difficult to start
- Poor performance

DIRTY OR DAMAGED CAM PROFILE SOLENOID (CPS).

CHECK OF DIRTY OR DAMAGED CAM PROFILE SOLENOID (CPS)

Impurities in the oil, such as cast material and cast burrs, may cause the cam profile solenoid (CPS) to jam. In most cases the solenoid does not have to be replaced, cleaning is enough.

Replace the solenoid if it still has malfunctions after two cleanings.

Other information

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P005200: HO2S HEATER CONTROL CIRCUIT HIGH (BANK 2, SENSOR 1). GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION

(B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P005200

Condition

Fig. 357: Identifying Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the Engine Control Module (ECM) registers that the front heated oxygen sensor (HO2S) preheating circuit (bank 2) has a short-circuit to supply voltage.

The engine cylinders are counted from the cylinder furthest away from the flywheel.

- Bank 1 (cylinder row nearest the front): cylinders 1, 3, 5 and 7.
- Bank 2 (cylinder row furthest to the rear, nearest the passenger compartment): cylinders 2, 4, 6, and 8.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Fuel trim switched off.
- Front heated oxygen sensor (HO2S) preheating switched off.

Possible Source

- Short-circuit to supply in the power cable.
- Damaged front heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

(B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P005700

Condition

Fig. 11: Identifying Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

Engine Control Module (ECM) checks if the rear heated oxygen sensor's preheating circuit (bank 2) is short-circuited to voltage, there is an open circuit or if the resistance in the heating resistor is incorrect.

The engine cylinders are counted from the cylinder furthest away from the flywheel.

- Bank 1 (cylinder row nearest the front): cylinders 1, 3, 5 and 7.
- Bank 2 (cylinder row furthest to the rear, nearest the passenger compartment): cylinders 2, 4, 6, and 8.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers any of these.

The diagnostic trouble code (DTC) can be diagnosed at ignition on and if the battery voltage is in the range 11-16 V.

Substitute Value

- Rear heated oxygen sensor (HO2S) preheating shut off.

Possible Source

- Contact resistance, oxidation in the terminals.
- Short-circuit to ground in the power cable.
- Open-circuit in the power supply cable.
- Damaged rear heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P007000: AMBIENT AIR TEMPERATURE SENSOR CIRCUIT. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-

2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P007000

Condition

Engine control module (ECM) measures the ambient temperature using an outside temperature sensor. The sensor is located in the left external rear-view mirror. The control module checks the direct voltage from the sensor.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The direct voltage is higher than 4.951 V.
- Incorrect value lasts longer than 9 seconds.
- Incorrect value lasts for 2 or more subsequent driving cycles.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 33: Identifying Outside Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- The control module uses a constant outside temperature, +20 °C.

Possible Source

- Open-circuit in signal cable or ground lead.
- Contact resistance and oxidation in the terminals.
- Short-circuit to supply voltage in the signal cable.
- Damaged outside temperature sensor.

Fault symptom[s]

- Malfunction indicator light (MIL), on

FAULT-TRACING

FAULT-TRACING INFORMATION

Use the following information and general checks during fault-tracing.

NOTE: Check that the fuses are intact. For locations, see the owner's manual or cover for fuse box.

1. Check, if possible, relevant functions in the vehicle using buttons/controls/test drives to determine the status of the fault.

   NOTE: If the vehicle does not show any of the given symptoms in the diagnostic trouble code information (DTC), this may mean that the fault is intermittent or that the control module is not detecting the fault at this moment.

2. Use the diagnostic trouble code's **frozen values** , **status identifiers** and **counter** to determine the operating conditions when the fault was detected, the fault's current status and any degree of intermittence of the fault.
3. Check and fault-trace according to **the fault causes** that are specified in the **diagnostic trouble code (DTC) information** .
4. Use **VIDA (Volvo scan tool)** . Read off the parameters, activate components and functions, carry out quick tests and checking routines for the diagnostic trouble codes to identify the fault.
5. Check relevant components according to **Component specifications** .
6. Check relevant signals using appropriate service information regarding **signal specification** and **breakout box** .

Remedy as necessary.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P007100

Condition

Fig. 37: Identifying Outside Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal from the outside temperature sensor in the left door mirror. The diagnostic trouble code is generated if the control module registers that the value from the outside temperature sensor deviates too much from the value of the intake temperature after the engine has cooled at least 8 hours since running at operating temperature.

The diagnostic trouble code can be diagnosed at ignition on after the engine temperature has dropped by at least 55 °C from fully warm engine (higher than 70 °C).

Substitute Value

- The value is set to the constant 20 °C.

Possible Source

- Contact resistance in connector.
- Damaged outside temperature sensor.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

ECM-P007200: AMBIENT AIR TEMPERATURE SENSOR CIRCUIT LOW INPUT SIGNAL. GENERAL FAULT INFORMATION. TYPE OF FAULT NOT SPECIFIED. (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P007200

Condition

Fig. 58: Identifying Outside Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal from the outside temperature sensor.

The diagnostic trouble code (DTC) is stored if the Engine Control Module (ECM) detects that the signal from the outside temperature sensor is too low.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- The value is set to the constant 20 °C.

Possible Source

- The signal cable is short-circuited to ground.
- Damaged outside temperature sensor.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

TROUBLESHOOTING ECM-P007200

CHECKING THE STATUS

Fig. 59: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on

  Read the diagnostic status and fault status for the diagnostic trouble code by selecting the diagnostic trouble code in the list.

  Check if the malfunction is permanent or intermittent by reading off the diagnostic trouble code's status when the diagnostic status is "Implemented".

  If the trouble status is "Malfunction found", this indicates that the malfunction is permanent. If the trouble

status is "No malfunction found", this indicates that the malfunction is intermittent and not active right now.

NOTE: Trouble status cannot go from "Malfunction found" to "No malfunction found" in the same operating cycle.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P007300: AMBIENT AIR TEMPERATURE SENSOR CIRCUIT HIGH INPUT. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION

(B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P007300

Condition

Engine control module (ECM) measures the ambient temperature using an outside temperature sensor. The sensor is located in the left external rear-view mirror. The control module checks the direct voltage from the sensor.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The direct voltage is higher than 4.941 V.
- Incorrect value lasts longer than 9 seconds.
- Incorrect value lasts for 2 or more subsequent driving cycles.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 68: Identifying Outside Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- The control module uses a constant outside temperature, +20 °C.

Possible Source

- Contact resistance and oxidation in the terminals.
- Short-circuit to supply voltage in the signal cable.
- Open-circuit in the signal cable.
- Damaged outside temperature sensor.

Fault symptom[s]

- Malfunction indicator light (MIL), on

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P007500: INTAKE VALVE CONTROL CIRCUIT (BANK 1). GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-

2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P007500

Condition

The engine control module (ECM) regulates the position of the camshaft (angle) by regulating the camshaft reset valve.

The engine control module (ECM) checks the control signal for the camshaft reset valve.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Signal missing.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.
- Battery voltage higher than 10.5 V.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Substitute Value

- Camshaft control switched off.

Possible Source

- Open circuit on signal cable.
- Open-circuit in the power supply cable.
- Damaged camshaft reset valve.

Fault symptom[s]

- Malfunction indicator light (MIL), on
- Uneven idle
- High emissions
- Engine stalls when driving

FAULT-TRACING

Fig. 115: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reconnect the connectors, components, etc.
- Start the engine.
- Test drive the car on the road in different driving conditions with high and low loads so that the engine control module (ECM) can carry out diagnostics.
- Connect the VCT2000 (or appropriate scan tool) to the data link connector **without switching off the engine.**
- Read the diagnostic status and fault status for the diagnostic trouble code by selecting the diagnostic trouble code in the list.

NOTE: If the engine is switched off, the stored fault status will be erased and the

test drive will have to be repeated.

Check the fault status for the diagnostic trouble code when the scan is "Implemented". When the function is correct the fault status should be "No fault found" when the scan is implemented.

CHECKING THE STATUS

Fig. 117: Belt Routing / Engine Idling - Volvo

Courtesy of VOLVO CARS CORPORATION

- Start the engine.

  Read the diagnostic status and fault status for the diagnostic trouble code by selecting the diagnostic trouble code in the list.

  Check whether the fault is permanent or intermittent. Read off the diagnostic trouble code (DTC) fault status when the diagnostic status is "Completed".

  The fault is permanent if the fault status is "Fault found". If the fault status is "No fault found" the fault is intermittent and not presently active.

  NOTE: The fault status cannot change from "Fault found" to "No fault found" in the same operating cycle.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P008700: FUEL RAIL/SYSTEM PRESSURE - TOO LOW. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P008700

Condition

The engine control module (ECM) controls the fuel pressure via the fuel pump (FP) control module using a pulse width modulation (PWM) signal.

The fuel pump (FP) control module then controls the fuel pump (FP) depending on the pressure requested by the engine control module (ECM).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Actual pressure (gauged pressure from the fuel pressure sensor) becomes too low compared with the requested pressure (engine control module (ECM) target value) for a certain amount of time.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Engine running.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Substitute Value

- Fuel pump (FP) is controlled using a calculated value.

Possible Source

- Leakage in the fuel lines.
- Damaged fuel pressure sensor.
- Damaged fuel pump.
- Damaged fuel pump (FP) control module.

Fault symptom[s]

- Malfunction indicator light (MIL), on
- Poor performance
- Engine stalls

FAULT-TRACING

CHECKING FUEL PRESSURE SENSOR

NOTE: **If diagnostic trouble codes (DTC) for the fuel pressure sensor or atmospheric pressure sensor are stored, these diagnostic trouble codes (DTC) must be fault-traced and remedied first.**

HINT: The following method is for checking if the diagnostic trouble code has been caused by a defective fuel pressure sensor. This can be done by comparing the fuel pressure sensor's readout signal with actual fuel pressure (readout on pressure gauge connected to fuel system's lines).

- Connect pressure gauge: **FUEL PRESSURE GAUGE**

CAUTION: **The pressure in the fuel injection system can reach approximately 650 kPa when this diagnostic trouble code (DTC) is stored. Use an adapted manometer.**

- Run the engine until it is warm and let it idle.
- A/C off.

Read off relative fuel pressure.

The relative fuel pressure is calculated from the fuel pressure sensor's and the atmospheric pressure sensor's signal (=absolute pressure minus atmospheric pressure).

Check that the value on the pressure gauge and the readout value are about the same. Different values indicate malfunction in the circuit for the fuel pressure sensor.

Fig. 135: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 136: Identifying Fuel Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

Is the fuel pressure sensor OK?

- **YES**

  Refer to **CHECKING COMPONENTS**

- **NO**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS

Check the connectors between fuel pump module and the fuel pump for contact resistance and oxidation.

Try with a new fuel pump module if no malfunction is found in the above troubleshooting.

Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 139: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 140: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Engine idling
- Read off the fuel pressure and the work load of the fuel pump.
    - The upper digital display and the graphic display (red font color) indicate the absolute fuel pressure, calculated from the fuel pressure sensor
    - The center digital display (blue font color) indicates the current work load required for the fuel pump (FP) to maintain the present fuel pressure. (Normal value 50 % ±10& %.)
    - The lower digital display indicates the relative fuel pressure (white font color), calculated from the fuel pressure sensor and the atmospheric pressure sensor (= absolute pressure minus atmospheric pressure). If a manometer is connected during the test, it should indicate this pressure.

Check the fuel pressure value together with the value for the fuel pump work load. The requested pressure is 380 kPa at idle speed. A (relative) fuel pressure lower than 380 kPa together with a high fuel pump work load indicates a fault in pressure regulation.

Fig. 141: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P008900

Condition

the engine control module (ECM) controls the fuel pressure via the fuel pump (FP) control module using a pulse width modulation (PWM) signal. The fuel pump (FP) control module then controls the fuel pump (FP) depending on the pressure requested by the engine control module (ECM).

The diagnostic trouble code (DTC) (measured pressure from the fuel pressure sensor) is stored if the actual pressure varies/pulses too much.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- The fuel pump (FP) is controlled using a calculated value.

Possible Source

- Air in the fuel lines.
- Blocked fuel lines.
- Damaged fuel pressure sensor.
- Damaged fuel pump.
- Damaged fuel pump (FP) control module.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.
- Poor performance.
- Engine stops.

TROUBLESHOOTING ECM-P008900 (2005)

CHECKING FUEL PRESSURE SENSOR

NOTE: **If diagnostic trouble codes (DTC) for the fuel pressure sensor or atmospheric pressure sensor are stored, these diagnostic trouble codes (DTC) must be fault-traced and remedied first.**

HINT: The following method is for checking if the diagnostic trouble code has been caused by a defective fuel pressure sensor. This can be done by comparing if the fuel pressure sensor's signal (readout in the diagnostic tool) is unstable when actual fuel pressure (readout on pressure gauge connected to fuel system's lines) is stable.

- Connect pressure gauge: **FUEL PRESSURE GAUGE**

  CAUTION: The pressure in the fuel injection system can reach approximately 650 kPa when this diagnostic trouble code (DTC) is stored. Use an adapted manometer.

- Run the engine until it is warm and let it idle.
- A/C off.

  Read off relative fuel pressure.

  The relative fuel pressure is calculated from the fuel pressure sensor's and the atmospheric pressure sensor's signal (=absolute pressure minus atmospheric pressure).

  Check the value on the pressure gauge and the readout value in the diagnostic tool. If the fuel pressure sensor's readout signal is unstable when the actual fuel pressure (readout on pressure gauge connected to fuel system's lines) is stable, this indicates that there is a malfunction in the circuit for the fuel pressure sensor.

Fig. 155: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P008968: FUEL PRESSURE REGULATOR PERFORMANCE. ALGORITHM BASED FAILURES. EVENT INFORMATION (B6324S; 2007-

2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P008968

Condition

NOTE: **This diagnostic trouble code (DTC) status is an event controlled diagnostic trouble code (DTC). An event controlled diagnostic trouble code (DTC) does not mean that there is a fault in the control module when it is active, but is designed as information.**

Engine control module (ECM) monitors the fuel system. If the control module detects that the fuel pressure is too low for a certain time, the diagnostic trouble code is generated.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- Nothing.

Possible Source

- This diagnostic trouble code (DTC) is not caused by a fault that needs to be remedied.

Fault symptom[s]

- None.

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-P008968: FUEL PRESSURE REGULATOR PERFORMANCE. ALGORITHM BASED FAILURES. EVENT INFORMATION (B6324S5; 2011-2012)

ECM-P009100: FUEL PRESSURE REGULATOR CONTROL CIRCUIT LOW.

GENERAL FAULT INFORMATION. TYPE OF FAULT NOT SPECIFIED. (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P009100

Condition

the engine control module (ECM) controls the fuel pressure via the fuel pump (FP) control module using a pulse width modulation (PWM) signal. The fuel pump (FP) control module then controls the fuel pump (FP) depending on the pressure requested by the engine control module (ECM).

The diagnostic trouble code (DTC) is stored if the actual pressure (gauged pressure from the fuel pressure sensor) becomes too low compared with the requested pressure (engine control module (ECM) target value) for a certain amount of time.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- The fuel pump (FP) is controlled using a calculated value.

Possible Source

- Leakage in the fuel lines.
- Damaged fuel pressure sensor.
- Damaged fuel pump.
- Damaged fuel pump (FP) control module.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.
- Poor performance.
- Engine stops.

TROUBLESHOOTING ECM-P009100 (2005)

CHECKING FUEL PRESSURE SENSOR

NOTE: **If diagnostic trouble codes (DTC) for the fuel pressure sensor or atmospheric pressure sensor are stored, troubleshooting of these diagnostic trouble codes shall be performed and remedied first.**

HINT: The following method is for checking if the diagnostic trouble code has been caused by defective fuel pressure sensor. This can be done by comparing the readout signal from the fuel pressure sensor with actual fuel pressure (readout on pressure gauge connected to fuel system's lines). The method

requires accurate calibration of the pressure gauge for measuring the fuel pressure.

- Connect pressure gauge: **FUEL PRESSURE GAUGE**

  CAUTION: The pressure in the fuel system can reach approximately 650 kPa when this diagnostic trouble code (DTC) is stored. Use an adapted manometer.

- Run the engine until it is warm and let it idle.
- A/C off.

  Read off relative fuel pressure.

  The relative fuel pressure is calculated from the fuel pressure sensor's and the atmospheric pressure sensor's signal (=absolute pressure minus atmospheric pressure).

  Check that the value on the pressure gauge and the readout value are the same. Different values indicate malfunction in the circuit for the fuel pressure sensor.

Fig. 169: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 170: Identifying Fuel Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

Is the fuel pressure sensor OK?

- **YES**

  Refer to **CHECKING CONTROL OF FUEL PRESSURE**

- **NO**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING CONTROL OF FUEL PRESSURE

CAUTION: The pressure in the fuel system can reach approximately 650 kPa when this diagnostic trouble code (DTC) is stored. Use an adapted manometer.

HINT: The following method is for checking the fuel system's pressure by reading out fuel pressure and the fuel pump's working load. If pressure gauge for pressure up to 650 kPa is connected, the fuel pressure sensor can also be checked during the test.

- Disconnect the pressure gauge if it is not adapted for higher pressures than 650 kPa.

- Run the engine until it is warm and let it idle.
- A/C off.
- Read off fuel pressure and the fuel pump's working load.
  - The upper digital display and the graphic display (red characters) show absolute fuel pressure, calculated from the fuel pressure sensor.
  - The middle digital display (blue characters) shows the fuel pump's current working load to hold current fuel pressure. (Normal value 50% ±10%.)
  - The lower digital display shows the relative fuel pressure (white characters), calculated from the fuel pressure sensor and the atmospheric pressure sensor (=absolute pressure minus atmospheric pressure). If a pressure gauge is connected during the test it shall show this pressure.

Check the value for fuel pressure together with the value for the fuel pump's working load. Requested pressure is 380 kPa at idle. Fuel pressure (relative) lower than 380 kPa together with high working load on the fuel pump indicates a malfunction of the pressure control.

Fig. 171: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the function OK?

- **YES**

Refer to **CHECKING COMPONENTS**

- **NO**

  Refer to **CHECKING COMPONENTS**

CHECKING COMPONENTS

HINT: The malfunction may be intermittent or may be due to the system having low flow capacity.

Check that the fuel level in the tank is not too low (almost no fuel).

Check fuel lines between fuel pump and the injector's distribution pipes for leakage.

Check the fuel pressure sensor's connector for contact resistance and oxidation.

Check the fuel pump module's connector for contact resistance and oxidation.

Check fuel lines and fuel filter for clogging.

Try with a new fuel pump if no malfunction is found in the above troubleshooting.

Remedy as necessary.

Other information

- see **CONNECTING THE BREAKOUT BOX**
- see **SIGNAL SPECIFICATION, ENGINE CONTROL MODULE (ECM)**
- For replacing fuel pump: **LEVEL SENSOR, FUEL TANK, RIGHT-HAND/FUEL TANK, REPLACING**
- see **FUEL PUMP DRIVER MODULE**

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P009200: FUEL PRESSURE REGULATOR CONTROL CIRCUIT HIGH. GENERAL FAULT INFORMATION. TYPE OF FAULT NOT SPECIFIED. (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P009200

Condition

the engine control module (ECM) controls the fuel pressure via the fuel pump (FP) control module using a pulse width modulation (PWM) signal. The fuel pump (FP) control module then controls the fuel pump (FP) depending on the pressure requested by the engine control module (ECM).

The diagnostic trouble code (DTC) (Signal too high/low) is stored if the actual pressure (gauged pressure from the fuel pressure sensor) becomes too high compared with the requested pressure (engine control module (ECM) target value) for a certain amount of time.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- The fuel pump (FP) is controlled using a calculated value.

Possible Source

- Damaged fuel pressure sensor.
- Damaged fuel pump (FP) control module.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.
- Poor performance.
- Engine stops.

TROUBLESHOOTING ECM-P009200 (2005)

CHECKING FUEL PRESSURE SENSOR

NOTE: **If diagnostic trouble codes (DTC) for the fuel pressure sensor or atmospheric pressure sensor are stored, these diagnostic trouble codes (DTC) must be fault-traced and remedied first.**

HINT: The following method is for checking if the diagnostic trouble code has been caused by a defective fuel pressure sensor. This can be done by comparing the fuel pressure sensor's readout signal with actual fuel pressure (readout on pressure gauge connected to fuel system's lines).

