
Fig. 85: Identifying A/C Relay
Courtesy of VOLVO CARS CORPORATION

Engine control module (ECM) checks the signal for controlling the A/C relay. If engine control module (ECM) detects a signal that is too high, the control module interprets this as a malfunction and the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Nothing.

Possible Source

- The signal cable is short-circuited to voltage.
- Damaged air conditioning (A/C) relay.

Fault symptom[s]

- A/C system does not work.

FAULT-TRACING

TROUBLESHOOTING ECM-P064700

CHECKING THE STATUS

Fig. 87: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on

  Read the diagnostic status and fault status for the diagnostic trouble code by selecting the diagnostic trouble code in the list.

  Check if the malfunction is permanent or intermittent by reading off the diagnostic trouble code's status when the diagnostic status is "Implemented".

  If the trouble status is "Malfunction found", this indicates that the malfunction is permanent. If the trouble status is "No malfunction found", this indicates that the malfunction is intermittent and not active right now.

NOTE: **Trouble status cannot go from "Malfunction found" to "No malfunction found" in the same operating cycle.**

NOTE: **This diagnostic trouble code (DTC) status is an event controlled diagnostic trouble code (DTC). An event controlled diagnostic trouble code (DTC) does not mean that there is a fault in the control module when it is active, but is designed as information.**

The engine control module (ECM) compares the front and rear heated oxygen sensor (HO2S) adaptation values. In order to check front oxygen sensor regulation, check the engine control module (ECM) output signals from the rear oxygen sensor. If the control system for the heated oxygen sensors is working correctly, the control signals from the rear oxygen sensor must be within a predefined statistical interval.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The measured signals from the rear oxygen sensor (bank 1) is over or under the permissible range for a long period of time.

  The diagnostic trouble code can be generated after 35 minutes of normal driving (not with heavy load).

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Engine running.

NOTE: This diagnostic trouble code (DTC) is primarily used for development purposes and has little or no information value during fault-tracing.

Substitute Value

- None.

Possible Source

- Leakage in the exhaust system.
- Contact resistance in the terminals.
- Damaged cable harness.
- Damaged heated oxygen sensor (HO2S).

Fault symptom[s]

- None

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P066800: PCM / ECM / TCM INTERNAL TEMPERATURE SENSOR CIRCUIT LOW. GENERAL FAILURE INFORMATION. NO SUB TYPE

INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P066800

Condition

Engine control module (ECM) measures the temperature internally in the control module using a temperature sensor. The control module checks the direct voltage from the sensor.

NOTE: The temperature sensor is integrated in the Engine control module (ECM).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The direct voltage is lower than 0.112 V.
- Incorrect value runs longer than 10 seconds.
- Incorrect value lasts for 2 or more subsequent driving cycles.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 119: Identifying Engine Control Module (ECM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- The control module uses a constant internal temperature, +60 °C.
- The control module controls the cooling fan (FC) according to pre-defined speed.

Possible Source

- Damaged engine control module (ECM).

Fault symptom[s]

- None

FAULT-TRACING

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 120: Identifying Engine Control Module (ECM)
Courtesy of VOLVO CARS CORPORATION

If engine control module (ECM) registers malfunction on temperature sensor's circuit internally in control module, the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed with the ignition on.

Substitute Value

- Engine cooling fan is activated according to predefined speed.
- Temperature assumed to be 60 °C.

Possible Source

- Damaged engine control module (ECM).

Fault symptom[s]

- Nothing.

TROUBLESHOOTING

CHECKING THE STATUS

Fig. 121: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on, wait for at least 15 seconds to perform the diagnosis.

  Read off diagnostic trouble code status.

  Check if the malfunction is permanent or intermittent by reading off the diagnostic trouble code's status when the diagnostic status is "Implemented".

  If the trouble status is "Malfunction found", this indicates that the malfunction is permanent. If the trouble status is "No malfunction found", this indicates that the malfunction is intermittent.

Fig. 122: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 123: Identifying Engine Control Module (ECM)
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

The engine control module (ECM) has registered an internal malfunction.

If the malfunction is intermittent, it has been registered previously but no longer remains. Intermittent malfunctions can be due to disruption when the engine control module (ECM) started or can be another type of malfunction that may recur at different instances. The malfunction is assessed on a case by case basis. If the malfunction recurs, replace the engine control module (ECM).

In case of permanent malfunction, replace the engine control module (ECM).

Remedy as necessary.

Other information

- see **ENGINE CONTROL MODULE (ECM), REPLACING**

ECM-P068500: ECM/PCM POWER RELAY CONTROL CIRCUIT/OPEN CIRCUIT. GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P068500

Condition

Fig. 126: Identifying Battery
Courtesy of VOLVO CARS CORPORATION

After the ignition has been turned off the engine control module (ECM) performs internal checks. Within 10 minutes the checks are completed. Then the control module cuts off the activation to the system relay's winding.

If the control module registers that the system relay still is active after activation has been cut off, the diagnostic trouble code is generated.

Substitute Value

- Nothing.

Possible Source

- Short-circuit to ground in the signal cable.
- The signal cable is short-circuited to voltage.
- Damaged system relay.

Fault symptom[s]

- Nothing.

FAULT-TRACING ECM-P068500

CHECKING THE COMPONENT AND WIRING

Fig. 127: Identifying Ignition In Off Position
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Remove the system relay.

  Check the relay for short-circuiting between #30(1) and #86(2).

  HINT: When the relay is not drawn, there shall be open circuit between the system relay's #30(1) and #86(2). If not open circuit, the relay is damaged.

  Check the signal cable between the system relay's socket #85(4) and Engine Control Module (ECM) #B16 (#C16) for short-circuiting to ground.

  HINT: The system relay winding #86(2) is connected to kl:30 and #85(4) is connected to Engine Control Module (ECM) #B16 (#C6) and actively low.

  Remedy as necessary.

- Reinstall the connectors, components etc.

- Ignition on.
- Loosen the connector for the mass air flow sensor. Check the voltage on the mass air flow sensor's connector #1. The voltage must be approximately battery voltage.
- Ignition off.

  Check the system relay when it releases (approx. 2-10 min after ignition off).

  Check the voltage on the mass air flow sensor's connector #1. There shall be no voltage when the system relay is not drawn.

Is the function OK?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

REPLACING RELAYS IN THE MAIN FUSE BOX AND OTHER RELAYS IN THE ENGINE COMPARTMENT

REMOVING

Remove:

- battery negative lead.
- relay. Position of relays according to: **INSTALLING** .

INSTALLING

Fig. 133: Identifying Fuse Box
Courtesy of VOLVO CARS CORPORATION

Install relay.

Connect battery negative lead.

- Test relay function.

Relay position, engine compartment:

- 1) Main relay.
- 2) Pulsed secondary air injection system (PAIR) pump.
- 3) Starter relay.
- 4) Air conditioning (A/C) relay.

- 5) Engine cooling fan (FC).

ECM-P068B00 CONTROL MODULE INTERNAL POWER +5V. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P068B00

Condition

Fig. 134: Identifying Battery
Courtesy of VOLVO CARS CORPORATION

After the ignition has been turned off the engine control module (ECM) performs internal checks. Within 10 minutes the checks are completed. Then the control module cuts off the activation to the system relay's winding.

If the control module registers that the system relay still is active after activation has been cut off, the diagnostic trouble code is generated.

Substitute Value

- Nothing.

Possible Source

- Short-circuit to ground in the signal cable.

- The signal cable is short-circuited to voltage.
- Damaged system relay.

Fault symptom[s]

- Nothing.

FAULT-TRACING

CHECKING THE COMPONENT AND WIRING

Fig. 135: Identifying Ignition In Off Position
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Remove the system relay.

  Check the relay for short-circuiting between #30(3) and #86(1).

  HINT: When the relay is not drawn, there shall be open circuit between the system relay's #30(3) and #86(1). If not open circuit, the relay is damaged.

  Check the signal cable between the system relay's socket #85(2) and Engine Control Module (ECM) #B16 (#C16) for short-circuiting to ground.

  HINT: Check the signal cable between the system relay's socket #85(2) and Engine Control Module (ECM) #B16 (#C16) for short-circuiting to ground.

  Remedy as necessary.

  Other information

  - see **CONNECTING THE BREAKOUT BOX**
  - see **SIGNAL SPECIFICATION**
  - see **CENTRAL ELECTRICAL UNIT ENGINE COMPARTMENT, REPLACING**

Fig. 136: Identifying Starter Motor Relay #2
Courtesy of VOLVO CARS CORPORATION

Has the fault been remedied?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING THE COMPONENT AND WIRING**

CHECKING THE COMPONENT AND WIRING

Fig. 137: Identifying Ignition In Off Position
Courtesy of VOLVO CARS CORPORATION

Check if there is voltage in the system relay's socket #87(5). System relay's socket #87(5) should not be voltage fed.

If there is voltage on the system relay's socket #87(5), check connections and branchings from the socket's #87 (5) for short-circuiting to voltage.

HINT: The system relay #30(3) is connected to kl:30 and #87(5) is the output.

Remedy as necessary.

Other information

- see **CONNECTING THE BREAKOUT BOX**
- see **SIGNAL SPECIFICATION**
- see **CENTRAL ELECTRICAL UNIT ENGINE COMPARTMENT, REPLACING**

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P069100

Condition

Fig. 141: Identifying Engine Cooling Fan
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) sends a signal (speed request to the cooling fan) to the cooling fan module. The cooling fan module then regulates voltage to the fan motor at an infinitely variable rate. The diagnostic trouble code is generated if the engine control module (ECM) detects that the control signal between the cooling fan module and the engine control module (ECM) is too low.

The diagnostic trouble code can be diagnosed when the engine is running.

NOTE: **The electric cooling fan may have a post-running time of up to approx. 6 minutes after the engine has been shut off. The time for the electric cooling fan's post-running depends on the engine's temperature, temperature in the engine compartment as well as the pressure level in the AC system.**

Substitute Value

- Cooling fan off.

Possible Source

- The signal cable is short-circuited to ground.
- Open circuit on signal cable.
- Damaged cooling fan module.

Fault symptom[s]

- Overheated engine.
- Electric cooling fan does not operate

ECM-P070000: TRANSMISSION CONTROL SYSTEM (MIL REQUEST). GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P070000

Condition

This diagnostic trouble code is only for the purpose of indicating that there is one or several diagnostic trouble codes that affect the emissions registered in the transmission control module (TCM). If transmission control module (TCM) requests that engine control module (ECM) shall activate the malfunction indicator light, the diagnostic trouble code is generated in engine control module (ECM).

Substitute Value

- Nothing.

Possible Source

- One or several diagnostic trouble codes registered in transmission control module (TCM).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULT-TRACING

INFORMATION

No fault-tracing has been developed for this diagnostic trouble code (DTC).

The diagnostic trouble code (DTC) for this fault is first stored in the Transmission control module (TCM), then in the Engine control module (ECM). This diagnostic trouble code (DTC) can first be erased when the root fault has been remedied and the diagnostic trouble code (DTC) for the root fault has been erased.

For further information on this diagnostic trouble code, see Diagnostic trouble code (DTC) information.

ECM-P070000: TRANSMISSION CONTROL SYSTEM (MIL REQUEST). GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S5; 2011-2012)

ECM-P073700: TCM ENGINE RPM OUTPUT CIRCUIT. GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P073700

Condition

Transmission control module (TCM) can request increased RPM before a downshift. Request is sent to engine control module (ECM) via the CAN-network.

If engine control module (ECM) for some reason does not allow this RPM increase, e. g., vehicle speed too low, the diagnostic trouble code is generated.

The diagnostic trouble code is only an information code, confirming that engine control module (ECM) has denied requested RPM increase.

Substitute Value

- Nothing.

Possible Source

- None.

Fault symptom[s]

- Poor gear shifting quality

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-P073768: TCM ENGINE SPEED OUTPUT CIRCUIT. ALGORITHM BASED FAILURES. EVENT INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P073768

Condition

Transmission control module (TCM) can request increased RPM before a downshift. Request is sent to engine control module (ECM) via the CAN-network.

If engine control module (ECM) for some reason does not allow this RPM increase, e. g., vehicle speed too low, the diagnostic trouble code is generated.

The diagnostic trouble code is only an information code, confirming that engine control module (ECM) has denied requested RPM increase.

Substitute Value

ECM-P085023: PARK / NEUTRAL SWITCH INPUT CIRCUIT. GENERAL SIGNAL FAILURES. SIGNAL STUCK LOW (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P085023

Condition

Engine control module (ECM) uses signals from Transmission control module (TCM) to decide which position the gear selector is in.

This is done so that Engine control module (ECM) can decide if engine start is permitted or not.

Engine control module (ECM) checks the CAN-signal from transmission control module (TCM) compared to the signal that passes via the direct-connected cable from the gear selector.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The signal on the direct-connected cable indicates that start is allowed, but the signal coming via CAN indicates the opposite.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: **The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.**

Substitute Value

- The signal coming via CAN is used.

Possible Source

- Trace the cause of the fault in the Transmission Control Module (TCM).

Fault symptom[s]

- Autostart; No Functionality
- Activation of starter engine; Delayed

FAULT-TRACING

ECM-P0A0F68 ENGINE FAILED TO START. ALGORITHM BASED FAILURES. EVENT INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P0A0F68

Condition

NOTE: **This diagnostic trouble code (DTC) status is an event controlled diagnostic trouble code (DTC). An event controlled diagnostic trouble code (DTC) does not mean that there is a fault in the control module when it is active, but is designed as information.**

Engine control module (ECM) monitors the time it takes for the engine to start. If the control module detects

that the start time has been outside the limit value for a certain time, the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed at engine start.

Substitute Value

- Nothing.

Possible Source

- This diagnostic trouble code (DTC) is not caused by a fault that needs to be remedied.

Fault symptom[s]

- None.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 163: Identifying Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) continuously detects the voltage of the rear lambda probe (bank 1).

The engine's cylinders are counted starting with the cylinder farthest from the engine's flywheel.

If engine control module (ECM) detects that the voltage is not below or above a certain value, the engine control module (ECM) interprets this as a malfunction and generates diagnostic trouble code.

The diagnostic trouble code can be diagnosed after approx. 3-5 minutes with the engine running.

Substitute Value

- Rear heated oxygen sensor control is shut off.

Possible Source

- Contact resistance and oxidation in connections.
- The signal cable is short-circuited to ground.
- Open circuit on signal cable.
- Damaged rear heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator light (MIL) on.

CHECKING THE STATUS

Fig. 164: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Start the engine and let it idle for approx. 3-5 minutes to perform the diagnosis.

  Check if the malfunction is permanent or intermittent by reading off the diagnostic trouble code's status when the diagnostic status is "Implemented".

  If the trouble status is "Malfunction found", this indicates that the malfunction is permanent. If the trouble status is "No malfunction found", this indicates that the malfunction is intermittent.

- **Continue**

  Refer to **CHECKING COMPONENTS**

CHECKING COMPONENTS

CAUTION: Do not apply rust solvent spray or grease to the heated oxygen sensor's (HO2S) connector.

Check the rear heated oxygen sensor connector (bank 1). Check for contact resistance and oxidation.

Check the signal cable between engine control module (ECM) and rear heated oxygen sensor for contact resistance and oxidation in the connections, open circuit and short-circuit to ground.

If the above troubleshooting does not solve the problem, try a new heated oxygen sensor.

Remedy as necessary.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 173: Identifying Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) continuously detects the voltage of the rear lambda probe (bank 1).

The engine's cylinders are counted starting with the cylinder farthest from the engine's flywheel.

- Bank 1 (cylinder row nearest the front): cylinders 1, 3, 5 and 7.
- Bank 2 (cylinder row furthest to the rear, nearest the passenger compartment): cylinders 2, 4, 6, and 8.

If engine control module (ECM) detects that the voltage is not below or above a certain value, the engine control module (ECM) interprets this as a malfunction and generates diagnostic trouble code.

The diagnostic trouble code can be diagnosed after approx. 3-5 minutes with the engine running.

Substitute Value

- Rear heated oxygen sensor control is shut off.

Possible Source

- Contact resistance and oxidation in connections.
- The signal cable is short-circuited to ground.

- Open circuit on signal cable.
- Damaged rear heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator light (MIL) on.

FAULT-TRACING

CHECKING THE STATUS

Fig. 174: Identifying Ignition ON

ECM-P117068: ENGINE SHUT OFF SOLENOID. ALGORITHM BASED FAILURES. EVENT INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P117068

Condition

NOTE: **This diagnostic trouble code (DTC) status is an event controlled diagnostic trouble code (DTC). An event controlled diagnostic trouble code (DTC) does not mean that there is a fault in the control module when it is active, but is designed as information.**

Engine Control Module (ECM) monitors the front heated oxygen sensor (bank 1). If the control module detects that the heated oxygen sensor value is below or above a certain level for a certain time, the diagnostic trouble code is generated.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- Nothing.

Possible Source

- This diagnostic trouble code (DTC) is not caused by a fault that needs to be remedied.

Fault symptom[s]

- None.

ECM-P117368: ROTOR CALIBRATION. ALGORITHM BASED FAILURES. EVENT INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P117368

Condition

NOTE: **This diagnostic trouble code (DTC) status is an event controlled diagnostic trouble code (DTC). An event controlled diagnostic trouble code (DTC) does not mean that there is a fault in the control module when it is active, but is designed as information.**

Engine Control Module (ECM) monitors the front heated oxygen sensor (bank 2). If the control module detects that the heated oxygen sensor value is below or above a certain level for a certain time, the diagnostic trouble code is generated.

The diagnostic trouble code (DTC) can be diagnosed when the engine is running.

Substitute Value

- Nothing.

Possible Source

- This diagnostic trouble code (DTC) is not caused by a fault that needs to be remedied.

Fault symptom[s]

- None.

ECM-P122400: THROTTLE POSITION SENSOR B OUT OF SELF TEST RANGE. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P122400

Condition

Fig. 243: Identifying Electronic Throttle Unit
Courtesy of VOLVO CARS CORPORATION

Engine control module (ECM) checks that the electronic throttle unit follows the requested throttle angle from engine control module (ECM).

If engine control module (ECM) detects that the current throttle angle deviates from the requested, the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed in specific operation situations.

Substitute Value

- Nothing.

Possible Source

- The throttle binds or is blocked (for example, dirt, ice, etc.)
- Damaged electronic throttle unit.

Fault symptom[s]

- Poor performance.
- Uneven idle.

FAULT-TRACING ECM-P122400

CHECKING COMPONENTS AND CONNECTIONS

Fig. 244: Identifying Ignition In Off Position
Courtesy of VOLVO CARS CORPORATION

- Engine idling
- Activate read-out of the throttle damper's current position and the throttle damper's reference value.
- Check that both signals follow each other at different RPM and movements of the throttle disc.
- Ignition off.

  Check if the throttle unit is blocked. Press the throttle disc to check for jamming.

  Clean the throttle unit if necessary.

  Other information

  - see **THROTTLE BODY (TB), CLEANING**
  - see **THROTTLE BODY (ELECTRONIC THROTTLE MODULE (ETM)), REPLACING**

ECM-P125000: THROTTLE VALVE SPRING. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P125000

Condition

Fig. 257: Identifying Electronic Throttle Unit
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the function in the throttle unit. When switching off the engine a mechanical function check of the electronic throttle module (ETM) is carried out where the throttle disc spring is moved to the open position (open throttle). When control has finished, the time it takes for the damper to return to the return rest position is measured.

If Engine Control Module (ECM) detects that the throttle movement does not take place within reasonable time, the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed when function check is performed.

Substitute Value

- Nothing.

Possible Source

- The throttle binds or is blocked (for example, dirt, ice, etc.)
- Damaged electronic throttle unit.

Fault symptom[s]

- Poor performance.
- Uneven idle.

ECM-P126000: THEFT DETECTED, VEHICLE IMMOBILIZED. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P126000

Condition

The Engine control module and the Central electronic module contain a code for the which is unique to each vehicle. In addition to this, each key for the vehicle is electronically coded for the intended vehicle only. Internal checks are made at the start to check that the key is the correct one for the vehicle and that the codes in the Engine control module (ECM) and Central electronic module (CEM) correspond.

The diagnostic trouble code is stored if the engine control module (ECM) registers that voltage feed for engine control module (ECM) as well as central electronic module is lost before codes are verified.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Substitute Value

- None.

Possible Source

- Loose connections to the battery.

Fault symptom[s]

- Engine fails to start
- Message in information display

FAULT-TRACING INFORMATION

ECM-P126000: THEFT REGISTERED, VEHICLE IMMOBILIZED. GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P126000

Condition

The Engine control module and the Central electronic module contain a code for the which is unique to each vehicle. In addition to this, each key for the vehicle is electronically coded for the intended vehicle only. Internal checks are made at the start to check that the key is the correct one for the vehicle and that the codes in the Engine control module (ECM) and Central electronic module (CEM) correspond.

The diagnostic trouble code is stored if the engine control module (ECM) registers that voltage feed for engine control module (ECM) as well as central electronic module is lost before codes are verified.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Nothing.

Possible Source

- Loose connections to the battery.

Fault symptom[s]

- The engine does not start.
- Message in the display.

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-P127000: ENGINE RPM OR SPEED LIMITATION REACHED. GENERAL

MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P127000

Condition

If engine control module (ECM) detects that an earlier registered malfunction of safety-related components has not been remedied in reasonable time, performance-limiting actions are taken and the diagnostic trouble code is generated.

The diagnostic trouble code confirms that engine control module (ECM) has been generated in degraded status.

Substitute Value

- Maximum vehicle speed is limited to 50 km/h.

Possible Source

- Malfunction that was detected by another diagnostic function in engine control module (ECM).

Fault symptom[s]

- Message in the display.
- Limited maximum vehicle speed.

FAULT-TRACING INFORMATION

INFORMATION

The diagnostic trouble code (DTC) is an information trouble code and never occurs alone. Therefore fault-trace for another diagnostic trouble code (DTC).

ECM-P134600: FUEL LEVEL SENSOR B CIRCUIT. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P134600

Condition

Fig. 259: Identifying Fuel Level Sensor
Courtesy of VOLVO CARS CORPORATION

If a malfunction of the fuel level sensor's ejector part is detected by central electronic module (CEM), a malfunction message is sent to engine control module (ECM) and the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Nothing.

Possible Source

- Look for the cause of the malfunction in central electronic module (CEM).

Fault symptom[s]

- Nothing.

ECM-P157200: BAKE PEDAL SWITCH CIRCUIT. GENERAL FAULT INFORMATION. TYPE OF FAULT NOT SPECIFIED. (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P157200

Condition

Fig. 260: Identifying Brake Pedal Switch
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the signal from the brake light contact by comparing it with the brake pedal position. The brake control module (BCM) transmits information on brake pedal position to the engine control module (ECM) via the CAN network.

The diagnostic trouble code is generated if the engine control module registers that the signal from the brake light contact indicates that the brake pedal is not depressed while the signal from the brake pedal position sensor indicates that the pedal is depressed.

The diagnostic trouble code can be diagnosed when the ignition is on and the brake pedal is depressed.

Substitute Value

- Cruise control turned off when fault is active.

Possible Source

- Contact resistance or oxidation in brake light contact connections.
- Contact resistance or oxidation in brake pedal position sensor connections.
- Open-circuit or short-circuit to ground on brake light contact cables.
- Damaged brake light contact.
- Damaged brake position sensor.

Fault symptom[s]

- Cruise control does not function at all.

TROUBLESHOOTING ECM-P157200

CHECKING THE STATUS

Fig. 261: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on

  Check if the malfunction is permanent or intermittent by activating readout of brake pedal position (via CAN) and position of the brake light switch.

  Check that the parameters match. Pressed brake pedal shall activate the signal from the brake light switch.

  If the signals do not match, this indicates that the malfunction is permanent. If the signals match, this indicates that the malfunction is intermittent and not active right now.

Fig. 262: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

Fig. 263: Identifying Brake Pedal Switch
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Fig. 264: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on

  Activate readout of brake pedal position (via CAN) and position of the brake light switch.

  Check that the value for brake pedal position at unaffected brake pedal is approx. 0 % and when the pedal is fully pressed down approx. 55 % when the engine is running.

  Also check that the brake light switch is activated when the pedal is pressed down.

  Check the connector for the brake pedal position sensor and the brake light switch for contact resistance, loose connections and oxidation.

  Check the ground cable between brake light switch and engine control module (ECM) #B41 (#C41) for

short-circuit to ground, as well as open circuit.

HINT: The brake pedal position sensor's signal is sent to engine control module (ECM) from brake control module (BCM) via CAN.

Remedy as necessary.

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-P157400: THROTTLE POSITION SENSOR OUTPUT SIGNALS ARE NOT CORRECT. GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P157400

Condition

Fig. 270: Identifying Electronic Throttle Unit
Courtesy of VOLVO CARS CORPORATION

Engine control module (ECM) checks the signals from the electronic throttle unit's two position sensors.

If engine control module (ECM) detects that the difference between both sensors' signals is too great, the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- In case a defective signal is detected, the other signal is used.
- Cruise control turned off when malfunction is active.

Possible Source

- Contact resistance or oxidation in the connections.
- Damaged electronic throttle unit.

Fault symptom[s]

- Poor performance.

- Cruise control does not function at all.

TROUBLESHOOTING ECM-P157400

CHECKING THE STATUS

Fig. 271: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on

  Read the diagnostic status and fault status for the diagnostic trouble code by selecting the diagnostic trouble code in the list.

  Check if the malfunction is permanent or intermittent by reading off the diagnostic trouble code's status when the diagnostic status is "Implemented".

If the trouble status is "Malfunction found", this indicates that the malfunction is permanent. If the trouble status is "No malfunction found", this indicates that the malfunction is intermittent and not active right now.

NOTE: **Trouble status cannot go from "Malfunction found" to "No malfunction found" in the same operating cycle.**

ECM-P158900: THROTTLE CONTROL UNABLE TO CONTROL TO DESIRED THROTTLE ANGLE. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P158900

Condition

Fig. 290: Identifying Electronic Throttle Unit
Courtesy of VOLVO CARS CORPORATION

Engine control module (ECM) checks the signals from the electronic throttle unit.

If engine control module (ECM) detects that feedback throttle position does not change, despite adjustment being performed, the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed in specific operation situations.

Substitute Value

- Cruise control turned off when malfunction is active.

- Feed to the electronic throttle unit shuts off, so that the throttle disc is turned to return position.

Possible Source

- The throttle binds or is blocked (for example, oil film, dust, ice, etc.)
- Incorrectly adapted electronic throttle unit.
- Damaged electronic throttle unit.
- Damaged engine control module (ECM).

Fault symptom[s]

- Message in information display
- Poor performance.
- High idle RPM.
- The cruise control does not function at all

FAULT-TRACING

CHECKING COMPONENTS AND CONNECTIONS

Fig. 291: Identifying Ignition In Off Position
Courtesy of VOLVO CARS CORPORATION

- Ignition on.
- Activate reading off the position of the throttle.
- Check that read-off throttle position shows reasonable values at different deployments.
- Ignition off.

  Check if the throttle unit is blocked. Press the throttle disc to check for jamming.

  Clean the throttle unit if necessary.

  HINT: The diagnostic trouble code (DTC) can be stored as the adaptation value for the throttle unit is incorrect. To reset this adaptation, lift the battery pole for a few seconds, refit it and turn the ignition to ignition position II for at least 5 seconds.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P160200: IMMOBILIZER/ECM COMMUNICATION ERROR. GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION

TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P160200

Condition

Engine control module (ECM) as well as central electronic module (CEM) contain a unique code for every vehicle for electronic immobilizer. In addition to this, each key for the vehicle is electronically coded to only fit in the intended vehicle. At start, internal checks are performed that the key is correct for the vehicle and that the immobilizer codes in the engine control module (ECM) and central electronic module (CEM) match.

If engine control module (ECM) registers that communication between engine control module (ECM) and central electronic module (CEM) (via CAN) is missing, the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

Nothing.

Possible Source

- Open circuit on one of the CAN-cables.
- Short-circuit between CAN-cables.
- Damaged engine control module (ECM).

Fault symptom[s]

- The engine does not start.
- Message in the display.

TROUBLESHOOTING ECM-P160200

INFORMATION

The diagnostic trouble code indicates that CAN-communication between engine control module (ECM) and central electronic module (CEM) is missing.

Among others, the code may be caused by:

- Engine control module (ECM) or central electronic module (CEM) contains no software for this vehicle.
- Open circuit in CAN-communication between central electronic module (CEM) and engine control module (ECM)
- Programmed engine control module (ECM) or central electronic module (CEM) has been moved from one vehicle to another.

HINT: Read off diagnostic trouble codes in central electronic module (CEM).

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After repairing, it is necessary to check that the malfunction has been fixed.

Fig. 304: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Reinstall connector, components, etc.

- Start the engine.

Did engine start?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P163800: CAN-LINK ECM/INSTM CIRCUIT/NETWORK. GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P163800

Condition

Fig. 305: Identifying Engine Control Module (ECM)
Courtesy of VOLVO CARS CORPORATION

If engine control module (ECM) registers that internal temperature in engine control module (ECM) has exceeded 105 °C for longer than 60 seconds, the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed when the engine is running.

Substitute Value

- Engine cooling fan is activated according to predefined speed.

Possible Source

- Extreme weather conditions.

Fault symptom[s]

- Nothing.

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-P170900: PARKING/NEUTRAL POSITION SWITCH OUTSIDE SELF-TEST RANGE. GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P170900

Condition

Fig. 306: Identifying Automatic Transmission Gear Shifter With Manual Gear Change
Courtesy of VOLVO CARS CORPORATION

Engine control module (ECM) checks the signals for the gear position sensor's position, the signal via direct-connected cable from the transmission control module (TCM) and the signal via CAN-communication from the transmission control module (TCM).