- Engine idling
- Read off the fuel pressure and the work load of the fuel pump.
    - The upper digital display and the graphic display (red font color) indicate the absolute fuel pressure, calculated from the fuel pressure sensor
    - The center digital display (blue font color) indicates the current work load required for the fuel pump (FP) to maintain the present fuel pressure. (Normal value 50 % ±10& %.)
    - The lower digital display indicates the relative fuel pressure (white font color), calculated from the fuel pressure sensor and the atmospheric pressure sensor (= absolute pressure minus atmospheric pressure). If a manometer is connected during the test, it should indicate this pressure.

Check the fuel pressure value together with the value for the fuel pump work load. The requested pressure is 380 kPa at idle speed. A (relative) fuel pressure lower than 380 kPa together with a high fuel pump work load indicates a fault in pressure regulation.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P009A21 INTAKE AIR TEMPERATURE /AMBIENT AIR TEMPERATURE CORRELATION. GENERAL SIGNAL FAILURES. SIGNAL TOO LOW (B6324S5; 2011-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 211: Identifying Outside Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal from the outside temperature sensor in the left door mirror. If the control module registers that the value from the outdoor temperature sensor deviates more than 25 °C from the value calculated the control module, a diagnostic trouble code is generated.

The control module's test for the diagnostic trouble code starts once per driving cycle and first when the engine temperature is above 80 °C. Also, 4 kg of air shall have been used at vehicle speed above 40 km/h.

Substitute Value

- The driving cycle's lowest value from air temperature sensor inlet (integrated in mass airflow sensor) is used.
- In case of faulty air temperature sensor inlet (integrated in mass airflow sensor) constant temperature is

used, 20 °C.

Possible Source

- Contact resistance in connector.
- Damaged outside temperature sensor.

Fault symptom[s]

- Warning lights and chimes/Malfunction Indicator Light ("Check engine" light) indication/no indication

FAULT-TRACING

see **FAULT-TRACING**

ECM-P010000: MASS OR VOLUME AIR FLOW CIRCUIT. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P010000

Condition

Engine control module (ECM) measures the amount of air that passes through the inlet manifold using a mass air flow sensor. The control module checks the direct voltage from the sensor.

NOTE: The mass air flow sensor and air temperature sensor are integrated in the same component.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The direct voltage is lower than 0.049 V.

- Incorrect value lasts longer than 9 seconds.
- Incorrect value lasts for 2 or more subsequent driving cycles.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 213: Identifying Integrated Air Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- A value calculated from engine speed (RPM) and pressure in the intake manifold is used.

Possible Source

- Open-circuit in signal cable or ground lead.
- Contact resistance and oxidation in the terminals.
- Short-circuit to ground in the signal cable.
- Damaged mass air flow (MAF) sensor.

Fault symptom[s]

- Malfunction indicator light (MIL), on

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P010700: MANIFOLD ABSOLUTE PRESSURE/BARO SENSOR LOW INPUT. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION

(B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P010700

Condition

The engine control module (ECM) measures the pressure in the intake manifold using an air pressure sensor. The control module checks the direct voltage from the sensor.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The direct voltage is lower than 0.649 V.
- Incorrect value lasts longer than 9 seconds.
- Incorrect value lasts for 2 or more subsequent driving cycles.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 271: Identifying Air Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- The control module uses a constant air pressure in the inlet manifold.
- The control module performs load and air flow calculations independent of the signal from the air pressure sensor in the inlet manifold.

Possible Source

- Contact resistance and oxidation in the terminals.
- Short-circuit to ground in the signal cable.
- Damaged air pressure sensor in the inlet manifold.

Fault symptom[s]

- Malfunction indicator light (MIL), on

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P010700

Condition

Fig. 272: Identifying Air Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) measures the air pressure in the intake manifold using an air pressure sensor.

The diagnostic trouble code (DTC) is stored if the Engine Control Module (ECM) detects that the signal from the manifold absolute pressure (MAP) sensor in the intake manifold is too low.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- The signal from the air pressure sensor in the intake manifold is set to a constant.
- Load/airflow calculations are carried out regardless of the signal from the air pressure sensor.

Possible Source

- The signal cable is short-circuited to ground.
- Damaged air pressure sensor in the intake manifold.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULT TRACING ECM-P010700

CHECKING THE STATUS

Fig. 273: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on

  Check whether the fault is permanent or intermittent. Read off the pressure sensor signal for intake pressure and the atmospheric pressure sensor signal. Check that the values are approximately the same.

  HINT: The atmospheric pressure sensor signal is used as a reference value for the pressure sensor signal for intake pressure.

  The fault is permanent if the values do not correspond. If the values do not correspond, it indicates that

the fault is intermittent and not presently active.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P011000: INTAKE AIR TEMPERATURE SENSOR 1 CIRCUIT. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P011000

Condition

Engine control module (ECM) measures the temperature of the inducted air using an air temperature sensor in the inlet manifold. The control module checks the direct voltage from the sensor.

NOTE: The mass air flow sensor and air temperature sensor are integrated in the same component.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The direct voltage is higher than 4.951 V.
- Incorrect value lasts longer than 9 seconds.
- Incorrect value lasts for 2 or more subsequent driving cycles.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 293: Identifying Integrated Air Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- The value for the inlet temperature is generated to equal to the value for the fuel temperature.

Possible Source

- Open-circuit in signal cable or ground lead.
- Contact resistance and oxidation in the terminals.
- Short-circuit to supply voltage in the signal cable.
- Damaged intake air temperature (IAT) sensor.

Fault symptom[s]

- Malfunction indicator light (MIL), on

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P011400: INTAKE AIR TEMPERATURE SENSOR 1 INTERMITTENT/ERRATIC. GENERAL FAILURE INFORMATION. NO SUB

TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P011400

Condition

Fig. 338: Identifying Mass Air Flow Sensor (With Integrated Air Temperature Sensor)
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal from the temperature sensor in the intake manifold under two different driving conditions. The check is first made during high airflow while the vehicle is travelling and then while the vehicle is stationary and idling. The diagnostic trouble code is generated if the control module registers that the temperature difference between these two measurements is unreasonably similar.

Substitute Value

- The value for the inlet temperature is generated to equal to the value for the fuel temperature.

Possible Source

- Contact resistance in connector.
- Damaged air temperature sensor (integrated in mass air flow sensor).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

ECM-P011500: ENGINE COOLANT TEMPERATURE CIRCUIT. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P011500

Condition

Engine control module (ECM) measures the engine temperature using a coolant temperature sensor. The control module checks the direct voltage from the sensor.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The direct voltage is higher than 4.951 V.
- Incorrect value lasts longer than 9 seconds.
- Incorrect value lasts for 2 or more subsequent driving cycles.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 340: Identifying Engine Coolant Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Open-circuit in signal cable or ground lead.
- Contact resistance and oxidation in the terminals.
- Short-circuit to supply voltage in the signal cable.
- Damaged coolant temperature sensor.

Fault symptom[s]

- Malfunction indicator light (MIL), on
- Engine is difficult to start
- Uneven idle
- Engine stalls
- Electric cooling fan runs continuously, when ignition is off

ECM-P011600: ENGINE COOLANT TEMPERATURE CIRCUIT RANGE/PERFORMANCE. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P011600

Condition

Fig. 341: Identifying Engine Coolant Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) monitors the engine temperature using a sensor.

The diagnostic trouble code (DTC) is stored if the control module detects that the value from the engine coolant temperature (ECT) sensor deviates too much from the value for intake temperature after the engine has been switched off for an extended period.

The diagnostic trouble code is diagnosed at ignition on once per driving cycle, but only when the fuel temperature has dropped by at least 20 °C and has ended up near the outdoor temperature from the previous driving cycle.

HINT: The diagnostic trouble code may be set incorrectly if, for example, a retrofitted engine heated is used.

Substitute Value

- During start-up: The intake air temperature (IAT) is used if no fault has been detected on the intake temperature sensor
- After start-up: The engine coolant temperature (ECT) is calculated based on a model.
- Engine cooling fan (FC) is activated at the predefined speed.

Possible Source

- Contact resistance in connector.
- Damaged engine coolant temperature sensor.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.
- Engine reluctant to start.
- Uneven idle.
- Engine stops.
- The engine cooling fan (FC) runs continuously even when the ignition is switched off.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P012023: THROTTLE/PEDAL POSITION SENSOR A CIRCUIT. GENERAL SIGNAL FAILURES. SIGNAL STUCK LOW (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P012023

Condition

The engine control module (ECM) checks the pulse width modulation (PWM) signal and the analog signal from the accelerator pedal (AP) position sensor. The analog signal is directly connected to the Central electronic module (CEM) and the signal is transmitted via CAN communication to the Engine control module (ECM). The pulse width modulation (PWM) signal is directly connected to the engine control module (ECM).

The PWM signal is used to determine the current accelerator pedal position in a fault free system.

The engine control module (ECM) checks the PWM signal.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The PWM signal is too low.
- Incorrect value lasts longer than 16 seconds.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 385: Identifying Accelerator Pedal Position Sensor
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- The control module uses analog signals (via CAN).
- The control module uses the accelerator pedal position corresponding to the released position when the

brake pedal is depressed at the same time.

Possible Source

- Short-circuit to ground in the signal cable.
- Damaged accelerator pedal (AP) position sensor.

Fault symptom[s]

- Message in information display
- Accelerator pedal ignored during braking

- Incorrect value lasts longer than 16 seconds.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 386: Identifying Accelerator Pedal Position Sensor
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- The control module uses analog signals (via CAN).
- The control module uses the accelerator pedal position corresponding to the released position when the brake pedal is depressed at the same time.

Possible Source

- Short-circuit to supply voltage in the signal cable.
- Open-circuit in the signal cable.
- Open-circuit in the power supply (12V) to the accelerator pedal (AP) position sensor.
- Open-circuit in the ground lead.
- Damaged accelerator pedal (AP) position sensor.

Fault symptom[s]

- Message in information display
- Accelerator pedal ignored during braking

ECM-P012038: THROTTLE/PEDAL POSITION SENSOR A CIRCUIT. FM (FREQUENCY MODULATED) / PWM (PULSE WIDTH MODULATED) FAILURES. SIGNAL FREQUENCY INCORRECT (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P012038

Condition

The engine control module (ECM) checks the pulse width modulation (PWM) signal and the analog signal from the accelerator pedal (AP) position sensor. The analog signal is directly connected to the Central electronic module (CEM) and the signal is transmitted via CAN communication to the Engine control module (ECM). The pulse width modulation (PWM) signal is directly connected to the engine control module (ECM).

The PWM signal is used to determine the current accelerator pedal position in a fault free system.

The engine control module (ECM) checks the PWM signal.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Incorrect frequency on the PWM signal.
- Incorrect value lasts longer than 16 seconds.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: **The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.**

Fig. 387: Identifying Accelerator Pedal Position Sensor
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- The control module uses analog signals (via CAN).
- The control module uses the accelerator pedal position corresponding to the released position when the brake pedal is depressed at the same time.

Possible Source

- Loose connections or contact resistance in the terminals on the pulse width modulation (PWM) signal cable.
- Interference on the pulse width modulation (PWM) signal cable.
- Damaged accelerator pedal (AP) position sensor.

Fault symptom[s]

- Message in information display
- Accelerator pedal ignored during braking

FAULT-TRACING

ECM-P012200: THROTTLE/PEDAL POSITION SENSOR A CIRCUIT LOW INPUT SIGNAL. GENERAL FAULT INFORMATION. NO INFORMATION ABOUT FAULT TYPE. (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P012200

Condition

Fig. 388: Identifying Accelerator Pedal Position Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) receives a pulse width modulation (PWM) signal and an analog signal from the accelerator pedal position sensor. In a fault-free system, the analog signal is used to determine the position of the accelerator pedal (AP).

The diagnostic trouble code (DTC) is stored if the control module registers that the analog signal is too low.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Acceleration is ignored when braking.
- Pulse width modulation (PWM) signal is used.

Possible Source

- The signal cable is short-circuited to ground.
- Open-circuit on the signal cable.
- Interruption of power supply.
- Open circuit in ground cable.
- Damaged accelerator pedal (AP) position sensor.

Fault symptom[s]

- Message in the display.
- Poor response from the accelerator pedal.
- Accelerator pedal (AP) is ignored when braking.
- Maximum vehicle speed reduced.

TROUBLESHOOTING ECM-P012200

CHECKING THE STATUS

Fig. 389: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on

  Check if the malfunction is permanent or intermittent by activating readout of the accelerator pedal position sensor's signals.

  Check that the value for both signals at unaffected accelerator pedal is approx. 8% and when the pedal is fully pressed down approx. 82%.

  If the signal is incorrect, this indicates that the malfunction is permanent. If the signal is correct, this indicates that the malfunction is intermittent and not active right now.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P012800: COOLANT THERMOSTAT (COOLANT TEMP BELOW THERMOSTAT REGULATING TEMPERATURE). GENERAL FAILURE

INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P012800

Condition

Checking of how the temperature increase proceeds takes place during the engine's warm-up phase. It is compared to the expected temperature increase, calculated according to load conditions and start temperature, among others.

If engine control module (ECM) registers that measured engine temperature deviates too much from the calculated, the diagnostic trouble code is generated.

The diagnostic trouble code is diagnosed once per operating cycle, with the engine running, when calculated engine temperature reaches 80 °C, but only if engine start is performed when measured engine temperature is between -10 and 63 °C.

Substitute Value

- Nothing.

Possible Source

- Damaged thermostat.
- Contact resistance and oxidation in cables and connections for the engine temperature sensor.
- Damaged engine temperature sensor.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.
- Engine does not get warm.

FAULT-TRACING

REPLACING THERMOSTAT

NOTE: **This diagnostic trouble code (DTC) is stored if the engine temperature sensor freezes. This may happen if the coolant level is low or there is too little glycol in the coolant. Check the coolant level and its freezing point.**

Engine control module (ECM) has registered that the actual temperature increase has deviated from the calculated temperature increase. This deviation is probably due to a damaged thermostat.

Check cables and connectors between engine control module (ECM) and engine temperature sensor for contact resistance and oxidation.

Remedy as necessary.

Other information

- see **SIGNAL SPECIFICATION**
- see **THERMOSTAT**
- see **ENGINE COOLANT TEMPERATURE SENSOR (ECT)**
- see **CHECKING WIRING AND TERMINALS**

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P013400: O2 CIRCUIT NO ACTIVITY DETECTED (BANK 1, SENSOR 1). GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P013400

Condition

Fig. 1: Identifying Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

Engine Control Module (ECM) checks the front heated oxygen sensor's signal (bank 1).

The engine cylinders are counted from the cylinder furthest away from the flywheel.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the heated oxygen sensor (HO2S) is not activated or is activated too slowly.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- Nothing.

Possible Source

- Contact resistance in the terminals
- Damaged front heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULT TRACING

see **FAULT TRACING**

ECM-P013400: O2 CIRCUIT NO ACTIVITY DETECTED (BANK 1, SENSOR 1). GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S5; 2011-2012)

ECM-P013400: HEATED OXYGEN SENSOR (HO2S) CIRCUIT NO ACTIVITY REGISTERED (BANK 1, SENSOR 1). GENERAL FAULT INFORMATION. NO INFORMATION ABOUT FAULT TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P013400

Condition

Fig. 2: Identifying Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

Engine Control Module (ECM) checks the front heated oxygen sensor's signal (bank 1).

The engine cylinders are counted from the cylinder furthest away from the flywheel.

- Bank 1 (cylinder row nearest the front): cylinders 1, 3, 5 and 7.
- Bank 2 (cylinder row furthest to the rear, nearest the passenger compartment): cylinders 2, 4, 6, and 8.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the heated oxygen sensor (HO2S) is not activated or is activated too slowly.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- Nothing.

Possible Source

- Contact resistance in the terminals
- Damaged front heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULT TRACING

see **FAULT TRACING**

ECM-P013600: HEATED OXYGEN SENSOR (HO2S) CIRCUIT (BANK 1, SENSOR 2). GENERAL FAULT INFORMATION. NO INFORMATION ABOUT FAULT TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P013600

Condition

Fig. 3: Identifying Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

Engine Control Module (ECM) measures the voltage difference between the rear heated oxygen sensor's (bank 1) max. value and min. value, and the difference must be greater than 0.3 V.

The engine cylinders are counted from the cylinder furthest away from the flywheel.

- Bank 1 (cylinder row nearest the front): cylinders 1, 3, 5 and 7.
- Bank 2 (cylinder row furthest to the rear, nearest the passenger compartment): cylinders 2, 4, 6, and 8.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that these parameters are not reached after approximately 5 minutes and the accumulated or actual probe preheating has reached its parameter.

The diagnostic trouble code (DTC) can be diagnosed approximately 5 minutes after start, if the oxygen sensor preheating is active and at least one fuel shut-off (at least 3 seconds) has been carried out.

Substitute Value

- Rear heated oxygen sensor (HO2S) control shut off.

Possible Source

- Contact resistance or oxidation in the terminals
- Damaged rear heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULT TRACING ECM-P013600

CHECKING COMPONENTS

CAUTION: Do not apply rust solvent spray or grease to the heated oxygen sensor (HO2S) connector.

Check the rear heated oxygen sensor connector (bank 1). Check for contact resistance and oxidation.

Try a new heated oxygen sensor (HO2S) if the above fault-tracing does not remedy the fault.

Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P013700: O2 CIRCUIT LOW VOLTAGE (BANK 1, SENSOR 2). GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION

(B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P013700

Condition

Fig. 10: Identifying Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) assumes two initial values for probe voltage, 0 V and 5 V.

If probe preheating is active and if at least one fuel shut-off (accelerator pedal released for at least 3 seconds) has been made, the rear heated oxygen sensor (bank 1) maximum value must have exceeded 0.6 V and the minimum value must have been below 0.1 V.

The engine cylinders are counted from the cylinder furthest away from the flywheel.

The diagnostic trouble code (DTC) is stored and the engine control module (ECM) interprets it as a fault if these parameters are not achieved after approximately 5 minutes and both the accumulated and actual heated oxygen sensor preheating have reached certain parameters.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- Rear heated oxygen sensor (HO2S) control shut off.

Possible Source

- The signal cable is short-circuited to ground.
- Open-circuit on the signal cable.
- Damaged rear heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P013A00 O2 SENSOR SLOW RESPONSE - RICH TO LEAN (BANK 1 AND SENSOR 2). GENERAL FAILURE INFORMATION. NO SUB TYPE

INFORMATION (B6324S5; 2011-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 32: Identifying Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the rear heated oxygen sensor (HO2S) signal (bank 1). The Engine control module (ECM) actively regulates between rich and lean fuel/air mixture and registers how well the rear heated oxygen sensor (HO2S) signal follows these changes.

The engine cylinders are counted from the cylinder furthest away from the flywheel.

- Bank 1 (cylinder row nearest the front): cylinders 1, 3, 5 and 7.
- Bank 2 (cylinder row furthest to the rear, nearest the passenger compartment): cylinders 2, 4, 6, and 8.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The heated oxygen sensor reacts too slowly at switch from rich to lean.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Special driving cases with fuel shut-offs.

Substitute Value

- None.

Possible Source

- Contact resistance or oxidation in the terminals.
- Damaged rear heated oxygen sensor (HO2S).

Fault symptom[s]

- Warning lights and chimes/Malfunction Indicator Light ("Check engine" light) indication/no indication

FAULT-TRACING

see **FAULT-TRACING**

see **FAULT-TRACING**

ECM-P015200: O2 CIRCUIT HIGH VOLTAGE (BANK 2, SENSOR 1). GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P015200

Condition

The Engine control module (ECM) measures the volume of oxygen in the exhaust gases before the three-way catalytic converter (TWC) using a front heated oxygen sensor (HO2S) (bank 2). The control module checks the direct voltage from the sensor.

NOTE: **Engine cylinders are counted starting from the right side of the vehicle, that is, the cylinder farthest from the engine's flywheel. Bank 1 (cylinder row nearest the front): cylinders 1, 3, 5 and 7. Bank 2 (cylinder row furthest to the rear, nearest the passenger compartment): cylinders 2, 4, 6, and 8.**

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The direct voltage is higher than 3.8 V.
- Incorrect value lasts longer than 5 seconds.
- Incorrect value lasts for 2 or more subsequent driving cycles.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Engine running for at least 2 minutes.

NOTE: **The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.**

Fig. 38: Identifying Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Contact resistance and oxidation in the terminals.
- Short-circuit to supply voltage in the signal cable.
- Damaged front heated oxygen sensor (bank 2).

Fault symptom[s]

- Malfunction indicator light (MIL), on
- Poor performance

FAULT-TRACING

see **FAULT-TRACING**

ECM-P015300: O2 CIRCUIT SLOW RESPONSE (BANK 2, SENSOR 1). GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P015300

Condition

Fig. 39: Identifying Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

Engine Control Module (ECM) checks the front heated oxygen sensor's signal (bank 2).

The engine cylinders are counted from the cylinder furthest away from the flywheel.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the heated oxygen sensor (HO2S) is not activated or is activated too slowly.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- Nothing.

Possible Source

- Contact resistance in the terminals
- Damaged front heated oxygen sensor (HO2S).

Fault symptom[s]

- Poor performance.
- Malfunction indicator lamp (MIL) lit.

FAULT TRACING

CHECKING THE STATUS

Fig. 40: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Start the engine to perform the diagnostic.

  Check whether the fault is permanent or intermittent. Read off the diagnostic trouble code (DTC) fault status when the diagnostic status is "Completed".

The fault is permanent if the fault status is "Fault found". The fault is intermittent if the fault status is "No fault found".

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P015700: O2 CIRCUIT LOW VOLTAGE (BANK 2, SENSOR 2). GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION

(B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P015700

Condition

Fig. 68: Identifying Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) is based on two initial sensor voltage values, 0 V and 5 V.

If probe preheating is active and if at least one fuel shut-off (accelerator pedal released for at least 3 seconds) has been made, the rear heated oxygen sensor (bank 2) maximum value must have exceeded 0.6 V and the minimum value must have been below 0.1 V.

The engine's cylinders are counted starting with the cylinder farthest from the engine's flywheel.

If these limit values are not reached after approx. 5 minutes and the accumulated as well as the current sensor preheating, respectively, have reached certain limit values, the engine control module (ECM) interprets this as a malfunction and generates the diagnostic trouble code.

The diagnostic trouble code can be diagnosed with the engine running.

Substitute Value

- Rear heated oxygen sensor control off.

Possible Source

- The signal cable is short-circuited to ground.
- Open circuit on the signal cable.
- Damaged rear heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator light (MIL) on.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P017068: FUEL TRIM (BANK 1). ALGORITHM BASED FAILURES. EVENT INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

NOTE: **This diagnostic trouble code (DTC) status is an event controlled diagnostic trouble code (DTC). An event controlled diagnostic trouble code (DTC) does not mean that there is a fault in the control module when it is active, but is designed as information.**

Engine control module (ECM) monitors the engine's heated oxygen sensor control. If the control module detects that heated oxygen sensor control is outside the limit values for a certain time when the engine is running, the diagnostic trouble code is generated.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- Nothing.

Possible Source

- This diagnostic trouble code (DTC) is not caused by a fault that needs to be remedied.

Fault symptom[s]

- None.

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-P017068: FUEL TRIM (BANK 1). ALGORITHM BASED FAILURES. EVENT INFORMATION (B6324S5; 2011-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-P017100: SYSTEM TOO LEAN (BANK 1). GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P017100

Condition

Engine Control Module (ECM) receives information from the heated oxygen sensor about fuel/air mixture in different load areas. If Engine Control Module (ECM) registers that fuel/air mixture deviates too much from target lambda, so that adaptations for bank 1 end up in any of its end-positions, the diagnostic trouble code is generated.

Substitute Value

- Nothing.

Possible Source

- Air leakage intake manifold.
- Air leakage, exhaust pipe.
- Low fuel pressure.
- Damaged mass air flow sensor.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.
- Poor performance.
- Engine misfires.
- High idle RPM.

FAULT-TRACING

PREPARATORY CHECKS

Check and note which adaption area for bank 1 is faulty by going through the list of adaption areas.

The adaptation value is considered outside normal range if it is lower than 0.85 (engine runs rich) or higher than 1.15 (engine runs lean).

HINT: The ranges consist of a table where the first digit in the name designates RPM range and the second load range.

HINT: Thus, range 1.1 designates a case with low RPM with low load, and 6.6 a case with high RPM and high load.

CHECKING SYSTEM

Fig. 91: Identifying Belt Routing
Courtesy of VOLVO CARS CORPORATION

HINT: If the fuel adaptations indicate too lean fuel/air mixture (adaptation value above 1.0) at idle, this indicates an air leak.

HINT: To find the problem, proceed as follows:

- Check the inlet system and exhaust system for leaks.

- Engine running.
- Check fuel pressure to, see if it is low.
- Ignition on
- Check residual pressure for too low residual pressure.

Remedy as necessary.

HINT: Normal fuel pressure at idle and warm engine shall be approx. 480 kPa.

HINT: The residual pressure when the engine is off and the ignition is on shall be approx. 100 kPa lower than during idle.

Other information

- Engine running.

Check and compare the calculated air mass with the actual air mass readout from the mass air flow sensor.

Try by measuring at different RPM.

HINT: Differences of more than approx. 20% between the signals indicate a malfunction of the mass air flow sensor.

HINT: Remedy as necessary.

NOTE: When replacing mass air flow sensor, repeat the check to verify that the problem has been solved with the replacement.

  Refer to **START ADAPTATIONS**

READOUT OF TOTAL FUEL COMPENSATION

Fig. 98: Identifying Belt Routing
Courtesy of VOLVO CARS CORPORATION

- Engine running.
- For reading out total fuel compensation at every given moment, use the VCT2000 (or appropriate scan tool).

  HINT: The readout value shows the short-term fuel trim's and the long-term fuel trim's total compensation of the injection time in real time.

HINT: Positive values indicate additional fuel, negative values indicate reduction of additional fuel.

Try by measuring at different RPM with different engine load.

NOTE: Keep in mind that the EVAP-valve's addition of fuel vapors affect the readout. For example, squeeze the hose between the EVAP-valve and inlet pipe to minimize addition of fuel from the EVAP-system.

Refer to **RESET ADAPTATIONS**

START ADAPTATIONS

Fig. 100: Identifying Belt Routing

Courtesy of VOLVO CARS CORPORATION

Test-drive the vehicle on road and drive a little in different operating situations for 20 minutes, in order to complete as many adaptations as possible.

Check and note if any adaptation range is still incorrect by scrolling through the list with adaptation ranges.

The adaptation value is considered outside normal range if it is lower than 0.85 or higher than 1.15.

HINT: Also, perform a few full throttle accelerations to perform the adaptations that are not affected by normal driving.

For adaptation to start, certain conditions must be fulfilled

- Engine speed > or = 600 RPM.
- Engine temperature between 80-110°C.
- Adaptation active = executed.
- EVAP-valve not active = 0 µs.

HINT: At high fuel vaporization the EVAP-valve is active longer time and then it may be necessary to disconnect the hose between the EVAP-valve and the canister.

ECM-P017100: SYSTEM TOO LEAN (BANK 1). GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P017100

Condition

Engine Control Module (ECM) receives information from the heated oxygen sensor about fuel/air mixture in different load areas. If Engine Control Module (ECM) registers that fuel/air mixture deviates too much from target lambda, so that adaptations for bank 1 end up in any of its end-positions, the diagnostic trouble code is generated.

Substitute Value

- Nothing.

Possible Source

- Too high ethanol content in fuel.
- Air leakage intake manifold.
- Air leakage, exhaust pipe.
- Low fuel pressure.
- Damaged mass air flow sensor.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.
- Poor performance.
- Engine misfires.
- High idle RPM.

TROUBLESHOOTING ECM-P017100

PREPARATORY CHECKS

Check and note which adaption area for bank 1 is faulty by going through the list of adaption areas.

The adaptation value is considered outside normal range if it is lower than 0.85 (engine runs rich) or higher than 1.15 (engine runs lean).

HINT: The ranges consist of a table where the first digit in the name designates RPM range and the second load range.

HINT: Thus, range 1.1 designates a case with low RPM with low load, and 6.6 a case with high RPM and high load.

Refer to **INFORMATION**

CHECKING ETHANOL CONTENT

Fig. 114: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

HINT: The cause of the symptom and/or diagnostic trouble code may be that the vehicle has been refuelled with incorrect fuel for that vehicle. The fuel system contains fuel with too high ethanol content.

The energy content in ethanol-diluted fuel is lower than in pure gasoline. This means that the control module compensates for the lower energy content, by increasing the injection volume, to be able to reach lambda=1 at the front heated oxygen sensor. This compensation is normally called "Front lambda control slow" or "Lambda integrator", and varies to compensate for the vehicle's status in the form of component spread, small air leaks, wear, etc. The value of this compensation in the ideal case is 1.0 for pure gasoline. Increased ethanol content of the fuel increases the compensation by approx. 0.05 per 10% ethanol dilution.

The control module is designed to handle an ethanol dilution up to 25%. In combination with other deviations from the ideal case, however, lower ethanol content may be enough to cause customer symptoms. This mainly occurs at engine start with cool engine at outdoor temperatures below 0 °C. Then the diagnostic trouble code may also be set for the engine running on too lean mixture.

NOTE: **In a vehicle intended for gasoline, only pure gasoline shall be used. Even if engine start/operation works, other fuel-related components in the vehicle may be damaged by too high ethanol content.**

- Measure the ethanol content of the fuel according to the instructions below.

  If measured ethanol content is above 25%, then ethanol dilution is the likely cause of the symptom and/or to the diagnostic trouble code being stored.

  If measured ethanol content is below 25%, symptoms and/or diagnostic trouble code may have been caused by earlier occurrence of incorrect fuel in the system for that vehicle.

  HINT: Check refuelling history by talking to customer.

  If nothing indicates incorrect fuel, neither now nor earlier, continue troubleshooting to check other possible causes of faults.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P017200: SYSTEM TOO RICH (BANK 1). GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P017200

Condition

Engine Control Module (ECM) receives information from the heated oxygen sensor about fuel/air mixture in different load areas. If Engine Control Module (ECM) registers that fuel/air mixture deviates too much from target lambda, so that adaptations for bank 1 end up in any of its end-positions, the diagnostic trouble code is generated.

Substitute Value

- Nothing.

Possible Source

- Clogged air filter.
- Oil level too high.
- Contaminated engine oil (gasoline mixed in oil).
- Leaking injectors.
- Leaking EVAP-valve
- High fuel pressure.
- Damaged mass air flow sensor.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.
- Poor performance.
- Engine misfires.

FAULT-TRACING

PREPARATORY CHECKS

Check and note which adaption area for bank 1 is faulty by going through the list of adaption areas.

The adaptation value is considered outside normal range if it is lower than 0.85 (engine runs rich) or higher than 1.15 (engine runs lean).

HINT: The ranges consist of a table where the first digit in the name designates RPM range and the second load range.

HINT: Thus, range 1.1 designates a case with low RPM with low load, and 6.6 a case with high RPM and high load.

  Refer to **CHECKING SYSTEM**

CHECKING SYSTEM

Fig. 116: Identifying Belt Routing
Courtesy of VOLVO CARS CORPORATION

- Check the air filter. Check for blockage.

HINT: If the fuel adaptations indicate too rich fuel/air mixture (adaptation value below 1.0) in several adaptation ranges, this indicates a fuel malfunction, e. g., too high fuel pressure.

HINT: To find the problem, proceed as follows:

- Check that the engine's oil level is not too high.

  HINT: The adaptations may show rich if several cold starts have been performed with short subsequent driving time, e. g., moving of vehicles, and the engine oil has thus been contaminated by gasoline. This affect on the adaptations disappears after a period of driving due to combustion of the fuel vapors by the engine.

  - Check the EVAP-valve for leakage.

  HINT: A valve that does not seal constantly leaks fuel vapors, which thus affect the adaptations.

- Engine running.
- Check fuel pressure for high fuel pressure.
- Ignition on
- Check residual pressure for too low residual pressure.

Remedy as necessary.

HINT: Normal fuel pressure at idle and warm engine shall be approx. 480 kPa.

HINT: The residual pressure when the engine is off and the ignition is on shall be approx. 100 kPa lower than during idle.

HINT: If the residual pressure is too low, one malfunction cause may be leaking (non-sealing) injectors, for example.

READOUT OF TOTAL FUEL COMPENSATION

Fig. 147: Identifying Belt Routing
Courtesy of VOLVO CARS CORPORATION

- Engine running.
- For reading out total fuel compensation at every given moment, use the VCT2000 (or appropriate scan tool).

  HINT: The readout value shows the short-term fuel trim's and the long-term fuel trim's total compensation of the injection time in real time.

HINT: Positive values indicate additional fuel, negative values indicate reduction of additional fuel.

Try by measuring at different RPM with different engine load.

NOTE: Keep in mind that the EVAP-valve's addition of fuel vapors affects the read-out. Squeeze the hose between the EVAP-valve and inlet pipe to minimize the addition of fuel from the EVAP-system.

Refer to **RESET ADAPTATIONS**

START ADAPTATIONS

Fig. 149: Identifying Belt Routing

Courtesy of VOLVO CARS CORPORATION

Test-drive the vehicle on road and drive a little in different operating situations for 20 minutes, in order to complete as many adaptations as possible.

Check and note if any adaptation range is still incorrect by scrolling through the list with adaptation ranges.

The adaptation value is considered outside normal range if it is lower than 0.85 or higher than 1.15.

HINT: Also, perform a few full throttle accelerations to perform the adaptations that are not affected by normal driving.

For adaptation to start, certain conditions must be fulfilled

- Engine speed > or = 600 RPM.
- Engine temperature between 80-110°C.
- Adaptation active = executed.
- EVAP-valve not active = 0 µs.

HINT: At high fuel vaporization the EVAP-valve is active longer time and then it may be necessary to disconnect the hose between the EVAP-valve and the canister.

see **FAULT-TRACING**

ECM-P017400: SYSTEM TOO LEAN (BANK 2). GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P017400

Condition

Engine Control Module (ECM) receives information from the heated oxygen sensor about fuel/air mixture in different load areas. If Engine Control Module (ECM) registers that fuel/air mixture deviates too much from target lambda, so that adaptations for bank 2 end up in any of its end-positions, the diagnostic trouble code is generated.

Substitute Value

- Nothing.

Possible Source

- Too high ethanol content in fuel.
- Air leakage intake manifold.
- Air leakage, exhaust pipe.
- Low fuel pressure.
- Damaged mass air flow sensor.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.
- Poor performance.
- Engine misfires.
- High idle RPM.

TROUBLESHOOTING ECM-P017400

PREPARATORY CHECKS

Fig. 151: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Check and note which adaption area for bank 2 is faulty by going through the list of adaption areas.

The adaptation value is considered outside normal range if it is lower than 0.85 (engine runs rich) or higher than 1.15 (engine runs lean).

HINT: The ranges consist of a table where the first digit in the name designates RPM range and the second load range.

HINT: Thus, range 1.1 designates a case with low RPM with low load, and 6.6 a case with high RPM and high load.

Fig. 152: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING ETHANOL CONTENT**

CHECKING SYSTEM

Fig. 153: Identifying Belt Routing
Courtesy of VOLVO CARS CORPORATION

HINT: If the fuel adaptations indicate too lean fuel/air mixture (adaptation value above 1.0) at idle, this indicates an air leak.

HINT: To find the problem, proceed as follows:

- Check the inlet system and exhaust system for leaks.

- Engine running.
- Check fuel pressure to, see if it is low.
- Ignition on
- Check residual pressure for too low residual pressure.

Remedy as necessary.

HINT: Normal fuel pressure at idle and warm engine shall be approx. 480 kPa.

HINT: The residual pressure when the engine is off and the ignition is on shall be approx. 100 kPa lower than during idle.

  Refer to **INFORMATION**

CHECKING ETHANOL CONTENT

Fig. 164: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

HINT: The cause of the symptom and/or diagnostic trouble code may be that the vehicle has been refuelled with incorrect fuel for that vehicle. The fuel system contains fuel with too high ethanol content.

The energy content in ethanol-diluted fuel is lower than in pure gasoline. This means that the control module compensates for the lower energy content, by increasing the injection volume, to be able to reach lambda=1 at the front heated oxygen sensor. This compensation is normally called "Front lambda control slow" or "Lambda integrator", and varies to compensate for the vehicle's status in the form of component spread, small air leaks, wear, etc. The value of this compensation in the ideal case is 1.0 for pure gasoline. Increased ethanol content of the fuel increases the compensation by approx. 0.05 per 10% ethanol dilution.

The control module is designed to handle an ethanol dilution up to 25%. In combination with other deviations from the ideal case, however, lower ethanol content may be enough to cause customer symptoms. This mainly occurs at engine start with cool engine at outdoor temperatures below 0 °C. Then the diagnostic trouble code may also be set for the engine running on too lean mixture.

NOTE: **In a vehicle intended for gasoline, only pure gasoline shall be used. Even if engine start/operation works, other fuel-related components in the vehicle may be damaged by too high ethanol content.**

- Measure the ethanol content of the fuel according to the instructions below.

  If measured ethanol content is above 25%, then ethanol dilution is the likely cause of the symptom and/or to the diagnostic trouble code being stored.

  If measured ethanol content is below 25%, symptoms and/or diagnostic trouble code may have been caused by earlier occurrence of incorrect fuel in the system for that vehicle.

  HINT: Check refuelling history by talking to customer.

  If nothing indicates incorrect fuel, neither now nor earlier, continue troubleshooting to check other possible causes of faults.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P017500: SYSTEM TOO RICH (BANK 2). GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P017500

Condition

Engine Control Module (ECM) receives information from the heated oxygen sensor about fuel/air mixture in different load areas. If Engine Control Module (ECM) registers that fuel/air mixture deviates too much from target lambda, so that adaptations for bank 2 end up in any of its end-positions, the diagnostic trouble code is generated.

Substitute Value

- Nothing.

Possible Source

- Clogged air filter.
- Oil level too high.
- Contaminated engine oil (gasoline mixed in oil).
- Leaking injectors.
- Leaking EVAP-valve
- High fuel pressure.
- Damaged mass air flow sensor.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.
- Poor performance.
- Engine misfires.

FAULT-TRACING

PREPARATORY CHECKS

Check and note which adaption area for bank 2 is faulty by going through the list of adaption areas.

The adaptation value is considered outside normal range if it is lower than 0.85 (engine runs rich) or higher than 1.15 (engine runs lean).

HINT: The ranges consist of a table where the first digit in the name designates RPM range and the second load range.

HINT: Thus, range 1.1 designates a case with low RPM with low load, and 6.6 a case with high RPM and

high load.

  Refer to **CHECKING SYSTEM**

CHECKING SYSTEM

Fig. 166: Identifying Belt Routing
Courtesy of VOLVO CARS CORPORATION

- Check the air filter. Check for blockage.

HINT: If fuel adaptations indicate too rich fuel/air mixture (adaptation value below 1.0) in several adaptation ranges, this indicates a fuel malfunction. The fault may be caused by too high fuel pressure

for example.

HINT: To find the problem, proceed as follows:

- Check that the engine's oil level is not too high.

  HINT: Adaptations may show rich fuel/air mixture if several cold starts with short subsequent driving time have been performed (e. g., moving cars) and thus the engine oil has been contaminated by gasoline. This affect on the adaptations disappears after driving for some time since the fuel vapors are combusted by the engine.

  - Check the EVAP-valve for leakage.

  HINT: A valve that does not seal constantly leaks fuel vapors, which thus affect the adaptations.

- Engine running.
- Check fuel pressure for high fuel pressure.
- Ignition on
- Check residual pressure for too low residual pressure.

Remedy as necessary.

HINT: Normal fuel pressure at idle and warm engine shall be approx. 480 kPa.

HINT: The residual pressure when the engine is off and the ignition is on shall be approx. 100 kPa lower than during idle.

HINT: If the residual pressure is too low, one malfunction cause may be leaking (non-sealing) injectors, for example.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P018000: FUEL TEMPERATURE SENSOR A CIRCUIT. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P018000

Condition

Engine control module (ECM) measures the temperature of the fuel in the fuel rail using a fuel temperature sensor. The control module checks the direct voltage from the sensor.