If the transmission control module (TCM) detects a malfunction of the gear position selector, then information about this is sent via CAN-communication to the engine control module (ECM) and the diagnostic trouble code is stored.

If engine control module (ECM) detects difference between the signals via CAN-communication and the signal via direct-connected cable, the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Nothing.

Possible Source

- Look for the cause of the malfunction in the transmission control module (TCM).

- Contact resistance in connector.
- Cable between gear position selector and engine control module (ECM) short-circuited to voltage.
- Open circuit on cable between gear position selector and engine control module (ECM).
- Cable between gear position selector and engine control module (ECM) short-circuited to ground.

Fault symptom[s]

- The engine does not start.
- Message in the display.

TROUBLESHOOTING ECM-P170900

CHECKING COMPONENTS AND WIRING

HINT: If diagnostic trouble code for gear position sensor is stored in transmission control module (TCM), then troubleshoot this diagnostic trouble code first.

- Check transmission control module (TCM) connector for contact resistance and oxidation.

  Check the signal cable for open circuit, short-circuit to voltage and short-circuit to ground.

  Measure between engine control module (ECM) #B15 (#C15) and transmission control module (TCM) #5.

  Remedy as necessary.

  HINT: Read off the gear position sensor's signals using the VCT2000 (or appropriate scan tool).

  Other information

  - see **CONNECTING THE BREAKOUT BOX**
  - see **SIGNAL SPECIFICATION, ENGINE CONTROL MODULE (ECM)**
  - see **CHECKING WIRING AND TERMINALS**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P193400: VEHICLE SPEED SIGNAL. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P193400

Condition

If a malfunction of the speed signal is detected in the brake control module (BCM), a malfunction message is sent to engine control module (ECM) and a diagnostic trouble code is stored in the engine control module (ECM).

Diagnostic trouble codes (DTCs) for the vehicle speed sensor (VSS) signal are stored in the brake control module (BCM).

Substitute Value

- Cruise control is disengaged when the fault is active.
- The speed signal from the transmission control module (TCM) is used, automatic transmission.
- The speed signal from the brake control module (BCM) is set to 6 km/h, manual transmission.

Possible Source

- Look for the cause of the fault in the brake control module (BCM).

Fault symptom[s]

- Malfunction indicator light (MIL), on
- Cruise control does not operate

FAULT-TRACING

see **FAULT-TRACING**

ECM-P193400: VEHICLE SPEED SIGNAL. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S5; 2011-2012)

ECM-P193400: SPEED SIGNAL VEHICLE. GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P193400

Condition

If a malfunction of the speed signal is detected in the brake control module (BCM), a malfunction message is sent to engine control module (ECM) and a diagnostic trouble code is stored in the engine control module (ECM).

Diagnostic trouble codes (DTCs) for the vehicle speed sensor (VSS) signal are stored in the brake control module (BCM).

Substitute Value

- Cruise control shut off.
- The speed signal from the transmission control module (TCM) is used, automatic transmission.
- The speed signal from the brake control module (BCM) is set to 6 km/h, manual transmission.

Possible Source

- Look for the cause of the fault in the brake control module (BCM).

Fault symptom[s]

- Malfunction indicator light (MIL), on
- Cruise control does not operate

FAULTY SIGNAL

INFORMATION

No fault-tracing has been developed for this diagnostic trouble code (DTC). The diagnostic trouble code (DTC) for this fault is stored first in the brake control module (BCM), then in the engine control module (ECM). This diagnostic trouble code (DTC) cannot be erased before the diagnostic trouble code (DTC) in the brake control module (BCM) has been remedied and erased.

First read off the diagnostic trouble codes (DTCs) in the brake control module (BCM). Fault-trace and remedy as necessary. This diagnostic trouble code (DTC) can then be erased.

ECM-P200400: INTAKE MANIFOLD RUNNER CONTROL STUCK OPEN (BANK 1). GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P200400

Condition

The Engine control module (ECM) checks the function of the variable intake system (VIS) that affects the air flow in the intake system.

The function can be checked by checking the difference between the measured air flow and the expected air flow.

Expected air flow based on requested position of the actuator.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- The actual air flow differs from the expected air flow, the primary throttle unit (upper) is detected to be open.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Less than 2500 meters above sea level.
- Fully open throttle.
- Engine speed 2300-3500 RPM.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 334: Identifying Atmospheric Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Damaged primary throttle unit (upper).

Fault symptom[s]

- Poor performance

FAULT-TRACING

CHECKING THE STATUS

Fig. 335: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Activate the upper primary actuator.

  Check if the fault is permanent or intermittent.

  Check that the throttle unit is activated.

  HINT: It may be necessary to remove the throttle unit from the induction pipe to ensure proper functionality.

  The fault is permanent if the function is faulty.

  If the function is correct, this is an indication that the fault was present previously but is not active at the moment, i. e. an intermittent fault.

Fig. 336: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING THE COMPONENT AND WIRING**

CHECKING THE COMPONENT AND WIRING

Check the voltage on throttle unit connector #3 to the system relay. The voltage must be approximately battery voltage when the ignition is on.

Check signal cable for an open-circuit and short-circuit to supply voltage.

Take readings between:

- Engine control module (ECM) terminal #A38 (#A38) and throttle unit terminal #1.

Remedy as necessary.

Other information

- see **CHECKING WIRING AND TERMINALS**
- **Continue**

  Refer to **VERIFICATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P200400

Condition

Fig. 340: Identifying Intake Manifold Control Valve
Courtesy of VOLVO CARS CORPORATION

The Engine control module checks the damper in the (VIS) by regulating the valve for the damper's vacuum motor. The function of the system can be diagnosed by interpreting the signal from the manifold absolute pressure (MAP) sensor.

A diagnostic trouble code (DTC) is stored if the control module detects:

- That the damper for the variable intake system has jammed in the open position.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- The engine RPM is greater than a certain value.

Substitute Value

- None.

Possible Source

- Damaged control valve.
- Sticking damper.
- Damaged vacuum motor.

Fault symptom[s]

- Poor performance

FAULT-TRACING ECM-P200400

CHECKING THE COMPONENT AND WIRING

Check the function of the control valve (2) by activating it. The valve should click on activation.

Connect a vacuum pump to the control valve's terminal (for hose connected to the intake manifold) and pump to create a vacuum. Listen for leakage and check the pump's gauge for stable pressure. If the pressure drops, this means a leaking valve.

Check that the dampers (4) can move freely and that nothing is obstructing them.

HINT: Check the function by pumping a vacuum to the vacuum motor.

Remedy as necessary.

Condition

Fig. 358: Identifying Fuel Level Sensor
Courtesy of VOLVO CARS CORPORATION

If a malfunction of the fuel level sensor's ejector part is detected by central electronic module (CEM), a malfunction message is sent to engine control module (ECM) and the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Nothing.

Possible Source

- Look for the cause of the malfunction in central electronic module (CEM).

Fault symptom[s]

- Nothing.

FAULTY SIGNAL

INFORMATION

No fault-tracing has been developed for this diagnostic trouble code (DTC). The diagnostic trouble code (DTC) for this fault is stored first in the central electronic module (CEM), then in the engine control module (ECM). This diagnostic trouble code (DTC) can not be erased before the diagnostic trouble codes (DTC) in the central electronic module (CEM) has been remedied and erased.

First read off the diagnostic trouble codes (DTCs) in the central electronic module (CEM). Fault-trace and remedy as necessary. This diagnostic trouble code (DTC) can then be erased.

ECM-P209600: POST CATALYST FUEL TRIM SYSTEM TOO LEAN BANK 1. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B8444S; 2008-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Engine Control Module (ECM) receives information from the rear heated oxygen sensor about fuel/air mixture in different load areas. Internal functions in the control module detect faults in the lambda control.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Large differences have been measured in fuel/air mixture between the front and rear heated oxygen sensors (HO2S). So large that the trims for the rear heated oxygen sensor are in one of their limit positions.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Run the engine to operating temperature (coolant temperature greater than 80 °C).
- Normal load at engine speeds between 1500-2000 RPM in 20-30 minutes.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 359: Identifying Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Contact resistance, oxidation or poor contact in connections.
- Air leakage in the exhaust system.
- Damaged front heated oxygen sensor (HO2S).
- Damaged rear heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator light (MIL), on

FAULT-TRACING

CHECKING COMPONENTS

Check relevant connectors for contact resistance and corrosion.

Check the exhaust system for air leakage.

HINT: Both a damaged front and/or a damaged rear heated oxygen sensor may be the cause of the stored diagnostic trouble code (DTC).

HINT: Check other stored DTCs to draw relevant conclusions about which heat oxygen sensor(s) should be replaced, this is to avoid incorrect replacement of components.

Remedy as necessary.

Other information

ECM-P211100: ELECTRONIC THROTTLE UNIT CONTROL SYSTEM - JAMMED IN OPEN POSITION. GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P211100

Condition

Fig. 364: Identifying Electronic Throttle Unit
Courtesy of VOLVO CARS CORPORATION

Engine control module (ECM) checks the difference in requested electronic throttle unit position from actual position.

If engine control module (ECM) detects that the electronic throttle unit cannot close, and jams in open position, which gives reduced brake vacuum, the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed when the engine is running.

Substitute Value

- The vehicle's max. speed is limited.

Possible Source

- Object is blocking the throttle plate (oil film, dust, etc.)
- Damaged electronic throttle unit.

Fault symptom[s]

- Reduced braking performance.

- Message in the display.
- The vehicle's max. speed is reduced.

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-P211800: THROTTLE ACTUATOR CONTROL MOTOR CURRENT RANGE/PERFORMANCE. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P211800

Condition

Fig. 365: Identifying Electronic Throttle Unit
Courtesy of VOLVO CARS CORPORATION

Engine control module (ECM) checks the signals from the electronic throttle unit.

If engine control module (ECM) detects electrical malfunction of the electronic throttle unit, the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed with the ignition on.

Substitute Value

- Cruise control turned off when malfunction is active.
- Feed to the electronic throttle unit shuts off, so that the throttle disc is turned to return position.

Possible Source

- Cables to the electronic throttle unit short-circuited to voltage or ground.
- Electrical malfunction of electronic throttle unit (Damaged electronic throttle unit.)
- Damaged engine control module (ECM).

Fault symptom[s]

- Poor performance.
- Uneven idle.
- The cruise control does not function at all
- Message in information display

FAULT-TRACING

CHECKING COMPONENTS AND CONNECTIONS

Fig. 366: Identifying Ignition In Off Position
Courtesy of VOLVO CARS CORPORATION

- Ignition on.
- Activate reading off the position of the throttle.
- Check that read-off throttle position shows reasonable values at different deployments.
- Ignition off.

  Check cables between Engine Control Module (ECM) and Throttle Module for short-circuit to voltage or ground.

  Check the Throttle Module electrically by measuring between casing and connector.

  Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P213500: THROTTLE/PEDAL POSITION SENSOR/CONTACT A/B VOLTAGE CORRELATION. GENERAL FAULT INFORMATION. TYPE OF

FAULT NOT SPECIFIED. (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P213500

Condition

Fig. 381: Identifying Accelerator Pedal Position Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) receives a pulse width modulation (PWM) signal and an analog signal from the accelerator pedal position sensor. In a fault-free system, the analog signal is used to determine the position of the accelerator pedal (AP).

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the signals deviate too much from each other.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Acceleration is ignored when braking.
- The lowest value input signal from the accelerator pedal position sensor is used.

Possible Source

- Loose connections or contact resistance in the connections on the analog signal cable.
- Fault in the power supply to the analog signal.
- Fault in the analog signal ground.
- Fault in the pulse width modulation (PWM) signal between the engine control module (ECM) and the electronic throttle module (ETM).
- Damaged accelerator pedal (AP) position sensor.

Fault symptom[s]

- Message in the display.
- Poor response from the accelerator pedal.
- Accelerator pedal (AP) is ignored when braking.
- Maximum vehicle speed reduced.

TROUBLESHOOTING ECM-P213500

CHECKING THE STATUS

Fig. 382: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on

  Check if the malfunction is permanent or intermittent by activating readout of the accelerator pedal position sensor's signals.

  Check that the value for both signals at unaffected accelerator pedal is approx. 8% and when the pedal is fully pressed down approx. 82%.

  If the signal is incorrect, this indicates that the malfunction is permanent. If the signal is correct, this indicates that the malfunction is intermittent and not active right now.

Fig. 383: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 384: Identifying Accelerator Pedal Position Sensor
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Check connector for contact resistance and oxidation.

Check voltage feed between engine control module (ECM) #B32 (#C32) and accelerator pedal position sensor #6.

Check the ground cable between engine control module (ECM) #B7 (#C7) and accelerator pedal position sensor #4.

Check the cable between engine control module (ECM) #B28 (#C28) and accelerator pedal position sensor #2.

Remedy as necessary.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P213562: THROTTLE/PEDAL POSITION SENSOR/SWITCH A / B VOLTAGE CORRELATION. ALGORITHM BASED FAILURES. SIGNAL

COMPARE FAILURE (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P213562

Condition

The engine control module (ECM) checks the pulse width modulation (PWM) signal and the analog signal from the accelerator pedal (AP) position sensor. The analog signal is directly connected to the Central electronic module (CEM) and the signal is transmitted via CAN communication to the Engine control module (ECM). The pulse width modulation (PWM) signal is directly connected to the engine control module (ECM).

The PWM signal is used to determine the current accelerator pedal position in a fault free system.

The Engine control module (ECM) compares both the signals to each other.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Difference between PWM signal and analog signal (via CAN) is too great.
- Incorrect value lasts longer than 16 seconds.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 391: Identifying Accelerator Pedal Position Sensor
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- The control module uses the input signal that gives the lowest accelerator pedal position.
- The control module uses the accelerator pedal position corresponding to the released position when the brake pedal is depressed at the same time.

Possible Source

- Fault-trace the central electronic module (CEM).
- Contact resistance and oxidation in the terminals.
- Damaged signal cable between the Engine control module (ECM) and the accelerator position sensor.
- Short-circuit in connections.

Fault symptom[s]

- Message in information display
- Accelerator pedal ignored during braking

FAULT-TRACING

see **FAULT-TRACING**

ECM-P215886: VEHICLE SPEED SENSOR B. BUS SIGNAL / MESSAGE FAILURES. SIGNAL INVALID (B8444S; 2008-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

If a malfunction of the speed signal is detected in the Transmission control module (TCM), a malfunction message is sent to engine control module (ECM) and a diagnostic trouble code is stored in the engine control module (ECM).

Diagnostic trouble code for the speed sensor's signal is stored in the Transmission control module (TCM).

Substitute Value

- None.

Possible Source

- Trace the cause of the fault in the Transmission Control Module (TCM).

Fault symptom[s]

- Cruise control does not operate

TROUBLESHOOTING INFORMATION

see **TROUBLESHOOTING INFORMATION**

ECM-P216200: SPEED SENSOR A/B CORRELATION. GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P216200

Condition

Information about vehicle speed is sent on the CAN-network from brake control module (BCM) and from transmission control module (TCM) to engine control module (ECM). If engine control module (ECM) detects a deviation between the speed signals from brake control module (BCM) and transmission control module (TCM), the diagnostic trouble code is stored.

Substitute Value

- Cruise control shuts off.

Possible Source

- Incorrect speed signal to brake control module (BCM).

  Look for the cause of the malfunction in the brake control module (BCM).

- Incorrect speed signal to transmission control module (TCM).

  Look for the cause of the malfunction in the transmission control module (TCM).

- Contact resistance in CAN-connections.
- Open circuit on one or both CAN-cables.
- Damaged Brake Control Module (BCM).

- Damaged transmission control module (TCM).

Fault symptom[s]

- The cruise control does not function at all
- Message in the display.

FAULT-TRACING INFORMATION

ECM-P217500: ELECTRONIC THROTTLE UNIT CONTROL SYSTEM - LOW AIR FLOW REGISTERED. GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P217500

Condition

Fig. 392: Identifying Electronic Throttle Unit
Courtesy of VOLVO CARS CORPORATION

Engine control module (ECM) checks the difference in requested electronic throttle unit position from actual position.

If engine control module (ECM) registers that the difference has been sufficiently great during warming of the catalytic converter, to give effect on emissions, the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed when the engine is running and warming of the catalytic converter.

Substitute Value

- Nothing.

Possible Source

- Other diagnostic trouble codes stored in engine control module (ECM).
- Contact resistance or oxidation in connections between electronic throttle unit and engine control module (ECM).
- Damaged electronic throttle unit.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

TROUBLESHOOTING ECM-P217500

CHECKING COMPONENT AND CONNECTIONS

Fig. 393: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Activate readout of electronic throttle unit's position.
- Check that read-off throttle position shows reasonable values at different deployments.
- Ignition off

Check engine control module ECM) and the electronic throttle unit's connector for contact resistance and oxidation.

Check if the electronic throttle unit is blocked by an object and press on the throttle disc to, see if it binds.

Clean the electronic throttle unit if needed.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P222600: BAROMETRIC PRESSURE CIRCUIT. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P222600

Condition

The Engine control module (ECM) measures the atmospheric pressure using an atmospheric pressure sensor. The control module checks the direct voltage from the sensor.

NOTE: The atmospheric pressure sensor is integrated in the Engine control module (ECM).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The direct voltage is lower than approximately 0.01 V.
- The direct voltage is higher than approximately 6 V.
- Incorrect value lasts longer than 9 seconds.
- Incorrect value lasts for 2 or more subsequent driving cycles.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 400: Identifying Engine Control Module (ECM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- The control module uses a value for atmospheric pressure that is calculated based on the air pressure in the inlet manifold.

- If a malfunction has been detected on the air pressure sensor, the control module uses a constant atmospheric pressure, 100 kPa (corresponds to sea level).

Possible Source

- Damaged engine control module (ECM).

NOTE: The diagnostic trouble code can be generated as a subsequent malfunction to a detected problem with the air pressure sensor in the inlet manifold.

Fault symptom[s]

- Malfunction indicator light (MIL), on

FAULT-TRACING

see **FAULT-TRACING**

ECM-P222600: BAROMETRIC PRESSURE CIRCUIT. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S5; 2011-2012)

ECM-P222700: BAROMETRIC PRESSURE CIRCUIT HIGH INPUT. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P222700

Condition

Fig. 401: Identifying Engine Control Module (ECM)
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) compares the filtered signal from the pressure sensor in the intake manifold with the signal from the atmospheric pressure sensor in the engine control module (ECM).

The diagnostic trouble code is generated if the control module registers that the deviation is greater than 100 hPa.

The diagnostic trouble code can be diagnosed 15 seconds after the ignition is switched.

Substitute Value

- If the pressure sensor in the intake manifold is OK, a filtered value from such is used. Otherwise, the value 1000 hPa is set (corresponds to sea level).

Possible Source

- Damaged manifold absolute pressure sensor (MAP).
- Damaged engine control module (ECM).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULT-TRACING ECM-P222700

CHECKING THE COMPONENTS AND WIRING

NOTE: Check if other diagnostic trouble codes (DTCs) are stored for the internal atmospheric pressure sensor or if diagnostic trouble codes (DTCs) for the air pressure sensor in the inlet manifold are stored in the Engine Control Module

(ECM). These diagnostic trouble codes (DTCs) must be fault-traced and any faults remedied first.

Fig. 402: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Activate reading the value from the manifold absolute pressure (MAP) sensor and the atmospheric pressure sensor.

  Check the difference between pressures, the difference shall not be greater than 70 hPa.

  HINT: Normal atmospheric pressure is 1013 hPa.

  Check cables and connectors to the air pressure sensor inlet for contact resistance or oxidation, short-circuit to ground and voltage as well as open circuit.

  Remedy as necessary.

  Try with a new air pressure sensor. Check the difference between pressures, the difference shall not be greater than 70 hPa.

  When the difference between the pressures is greater than 70 hPa this indicates that the internal atmospheric pressure sensor in the engine control module (ECM) is damaged. The atmospheric pressure sensor is built into the engine control module (ECM) and therefore cannot be replaced as a separate item.

  Remedy as necessary.

Condition

The Engine control module (ECM) measures the atmospheric pressure using an atmospheric pressure sensor. The control module checks the direct voltage from the sensor.

NOTE: The atmospheric pressure sensor is integrated in the Engine control module (ECM).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The direct voltage is lower than 0.098 V.
- Incorrect value lasts longer than 9 seconds.
- Incorrect value lasts for 2 or more subsequent driving cycles.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 1: Identifying Engine Control Module (ECM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- The control module uses a value for atmospheric pressure that is calculated based on the air pressure in the inlet manifold.
- If a malfunction has been detected on the air pressure sensor, the control module uses a constant atmospheric pressure, 100 kPa (corresponds to sea level).

Possible Source

- Damaged engine control module (ECM).

NOTE: **The diagnostic trouble code can be generated as a subsequent malfunction to a detected problem with the air pressure sensor in the inlet manifold.**

Fault symptom[s]

- Malfunction indicator light (MIL), on

ECM-P222800: ATMOSPHERIC PRESSURE CIRCUIT LOW INPUT SIGNAL. GENERAL FAULT INFORMATION. TYPE OF FAULT NOT SPECIFIED. (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 2: Identifying Engine Control Module (ECM)
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code is generated if the engine control module (ECM) registers an internal fault that indicates that the signal from the internal atmospheric pressure sensor is faulty.

The diagnostic trouble code can be diagnosed when the ignition has been switched on for at least 15 seconds.

Substitute Value

- If the pressure sensor in the intake manifold is OK, a filtered value from such is used. Otherwise, the value 1000 hPa is set (corresponds to sea level).

Possible Source

- Damaged engine control module (ECM).

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULT TRACING

CHECKING THE STATUS

Fig. 3: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on, wait for at least 15 seconds to carry out diagnostics.

  Read the diagnostic status and fault status for the diagnostic trouble code by selecting the diagnostic trouble code in the list.

Check whether the fault is permanent or intermittent. Read off the diagnostic trouble code (DTC) fault status when the diagnostic status is "Completed".

The fault is permanent if the fault status is "Fault found". If the fault status is "No fault found" the fault is intermittent and not presently active.

NOTE: The fault status cannot change from "Fault found" to "No fault found" in the same operating cycle.

Fig. 4: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

The engine control module (ECM) has registered an internal fault in the atmospheric pressure sensor in the control module.

If the fault is intermittent, it has been registered previously but no longer remains. Intermittent faults can be due to disruption when the engine control module (ECM) started or can be another type of fault that may recur at different instances. The fault is assessed on a case by case basis. If the fault recurs, replace the engine control

module (ECM).

In the event of a permanent fault, replace the engine control module (ECM).

Remedy as necessary.

Other information

- see **ENGINE CONTROL MODULE (ECM), REPLACING**

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 7: Identifying Heated Oxygen Sensor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) continuously detects the voltage of the rear lambda probe (bank 1).

The engine's cylinders are counted starting with the cylinder farthest from the engine's flywheel.

If engine control module (ECM) detects that the voltage is not below or above a certain value, the engine control module (ECM) interprets this as a malfunction and generates diagnostic trouble code.

The diagnostic trouble code can be diagnosed after approx. 3-5 minutes with the engine running.

Substitute Value

- Rear heated oxygen sensor control is shut off.

Possible Source

- Contact resistance and oxidation in connections.
- The signal cable is short-circuited to ground.
- Open circuit on signal cable.
- Damaged rear heated oxygen sensor (HO2S).

Fault symptom[s]

- Malfunction indicator light (MIL) on.

ECM-P240700: EVAPORATIVE EMISSION SYSTEM LEAK DETECTION PUMP SENSE CIRCUIT INTERMITTENT/ERRATIC. GENERAL FAILURE

INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P240700

Condition

Fig. 37: Identifying Leak Diagnostic Pump
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the function of the leakage diagnosis unit by measuring the current through the leakage diagnosis pump.

If the Engine control module (ECM) registers that the current curve is unreasonably noisy, the control module interprets that the reference measurement has produced a faulty result and the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed when leakage diagnosis is running.

Substitute Value

- Leakage diagnosis is interrupted.

Possible Source

- Dirt or moisture in the pump.
- Damaged heating element in the pump.
- Damage leakage diagnosis pump.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULT-TRACING

see **FAULT-TRACING**

ECM-P240800: FUEL CAP SENSOR/SWITCH CIRCUIT. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P240800

Condition

The engine control module (ECM) receives confirmation from the central electronic module (CEM) as to whether the request for tank flap locking was sent to the locking relay.

Locking should occur at 17 km/h. The diagnostic trouble code is generated if the engine control module (ECM) registers that vehicle speed has exceeded 17 km/h for at least 10 seconds without receipt of the central electronic module (CEM) signal.

Substitute Value

- Nothing.

Possible Source

- Loose connections or contact resistance in CAN connections.

- Damaged CAN cables.
- Disruptions on CAN signal cables.
- Another node in the HS-CAN network is damaged.

Fault symptom[s]

- Nothing.

FAULT-TRACING

GENERAL INFORMATION

The diagnostic trouble code (DTC) is stored in the event of communication faults on the high speed side of the control area network (CAN). There can be a number of causes for faults in the communication:

- Intermittent open-circuit in one or both CAN cables in part of the network
- Intermittent short-circuits between the CAN cables
- Intermittent short-circuits between one of the CAN cables and ground or supply voltage
- Fault in the communication circuit in one or more control modules
- Internal fault in a control module on the CAN network that results in the control module transmitting faulty messages on the CAN network.

In the event of a diagnostic trouble code (DTC) for a communication fault in the relevant control module, any diagnostic trouble codes (DTCs) in the central electronic module (CEM) must also be checked. The central electronic module (CEM) monitors the voltage level in the CAN cables. The central electronic module (CEM) is the only control module that can directly store a diagnostic trouble code (DTC) for a short-circuit in one of the cables for ground or supply voltage. Do not replace the central electronic module (CEM) in the event of a CAN fault unless fault-tracing has indicated that the central electronic module (CEM) has an internal fault.

In order to check the control area network (CAN) cables, the resistance in the network must be measured.

Other information

- see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK (2005-2012)**

- **Continue**

  Refer to **TAKING READING ON CABLE IN THE CAN NETWORK (HS-CAN)**

TAKING READING ON CABLE IN THE CAN NETWORK (HS-CAN)

Fig. 38: Identifying Ignition In Off Position And Disconnecting Negative Cable From Battery
Courtesy of VOLVO CARS CORPORATION

- Disconnect the battery negative lead.
- Remove the central electronic module (CEM)
- Connect the breakout box to the cable harness for the central electronic module (CEM). Do not connect the central electronic module (CEM).

  HINT: Where a breakout box cannot be used, take readings from the rear of the affected connectors if possible. This prevents terminal pins and socket housings being damaged.

  Disconnect the CAN network to make it easier to locate a fault. A suitable point to disconnect the network is at the central electronic module (CEM). Fault-tracing therefore starts from the central electronic module (CEM).

  Take resistance readings across the following terminals. Various readings will be obtained due to the structure of the network. Twist the cable harness and work the connectors at accessible points along the cable harness in order to check whether the resistance changes during each measurement. This method can be used to detect intermittent short-circuits or open-circuits.

  NOTE: The following resistance readings only measure the main arteries in the high speed network, not the junctions that exist for some control modules. If an open-circuit is suspected in a cable, or a short-circuit is suspected in one of its junctions, the connector at the control module for this junction must be disconnected and the reading taken from there.

  Take the following readings

  - Resistance between C3:47 and C3:48. Resistance should be 120 ohms.

NOTE: **Measuring will only give value 120 ohms if the main circuit in the CAN-net is intact. If there is a short-circuit somewhere in the CAN-net (either main circuit or other branching) the resistance will be 0 ohms.**

- The resistance between C3:48 and a connection to voltage as well as between C3:48 and a short-circuit to ground. The resistance shall be very high (more than 1 Mohms).
- The resistance between C3:47 and a connection to voltage as well as between C3:47 and a short-circuit to ground. The resistance shall be very high (more than 1 Mohms).

HINT: Any short-circuit detected on the CAN-net may be on the main circuit or on any branching running out to some control modules. If a fault is found, try to disconnect the junction with the fault at a point further forward. Try to locate the fault in this way.

Remedy as necessary.

Other information

- see **BATTERY, DISCONNECTING**
- see **CONNECTING THE BREAKOUT BOX**
- see **SIGNAL SPECIFICATION**
- see **CHECKING WIRING AND TERMINALS**

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING THE TRAFFIC LOAD ON THE CAN CABLES**

CHECKING THE TRAFFIC LOAD ON THE CAN CABLES

Fig. 39: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Connect the central electronic module (CEM) to the breakout box
- Connect the battery.
- Ignition on.

NOTE: **When the adapter cable harness and the central electronic module (CEM) have been connected, there is access to both sides of the CAN network (both LS-CAN and HS-CAN). There will also be traffic on both networks. Be careful to check the terminals between which the readings are to be taken so that the intended reading is not taken on the wrong network.**

Faults in the CAN network may be due to a control module sending faulty messages that disrupt normal communication. When messages are sent incorrectly, this results in a considerable increase in the amount

of traffic on the CAN network. Check the load by measuring the average voltage value on the CAN cables in relation to ground.

Check as follows:

- Measure the voltage between C3:48 and ground. The voltage shall be approx. 2.3 V.
- Measure the voltage between C3:47 and ground. The voltage shall be approx. 2.8 V.

Other information

- see **BATTERY, DISCONNECTING**

Is the value OK?

- **YES**

  Refer to **INFORMATION**

- **NO**

  Refer to **IDENTIFYING A CONTROL MODULE IN THE CAN NETWORK**

IDENTIFYING A CONTROL MODULE IN THE CAN NETWORK

If the load on the CAN network is too high, this may be due to a control module sending faulty messages on the CAN network (known as a disruptive control module). The fault may also be due to an intermittent short-circuit to supply voltage or ground in one of the CAN cables. This results in the control modules on the CAN network starting to send faulty messages. The faults can occur without a diagnostic trouble code (DTC) being stored by the control modules. The voltage can be measured between the CAN cables in order to check the load on the CAN network.