NOTE: The fuel pressure sensor and fuel temperature sensor are integrated in the same component.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The direct voltage is higher than 4.951 V.
- Incorrect value lasts longer than 5 seconds.
- Incorrect value lasts for 2 or more subsequent driving cycles.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 189: Identifying Fuel Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- The control module assumes that the fuel temperature is the same as the coolant temperature.

Possible Source

- Open-circuit in signal cable or ground lead.
- Contact resistance and oxidation in the terminals.
- Short-circuit to supply voltage in the signal cable.
- Damaged fuel temperature sensor.

Fault symptom[s]

- None.

The engine control module (ECM) checks the signal from the fuel temperature sensor.

The diagnostic trouble code (DTC) is stored if the control module detects that the value from the fuel temperature sensor deviates too much from the values for engine coolant and intake temperatures after the engine has been switched off for an extended period.

The diagnostic trouble code can be diagnosed at ignition on after the engine temperature has dropped by at least 55 °C from fully warm engine (higher than 70 °C).

Substitute Value

- The signal from the engine coolant temperature (ECT) sensor is used.

Possible Source

- Contact resistance in the connectors.
- Damaged fuel temperature sensor.

Fault symptom[s]

- Nothing.

FAULT TRACING

CHECKING THE STATUS

Fig. 191: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start the engine.

  Check whether the fault is permanent or intermittent by reading the signal of the fuel temperature sensor. Check that the value is feasible.

  HINT: The signal is measured in the injector delivery pipe and is thus affected by engine temperature.

  If the value is not feasible, the fault is permanent. If the value is feasible, the fault is intermittent and not currently active.

The engine control module (ECM) checks the signal from the fuel temperature sensor.

The diagnostic trouble code (DTC) is stored if the control module detects that the value from the fuel temperature sensor deviates too much from the values for engine coolant and intake temperatures after the engine has been switched off for an extended period.

The diagnostic trouble code (DTC) is diagnosed once per operating cycle when the ignition is switched on, but only when the engine temperature has dropped by approximately 60°C from operating temperature (higher than 70°C) since the previous operating cycle.

Substitute Value

- The signal from the engine coolant temperature (ECT) sensor is used.

Possible Source

- Contact resistance in the connectors.
- Damaged fuel temperature sensor.

Fault symptom[s]

- Nothing.

FAULT TRACING

CHECKING THE STATUS

Fig. 200: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start the engine.

  Check whether the fault is permanent or intermittent by reading the signal of the fuel temperature sensor. Check that the value is feasible.

  HINT: The signal is measured in the injector delivery pipe and is thus affected by engine temperature.

  If the value is not feasible, the fault is permanent. If the value is feasible, the fault is intermittent and not currently active.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P018200: FUEL TEMPERATURE SENSOR A CIRCUIT LOW INPUT. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION

(B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P018200

Condition

Engine control module (ECM) measures the temperature of the fuel in the fuel rail using a fuel temperature sensor. The control module checks the direct voltage from the sensor.

NOTE: The fuel pressure sensor and fuel temperature sensor are integrated in the same component.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The direct voltage is lower than 0.4 V.
- Incorrect value lasts longer than 5 seconds.
- Incorrect value lasts for 2 or more subsequent driving cycles.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 208: Identifying Fuel Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- The control module assumes that the fuel temperature is the same as the coolant temperature.

Possible Source

- Contact resistance and oxidation in the terminals.
- Short-circuit to ground in the signal cable.
- Damaged fuel temperature sensor.

Fault symptom[s]

- None.

FAULT TRACING ECM-P019200

CHECKING THE STATUS

Fig. 250: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start and run the engine to operating temperature.

  Check whether the fault is permanent or intermittent by reading off the signal from the fuel pressure sensor. Check that the value is within its permitted range. The value must be 480 ±5 kPa when idling, with the engine at operating temperature and in neutral. The pressure must drop with the ignition off.

  The fault is permanent if the value is not within its permitted range. If the value is within its permitted

range, this indicates that the fault is intermittent and not presently active.

ECM-P019300: FUEL RAIL PRESSURE SENSOR HIGH INPUT. GENERAL FAULT INFORMATION. NO INFORMATION ABOUT FAULT TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P019300

Condition

Fig. 260: Identifying Fuel Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

The Engine control module (ECM) monitors the fuel pressure in the fuel rail using the fuel pressure sensor.

The diagnostic trouble code (DTC) is stored if the Engine Control Module (ECM) detects that the signal from the fuel pressure sensor is too high.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- The fuel pressure is set to a constant.
- The control signal to the fuel pump (FP) control module is set to a calculated value.

Possible Source

- The signal cable is short-circuited to voltage.
- Open-circuit in the signal cable.
- Damaged fuel pressure sensor.

Fault symptom[s]

- Malfunction indicator light (MIL), on
- Engine misfires.

FAULT TRACING ECM-P019300

CHECKING THE STATUS

Fig. 261: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start and run the engine to operating temperature.

  Check whether the fault is permanent or intermittent by reading off the signal from the fuel pressure sensor. Check that the value is within its permitted range. The value must be 480 ±5 kPa when idling, with the engine at operating temperature and in neutral. The pressure must drop with the ignition off.

The fault is permanent if the value is not within its permitted range. If the value is within its permitted range, this indicates that the fault is intermittent and not presently active.

Fig. 262: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Fig. 263: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 264: Disconnecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the engine control module (ECM).

  Check the signal cable with regard to short circuit to supply voltage. Check the signal cable with regard to open circuit.

  Take readings between control module terminal #A71 (#B11) and fuel pressure sensor terminal #4.

  Remedy as necessary.

  Other information

  - see **CONNECTING THE BREAKOUT BOX**

- see **SIGNAL SPECIFICATION, ENGINE CONTROL MODULE (ECM)**
- see **FUEL PRESSURE AND TEMPERATURE SENSOR, REPLACING**

  Refer to **VERIFICATION**

VERIFICATION

VERIFICATION

HINT: After repairing, it is necessary to check that the malfunction has been fixed.

Fig. 267: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 268: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reconnect the connectors, components, etc.
- Start and warm up the engine.
- Read off the fuel pressure sensor's signal.

  Check that the fuel pressure sensor's signal is correct. The value shall be 480 ± 5 kPa at idle, neutral and warm engine. The pressure shall drop at ignition off.

Is the function OK?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P020100: CYLINDER 1 INJECTOR CIRCUIT / OPEN. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P020100

Condition

Engine control module (ECM) controls injection time and injection timing by controlling the injectors' opening and closing. Control is performed by pulsating grounding of the signal line to respective valve. The control module checks the signal's shape and amplitude at opening and closing.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The signal's shape and amplitude do not follow expected signal.
- Incorrect value in more than 20 of 400 pulses.
- Incorrect value lasts for 2 or more subsequent driving cycles.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Engine running.

NOTE: **The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.**

Fig. 270: Identifying Fuel Injector
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- The control module blocks heated oxygen sensor control.

Possible Source

- Contact resistance and oxidation in the terminals.
- Short-circuit to supply voltage in the signal cable.
- Open-circuit in the signal cable.
- Open-circuit in the power supply cable.
- Damaged injector.

Fault symptom[s]

- Malfunction indicator light (MIL), on
- Engine does not fire on all cylinders
- Cranking motor running but engine does not start

FAULT-TRACING

see **FAULT-TRACING**

ECM-P020100: INJECTOR CYLINDER 1 OPEN-CIRCUIT. GENERAL FAULT INFORMATION. TYPE OF FAULT NOT SPECIFIED. (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 271: Identifying Fuel Injector
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) regulates the injection period and the injection time by controlling the opening/closing of the injectors.

The diagnostic trouble code (DTC) is stored if the control module detects that the control signal for the injector is too high, too low or if the signal is missing. The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

The diagnostic trouble code (DTC) indicates which injector valve is being referred to:

- ECM-P020100, injector valve cylinder 1.
- ECM-P020200, injector valve cylinder 2.
- ECM-P020300, injector valve cylinder 3.
- ECM-P020400, injector valve cylinder 4.
- ECM-P020500, injector valve cylinder 5.
- ECM-P020600, injector valve cylinder 6.
- ECM-P020700, injector valve cylinder 7.
- ECM-P020800, injector valve cylinder 8.

Substitute Value

- Fuel trim disabled.

Possible Source

- Contact resistance and oxidation in the injector valve connector.
- The signal cable is short-circuited to voltage.
- Open-circuit on the signal cable.
- Open-circuit in the power supply cable.
- Damaged injector valve.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.
- The engine is not firing on all cylinders.
- The starter motor turns but the engine does not start.

FAULT TRACING

CHECKING COMPONENTS AND WIRING

HINT: Engine cylinders are counted starting from the right-hand side of the vehicle, that is to say the cylinder farthest from the engine flywheel.

- Bank 1 (cylinder row nearest the front): cylinders 1, 3, 5 and 7.
- Bank 2 (cylinder row furthest to the rear, nearest the passenger compartment): cylinders 2, 4, 6, and 8.

HINT: If the engine does not start or if diagnostic trouble codes are stored for all the injectors, check the fuse. If the fuse is blown, check the circuit for short-circuit to supply voltage.

Fig. 272: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 273: Disconnecting Connector
Courtesy of VOLVO CARS CORPORATION

- Check the resistance of the injector to which the diagnostic trouble code refers.
- Ignition off
- Disconnect the engine control module (ECM).

  Check for contact resistance and oxidation on the injector connector to which the diagnostic trouble code refers.

  Check the power cable for open-circuit. Measure between the system relay and terminal #2 of the injector to which the diagnostic trouble code refers.

  Check the power cable to which the diagnostic trouble code refers for open-circuit as well as short-circuit to supply voltage and ground.

Measure between:

- Control module terminals #A79 (#B19) and #1 for injector 1 (ECM-P020100).
- Control module terminals #A78 (#B18) and #1 for injector 2 (ECM-P020200).
- Control module terminals #A81 (#B21) and #1 for injector 3 (ECM-P020300).
- Control module terminals #A80 (#B20) and #1 for injector 4 (ECM-P020400).
- Control module terminals #A83 (#B23) and #1 for injector 5 (ECM-P020500).
- Control module terminals #A82 (#B22) and #1 for injector 6 (ECM-P020600).
- Control module terminals #A85 (#B25) and #1 for injector 7 (ECM-P020700).
- Control module terminals #A84 (#B24) and #1 for injector 8 (ECM-P020800).

Activate the injector using the VCT2000 (or appropriate scan tool). The injector should make a clicking noise upon activation.

Remedy as necessary.

ECM-P022023: THROTTLE/PEDAL POSITION SWITCH B CIRCUIT. GENERAL SIGNAL FAILURES. SIGNAL STUCK LOW (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P022023

Condition

The engine control module (ECM) checks the pulse width modulation (PWM) signal and the analog signal from the accelerator pedal (AP) position sensor. The analog signal is directly connected to the Central electronic module (CEM) and the signal is transmitted via CAN communication to the Engine control module (ECM). The pulse width modulation (PWM) signal is directly connected to the engine control module (ECM).

The PWM signal is used to determine the current accelerator pedal position in a fault free system.

The Engine control module (ECM) checks the analog signal (via CAN).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Analog signal (via CAN) is too low.
- Incorrect value lasts longer than 16 seconds.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: **The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.**

Fig. 285: Identifying Accelerator Pedal Position Sensor
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- The control module uses the accelerator pedal position corresponding to the released position when the brake pedal is depressed at the same time.

Possible Source

- Fault-trace the central electronic module (CEM).

Fault symptom[s]

- Message in information display
- Accelerator pedal ignored during braking

ECM-P022100: THROTTLE/PEDAL POSITION SWITCH B CIRCUIT WITHIN/OUTSIDE RANGE. GENERAL FAULT INFORMATION. NO INFORMATION ABOUT FAULT TYPE. (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P022100

Condition

Fig. 288: Identifying Accelerator Pedal Position Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) receives a pulse width modulation (PWM) signal and an analog signal from the accelerator pedal position sensor. In a fault-free system, the analog signal is used to determine the position of the accelerator pedal (AP).

The diagnostic trouble code is stored if the control module registers an incorrect pulse width modulation (PWM) signal.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Acceleration is ignored when braking.

Possible Source

- Loose connections or contact resistance in the connections on the pulse width modulation (PWM) signal cable.
- Interference on the pulse width modulation (PWM) signal cable.
- Damaged accelerator pedal (AP) position sensor.

Fault symptom[s]

- Message in the display.
- Poor response from the accelerator pedal.
- Accelerator pedal (AP) is ignored when braking.
- Maximum vehicle speed reduced.

TROUBLESHOOTING ECM-P022100

CHECKING THE STATUS

Fig. 289: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on

Check if the malfunction is permanent or intermittent by activating readout of the accelerator pedal position sensor's signals.

Check that the value for both signals at unaffected accelerator pedal is approx. 8% and when the pedal is fully pressed down approx. 82%.

If the signal is incorrect, this indicates that the malfunction is permanent. If the signal is correct, this indicates that the malfunction is intermittent and not active right now.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P022200: THROTTLE/PEDAL POSITION SENSOR B CIRCUIT LOW INPUT SIGNAL. GENERAL FAULT INFORMATION. NO INFORMATION

ABOUT FAULT TYPE. (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P022200

Condition

Fig. 298: Identifying Accelerator Pedal Position Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) receives a pulse width modulation (PWM) signal and an analog signal from the accelerator pedal position sensor. In a fault-free system, the analog signal is used to determine the position of the accelerator pedal (AP).

The diagnostic trouble code (DTC) is stored if the control module registers that the pulse width modulation (PWM) signal is too low.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Acceleration is ignored when braking.

Possible Source

- The signal cable is short-circuited to voltage.
- Open-circuit on the signal cable.
- Interruption of power supply.
- Open circuit in ground cable.
- Damaged accelerator pedal (AP) position sensor.

Fault symptom[s]

- Message in the display.
- Poor response from the accelerator pedal.
- Accelerator pedal (AP) is ignored when braking.
- Maximum vehicle speed reduced.

TROUBLESHOOTING ECM-P022200

CHECKING THE STATUS

Fig. 299: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on

  Check if the malfunction is permanent or intermittent by activating readout of the accelerator pedal position sensor's signals.

  Check that the value for both signals at unaffected accelerator pedal is approx. 8% and when the pedal is fully pressed down approx. 82%.

  If the signal is incorrect, this indicates that the malfunction is permanent. If the signal is correct, this indicates that the malfunction is intermittent and not active right now.

- **Continue**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Check the cable between engine control module (ECM) #B28 (#C28) and accelerator pedal position sensor #2 for short-circuit to voltage, also check for open circuit.

Check voltage feed to the accelerator pedal position sensor #1 for open circuit.

Check the ground cable from the accelerator pedal position sensor #3 for open circuit.

Remedy as necessary.

Other information

- see **CONNECTING THE BREAKOUT BOX**
- see **SIGNAL SPECIFICATION, ENGINE CONTROL MODULE (ECM)**
- For replacing accelerator pedal position sensor: **ACCELERATOR PEDAL (AP), REPLACING**

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P029C68 CYLINDER 1 BALANCE - INJECTOR RESTRICTED. ALGORITHM BASED FAILURES. EVENT INFORMATION (B6324S; 2007-

2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P029C68

Condition

The Engine control module (ECM) continually monitors the engine's exhaust gases from the oxygen content in the exhaust gases (the lambda value).

Using the built-in functions, the control module can determine the lambda value for each cylinder individually.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The discrepancy in the lambda value between the cylinders in bank 1 (cyl. 1-3) is too great to be compensated using individual fuel trim.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Individual cylinder fuel trim active.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Substitute Value

- Individual cylinder fuel trim is deactivated.

Possible Source

- Mechanical fault causes in the engine.

Fault symptom[s]

- None.

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-P02A068 CYLINDER 2 BALANCE - INJECTOR RESTRICTED. ALGORITHM BASED FAILURES. EVENT INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P02A068

Condition

The Engine control module (ECM) continually monitors the engine's exhaust gases from the oxygen content in the exhaust gases (the lambda value).

Using the built-in functions, the control module can determine the lambda value for each cylinder individually.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The Engine control module (ECM) detects that the deviation in the lambda value between the cylinders in bank 2 (cyl. 4-6) is too great to compensate using individual fuel trim.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Individual cylinder fuel trim active.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Substitute Value

- Individual cylinder fuel trim is deactivated.

Possible Source

- Mechanical fault causes in the engine.

Fault symptom[s]

- None.

ECM-P02A468 CYLINDER 3 BALANCE - INJECTOR RESTRICTED. ALGORITHM BASED FAILURES. EVENT INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P02A468

Condition

The Engine control module (ECM) continually monitors the engine's exhaust gases from the oxygen content in the exhaust gases (the lambda value).

Using the built-in functions, the control module can determine the lambda value for each cylinder individually.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The front heated oxygen sensor (bank 1) has become too slow to be used in cylinder individual fuel trim.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Individual cylinder fuel trim active.

NOTE: **The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.**

Substitute Value

- Individual cylinder fuel trim is deactivated.

Possible Source

- Mechanical fault causes in the engine.

Fault symptom[s]

- None.

ECM-P030000: RANDOM MISFIRE DETECTED. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P030000

Condition

The engine control module (ECM) checks engine combustion regarding misfire by registering speed deviations in flywheel rotation. If a certain number of misfires are detected for several cylinders during a certain number of crankshaft rotations, the misfires are considered emission-related or capable of damaging the catalytic converter and the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed when the engine is running.

Substitute Value

- Nothing.

Possible Source

- Low fuel level.
- Repeated cold starts where the engine temperature does not reach proper operating temperature between starts.

- Water in spark plug wells.
- Damaged spark plug.
- Dirty or damaged cam profile solenoid (CPS).
- Dirty or damaged valve depressor.
- Contaminated or wrong fuel.
- Wrong fuel grade (summer fuel in the winter, certain markets).
- Air leakage.
- Blocked crankcase ventilation.
- Damaged VVT-unit.
- Clogged/leaking injector.
- Faulty fuel pressure.
- Uneven compression.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.
- Malfunction indicator lamp (MIL) flashes.
- Engine misfire.
- Engine reluctant to start.
- Poor performance.
- Uneven idle.
- The engine does not run on all cylinders.
- Message in the display.

FAULT-TRACING

CHECKING THE FUEL INJECTION SYSTEM, IGNITION SYSTEM AND COMPONENTS

NOTE: In the event of diagnostic trouble codes (DTCs), that affect camshaft control or camshaft reset valve, these must be fault-traced first.

HINT: Engine cylinders are counted starting from the right side of the vehicle, that is, the cylinder farthest from the engine's flywheel.

HINT: The cause of misfiring does not necessarily have to be associated to the specific identified cylinder. The cause may sometimes be traced to previous cylinder/cylinders (counted in firing order) or to components connected per bank and thus to several cylinders.

Check the fuel level in the tank.

Check that the engine oil level is correct.

Check for moisture in the electrical terminals for the ignition coils and in the spark plug well.

Check the spark plugs. Search for damage to the insulation and other damage.

Check cam profile solenoid and valve depressor for dirt and damages.

Check the engine intake system for air leakage.

Check the function of the crankcase ventilation.

Check the fuel pressure and residual pressure.

Check the compression of the engine.

HINT: Read off the misfire counter using the VCT2000 (or appropriate scan tool).

Remedy as necessary.

Other information

- see **CONTROL MODULE FUEL PUMP (FP), REPLACING**
- see **IGNITION COIL**

FAULT TRACING

CHECKING THE FUEL INJECTION SYSTEM, IGNITION SYSTEM AND COMPONENTS

NOTE: In the event of diagnostic trouble codes (DTCs), that affect camshaft control or camshaft reset valve, these must be fault-traced first.

HINT: The engine cylinders are counted from the cylinder furthest away from the flywheel.

- Bank 1 (cylinder row nearest the front): cylinders 1, 3, 5 and 7.
- Bank 2 (cylinder row furthest to the rear, nearest the passenger compartment): cylinders 2, 4, 6, and 8.

Check the fuel level in the tank.

Check that the engine oil level is correct.

Check for moisture in the electrical terminals for the ignition coils and in the spark plug well.

Check the spark plugs. Search for damage to the insulation and other damage.

Check the engine intake system for air leakage.

Check the fuel pressure and residual pressure.

Check the compression of the engine.

HINT: Read off the misfire counter using the VCT2000 (or appropriate scan tool).

Remedy as necessary.

ECM-P032600: KNOCK SENSOR 1 CIRCUIT RANGE/PERFORMANCE

(BANK 1). GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P032600

Condition

Fig. 326: Identifying Knock Sensor (KS) Connector
Courtesy of VOLVO CARS CORPORATION

The knock sensor signal varies with engine speed. The engine control module (ECM) checks that the knock sensor signal is within certain limits, which are determined by engine speed. The diagnostic trouble code is generated if the signal from the knock sensor is not within the limit values.

The diagnostic trouble code can be diagnosed during a road test.

The diagnostic trouble code refers to knock sensor 1.

Substitute Value

- Ignition angle reduction for reasons of safety.
- Knock control is blocked.

Possible Source

- Contact resistance or oxidation in the knock sensor connector.
- Improperly installed knock sensor.
- Damaged knock sensor.

Fault symptom[s]

- Poor performance.

FAULT-TRACING

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 332: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 333: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reconnect the connectors, components, etc.
- Start the engine.
- Test drive the car on the road in different driving conditions with high and low loads so that the engine control module (ECM) can carry out diagnostics.
- Connect VCT2000 (or appropriate scan tool) to the data link connector **without switching off the engine.**
- Read the diagnostic status and fault status for the diagnostic trouble code by selecting the diagnostic trouble code in the list.

NOTE: **If the engine is switched off, the stored fault status will be erased and the test drive will have to be repeated.**

Check the fault status for the diagnostic trouble code when the scan is "Implemented". When the function is correct the fault status should be "No fault found" when the scan is implemented.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P032700: KNOCK SENSOR 1 CIRCUIT LOW INPUT (BANK1). GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P032700

Condition

Engine control module (ECM) monitors combustion knock from the engine to, when needed, adjust the ignition and thus prevent continued knock. Monitoring is performed with two knock sensors located on the engine block between the cylinder rows. The control module checks the direct voltage from the sensors.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The direct voltage is lower than 1.25 V.
- Incorrect value lasts longer than 26 seconds.
- Incorrect value lasts for 2 or more subsequent driving cycles.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 335: Identifying Knock Sensor
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- The control module reduces the ignition angle.

- The control module blocks knock control.

Possible Source

- Contact resistance and oxidation in the terminals.
- Short-circuit to ground in the signal cable.
- Damaged knock sensor (KS).

Fault symptom[s]

- Poor performance

FAULT-TRACING

ECM-P032700: KNOCK SENSOR 1 CIRCUIT LOW INPUT SIGNAL (BANK 1). GENERAL FAULT INFORMATION. TYPE OF FAULT NOT SPECIFIED. (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P032700

Condition

Fig. 336: Identifying Knock Sensor (KS) Connector
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) uses the signal from the knock sensors to detect combustion knocks in the cylinders. The diagnostic trouble code is generated if the control module detects that the signal from the knock sensor is lower than its normal signal interval for a certain period of time.

The diagnostic trouble code can be diagnosed when the ignition is on.

The diagnostic trouble code refers to knock sensor 1.

HINT: Knock sensor 1detects knocking on cylinders 5, 6, 7 and 8.

Substitute Value

- Ignition angle reduction for reasons of safety.
- Knock control blocked.

Possible Source

- The signal cable is short-circuited to ground.
- Damaged knock sensor.

Fault symptom[s]

- Poor performance.

FAULT TRACING

CHECKING COMPONENTS AND WIRING

HINT: Knock sensor 1detects knocking on cylinders 5, 6, 7 and 8.

HINT: Knock sensor 2 detects knocking on cylinders 1, 2, 3 and 4.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P033100: KNOCK SENSOR 2 CIRCUIT RANGE/PERFORMANCE (BANK 2). GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P033100

Condition

Fig. 353: Identifying Knock Sensor (KS) Connector
Courtesy of VOLVO CARS CORPORATION

The knock sensor signal varies with engine speed. The engine control module (ECM) checks that the knock sensor signal is within certain limits, which are determined by engine speed. The diagnostic trouble code is generated if the signal from the knock sensor is not within the limit values.

The diagnostic trouble code can be diagnosed during a road test.

The diagnostic trouble code refers to knock sensor 2.

Substitute Value

- Ignition angle reduction for reasons of safety.

Possible Source

- Contact resistance or oxidation in the connector for the knock sensor (KS).
- Loosely installed knock sensor (KS).
- Damaged knock sensor (KS).

Fault symptom[s]

- Poor performance.

CHECKING THE STATUS

Fig. 361: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start the engine.

  Read the diagnostic status and fault status for the diagnostic trouble code by selecting the diagnostic trouble code in the list.

  Increase the engine speed a few times until the diagnosis is "Completed".

Check whether the fault is permanent or intermittent by reading the fault status of the trouble code when the diagnostic status is "Completed".

If the fault status is "Fault found", the fault is permanent. If the fault status is "No fault found", the fault is intermittent and not currently active.

NOTE: The fault status cannot switch from "Fault found" to "No fault found" within the same operating cycle.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P033600

Condition

Fig. 380: Detecting The Reference Positions Of The Camshaft
Courtesy of VOLVO CARS CORPORATION

The signal sent by the engine speed sensor to the engine control module (ECM) provides information on the number of teeth in the flywheel/number of holes in the carrier plate that has passed the engine speed sensor. The control module uses the signal to calculate engine speed. The diagnostic code is generated if via the engine speed sensor signal the control module detects an incorrect number of teeth on the flywheel/holes in the carrier plate for a certain number of crankshaft revolutions.

The diagnostic trouble code can be diagnosed by the control module when engine speed exceeds 1000 RPM.

Substitute Value

- Signal from the camshaft position sensor.

Possible Source

- Contact resistance or oxidation in the engine speed sensor connector.
- Engine speed (RPM) sensor fitted incorrectly.
- Damage to flywheel/carrier plate.
- Damaged engine speed (RPM) sensor

Fault symptom[s]

- Nothing.

FAULT TRACING ECM-P033600

CHECKING THE STATUS

Fig. 381: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start the engine.

  Read the diagnostic status and fault status for the diagnostic trouble code by selecting the diagnostic trouble code in the list.

  Increase the engine speed a few times until the diagnosis is "Completed".

  Check whether the fault is permanent or intermittent by reading the fault status of the trouble code when the diagnostic status is "Completed".

  If the fault status is "Fault found", the fault is permanent. If the fault status is "No fault found", the fault is intermittent and not currently active.

NOTE: **The fault status cannot switch from "Fault found" to "No fault found" within the same operating cycle.**

CHECKING COMPONENTS AND WIRING

Fig. 383: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 384: Disconnecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off

  Check the engine speed sensor connections for contact resistance and oxidation.

  Check that the engine speed sensor is properly installed and in the correct position.

  HINT: The engine speed sensor and its cables are sensitive to disruptions from nearby cables, such as the starter motor cable or a similar cable with a high current rating.

  Check if a cable with high current consumption is improperly installed, that is to say lies too close to the engine speed sensor or its cables.

  HINT: The cause of this diagnostic trouble code can also be damage to the flywheel reference holes

for the engine speed sensor.

Remedy as necessary.

ECM-P034600: CAMSHAFT POSITION SENSOR A CIRCUIT WITHIN/EXCEEDING LIMIT VALUES (BANK 2). GENERAL FAULT INFORMATION. TYPE OF FAULT NOT SPECIFIED. (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P034600

Condition

Fig. 427: Detecting Camshaft Flanks On Sensor
Courtesy of VOLVO CARS CORPORATION

The camshaft is divided into a number of segments (flanks). The camshaft houses a gearwheel with a number of teeth (the teeth are positioned between each segment) that are read by the engine control module (ECM) via the camshaft position sensor.

The diagnostic trouble code can be diagnosed by the control module when the engine is running and engine speed exceeds a certain value.

The diagnostic trouble code (DTC) corresponds to intake camshaft position (CMP) sensor, bank 2.

Substitute Value

- Engine speed sensor signal.

Possible Source

- Intermittent fault in the cable harness or connectors.
- Camshaft sensor fitted incorrectly.
- Damaged mass air flow sensor.

Fault symptom[s]

- Nothing.

FAULT TRACING

ECM-P034900: CAMSHAFT POSITION SENSOR A CIRCUIT INTERMITTENT (BANK 2). GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P034900

Condition

Fig. 428: Detecting Camshaft Flanks On Sensor
Courtesy of VOLVO CARS CORPORATION

The camshaft houses a gearwheel with a number of teeth (the teeth are positioned between each segment) that are read by the engine control module (ECM) via the camshaft position sensor. The diagnostic trouble code is generated if the control module detects too few segments for a certain number of crankshaft revolutions.

The diagnostic trouble code can be diagnosed by the control module when the engine is running and engine speed exceeds a certain value.

Substitute Value

- Engine speed sensor signal.

Possible Source

- Open-circuit on the signal cable.
- The signal cable is short-circuited to ground.
- The signal cable is short-circuited to voltage.
- Damaged mass air flow sensor.

Fault symptom[s]

- Nothing.

ENGINE PERFORMANCE

Ignition And Control Systems - Diagnostic Trouble Codes and Associated Procedures

ECM-P035100: IGNITION COIL A PRIMARY/SECONDARY CIRCUIT. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P035100

Condition

Engine control module (ECM) controls the ignition coils so that spark occurs at the right time. The control module checks the ignition coils' function using a separate diagnostic line.

The control module also checks the direct voltage on the signal line from the ignition coil.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The signal in the diagnostics line indicates malfunction, or that direct voltage in the signal line is considered too high or too low.
- Incorrect value lasts longer than 9 seconds.
- Incorrect value lasts for 2 or more subsequent driving cycles.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Engine running.

NOTE: **The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.**

Fig. 1: Identifying Ignition Coil
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- The control module blocks heated oxygen sensor control.

Possible Source

- Contact resistance and oxidation in the terminals.
- Short-circuit to supply voltage in the signal cable.
- Short-circuit to ground in the signal cable.
- Open-circuit in the signal cable.
- Open-circuit in the power supply cable.
- Diagnostics line short-circuited to voltage.
- Diagnostics line short-circuited to ground.
- Open-circuit on the diagnostic cable.
- Damaged ignition coil.

Fault symptom[s]

- Engine misfires

FAULT-TRACING

ECM-P035100: IGNITION COIL A, PRIMARY/SECONDARY CIRCUIT. GENERAL FAULT INFORMATION. TYPE OF FAULT NOT SPECIFIED. (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 2: Identifying Ignition Coil
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) regulates the ignition coils and checks their function via a separate diagnostic cable. The diagnostic trouble code is generated if the control module detects that the signal for an ignition coil is faulty.

The diagnostic trouble code can be diagnosed when the engine is running.

The trouble code indicates which ignition coil is involved.

- ECM-P035100, ignition coil cylinder 1.
- ECM-P035200, ignition coil cylinder 2.
- ECM-P035300, ignition coil cylinder 3.
- ECM-P035400, ignition coil cylinder 4.
- ECM-P035500, ignition coil cylinder 5.
- ECM-P035600, ignition coil cylinder 6.
- ECM-P035700, ignition coil cylinder 7.
- ECM-P035800, ignition coil cylinder 8.

Substitute Value

- Closed loop blocked.

Possible Source

- Contact resistance and oxidation in the ignition coil connector.
- The signal cable is short-circuited to ground or supply voltage.
- Open-circuit on the signal cable.
- Open-circuit in the power supply cable.
- The diagnostic cable is short-circuited to ground or supply voltage.
- Open-circuit on the diagnostic cable.
- Damaged ignition coil.

Fault symptom[s]

- Engine misfire.

FAULT TRACING

CHECKING COMPONENTS AND WIRING

Fig. 3: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 4: Disconnecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off

  HINT: The engine cylinders are counted from the right-hand side of the vehicle. I. E. the cylinder furthest away from the flywheel.

  - Bank 1 (cylinder row nearest the front): cylinders 1, 3, 5 and 7.
  - Bank 2 (cylinder row furthest to the rear, nearest the passenger compartment): cylinders 2, 4, 6, and 8.

  HINT: If diagnostic trouble codes (DTCs) are stored for all ignition coils, the most probable fault cause is a faulty diagnostic cable or power supply cable for the ignition coils. If the diagnostic trouble code (DTC) is stored for an individual ignition coil, the most probable cause is a faulty signal cable or ignition coil.

Check the ignition coil connector. Check for contact resistance and oxidation.

Disconnect the engine control module (ECM).

Check the diagnostic cables between the control module and the diagnostic trouble codes (DTC) relevant camshaft position sensor. Check for a short-circuit to ground. Check for a short-circuit to supply voltage. Check for an open-circuit.

Measure between:

- For ignition coils cylinder 2, 3, 5 and 8: control module terminal #A62 (#B2) and relevant ignition coil terminal #2.
- For ignition coils cylinder 1, 4, 6 and 7: control module terminal #A64 (#B4) and relevant ignition coil terminal #2.

Check the voltage supply cable between the system relay and the relevant ignition coil terminal #1. Check for a short-circuit to ground. Check for an open-circuit.

Check the diagnostic trouble code (DTC) relevant signal cable. Check for a short-circuit to ground. Check for a short-circuit to supply voltage. Check for an open-circuit.

Measure between:

- Control module #A60 (#A60) and #4 for ignition coil cylinder 1.
- Control module #A61 (#B1) and #4 for ignition coil cylinder 2.
- Control module #A58 (#A58) and #4 for ignition coil cylinder 3.
- Control module #A59 (#A59) and #4 for ignition coil cylinder 4.
- Control module #A56 (#A56) and #4 for ignition coil cylinder 5.
- Control module #A57 (#A57) and #4 for ignition coil cylinder 6.
- Control module #A54 (#A54) and #4 for ignition coil cylinder 7.
- Control module #A55 (#A55) and #4 for ignition coil cylinder 8.

Remedy as necessary.

see **FAULT TRACING**

ECM-P042000: CATALYST SYSTEM EFFICIENCY BELOW THRESHOLD (BANK 1). GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P042000

Condition

Engine Control Module (ECM) checks the efficiency of catalytic converter (bank 1) by switching between rich and lean fuel/air mixture. When the change-over is made, the signal from the rear heated oxygen sensor (HO2S) is checked and the time taken for the probe to switch.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the rear heated oxygen sensor (HO2S) switches too quickly and is interpreted as poor catalytic converter efficiency.

The diagnostic trouble code (DTC) can be diagnosed with the engine at operating temperature, approximately 15 minutes after the engine has first been started if the vehicle is driven (normal road load) at 70-90 km/h for 30-40 seconds.

Substitute Value

- Nothing.

Possible Source

- Air leak in the exhaust system.
- Damaged front heated oxygen sensor (bank 1).
- Damaged front catalytic converter (bank 1).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULT-TRACING

CHECKING AIR LEAKAGE AND COMPONENT

Check the exhaust system for air leakage.

If no air leakage is found on the exhaust system, replace the front heated oxygen sensor (bank 1).

If the above troubleshooting does not fix the problem, try with a new front catalytic converter (bank 1).

Remedy as necessary.

Other information:

- see **EXHAUST MANIFOLD**
- see **OXYGEN SENSOR (CATALYST MONITOR SENSOR)**

Fig. 20: Identifying Heated Oxygen Sensor

- **Continue**

  Refer to **VERIFICATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

- Start the engine and let it idle until it has reached operating temperature (approx. 80 °C).
- Test-drive the vehicle on road. Drive in float mode (normal road load), constant speed around 70-90 km/h for approx. 30-40 seconds.

- Connect the VCT2000 (or appropriate scan tool) to the data link connector without turning off the engine.

  NOTE: If the engine is switched off, the stored fault status will be erased and the test drive will have to be repeated.

  Read off the diagnostic status and trouble status for the diagnostic trouble code.

  Check that the diagnosis is "Implemented" and that the trouble status is "No malfunction found". If the trouble status is "Malfunction found", this indicates defective function.

Fig. 21: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

- Installation of the front and rear heated oxygen sensor mixed up.
- Air leakage in the exhaust system.
- Damaged front heated oxygen sensor (bank 2).
- Damaged front catalytic converter (bank 2).

Fault symptom[s]

- Malfunction indicator light (MIL), on

FAULT-TRACING ECM-P043000

CHECKING AIR LEAKAGE AND COMPONENT

NOTE: **This diagnostic trouble code (DTC) can be stored if installation of the front and rear oxygen sensors is mixed up. Mixing up regards the physical installation of the heated oxygen sensors, where the front one is screwed into place where the rear one is to be located, and vice versa. The connectors and cable harness are correctly connected. These cannot be mixed.**

HINT: Check the part nos. of the components visually and compare with the parts register in VIDA (Volvo scan tool). Ensure that they are installed in the correct location.

Check the exhaust system for air leakage.

If no air leakage is found on the exhaust system, replace the front heated oxygen sensor (bank 2).

If the above troubleshooting does not fix the problem, try with a new front catalytic converter (bank 2).

Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P043E00 EVAPORATIVE EMISSION SYSTEM LEAK DETECTION REFERENCE ORIFICE LOW FLOW. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 28: Identifying Leak Diagnostic Pump
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the function of the leakage diagnosis unit by measuring the current through the leakage diagnosis pump.

If the control module registers that the current curve is unreasonably high, low or noisy, it determines that the reference measurement has produced a faulty result and the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed when leakage diagnosis is running.

Substitute Value

- Leakage diagnosis is interrupted.

Possible Source

- Dirt or moisture in the pump.
- Damaged heating element in the pump.
- Damage leakage diagnosis pump.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULT-TRACING

CHECKING SOFTWARE

NOTE: For vehicles of model year 2007-2008, the software in the engine control module (ECM) should be checked before fault tracing is carried out of the fault relating to the leak from the tank system.

Fig. 29: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Use the VCT2000 (or appropriate scan tool) to read out and check the software version in the Engine control module.

  NOTE: More instructions follow together with the read out.

Fig. 30: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Has the latest software been downloaded to the control module?

- **YES**

  Refer to **PERFORM QUICK-TEST TANK SYSTEM**

PERFORM QUICK-TEST TANK SYSTEM

Fig. 31: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

- Activate the test using the VCT2000 (or appropriate scan tool).
- Read off initial parameters and check them according to start conditions for performing the test.
- Check that the test has started. Parameters run status shall go to "In progress" and the test phase shall go to "Reference".

NOTE: If the test does not start, check that the start conditions are fulfilled.

When the reference phase is finished, check of the tank system starts. The pressure in the tank starts to increase, see graph. Within 15 minutes the Engine control module makes a decision as to whether there is leakage in the tank system or not. The test is finished.

- Check parameters for test result and follow relevant instructions provided in this service information.

NOTE: Estimated leakage shall be used to get an idea of the proximity to the diagnostic trouble code limit. If the estimated leakage is very near the diagnostic trouble code limit (greater than 0.3mm), troubleshooting should probably be performed despite the Tank system, test result shows "No leakage found", especially if a diagnostic trouble code for leakage has been stored earlier.

NOTE: Use diagnostic trouble code counter to, see the frequency of the problem. Also use frozen values to get an idea if external conditions may have affected the result. Compare with current conditions in the workshop.

Conditions for starting the quick test of the fuel tank system

- No DTCs related to EVAP purge valve or ambient air pressure sensor set.
- Battery voltage 11-15 V.
- Atmospheric pressure higher than 750 hPa, approx. 2500 m (8200 ft).
- Fuel level 0-85 %.
- Ambient air temperature 4-35 °C.

NOTE: The battery voltage must be correct throughout the entire test. The test can take up to 15 minutes, depending on the quantity of fuel in the fuel tank. It is highly recommended to use the constant voltage charger, Midtronics PSC-550, during the test. For more information, see 30-04

(USA/CDN).

Other information

- see **DESCRIPTION OF PARAMETERS, QUICK TEST OF THE FUEL TANK SYSTEM**
- see **TEST PHASES, QUICK TEST FUEL TANK SYSTEM**
- see **LOCATION OF COMPONENTS**
- see **LEAK DIAGNOSTIC PUMP, REPLACING**

Select alternative according to relevant test results:

1. DMTL, test result = "Problem found"

   Refer to **DMTL, TEST RESULT = "PROBLEM FOUND"**

2. Tank system, test result = "No leakage found"

   Refer to **TANK SYSTEM, TEST RESULT = "NO LEAKAGE FOUND"**

3. Tank system, test result = "Major leakage found" or "Minor leakage found"

   Refer to **TANK SYSTEM, TEST RESULT = "MAJOR LEAKAGE FOUND" OR "MINOR LEAKAGE FOUND"**

4. DMTL, test result and Tank system, test result = "Unknown"

   Refer to **DMTL, TEST RESULT AND TANK SYSTEM, TEST RESULT = "UNKNOWN"**

5. Cancel fault-tracing.

   FAULT NOT FOUND: Troubleshooting has been completed.