- Check communication/load on HS-CAN by measuring voltage between C3:48 and C3:47. The voltage's average value shall be approx. 0.5 V (permitted is 0.4 to 0.6 V). In case of communication error, the voltage is approx. 0.7 V and higher.

In order to identify which control module is communicating incorrectly, cut the power supply to one control module at a time. Check the voltage in the CAN cables again. The easiest way to cut the power supply is to remove the fuse(s) for the relevant control module. Continue until the voltage between the CAN cables drops to approximately 0.5 V.

HINT: When the suspected control module has been identified, connect and disconnect the supply voltage to the control module a number of times to verify that the fault appears and disappears. Ignition off between each check.

NOTE: Do not cut the power to the central electronic module (CEM) unless it is the last control module left to check.

A control module that is communicating incorrectly must be replaced. Remedy as necessary.

NOTE: **Following a fault involving control modules that disrupt communication, other control modules may operate in Limp-Home mode (i. e. they work but with limited functionality) even after switching the ignition off and on a number of times. To remedy this, disconnect and reconnect the battery negative terminal to restore the control modules to normal function.**

NOTE: **A faulty control module that disrupts communication can place other control modules in Limp-Home mode (i. e. they work but with limited functionality) even after switching the ignition off and on a number of times. To remedy this, disconnect and reconnect the battery negative terminal to restore the control modules to normal function.**

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: Once a fault has been repaired, conduct a verification to check that the fault has been remedied.

Fig. 40: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Reinstall the connectors, components etc.
- Ignition on
- Erase diagnostic trouble codes (DTCs) in all control modules
- Start the vehicle. Allow the vehicle to run for 10 minutes.

  Read out the diagnostic trouble codes in the vehicle via the DIAGNOSTICS tab.

Does the diagnostic trouble code (DTC) for faulty communication return?

- **YES**

  Refer to **INFORMATION**

- **NO**

  OKAY: Troubleshooting has been completed.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

INFORMATION

FAULT-TRACING INFORMATION

Verification shows that the fault is no longer present. The diagnostic trouble code (DTC) was probably caused by an intermittent fault.

Fault-tracing for this diagnostic trouble code (DTC) is not followed by a verification.

You can view the information again or exit fault-tracing for this diagnostic trouble code (DTC).

CHECKING THE STATUS

Fig. 43: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on

  Read the diagnostic status and trouble status for the diagnostic trouble code by selecting the diagnostic trouble code in the list.

  Check if the malfunction is permanent or intermittent by reading off the diagnostic trouble code's status when the diagnostic status is "Implemented".

  If the trouble status is "Malfunction found", this indicates that the malfunction is permanent. If the trouble

status is "No malfunction found", this indicates that the malfunction is intermittent and not active right now.

NOTE: Trouble status cannot go from "Malfunction found" to "No malfunction found" in the same operating cycle.

Fig. 44: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING COMPONENT AND CABLES**

CHECKING COMPONENT AND CABLES

Check the leakage diagnostics unit's connector for contact resistance and oxidation.

Check the cable between engine control module (ECM) #B23 (#C23) and the leakage diagnostics unit #2 for short-circuit to voltage.

Remedy as necessary.

ECM-P242100: EVAPORATIVE EMISSION CONTROL SYSTEM VENT VALVE STUCK OPEN. GENERAL FAILURE INFORMATION. NO SUB TYPE

INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P242100

Condition

Fig. 79: Identifying Leak Diagnostic Pump
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the function of the valve in the leakage diagnosis unit pump by measuring the current through the leakage diagnosis pump.

After the initial reference phase of leakage diagnosis, the airflow is guided from the reference leak to the tank system and begins to pressurize it. During this shift, there is a short drop in current consumption before pressure is built up in the tank system. The control module registers that current consumption drops too slowly or not at all, it takes it as an indication that the valve in the pump is damaged and the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed when leakage diagnosis is running.

Substitute Value

- Leakage diagnosis interrupted.

Possible Source

- Dirt or moisture in the pump.
- The pump valve has seized.
- Damage leakage diagnosis pump.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P242100

Condition

Fig. 80: Identifying Leak Diagnostic Pump
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the function of the valve in the leakage diagnosis unit pump by measuring the current through the leakage diagnosis pump.

After the initial reference phase of leakage diagnosis, the airflow is guided from the reference leak to the tank system and begins to pressurize it. During this shift, there is a short drop in current consumption before pressure is built up in the tank system. The control module registers that current consumption drops too slowly or not at all, it takes it as an indication that the valve in the pump is damaged and the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed when leakage diagnosis is running.

Substitute Value

- Leakage diagnosis interrupted.

Possible Source

- Dirt or moisture in the pump.
- The pump valve has seized.
- Damage leakage diagnosis pump.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

FAULT-TRACING

see **FAULT-TRACING**

ECM-P242200: EVAPORATIVE EMISSION CONTROL SYSTEM VENT VALVE STUCK CLOSED. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P242200

Condition

Fig. 81: Identifying Leak Diagnostic Pump
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) checks the function of the valve in the leakage diagnosis unit pump by measuring the current through the leakage diagnosis pump.

After the initial reference phase in the leakage diagnosis, the air flow is directed over from the reference leak to

the tank system and starts to pressurize it. If the control module registers that power consumption during the reference phase is unreasonable, it interprets this as the valve in the pump being damaged and the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed when leakage diagnosis is running.

Substitute Value

- Leakage diagnosis interrupted.

Possible Source

- Dirt or moisture in the pump.
- The pump valve has seized.
- Damage leakage diagnosis pump.

Fault symptom[s]

- Malfunction indicator lamp (MIL) lit.

ECM-P250C00 OIL LEVEL SENSOR CIRCUIT LOW. GENERAL FAULT INFORMATION. TYPE OF FAULT NOT SPECIFIED. (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P250C00

Condition

Fig. 83: Identifying Oil Level Sensor
Courtesy of VOLVO CARS CORPORATION

The oil level sensor is housed in the oil pan and sends information on engine oil level and quality to the engine control module (ECM). The diagnostic trouble code is generated if the engine control module (ECM) detects that the oil level signal is abnormally low.

The diagnostic trouble code can be diagnosed when the engine is running.

Substitute Value

- Nothing.

Possible Source

- Extremely low oil level.
- Damaged oil level sensor.

Fault symptom[s]

- Nothing.

ECM-P250E00 OIL LEVEL SENSOR CIRCUIT INTERMITTENT/IRREGULAR. GENERAL FAULT INFORMATION. TYPE OF FAULT NOT SPECIFIED. (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P250E00

Condition

Fig. 90: Identifying Oil Level Sensor
Courtesy of VOLVO CARS CORPORATION

The oil level sensor is housed in the oil pan and sends information on engine oil level and quality to the engine control module (ECM). The diagnostic trouble code is generated if the engine control module (ECM) detects disruptions in the oil level signal or that there are many oil level changes.

The diagnostic trouble code can be diagnosed during a road test when a number of different criteria (engine speed, vehicle speed, etc) have been fulfilled.

Substitute Value

- Nothing.

Possible Source

- Rapid oil level change (oil leak).
- Loose connections, contact resistance or oxidation in the connections.
- Damaged oil level sensor.

Fault symptom[s]

- Nothing.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-P258382: CRUISE CONTROL FRONT DISTANCE RANGE SENSOR. BUS SIGNAL / MESSAGE FAILURES. ALIVE / SEQUENCE COUNTER

INCORRECT / NOT UPDATED (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P258382

Condition

The control module is continually supplied with necessary information from the Forward Sensing Module (FSM) via CAN communication.

The control module checks the communication with the Forward Sensing Module (FSM).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- No communication with the Forward Sensing Module (FSM).

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Substitute Value

- Cruise control is disengaged when the fault is active.

Possible Source

- Open-circuit in the communication cable.
- Short-circuit to ground in the communication cable.
- Short-circuit to supply voltage in the communication cable.
- Contact resistance or oxidation in the terminals.
- Open-circuit in terminals.
- Short-circuit in connections.

Fault symptom[s]

- Cruise control does not operate

ECM-P261000: ECM/PCM INTERNAL ENGINE SHUT-DOWN TIMER PERFORMANCE. GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-P261000

Condition

Central electronic module (CEM) sends, via the CAN-network, information about how long time has elapsed since the engine was turned off the last time. Engine control module (ECM) receives the signal and compares it to its own calculated time (calculated from temperature changes of engine temperature and inlet temperature).

If engine control module (ECM) detects that the received time differs too much from the calculated time, the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- The calculated time is used.

Possible Source

- Malfunction detected by another diagnostic function (engine temperature sensor, air pressure sensor inlet) in engine control module (ECM).
- Malfunction detected by central electronic module (CEM).
- Open-circuit in the control area network (CAN) wiring.
- Short-circuit between the control area network (CAN) wiring.
- Internal malfunction in central electronic module (CEM).
- Internal fault in the engine control module (ECM).
- Internal fault in another control module in the same part of the control area network (CAN).

Fault symptom[s]

- Nothing.

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-P261085: ECM/PCM INTERNAL ENGINE OFF TIMER PERFORMANCE. BUS SIGNAL / MESSAGE FAILURES. SIGNAL ABOVE ALLOWABLE RANGE (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Central electronic module (CEM) sends, via the CAN-network, information about how long time has elapsed since the engine was turned off the last time. Engine control module (ECM) receives the signal and compares it to its own calculated time (calculated from temperature changes of engine temperature and inlet temperature).

If engine control module (ECM) detects that the received time differs too much from the calculated time, the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- The calculated time is used.

Possible Source

- Malfunction detected by another diagnostic function (engine temperature sensor, air pressure sensor inlet) in engine control module (ECM).
- Malfunction detected by central electronic module (CEM).
- Open-circuit in the control area network (CAN) wiring.
- Short-circuit between the control area network (CAN) wiring.
- Internal malfunction in central electronic module (CEM).
- Internal fault in the engine control module (ECM).
- Internal fault in another control module in the same part of the control area network (CAN).

Fault symptom[s]

- Nothing.

ECM-U000100: HIGH SPEED CAN COMMUNICATION BUS. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-U000100

Condition

The control modules transmit and receive information via a standardized serial communication method - CAN (Control Area Network). The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers serious interference (CAN communication blocked).

NOTE: **In case of system communication problems, it is not possible to communicate with the engine control module (ECM). Therefore it will only be possible to read off the diagnostic trouble code (DTC) if the malfunction is intermittent.**

Substitute Value

- Engine control module (ECM) stops communicating on the CAN-network "bus-off".

HINT: The engine control module (ECM) will remain off until the voltage feed is broken (15, 30, x-feed). When the voltage is switched on, the engine control module (ECM) will make a new attempt to communicate.

Possible Source

- Contact resistance or oxidation in the connections.
- Open circuit on one of the CAN-cables.
- Short-circuit between the control area network (CAN) wiring.
- Internal malfunction in engine control module (ECM).
- Internal malfunction in another control module in the same part of the CAN-network.

Fault symptom[s]

- General warning light on.
- The cruise control does not function at all
- The engine jerks at acceleration.
- The engine jerks heavily after engine braking.
- Rough idling.

ECM-U000100: HS-CAN COMMUNICATION BUS. GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-U000100

Condition

The control modules transmit and receive information via a standardized serial communication method - CAN (Control Area Network). The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers serious interference (CAN communication blocked).

NOTE: **In case of system communication problems, it is not possible to communicate with the engine control module (ECM). Therefore it will only be possible to read off the diagnostic trouble code (DTC) if the malfunction is intermittent.**

Substitute Value

- Engine control module (ECM) stops communicating on the CAN-network "bus-off".

HINT: The engine control module (ECM) will remain off until the voltage feed is broken (15, 30, x-feed). When the voltage is switched on, the engine control module (ECM) will make a new attempt to

communicate.

Possible Source

- Contact resistance or oxidation in the connections.
- Open circuit on one of the CAN-cables.
- Short-circuit between the control area network (CAN) wiring.
- Internal malfunction in engine control module (ECM).
- Internal malfunction in another control module in the same part of the CAN-network.

Fault symptom[s]

- General warning light on.
- The cruise control does not function at all
- The engine jerks at acceleration.
- The engine jerks heavily after engine braking.
- Rough idling.

TROUBLESHOOTING

GENERAL INFORMATION

HINT: For general information about troubleshooting in the Control Area Network (CAN), see the linked document below.

NOTE: When selecting the vehicle profile, the correct vehicle must be identified. Use the "Retrieve VIN" button. Troubleshooting may fail if this is not done.

In order to check the CAN cables, the resistance of the network must be measured. The resistance between the two high-speed CAN cables, with the network connected, must be 60 ohms. The acceptable range of this reading is approx. 55-65 ohms.

If the communication diagnostic trouble code can be read from the control module, the malfunction is probably intermittent.

An intermittent malfunction in the power supply to a control module is indicated by individual diagnostic trouble codes in the Central Electronic Module (CEM) (CEM-1A5X or CEM-1A6X, as appropriate). There is probably no diagnostic trouble code in the control module that the central electronic module (CEM) has generated, since the module cannot generate a diagnostic trouble code when it is not supplied with voltage.

Other information

- see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK**

- **Continue**

Refer to **MEASURING CABLES IN CAN-NETWORK (HS-CAN)**

MEASURING CABLES IN CAN-NETWORK (HS-CAN)

Fig. 123: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the minus terminal on the battery.
- Connect a breakout box to the Engine Control Module (ECM).

NOTE: Also connect the engine control module (ECM) to the adapter cable harness, otherwise the measured values will be incorrect.

Measure the resistance between the connections below. Due to the network design, different measurement

values will be obtained. For each measurement, twist the cable harness and wiggle the connections, where accessible, to detect any intermittent short-circuits or open circuits.

NOTE: The following resistance measurements only measure the main paths in the high-speed network, not the junctions that exist for some control modules. An open circuit in one path cannot be detected by this measurement. However, a short-circuit in a branch can be detected.

Measure the resistance between #B58 (#C58) and #B45 (#C45). The resistance shall be approx. 60 ohms. Permitted values approx. 55-65 ohms.

Also measure the resistance between each connection and the voltage as well as ground. The resistance must be infinite or very large (more than 1 Mohms).

HINT: If a malfunction is detected, then try to separate the junction with the measured malfunction at an appropriate point further along the cable. Unplug any connector/control module nearest to the previous measurement point and measure again. In this manner, try to find the malfunction.

Remedy the cables as necessary.

- see **CONTENTS**

Was a malfunction detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING THE TRAFFIC LOAD ON THE CAN CABLES**

CHECKING THE TRAFFIC LOAD ON THE CAN CABLES

Fig. 124: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Connect the battery
- Ignition on

  Malfunctions in the Control Area Network (CAN) may be due to a control module sending incorrect messages that disrupt normal communication. When messages are sent incorrectly, this results in a considerable increase in the amount of traffic on the Control Area Network (CAN). Check the load by measuring the average voltage value on the network cables in relation to ground.

  Check in the following manner:

  - Measure the voltage between #B45 (#C45) (HS-CAN-L) and ground. The voltage shall be approx. 2.3 V.

- Measure the voltage between #B58 (#C58) (HS-CAN-H) and ground. The voltage shall be approx. 2.8 V.

Other information

- see **BATTERY, DISCONNECTING**

Is the value OK?

- **YES**

  Refer to **INFORMATION**

- **NO**

  Refer to **IDENTIFYING A CONTROL MODULE IN THE CAN-NETWORK**

IDENTIFYING A CONTROL MODULE IN THE CAN-NETWORK

If the load on the CAN network is too high, this may be due to a control module sending incorrect messages on the CAN network (known as a disruptive control module). The malfunction may also be due to an intermittent short-circuit to voltage or ground in one of the CAN-cables. This results in the control modules on the CAN-network starting to send incorrect messages. The malfunctions can occur without a diagnostic trouble code (DTC) being stored by the control modules. The voltage can be measured between the CAN-cables in order to check the load on the CAN-network.

NOTE: It is not necessarily the control module(s) that stored the diagnostic trouble code (DTC) that is communicating incorrectly. Incorrect messages can come from any control module in the same section of the CAN-network. However, incorrect communication in one network cannot affect the communication on the other network. In other words, incorrect communication on the LS-CAN cannot disrupt communication on the HS-CAN, and vice versa.

Check the communication/load on the CAN-network by measuring the voltage between #B45 (#C45) and #B58 (#C58). The average value of the voltage shall be approx. 0.5 V (0.4-0.6 V). In case of malfunctioning communication, the voltage is at approx. 0.7 V and above.

To identify which control module is responsible for the incorrect communication, one can disconnect the voltage feed to each control module in turn and re-check the voltage on the CAN-cables. The voltage feed is most easily disconnected by removing the fuse/fuses for the particular control module. Continue until the voltage between the CAN-cables drops to about 0.5 V.

NOTE: When connecting and disconnecting individual control modules, other diagnostic trouble codes (DTCs) may be stored in certain control modules.

HINT: When a suspected control module is identified, connect and disconnect the voltage feed several times to verify that the malfunction appears and disappears. Turn off the ignition between each check.

NOTE: **Do not cut the voltage to the central electronic module (CEM) unless it is the last control module left to check.**

A control module which communicates incorrectly must be replaced.

NOTE: **Following a malfunction involving control modules that disrupt communication, other control modules may remain in Limp-Home mode (that is, they work but with limited functionality) even after the ignition has been turned off and on a number of times. To remedy this, disconnect and reconnect the battery's minus terminal to restore the control modules to normal function.**

VERIFICATION

Fig. 125: Identifying Belt Routing
Courtesy of VOLVO CARS CORPORATION

- Erase diagnostic trouble codes via vehicle communication service.
- Start the engine and let it run for 10 minutes.
- Read out diagnostic trouble codes.

  Check to see if the communication diagnostic trouble code has been stored again.

Did the trouble code(s) return?

- **YES**

  Refer to **INFORMATION**

- **NO**

  OKAY: Troubleshooting has been completed.

INFORMATION

FAULT-TRACING INFORMATION

Verification shows that the fault is no longer present. The diagnostic trouble code (DTC) was probably caused by an intermittent fault.

Fault-tracing for this diagnostic trouble code (DTC) is not followed by a verification.

You can view the information again or exit fault-tracing for this diagnostic trouble code (DTC).

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-U010100: LOST COMMUNICATION WITH TRANSMISSION CONTROL MODULE. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-U010100

Condition

The control modules transmit and receive information via a standardized serial communication method - CAN (Control Area Network). If engine control module (ECM) registers a communication malfunction between transmission control module (TCM) and engine control module (ECM), the diagnostic trouble code is stored in engine control module (ECM).

Substitute Value

- Nothing.

Possible Source

- Open circuit on one of the CAN-cables.
- Short-circuit between the control area network (CAN) wiring.
- Internal malfunction in engine control module (ECM).
- Internal malfunction in another control module in the same part of the CAN-network.

Fault symptom[s]

- Harsh shifting.
- Malfunction indicator lamp (MIL) lit.

FAULT-TRACING

ECM-U010400: FAILED COMMUNICATION WITH CRUISE CONTROL MODULE. GENERAL FAULT INFORMATION. TYPE OF FAULT NOT SPECIFIED. (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-U010400

Condition

The engine control module (ECM) checks the CAN communication to the steering wheel module (SWM).

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) receives an incorrect check sum or if the update bit from the steering wheel module (SWM) is missing.

The diagnostic trouble code can be diagnosed when the engine is running.

Substitute Value

- Cruise control turned off when the fault is active.

Possible Source

- Open-circuit in the control area network (CAN) wiring.
- Short-circuit between the control area network (CAN) wiring.
- Internal fault in the engine control module (ECM).
- Internal fault in another control module in the same part of the control area network (CAN).

Fault symptom[s]

- Cruise control does not function at all.

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-U010482: LOST COMMUNICATION WITH CRUISE CONTROL MODULE. BUS SIGNAL / MESSAGE FAILURES. SIGNAL COMPARE FAILURE

(B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-U010482

Condition

The control module is continually supplied with necessary information about the steering wheel buttons for cruise control from the Central electronic module (CEM) via CAN communication.

The control module checks the communication with the Central electronic module (CEM).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- No communication with the Central electronic module (CEM).

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Substitute Value

- Cruise control is disengaged when the fault is active.

Possible Source

- Open-circuit in the communication cable.
- Short-circuit to ground in the communication cable.
- Short-circuit to supply voltage in the communication cable.
- Contact resistance or oxidation in the terminals.
- Open-circuit in terminals.
- Short-circuit in connections.

Fault symptom[s]

- Cruise control does not operate

FAULT-TRACING

ECM-U010700: LOST COMMUNICATION WITH THROTTLE ACTUATOR CONTROL MODULE. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-U010700

Condition

Engine control module (ECM) checks the difference between requested throttle position and actual throttle position.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The difference between requested position and actual position has been sufficiently great to give effect on emissions.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Engine running.

NOTE: **The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.**

Substitute Value

- Reduced throttle angle.

Possible Source

- Other diagnostic trouble codes are stored in engine control module (ECM).
- Throttle is sticking or is blocked (e. g. oil film, dust, icing).
- Contact resistance or oxidation in the terminals.
- Damaged throttle unit.

Fault symptom[s]

- Driving/Poor performance/lacks power/At take off
- Driving/Poor performance/lacks power
- Driving/Hesitates/surges/Unsure when/at all times
- Driving/Hesitates/surges/During acceleration
- Driving/Hesitates/surges/During deceleration

ECM-U012900: LOST COMMUNICATION WITH BRAKE SYSTEM CONTROL MODULE. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-U012900

Condition

Engine control module (ECM) and Brake control module contain a code that is unique code for each vehicle for electronic immobilizer. In addition to this, each key for the vehicle is electronically coded for the intended vehicle only. Internal checks are made at the start to check that the key is the correct one for the vehicle and that the codes in the Engine control module (ECM) and Central electronic module (CEM) correspond.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- If Engine control module (ECM) registers that communication between Engine control module (ECM) and Brake control module (BCM) (via CAN) is missing.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition on.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Substitute Value

- None.

Possible Source

- Open circuit on one of the CAN-cables.
- Short-circuit between CAN-cables.
- Damaged engine control module (ECM).

Fault symptom[s]

- The engine does not start.
- Message in the display.

FAULT-TRACING

INFORMATION

The diagnostic trouble code indicates that CAN-communication between engine control module (ECM) and Brake control module (BCM) is missing.

Among others, the code may be caused by:

- Engine control module (ECM) or Brake control module (BCM) contains no software for this vehicle.
- Open circuit on CAN-communication between Brake control module (BCM) and Engine control module (ECM).
- Programmed engine control module (ECM) or Brake control module (BCM) has been moved from one vehicle to another.

HINT: Read off the diagnostic trouble codes (DTCs) from the brake control module (BCM).

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After repairing, it is necessary to check that the malfunction has been fixed.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-U014100

Condition

The control modules transmit and receive information via a standardized serial communication method - CAN (Control Area Network). If engine control module (ECM) registers a communication malfunction between central electronic module (CEM) and engine control module (ECM), the diagnostic trouble code is stored in engine control module (ECM).

Substitute Value

- Nothing.

Possible Source

- Open circuit on one of the CAN-cables.
- Short-circuit between the control area network (CAN) wiring.
- Internal malfunction in another control module in the same part of the CAN-network.

Fault symptom[s]

- Nothing.

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-U016700: LOST COMMUNICATION WITH VEHICLE IMMOBILIZER CONTROL MODULE. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-U016700

Condition

Engine control module (ECM) as well as central electronic module (CEM) contain a unique code for every vehicle for electronic immobilizer. In addition to this, each key for the vehicle is electronically coded to only fit in the intended vehicle. At start, internal checks are performed that the key is correct for the vehicle and that the immobilizer codes in the engine control module (ECM) and central electronic module (CEM) match.

If engine control module (ECM) registers that communication between engine control module (ECM) and central electronic module (CEM) (via CAN) is missing, the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- None.

Possible Source

- Open circuit on one of the CAN-cables.
- Short-circuit between CAN-cables.
- Damaged engine control module (ECM).

Fault symptom[s]

- The engine does not start.
- Message in the display.

FAULT-TRACING

INFORMATION

The diagnostic trouble code indicates that CAN-communication between engine control module (ECM) and central electronic module (CEM) is missing.

Among others, the code may be caused by:

- Engine control module (ECM) or central electronic module (CEM) contains no software for this vehicle.
- Open circuit in CAN-communication between central electronic module (CEM) and engine control module (ECM)

- Programmed engine control module (ECM) or central electronic module (CEM) has been moved from one vehicle to another.

HINT: Read off diagnostic trouble codes in central electronic module (CEM).

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After repairing, it is necessary to check that the malfunction has been fixed.

Fig. 148: Identifying Belt Routing
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall connector, components, etc.
- Start the engine.

Did engine start?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-U016700: LOST COMMUNICATION WITH VEHICLE IMMOBILIZER CONTROL MODULE. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S5; 2011-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-U016700

see **DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-U016700**

FAULT-TRACING

see **FAULT-TRACING**

ECM-U030000: INTERNAL CONTROL MODULE SOFTWARE INCOMPATIBILITY. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-U030000

Condition

Engine control module (ECM) compares its own configuration-ID with the ID of the signal configuration that the central electronic module (CEM) sends out as a message on the CAN-network. This message is sent at regular intervals. If the configuration-IDs do not match, the diagnostic trouble code is generated. The diagnostic

trouble code is also generated if communication between engine control module (ECM) and central electronic module (CEM) is or has been interrupted.

NOTE: **In case of an open circuit in both CAN-cables, it is not possible to communicate with the engine control module (ECM). Therefore it will only be possible to read out the diagnostic trouble code (DTC) if this type of malfunction is intermittent. When the diagnostic trouble code (DTC) is stored, the engine control module (ECM) responds to the diagnostic commands, however, normal CAN-communication Expulsion mode does not work.**

Substitute Value

- Nothing.

Possible Source

- An incorrect CAN configuration-ID (current engine control module (ECM) is not designed for the vehicle, for example, a used control module with different hardware/software).
- A break in the CAN leads between the engine control module (ECM) and the central electronic module (CEM).

Fault symptom[s]

- General warning light on.
- The cruise control does not function at all
- The engine jerks at acceleration.
- The engine jerks heavily after engine braking.
- Rough idling.

FAULT-TRACING

GENERAL INFORMATION

The diagnostic trouble code (DTC) is stored when the communication between the central electronic module (CEM) and the relevant control module has been interrupted. There can be a number of causes for interruptions in the communication:

- Faulty signal configuration in the control module that stored the diagnostic trouble code (DTC). The fault can be due to a customer or workshop replacing a control module without downloading new software for the replacement
- Intermittent open-circuit in one or both CAN cables in part of the network
- Intermittent short-circuits between the CAN cables
- Intermittent short-circuits between one of the CAN cables and ground or supply voltage
- Internal fault in the control module that stored the diagnostic trouble code (DTC).

The fault can also be due to faulty software in a control module, a hardware problem in the CAN network (faulty cables) or a fault in a control module.

NOTE: **If there is a diagnostic trouble code (DTC) for a communication fault in a control module, check whether diagnostic trouble codes (DTCs) have been stored in the central electronic module (CEM). The central electronic module (CEM) monitors the voltage level in the CAN cables and is the only control module that can directly store a diagnostic trouble code (DTC) for a short-circuit in one of the cables for ground or supply voltage. Do not replace the central electronic module (CEM) in the event of a CAN fault unless fault-tracing has indicated that the central electronic module (CEM) has an internal fault.**

Corrective actions

1. If this diagnostic trouble code (DTC) is the only communication diagnostic trouble code (DTC) stored in one of the control modules in the high speed network, try to remedy the fault by downloading new software for the control module that stored the diagnostic trouble code (DTC)
2. Check the cables in the CAN network according to the following fault-tracing
3. The control module should be replaced as a last resort.

Other information

- see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK**
- Go to the tab software and program the control module with the latest software.

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

Fig. 149: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Wait for 20 seconds.

NOTE: **This first verification assumes that download of new software was required in the control module that generated the diagnostic trouble code. If download of new software was not required: read out diagnostic trouble codes and check if the code status is permanent or intermittent to learn how difficult it will be to find the fault.**

Read out the diagnostic trouble codes in the vehicle via the DIAGNOSTICS tab.

Check that the diagnostic trouble code (DTC) for faulty communication is not stored again.

Has the fault been remedied?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **TAKING READING ON CABLE IN THE CAN NETWORK (HS-CAN)**

TAKING READING ON CABLE IN THE CAN NETWORK (HS-CAN)

Fig. 150: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off

- Disconnect the battery negative lead.
- Connect the breakout box with the engine control module (ECM) connected.

HINT: Where a breakout box cannot be used, take readings from the rear of the affected connectors if possible. This prevents terminal pins and socket housings being damaged.

Take resistance readings across the following terminals. Various readings will be obtained due to the structure of the network. Twist the cable harness and work the connectors at accessible points along the cable harness in order to check whether the resistance changes during each measurement. This method can be used to detect intermittent short-circuits or open-circuits.

NOTE: The following resistance readings only measure the main arteries in the high speed network, not the junctions that exist for some control modules. If an open-circuit is suspected in a cable, or a short-circuit is suspected in one of its junctions, the connector at the control module for this junction must be disconnected and the reading taken from there.

Take the following readings

- Measure the resistance between the terminals for HS CAN on the Engine control module (ECM). Resistance must be approximately 60 ohms. Permitted values are approximately 55 - 65 ohms.

  NOTE: If there is a short-circuit somewhere in the CAN-net the resistance will be 0 ohms.

- Also measure the resistance between each terminal and supply voltage and ground. The resistance shall be very high.

HINT: Any short-circuit detected on the CAN-net may be on the main circuit or on any branching running out to some control modules. If a fault is found, try to disconnect the junction with the fault at a point further forward. Try to locate the fault in this way.

Remedy as necessary.