Fig. 32: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 33: Identifying Leak Diagnostic Pump
Courtesy of VOLVO CARS CORPORATION

DMTL, TEST RESULT = "PROBLEM FOUND"

If a problem is detected on the leakage diagnostics unit (DMTL), it may be due to a defective DMTL.

- Replace leakage diagnostics unit (DMTL).
- Perform "Quick-test tank system" again to verify that the problem has been solved.

NOTE: The tank system's status is unknown since the test was interrupted.

- **Continue**

  Refer to **PERFORM QUICK-TEST TANK SYSTEM**

TANK SYSTEM, TEST RESULT = "NO LEAKAGE FOUND"

Diagnostic trouble code limit (minor leakage):Estimated leakage = 0.40 mm

No problem has been detected on leakage diagnostics unit and fuel tank system is OK. The vehicle is ready to be delivered back to customer.

NOTE: The parameter estimated leakage does not necessarily have to show 0 mm for a sealed system.

TANK SYSTEM, TEST RESULT = "MAJOR LEAKAGE FOUND" OR "MINOR LEAKAGE FOUND"

If a leakage is detected during this test, it indicates that the problem with the leakage diagnostics unit (DMTL) is solved. Now the Engine control module (ECM) has the possibility to check the fuel tank system. A leakage has been found.

- Cancel troubleshooting for this problem.
- Read off diagnostic trouble codes again and start troubleshooting for the new diagnostic trouble code.

DMTL, TEST RESULT AND TANK SYSTEM, TEST RESULT = "UNKNOWN"

Engine control module (ECM) cannot perform check of tank system. This may be due to the conditions for start of the quick-test not being fulfilled, that they have changed during the course of the test, or that a problem has occurred during troubleshooting.

- Check that all conditions for start of the quick-test are fulfilled.
- Visually check hoses and connections on leakage diagnostics unit, canister, EVAP-valve, and filler pipe. Check for damage or incorrect/loose installation.
- Remedy as necessary.
- Restart the test.

- **Continue**

  Refer to **PERFORM QUICK-TEST TANK SYSTEM**

ECM-P044100: EVAPORATIVE EMISSION SYSTEM INCORRECT PURGE FLOW. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P044100

Condition

Fig. 40: Identifying Canister Purge (CP) Valve
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) detects a fault in the function of the EVAP valve by analyzing the signal from the pressure sensor in the induction pipe. The diagnostic trouble code is generated if the control module registers that the EVAP valve has seized.

The diagnostic trouble code can be diagnosed during EVAP control.

Substitute Value

- Nothing.

Possible Source

- The hose between the induction pipe and EVAP valve is broken, clogged or pinched.
- The hose between the EVAP valve and canister is broken, clogged or pinched.
- The EVAP valve is stuck in the open position.
- The EVAP valve is stuck in the closed position.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

- Fuel odor.

FAULT-TRACING

CHECKING COMPONENT AND CONNECTIONS

Fig. 41: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- By activating quick-test of EVAP-valve, the valve's status can be decided. The test is based on pressure pulses through the valve and, in this way, the valve's function can be checked.

  If malfunction is detected on the EVAP-valve when performing the quick-test, this indicates that the malfunction is permanent.

- Engine idling during the entire test.

Activate quick-test EVAP-valve. The test takes a few seconds.

If the result shows "Malfunction found", function is poor. Check hose/hose connections between EVAP-valve and canister for damage, clogging or squeezing. The valve may need to be cleaned or replaced.

If the result shows "No malfunction found", function is correct. Then check hose/hose connections between EVAP-valve and inlet pipe for damage, clogging or squeezing.

Remedy as necessary.

Other information

Condition

Fig. 48: Identifying Canister Purge (CP) Valve
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) detects a fault in the function of the EVAP valve by analyzing the signal from the pressure sensor in the induction pipe. The diagnostic trouble code is generated if the control module registers that the EVAP valve has seized.

The diagnostic trouble code can be diagnosed during EVAP control.

Substitute Value

- Nothing.

Possible Source

- The hose between the induction pipe and EVAP valve is broken, clogged or pinched.
- The hose between the EVAP valve and canister is broken, clogged or pinched.
- The EVAP valve is stuck in the open position.
- The EVAP valve is stuck in the closed position.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.
- Fuel odor.

TROUBLESHOOTING ECM-P044100

CHECKING COMPONENT AND CONNECTIONS

Fig. 49: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- By activating quick-test of EVAP-valve, the valve's status can be decided. The test is based on pressure pulses through the valve and, in this way, the valve's function can be checked.

  If malfunction is detected on the EVAP-valve when performing the quick-test, this indicates that the malfunction is permanent.

- Engine idling during the entire test.

  Activate quick-test EVAP-valve. The test takes a few seconds.

  If the result shows "Malfunction found", function is poor. Check hose/hose connections between EVAP-valve and canister for damage, clogging or squeezing. The valve may need to be cleaned or replaced.

If the result shows "No malfunction found", function is correct. Then check hose/hose connections between EVAP-valve and inlet pipe for damage, clogging or squeezing.

Remedy as necessary.

VERIFICATION

VERIFICATION

HINT: After repairing, it is necessary to check that the malfunction has been fixed.

Fig. 52: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 53: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- By once again starting quick-test of EVAP-valve and checking result, one can confirm if the work has fixed the malfunction.
- Engine idling during the entire test.

  Activate quick-test EVAP-valve. The test takes a few seconds.

  Check that the result shows "No malfunction found". This indicates that the malfunction has been fixed and the function is OK.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P044200: EVAPORATIVE EMISSION SYSTEM LEAK DETECTED (SMALL LEAK). GENERAL FAILURE INFORMATION. NO SUB TYPE

INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P044200

Condition

Fig. 56: Identifying Leak Diagnostic Pump
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks for leaks in the fuel system by measuring the current consumption of the leakage diagnosis pump when pressure is applied.

If the current consumption measured under pressure does not change in a specific way or a certain pressure is not obtained in the system within a reasonable amount of time, the control module assesses this as a small leak (leak between 0.5 mm and 1.0 mm) from the fuel system.

The diagnostic trouble code can be diagnosed when leakage diagnosis is running.

Substitute Value

- Nothing.

Possible Source

- Leaking tank, filler pipe, tank cap, canister, EVAP valve or lines between these components.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULT-TRACING

CHECKING SOFTWARE

NOTE: **For vehicles of model year 2007-2008, the software in the engine control module (ECM) should be checked before fault tracing is carried out of the fault relating to the leak from the tank system.**

Fig. 57: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Use the VCT2000 (or appropriate scan tool) to read out and check the software version in the Engine control module.

  NOTE: **More instructions follow together with the read out.**

Fig. 58: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Has the latest software been downloaded to the control module?

- **YES**

  Refer to **PERFORM QUICK-TEST TANK SYSTEM**

PERFORM QUICK-TEST TANK SYSTEM

Fig. 59: Identifying Ignition On Position
Courtesy of VOLVO CARS CORPORATION

- Activate the test using the VCT2000 (or appropriate scan tool).
- Read off initial parameters and check them according to start conditions for performing the test.
- Check that the test has started. Parameters run status shall go to "In progress" and the test phase shall go to "Reference".

NOTE: If the test does not start, check that the start conditions are fulfilled.

When the reference phase is finished, check of the tank system starts. The pressure in the tank starts to increase, see graph. Within 15 minutes the Engine control module makes a decision as to whether there is leakage in the tank system or not. The test is finished.

- Check parameters for test result and follow relevant instructions provided in this service information.

NOTE: Estimated leakage shall be used to get an idea of the proximity to the diagnostic trouble code limit. If the estimated leakage is very near the diagnostic trouble code limit (greater than 0.3mm), troubleshooting should probably be performed despite the Tank system, test result shows "No leakage found", especially if a diagnostic trouble code for leakage has been stored earlier.

NOTE: Use diagnostic trouble code counter to, see the frequency of the problem. Also use frozen values to get an idea if external conditions may have affected the result. Compare with current conditions in the workshop.

Conditions for starting the quick test of the fuel tank system

- No DTCs related to EVAP purge valve or ambient air pressure sensor set.
- Battery voltage 11-15 V.
- Atmospheric pressure higher than 750 hPa, approx. 2500 m (8200 ft).
- Fuel level 0-85 %.
- Ambient air temperature 4-35 °C.

NOTE: The battery voltage must be correct throughout the entire test. The test can take up to 15 minutes, depending on the quantity of fuel in the fuel tank. It is highly recommended to use the constant voltage charger, Midtronics PSC-550, during the test. For more information, see 30-04

(USA/CDN).

Other information

- see **DESCRIPTION OF PARAMETERS, QUICK TEST OF THE FUEL TANK SYSTEM**
- see **TEST PHASES, QUICK TEST FUEL TANK SYSTEM**
- see **LOCATION OF COMPONENTS**

Select alternative according to relevant test results:

1. DMTL, test result = "Problem found"

   Refer to **DMTL, TEST RESULT = "PROBLEM FOUND"**

2. Tank system, test result = "No leakage found"

   Refer to **TANK SYSTEM, TEST RESULT = "NO LEAKAGE FOUND"**

3. Tank system, test result = "Minor leakage found"

   Refer to **TANK SYSTEM, TEST RESULT = "MINOR LEAKAGE FOUND"**

4. Tank system, test result = "Major leakage found"

   Refer to **TANK SYSTEM, TEST RESULT = "MAJOR LEAKAGE FOUND"**

5. DMTL, test result and Tank system, test result = "Unknown"

   Refer to **DMTL, TEST RESULT AND TANK SYSTEM, TEST RESULT = "UNKNOWN"**

6. Cancel fault-tracing.

   FAULT NOT FOUND: Troubleshooting has been completed.

Fig. 60: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 61: Identifying Leak Diagnostic Pump
Courtesy of VOLVO CARS CORPORATION

DMTL, TEST RESULT = "PROBLEM FOUND"

If a problem is detected on the leakage diagnostics unit (DMTL), this may have been caused during the test itself. Checks on DMTL are normal electric checks of leakage diagnostics unit and cabling and is no indication of if there is leakage or not.

- Cancel troubleshooting for this problem.
- Read off diagnostic trouble codes again and start troubleshooting for the new diagnostic trouble code.

NOTE: The tank system's status is unknown since the test was interrupted.

TANK SYSTEM, TEST RESULT = "NO LEAKAGE FOUND"

Diagnostic trouble code limit (minor leakage):Estimated leakage = 0.40 mm

If no leakage was found, the Engine control module (ECM) has detected leakage in the tank system earlier, but the problem is not active at this time. The fault could be caused by leakage in the tank, filler pipe, fuel tank filler cap, canister, EVAP valve, leakage diagnosis unit or hoses between these components.

NOTE: Problems caused by a loose tank cap or loose hose connections may be difficult to find. If no leakage was found in the quick-test of the tank system after completed checks and actions according to the above, the problem has likely been repaired.

NOTE: The parameter estimated leakage does not necessarily have to show 0 mm for a sealed system.

TANK SYSTEM, TEST RESULT = "MINOR LEAKAGE FOUND"

Diagnostic trouble code limit:Estimated leakage = 0.40 mm

- Check that the tank cap is properly fitted and that its seal is undamaged.
- Check the hoses and connections on the leak diagnostic unit, the canister, EVAP-valve and the fuel filler pipe visually. Check for damage or incorrect/loose installation.
- Remedy as necessary.
- Restart the test.

NOTE: **Problems caused by a loose tank cap or loose hose connections may be difficult to find. If no leakage was found in the quick-test of the tank system after completed checks and actions according to the above, the problem has likely been repaired.**

NOTE: **By blocking the hose between canister and EVAP-valve and then repeating quick-test tank system, leakage through the EVAP-valve can be detected. If leakage was detected in a previous quick test of the fuel tank system but is not now detected when the hose between the canister and the EVAP valve is blocked, the leakage may be through the EVAP valve.**

- Disconnect the hose between the EVAP canister purge valve and the EVAP canister from the connection to the EVAP canister purge valve.
- Block the hose while running the quick test of the fuel tank system.

- **Continue**

  Refer to **PERFORM QUICK-TEST TANK SYSTEM**

DMTL, TEST RESULT AND TANK SYSTEM, TEST RESULT = "UNKNOWN"

Engine control module (ECM) cannot perform check of tank system. This may be due to the conditions for start of the quick-test not being fulfilled, that they have changed during the course of the test, or that a problem has occurred during troubleshooting.

- Check that all conditions for start of the quick-test are fulfilled.
- Visually check hoses and connections on leakage diagnostics unit, canister, EVAP-valve, and filler pipe. Check for damage or incorrect/loose installation.
- Remedy as necessary.
- Restart the test.

- **Continue**

  Refer to **PERFORM QUICK-TEST TANK SYSTEM**

TANK SYSTEM, TEST RESULT = "MAJOR LEAKAGE FOUND"

Diagnostic trouble code limit:Tank pressure lower than 1500 Pa after 450 seconds in test phase "Major leakage".

- Check that the tank cap is properly fitted and that its seal is undamaged.
- Check the hoses and connections on the leak diagnostic unit, the canister, EVAP-valve and the fuel filler pipe visually. Check for damage or incorrect/loose installation.
- Remedy as necessary.
- Restart the test.

NOTE: **Problems caused by a loose tank cap or loose hose connections may be difficult to find. If no leakage was found in the quick-test of the tank system after completed checks and actions according to the above, the problem has likely been repaired.**

- **Continue**

  Refer to **PERFORM QUICK-TEST TANK SYSTEM**

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P044200

Condition

Fig. 62: Identifying Leak Diagnostic Pump
Courtesy of VOLVO CARS CORPORATION

Engine control module (ECM) checks sealing in the fuel tank system by, using the leakage diagnostics unit, pressurizing the tank system and at the same time measuring the relationship between reached pressure and flow from the pump. In a sealed system, the relationship between these shall be linear. Any deviations from the linear relationship are calculated and used to evaluate the tank system's sealing.

If Engine control module (ECM) determines that the deviation corresponds to a leakage bigger than 0.5 mm in diameter, the diagnostic trouble code for minor leakage is stored.

The diagnostic trouble code can be diagnosed when leakage diagnosis is running.

Substitute Value

- Nothing.

Possible Source

- Leaking tank, filler pipe, tank cap, canister, EVAP valve or lines between these components.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULT-TRACING

CHECKING SOFTWARE

NOTE: For vehicles of model year 2005-2007, the software in the engine control module (ECM) should be checked before fault tracing of the fault relating to the leak from the tank system is carried out.

Fig. 63: Identifying Ignition On Position

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Fuel trim blocked.

Possible Source

- Contact resistance in the connectors.
- The signal cable is short-circuited to voltage.
- Damaged EVAP valve.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.
- Fuel odor.

TROUBLESHOOTING ECM-P045900

CHECKING THE STATUS

Fig. 83: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on

  Check if the malfunction is permanent or intermittent by activating the EVAP-valve. Listen for clicking sounds and/or feel the valve for frequent vibrations.

  If the valve does not vibrate, this indicates a permanent malfunction. If the valve vibrates, this indicates that the malfunction is intermittent and not active right now.

Fig. 84: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING COMPONENTS AND CABLES**

CHECKING COMPONENTS AND CABLES

Check the EVAP-valve's connector for contact resistance and oxidation.

Check the cable between engine control module (ECM) #A92 (#B32) and EVAP-valve #2 for short-circuit to voltage.

Remedy as necessary.

Other information

- see **CONNECTING THE BREAKOUT BOX**
- see **SIGNAL SPECIFICATION, ENGINE CONTROL MODULE (ECM)**

Is the function OK?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P046000: FUEL LEVEL SENSOR A CIRCUIT. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P046000

Condition

Fig. 91: Identifying Fuel Level Sensor
Courtesy of VOLVO CARS CORPORATION

If a malfunction of the fuel level sensor's pump part is detected by central electronic module (CEM), a malfunction message is sent to engine control module (ECM) and the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Nothing.

Possible Source

- Look for the cause of the malfunction in central electronic module (CEM).

Fault symptom[s]

- Nothing.

FAULT-TRACING

see **FAULT-TRACING**

ECM-P046000: FUEL LEVEL SENSOR A CIRCUIT. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S5; 2011-2012)

ECM-P046100: FUEL LEVEL SENSOR A CIRCUIT RANGE/PERFORMANCE. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P046100

Condition

Fig. 92: Identifying Fuel Level Sensor
Courtesy of VOLVO CARS CORPORATION

The central electronic module (CEM) sends the engine control module (ECM) information on fuel level and the fault status of the fuel level sensor.

The engine control module (ECM) compares engine fuel consumption with the change in the fuel level over a certain period of time. The diagnostic trouble code is generated if the engine control module (ECM) registers an unreasonably small reduction in the fuel level as compared to calculated fuel consumption.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Nothing.

Possible Source

- Contact resistance in the connectors.
- Damaged fuel level sensor.

Fault symptom[s]

- Nothing.

FAULT TRACING

CHECKING THE STATUS

Fig. 93: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on

  Check if the malfunction is permanent or intermittent by reading off the signal from the fuel level sensor (via central electronic module (CEM)) and check that it is reasonable, that it moves when the vehicle is rocked lightly and that it then stabilizes at a reasonable level.

  Incorrect signal indicates that the malfunction is permanent. If the signal is reasonable, this indicates that the malfunction is intermittent.

  HINT: Completely full tank may mean that the level change when rocking the vehicle is not clear enough.

Fig. 94: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 95: Fuel Level Sensor Connector
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING CONNECTOR**

CHECKING CONNECTOR

Check the fuel level sensor's connector and connections for contact resistance and oxidation.

Remedy as necessary.

ECM-P048000: FAN 1 CONTROL CIRCUIT. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P048000

Condition

Fig. 117: Identifying Engine Cooling Fan
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) sends a signal (speed request to the cooling fan) to the cooling fan module. The cooling fan module then regulates voltage to the fan motor at an infinitely variable rate. The diagnostic trouble code is generated if the engine control module (ECM) detects that fan speed is low.

The diagnostic trouble code can be diagnosed when the engine is running.

NOTE: **The electric cooling fan may have a post-running time of up to approx. 6 minutes after the engine has been shut off. The time for the electric cooling fan's post-running depends on the engine's temperature, temperature in the engine compartment as well as the pressure level in the AC system.**

Substitute Value

- Nothing.

Possible Source

- Blocked fan blade.
- Cooling fan seizing.
- Open-circuit on cooling fan power cable.
- Damaged cooling fan module.

Fault symptom[s]

- Overheated engine.
- Electric cooling fan does not operate

ECM-P048368: FAN PERFORMANCE. ALGORITHM BASED FAILURES. EVENT INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P048368

Condition

NOTE: **This diagnostic trouble code (DTC) status is an event controlled diagnostic trouble code (DTC). An event controlled diagnostic trouble code (DTC) does not mean that there is a fault in the control module when it is active, but is designed as information.**

Engine control module (ECM) monitors the engine's cooling system. The diagnostic trouble code (DTC) is stored if the control module detects that:

- The electric cooling fan is blocked.
- The electric cooling fan is overheated.
- Voltage feed to the electric cooling fan is too low.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- Nothing.

Possible Source

- This diagnostic trouble code (DTC) is not caused by a fault that needs to be remedied.

Fault symptom[s]

- None.

ECM-P050000: SPEED SENSOR A. GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P050000

Condition

Information about vehicle speed is sent on the CAN-network from brake control module (BCM) to engine control module (ECM).

If brake control module (BCM) registers a malfunction of the speed signal, information about the malfunction is sent to engine control module (ECM) which generates the diagnostic trouble code.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Cruise control turned off when malfunction is active.

Possible Source

- Look for the cause of the malfunction in the brake control module (BCM).

Fault symptom[s]

- Cruise control does not function at all.
- Message in the display.