Other information

- see **BATTERY, DISCONNECTING**
- see **CONNECTING THE BREAKOUT BOX**
- see **SIGNAL SPECIFICATION**
- see **CHECKING WIRING AND TERMINALS**

Was a fault detected?

- **YES**

Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING THE TRAFFIC LOAD ON THE CAN CABLES**

CHECKING THE TRAFFIC LOAD ON THE CAN CABLES

Fig. 151: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Connect the battery.
- Ignition on

  Faults in the CAN network may be due to a control module sending faulty messages that disrupt normal communication. When messages are sent incorrectly, this results in a considerable increase in the amount

of traffic on the CAN network. Check the load by measuring the average voltage value on the CAN cables in relation to ground.

Check as follows:

- Connect a voltmeter between CAN-L and ground. The voltage should be approx: V
- Connect a voltmeter between CAN-H and ground. The voltage should be approx: V

Other information

- see **BATTERY, DISCONNECTING**

Is the value OK?

- **YES**

  Refer to **INFORMATION**

- **NO**

  Refer to **IDENTIFYING A CONTROL MODULE IN THE CAN NETWORK**

IDENTIFYING A CONTROL MODULE IN THE CAN NETWORK

If the load on the CAN network is too high, this may be due to a control module sending faulty messages on the CAN network (known as a disruptive control module). The fault may also be due to an intermittent short-circuit to supply voltage or ground in one of the CAN cables. This results in the control modules on the CAN network starting to send faulty messages. The faults can occur without a diagnostic trouble code (DTC) being stored by the control modules. The voltage can be measured between the CAN cables in order to check the load on the CAN network.

NOTE: **It is not necessarily the control module(s) that stored the diagnostic trouble code (DTC) that is communicating faultily. Faulty messages can come from any control module in the same section of the CAN network. However, faulty communication in one network cannot affect the communication on the other network. In other words, faulty communication on the LS-CAN cannot disrupt communication on the HS-CAN and vice versa.**

Take the following readings

- Connect a voltmeter between the CAN cables. The average value of the voltage must be approximately 0.6-1.4 V. In case of a problem with communication the voltage is considerably higher.
- In order to identify which control module has faulty communication, cut the power supply to one control module at a time. Check the voltage in the CAN cables again. The easiest way to cut the power supply is to remove the fuse(s) for the relevant control module. Repeat until the voltage between the CAN wiring drops to the normal level.

NOTE: **When connecting and disconnecting certain control modules, diagnostic trouble codes (DTCs) may be stored in other control modules.**

HINT: When the suspected control module has been identified, connect and disconnect the supply voltage to the control module a number of times to verify that the fault appears and disappears. Ignition off between each check.

NOTE: **Do not cut the power to the central electronic module (CEM) unless it is the last control module left to check.**

The control module that is communicating incorrectly must be replaced.

NOTE: **A faulty control module that disrupts communication can place other control modules in Limp-Home mode (i. e. they work but with limited functionality) even after switching the ignition off and on a number of times. To remedy this, disconnect and reconnect the battery negative terminal to restore the control modules to normal function.**

Remedy as necessary.

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: Once a fault has been repaired, conduct a verification to check that the fault has been remedied.

Fig. 152: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Reinstall the connectors, components etc.
- Ignition on
- Erase diagnostic trouble codes (DTCs) in all control modules
- Start the vehicle. Allow the vehicle to run for 10 minutes.

  Read out the diagnostic trouble codes in the vehicle via the DIAGNOSTICS tab.

Is the diagnostic trouble code for configuration fault regenerated?

- **YES**

  Refer to **INFORMATION**

- **NO**

  OKAY: Troubleshooting has been completed.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

INFORMATION

FAULT-TRACING INFORMATION

Verification shows that the fault is no longer present. The diagnostic trouble code (DTC) was probably caused by an intermittent fault.

Fault-tracing for this diagnostic trouble code (DTC) is not followed by a verification.

You can view the information again or exit fault-tracing for this diagnostic trouble code (DTC).

ECM-U030000: INTERNAL CONTROL MODULE SOFTWARE INCOMPATIBILITY. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S5; 2011-2012)

ECM-U032200: SOFTWARE INCOMPATIBILITY WITH BODY CONTROL MODULE. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-U032200

Condition

To check that the correct software is in the engine control module (ECM), the engine control module (ECM) calculates a checksum. This checksum shall also be stored in the central electronic module (CEM). When the ignition is turned on, a communication test is performed between the engine control module (ECM) and central

electronic module (CEM). During this test, the checksum is sent from the engine control module (ECM) to central electronic module (CEM).

If central electronic module (CEM) detects that the checksum that engine control module (ECM) calculates does not match the stored checksum in the central electronic module (CEM), the central electronic module (CEM) will store a diagnostic trouble code. For information purposes, the diagnostic trouble code is also stored in the engine control module (ECM).

The diagnostic trouble code can be diagnosed with the ignition on.

Substitute Value

- Nothing.

Possible Source

- One or several diagnostic trouble codes registered in central electronic module (CEM).

Fault symptom[s]

- Nothing.

FAULT-TRACING

see **FAULT-TRACING**

ECM-U032200: SOFTWARE INCOMPATIBLE WITH BODY CONTROL MODULE. GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-U032200

Condition

To check that the correct software is in the engine control module (ECM), the engine control module (ECM) calculates a checksum. This checksum shall also be stored in the central electronic module (CEM). When the ignition is turned on, a communication test is performed between the engine control module (ECM) and central electronic module (CEM). During this test, the checksum is sent from the engine control module (ECM) to central electronic module (CEM).

If central electronic module (CEM) detects that the checksum that engine control module (ECM) calculates does not match the stored checksum in the central electronic module (CEM), the central electronic module (CEM) will store a diagnostic trouble code. For information purposes, the diagnostic trouble code is also stored in the engine control module (ECM).

The diagnostic trouble code can be diagnosed with the ignition on.

Substitute Value

- Nothing.

Possible Source

- One or several diagnostic trouble codes registered in central electronic module (CEM).

Fault symptom[s]

- Nothing.

TROUBLESHOOTING ECM-U032200

INFORMATION

No troubleshooting has been developed for this diagnostic trouble code. The trouble code for this malfunction is first generated in the central electronic module (CEM) and then in the engine control module (ECM). This diagnostic trouble code cannot be erased until the trouble code in the central electronic module (CEM) has been remedied and erased.

For this reason, first read off the diagnostic trouble codes in the central electronic module (CEM) and then perform troubleshooting and take appropriate action. After that, this diagnostic trouble code can be erased.

ECM-U040000: INVALID DATA RECEIVED. GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-U040000

Condition

Engine control module (ECM) compares its own configuration-ID with the ID of the signal configuration that the central electronic module (CEM) sends out as a message on the CAN-network. This message is sent at

regular intervals. If the configuration-IDs do not match, the diagnostic trouble code is generated. The diagnostic trouble code is also generated if communication between engine control module (ECM) and central electronic module (CEM) is or has been interrupted.

NOTE: **In case of an open circuit in both CAN-cables, it is not possible to communicate with the engine control module (ECM). Therefore it will only be possible to read out the diagnostic trouble code (DTC) if this type of malfunction is intermittent. When the diagnostic trouble code (DTC) is stored, the engine control module (ECM) responds to the diagnostic commands, however, normal CAN-communication Expulsion mode does not work.**

Substitute Value

- Nothing.

Possible Source

- An incorrect CAN configuration-ID (current engine control module (ECM) is not designed for the vehicle, for example, a used control module with different hardware/software).
- A break in the CAN leads between the engine control module (ECM) and the central electronic module (CEM).

Fault symptom[s]

- General warning light on.
- The cruise control does not function at all
- The engine jerks at acceleration.
- The engine jerks heavily after engine braking.
- Rough idling.

TROUBLESHOOTING

ECM-U040500: INVALID DATA FROM CRUISE CONTROL MODULE. GENERAL FAULT INFORMATION. TYPE OF FAULT NOT SPECIFIED. (B8444S; 2005-2011)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-U040500

Condition

The steering wheel module (SWM) checks the signals from the buttons on the cruise control.

The diagnostic trouble code (DTC) is stored in the engine control module (ECM) if the steering wheel module

(SWM) registers a fault in one of the signals from the cruise control buttons or if one of the buttons has been pressed in for too long.

The diagnostic trouble code can be diagnosed when the engine is running.

Substitute Value

- Cruise control turned off when the fault is active.

Possible Source

- Search for the cause of the fault in the steering wheel module (SWM).

Fault symptom[s]

- Cruise control does not function at all.

TROUBLESHOOTING INFORMATION

INFORMATION

No troubleshooting has been developed for this diagnostic trouble code. Diagnostic trouble code for this malfunction is first generated in the steering wheel module (SWM) then in the engine control module (ECM). This diagnostic trouble code cannot be erased until the diagnostic trouble code in the steering wheel module (SWM) is erased and remedied.

Therefore, first read off the diagnostic trouble codes in the steering wheel module (SWM), perform troubleshooting and take appropriate action. Then this diagnostic trouble code can be erased.

ECM-U040583: INVALID DATA RECEIVED FROM CRUISE CONTROL MODULE. BUS SIGNAL / MESSAGE FAILURES. VALUE OF SIGNAL PROTECTION CALCULATION INCORRECT (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-U040583

Condition

The Central electronic module (CEM) receives and checks the signals from the steering wheel buttons for cruise control. The information is transmitted via CAN to the Engine control module (ECM).

The Engine control module (ECM) checks the received information.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The information from Central electronic module (CEM) is incorrect/invalid.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Engine running.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Substitute Value

- Cruise control is disengaged when the fault is active.

Possible Source

- Fault-trace the central electronic module (CEM).

Fault symptom[s]

- Cruise control does not operate

FAULT-TRACING

ECM-U041800: INVALID DATA RECEIVED FROM BRAKE CONTROL MODULE. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-U041800

Condition

Engine control module (ECM) and Brake control module contain a code that is unique code for each vehicle for electronic immobilizer. In addition to this, each key for the vehicle is electronically coded for the intended vehicle only. Internal checks are made at the start to check that the key is the correct one for the vehicle and that the codes in the Engine control module (ECM) and Central electronic module (CEM) correspond.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Engine control module (ECM) registers problems with reading out immobilizer codes.
- The immobilizer codes do not match.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Substitute Value

- None.

Possible Source

- Engine control module (ECM) has incorrect code for electronic immobilizer.
- Brake control module (BCM) has incorrect code for electronic immobilizer.
- Damaged engine control module (ECM).

Fault symptom[s]

- The engine does not start.
- Message in the display.

FAULT-TRACING

INFORMATION

The diagnostic trouble code indicates that the immobilizer codes do not match between Engine control module (ECM) and Brake control module (BCM). The diagnostic trouble code is also generated if CAN-communication between engine control module (ECM) and Brake control module (BCM) is missing.

Among others, the code may be caused by:

- Engine control module (ECM) is not programmed or has incorrect code for immobilizer, that is, the code does not match the code stored in Brake control module (BCM).
- Brake control module (BCM) is not programmed or has incorrect code for immobilizer, that is, the code does not match the code stored in Engine control module (ECM).
- Open circuit on CAN-communication between Brake control module (BCM) and Engine control module (ECM).

- Programmed engine control module (ECM) or Brake control module (BCM) has been moved from one vehicle to another.

HINT: Read out diagnostic trouble codes in brake control module (BCM).

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After repairing, it is necessary to check that the malfunction has been fixed.

The central electronic module (CEM) transmits the global time on the CAN network.

The diagnostic trouble code (DTC) is stored if the engine control module (ECM) registers that the signal is missing and interprets it as a fault.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- Nothing.

Possible Source

- Open-circuit in the control area network (CAN) wiring.
- Short-circuit between the control area network (CAN) wiring.
- Internal fault in the engine control module (ECM).
- Internal fault in another control module in the same part of the control area network (CAN).

Fault symptom[s]

Nothing.

FAULT-TRACING INFORMATION

see **FAULT-TRACING INFORMATION**

ECM-U042600: INVALID DATA RECEIVED FROM VEHICLE IMMOBILIZER CONTROL MODULE. GENERAL MALFUNCTION INFORMATION. NO INFORMATION ON MALFUNCTION TYPE (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-U042600

Condition

Engine control module (ECM) as well as central electronic module (CEM) contain a unique code for every vehicle for electronic immobilizer. In addition to this, each key for the vehicle is electronically coded to only fit in the intended vehicle. At start, internal checks are performed that the key is correct for the vehicle and that the immobilizer codes in the engine control module (ECM) and central electronic module (CEM) match.

If engine control module (ECM) registers problems with readout of the immobilizer codes or that the immobilizer codes do not match, the diagnostic trouble code is generated.

The diagnostic trouble code can be diagnosed when the ignition is on.

Substitute Value

- None.

Possible Source

- Engine control module (ECM) has incorrect code for electronic immobilizer.
- Central electronic module (CEM) has incorrect code for electronic immobilizer.
- Damaged engine control module (ECM).

Fault symptom[s]

- The engine does not start.
- Message in the display.

FAULT-TRACING

INFORMATION

The diagnostic trouble code indicates that the immobilizer codes do not match between the engine control module (ECM) and central electronic module (CEM). The code is also generated if CAN-communication between engine control module (ECM) and central electronic module (CEM) is missing.

Among others, the code may be caused by:

- Engine control module (ECM) is not programmed or has incorrect code for immobilizer, that is, the code does not match the code stored in central electronic module (CEM).
- Central electronic module (CEM) is not programmed or has incorrect code for immobilizer, that is, the code does not match the code stored in engine control module (ECM).
- Open circuit in CAN-communication between central electronic module (CEM) and engine control module (ECM)
- Programmed engine control module (ECM) or central electronic module (CEM) has been moved from one vehicle to another.

HINT: Read off diagnostic trouble codes in central electronic module (CEM).

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After repairing, it is necessary to check that the malfunction has been fixed.

Fig. 156: Identifying Belt Routing
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall connector, components, etc.
- Start the engine.

Did engine start?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

ECM-U210765: COLLISION MITIGATION BY BRAKING. ALGORITHM BASED FAILURES. SIGNAL HAS TOO FEW TRANSITIONS / EVENTS (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-U210765

Condition

Engine control module (ECM) uses signals from Forward Sensing Module (FSM) to provide brake support in case of collision risk (included in adaptive cruise control function).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Request for adaptive cruise control is sent too often.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Substitute Value

- None.

Possible Source

- Fault-trace the Forward Sensing Module (FSM).
- Fault-trace the central electronic module (CEM).

Fault symptom[s]

- Message in information display

FAULT-TRACING

INFORMATION

No fault-tracing has been developed for this diagnostic trouble code (DTC).

The diagnostic trouble code (DTC) for this fault is first stored in the Central electronic module (CEM) or in the Forward Sensing Module (FSM), then in the Engine control module (ECM). This diagnostic trouble code (DTC) can first be erased when the root fault has been remedied and the diagnostic trouble code (DTC) for the root fault has been erased.

ECM-U210800: ADAPTIVE CRUISE CONTROL. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-U210800

Condition

The control module is continually supplied with information about whether adaptive cruise control is permitted or not from the Central electronic module (CEM) and the Forward Sensing Module (FSM) via CAN communication.

The Engine control module (ECM) checks the received information.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Received information states that adaptive cruise control is not permitted.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: **The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.**

Substitute Value

- Cruise control is disengaged when the fault is active.

Possible Source

- Fault-trace the central electronic module (CEM).
- Fault-trace the Forward Sensing Module (FSM).

Fault symptom[s]

- Cruise control does not operate

ECM-U300192: CONTROL MODULE IMPROPER SHUTDOWN. COMPONENT FAILURES. PERFORMANCE OR INCORRECT OPERATION (B6324S5; 2011-

2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION ECM-U300192

Condition

Fig. 158: Identifying Engine Control Module (ECM)
Courtesy of VOLVO CARS CORPORATION

The Engine control module (ECM) continuously monitors a number of internal signals through calculations and compares them. The aim is to ensure reliability during operation.

Some of the control module's internal checks are performed when the control module is switched off. i. e. after the engine has been switched off and the control module's run-on has ended.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Internal checks give unacceptable results.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Shutting off the control module.

Substitute Value

- Maximum vehicle speed limited.

Possible Source

- Sequential fault related to throttle. Therefore fault-trace for another diagnostic trouble code (DTC).
- Poorly charged battery or corroded connecting wiring.

- Damaged software in the engine control module (ECM).
- Damaged engine control module (ECM).

Fault symptom[s]

- Text window and warning symbol/Text message
- Driving/Poor performance/lacks power
- Driving/Hesitates/surges/Unsure when/at all times
- Driving/Hesitates/surges/During acceleration

FAULT TRACING

CHECKING THE BATTERY AND CONNECTIONS

Check the battery.

Check the battery terminals and the engine control module (ECM) connector. Check for contact resistance, play and oxidation.

- **Continue**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

The engine control module (ECM) has registered an internal fault.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults may be due to interference at start or may be a different type of fault that occurs on different occasions. The fault is evaluated depending on how it occurs.

Ensure that the software in the Engine control module (ECM) is correct by downloading it again.

If the fault recurs, replace the control module.

In the event of a permanent fault, replace the control module.

Remedy as necessary.

ENGINE PERFORMANCE

Ignition And Control Systems - General Diagnostics and Tests

CHECKING POWER AND GROUND TERMINALS. ENGINE MANAGEMENT SYSTEM (B5254T2; 2005-2007)

CHECKING POWER SUPPLY AND GROUND TERMINAL, ENGINE CONTROL MODULE (ECM)

CHECKING POWER SUPPLY AND GROUND TERMINAL, ENGINE CONTROL MODULE (ECM)

Checking the power supply

- Check the fuse for power supply to engine control module (ECM) terminal #A17 (#A17).

  If the fuse is blown, check the circuit for a short-circuit to ground

- Check the fuse for power supply to engine control module (ECM) terminal #B11 (#B21).

  If the fuse is blown, check the circuit for a short-circuit to ground

- Check the power supply to engine control module (ECM) terminal #A17 (#A17). The voltage must be approximately battery voltage when the ignition is on.

  If the voltage is incorrect, check the cable between ignition switch terminal 30 and system relay terminal #3 and the cable between system relay terminal #5 and engine control module (ECM) terminal #A17 (#A17). Check for an open-circuit

- Check the power supply to engine control module (ECM) terminal #B11 (#B21). The voltage must be approximately battery voltage when the ignition is on.

  If the voltage is incorrect, check the cable between ignition switch terminal 30 and engine control module (ECM) terminal #B11 (#B21). Check for an open-circuit.

Checking ground terminal

- Check the ground leads between engine control module (ECM) terminals #A53 (#A53), #A54 (#A54), #A63 (#B3) and the common ground terminal in the body for the wiring. Check for an open-circuit
- Check the ground terminal in the body for the engine control module (ECM). Check for contact resistance and oxidation.

Remedy as necessary

Other information

CHECKING POWER AND GROUND TERMINALS. ENGINE MANAGEMENT SYSTEM (B6294T; 2005-2006)

CHECKING POWER SUPPLY AND GROUND TERMINAL, ENGINE CONTROL MODULE (ECM)

see **CHECKING POWER SUPPLY AND GROUND TERMINAL, ENGINE CONTROL MODULE (ECM)**

CHECKING THE SUPPLY VOLTAGE/GROUND TERMINAL, ENGINE CONTROL MODULE (ECM) (B6324S; 2007-2010)

CHECKING THE VOLTAGE / GROUND TERMINAL

POWER SUPPLY ENGINE CONTROL MODULE (ECM)

The engine control module (ECM) is supplied power via four voltage inputs on the control module.

With the ignition on, power is supplied to all voltage inputs and the engine control module (ECM) is in active mode.

1. Power input 1, terminal #B16 (#C16) is supplied with power via a fuse from the battery. This power input is used to power the memory in the Engine control module (ECM). In the event of an open-circuit, the engine control module (ECM) will be reset and adaptation values and diagnostic trouble codes (DTCs) and other information in the memory will disappear.
2. Voltage intake 2, #B15 (#C15) is supplied power from the ignition switch via the central electronic module (CEM). This power input is used to activate the system relay. The engine control module (ECM) will not be activated if there is an open-circuit.
3. Power input 3, terminal #B3 (#C3) is supplied with power via a fuse from the system relay. The system relay is activated by the engine control module (ECM). This power input governs the supply of power to the Engine control module (ECM).
4. Power input 4, terminal #B5 (#C5) is supplied with power via a fuse from the system relay. The system relay is activated by the engine control module (ECM). This power input governs the supply of power to the Engine control module (ECM).

Checking the power supply

Check the power supply cable from the battery to the Engine control module (ECM) terminal #B16 (#C16). Check for an open-circuit. Check for loose connections. Check for contact resistance. Check for oxidation. Check the fuse. The voltage must be approximately battery voltage.

Check the power supply cable from the start control module (SCU) to engine control module (ECM) terminal #B15 (#C15). Check for an open-circuit. Check for loose connections. Check for contact resistance. Check for oxidation. Check the fuse. The voltage must be approximately battery voltage.

Check the power supply from the system relay to engine control module (ECM) terminals #B3 (#C3) and #B5 (#C5). Check for an open-circuit. Check for loose connections. Check for contact resistance. Check for oxidation. Check the fuse. The voltage must be approximately battery voltage when the ignition is on.

Ground terminal engine control module (ECM)

Then engine control module (ECM) has three ground inputs. All ground inputs from the control module are connected via three separate ground leads to the same ground terminal in the car body.

1. Ground input 1, #B2 (#C2) is power ground and is connected to the ground terminal in the body.

2. Ground input terminal 2, #B4 (#C4), is power ground and is connected to the ground terminal in the car body.
3. Ground input terminal 3, #B6 (#C6), is power ground and is connected to the ground terminal in the car body.

Checking the ground terminal

Check the ground lead between engine control module (ECM) ground terminals #B2 (#C2), #B4 (#C4) and #B6 (#C6). Check for an open-circuit. Check for loose connections. Check for contact resistance. Check for oxidation. With the ignition on, the drop in voltage between the ground connection for the control module and the ground terminal must not be greater than 0.5 V.

Remedy as necessary.

Other information

CHECKING THE SUPPLY VOLTAGE/GROUND TERMINAL, ENGINE CONTROL MODULE (ECM) (B6324S5; 2011-2012)

CHECKING THE VOLTAGE / GROUND TERMINAL

see **CHECKING THE VOLTAGE / GROUND TERMINAL**

CHECKING THE SUPPLY VOLTAGE/GROUND TERMINAL, ENGINE CONTROL MODULE (ECM) (B8444S; 2005-2011)

CHECKING THE VOLTAGE / GROUND TERMINAL

CHECKING THE POWER SUPPLY AND GROUND TERMINALS

Power supply engine control module (ECM)

The engine control module (ECM) is powered via five power inputs on the control module.

With the ignition on, power is supplied to all voltage inputs and the engine control module (ECM) is in active mode.

1. Power input 1, terminal #B54 (#C54) is constantly supplied with power from the battery. This power input is used to power the memory in the Engine control module (ECM). In the event of an open-circuit, the engine control module (ECM) will be reset and adaptation values and diagnostic trouble codes (DTCs) and other information in the memory will disappear.

2. Power input 2, terminal #B27 (#C27) is temporarily supplied with power from the central electronic module (CEM) when the key is inserted in the ignition switch. This power input is used to prepare the engine for start-up, e. g. temporarily activates the system relay and the fuel pump. The engine control module (ECM) will not be activated if there is an open-circuit.
3. Power input 3, terminal #B30 (#C30) is supplied with power from the ignition switch via the central electronic module (CEM) with the ignition on. This power input is used to activate the system relay. The engine control module (ECM) will not be activated if there is an open-circuit.
4. Power input 4, terminal #B4 (#C4) is supplied with power from the system relay. The system relay is activated by the Engine control module (ECM) with the ignition on. This power input governs the supply of power to the Engine control module (ECM). The engine control module (ECM) will not be activated if there is an open-circuit.
5. Power input 5, terminal #B6 (#C6) is supplied with power from the system relay. The system relay is activated by the Engine control module (ECM) with the ignition on. This power input governs the supply of power to the throttle unit. In the event of an open-circuit, the engine control module (ECM) will be activated but the throttle unit will not be activated.

Checking the power supply

Check the power supply cable from the battery to the Engine control module (ECM) terminal #B54 (#C54). Check for an open-circuit. Check for loose connections. Check for contact resistance. Check for oxidation. The voltage must be approximately battery voltage.

Check the power supply cable from the Central electronic module (CEM) to the Engine control module (ECM) terminal #B30 (#C30). Check for an open-circuit. Check for loose connections. Check for contact resistance. Check for oxidation. The voltage must be battery voltage when the key is in the ignition switch.

Check the power supply from the system relay to the Engine control module (ECM) terminal #B30 (#C30), #B4 (#C4) and #B6 (#C6). Check for an open-circuit. Check for loose connections. Check for contact resistance. Check for oxidation. The voltage must be approximately battery voltage when the ignition is on.

Ground terminal engine control module (ECM)

The Engine control module (ECM) has four ground inputs that are all internally connected in the control module.

1. Ground input 1, #B1 (#C1) is power ground and is connected to the ground terminal in the body.
2. Ground input 2, #B2 (#C2) is power ground and is connected to the ground terminal in the body.
3. Ground input 3, #B3 (#C3) is power ground and is connected to the ground terminal in the body.
4. Ground input 4, #B5 (#C5) is power ground and is connected to the ground terminal in the body.

Checking the ground terminal

Check the ground cable between the Engine control module (ECM) terminal #B1 (#C1), #B2 (#C2), #B3 (#C3), #B5 (#C5) and the ground terminal. Check for an open-circuit. Check for loose connections. Check for contact resistance. Check for oxidation. With the ignition on, the drop in voltage between the ground connection for the control module and the ground terminal must not be greater than 0.5 V.

Remedy as necessary.

Other information

- see **CONNECTING THE BREAKOUT BOX**
- see **SIGNAL SPECIFICATION, ENGINE CONTROL MODULE (ECM)**
- see **CHECKING WIRING AND TERMINALS**

Fig. 2: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

CONNECTING THE BREAKOUT BOX, ENGINE CONTROL MODULE (ECM) (B6324S; 2007-2010)

CONNECTING THE BREAKOUT BOX

Special tools:

see **9512902**

see **9512974**

see **9511428**

see **9511499**

HINT: The breakout box is designed to facilitate the reading of control module input and output signals when the control module is connected as well as the resistance of cables and components when the control module is disconnected. Using the breakout box reduces the risk of unintentionally short-circuited cables or damaged connector pins.

CONTROL MODULE DISCONNECTION

- Wait 3 minutes after switching off the ignition before disconnecting the connectors from the engine control module (ECM). The system relay must be voltage free **before** the control module can be removed from the vehicle. If the engine cooling fan (FC) runs on after the ignition has been switched off, wait until it stops and then wait for a further 3 minutes.
- Remove the engine control module (ECM).

  see **ENGINE CONTROL MODULE (ECM)**

- Install the cover plate see **9512974** over the hole after the engine control module (ECM).

NOTE: Ensure that the cover plate is properly sealed

ADAPTER CONNECTION

- Check that no connector pins or sleeves are damaged.
- Check that the male and female terminals on the engine control module (ECM) are undamaged and secure (cannot be pressed in). Check that the cables to the female terminals are secured to the terminal pins.
- Carefully install the vehicle wiring harness on see **9512902** . Lock the connectors in position by pressing in the catches fully.

BREAKOUT BOX AND ENGINE CONTROL MODULE (ECM) CONNECTION

- Connect breakout box see **9511428** to the adapter via wiring harness see **9511499** .
- Carefully install the adapter on the engine control module (ECM). Lock the adapter in position by pressing in the catches fully.

REMOVING THE ADAPTER AND CONNECTORS

- Wait 3 minutes after the ignition has been switched off. The main relay must be voltage free **before** the

control module can be removed from the vehicle. If the engine cooling fan (FC) runs on after the ignition has been switched off, wait until it stops and then wait for a further 3 minutes.

NOTE: Do not touch the terminal pins of the engine control module (ECM) with your fingers. Engine control module (ECM) components can be damaged by static electricity.

- Carefully detach the engine control module (ECM) from the adapter wiring harness.
- Carefully detach the adapter from the vehicle wiring harness.
- Remove the cover plate.

CONTROL MODULE CONNECTION

- Check that no pins or sockets are damaged on the connector.
- Install the engine control module (ECM).

see **ENGINE CONTROL MODULE (ECM)**

CONNECTING THE BREAKOUT BOX, ENGINE CONTROL MODULE (ECM) (B6324S5; 2011-2012)

CONNECTING THE BREAKOUT BOX

- Install cover plate see **9512974** over the hole after the engine control module (ECM).

NOTE: Ensure that the cover plate is properly sealed

ADAPTER CONNECTION

- Check that no connector pins or sleeves are damaged.
- Check that the male and female terminals on the engine control module (ECM) are undamaged and secure (cannot be pressed in). Check that the cables to the female terminals are secured to the terminal pins.
- Carefully install the vehicle wiring harness on see **9512902** . Lock the connectors in position by pressing in the catches fully.

BREAKOUT BOX AND ENGINE CONTROL MODULE (ECM) CONNECTION

- Connect breakout box see **9511428** to the adapter via wiring harness see **9511499** .
- Carefully install the adapter on the engine control module (ECM). Lock the adapter in position by pressing in the catches fully.

REMOVING THE ADAPTER AND CONNECTORS

- Wait 3 minutes after the ignition has been switched off. The main relay must be voltage free **before** the control module can be removed from the vehicle. If the engine cooling fan (FC) runs on after the ignition has been switched off, wait until it stops and then wait for a further 3 minutes.

  NOTE: Do not touch the terminal pins of the engine control module (ECM) with your fingers. Engine control module (ECM) components can be damaged by static electricity.

- Carefully detach the engine control module (ECM) from the adapter wiring harness.
- Carefully detach the adapter from the vehicle wiring harness.
- Remove the cover plate.