TROUBLESHOOTING INFORMATION

INFORMATION

No troubleshooting has been developed for this diagnostic trouble code (DTC). Diagnostic trouble code (DTC) for this malfunction is first stored in the brake control module (BCM), then in the engine control module (ECM). This diagnostic trouble code (DTC) cannot be erased before the diagnostic trouble code (DTC) in the brake control module (BCM) has been erased and remedied.

Therefore, first read off the diagnostic trouble codes in the brake control module (BCM), perform troubleshooting and take appropriate action. Then this diagnostic trouble code can be erased.

ECM-P050082: VEHICLE SPEED SENSOR A. BUS SIGNAL / MESSAGE FAILURES. ALIVE / SEQUENCE COUNTER INCORRECT / NOT UPDATED (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Information about vehicle speed is sent on the CAN-network from brake control module (BCM) to engine control module (ECM).

If brake control module (BCM) registers a malfunction of the speed signal, information about the malfunction is sent to engine control module (ECM) which generates the diagnostic trouble code.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Cruise control turned off when malfunction is active.

Possible Source

- Look for the cause of the malfunction in the brake control module (BCM).

Fault symptom[s]

- Cruise control does not function at all.
- Message in the display.

FAULT-TRACING

INFORMATION

No fault-tracing has been developed for this diagnostic trouble code (DTC).

The diagnostic trouble code (DTC) for this fault is first stored in the Brake control module (BCM), then in the Engine control module (ECM). This diagnostic trouble code (DTC) can first be erased when the root fault has been remedied and the diagnostic trouble code (DTC) for the root fault has been erased.

For further information on this diagnostic trouble code, see Diagnostic trouble code (DTC) information.

ECM-P050087: VEHICLE SPEED SENSOR A. BUS SIGNAL / MESSAGE FAILURES. MISSING MESSAGE (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P050087

Condition

Information about vehicle speed is sent on the CAN-network from brake control module (BCM) to engine control module (ECM).

If communication between brake control module (BCM) and engine control module (ECM) is missing, the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Cruise control turned off when malfunction is active.

Possible Source

- Open circuit on one of the CAN-cables.

- Short-circuit between the control area network (CAN) wiring.
- Internal malfunction in brake control module (BCM).
- Internal malfunction in engine control module (ECM).
- Internal malfunction in another control module in the same part of the CAN-network.

Fault symptom[s]

- Cruise control does not function at all.
- Message in the display.

ECM-P050100: SPEED SENSOR A WITHIN/OUTSIDE LIMIT VALUES. GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P050100

Condition

Information about vehicle speed is sent on the CAN-network from brake control module (BCM) to engine control module (ECM).

If communication between brake control module (BCM) and engine control module (ECM) is missing, the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Cruise control turned off when malfunction is active.

Possible Source

- Open circuit on one of the CAN-cables.
- Short-circuit between the control area network (CAN) wiring.
- Internal malfunction in brake control module (BCM).
- Internal malfunction in engine control module (ECM).
- Internal malfunction in another control module in the same part of the CAN-network.

Fault symptom[s]

- Cruise control does not function at all.
- Message in the display.

FAULT-TRACING INFORMATION

INFORMATION

There is no troubleshooting for this diagnostic trouble code (DTC). A diagnostic trouble code for CAN-communication can also be generated in the central electronic module (CEM). In some instances, the diagnostic trouble code is generated in other related control modules. This code should not be erased until the code in the central electronic module (CEM) and other related control modules has been remedied and erased. Thus, first read out diagnostic trouble codes (DTCs) in the central electronic module (CEM) and other related control modules, perform troubleshooting and take appropriate action. After that, this code can be erased.

Other information

- see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK**

HINT: Try using the Information Manager if the desired diagnostic trouble code information cannot be found.

ECM-P050429: BRAKE SWITCH A / B CORRELATION. GENERAL SIGNAL FAILURES. SIGNAL INVALID (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P050429

Condition

The engine control module (ECM) checks the stop lamp switch by comparing the received signal with the brake pedal switch position. Information about the position of the brake pedal switch is transmitted from the brake control module (BCM) via CAN communication.

The control module compares both the signals.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The signals indicate different positions of the brake pedal at several times.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.
- The brake pedal depressed several times.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 128: Identifying Stop Lamp Switch
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- The control module blocks auto start.
- Cruise control is disengaged when the fault is active.

Possible Source

- Contact resistance or oxidation in brake light contact connections.
- Contact resistance or oxidation in the terminals for the brake pedal switch. Look for the cause of the fault in the brake control module (BCM).
- Open circuit on signal cable.
- The signal cable is short-circuited to ground.
- Damaged stop lamp switch.
- Damaged brake pedal switch. Look for the cause of the fault in the brake control module (BCM).

Fault symptom[s]

- Cruise control does not operate

- Autostart; No Functionality

FAULT-TRACING

ECM-P050462: BRAKE SWITCH A / B CORRELATION. ALGORITHM BASED FAILURES. SIGNAL COMPARE FAILURE (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P050462

Condition

The engine control module (ECM) checks the stop lamp switch by comparing the received signal with the brake pedal switch position. Information about the position of the brake pedal switch is transmitted from the brake control module (BCM) via CAN communication.

The control module compares both the signals.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The signals indicate different positions on the brake pedal for a total of two minutes and at least 5 shifts.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.
- The brake pedal depressed several times.

NOTE: **The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.**

Fig. 129: Identifying Stop Lamp Switch
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- The control module blocks auto start.
- Cruise control is disengaged when the fault is active.

Possible Source

- Contact resistance or oxidation in brake light contact connections.
- Contact resistance or oxidation in the terminals for the brake pedal switch. Look for the cause of the fault in the brake control module (BCM).
- Open circuit on signal cable.
- The signal cable is short-circuited to ground.
- Damaged stop lamp switch.
- Damaged brake pedal switch. Look for the cause of the fault in the brake control module (BCM).

Fault symptom[s]

- Cruise control does not operate
- Autostart; No Functionality

ECM-P050465: BRAKE SWITCH A / B CORRELATION. ALGORITHM BASED FAILURES. SIGNAL HAS TOO FEW TRANSITIONS / EVENTS (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P050465

Condition

The engine control module (ECM) checks the stop lamp switch by comparing the received signal with the brake pedal switch position. Information about the position of the brake pedal switch is transmitted from the brake control module (BCM) via CAN communication.

The control module compares both the signals.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The signals indicate one and the same position for an implausibly long time.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.
- The brake pedal depressed several times.

NOTE: **The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.**

Fig. 130: Identifying Stop Lamp Switch

ECM-P050568: IDLE AIR CONTROL SYSTEM. ALGORITHM BASED FAILURES. EVENT INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P050568

Condition

NOTE: **This diagnostic trouble code (DTC) status is an event controlled diagnostic trouble code (DTC). An event controlled diagnostic trouble code (DTC) does not mean that there is a fault in the control module when it is active, but is designed as information.**

Engine control module (ECM) monitors the idle control. If the control module detects that idle control has been outside the limit value for a certain time, the diagnostic trouble code is generated.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- Nothing.

Possible Source

- This diagnostic trouble code (DTC) is not caused by a fault that needs to be remedied.

Fault symptom[s]

- None.

FAULT-TRACING INFORMATION

ECM-P050600: IDLE CONTROL RPM LOWER THAN EXPECTED. GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P050600

Condition

If engine control module (ECM) registers that idle RPM is 100 RPM lower than the nominal idle RPM, the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed with warm engine (higher than 80 °C), vehicle stationary and idling.

Substitute Value

- Nothing.

Possible Source

- Look for the cause of the malfunction in some part of the air or fuel system (air leakage, clogging, etc.).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.
- Low idle RPM.

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-P050600: IDLE CONTROL RPM LOWER THAN EXPECTED. GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P050600

Condition

If engine control module (ECM) registers that idle RPM is 100 RPM lower than the nominal idle RPM, the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed with warm engine (higher than 80 °C), vehicle stationary and idling.

Substitute Value

- Nothing.

Possible Source

- Look for the cause of the malfunction in some part of the air or fuel system (air leakage, clogging, etc.).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.
- Low idle RPM.

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-P050700: IDLE CONTROL RPM HIGHER THAN EXPECTED. GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P050700

Condition

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Idling speed is 200 RPM greater than the nominal idling speed.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Run the engine to operating temperature (coolant temperature greater than 80 °C).
- Stationary vehicle idling.

Substitute Value

- None.

Possible Source

- Search the air and fuel supplies in the fuel system for the fault cause (air leakage, blockages, etc.).

Fault symptom[s]

- Malfunction indicator light (MIL), on
- High idle speed

FAULT-TRACING INFORMATION

ECM-P050A00 COLD START IDLE AIR CONTROL SYSTEM PERFORMANCE. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S5; 2011-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

The Engine control module (ECM) checks the function for quick catalytic converter warm-up. The catalytic converter can be warmed up quickly by increasing the throttle angle, changing the camshaft angle etc. for example. The Engine control module (ECM) checks the function for catalytic converter warm-up.

The Engine control module (ECM) calculates the difference between the requested energy applied for catalytic converter warm-up and the actual excess energy for catalytic converter warm-up.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The difference between applied energy for warm-up of the catalytic converter and the actual energy for warm-up of the catalytic converter is too great.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- When starting the engine.
- Cold engine.
- Warming-up of catalytic converter started.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Substitute Value

- None.

Possible Source

- Sticking throttle.
- Fault in the throttle.
- Blocked intake system.
- Clogged air filter.
- Sticking/slow throttle.
- Mechanical fault causes in the engine.

Fault symptom[s]

- Warning lights and chimes/Malfunction Indicator Light ("Check engine" light) indication/no indication

FAULT-TRACING

ECM-P051200: START REQUEST CIRCUIT. GENERAL FAULT INFORMATION. TYPE OF FAULT NOT SPECIFIED. (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P051200

Condition

Fig. 131: Identifying Main Relay
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) regulates the starter motor via the starter relay and checks its function. The diagnostic trouble code is generated if the control module detects that the start signal from the ignition switch is lost when engine speed exceeds a certain value and no vehicle speed has been registered or if the control module detects a start signal from the ignition switch during driving conditions when there should not be a start signal.

Substitute Value

- Nothing.

Possible Source

- The signal cable from the ignition switch is short-circuited to supply voltage.
- The signal cable from the ignition switch is short-circuited to ground.
- Open-circuit on the signal cable from the ignition switch.
- Damaged starter relay.

Fault symptom[s]

- None.

FAULT TRACING ECM-P051200

CHECKING COMPONENTS AND WIRING

Fig. 132: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 133: Disconnecting Connector

Is the function OK?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P052548: CRUISE CONTROL SERVO CONTROL CIRCUIT RANGE/PERFORMANCE. SYSTEM INTERNAL FAILURES. SUPERVISION

SOFTWARE FAILURE (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P052548

Condition

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers an internal fault when the cruise control is active.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Fig. 138: Identifying Engine Control Module (ECM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- Cruise control is disengaged when the fault is active.

Possible Source

- Damaged engine control module (ECM).

Fault symptom[s]

- Cruise control does not operate

FAULT TRACING

CHECKING THE STATUS

Fig. 139: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on, wait for at least 15 seconds to perform the diagnosis.

  Read the diagnostic status and fault status for the diagnostic trouble code by selecting the diagnostic trouble code in the list.

  Check if the malfunction is permanent or intermittent by reading off the diagnostic trouble code's status when the diagnostic status is "Implemented".

  If the trouble status is "Malfunction found", this indicates that the malfunction is permanent. If the trouble status is "No malfunction found", this indicates that the malfunction is intermittent and not active right now.

NOTE: Trouble status cannot go from "Malfunction found" to "No malfunction

found" in the same operating cycle.

Fig. 140: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

The engine control module (ECM) has registered an internal fault.

If the fault is intermittent, it has been registered previously but no longer remains. Intermittent faults can be due to disruption when the engine control module (ECM) started or can be another type of fault that may recur at different instances. The fault is assessed on a case by case basis. If the fault recurs, replace the engine control module (ECM).

In the event of a permanent fault, replace the engine control module (ECM).

Remedy as necessary.

Other information

- see **ENGINE CONTROL MODULE (ECM)**

- Damaged VVT-unit.

Fault symptom[s]

- Uneven idle

- Engine misfires

FAULT-TRACING

CHECKING COMPONENTS

HINT: Incorrect oil grade can cause malfunctions in the variable valve timing (VVT) unit. Contaminants in the engine oil can cause damage to components in the variable valve timing (VVT) unit.

Check the engine oil grade. Check especially for contaminants.

Remove the camshaft reset valve, check the reset valve and the oil ducts in the cylinder head. Check for contaminants and blockages.

Check the engine oil pressure.

Try a new camshaft reset valve if no fault is found or if the above remedies do not rectify the fault.

HINT: The fault can also be caused by an internal fault in the variable valve timing (VVT) unit. If the above fault-tracing/remedies do not rectify the fault, the variable valve timing (VVT) unit may be damaged.

Remedy as necessary.

Other information

VERIFICATION

VERIFICATION, PART 1

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 143: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 144: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Verification consists of 2 parts. Part 1 is carried out via a test in the workshop. Part 2 is carried out on the road.

  If the function is determined as **incorrect** in part 1, then part 2 does **not** need to be carried out. If the function is determined as being correct in part 1 and the vehicle can be tested on the road, part 2 must be carried out. This is because the function can be difficult the check in a workshop environment in certain cases.

- Ignition off
- Reconnect the connectors, components, etc.
- Start and run the engine to operating temperature.
- Read off the shift angle of the camshaft and the desired shift angle of the camshaft to check the function.

Check that the camshaft shift angle corresponds to the desired value for the camshaft shift angle with an accuracy of approximately 8° CA (camshaft angle). The difference between the values can be read off in the lower digital display.

Fig. 145: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the function OK?

- **YES**

  Refer to **VERIFICATION, PART 2**

- **NO**

  Refer to **INFORMATION**

VERIFICATION, PART 2

Fig. 146: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Test drive the car on the road. Use acceleration and engine braking. Repeat the procedure several times so that the camshaft control works and the engine control module (ECM) can carry out diagnostics.
- Connect the VCT2000 (or appropriate scan tool) to the data link connector **without switching off the engine.**
- Read the diagnostic status and fault status for the diagnostic trouble code by selecting the diagnostic trouble code in the list.

NOTE: **If the engine is switched off, the stored fault status will be erased and the test drive will have to be repeated.**

Check the fault status for the diagnostic trouble code when the scan is "Implemented". When the function is correct the fault status should be "No fault found" when the scan is implemented.

Fig. 147: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

VERIFICATION

VERIFICATION, PART 1

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 149: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 150: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Verification consists of 2 parts. Part 1 is carried out via a test in the workshop. Part 2 is carried out on the road.

  If the function is determined as **incorrect** in part 1, then part 2 does **not** need to be carried out. If the function is determined as being correct in part 1 and the vehicle can be tested on the road, part 2 must be carried out. This is because in certain cases the function can be difficult the check in a workshop environment.

- Ignition off
- Reconnect the connectors, components, etc.
- Start and run the engine to operating temperature.
- Read off the shift angle of the camshaft and the desired shift angle of the camshaft to check the function.

Check that the camshaft shift angle corresponds to the desired value for the camshaft shift angle with an accuracy of approximately 8° CA (camshaft angle). The difference between the values can be read off in the lower digital display.

Fig. 151: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

CHECKING COMPONENTS

HINT: Incorrect oil grade can cause malfunctions in the variable valve timing (VVT) unit. Contaminants in the engine oil can cause damage to components in the variable valve timing (VVT) unit.

Check the engine oil grade. Check especially for contaminants.

Remove the camshaft reset valve, check the reset valve and the oil ducts in the cylinder head. Check for contaminants and blockages.

Check the engine oil pressure.

Try a new camshaft reset valve if no fault is found or if the above remedies do not rectify the fault.

HINT: The fault can also be caused by an internal fault in the variable valve timing (VVT) unit. If the above fault-tracing/remedies do not rectify the fault, the variable valve timing (VVT) unit may be damaged.

Remedy as necessary.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P052D00 COLD START CAMSHAFT POSITION TIMING OVER-RETARDED (BANK 2). GENERAL FAILURE INFORMATION. NO SUB TYPE

INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P052D00

Condition

The Engine control module (ECM) regulates the camshaft position (angle). The difference between requested angle and actual angle is stored in the Engine control module (ECM) during warm-up of the catalytic converter.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The camshaft angle is less than the requested during warm-up of the catalytic converter.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Cold engine.
- Warming-up of catalytic converter.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Substitute Value

- None.

Possible Source

- Poor engine oil quality.
- Low oil pressure.
- Damaged camshaft reset valve.
- Damaged VVT-unit.

Fault symptom[s]

- Uneven idle
- Poor performance

FAULT-TRACING

see **FAULT-TRACING**

ECM-P053100: A/C REFRIGERANT PRESSURE SENSOR A CIRCUIT RANGE/PERFORMANCE. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P053100

Condition

The engine control module (ECM) calculates when a certain pressure change should have been reached in the air conditioning (A/C) system.

The control module also measures the actual pressure changes at the air conditioning (A/C) pressure sensor.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The calculated A/C pressure value differs from the actual pressure value.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Engine running.
- Air conditioning (A/C) control, active.

NOTE: **The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.**

FAULT-TRACING

CHECKING THE STATUS

Fig. 161: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start the engine.
- A/C on.

  Read the diagnostic status and trouble status for the diagnostic trouble code by selecting the diagnostic trouble code in the list.

  Check if the malfunction is permanent or intermittent by reading off the diagnostic trouble code's status when the diagnostic status is "Implemented".

  If the trouble status is "Malfunction found", this indicates that the malfunction is permanent. If the trouble status is "No malfunction found", this indicates that the malfunction is intermittent and not active right now.

NOTE: **Trouble status cannot go from "Malfunction found" to "No malfunction found" in the same operating cycle.**

Fig. 162: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 163: Identifying A/C Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

Engine control module (ECM) has registered that the A/C pressure sensor is damaged.

If the malfunction is intermittent, it has been registered previously but no longer remains. Intermittent malfunctions can be due to disruption when the control module started or can be another type of malfunction that may recur at different instances. If the malfunction is permanent it means that it is active right now. The malfunction is assessed on a case by case basis.

Remedy as necessary.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P053400

Condition

The A/C system must have a certain basic pressure for optimal function. If engine control module (ECM) detects a pressure that is too low in the A/C system, the control module interprets this as a malfunction and the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed with the engine running and the A/C control active.

Substitute Value

- Nothing.

Possible Source

- Leak in the A/C system.

Fault symptom[s]

- A/C system does not work.

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-P054A00 COLD START EXHAUST (B) CAMSHAFT POSITION TIMING OVER-ADVANCED (BANK 1). GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B8444S; 2008-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION**

FAULT-TRACING

CHECKING COMPONENTS

HINT: Incorrect oil grade can cause malfunctions in the variable valve timing (VVT) unit. Contaminants in the engine oil can cause damage to components in the variable valve timing (VVT) unit.

Check the engine oil grade. Check especially for contaminants.

HINT: The VVT unit for the exhaust camshaft has a spring which turns the camshaft at control. This means that if the oil pressure becomes too low for the VVT unit, the spring controls the camshaft out too much.

Remove the camshaft reset valve, check the reset valve and the oil ducts in the cylinder head. Check for contaminants and blockages.

Check the engine oil pressure.

Try a new camshaft reset valve if no fault is found or if the above remedies do not rectify the fault.

HINT: The fault can also be caused by an internal fault in the variable valve timing (VVT) unit. If the above fault-tracing/remedies do not rectify the fault, the variable valve timing (VVT) unit may be damaged.

Remedy as necessary.

Other information

- see **OIL PRESSURE, CHECKING**
- see **VVT UNIT EXHAUST CAMSHAFT, REPLACING**
- see **LOCATION OF COMPONENTS, ENGINE COMPARTMENT**

  Refer to **VERIFICATION**

VERIFICATION

VERIFICATION, PART 1

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 199: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 200: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Verification consists of 2 parts. Part 1 is carried out via a test in the workshop. Part 2 is carried out on the road.

  If the function is determined as **incorrect** in part 1, then part 2 does **not** need to be carried out. If the function is determined as being correct in part 1 and the vehicle can be tested on the road, part 2 must be carried out. This is because in certain cases the function can be difficult the check in a workshop environment.

- Ignition off
- Reconnect the connectors, components, etc.
- Start and run the engine to operating temperature.
- Read off the shift angle of the camshaft and the desired shift angle of the camshaft to check the function.