CONTROL MODULE CONNECTION

- Check that no pins or sockets are damaged on the connector.

- Install the engine control module (ECM).

  see **ENGINE CONTROL MODULE (ECM), REPLACING**

CONNECTING THE TEST BOX (AW50/51 AWD; AW55-50/51SN; 2003-2004)

CONNECTING THE BREAKOUT BOX

Special tools:

see **9511504**

see **9511428**

see **9511499**

see **9995722**

REMOVING THE CONTROL MODULE

Fig. 3: Removing Engine Control Module
Courtesy of VOLVO CARS CORPORATION

- Wait 2 minutes after the ignition has been switched off. The main relay must be voltage free **before** the control module is removed from the car. If the engine cooling fan (FC) runs on after the ignition has been switched off, wait until it stops and then wait for a further 2 minutes
- Remove the cover over the control module box. Put the cover to one side.

NOTE: **Do not touch the control module terminal pins with your fingers. Static electricity may damage components in the control module.**

- Insert tool see **9995722** around the control module
- Move the upper section of the tool backwards as far as it will go. Pull up the tool
- Carefully pull up the control module.

CONNECTING THE ADAPTER

Fig. 4: Identifying Adapter

Courtesy of VOLVO CARS CORPORATION

- Check that no pins or sockets are damaged on the connector
- Gently press adapter see **9511504** down into the grooves inside the control module box. Press to the limit position!
- Insert tool see **9995722** around the adapter
- Move the upper section of the tool forwards as far as it will go. Pull the tool up.

CONNECTING THE BREAKOUT BOX

Fig. 5: Identifying Breakout Box
Courtesy of VOLVO CARS CORPORATION

- Check the control module and control module connectors to ensure that the male and female terminals are undamaged and secure (cannot be pressed in). Check that the cables to the female terminals are secured to

the terminal pins

- Connect adapter see **9511504** to the control module connector (wiring side). Connect breakout box see **9511428** to the adapter via wiring see **9511499**
- The breakout box is designed to facilitate reading off the control module input and output signals when the control module is connected; and the cable and component resistance when the control module is disconnected. The use of a breakout box reduces the risk of accidental short-circuits and damage to the connector pins.

REMOVING THE ADAPTER

Fig. 6: Identifying Adapter
Courtesy of VOLVO CARS CORPORATION

- Wait 2 minutes after the ignition has been switched off. The main relay must be voltage free **before** removing the control module from the car. If the engine cooling fan (FC) runs on after the ignition has been switched off, wait until it stops and then wait for a further 2 minutes

NOTE: **Do not touch the control module terminal pins with your fingers. Static electricity may damage components in the control module.**

- Insert tool see **9995722** around the adapter
- Move the upper section of the tool backwards as far as it will go. Pull up the tool
- Carefully pull up the adapter.

INSTALLING THE CONTROL MODULE

Fig. 7: Installing Engine Control Module
Courtesy of VOLVO CARS CORPORATION

- Check that no pins or sockets are damaged on the connector
- Gently press the control module down into the grooves inside the control module box. Press to the limit position!
- Insert tool see **9995722** around the control module
- Move the upper section of the tool forwards as far as it will go. Pull the tool up
- Press the cover into place over the control modules
- Check that the air ducts are correctly positioned.

MEASURING THE ETHANOL CONTENT (2005-2009)

MEASURING THE ETHANOL CONTENT

The method works for gasoline-ethanol fuel.

NOTE: **First read the safety instructions for handling fuel.**

Drain the fuel carefully from the vehicle.

NOTE: **The fuel should be drained from the fuel distribution pipe and not from the fuel filling pipe/tank.**

Fig. 8: Measuring Ethanol Content
Courtesy of VOLVO CARS CORPORATION

Mix equal parts of fuel and water in a graduated, transparent container. Let stand for at least 5 minutes. The ethanol dissolves in the water and the mixture separates into layers. Gasoline is the lightest and ends up at the top.

Read off the number of graduation steps of gasoline and compare to the number of graduation steps of fuel that has been added. Best accuracy is achieved with a long-narrow measuring glass. Suitable design of version measuring glass is total volume of 500 ml with markings for every 5 ml, or total volume of 1, 000 ml with markings for every 10 ml.

CAUTION: Measuring has to be accurate.

Example: Mix 500 ml fuel with approx. equal parts water. After the ethanol has dissolved we can assume that the measured amount of gasoline is 120 ml.

Gasoline content is then calculated to: 120 ml/500 ml = 0.24 = 24%

This, ethanol content is: 100%-24% = 76%

HINT: When the ethanol dissolves in the water the fluids' total volume is reduced. To facilitate read-off you can fill the container with more water. Note that this does not affect the calculations above, since this takes place in relation to the amount of added fuel.

MEASURING THE ETHANOL CONTENT (B8444S; 2010-2011)

MEASURING THE ETHANOL CONTENT

see **MEASURING THE ETHANOL CONTENT**

ENGINE PERFORMANCE

Ignition And Control Systems - General Information

CONTROL MODULE GENERAL INFORMATION

CONTROL MODULES

Fig. 1: Control Module And Connectors
Courtesy of VOLVO CARS CORPORATION

Connecting and disconnecting control modules

Always switch off the ignition before connecting and disconnecting control modules, connectors and the breakout box.

The ignition must be switched off when taking readings with an ohmmeter.

Fig. 2: Identifying Precaution For Storing Control Module In High Temperature
Courtesy of VOLVO CARS CORPORATION

Temperature

The control modules must not be heated to above 80°C. Remove control modules when stoving for example.

Arc welding

Always disconnect the battery negative lead to prevent a short-circuit.

Position the welding ground as close to the welding site as possible, otherwise different ground potentials may be generated in different components.

When welding close to an electronic module, the unit **must** be removed to avoid heat damage.

Replacement

Do not replace a control module without checking its wiring and components. Otherwise the new component may be damaged in the same way as the old one.

ENGINE PERFORMANCE

Ignition And Control Systems - General Safety Information

GENERAL SAFETY INFORMATION

BATTERY, CHARGING

Fig. 1: Charging Battery
Courtesy of VOLVO CARS CORPORATION

It is important that the battery voltage is normal (approximately 12 V) when testing the car system components. If necessary a battery charger can be connected during the test.

Connect the battery charger to the battery terminals. Charge the battery for approximately 10 hours at the recommended current - maximum 6 A.

Example: If the battery is marked 520 A, the recommended charge current is 0.01x520 = 5.2 A.

A higher than recommended charge current may damage the battery.

NOTE: **Boost charging (with a high current or voltage above 16 V) will damage the battery and is prohibited.**

WARNING: Explosive oxyhydrogen accumulates when the battery charges. Smoking, welding, grinding or other activities involving sparks or naked flames are prohibited in the vicinity of a charging battery. Only charge the battery in a well ventilated area.

CLEANLINESS

Fig. 2: Disconnecting/Connecting Fuel Line Connections
Courtesy of VOLVO CARS CORPORATION

Cleanliness is particularly important when working on the fuel system.

Clean the fuel line connections thoroughly before disconnecting them.

IGNITION AND HIGH VOLTAGE COMPONENTS

Fig. 3: Identifying Ignition In Off Position

Courtesy of VOLVO CARS CORPORATION

Switch off the ignition before:

- Connecting and disconnecting the test instruments
- Connecting and disconnecting the connectors
- Taking readings using an ohmmeter.

Fig. 4: Identifying Low & High Voltage Circuit Caution
Courtesy of VOLVO CARS CORPORATION

High voltage

There are dangerous voltages at all points in the ignition system, including the connectors etc.

WARNING: **The ignition system operates at high power and voltages. Contact with the high tension circuit - the ignition coil, spark plug caps and distributor cap - is dangerous.**

CAUTION: **Because of the fire hazard avoid sparking when working on the fuel system, especially when checking the injectors.**

WHEN COMPRESSION TESTING

Fig. 5: Compression Testing
Courtesy of VOLVO CARS CORPORATION

- Disconnect engine speed (RPM) sensor before carrying out a compression test.
- The diagnostic trouble code (DTC) must be erased when the engine speed (RPM) sensor has been reconnected.

ENGINE PERFORMANCE

Ignition And Control Systems - Removal, replacement and installation

CONTROL SYSTEM, FUEL SUPPLY (B5254T2; 2003)

ENGINE CONTROL MODULE (ECM), REPLACING

see **ENGINE CONTROL MODULE (ECM), REPLACING**

CONTROL SYSTEM, FUEL SUPPLY (B5254T2; 2004)

ENGINE CONTROL MODULE (ECM), REPLACING

Special tools:

see **9995722**

POINTS TO OBSERVE WHEN REPLACING THE CONTROL MODULE

Fig. 1: Engine Control Module
Courtesy of VOLVO CARS CORPORATION

CAUTION: New software can only be ordered when the control module is installed in the vehicle. VIDA reads off the new control module identity which is required to order the correct software.

The software can only be ordered when the control module is installed in the car.

CAUTION: Wait 2 minutes after the ignition has been switched off. The main relay must be voltage-free before the control module can be removed from the car. If the engine cooling fan runs on after the ignition has been switched off, wait until it stops and then wait for another 2 minutes.

CAUTION: Always check that the control module and control module box connector pins and sleeves are not bent or damaged. This may have caused the fault.

REMOVING THE ENGINE CONTROL MODULE (ECM)

Fig. 2: Identifying Engine Control Module
Courtesy of VOLVO CARS CORPORATION

- Ignition off. Wait for 2 minutes
- Remove the cover over the control module box. Put the cover to one side

NOTE: **Do not touch the control module terminal pins with your fingers. Static electricity can damage control module components.**

-
- Insert tool see **9995722** around the control module.
- Move the upper section of the tool backwards as far as it will go. Pull up the tool
- Carefully pull up the control module.

INSTALLING THE ENGINE CONTROL MODULE (ECM)

Fig. 3: Identifying Engine Control Module
Courtesy of VOLVO CARS CORPORATION

- Check that no pins or sockets are damaged on the connector.
- Carefully press the control module down into the grooves on the inside of the control module box. Press to the limit position
- Insert tool see **9995722** around the control module.
- Move the upper section of the tool forwards as far as it will go. Pull up the tool
- Press the cover into place over the control modules
- Check that the air ducts are correctly positioned.

ORDERING SOFTWARE

Order software according to the table below.

XC90	9438288

NOTE: **After downloading the software or replacing the engine control module (ECM), the throttle unit must be adapted according to vehicle communication input: "Adapting the throttle unit".**

FINISHING

Check that no diagnostic trouble codes have been stored during the repair.

Test drive the car. Check the function of the engine.

FUEL PRESSURE SENSOR, REPLACEMENT

REMOVAL AND INSTALLATION

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATION

Fig. 4: Engine Compartment Components
Courtesy of VOLVO CARS CORPORATION

Drain the fuel injection system. See **FUEL SYSTEM PRESSURE RELEASE**.

Remove the charge air pipe over the engine. Seal the openings.

Remove the cover over the fuel rail.

FUEL SYSTEM PRESSURE RELEASE

Operation Number(s):

Start the engine.

Remove the fuel pump fuse. Placement may vary between engine types and model year. See the Owner's manual or wiring diagram.

The engine will stop after approx. 20 seconds.

Turn over the engine 3-5 seconds.

Switch off the ignition.

Replace the fuse.

REMOVING THE FUEL PRESSURE SENSOR

Fig. 5: Fuel Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

CAUTION: Collect any spill using paper or similar.

Remove:

- the tie strap for the cable for the sensor
- the screw for the sensor
- the sensor.

INSTALLING THE FUEL PRESSURE SENSOR

NOTE: For tightening torques, see TIGHTENING TORQUE .

Install:

- the sensor
- the screw for the sensor. Tighten
- the tie strap for the wiring. Connect the cable to the sensor
- the cover over the fuel rail.

Fig. 6: Engine Compartment Components
Courtesy of VOLVO CARS CORPORATION

Remove the seals from the charge air pipe. Reinstall the charge air pipe over the engine.

Start the engine. Check for fuel leakage.

FUEL PUMP DRIVER MODULE

Materials:	
Designation	**Part number**
Plug	974688
Control module	30769225
Cable harness	30724838

NOTE: Removal steps in this procedure may contain installation details.

VEHICLES WITH FUEL PUMP DRIVER MODULE LOCATED IN THE RIGHT-HAND REAR WHEEL HOUSING

Fig. 7: Locating Pump Driver Module

Courtesy of VOLVO CARS CORPORATION

Fuel pump driver modules that are located under the inner fender on the right-hand side in the front part of the rear wheel housing are installed when replacing on the right-hand side under the rear bench

Fig. 8: Identifying Ignition Switch In OFF Position
Courtesy of VOLVO CARS CORPORATION

Fig. 9: Identifying Seat Rail Cover
Courtesy of VOLVO CARS CORPORATION

Remove:

- the covers over the seat rails
- screws for seat rails-body frame, 12 pcs

Lift out the seats.

Fig. 10: Identifying Seat Rail Cover
Courtesy of VOLVO CARS CORPORATION

Fig. 11: Folding The Carpet Back
Courtesy of VOLVO CARS CORPORATION

Fold the carpet back

Remove:

1. ventilation pipe
2. the insulation block
3. the insulation block

Fig. 12: Identifying Right-Hand Cover Over The Fuel Pump.
Courtesy of VOLVO CARS CORPORATION

Remove the cover on the right-hand side over the fuel pump.

Fig. 13: Locating Cable Harness Connectors
Courtesy of VOLVO CARS CORPORATION

Remove:

- the cable harness connectors from the fuel pump
- connection to the sill
- the mounting on the floor for the cable harness

Fig. 14: Cutting Off The Removed Cable Connectors
Courtesy of VOLVO CARS CORPORATION

Cut off the removed cable so that both connectors can be removed. This is done so that the cable can be removed from underneath.

Fig. 15: Accessing Inner Fender
Courtesy of VOLVO CARS CORPORATION

Remove the right rear wheel.

Remove the rivet and plastic nuts for the inner fender.

Bend the fender liner out of the way.

Fig. 16: Removing Module With Mounting
Courtesy of VOLVO CARS CORPORATION

Remove:

- the module from the wheel housing assembly with the mounting
- the cable harness with mountings

VEHICLES WITH FUEL PUMP DRIVER MODULE LOCATED UNDER THE RIGHT-HAND REAR BENCH SEAT.

Fig. 17: Locating Fuel Pump Driver Module
Courtesy of VOLVO CARS CORPORATION

Fig. 18: Identifying Covers Over Seat Rails
Courtesy of VOLVO CARS CORPORATION

Remove:

- covers over seat rails
- the 4 screws

Lift out the seat on the right-hand side.

Fig. 19: Installing A New Module
Courtesy of VOLVO CARS CORPORATION

Fold up the carpet. Detach the sill trim panel slightly.

Carefully lift up the insulation block and place a block under the insulation block to access the module.

Install the new module and connect the cable connector.

Remove the block and fold the carpet back. Press the sill trim panel into place.

VEHICLES WITH FUEL PUMP DRIVER MODULE ORIGINALLY LOCATED IN THE RIGHT-HAND REAR WHEEL HOUSING

Fig. 20: Plug, 974688
Courtesy of VOLVO CARS CORPORATION

Install two rubber plugs for the wheel housing.

Use: Plug, 974688

Fig. 21: Accessing Inner Fender
Courtesy of VOLVO CARS CORPORATION

Install the inner fender with plastic nuts and rivets

Install wheel. See **INSTALLING WHEELS**

Fig. 22: Control module, 30769225
Courtesy of VOLVO CARS CORPORATION

Place the module on the two embossings in the floor leaving a clearance for the seat frame of at least 5 mm.

Use: Control module, 30769225

Remove the protective tape for the Velcro attachments and install the control module.

Install the cable mounting for the connection at the sill, fuel pump and module as well as the mounting in the floor.

Use: Cable harness, 30724838

Fig. 23: Identifying Right-Hand Cover Over The Fuel Pump.
Courtesy of VOLVO CARS CORPORATION

Check the cover seal for faults and check that the cables are in the cut-outs.

Check that the plugs are in the seal.

Install the cover and tighten to 6 Nm.

Fig. 24: Cutting A Hole In The Insulation
Courtesy of VOLVO CARS CORPORATION

Mark and make a hole for the module in the insulation block.

Fig. 25: Folding The Carpet Back
Courtesy of VOLVO CARS CORPORATION

Fold the carpet back

Install:

- ventilation pipe (1)
- the insulation block (2)
- the insulation block (3)

Fig. 26: Identifying Covers Over Seat Rails
Courtesy of VOLVO CARS CORPORATION

Install

- the seats. Use new screws, 12 x M10. Tighten to 50 Nm.
- the covers over the seat rails

VEHICLES WITH FUEL PUMP DRIVER MODULE ORIGINALLY LOCATED UNDER THE RIGHT-HAND REAR BENCH SEAT.

Fig. 27: Identifying Covers Over Seat Rails
Courtesy of VOLVO CARS CORPORATION

Install the seat. Use new screws, 4 x M10

Tighten to 50Nm

KNOCK SENSOR (KS), REPLACING

REMOVAL AND INSTALLATION

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVING THE KNOCK SENSOR (KS)

Disconnect the battery negative lead. First read, see **BATTERY, DISCONNECTING** .

Fig. 28: Identifying Intake Manifold
Courtesy of VOLVO CARS CORPORATION

Remove the intake manifold and gasket. See **INTAKE PIPE/GASKET, REPLACEMENT** .

Remove:

- the screws for the knock sensors (KS)
- the tie strap at the connector. Pull the sensors downwards and past the starter motor bracket at the rear edge.

INSTALLING KNOCK SENSORS (KS)

Fig. 29: Identifying Knock Sensors (KS) Orientation & Air Hoses
Courtesy of VOLVO CARS CORPORATION

CAUTION: Tighten to the correct torque. If the knock sensor is over-tightened it may deform. If it is too loose it may disrupt the function of the sensor.

- Install the new sensors using the screws in the cylinder block
- Route the cables on the outside of the starter motor bracket
- Align the sensors (looking from the front)
- The cable from the sensor at cylinder 3 = 3 o'clock and from the sensor for cylinder 5 = 6 o'clock
- Tighten the knock sensors. See **TIGHTENING TORQUE**
- Press the knock sensor (KS) connectors together. Check that the wiring is in the correct position. Use a clamp if necessary.

Install the intake manifold according to **INTAKE PIPE/GASKET, REPLACEMENT** .

Connect the battery lead. See **BATTERY, DISCONNECTING** .

REPLACING THE THERMOSTAT AND/OR ENGINE COOLANT TEMPERATURE SENSOR

see **REPLACING THE THERMOSTAT AND/OR ENGINE COOLANT TEMPERATURE SENSOR**

TEMPERATURE AND PRESSURE SENSORS, REPLACING

REMOVAL AND INSTALLATION

NOTE: As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE TEMPERATURE AND PRESSURE SENSORS

Fig. 30: Boost Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

Remove the boost pressure sensor which is on the pipe coming from the charge air cooler (CAC).

INSTALLING THE TEMPERATURE AND PRESSURE SENSORS

Install a new sensor.

CONTROL SYSTEM, FUEL SUPPLY (B5254T2; 2005)

ENGINE CONTROL MODULE (ECM), REPLACING

see **ENGINE CONTROL MODULE (ECM), REPLACING**

FUEL PUMP DRIVER MODULE

see **FUEL PUMP DRIVER MODULE**

REPLACING KNOCK SENSORS (KS)

NOTE: As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information is always correct.

REMOVING THE KNOCK SENSOR (KS)

Remove

- the cable from the battery negative terminal. First read, see **BATTERY, DISCONNECTING**
- the intake pipe between the front cover plate and the air cleaner (ACL)

  Detach the pipe from the charge air cooler at the throttle housing. Push the pipe to one side

- the dip stick and its holder
- the screws for the knock sensors (KS)
- the tie strap at the connector.

  Disconnect the connector. Pull the sensors downwards and past the rear edge of the starter motor bracket.

INSTALLING KNOCK SENSORS (KS)

Fig. 31: Identifying Knock Sensors
Courtesy of VOLVO CARS CORPORATION

Install the new sensor. Tighten by hand.

Route the cables on the outside of the starter motor bracket.

Align the sensors. The cable from the sensor for cylinder 2 = 3 o'clock and from the sensor for cylinder 4 = 6 o'clock.

Tighten the knock sensors (KS) to **20 Nm** .

Connect the knock sensor (KS) connectors. Check that the wiring is in the correct position. Secure with a tie strap at the starter motor bracket.

Install

- the dip stick
- the pipe between the throttle body (TB) and the charge air cooler (CAC)
- the intake pipe between the front cover plate and the air cleaner (ACL)
- the negative battery cable. First read, see **BATTERY, DISCONNECTING** .

TEMPERATURE AND PRESSURE SENSORS, REPLACING

see **TEMPERATURE AND PRESSURE SENSORS, REPLACING**

THERMOSTAT / TEMPERATURE SENSOR, ENGINE COOLANT, REPLACING

see **THERMOSTAT / TEMPERATURE SENSOR, ENGINE COOLANT, REPLACING**

CONTROL SYSTEM, FUEL SUPPLY (B5254T2; 2006-2007)

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVAL

Fig. 36: Identifying Ignition In OFF Position
Courtesy of VOLVO CARS CORPORATION

Fig. 37: Identifying Covers Over Seat Rails
Courtesy of VOLVO CARS CORPORATION

Remove:

- the covers over the seat rails
- screws, 4 pcs.

Lift out the seat on the right-hand side.

Fig. 38: Installing A New Module
Courtesy of VOLVO CARS CORPORATION

Fold up the carpet. Detach the sill trim panel slightly.

Carefully lift up the insulation block and place a block under the insulation block to access the module.

Disconnect the connector and remove the old module from the Velcro.

Remove the block and fold the carpet back. Press the sill trim panel into place.

INSTALLATION

Fig. 39: Identifying Covers Over Seat Rails

Courtesy of VOLVO CARS CORPORATION

Install the seat. Use new screws, 4 x M10

Tighten to 50 Nm.

ENGINE CONTROL MODULE (ECM), REPLACING

see **ENGINE CONTROL MODULE (ECM), REPLACING**

ENGINE COOLANT TEMPERATURE (ECT) SENSOR, REPLACING

REMOVAL AND INSTALLATION

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVING THE TEMPERATURE SENSOR

Remove the cap from the expansion tank.

Raise the car. Remove the lower splashguard.

Position a container under the engine drain cock. Drain the engine coolant.

Close the cock.

Install the lower splash guard.

Lower the car.

Fig. 40: Identifying Expansion Tank
Courtesy of VOLVO CARS CORPORATION

Remove the screw holding the engine stabilizer brace to the bracket on the engine.

Undo the clamp holding the return hose for the power steering.

Remove the cross stay.

Fig. 41: Identifying Plastic Hoses Between Turbocharger, Charge Air Cooler & Air Cleaner/Turbocharger
Courtesy of VOLVO CARS CORPORATION

Remove the crankcase ventilation pipe from the intake manifold. Start with the cover.

Remove the plastic hoses between the turbocharger (TC) and the charge air cooler and between the air cleaner (ACL) and the turbocharger (TC).

Remove the clamp for the intake manifold at the turbocharger (TC) for cylinders 1, 2 and 3. Detach the upper section of the pipe by turning it towards the firewall.

Fig. 42: Front Timing Belt Cover
Courtesy of VOLVO CARS CORPORATION

Remove:

- the upper timing belt cover.

  Lift up the servo reservoir and place it on top of the engine.

  WARNING: **Seal the cover for the servo reservoir. Check that no oil leaks out.**

  Servo oil is highly inflammable.

- the screw for the front timing belt cover.
- the timing belt cover.

  Disconnect the connector for the sensor cable.

Remove the variable valve timing solenoids and place them to one side.

Remove the screw for the cable duct.

Fig. 43: Identifying Thermostat Housing & Cable Duct
Courtesy of VOLVO CARS CORPORATION

Remove the thermostat housing with the cable duct.

Clean the mating surfaces of the cylinder block. Ensure that no dirt enters the fluid ducts.

Fig. 44: Identifying Thermostat Housing And Sensor
Courtesy of VOLVO CARS CORPORATION

Secure the thermostat housing in a vise. Remove the sensor.

NOTE: Handle the thermostat housing carefully when securing it in the vise.

INSTALLING THE TEMPERATURE SENSOR

NOTE: For tightening torques, see TIGHTENING TORQUE .

Clean the thermostat housing mating surfaces. Ensure that there is no dirt left in the thermostat housing.

Install

- the new sensor. Use a **new gasket** . Tighten to **20 Nm** . Ensure that the sensor cable is correctly routed in the thermostat housing and in the cable duct
- the thermostat housing using a new gasket. Tighten to **17 Nm**
- the screw for the cable duct. Tighten to **10 Nm**
- the variable valve timing solenoids. Tighten to **10 Nm**
- the front timing belt cover. See **INSTALLING THE FRONT TIMING COVER** . The mudguard over the right drive shaft boot may come loose. If this happens, secure it from underneath

- the screw for the front timing belt cover. Tighten to **12 Nm**
- the servo reservoir. Check that the hoses are correctly positioned
- the upper timing belt cover.

Install the plastic hoses between the turbocharger (TC) and the charge air cooler and between the air cleaner (ACL) and the turbocharger (TC).

Install the crankcase ventilation pipe on the intake manifold.

Tighten all hose clamps.

Install

- the engine stabilizer brace. Tighten to **50 Nm**
- the torque rod on the bracket on the engine. Tighten to **80 Nm**
- the clamp holding the return hose for the power steering.

FUNCTION TEST

Fill with coolant.

Install the cap on the expansion tank.

Test drive the engine until the thermostat has opened.

Top up the coolant if necessary.

KNOCK SENSOR (KS), REPLACING

REMOVAL AND INSTALLATION

REMOVING THE KNOCK SENSOR (KS)

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

Remove the cable from the battery negative terminal. First read, see **BATTERY, DISCONNECTING** .

Fig. 45: Identifying Injector Connectors Cover
Courtesy of VOLVO CARS CORPORATION

The intake manifold. See **INTAKE MANIFOLD / GASKET, REPLACING** .

Fig. 46: Gasket
Courtesy of VOLVO CARS CORPORATION

Remove:

- the screws for the knock sensors (KS)
- the tie strap at the connector. Pull the sensors downwards and past the starter motor bracket at the rear edge.

INSTALLING KNOCK SENSORS (KS)

NOTE: For tightening torques, see TIGHTENING TORQUE

Fig. 47: Identifying Knock Sensors (KS) Orientation & Air Hoses
Courtesy of VOLVO CARS CORPORATION

CAUTION: Tighten to the correct torque. If the knock sensor is over-tightened it may deform. If it is too loose it may disrupt the function of the sensor.

- Install the new sensors using the screws in the cylinder block
- Route the cables on the outside of the starter motor bracket
- Align the sensor (looking from the front towards the rear)
- The cable from the sensor for cylinder **3 = 3 o'clock** and from the sensor for cylinder **5 = 6 o'clock** . Tighten the knock sensors. See **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS** .

Press the knock sensor (KS) connectors together. Check that the wiring is in the correct position. Use a clamp if necessary.

Install:

- the intake manifold. See **INSTALLATION**
- the battery lead. First read, see **BATTERY, DISCONNECTING** .

TEMPERATURE AND PRESSURE SENSORS, REPLACING

see **TEMPERATURE AND PRESSURE SENSORS, REPLACING**

CONTROL SYSTEM, FUEL SUPPLY (B6294T; 2003-2005)

ENGINE CONTROL MODULE (ECM), REPLACING

see **ENGINE CONTROL MODULE (ECM), REPLACING**

ENGINE COOLANT TEMPERATURE (ECT) SENSOR, REPLACING

see **ENGINE COOLANT TEMPERATURE (ECT) SENSOR, REPLACING**

FUEL PUMP DRIVER MODULE

Materials:	
Designation	**Part number**
Plug	974688
Control module	30769225
Cable harness	30724838

NOTE: Removal steps in this procedure may contain installation details.

VEHICLES WITH FUEL PUMP DRIVER MODULE LOCATED IN THE RIGHT-HAND REAR WHEEL HOUSING

Fig. 48: Locating Pump Driver Module
Courtesy of VOLVO CARS CORPORATION

Fuel pump driver modules that are located under the inner fender on the right-hand side in the front part of the rear wheel housing are installed when replacing on the right-hand side under the rear bench

Fig. 49: Identifying Ignition Switch In OFF Position
Courtesy of VOLVO CARS CORPORATION

Fig. 50: Identifying Seat Rail Cover
Courtesy of VOLVO CARS CORPORATION

Remove:

- the covers over the seat rails
- screws for seat rails-body frame, 12 pcs

Lift out the seats.

Fig. 51: Identifying Seat Rail Cover
Courtesy of VOLVO CARS CORPORATION

Fig. 52: Folding The Carpet Back
Courtesy of VOLVO CARS CORPORATION

Fold the carpet back

Remove:

1. ventilation pipe
2. the insulation block
3. the insulation block

Fig. 53: Identifying Right-Hand Cover Over The Fuel Pump.
Courtesy of VOLVO CARS CORPORATION

Remove the cover on the right-hand side over the fuel pump.

Fig. 54: Locating Cable Harness Connectors
Courtesy of VOLVO CARS CORPORATION

Remove:

- the cable harness connectors from the fuel pump
- connection to the sill
- the mounting on the floor for the cable harness

Fig. 55: Cutting Off The Removed Cable Connectors
Courtesy of VOLVO CARS CORPORATION

Cut off the removed cable so that both connectors can be removed. This is done so that the cable can be removed from underneath.

Fig. 56: Accessing Inner Fender
Courtesy of VOLVO CARS CORPORATION

Remove the right rear wheel.

Remove the rivet and plastic nuts for the inner fender.

Bend the fender liner out of the way.