Check that the camshaft shift angle corresponds to the desired value for the camshaft shift angle with an accuracy of approximately 8° CA (camshaft angle). The difference between the values can be read off in the lower digital display.

Fig. 201: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

Is the function OK?

- **YES**

  Refer to **VERIFICATION, PART 2**

- **NO**

  Refer to **INFORMATION**

VERIFICATION, PART 2

Fig. 202: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Test drive the car on the road. Use acceleration and engine braking. Repeat the procedure several times so that the camshaft control works and the engine control module (ECM) can carry out diagnostics.
- Connect the VCT2000 (or appropriate scan tool) to the data link connector **without switching off the engine.**
- Read the diagnostic status and fault status for the diagnostic trouble code by selecting the diagnostic trouble code in the list.

NOTE: **If the engine is switched off, the stored fault status will be erased and the test drive will have to be repeated.**

Check the fault status for the diagnostic trouble code when the scan is "Implemented". When the function is correct the fault status should be "No fault found" when the scan is implemented.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P057400: CRUISE CONTROL SYSTEM - VEHICLE SPEED TOO HIGH. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION

(B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P057400

Condition

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers an internal fault when the cruise control is active.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Fig. 234: Identifying Engine Control Module (ECM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- Cruise control is disengaged when the fault is active.

Possible Source

- Damaged engine control module (ECM).

Fault symptom[s]

- Cruise control does not operate

FAULT TRACING

CHECKING THE STATUS

Fig. 235: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on, wait for at least 15 seconds to perform the diagnosis.

  Read the diagnostic status and fault status for the diagnostic trouble code by selecting the diagnostic trouble code in the list.

  Check if the malfunction is permanent or intermittent by reading off the diagnostic trouble code's status when the diagnostic status is "Implemented".

  If the trouble status is "Malfunction found", this indicates that the malfunction is permanent. If the trouble status is "No malfunction found", this indicates that the malfunction is intermittent and not active right now.

  NOTE: Trouble status cannot go from "Malfunction found" to "No malfunction

found" in the same operating cycle.

Fig. 236: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

The engine control module (ECM) has registered an internal fault.

If the fault is intermittent, it has been registered previously but no longer remains. Intermittent faults can be due to disruption when the engine control module (ECM) started or can be another type of fault that may recur at different instances. The fault is assessed on a case by case basis. If the fault recurs, replace the engine control module (ECM).

In the event of a permanent fault, replace the engine control module (ECM).

Remedy as necessary.

Other information

- see **ENGINE CONTROL MODULE (ECM), REPLACING**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

ECM-P057500: CRUISE CONTROL INPUT CIRCUIT. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P057500

Condition

The Central electronic module (CEM) receives and checks the signals from the steering wheel buttons for cruise control. The information is transmitted via CAN to the Engine control module (ECM).

The Engine control module (ECM) checks the received information.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The information means that any of the steering wheel buttons have been depressed longer than 180

seconds.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Engine running.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Substitute Value

- Cruise control is disengaged when the fault is active.

Possible Source

- Steering wheel button stuck in depressed position.
- Damaged steering wheel keypad.

Fault symptom[s]

- Cruise control does not operate

ECM-P060661: CONTROL MODULE PROCESSOR. ALGORITHM BASED FAILURES. SIGNAL CALCULATION FAILURE (B6324S5; 2011-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P060661

Condition

Fig. 250: Identifying Engine Control Module (ECM)
Courtesy of VOLVO CARS CORPORATION

The Engine control module (ECM) continuously monitors a number of internal signals through calculations and compares them. The aim is to ensure reliability during operation.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Internal checks give unacceptable results.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Engine running.

Substitute Value

- Various internal signals in the engine control module (ECM) are replaced with default values.

Possible Source

- Poorly charged battery or corroded connecting wiring.
- Damaged software in the engine control module (ECM).
- Damaged engine control module (ECM).

Fault symptom[s]

- Warning lights and chimes/Malfunction Indicator Light ("Check engine" light) indication/no indication
- Driving/Poor performance/lacks power
- Driving/Poor performance/lacks power/At take off
- Driving/Hesitates/surges/Unsure when/at all times
- Driving/Hesitates/surges/During acceleration

- Driving/Hesitates/surges/During deceleration
- Driving/Hesitates/surges/At steady speed

FAULT TRACING

CHECKING THE STATUS

Fig. 251: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Engine idling.

  Read the diagnostic status and fault status for the diagnostic trouble code by selecting the diagnostic trouble code in the list.

Check if the malfunction is permanent or intermittent by reading off the diagnostic trouble code's status when the diagnostic status is "Implemented".

If the trouble status is "Malfunction found", this indicates that the malfunction is permanent. If the trouble status is "No malfunction found", this indicates that the malfunction is intermittent and not active right now.

NOTE: Trouble status cannot go from "Malfunction found" to "No malfunction found" in the same operating cycle.

Fig. 252: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **CHECKING THE BATTERY AND CONNECTIONS**

REPLACING THE COMPONENT

The engine control module (ECM) has registered an internal fault.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults may be due to interference at start or may be a different type of fault that occurs on different occasions. The fault is evaluated depending on how it occurs.

Ensure that the software in the Engine control module (ECM) is correct by downloading it again.

If the fault recurs, replace the control module.

In the event of a permanent fault, replace the engine control module (ECM).

Remedy as necessary.

Other information

- see **ENGINE CONTROL MODULE (ECM)**

  Refer to **INFORMATION**

CHECKING THE BATTERY AND CONNECTIONS

Check the battery.

Check the battery terminals and the engine control module (ECM) connector. Check for contact resistance, play and oxidation.

- **Continue**

  Refer to **REPLACING THE COMPONENT**

INFORMATION

FAULT-TRACING INFORMATION

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

ECM-P060662: CONTROL MODULE PROCESSOR. ALGORITHM BASED FAILURES. SIGNAL COMPARE FAILURE (B6324S5; 2011-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P060662

Condition

Fig. 254: Identifying Engine Control Module (ECM)
Courtesy of VOLVO CARS CORPORATION

The Engine control module (ECM) continuously monitors a number of internal signals through calculations and compares them. The aim is to ensure reliability during operation.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Internal checks give unacceptable results.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Engine running.

Substitute Value

- Various internal signals in the engine control module (ECM) are replaced with default values.

Possible Source

- Sequential fault related to throttle. Therefore fault-trace for another diagnostic trouble code (DTC).
- Poorly charged battery or corroded connecting wiring.
- Damaged software in the engine control module (ECM).
- Damaged engine control module (ECM).

Fault symptom[s]

- Warning lights and chimes/Malfunction Indicator Light ("Check engine" light) indication/no indication
- Driving/Poor performance/lacks power
- Driving/Poor performance/lacks power/At take off
- Driving/Hesitates/surges/Unsure when/at all times
- Driving/Hesitates/surges/During acceleration
- Driving/Hesitates/surges/During deceleration
- Driving/Hesitates/surges/At steady speed

FAULT TRACING

see **FAULT TRACING**

ECM-P060696: CONTROL MODULE PROCESSOR. COMPONENT FAILURES. COMPONENT INTERNAL FAILURE (B6324S5; 2011-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P060696

Condition

Fig. 255: Identifying Engine Control Module (ECM)
Courtesy of VOLVO CARS CORPORATION

The Engine control module (ECM) continuously monitors a number of internal signals through calculations and compares them. The aim is to ensure reliability during operation.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Internal checks give unacceptable results.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition on.

Substitute Value

- Various internal signals in the engine control module (ECM) are replaced with default values.

Possible Source

- Poorly charged battery or corroded connecting wiring.
- Damaged software in the engine control module (ECM).
- Damaged engine control module (ECM).

Fault symptom[s]

- Warning lights and chimes/Malfunction Indicator Light ("Check engine" light) indication/no indication
- Driving/Poor performance/lacks power
- Driving/Poor performance/lacks power/At take off
- Driving/Hesitates/surges/Unsure when/at all times
- Driving/Hesitates/surges/During acceleration
- Driving/Hesitates/surges/During deceleration
- Driving/Hesitates/surges/At steady speed

FAULT TRACING

CHECKING THE STATUS

Fig. 256: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on, wait for at least 15 seconds to perform the diagnosis.

  Read the diagnostic status and fault status for the diagnostic trouble code by selecting the diagnostic trouble code in the list.

  Check if the malfunction is permanent or intermittent by reading off the diagnostic trouble code's status when the diagnostic status is "Implemented".

  If the trouble status is "Malfunction found", this indicates that the malfunction is permanent. If the trouble status is "No malfunction found", this indicates that the malfunction is intermittent and not active right now.

NOTE: Trouble status cannot go from "Malfunction found" to "No malfunction

found" in the same operating cycle.

Fig. 257: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

The engine control module (ECM) has registered an internal fault.

If the fault is intermittent, it has been registered previously but no longer remains. Intermittent faults can be due to disruption when the engine control module (ECM) started or can be another type of fault that may recur at different instances. The fault is assessed on a case by case basis. If the fault recurs, replace the engine control module (ECM).

In the event of a permanent fault, replace the engine control module (ECM).

Remedy as necessary.

Other information

- see **ENGINE CONTROL MODULE (ECM)**

ECM-P060700: CONTROL MODULE PERFORMANCE. GENERAL FAULT INFORMATION. NO INFORMATION ABOUT FAULT TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P060700

Condition

Fig. 259: Identifying Engine Control Module (ECM)
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers an internal fault

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Various internal signals in the engine control module (ECM) are replaced with default values.
- Cruise control turned off when the fault is active.
- The electronic throttle module (ETM) follows the pulse width modulated accelerator pedal signal directly.

Possible Source

- Poorly charged battery or corroded connecting wiring.
- Damaged software in the engine control module (ECM).
- Damaged engine control module (ECM).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit
- Engine misfires.
- Cruise control does not function at all.

FAULT TRACING

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P061A00 INTERNAL CONTROL MODULE TORQUE PERFORMANCE. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION

(B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Engine Control Module (ECM) monitors the torque in the engine by reading and interpreting signals from mass air flow sensor, electronic throttle unit and air pressure sensor in the inlet manifold.

The diagnostic trouble code (DTC) is stored if the measured torque exceeds the requested torque, based on the pedal position and the engine speed (RPM).

The diagnostic trouble code (DTC) can be diagnosed in specific driving conditions.

Substitute Value

- The engine torque is limited by the throttle position (maximum permitted torque depends on accelerator pedal position).

Possible Source

- Air leakage in the intake manifold (downstream of the mass air flow (MAF) sensor and electronic throttle unit).
- Damaged throttle unit.
- Damaged mass air flow (MAF) sensor.
- Damaged engine coolant temperature (ECT) sensor.
- Damaged flywheel sensor.
- Damaged air pressure sensor in the inlet manifold.
- Damaged camshaft reset valve.
- Damaged VVT-unit.
- Damaged engine control module (ECM).

Fault symptom[s]

- Jerky running

FAULT-TRACING

INFORMATION

The diagnostic trouble code is stored since another diagnostic function has been close to or above the malfunction limit. Likely, this diagnostic trouble code is stored together with the diagnostic trouble code for the basic problem. Therefore fault-trace for another diagnostic trouble code (DTC).

For further information on this diagnostic trouble code, see Diagnostic trouble code (DTC) information.

ECM-P061A62 INTERNAL CONTROL MODULE TORQUE PERFORMANCE. ALGORITHM BASED FAILURES. SIGNAL COMPARE FAILURE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Engine Control Module (ECM) monitors the torque in the engine by reading and interpreting signals from mass air flow sensor, electronic throttle unit and air pressure sensor in the inlet manifold.

The diagnostic trouble code (DTC) is stored if the measured torque exceeds the requested torque, based on the pedal position and the engine speed (RPM).

The diagnostic trouble code (DTC) can be diagnosed in specific driving conditions.

Substitute Value

- Cruise control is disengaged when the fault is active.
- The engine torque is limited using fuel shut-off (maximum permitted torque depends on accelerator pedal position).

Possible Source

- Air leak downstream of the mass air flow (MAF) sensor.
- Damaged throttle unit.
- Damaged mass air flow (MAF) sensor.
- Damaged engine coolant temperature (ECT) sensor.
- Damaged flywheel sensor.
- Damaged air pressure sensor in the inlet manifold.
- Damaged camshaft reset valve.
- Damaged VVT-unit.

- Damaged engine control module (ECM).

Fault symptom[s]

- Jerky running

FAULT-TRACING INFORMATION

INFORMATION

The diagnostic trouble code is stored since another diagnostic function has been close to or above the malfunction limit. Likely, this diagnostic trouble code is stored together with the diagnostic trouble code for the basic problem. Therefore fault-trace for another diagnostic trouble code (DTC).

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P061A68

Condition

NOTE: **This diagnostic trouble code (DTC) status is an event controlled diagnostic trouble code (DTC). An event controlled diagnostic trouble code (DTC) does not mean that there is a fault in the control module when it is active, but is designed as information.**

Engine Control Module (ECM) monitors the torque in the engine by reading and interpreting signals from mass air flow sensor, electronic throttle unit and air pressure sensor in the inlet manifold. The diagnostic trouble code (DTC) is stored if the measured torque exceeds the requested torque, based on the pedal position and the engine speed (RPM).

The diagnostic trouble code (DTC) can be diagnosed in specific driving conditions.

Substitute Value

- Nothing.

Possible Source

- This diagnostic trouble code (DTC) is not caused by a fault that needs to be remedied.

Fault symptom[s]

- None.

ECM-P061B64 INTERNAL CONTROL MODULE TORQUE CALCULATION PERFORMANCE. ALGORITHM BASED FAILURES. SIGNAL PLAUSIBILITY FAILURE (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P061B64

Condition

Engine Control Module (ECM) monitors the torque in the engine by reading and interpreting signals from mass air flow sensor, electronic throttle unit and air pressure sensor in the inlet manifold.

Torque is calculated according to two separate methods. The control module checks and compares both results of the calculation.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects that both results of the calculations deviate too much from each other.

The diagnostic trouble code (DTC) can be diagnosed in specific driving conditions.

Substitute Value

- The engine torque is limited by the throttle position (maximum permitted torque depends on accelerator pedal position).

Possible Source

- Air leakage in the intake manifold (downstream of the mass air flow (MAF) sensor and electronic throttle unit).
- Damaged throttle unit.
- Damaged mass air flow (MAF) sensor.
- Damaged engine coolant temperature (ECT) sensor.
- Damaged flywheel sensor.
- Damaged air pressure sensor in the inlet manifold.
- Damaged camshaft reset valve.
- Damaged VVT-unit.
- Damaged engine control module (ECM).

Fault symptom[s]

ECM-P061B68 INTERNAL CONTROL MODULE TORQUE CALCULATION PERFORMANCE. ALGORITHM BASED FAILURES. EVENT INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P061B68

Condition

NOTE: **This diagnostic trouble code (DTC) status is an event controlled diagnostic trouble code (DTC). An event controlled diagnostic trouble code (DTC) does not mean that there is a fault in the control module when it is active, but is designed as information.**

Engine control module (ECM) monitors the torque model internally in the control module. If the control module detects that the torque model has been outside the limit value for a certain time, the diagnostic trouble code is generated.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- Nothing.

Possible Source

- This diagnostic trouble code (DTC) is not caused by a fault that needs to be remedied.

Fault symptom[s]

- None.

ECM-P062001: GENERATOR CONTROL CIRCUIT. GENERAL FAILURE INFORMATION. GENERAL ELECTRICAL FAILURE (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P062001

Condition

Fig. 304: Locating Alternator Control Module (Charge Regulator)
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) regulates the alternator charge voltage (via LIN communication) on request of the central electronic module (CEM) (via CAN communication). The alternator control module (ACM) sends information on the fault to the engine control module (ECM) (via LIN communication). The diagnostic trouble code is generated if the alternator control module (ACM) sends the engine control module (ECM) information on an electrical fault in the alternator.

The diagnostic trouble code can be diagnosed when the engine is running.

Substitute Value

- The alternator control module (ACM) (charge regulator) charges with a fixed voltage of 13.8 V.

Possible Source

- A battery charger with high charging voltage was connected previously.
- Worn carbon brushes.
- Damaged alternator control module (ACM) (charge regulator).
- Damaged alternator.

Fault symptom[s]

- Battery discharged.

FAULT-TRACING

CHECKING COMPONENTS AND WIRING

Fig. 305: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off

  HINT: This diagnostic trouble code (DTC) can be stored if a battery charger with too high charge voltage has been connected.

  Check the generator (GEN) brushes (carbon). Check that the brushes can move in the regulator housing. The brushes are lightly sprung. Also check the slip rings.

If the brushes and slip rings appear to be OK, try a new alternator control module (ACM) (charge regulator).

Remedy as necessary.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P062900: FUEL PUMP A CONTROL CIRCUIT HIGH. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-

2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P062900

Condition

Fig. 33: Identifying Fuel Pump (FP) Control Module
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the control signal to the fuel pump.

The diagnostic trouble code (DTC) is stored if the control module registers a fault in the control signal to the fuel pump.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- Nothing.

Possible Source

- Fault registered by the central electronic module (CEM)

- Short-circuit to supply voltage in the signal cable.
- Damaged fuel pump (FP) control module.

Fault symptom[s]

- The starter motor turns but the engine does not start.
- Engine stops.

FAULT-TRACING

see **FAULT-TRACING**

ECM-P062900: FUEL PUMP A CONTROL CIRCUIT HIGH. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S5; 2011-2012)

CHECKING THE STATUS

Fig. 35: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on, wait for at least 15 seconds to perform the diagnosis.

  Read the diagnostic status and fault status for the diagnostic trouble code by selecting the diagnostic trouble code in the list.

  Check if the malfunction is permanent or intermittent by reading off the diagnostic trouble code's status when the diagnostic status is "Implemented".

If the trouble status is "Malfunction found", this indicates that the malfunction is permanent. If the trouble status is "No malfunction found", this indicates that the malfunction is intermittent and not active right now.

NOTE: Trouble status cannot go from "Malfunction found" to "No malfunction found" in the same operating cycle.

Fig. 36: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)**

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

HINT: This diagnostic trouble code may be generated for malfunctions detected by the central electronic module (CEM).

NOTE: If there are diagnostic trouble codes stored in the central electronic module (CEM) for fuel pump or relay for fuel pump, then troubleshoot and remedy these first.

Fig. 37: Identifying Fuel Pump (FP) Control Module

ECM-P064100: SENSOR REFERENCE VOLTAGE A OPEN CIRCUIT. GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P064100

Condition

Fig. 59: Identifying Engine Control Module (ECM)
Courtesy of VOLVO CARS CORPORATION

Engine control module motor (ECM) checks the internal end-stage for 5 volt feed.

If voltage becomes too high or too low, the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Nothing

Possible Source

- Signal cable for connected component short-circuited to voltage
- Open circuit on signal cable for connected component.
- Signal cable for connected component short-circuited to ground.
- Damaged engine control module (ECM).

Fault symptom[s]

- Uneven idle.
- Increased emissions.
- Poor performance.
- Engine stops while driving.

FAULT TRACING

CHECKING THE STATUS

NOTE: **Trouble status cannot go from "Malfunction found" to "No malfunction found" in the same operating cycle.**

Fig. 60: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on, wait for at least 15 seconds to perform the diagnosis.

  Read the diagnostic status and fault status for the diagnostic trouble code by selecting the diagnostic trouble code in the list.

  Check if the malfunction is permanent or intermittent by reading off the diagnostic trouble code's status when the diagnostic status is "Implemented".

  If the trouble status is "Malfunction found", this indicates that the malfunction is permanent. If the trouble status is "No malfunction found", this indicates that the malfunction is intermittent and not active right

now.

NOTE: Trouble status cannot go from "Malfunction found" to "No malfunction found" in the same operating cycle.

Fig. 61: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

The engine control module (ECM) has registered an internal fault.

If the fault is intermittent, it has been registered previously but no longer remains. Intermittent faults can be due to disruption when the engine control module (ECM) started or can be another type of fault that may recur at different instances. The fault is assessed on a case by case basis. If the fault recurs, replace the engine control module (ECM).

In the event of a permanent fault, replace the engine control module (ECM).

Remedy as necessary.

Other information

- see **ENGINE CONTROL MODULE (ECM), REPLACING**