Fig. 57: Removing Module With Mounting
Courtesy of VOLVO CARS CORPORATION

Remove:

- the module from the wheel housing assembly with the mounting
- the cable harness with mountings

VEHICLES WITH FUEL PUMP DRIVER MODULE LOCATED UNDER THE RIGHT-HAND REAR BENCH SEAT.

Fig. 58: Locating Fuel Pump Driver Module
Courtesy of VOLVO CARS CORPORATION

Fig. 59: Identifying Covers Over Seat Rails
Courtesy of VOLVO CARS CORPORATION

Remove:

- covers over seat rails
- the 4 screws

Lift out the seat on the right-hand side.

Fig. 60: Installing A New Module
Courtesy of VOLVO CARS CORPORATION

Fold up the carpet. Detach the sill trim panel slightly.

Carefully lift up the insulation block and place a block under the insulation block to access the module.

Install the new module and connect the cable connector.

Remove the block and fold the carpet back. Press the sill trim panel into place.

VEHICLES WITH FUEL PUMP DRIVER MODULE ORIGINALLY LOCATED IN THE RIGHT-HAND REAR WHEEL HOUSING

Fig. 61: Plug, 974688
Courtesy of VOLVO CARS CORPORATION

Install two rubber plugs for the wheel housing.

Use: Plug, 974688

Fig. 62: Accessing Inner Fender
Courtesy of VOLVO CARS CORPORATION

Install the inner fender with plastic nuts and rivets

Install wheel. See **INSTALLING WHEELS**

Fig. 63: Control module, 30769225
Courtesy of VOLVO CARS CORPORATION

Place the module on the two embossings in the floor leaving a clearance for the seat frame of at least 5 mm.

Use: Control module, 30769225

Remove the protective tape for the Velcro attachments and install the control module.

Install the cable mounting for the connection at the sill, fuel pump and module as well as the mounting in the floor.

Use: Cable harness, 30724838

Fig. 64: Identifying Right-Hand Cover Over The Fuel Pump.
Courtesy of VOLVO CARS CORPORATION

Check the cover seal for faults and check that the cables are in the cut-outs.

Check that the plugs are in the seal.

Install the cover and tighten to 6 Nm.

Fig. 65: Cutting A Hole In The Insulation
Courtesy of VOLVO CARS CORPORATION

Mark and make a hole for the module in the insulation block.

Fig. 66: Folding The Carpet Back
Courtesy of VOLVO CARS CORPORATION

Fold the carpet back

Install:

- ventilation pipe (1)
- the insulation block (2)
- the insulation block (3)

Fig. 67: Identifying Covers Over Seat Rails
Courtesy of VOLVO CARS CORPORATION

Install

- the seats. Use new screws, 12 x M10. Tighten to 50 Nm.
- the covers over the seat rails

VEHICLES WITH FUEL PUMP DRIVER MODULE ORIGINALLY LOCATED UNDER THE RIGHT-HAND REAR BENCH SEAT.

Fig. 68: Identifying Covers Over Seat Rails
Courtesy of VOLVO CARS CORPORATION

Install the seat. Use new screws, 4 x M10

Tighten to 50Nm

KNOCK SENSOR (KS), REPLACING

see **KNOCK SENSOR (KS), REPLACING**

TEMPERATURE AND PRESSURE SENSORS, REPLACING

see **TEMPERATURE AND PRESSURE SENSORS, REPLACING**

CONTROL SYSTEM, FUEL SUPPLY (B6324S/5; 2007-2012)

ENGINE CONTROL MODULE (ECM)

Fig. 69: Identifying Ignition Switch In OFF Position
Courtesy of VOLVO CARS CORPORATION

Fig. 70: Lifting the Cover
Courtesy of VOLVO CARS CORPORATION

Fig. 71: Locating Engine Control Module (ECM)
Courtesy of VOLVO CARS CORPORATION

NOTE: Make sure that the component terminals are not bent or damaged.

NOTE: Make sure that the seal remains correctly located.

To install, reverse the removal procedure.

Order and download software 9438288 .

ENGINE COOLANT TEMPERATURE SENSOR (ECT)

Drain the cooling system. See **COOLING SYSTEM - DRAINING, CHARGING AND BLEEDING** .

Fig. 72: Identifying Engine Coolant Temperature Sensor (ECT)
Courtesy of VOLVO CARS CORPORATION

Charge the cooling system. See **COOLING SYSTEM - DRAINING, CHARGING AND BLEEDING** .

KNOCK SENSOR (KS)

NOTE: Removal steps in this procedure may contain installation details.

Fig. 73: Identifying Engine Cover Removal
Courtesy of VOLVO CARS CORPORATION

Remove the intake manifold. See **INDUCTION PIPE** .

Fig. 74: Locating Knock Sensor
Courtesy of VOLVO CARS CORPORATION

Remove the oil cooler. See **OIL COOLER, ENGINE**

Fig. 75: Locating Knock Sensor
Courtesy of VOLVO CARS CORPORATION

Knock sensor. See **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS**

To install, reverse the removal procedure

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR

Fig. 76: Locating Engine Undercover And Clips
Courtesy of VOLVO CARS CORPORATION

Fig. 77: Identifying Manifold Absolute Pressure (MAP) Sensor
Courtesy of VOLVO CARS CORPORATION

PRESSURE SENSOR, FUEL RAIL (FRP)

NOTE: Removal steps in this procedure may contain installation details.

Always read the safety precautions, see: **SAFETY INFORMATION GASOLINE**

Drain the fuel system. See **FUEL SYSTEM PRESSURE RELEASE**

Fig. 78: Identifying Engine Cover Removal
Courtesy of VOLVO CARS CORPORATION

Fig. 79: Locating Fuel Rail Pressure Sensor (FRP)
Courtesy of VOLVO CARS CORPORATION

M5. See **TIGHTENING TORQUE**

SAFETY INFORMATION GASOLINE

WARNING: **Risk of explosion and fire.**

Make sure there are no open flames or sparks in the vicinity of fuel system components. It is possible that there is no obvious warning in the form of odor or irritation before a poisonous or hazardous situation arises. This could be immediate or delayed.

WARNING: **Gasoline for engine operation can contain considerable amounts of benzene, which is toxic if inhaled. The concentration of gasoline fumes must be kept very low. Make sure there is suitable ventilation when handling and using gasoline.**

The greatest of care must be taken to avoid the serious consequences of inhaling if there is fume build-up from spills in enclosed spaces.

High concentrations cause eye/nose/throat irritation, nausea, headaches, depression and signs of insobriety. Very high concentrations result in quick loss of consciousness.

Special methods are to be applied to clean and maintain gasoline storage tanks. Gasoline must not be used as a cleaner. Gasoline must not be taken into the mouth.

• In the event of skin contact: Take extreme care when handling hot fluids. Always wash spilled fluid off of exposed skin immediately.

• In the event of consumption: Consumption can result in mouth and skin

irritation and absorption from the stomach can result in drowsiness and loss of consciousness. Small amounts could be fatal to children.

• In the event of inhalation: Inhaling fluid into the lungs, through vomiting, is extremely dangerous. Gasoline dries out the skin. Long-term or repeated exposure can cause irritation and skin inflammation.

• In the event of contact with the eyes: Fluid in the eyes causes severe pain.

CAUTION: Fuel injection equipment is manufactured with extremely tight tolerances and minimum clearance.

CAUTION: It is vital that the utmost cleanliness is upheld when working with these components. Make sure the area around the vehicle is as clean and free of dust as possible.

CONTROL SYSTEM, FUEL SUPPLY (B8444S; 2005-2011)

CONTROL MODULE FUEL PUMP (FP), REPLACING

see **CONTROL MODULE FUEL PUMP (FP), REPLACING**

ENGINE CONTROL MODULE (ECM), REPLACING

NOTE: The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

REMOVAL

PREPARATORY WORK

Fig. 80: Identifying Ignition In OFF Position
Courtesy of VOLVO CARS CORPORATION

Ignition off.

Disconnect the battery negative cable. See: **BATTERY, DISCONNECTING** .

REMOVING THE ENGINE CONTROL MODULE (ECM)

Fig. 81: Removing Cover
Courtesy of VOLVO CARS CORPORATION

Remove the cover by lifting it straight up.

Fig. 82: Removing The Engine Control Module (ECM)
Courtesy of VOLVO CARS CORPORATION

Remove:

- the connectors, x2
- the bolts, x4
- the Engine Control Module (ECM).

INSTALLATION

INSTALLING THE ENGINE CONTROL MODULE (ECM)

NOTE: Ensure that the rubber seal is positioned correctly in its channel.

Install:

- the Engine Control Module (ECM)
- the bolts, x4
- the connectors, x2
- the cover
- the battery's negative cable in accordance with: **BATTERY, DISCONNECTING** .

ORDERING SOFTWARE

Order the software in accordance with: 9438288 .

FINISHING

Check that no diagnostic trouble codes (DTC) have been stored in the control module during the repair.

Test drive the vehicle and check the function of the engine.

FUEL PRESSURE AND TEMPERATURE SENSOR, REPLACING

NOTE: The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

REMOVAL

DRAINING THE FUEL SYSTEM

Drain the fuel system. See: **FUEL SYSTEM, DRAINING** .

REMOVING THE UPPER CROSS STAY

Fig. 83: Engine Stabilizer Brace
Courtesy of VOLVO CARS CORPORATION

Remove:

- the 4 screws at the suspension turrets
- the screws of the upper engine mount on the engine
- the upper cross stay.

REMOVING THE UPPER ENGINE MOUNT

Fig. 84: Identifying Upper Engine Mount
Courtesy of VOLVO CARS CORPORATION

Remove:

- the 4 screws
- the upper engine mount.

REMOVAL OF UPPER ENGINE COVER OVER CYLINDER 2, 4, 6 AND 8 (BANK 2)

Remove the upper engine cover over cylinder 2, 4, 6 and 8 (bank 2) by pulling it straight up.

REMOVING THE VACUUM HOSE

Fig. 85: Identifying Vacuum Hose (1)
Courtesy of VOLVO CARS CORPORATION

Remove:

- the hose clip on the vacuum hose (1)
- the vacuum hose (1).

REMOVAL OF FUEL PRESSURE AND TEMPERATURE SENSOR

Fig. 86: Identifying Fuel Pressure And Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

Remove:

- the connector for fuel pressure and temperature sensor
- the screw
- fuel pressure and temperature sensor.

INSTALLATION

NOTE: For tightening torques, see: TIGHTENING TORQUE .

INSTALLATION OF FUEL PRESSURE AND TEMPERATURE SENSOR

Fig. 87: Identifying Fuel Pressure And Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

Install:

- fuel pressure and temperature sensor
- the screw; tighten
- the connector for fuel pressure and temperature sensor

INSTALLING THE VACUUM HOSE

Fig. 88: Identifying Vacuum Hose (1)
Courtesy of VOLVO CARS CORPORATION

Install the vacuum hose (1); secure with the clamp.

INSTALLATION OF UPPER ENGINE COVER OVER CYLINDER 2, 4, 6 AND 8 (BANK 2)

Install the upper engine cover over cylinder 2, 4, 6 and 8 (bank 2)

INSTALLING THE UPPER ENGINE MOUNT

Fig. 89: Identifying Upper Engine Mount
Courtesy of VOLVO CARS CORPORATION

Install the upper engine mount. Tighten the 4 M10 screws.

INSTALLING THE UPPER CROSS STAY

Fig. 90: Engine Stabilizer Brace
Courtesy of VOLVO CARS CORPORATION

Install:

- the upper cross stay between the suspension turrets
- the 4 screws in the suspension turrets; tighten
- the screw of the cross stay mount on the engine; tighten.

KNOCK SENSOR (KS), REPLACING

NOTE: The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

REMOVAL

REMOVING THE INTAKE MANIFOLD

Remove the intake manifold. See **INTAKE MANIFOLD/GASKET, REPLACING** .

REMOVING THE KNOCK SENSOR

Fig. 91: Locating Knock Sensors
Courtesy of VOLVO CARS CORPORATION

Remove:

- the knock sensor screw
- the connector from the knock sensor
- the knock sensor.

INSTALLATION

INSTALLING THE KNOCK SENSOR

Install:

- the knock sensor.
- the screw; tighten as specified: **TIGHTENING TORQUE** .
- the connector to the knock sensor.

INSTALLING THE INTAKE MANIFOLD

Install the intake manifold. See **INTAKE MANIFOLD/GASKET, REPLACING** .

CHECK

Start the engine and check the function.

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR, REPLACING

NOTE: The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

REMOVAL

REMOVAL OF PRESSURE SENSOR INLET AIR

Fig. 92: Locating Pressure Sensor Inlet Air
Courtesy of VOLVO CARS CORPORATION

Remove:

- the connector from the sensor
- the 2 screws
- the sensor by pulling it straight up.

(In the illustration, the upper engine cover and torque arm are removed to better depict the location of the sensor.)

INSTALLATION

NOTE: For tightening torques, see: TIGHTENING TORQUE .

INSTALLATION OF PRESSURE SENSOR INLET AIR

Install:

- a new sensor
- the 2 screws; tighten
- the connector to the sensor.

CHECK

Start the engine and check the function.

TEMPERATURE SENSOR ENGINE COOLANT, REPLACING

Special tools:

see **9512885**

see **9512957**

see **9512953**

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVAL

REMOVAL OF UPPER ENGINE COVER OVER CYLINDER 1, 3, 5 AND 7 (BANK 1)

Remove:

- the oil filler cap
- upper engine cover over cylinder 1, 3, 5 and 7 (bank 1) by pulling it straight up. Install the oil filler cap.

REMOVING THE AIR CLEANER INTAKE PIPE

Fig. 93: Identifying Air Cleaner Intake
Courtesy of VOLVO CARS CORPORATION

Remove:

- the 2 screws
- the air cleaner intake pipe
- the expansion tank cap.

REMOVING PROTECTIVE PLATE

Fig. 94: Splash Guard. Protective Plate And Screws
Courtesy of VOLVO CARS CORPORATION

NOTE: There is a guide sleeve on the upper mounting for the plate. This must be lifted slightly so that the panel can be slid forward.

Remove the 6 screws.

Lift and slide the protective plate forward.

Remove the protective plate.

DRAINING COOLANT

Open the cock on the lower left edge of the radiator.

Drain the coolant into a clean receptacle.

Close the cock.

INSTALLING THE PROTECTIVE PLATE

Fig. 95: Splash Guard. Protective Plate And Screws
Courtesy of VOLVO CARS CORPORATION

Install:

- the protective plate
- the 6 screws; tighten.

REMOVING CONNECTORS

Fig. 96: Removing Connectors
Courtesy of VOLVO CARS CORPORATION

Remove:

- the connector of the injectors from the retainer
- the connector; bend aside
- the connector from the retainer; bend aside.

REMOVING THE COOLANT TEMPERATURE SENSOR

Fig. 97: Identifying Coolant Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

Remove:

- the connector from the temperature sensor
- the temperature sensor using see **9512885** .

INSTALLATION

NOTE: For tightening torques, see: TIGHTENING TORQUE .

INSTALLING THE COOLANT TEMPERATURE SENSOR

Install:

- the temperature sensor using see **9512885** .
- the connector to the temperature sensor.

INSTALLING CONNECTORS

Fig. 98: Removing Connectors
Courtesy of VOLVO CARS CORPORATION

Install:

- the connector to the injectors
- the connector of the injectors in the retainer
- the connector in the retainer.

INSTALLING THE AIR CLEANER INTAKE PIPE

Fig. 99: Identifying Air Cleaner Intake
Courtesy of VOLVO CARS CORPORATION

Install:

- the air cleaner intake pipe
- the 2 M6 screws; tighten.

INSTALLATION OF UPPER ENGINE COVER OVER CYLINDER 1, 3, 5 AND 7 (BANK 1)

Remove the oil filler cap.

Install:

- upper engine cover over cylinder 1, 3, 5 and 7 (bank 1)
- the oil filler cap.

CHECK

CAUTION: Make sure the outlet hose of filling equipment is not blocked as this could damage the cooling system.

Fill with coolant using filling equipment see **9512957** and cover see **9512953** .

Check the oil level in the engine and transmission. Start the engine and allow it to warm to normal operating temperature. Check for leaks and proper function. Fill up fluids as necessary.

CONTROL SYSTEM, IGNITION (B5254T2; 2003-2007)

POSITION SENSOR CAMSHAFT, REPLACING

NOTE: The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE POSITION SENSOR

Fig. 100: Camshaft Position Sensor
Courtesy of VOLVO CARS CORPORATION

Disconnect the connector from the sensor.

Remove:

- the screw for the sensor
- the sensor.

INSTALLING THE POSITION SENSOR

Fig. 101: Camshaft Position Sensor
Courtesy of VOLVO CARS CORPORATION

Install:

- the sensor
- screws. Tighten.

Connect the connector for the sensor.

FINISHING

Start the engine. Check the function.

REPLACING THE ENGINE SPEED (RPM) SENSOR

REMOVING THE ENGINE SPEED (RPM) SENSOR

Fig. 102: Engine Speed Sensor
Courtesy of VOLVO CARS CORPORATION

Remove the tie strap from the torque rod.

Open the hose clamp.

Remove:

- the hoses
- the connector from the sensor
- the nut for the sensor
- the sensor.

INSTALLING THE ENGINE SPEED (RPM) SENSOR

Fig. 103: Engine Speed Sensor
Courtesy of VOLVO CARS CORPORATION

Install

- the sensor. Use a **new** nut. Tighten to **10 Nm**
- the connector
- the hoses and close the clamp
- the tie strap on the torque rod.

CONTROL SYSTEM, IGNITION (B6294T; 2003-2006)

CAMSHAFT POSITION SENSOR (CMP), REPLACING

REMOVING CAMSHAFT POSITION (CMP) SENSOR

Remove the preheating pipe from the air cleaner (ACL):**Applies only to B6xx4S engines** .

Fig. 104: Identifying Intake Manifold Between Front Cover Plate & Air Cleaner Housing
Courtesy of VOLVO CARS CORPORATION

Applies only to B6xx4T

- Remove the intake pipe between the front cover plate and the air cleaner (ACL).

Fig. 105: Identifying Clamp On Hose Between Mass Air Flow Sensor And Pipe To Turbocharger
Courtesy of VOLVO CARS CORPORATION

- Remove the clamp on the hose between the mass air flow (MAF) sensor and the pipe to the turbocharger (TC)
- Remove the turbocharger (TC) control valve from the air cleaner (ACL) housing
- Disconnect the turbocharger (TC) control valve connector
- Remove the air cleaner (ACL) housing. Place it to one side
- Remove the hose clamp from the crankcase ventilation and the heater hose.

Fig. 106: Camshaft Position Sensor Connector
Courtesy of VOLVO CARS CORPORATION

Hose bracket.

Disconnect the connector at the bracket

Remove the cable from the clamp on the cylinder block.

Remove the camshaft position (CMP) sensor housing.**Applies only to B6xx4T engines** .

Remove the sensor mounting screw. Pull off sensor.

INSTALLING THE CAMSHAFT POSITION (CMP) SENSOR

Fig. 107: Camshaft Position Sensor Connector
Courtesy of VOLVO CARS CORPORATION

Install

- **new sensor** . Tighten to **10 Nm**
- the camshaft position (CMP) sensor housing. Tighten to **17 Nm** .**Applies only to B6xx4T**
- the cable from the clamp on the cylinder block
- the connector on the bracket
- the hose bracket on the cylinder block.

Fig. 108: Identifying Clamp On Hose Between Mass Air Flow Sensor And Pipe To Turbocharger
Courtesy of VOLVO CARS CORPORATION

Applies only to B6xx4T

- the crankcase ventilation pipe and the heater hose. Tighten the hose clamps
- air cleaner (ACL) housing
- the turbocharger (TC) control valve connector
- the turbocharger (TC) control valve from the air cleaner (ACL) housing
- the hose between the air cleaner (ACL) housing and turbocharger (TC). Tighten the hose clamp
- the intake manifold between the front cover plate and the air cleaner (ACL) housing.

Install the preheating pipe on the air cleaner (ACL):**Applies only to B6xx4S engines** .

ENGINE SPEED (RPM) SENSOR, REPLACING

REMOVING THE ENGINE SPEED (RPM) SENSOR

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

Fig. 109: Engine And Stabilizer Brace
Courtesy of VOLVO CARS CORPORATION

Remove:

- the hose clamp for the air cleaner (ACL) / fresh air intake
- the air cleaner (ACL) in the intake pipe
- lift out the air cleaner (ACL).

Fig. 110: Identifying Engine Speed (RPM) Sensor

Courtesy of VOLVO CARS CORPORATION

Remove the mounting nut for the sensor.

Pull up the sensor.

INSTALLING THE ENGINE SPEED (RPM) SENSOR

Install the sensor. Use a new nut. Tighten to **10 Nm** .

Install

- the air cleaner (ACL) housing and the hose clamp for the air cleaner (ACL) / fresh air intake
- the intake pipe.

CONTROL SYSTEM, IGNITION (B6324S/5; 2007-2012)

CAMSHAFT POSITION SENSOR (CMP)

NOTE: Removal steps in this procedure may contain installation details.

Fig. 111: Identifying Engine Cover Removal
Courtesy of VOLVO CARS CORPORATION

Fig. 112: Identifying Camshaft Position Sensors (CMP)
Courtesy of VOLVO CARS CORPORATION

M6. See **TIGHTENING TORQUE**

To install, reverse the removal procedure

CRANKSHAFT POSITION SENSOR (CKP)

NOTE: Removal steps in this procedure may contain installation details.

Fig. 113: Locating Engine Undercover And Clips
Courtesy of VOLVO CARS CORPORATION

Fig. 114: Identifying Crankshaft Position Sensor (CKP)
Courtesy of VOLVO CARS CORPORATION

M6. See **TIGHTENING TORQUE**

To install, reverse the removal procedure

CONTROL SYSTEM, IGNITION (B8444S; 2005-2011)

ENGINE SPEED (RPM) SENSOR, REPLACING

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVAL

REMOVING THE UPPER CROSS STAY

Fig. 115: Engine Stabilizer Brace
Courtesy of VOLVO CARS CORPORATION

Remove:

- the 4 screws at the suspension turrets
- the screws of the upper engine mount on the engine
- the upper cross stay.

REMOVING THE UPPER REAR ENGINE COVER

Remove the upper rear engine cover by pulling it straight up.

DISCONNECTING THE ENGINE SPEED SENSOR

Fig. 116: Locating Engine Speed Sensor
Courtesy of VOLVO CARS CORPORATION

Remove:

- the 1 M6 screw of the engine speed sensor; pull out the sensor
- the connector from the engine speed sensor.

INSTALLATION

NOTE: For tightening torques, see: TIGHTENING TORQUE .

INSTALLING THE ENGINE SPEED SENSOR

Install:

- the engine speed sensor; tighten the screw
- the connector to the engine speed sensor.

INSTALLING THE UPPER REAR ENGINE COVER AND UPPER CROSS STAY

Fig. 117: Engine Stabilizer Brace
Courtesy of VOLVO CARS CORPORATION

Install:

- the upper engine cover; press it into the mountings
- the upper cross stay between the suspension turrets.
- the 4 screws at the suspension turrets; tighten
- the screw of the cross stay mount on the upper engine mount; tighten.

CHECK

Start the engine and check the function.

EXHAUST CAMSHAFT POSITION SENSOR, REPLACING

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVAL OF POSITION SENSOR, CYLINDER 1, 3, 5 AND 7 (BANK 1)

Fig. 118: Identifying Camshaft Position Sensor
Courtesy of VOLVO CARS CORPORATION

Lift the upper coolant hose out of its mounting and bend it aside.

Remove:

- the connector from the position sensor
- the 1 M6 screw
- the position sensor.

INSTALLATION OF POSITION SENSOR, CYLINDER 1, 3, 5 AND 7 (BANK 1)

NOTE: For tightening torques, see: TIGHTENING TORQUE .

Install:

- the position sensor; tighten the screw
- the connector for the position sensor
- the upper coolant hose in its mounting.

REMOVING THE UPPER CROSS STAY

Fig. 119: Engine Stabilizer Brace
Courtesy of VOLVO CARS CORPORATION

Remove:

- the 4 screws at the suspension turrets
- the screws of the upper engine mount on the engine
- the upper cross stay.

REMOVING THE UPPER REAR ENGINE COVER

Remove the upper rear engine cover by pulling it straight up.

REMOVAL OF POSITION SENSOR, CYLINDER 2, 4, 6 AND 8 (BANK 2)

Fig. 120: Identifying Camshaft Position Sensor
Courtesy of VOLVO CARS CORPORATION

Remove:

- the M6 screw at the heat shield of the position sensor
- the connector from the position sensor
- the 1 M6 screw
- the position sensor.

INSTALLATION OF POSITION SENSOR, CYLINDER 2, 4, 6 AND 8 (BANK 2)

NOTE: For tightening torques, see: TIGHTENING TORQUE .

Install:

- the position sensor; tighten the screw
- the connector for the position sensor
- the heat shield of the position sensor; tighten the screw.

INSTALLING THE UPPER REAR ENGINE COVER

Position the upper rear engine cover and press it into place in the mountings.

INSTALLING THE UPPER CROSS STAY

Fig. 121: Engine Stabilizer Brace
Courtesy of VOLVO CARS CORPORATION

Install:

- the cross stay between the suspension turrets
- the 4 screws in the suspension turrets; tighten
- the screw of the cross stay mount on the upper engine mount; tighten.

CHECK

Start the engine and check the function.

INTAKE CAMSHAFT POSITION SENSOR, REPLACING

NOTE: The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

REMOVAL

REMOVING THE FUEL RAIL

Remove the fuel rail.

REMOVING THE INTAKE CAMSHAFT POSITION SENSOR

Fig. 122: Identifying Camshaft Position Sensor
Courtesy of VOLVO CARS CORPORATION

Remove:

- the connector from the position sensor
- the screw
- the intake camshaft position sensor.

INSTALLATION

NOTE: For tightening torques, see: TIGHTENING TORQUE .

INSTALLING THE INTAKE CAMSHAFT POSITION SENSOR

Fig. 123: Identifying Camshaft Position Sensor
Courtesy of VOLVO CARS CORPORATION

Install:

- the intake camshaft position sensor
- the screw
- the connector for the position sensor.

INSTALLING THE FUEL RAIL

Install the fuel rail.

IGNITION COIL, SPARK PLUG, IGNITION CABLE (B8444S; 2005-2011)

IGNITION COIL, REPLACING

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVAL

REMOVING THE ENGINE COVERS

Remove the upper engine covers by pulling straight up.

REMOVAL OF IGNITION COILS, CYLINDER 1, 3, 5 AND 7 (BANK 1)

Fig. 124: Locating Ignition Coils
Courtesy of VOLVO CARS CORPORATION

Remove:

- the 4 connectors from the ignition coils
- the 4 screws of the ignition coils
- the 4 ignition coils of the cylinders.

REMOVAL OF IGNITION COILS, CYLINDER 2, 4, 6 AND 8 (BANK 2)

Fig. 125: Locating Ignition Coils
Courtesy of VOLVO CARS CORPORATION

Remove:

- the 2 screws of the cable harness
- the retaining screw of the upper engine cover.

Carefully bend aside the cable harness.

Remove:

- the 4 connectors from the ignition coils
- the 4 screws of the ignition coils
- the 4 ignition coils of the cylinders.

INSTALLATION

NOTE: For tightening torques, see: TIGHTENING TORQUE .

INSTALLATION OF IGNITION COILS, CYLINDER 1, 3, 5 AND 7 (BANK 1)

Fig. 126: Locating Ignition Coils
Courtesy of VOLVO CARS CORPORATION

Install:

- the 4 ignition coils of the cylinders
- the 4 screws of the ignition coils; tighten
- the 4 connectors to the ignition coils.

INSTALLATION OF IGNITION COILS, CYLINDER 2, 4, 6 AND 8 (BANK 2)

Fig. 127: Locating Ignition Coils
Courtesy of VOLVO CARS CORPORATION

Install:

- the 4 ignition coils of the cylinders
- the 4 screws of the ignition coils
- the 4 connectors to the ignition coils
- the 2 screws of the cable harness
- the retaining screw of the upper engine cover.

INSTALLING THE ENGINE COVERS

Install the engine covers over the front and rear cylinder bank.

IGNITION COIL, SPARK PLUGS, IGNITION LEADS (B5254T2; 2003-2007)

REPLACING IGNITION COILS

REMOVING IGNITION COILS

Fig. 128: Charge Air Pipe Over Engine

Remove

- the charge air pipe over the engine.

  Seal the openings

Fig. 129: Identifying Ignition Coil, Connector, And Screw
Courtesy of VOLVO CARS CORPORATION

- the upper timing belt cover
- the cover over the ignition coils

  Disconnect the ignition coil connector.

- the mounting screw. Pull the coil up.

INSTALLING IGNITION COILS

Fig. 130: Identifying Ignition Coil, Connector, And Screw
Courtesy of VOLVO CARS CORPORATION

Install the **new** coil.

Align the coil and press it down. Install the screw. Tighten to **10 Nm** .

Press in the connector until a clicking sound is heard.

Install the cover over the ignition coil.

Install the upper timing belt cover.

Remove the seals from the charge air pipe. Reinstall the charge air pipe over the engine.

IGNITION COIL, SPARK PLUGS, IGNITION LEADS (B6294T; 2003-2006)

REPLACING IGNITION COIL

REMOVING IGNITION COIL

Fig. 131: Identifying Plastic Hoses Between Turbocharger, Charge Air Cooler & Air Cleaner/Turbocharger
Courtesy of VOLVO CARS CORPORATION

Remove

- plastic hoses turbocharger (TC)/charge air cooler (CAC) and air cleaner (ACL)/turbocharger (TC). Place them to one side. Seal the openings.**Applies only to B6xx4T**

Fig. 132: Identifying Ignition Coil
Courtesy of VOLVO CARS CORPORATION

- upper camshaft belt cover
- the ignition coils cover
- the ignition coil connector
- mounting screw and pull up the coil.

INSTALLING IGNITION COIL

Fig. 133: Identifying Ignition Coil
Courtesy of VOLVO CARS CORPORATION

Install a new coil.

Align the coil and press down. Install the screw. Tighten to **10 Nm (7.4 lb. ft)** .

Press in the connector until a clicking sound is heard.

Install the ignition coil cover.

Install upper camshaft belt cover.

Applies only to B6xx4T

Remove the seals.

Install the plastic hoses between the turbocharger (TC)/charge air cooler and the air cleaner (ACL)/turbocharger (TC).

ENGINE PERFORMANCE

Ignition And Control Systems - Specifications, electrical/electronic

COMPONENT SPECIFICATIONS, ENGINE CONTROL MODULE (ECM) (B6324S; 2007-2010)

COMPONENT SPECIFICATIONS

The component specification gives the value of the component when the connector is disconnected. Where no value is given, it is not possible to measure a relevant value at the component.

Numbers in parenthesis indicate to which pin of the component the value corresponds.

Designation	Type	Supply voltage	Value	Other
Air conditioning (A/C) relay	Mechanical relay	12 V	92 ohms ± 10% at 23 °C	
System relay Starter relay	Mechanical relay	12 V	82ohms ± 10% at 23° C (coil)	
A/C pressure sensor	Absolute manifold absolute pressure (MAP) sensor	5 V (#3)		Air conditioning (A/C) high pressure
Brake light switch	Position switch	12 V (#1)	The switch is closed when the pedal is depressed (terminals #1-#5)	
Intake pressure sensor		5 V (#3)		
Fuel temperature sensor	NTC resistor	5 V (#3)	2500 ohms ± 6% at 20 °C (#1-#2)	Integrated in the fuel pressure sensor
Fuel pressure sensor	Piezo resistive pressure sensor	5 V (#3)		
Engine cooling fan (FC) control module	-	12 V (#2)		
Evaporative emission system (EVAP) valve	Electromagnetic valve	12 V (#1)	20, 5 ohms ± 1, 5 ohms	
Actuator variable intake	Actuator, DC motor 1&2	12 V (#1)	4 ohms	
Accelerator pedal (AP) position sensor	Electronic pedal sensor with two output signals, PWM and a linear analog signal	12 V (#1) power supply digital position sensor 5 V (#6) Power		

		supply analog position sensor		
Throttle unit	Electronic throttle module (ETM) with two integrated potentiometers and a throttle motor	5 V (#5)	1.2ohms (#1-#2 motor winding) at normal operating temperature.	-
Injector	Electromagnetic injector valve	12 V (#2)	Approximately 12 ohms at 20°C (terminal #1-#2)	
Camshaft sensor	Magneto-resistive sensor	5 V (#1)		
Knock sensor (KS)	Piezo electric component		Greater than 1 Mohms at 25 ± 10°C(#1-#2)	
Oil level and oil temperature sensor		5 V (#3)		
Ignition coil		12 v (#1)	Approximately 0.98 ohms (primary winding)	
Preheating, front heated oxygen sensor	PTC resistor	12 V (#3)	2.18 - 2.68 ohms at 20 °C (#1-#2)	
Preheating, rear heated oxygen sensor (HO2S)	PTC resistor	12 V (#1)	Approximately 13 ohms ± 1.3ohms (terminal #1-#2)	
Leak diagnostic unit	Consists of pump, electromagnetic valve and an internal heating element (PTC resistor)	12 V (#4)	118ohms (#1-#4 pump motor winding) 29.5ohms ± 10% (terminals #3-#4 Valve coil) 30ohms (#2-#4 Heating element)	
Engine coolant temperature (ECT) sensor	NTC resistor	5 V (#1)	15040 ohms at -20 °C 2450 ohms at 20 °C 318 ohms at 80 °C (#1- #2)	
Reset valve camshaft	Electromagnetic valve	12 V (#1)	7.4 ohms ± 0.5 ohms at 20 °C (#1-#2)	
Flywheel sensor	Induction sensor	-	125, 5 ohms ± 17 ohms(#1-#2)	
Outside temperature sensor	NTC resistor	5 V (#1)	18702 ohms at -20 °C 6318 ohms at 0 °C 2424 ohms at 20 °C 1034 ohms at 40 °C (#1- #3)	
Cam profile	Electromagnetic valve	12 V (#1)	8, 5 ohms ± 0, 5 ohms	

solenoid				

COMPONENT SPECIFICATIONS, ENGINE CONTROL MODULE (ECM) (B6324S5; 2011-2012)

COMPONENT SPECIFICATIONS

see **COMPONENT SPECIFICATIONS**

COMPONENT SPECIFICATIONS, ENGINE CONTROL MODULE (ECM) (B8444S; 2005-2011)

COMPONENT SPECIFICATIONS

The component specification gives the value of the component when the connector is disconnected. Where no value is given, it is not possible to measure a relevant value at the component.

Numbers in brackets indicate to which pin of the component the value corresponds.

Designation	Type	Supply voltage	Value	Other
Air conditioning (A/C) relay	Mechanical relay	12V	92 ohms± 10% at +23°C	
System relay Starter relay	Mechanical relay	12V	82ohms ± 10% at 23° C (coil)	
A/C pressure sensor	Absolute manifold absolute pressure (MAP) sensor	5 V (#3)		Air conditioning (A/C) high pressure
Stop lamp switch	Position switch	12 V (#1)	The switch is closed when the pedal is depressed (terminals #1-#5)	
Intake pressure sensor		5 V (#3)		
Fuel temperature sensor	NTC resistor	5V (#3)	2500ohms± 6% at 20°C (terminals #1-#2)	Integrated in the fuel pressure sensor
Fuel pressure sensor	Piezo resistive pressure sensor	5V (#3)		
Engine cooling fan (FC) control module	-	12 V (#2)		
Evaporative emission system (EVAP) valve	Electromagnetic valve	12 V (#1)	20.5ohms ± 1.5ohms	

Valve variable inlet	Electromagnetic valve	12 V (#1)	37-44 ohms	
Accelerator pedal (AP) position sensor	Electronic pedal sensor with two output signals, PWM and a linear analog signal	12 V (#1) voltage supply digital position sensor 5 V (#6) Voltage supply analog position sensor		
Throttle unit	Electronic throttle module (ETM) with two integrated potentiometers and a throttle motor	5 V (#5)	1.2ohms (#1-#2 motor winding) at normal operating temperature.	-
Injector	Electromagnetic injector valve	12 V (#2)	Approximately 12 ohms at 20°C (terminal #1-#2)	
Camshaft position (CMP) sensor	Magneto-resistive sensor	5 V (#1)		
Knock sensor (KS)	Piezo electric component		Greater than 1 Mohms at 25 ± 10°C (#1-#2)	
Oil quality sensor		5 V (#3)		
Ignition coil		12 v (#1)	Approximately 0.98ohms (primary winding)	
Coolant level sensor	Position switch	Ground connection (terminal #2)	Closed when the engine coolant level is normal	
Preheating front heated oxygen sensor (HO2S)	PTC resistor	12 V (#3)	2.18-2.68 ohms at 20°C (terminals #1-#2)	
Preheating, rear heated oxygen sensor (HO2S)	PTC resistor	12 V (#1)	Approximately 13 ohms ± 1.3ohms (terminal #1-#2)	
Leak diagnostic unit	Consists of pump, electromagnetic valve and an internal heating element (PTC resistor)	12 V (#4)	118ohms (#1-#4 pump motor winding) 29.5ohms ± 10% (terminals #3-#4 Valve coil) 30ohms (#2-#4 Heating element)	
Engine coolant temperature (ECT) sensor	NTC resistor	5 V (#1)	15040 ohms at -20°C 2450 ohms at 20°C 318 ohms at 80°C (#1- #2)	

Oil pressure sensor	Pressure switch (Pressostat)	Grounded in the engine block	Closed switch when the oil pressure is low	
Reset valve camshaft	Electromagnetic valve	12 V (#1)	7.4 ohms ± 0.5ohms at 20°C (terminals #1-#2)	
Flywheel sensor	Engine speed sensor	-	125, 5ohms ± 17ohms(#1-#2)	
Outside temperature sensor	NTC resistor	5 V (#1)	18702ohms at -20°C 6318ohms at 0°C 2424ohms at 20°C 1034ohms at 40°C (#1- #3)	

SIGNAL DESCRIPTION, ENGINE CONTROL MODULE (ECM) (B5254T2; 2003-2004)

SIGNAL DESCRIPTION

General

All values stated below are measured between each connection in column 1 (Conn. control module) and breakout box connection #B3 unless otherwise noted in column 6 (Other). The control module's connections #A1-#A70 correspond to #A1-#B10 on the breakout box, #B1-#B50 correspond to #B11- #B60 on the breakout box.

NOTE: **It is important to connect the breakout box and check the ground connections before starting to measure.**

HINT: If the numbering of the connector is different from the numbering on the breakout box, the connector number is given first, #A61, followed by the breakout box number in brackets, #B1. Example: #A61 (#B1).

U=	DC voltage in volts (V)	U_{AC} =	AC voltage in volts (V)
U_{bat} =	Battery voltage (V)	f =	Frequency in Hertz (Hz)
U_{low} =	Voltage approximately 0 V	% duty =	Duty cycle (pulse ratio) in percent (%)
t =	Time in milliseconds (ms)	I =	Current in amperes (A)

Control module terminal	Breakout box terminal	Signal type	Ignition on	Engine idling	Other
#A1	#A1	Signal electronic throttle module, potentiometer 1 (circuit 1)	Uapprox. 0.4 - 4 V	-	The voltage varies depending on the position of

					the throttle. U increases with increased throttle opening.
#A2	#A2	Fuel pressure sensor signal	-	350-400 kPa (absolute pressure) U = 1.8 - 2 V	The voltage increases with increased fuel pressure.
#A3	#A3	Fuel temperature sensor signal	-	Uapprox. 0.5 V-4.5 V	Voltage drops with increased fuel temperature. The fuel temperature sensor is integrated in the fuel pressure sensor.
#A4	#A4	Signal engine temperature sensor	-	(+30°C) U=1.22 V (+80°C) U=0.29 V (+100 °C) U=0.17 V	
#A5	#A5	Intake air temperature (IAT) sensor signal	-	(+20°C) U=3.50 V (+30°C) U=3.00 V (+40°C) U=2.50 V	Air temperature sensor inlet is integrated in boost pressure sensor.
#A6	#A6	Control signal preheating rear heated oxygen sensor	U = U_{bat}	Preheating of: U=U_{bat} Preheating on: U=U_{low}	
#A7	#A7	Engine cooling fan (FC) control signal	Pulse width modulation (PWM) signal U_{high} min. 70% of U_{bat} U_{low} =1.2 V f = 100 Hz Pulse ratio= 10-95%		
#A8	#A8	-	-	-	
#A9	#A9	Control signal EVAP-valve	U = U_{bat}	-	PWM signal during activation

					of the canister purge (CP) valve
#A10	#A10	-	-	-	
#A11	#A11	-	-	-	
#A12	#A12	-	-	-	
#A13	#A13	Control signal, intake camshaft reset valve	-	Pulse width modulation (PWM) signal U_{top} =U_{bat} f=250 Hz (±12.5 Hz) Pulse ratio 20-95%	Pulse ratio controls control of the camshaft
#A14	#A14	Control signal injector no. 5	U = U_{bat}	t = 2-3 ms	t increases with engine speed (RPM) and load
#A15	#A15	Control signal injector no. 3	U = U_{bat}	t = 2-3 ms	t increases with engine speed (RPM) and load
#A16	#A16	Control signal injector no. 1	U = U_{bat}	t = 2-3 ms	t increases with engine speed (RPM) and load
#A17	#A17	Power supply	U = U_{bat}	-	Supplied via system relay
#A18	#A18	Control signal preheating front heated oxygen sensor	U = U_{bat}	Preheating of: U=U_{bat} Preheating on: U=U_{low}	
#A19	#A19	Signal ground electronic throttle module, potentiometer 1 and 2	U=U_{low}	-	
#A20	#A20	Signal electronic throttle module, potentiometer 2 (circuit 2)	Uapprox.4-0.4 V	-	The voltage varies depending on the position of the throttle. U decreases with increasing throttle opening.
#A21	#A21	Exhaust camshaft reset valve control signal	-	Pulse width modulation (PWM) signal U_{top} =U_{bat} f=250 Hz (±12.5 Hz) Pulse ratio 20-	Pulse ratio controls control of the camshaft

				95%	
#A22	#A22	Mass air flow (MAF) sensor signal	U = 1 V	U=1.7 V	U increases with increasing air mass
#A23	#A23	Signal boost pressure sensor	U=1.96 V	-	U increases with increasing boost pressure.
#A24	#A24	Front heated oxygen sensor (HO2S), pump current	-	-	Pulsed current measurement, not measured
#A25	#A25	-	-	-	
#A26	#A26	Oil pressure switch signal	$U=U_{low}$	$U = U_{bat}$	
#A27	#A27	Signal camshaft sensor 2, camshaft exhaust	U=5 V	U= Pulsed signal U_{top} =5 V U_{offset} = 2.5 V	The frequency varies according to engine speed (RPM)
#A28	#A28	Front heated oxygen sensor (HO2S), calibration current	-	-	Not measured
#A29	#A29	Voltage feed 5 V camshaft sensor	U=5 V	-	
#A30	#A30	Control signal ignition coil no. 2	$U=U_{low}$	U=2.5 V t_{high} =2 ms	The frequency varies according to engine speed (RPM)
#A31	#A31	Control signal ignition coil no. 1	$U=U_{low}$	U=2.5 V t_{high} =2.5 ms	The frequency varies according to engine speed (RPM)
#A32	#A32	-	-	-	
#A33	#A33	Control signal injector no. 4	$U = U_{bat}$	t_{low} =2-3 ms	t increases with engine speed (RPM) and load
#A34	#A34	Control signal injector no. 2	$U = U_{bat}$	t_{low} =2-3 ms	t increases with engine speed (RPM) and load
#A35	#A35	Control signal (+) electronic throttle module's damper motor	-	Pulse width modulation (PWM) signal U_{top} =U_{bat} Pulse ratio 0-100% The polarity of the control	The damper motor is controlled using a PWM-signal from the integrated end-stage in the engine control module (ECM)

				signal switches when the damper motor is to be controlled in the opposite rotational direction.	measured to #A36 (#A36)
#A36	#A36	Control signal (-) electronic throttle module's damper motor	-	Pulse width modulation (PWM) signal $U_{top} = U_{bat}$ Pulse ratio 0-100% The polarity of the control signal switches when the damper motor is to be controlled in the opposite rotational direction.	The damper motor is controlled using a PWM-signal from the integrated end-stage in the engine control module (ECM) measured to #A35 (#A35)
#A37	#A37	-	-	-	
#A38	#A38	Control signal turbo control valve	$U = U_{bat}$	-	For turbo control: PWM-signal f=32 Hz
#A39	#A39	Voltage feed 5V boost pressure sensor, AC pressure sensor, mass airflow sensor	U=5 V	-	
#A40	#A40	-	-	-	
#A41	#A41	Signal (+) front heated oxygen sensor	-	-	Pulsed current signal, not measured
#A42	#A42	Signal (-) front heated oxygen sensor	-	-	Pulsed current signal, not measured
#A43	#A43	-	-	-	
#A44	#A44	-	-	-	
#A45	#A45	Signal (+) rear knock sensor	$U=U_{low}$	-	
#A46	#A46	Signal (+) front knock sensor	$U=U_{low}$	-	
#A47	#A47	Signal camshaft sensor 1,	U=5 V	U= Pulsed	The frequency

		camshaft intake		signal U_{top} =5 V U_{offset} = 2.5 V	varies according to engine speed (RPM)
#A48	#A48	Signal (+), flywheel sensor	U=2.5 V	U=sinus voltage U_{top} =5 V U_{offset} = 2.5 V	Measured to #A66 (#B6) The frequency increases with engine speed (RPM)
#A49	#A49	-	-	-	
#A50	#A50	Control signal ignition coil no. 3	$U=U_{low}$	U=2.5 V t_{high} =2 ms	The frequency varies according to engine speed (RPM)
#A51	#A51	Control signal ignition coil no. 5	$U=U_{low}$	U=2.5 V t_{high} =2 ms	The frequency varies according to engine speed (RPM)
#A52	#A52	Control signal ignition coil no. 4	$U=U_{low}$	U=2.5 V t_{high} =2 ms	The frequency varies according to engine speed (RPM)
#A53	#A53	Power ground 3	U_{low}	-	Grounding point, connected to chassis
#A54	#A54	Power ground 2	U_{low}	-	Grounding point, connected to chassis
#A55	#A55	-	-	-	
#A56	#A56	-	-	-	
#A57	#A57	-	-	-	
#A58	#A58	Signal ground mass airflow sensor	$U=U_{low}$	-	
#A59	#A59	Voltage feed 5 V electronic throttle module, potentiometer 1 and 2	U=5 V	-	
#A60	#A60	Signal ground AC pressure sensor, boost pressure sensor, engine temperature sensor	$U=U_{low}$	-	
#A61	#B1	Signal (+) rear heated oxygen sensor	Uapprox.0.50 V	Above 0.6 V or below 0.3 V	
#A62	#B2	Signal (-) rear heated oxygen sensor	$U=U_{low}$	$U=U_{low}$	

#A63	#B3	Signal ground	$U=U_{low}$	-	Grounding point, connected to chassis
#A64	#B4	Signal (-) front knock sensor	$U=U_{low}$	-	
#A65	#B5	Signal ground camshaft sensor	$U=U_{low}$	-	
#A66	#B6	Signal (-) flywheel sensor	U=2.5 V	U=sinus voltage U_{top} =5 V U_{offset} = 2.5 V	Measured to #A48 (#A48) The frequency increases with increasing engine speed
#A67	#B7	Signal (-) rear knock sensor	$U=U_{low}$	-	
#A68	#B8	Signal AC pressure sensor	U=0.9 V (at approximately 20° C)	-	U increases with increasing pressure in the AC-system
#A69	#B9	-	-	-	
#A70	#B10	-	-	-	

Control module terminal	**Breakout box terminal**	**Signal type**	**Ignition on**	**Engine idling**	**Other**

SIGNAL SPECIFICATION

General

All values given below are between the terminals stated in column 1 and breakout box terminal in the Control unit) and breakout box terminal #B3 unless otherwise indicated in column 6 (Miscellaneous). Control module terminals #A1-#A70 correspond to terminals #A1-#B10 on the breakout box, terminals #B1-#B50 correspond to #B11 - #B60 on the breakout box.

NOTE: It is important to connect the breakout box and check the ground terminals before taking readings.

HINT: If the numbering of the connector is different from the numbering on the breakout box, the connector number is given first, terminal #A61, followed by the breakout box number in brackets, (#B1). Example: #A61 (#B1).

U=	DC voltage in volts (V)	U_{AC} =	AC voltage in volts (V)
U_{bat} =	Battery voltage (V)	f =	Frequency in Hertz (Hz)
U_{low} =	Voltage approximately 0 V	% duty =	Duty cycle (pulse ratio) as a percentage (%)
t =	Time in milliseconds (ms)	I =	Current in amperes (A)

Control module terminal	Breakout box terminal	Signal type	Ignition on	Engine idling	Other
#A1	#A1	Throttle unit signal, potentiometer 1 (circuit 1)	U approx. 0.4 -4 V	-	The voltage varies depending on the position of the throttle. U increases with throttle opening.
#A2	#A2	Fuel pressure sensor signal	-	350 - 400 kPa (absolute pressure) U=1.8-2 V	The voltage increases with increased fuel pressure.
#A3	#A3	Fuel temperature sensor signal	-	Uapprox. 0.5 V-4.5 V	The voltage falls with increased fuel temperature.

					The fuel temperature sensor is integrated in the fuel pressure sensor.
#A4	#A4	Engine coolant temperature (ECT) sensor signal	-	(+30°C) U=1.22 V (+80°C) U = 0.29 V (+100°C) U = 0.17 V	
#A5	#A5	Intake air temperature (IAT) sensor signal	-	(+20°C) U = 3.50 V (+30°C) U = 3.00 V (+40°C) U = 2.50 V	The intake air temperature (IAT) sensor is integrated in the boost pressure sensor.
#A6	#A6	Control signal, rear heated oxygen sensor (HO2S) preheating	$U = U_{bat}$	Preheating off: $U = U_{bat}$ Preheating on $U=U_{low}$	
#A7	#A7	Engine cooling fan (FC) control signal	Pulse width modulation (PWM) signal U_{high} at least 70% of U_{bat} U_{low} = 1.2 V f = 100 Hz Pulse ratio = 10-95%		
#A8	#A8	-	-	-	
#A9	#A9	Control signal, canister purge (CP) valve	$U = U_{bat}$	-	PWM signal during activation of the canister purge (CP) valve

SIGNAL SPECIFICATION, ENGINE CONTROL MODULE (ECM) (B5254T2; 2005-2007)

SIGNAL SPECIFICATION

General

All values given below are between the terminals stated in column 2 (Control module terminal) and breakout box terminal #B3 unless otherwise indicated in column 6 (Miscellaneous). Control module terminals #A1-#A70 correspond to terminals #A1-#B10 on the breakout box, terminals #B1-#B50 correspond to #B11 - #B60 on the breakout box.

NOTE: **It is important to connect the breakout box and check the ground terminals before taking readings.**

HINT: If the numbering of the connector is different from the numbering on the breakout box, the connector number is given first, terminal #A61, followed by the breakout box number in brackets, (#B1). Example: #A61 (#B1).

U=	DC voltage in volts (V)	U_{AC} =	AC voltage in volts (V)
U_{bat} =	Battery voltage (V)	f =	Frequency in Hertz (Hz)
U_{low} =	Voltage approximately 0 V	% duty =	Duty cycle (pulse ratio) as a percentage (%)
t =	Time in milliseconds (ms)	I =	Current in amperes (A)

CONNECTOR A

Breakout box terminal	Control module terminal	Signal type	Ignition on	Engine idling	Other
#A1	#A1	Throttle unit signal, potentiometer 1 (circuit 1)	Uapprox. 0.4 - 4 V	-	The voltage varies depending on the position of the throttle. U increases with throttle opening.
#A2	#A2	Fuel pressure sensor signal	-	350 - 400 kPa (absolute pressure)	The voltage increases with increased fuel

				U=1.8-2 V	pressure.
#A3	#A3	Fuel temperature sensor signal	-	Uapprox. 0.5 V- 4.5 V	The voltage falls with increased fuel temperature. The fuel temperature sensor is integrated in the fuel pressure sensor.
#A4	#A4	Engine coolant temperature (ECT) sensor signal	-	(+30°C) U=1.22 V (+80°C) U = 0.29 V (+100°C) U = 0.17 V	
#A5	#A5	Intake air temperature (IAT) sensor signal	-	(+20°C) U = 3.50 V (+30°C) U = 3.00 V (+40°C) U = 2.50 V	The intake air temperature (IAT) sensor is integrated in the boost pressure sensor.
#A6	#A6	Control signal, rear heated oxygen sensor (HO2S) preheating	$U=U_{bat}$	Preheating off: $U = U_{bat}$ Preheating on $U=U_{low}$	
#A7	#A7	Engine cooling fan (FC) control signal	Pulse width modulation (PWM) signal U_{high} at least 70% of U_{bat} U_{low} = 1.2 V f = 100 Hz Pulse ratio = 10-95%		
#A8	#A8	-	-	-	
#A9	#A9	Control signal, canister purge (CP) valve	$U=U_{bat}$	-	PWM signal during activation of the canister purge (CP) valve
#A10	#A10	-	-	-	
#A11	#A11	-	-	-	
#A12	#A12	-	-	-	

#A13	#A13	Control signal, intake camshaft reset valve	-	Pulse width modulation (PWM) signal U_{top} =U_{bat} f=250 Hz (±12.5 Hz) Pulse ratio 20-95%	The pulse ratio governs control of the camshaft
#A14	#A14	Injector no. 5 control signal	U=U_{bat}	t= 2-3 ms	t increases with engine speed (RPM) and load
#A15	#A15	Injector no. 3 control signal	U=U_{bat}	t= 2-3 ms	t increases with engine speed (RPM) and load
#A16	#A16	Injector no. 1 control signal	U=U_{bat}	t= 2-3 ms	t increases with engine speed (RPM) and load
#A17	#A17	Power supply	U=U_{bat}	-	Supplied via the system relay
#A18	#A18	Control signal, front heated oxygen sensor (HO2S) preheating	U=U_{bat}	Preheating off: U = U_{bat} Preheating on U=U_{low}	
#A19	#A19	Signal ground, throttle unit, potentiometers 1 and 2	U=U_{low}	-	
#A20	#A20	Throttle unit signal, potentiometer 2 (circuit 2)	Uapprox. 4-0.4 V	-	The voltage varies depending on the position of the throttle. U decreases with increasing throttle opening.
#A21	#A21	Exhaust camshaft reset valve control signal	-	Pulse width modulation (PWM) signal U_{top} =U_{bat} f=250 Hz (±12.5 Hz) Pulse ratio 20-95%	The pulse ratio governs control of the camshaft
#A22	#A22	Mass air flow (MAF) sensor signal	U = 1 V	U = 1.7 V	U increases with increasing air mass

#A23	#A23	Boost pressure sensor signal	U = 1.96 V	-	U increases with increasing boost pressure.
#A24	#A24	Front heated oxygen sensor (HO2S), pump current	-	-	Pulsed current supply, not measured
#A25	#A25	-	-	-	
#A26	#A26	Oil pressure switch signal	$U=U_{low}$	$U=U_{bat}$	
#A27	#A27	Signal camshaft position (CMP) sensor 2, exhaust camshaft	U =5 V	U = Pulsed signal U_{top} =5 V U_{offset} =2.5V	The frequency varies according to engine speed (RPM)
#A28	#A28	Front heated oxygen sensor (HO2S), calibration current	-	-	Not measured
#A29	#A29	Power supply, 5 V camshaft position (CMP) sensor	U =5 V	-	
#A30	#A30	Control signal ignition coil C, cylinder 4	$U=U_{low}$	U=2.5 V t_{high} =2 ms	The frequency varies according to engine speed (RPM)
#A31	#A31	Control signal ignition coil B, cylinder 2	$U=U_{low}$	U=2.5 V t_{high} =2.5 ms	The frequency varies according to engine speed (RPM)
#A32	#A32	-	-	-	
#A33	#A33	Injector no. 4 control signal	$U=U_{bat}$	t_{low} =2-3 ms	t increases with engine speed (RPM) and load
#A34	#A34	Injector no. 2 control signal	$U=U_{bat}$	t_{low} =2-3 ms	t increases with engine speed (RPM) and load
#A35	#A35	Control signal (+) damper motor for the throttle unit	-	Pulse width modulation (PWM) signal U_{top} =U_{bat} Pulse ratio 0-100% The polarity of the control signal changes when the damper motor is deployed	The damper motor is controlled using a pulse width modulation (PWM) signal from the integrated power stage in the engine control module (ECM)

				against the direction of rotation.	measured to terminal #A36 (#A36)
#A36	#A36	Control signal (-) damper motor for the throttle unit	-	Pulse width modulation (PWM) signal U_{top} =U_{bat} Pulse ratio 0-100% The polarity of the control signal changes when the damper motor is deployed against the direction of rotation.	The damper motor is controlled using a pulse width modulation (PWM) signal from the integrated power stage in the engine control module (ECM) measured to terminal #A35 (#A35)
#A37	#A37	-	-	-	
#A38	#A38	Turbocharger (TC) control valve control signal	U=U_{bat}	-	During turbocharger (TC) control: Pulse width modulation (PWM) signal f = 32 Hz
#A39	#A39	Sensor, power supply 5 V	U =5 V		See the relevant wiring diagram for information about connected sensors
#A40	#A40	Oil level sensor	-	Pulse width modulation (PWM) signal U_{top} =5 V Pulse ratio 17-83% T=120 ms Pulse train with three pulses, then pause for 1.2 seconds. Pulse no. 1= oil temperature. Pulse no. 2= oil level.	The PWM signal is generated by the oil level sensor.

				Pulse no. 3= oil grade. The pulse ratio for each pulse changes depending on the present: - oil temperature - oil level - oil grade.

SIGNAL SPECIFICATION, ENGINE CONTROL MODULE (ECM) (B6294T; 2005-2006)

SIGNAL SPECIFICATION

General

All values given below are between the terminals stated in column 2 (Control module terminal) and breakout box terminal #B3 unless otherwise indicated in column 6 (Miscellaneous). Control module terminals #A1-#A70 correspond to terminals #A1-#B10 on the breakout box, terminals #B1-#B50 correspond to #B11-#B60 on the breakout box.

NOTE: **It is important to connect the breakout box and check the ground terminals before taking readings.**

HINT: If the numbering of the connector is different from the numbering on the breakout box, the connector number is given first, terminal #A61, followed by the breakout box number in brackets, (#B1). Example: #A61 (#B1).

U=	DC voltage in volts (V)	U_{AC} =	AC voltage in volts (V)
U_{bat} =	Battery voltage (V)	f =	Frequency in Hertz (Hz)
U_{low} =	Voltage approximately 0 V	% duty =	Duty cycle (pulse ratio) as a percentage (%)
t =	Time in milliseconds (ms)	I =	Current in amperes (A)

CONNECTOR A

Breakout box terminal	Control module terminal	Signal type	Ignition on	Engine idling	Other
#A1	#A1	Throttle unit signal, potentiometer 1 (circuit 1)	Uapprox. 0.4-4 V	-	The voltage varies depending on the position of the throttle. U

					increases with throttle opening.
#A2	#A2	-	-	-	
#A3	#A3	-	-	-	
#A4	#A4	Engine coolant temperature (ECT) sensor signal	-	(+30°C) U=1.22 V (+80°C) U = 0.29 V (+100°C) U = 0.17 V	
#A5	#A5	Intake air temperature (IAT) sensor signal	-	(+20°C) U = 3.50 V (+30°C) U = 3.00 V (+40°C) U = 2.50 V	The intake air temperature (IAT) sensor is integrated in the boost pressure sensor.
#A6	#A6	Control signal, rear heated oxygen sensor (HO2S) preheating	U = Ubat	Preheating off: U = U_{bat} Preheating on U=U_{low}	
#A7	#A7	Engine cooling fan (FC) control signal	Pulse width modulation (PWM) signal U_{high} at least 70% of U_{bat} U_{low} =1.2V f = 100 Hz Pulse ratio = 10-95%	-	
#A8	#A8	Control signal, preheating, bank 2, rear heated oxygen sensor (HO2S)	U = Ubat	Preheating off: U=Ubat Preheating on: U=Ulow	Not connected on the XC90
#A9	#A9	Control signal, canister purge (CP) valve	U=U_{bat}		PWM signal during activation of the canister purge (CP) valve
#A10	#A10	Signal (+) rear heated oxygen sensor (HO2S), bank 2	-	-	Not connected on the XC90

SIGNAL SPECIFICATION, ENGINE CONTROL MODULE (ECM) (B6324S; 2007-2010)

SIGNAL SPECIFICATION

All values indicated below are between respective connection in column 1 and #A C2 on the breakout box. If this is not the case, it is indicated within brackets.

Connector A (96-pin) corresponds to terminals #A1 - #B36 on the breakout box.

Connector B (58-pin engine side) corresponds to terminals #C1 - #58 on the breakout box.

NOTE: **Connect the breakout box and check the ground connections before starting to measure.**

SIGNAL SPECIFICATION

see **SIGNAL SPECIFICATION**

SIGNAL SPECIFICATION, ENGINE CONTROL MODULE (ECM) (B8444S; 2005-2011)

SIGNAL SPECIFICATION, ENGINE CONTROL MODULE (ECM)

All values indicated below are between respective connection in column 1 and #A C2 on the breakout box. If this is not the case, it is indicated within brackets.

Connector A (96-pin) corresponds to terminals #A1 - #B36 on the breakout box.

Connector B (58-pin engine side) corresponds to terminals #C1 - #58 on the breakout box.

NOTE: **Connect the breakout box and check the ground connections before starting to measure.**

SIGNAL SPECIFICATIONS, ENGINE CONTROL MODULE (ECM) (B6294T; 2003-2004)

SIGNAL SPECIFICATION

General

All values listed below should be measured between the respective terminal in column 1 (control module terminal) and terminal #B3 unless stated otherwise in column 6 (Other). Control module terminals #A1-#A70 correspond to terminals #A1-#B10 on the breakout box, terminals #B1-#B50 correspond to #B11 - #B60 on the breakout box.

NOTE: **It is important to connect the breakout box and check the ground terminals before taking readings.**

HINT: If the numbering of the connector is different from the numbering on the breakout box, the connector number is given first, terminal #A61, followed by the breakout box number in brackets, (#B1). Example: #A61 (#B1).

U=	DC voltage in volts (V)	U_{AC} =	AC voltage in volts (V)
U_{bat} =	Battery voltage (V)	f =	Frequency in Hertz (Hz)
U_{low} =	Voltage approximately 0 V	% duty =	Duty cycle (pulse ratio) as a percentage (%)
t =	Time in milliseconds (ms)	I =	Current in amperes (A)

Control module terminal	Breakout box terminal	Signal type	Ignition on	Engine idling	Other
#A1	#A1	Throttle unit signal, potentiometer 1 (circuit 1)	U approx. 0.4 -4 V	-	The voltage varies depending on the position of the throttle. U increases with

					throttle opening.
#A2	#A2	-	-	-	
#A3	#A3	-	-	-	
#A4	#A4	Engine coolant temperature (ECT) sensor signal	-	(+30°C) U=1.22 V (+80°C) U = 0.29 V (+100°C) U = 0.17 V	
#A5	#A5	Intake air temperature (IAT) sensor signal	-	(+20°C) U = 3.50 V (+30°C) U = 3.00 V (+40°C) U = 2.50 V	The intake air temperature (IAT) sensor is integrated in the boost pressure sensor.
#A6	#A6	Control signal, rear heated oxygen sensor (HO2S) preheating	U = Ubat	Preheating off: U = U_{bat} Preheating on U=U_{low}	
#A7	#A7	Engine cooling fan (FC) control signal	Pulse width modulation (PWM) signal U_{high} at least 70% of U_{bat} U_{low} =1.2V f = 100 Hz Pulse ratio = 10-95%	-	
#A8	#A8	-	-	-	
#A9	#A9	Control signal, canister purge (CP) valve	U = U_{bat}		PWM signal during activation of the canister purge (CP) valve
#A10	#A10	-	-	-	
#A11	#A11	-	-	-	
#A12	#A12	-	-	-	
#A13	#A13	Control signal, intake camshaft reset valve	-	PWM signal U_{top} =U_{bat} f=250Hz (±12.5 Hz) Pulse ratio 20-95%	The pulse ratio governs control of the camshaft
#A14	#A14	Injector no. 6 control		t= 2-3 ms	t increases with

		signal	$U = U_{bat}$		engine speed (RPM) and load
#A15	#A15	Injector no. 2 control signal	$U = U_{bat}$	t= 2-3 ms	t increases with engine speed (RPM) and load
#A16	#A16	Injector no. 1 control signal	$U = U_{bat}$	t= 2-3 ms	t increases with engine speed (RPM) and load
#A17	#A17	Power supply	$U = U_{bat}$	-	Measured via the system relay
#A18	#A18	Control signal, preheating, bank 1, front heated oxygen sensor (HO2S)	$U = U_{bat}$	Preheating off: $U = U_{bat}$ Preheating on: $U=U_{low}$	
#A19	#A19	Signal ground, throttle unit, potentiometers 1 and 2	$U=U_{low}$	-	
#A20	#A20	Throttle unit signal, potentiometer 2 (circuit 2)	U approx. 4 -0.4 V	-	The voltage varies depending on the position of the throttle. U decreases with increasing throttle opening
#A21	#A21	Exhaust camshaft reset valve control signal	-	Pulse width modulation (PWM) signal $U_{top} = U_{bat}$ f=250 Hz (±12.5 Hz) Pulse ratio 20-95%	The pulse ratio governs control of the camshaft
#A22	#A22	Mass air flow (MAF) sensor signal	U = 1 V	U = 1.7 V	U increases with increasing air mass
#A23	#A23	Boost pressure sensor signal	U = 1.96 V	-	U increases with increasing boost pressure
#A24	#A24	Front heated oxygen sensor (HO2S), bank 1, pump current	-	-	Pulsed current supply, not measured
#A25	#A25	Front heated oxygen sensor (HO2S), bank 2, pump current	-	-	Pulsed current supply, not measured

#A26	#A26	Oil pressure switch signal	$U=U_{low}$	$U = U_{bat}$	
#A27	#A27	Signal camshaft position (CMP) sensor 2, exhaust camshaft	U =5 V	U = Pulsed signal U_{top} =5 V Uoffset=2.5V	The frequency varies according to engine speed (RPM)
#A28	#A28	Front heated oxygen sensor (HO2S), bank 1, calibration current	-	-	Not measured
#A29	#A29	Power supply, 5 V camshaft position (CMP) sensor	U =5 V	-	
#A30	#A30	Ignition coil no. 5 control signal	$U=U_{low}$	U=2.5 V t_{high} =2 ms	The frequency varies according to engine speed (RPM)
#A31	#A31	Ignition coil no. 1 control signal	$U=U_{low}$	U=2.5 V t_{high} =2.5 ms	The frequency varies according to engine speed (RPM)
#A32	#A32	Injector no. 4 control signal	$U = U_{bat}$	t_{low} =2-3 ms	t increases with engine speed (RPM) and load
#A33	#A33	Injector no. 3 control signal	$U = U_{bat}$	t_{low} =2-3 ms	t increases with engine speed (RPM) and load
#A34	#A34	Injector no. 5 control signal	$U = U_{bat}$	t_{low} =2-3 ms	t increases with engine speed (RPM) and load
#A35	#A35	Control signal (+) damper motor for the throttle unit	-	Pulse width modulation (PWM) signal U_{top} =U_{bat} Pulse ratio 0-100%. The polarity of the control signal changes when the damper motor is deployed against the direction of rotation.	The damper motor is controlled from the integrated power stage in the engine control module (ECM) measured to terminal #A36 (#A36)
#A36	#A36	Control signal (-) damper motor for the throttle unit	-	Pulse width modulation (PWM) signal U_{top} =U_{bat}	The damper motor is controlled from the integrated power stage in

				Pulse ratio 0-100%. The polarity of the control signal changes when the damper motor is deployed against the direction of rotation.	the engine control module (ECM) measured to terminal #A35 (#A35)
#A37	#A37	-	-	-	
#A38	#A38	Turbocharger (TC) control valve control signal	$U = U_{bat}$	-	During turbocharger (TC) control: Pulse width modulation (PWM) signal f = 32 Hz
#A39	#A39	Power supply 5 V boost pressure sensor, air conditioning (A/C) pressure sensor, mass air flow (MAF) sensor	U =5 V	-	
#A40	#A40	-	-	-

SPECIFICATIONS, ENGINE MANAGEMENT SYSTEM (B5254T2; B6294T; 2003-2004)

COMPONENT SPECIFICATIONS

The component specification gives the value of the component when the connector is disconnected. Where no value is given, it is not possible to measure a relevant value at the component.

The figure within the brackets indicates the terminal pin on the component to which the value refers.

Designation	Type	Supply voltage	Value	Miscellaneous
Air conditioning (A/C) relay	Mechanical relay	12V (#1)	Approximately 96 ohms (coil)	-
A/C pressure sensor	Absolute pressure sensor	5 V (#3)	-	-
Brake lamp switch	Position switch	12 V (#1)	The switch is closed when the pedal is depressed (terminals #1-#5)	-
Fuel pump (FP) relay	Mechanical relay	-	Approximately 96 ohms (coil)	The relay is controlled by the central electronic module (CEM)
Engine cooling fan (FC) control module	-	-	-	There are different engine cooling fan control modules depending on the engine variant.
Canister purge (CP) valve	Electromagnetic valve	12 V (#1)	17-24 ohms at 20°C (terminals #1-#2)	-
Accelerator pedal (AP) position sensor	Electronic pedal sensor with 2 output signals, PWM and a linear analogue signal	12 V (terminal #1) 5 V (terminal #6) Power supply analogue position sensors	-	-
Throttle unit	Electronic throttle control module with two integrated potentiometers and a damper motor	5 V (#3)	1.2-3.5 ohms (terminals #1-#4 motor winding). 1000-1500 ohms (terminals #2-#3 Parallel connection of potentiometers 1 and 2). Approximately 820 ohms when the throttle is closed.	-

			Approximately 1580 ohms at wide open throttle (terminals #2-#6 potentiometer 1). Approximately 1480 ohms when the throttle is closed. Approximately 500 ohms at wide open throttle (terminals #2-#5 potentiometer 2)	
Fuel injector	Electromagnetic injector valve	12 V (#1)	Approximately 12 ohms at 20°C (terminal #1-#2)	-
Camshaft sensor	Magneto-resistive sensor	5 V (#1)	-	-
Knock sensor (KS)	Piezo electric component	-	Greater than 1 Mohms (terminal #1-#2 front knock sensor (KS). Greater than 1Mohms (terminals #3-#4 rear knock sensor (KS)	Separate signal ground for the knock sensors (KS)
Clutch pedal sensor	Slide potentiometer	5 V (#2)	Unaffected pedal: 1400-2400 ohms Fully depressed pedal: 200-800 ohms (#2-#4)	-
Engine cooling fan (FC) control modules	Fan motor	12 V (#1)	-	The engine cooling fan (FC) is controlled by the engine control module (ECM)
Coolant level sensor	Position switch	Connected to ground (terminal #2)	Closed when the engine coolant level is normal	-
Boost pressure sensor	Absolute pressure sensor	5 V (#3)	-	Turbocharged (TC) engines only
Preheating front heated oxygen sensor (HO2S)	PTC resistor	12 V (#3)	2.6-3.4 ohms at 20° C (terminals #3-#4)	-
Preheating, rear heated oxygen	PTC resistor	12 V (#1)	Approximately 9 ohms at 20°C	-

sensor (HO2S)			(terminal #1-#2)	
Mass air flow (MAF) sensor	-	12 V (#2) 5 V (#4)	-	-
Intake air temperature (IAT) sensor inlet	NTC resistor	Turbocharged engines: 5 V (#2) Naturally aspirated engines: 5 V (#1)	5886 ohms at 0°C 3791 ohms at 10°C 2510 ohms at 20°C 1715 ohms 30°C Turbocharged engines: (#1-#2). Naturally aspirated engines: (#1-#3)	Turbocharged engines: intake air temperature (IAT) sensor, integrated in the boost pressure sensor. Naturally aspirated engines: intake air temperature (IAT) sensor, integrated in the mass air flow (MAF) sensor
Leak diagnostic unit	Consists of an air pump, electromagnetic valve and an internal heating element (PTC resistor)	12 V (#4)	Approximately 118 ohms (terminals #1-#4 pump motor winding) 27.9 -34.1 ohms (terminals #3-#4 Valve coil)	The heating element for heating up the pulsed secondary air injection system (PAIR) pump is controlled by the central electronic module (CEM)
Engine coolant temperature (ECT) sensor	NTC resistor	5 V (#1)	15040 ohms at -20° C 2450 ohms at 20°C 318 ohms at 80°C (#1- #2)	-
PTC resistor air preheating	PTC resistor	12 V (#1)	Approximately 10 ohms at 20°C (#1-#2)	-
Oil pressure sensor	Pressure switch (Pressostat)	Grounded in the cylinder block	Closed switch when the oil pressure is low	-
Camshaft reset valve	Electromagnetic valve	12 V (#1)	3.7-11.1 ohms (#1-#2)	-
Flywheel sensor	Engine speed sensor	-	108.5-142.5 ohms at 20°C (terminals #1-#2)	-
System relay	Mechanical relay	12V (#1)	Approximately 80 ohms (coil)	-
Turbocharger (TC) control valve	Electromagnetic valve (3 way)	12 V (#1)	21.8-24.2 ohms at 20°C (terminals #1-#2)	Turbocharged (TC) engines only
Outer temperature sensor	NTC resistor	5 V (#2)	18702 ohms at -20 ° C	-

			6318 ohms at 0°C 2424 ohms at 20°C 1034 ohms at 40°C (#2- #3)	

SPECIFICATIONS, ENGINE MANAGEMENT SYSTEM (B5254T2; 2005-2007)

COMPONENT SPECIFICATIONS

The component specification gives the value of the component when the connector is disconnected. Where no value is given, it is not possible to measure a relevant value at the component.

The figure within the brackets indicates the terminal pin on the component to which the value refers.

Designation	Type	Supply voltage	Value	Miscellaneous
A/C-relay	Mechanical relay	12V (#1)	Approximately 96 ohms (coil)	
A/C pressure sensor	Absolute pressure sensor	5 V (#3)	-	
Brake lamp switch	Position switch	12 V (#1)	The switch is closed when the pedal is depreseed (terminals#1-#5)	
Fuel pump	Mechanical relay	-	Approximately 96 ohms (coil)	The relay is controlled by the central electronic module (CEM)
Male Temperature probe	NTC-resistance	5V (#3)	5896 ohms at 0°C 3792 ohms at 10°C 2500ohms at 20°C 1707ohms at 30°C 1175 ohms at 40°C (#1-#2)	Integrated in br?nsletryckgivare
Fuel pressure sensor	Piezoresistiv tryckgivare	5V (#3)	-	
Cooling fan controller	-	12 V (#2)	-	
EVAP-valve	Electromagnetic valve	12 V (#1)	17-24 ohms at 20°C (#1-#2)	
Accelerator pedal position sensor	Electronic pedal sensor with 2 output signals, PWM- and a linear analog signal	12 V (#1) 5 V (#6) Power supply analog position sensors	-	
Throttle unit	Electronic throttle control module with	5 V (#3)	1.2-3.5 ohms (#1-#4 motor winding).	-

	two integrated potentiometers and a damper motor		1000-1500 ohms (#2-#3 Parallel connection of potentiometers1 and 2). Approximately 820 ohms when the throttle is closed. Ca 1580 ohms at wide open throttle(#2-#6 potentiometer 1). Approximately 1480 ohms when the throttle is closed. Approximately 500 ohms at wide open throttle (#2-#5 potentiometer 2)	
Fuel injector	Electromagnetic injector valve	12 V (#1)	Approximately 12 ohms at 20°C (#1-#2)	
Camshaft sensor	Magneto-resistive sensor	5 V (#1)	-	
Knock sensor	Piezo electric component	-	Greater than 1 Mohms (#1-#2 front knock sensor). Greater than 1 Mohms (#3- #4 rear knock sensor)	Separate signal ground for knock sensors
Clutch pedal sensor	Slide potentiometer	5 V (#2)	Unaffected pedal: 1400-2400 ohms Fully depressed pedal: 200-800 ohms (#2-#4)	
Engine cooling fan control module	Fan motor	12 V (#1)	-	The engine cooling fan is controlled by the engine control module
Coolant level sensor	Position switch	Connected to ground (#2)	Closed when engine coolant level is normal	
Boost pressure sensor	Absolute pressure sensor	5 V (#3)	-	
Preheating front heated oxygen sensor	PTC resistor	12 V (#3)	2, 6-3, 4 ohms at 20° C (#3-#4)	

Preheating rear heated oxygen sensor	PTC resistor	12 V (#1)	Approximately 9 ohms at 20°C (#1-#2)	
Mass air flow sensor	-	12 V (#2) 5 V (#4)	-	
Intake air temperature sensor inlet	NTC resistor	5 V (#3)	5886 ohms at 0°C 3791 ohms at 10°C 2510 ohms at 20°C 1715 ohms at 30°C (#1-#2)	Integrated in the mass air flow sensor
Leak diagnostic unit	Consists of an air pump, electromagnetic valve and an internal heating element (PTC resistor	12 V (#4)	Approximately 118 ohms (#1-#4 pump motor winding) 27.9 -34.1 ohms (#3-#4 Valve coil)	The heating element for heating up the pulsed secondary air injection system pump is controlled by the central electronic module (CEM)
Engine coolant temperature sensor	NTC resistor	5 V (#1)	15040 ohms at -20°C 2450 ohms at 20°C 318 ohms at 80°C (#1- #2)	
PTC-resistor air preheating	PTC resistor	12 V (#1)	Approximately 10 ohms at 20°C	
Oil level sensor	Elektronisk givare med PTC-motst nd och kapacitiva m? telement	5 V (#3)	-	
Oil pressure sensor	Pressure switch (Pressostat)	Grounded in the cylinder	Closed switch when the oil pressure is low	
Camshaft reset valve	Electromagnetic valve	12 V (#1)	3.7-11.1 ohms (#1-#2)	
Flywheel sensor	Engine speed sensor	-	108.5-142.5 ohms at 20°C (#1-#2)	
System relay	Mechanical relay	12V (#1)	Approximately 80 ohms (coil)	
Turbocharger control valve	Electromagnetic valve (3-way)	12 V (#1)	21.8-24.2 ohms at 20° C (#1-#2)	
Outer temperature sensor	NTC resistor	5 V (#1)	18702 ohms at-20 °C 6318 ohms at 0°C 2424 ohms at 20°C 1034 ohms at 40°C (#1- #3)

VEHICLE COMMUNICATION INFORMATION, QUICK TEST OF THE FUEL TANK SYSTEM (B5254T2; 2005-2007)

DESCRIPTION OF PARAMETERS, QUICK TEST OF THE FUEL TANK SYSTEM

LEAK DIAGNOSTIC UNIT PUMP

Graphic display in the fuel tank system quick test.

Measurement range 0-400 mA.

The engine control module (ECM) calculates the value from the pump in the leak diagnostic unit.

The value varies depending on the pressure in the fuel tank system. Higher pressure results in increased power consumption.

BATTERY VOLTAGE

Measurement range 0-17.95 V.

The value indicates the voltage from the system relay to the engine control module (ECM).

The voltage must not be below 11 V when the quick test of the fuel tank system is run.

FUEL TANK SYSTEM QUICK TEST

In order for the quick test to start, the status of this parameter must be "Not completed".

- Completed = The engine control module (ECM) has completed the quick test / diagnostic of the fuel tank system during the present operating cycle
- Not completed = The engine control module (ECM) has not completed the quick test / diagnostic of the fuel tank system during the present operating cycle.

TEST PHASE

In order for the quick test to start, the status of this parameter must be "Not running".

The parameter indicates the phase of the test.

- Reference= Reference phase for leaks and function test of the leak diagnostic unit is running
- Fuel tank system = Diagnostics for major leak and minor leak running
- Not running = No quick test or diagnostic is running.

For more information about these parameters:

see **TEST PHASES, QUICK TEST FUEL TANK SYSTEM**

ECM-439C

The parameter indicates the result of the diagnostic for leakage in the fuel tank system. This diagnostic is run during the "Fuel tank system" test phase:

- No fault found= No leak corresponding to the definition of major leak detected by the engine control module (ECM)
- Fault found= Leakage > or = 1.0 mm detected by the engine control module (ECM). Diagnostic Trouble Code (DTC) ECM-439C will be set in the engine control module (ECM).

ECM-434C

The parameter indicates the result of the diagnostic for leakage in the fuel tank system. This diagnostic is run during the "Fuel tank system" test phase.

- No fault found= No leak corresponding to the definition of minor leak detected by the engine control module (ECM)
- Fault found= 1.0 mm > leakage > or = 0.5 is detected by the engine control module (ECM). Diagnostic Trouble Code (DTC) ECM-434C will be set in the engine control module (ECM).

ECM-4360

The parameter displays the result of the diagnostic for the function in the leak diagnostic unit corresponding to the diagnostic trouble code (DTC) ECM-4360. The diagnostic is run during "Reference" test phase.

- No fault found = No fault is detected by the engine control module (ECM)
- Fault found= Fault in the leak diagnostic unit detected by the engine control module (ECM). Diagnostic Trouble Code (DTC) ECM-4360 will be stored in the engine control module (ECM).

ECM-436B

The parameter displays the result of the diagnostic for the function in the leak diagnostic unit corresponding to the diagnostic trouble code (DTC) ECM-436B. The diagnostic is run during "Reference" test phase.

- No fault found = No fault is detected by the engine control module (ECM)
- Fault found= Fault in the leak diagnostic unit detected by the engine control module (ECM). Diagnostic Trouble Code (DTC) ECM-436B will be stored in the engine control module (ECM).

ECM-436C

The parameter displays the result of the diagnostic for the function in the leak diagnostic unit corresponding to the diagnostic trouble code (DTC) ECM-436C. The diagnostic is run during "Reference" test phase.

- No fault found = No fault is detected by the engine control module (ECM)
- Fault found= Fault in the leak diagnostic unit detected by the engine control module (ECM). Diagnostic Trouble Code (DTC) ECM-436C will be stored in the engine control module (ECM).

ECM-436D

The parameter displays the result of the diagnostic for the function in the leak diagnostic unit corresponding to the diagnostic trouble code (DTC) ECM-436D. The diagnostic is run during "Reference" test phase.

- No fault found = No fault is detected by the engine control module (ECM)
- Fault found= Fault in the leak diagnostic unit detected by the engine control module (ECM). Diagnostic Trouble Code (DTC) ECM-436D will be stored in the engine control module (ECM).

TEST PHASES, QUICK TEST FUEL TANK SYSTEM

REFERENCE

The reference phase for leaks and the function test of the leak diagnostic unit are running. If no faults are detected during this phase the leak test in the fuel tank system starts. If any faults are detected during the phase, the test is interrupted and the test result for the leak diagnostic unit (ECM-436X) will be "Fault found".

FUEL TANK SYSTEM

Testing for leakage in the fuel tank system is running. During the first half of the test, major leaks (leaks larger than 1.0 mm) can be detected. Diagnostic trouble code (DTC) is stored in the engine control module (ECM) if leakage is detected.

After a certain amount of time (time is dependent on the fuel level in the tank) the engine control module (ECM) assesses the seal of the fuel tank system. Assessment is made using the results of the calculations of time, measured reference power consumption of the pump, measured power consumption of the pump during the time of assessment and from the shape of the power supply curve and characteristics during pressurization. If the leak in the fuel tank system is larger than 0.5 mm but smaller than 1.0 mm a diagnostic trouble code (DTC) is stored for minor leakage in the engine control module (ECM).

NOT RUNNING

The leak diagnostic is not running, the quick test of the fuel tank system has not started or has finished.

VEHICLE COMMUNICATION INFORMATION (B5254T2; B6294T; 2003-2004)

DESCRIPTION OF COMPONENT / FUNCTIONS ACTIVATION

Component	Function
Injector (1-6)	Injectors 1-6. The injectors open and close approximately 6 times per second. A clicking noise is heard from the injectors. The engine must be switched off.
A/C RELAY	A/C relay. Air conditioning A/C must be requested from the control panel. The air conditioning (A/C) relay and the magnetic clutch for the air conditioning (A/C) compressor click.
ENGINE COOLING FAN (FC) pulse width modulation (PWM) controlled 16-93 %	The speed of the engine cooling fan (FC) changes depending on which activation is selected. The fan can be heard.
MIL LAMP	Malfunction indicator lamp (MIL). The engine must be running and the lamp off before activation. The lamp lights when the start button is pressed and goes out when the stop button is pressed.
LEAK DIAGNOSTIC UNIT, VALVE	Certain markets only. A clicking noise is heard from the valve in the leak diagnostic unit at activation.
CANISTER PURGE (CP) VALVE	The EVAP canister purge valve opens and closes 5 times per second. The valve is activated by the start button and stopped using the stop button. The canister purge (CP) valve clicks.
COOLING FAN CONTROL MODULE	There is a buzzing noise from the cooling fan for the control modules at activation.
THROTTLE UNIT 50-100 %	The shutter in the throttle unit opens. The throttle unit opens to different positions depending on which activation is selected (50, 75 or 100 %) Read off "Throttle Position Sensor (TP) potentiometer 1" or "Throttle Position Sensor (TP) potentiometer 2" at activation to check the function. The engine must be switched off at activation.
TURBOCHARGER CONTROL VALVE	There is a clicking noise from the turbocharger (TC) control valve at activation. The engine must be switched off at activation.

DESCRIPTION OF PARAMETERS

HINT: Not all the parameters described need to be implemented in the control module. This varies between different systems and markets.

HINT: Bank 1: indicates cylinders 1-3 on 6 cylinder engines and all cylinders on 5-cylinder engines.

HINT: The rear heated oxygen sensor (HO2S) on vehicles with fuel trim using the Y-concept (two front heated oxygen sensors (HO2S) and one rear heated oxygen sensors (HO2S) is called "Bank 1".

HINT: Bank 2: indicates cylinders 4-6 on 6-cylinder engines.

ENGINE SPEED

Measurement range 0-10400 RPM.

The engine control module (ECM) derives the engine speed (RPM) from the engine speed (RPM) sensor signal.

The idle speed varies depending on the engine coolant temperature (ECT).

IDLE SPEED, DIFFERENCE DESIRED VALUE

Measurement range -1280-1270 RPM.

The value indicates the idle speed deviation from the control module desired value (target value).

ENGINE COOLANT TEMPERATURE (ECT)

Measurement range -48 to +143°C.

The engine control module (ECM) derives the temperature from the engine coolant temperature (ECT) sensor signal.

INTAKE AIR TEMPERATURE (IAT) INLET

Measurement range -48 to +143°C.

The engine control module (ECM) calculates the temperature from the temperature sensor for the intake air.

AMBIENT TEMPERATURE °C

Measurement range -40 to +110°C.

The engine control module (ECM) derives the temperature from the outside temperature sensor signal.

ATMOSPHERIC PRESSURE

Measurement range 0-5120 hPa.

The value indicates atmospheric pressure at the engine control module (ECM).

Normal value at sea level is 1, 013 hPa.

BOOST PRESSURE

Measurement range 0-2550 hPa.

The value indicates the pressure in the intake system downstream of the turbocharger (TC).

The engine control module (ECM) calculates the boost pressure from the boost pressure sensor. The pressure is relative to atmospheric pressure.

IGNITION ADVANCE

Measurement range -96 to +95.3° before top dead center (BTDC).

The value when idling varies depending on the engine coolant temperature (ECT).

AIR MASS

Measurement range 0-1020 kg/h.

The value indicates the mass air flow that passes through the mass air flow (MAF) sensor.

The engine control module (ECM) calculates the value based on the signal from the mass air flow (MAF) sensor.

Normal value with the engine at operating temperature and idling, neutral and air conditioning (A/C) switched off: approximately 14 kilograms per hour.

NOTE: Other values apply if the generator (GEN.) is under load, if for example, high beam is on, the heated rear windshield is on etc.

MASS AIR FLOW, CORRECTION VALUE

Measurement range 0-4.

The value is a stored average of the correction factor of the mass air flow that the engine draws in.

Mass air flow, correction factor= The control module's calculated desired value for the mass air flow divided by (/) the actual measured mass air flow.

Normal range: 1 (±0.1).

BATTERY VOLTAGE

Measurement range 0-17.95 V.

The normal value is 13.5-14.5 V when the generator (GEN.) is charging.

The value indicates the voltage from the system relay to engine control module (ECM) terminal #A17.

POWER SUPPLY, 5 V

Measurement range 0-5 V.

Normal value approximately 5 V.

The value indicates the voltage supplied to components from engine control module (ECM) terminal #A39.

ACCELERATOR PEDAL (AP) POSITION SENSOR, ANALOGUE

Measurement range 0-320 V.

Analogue signal from the accelerator pedal (AP) position sensor to the engine control module (ECM). The engine control module (ECM) derives the value from the analogue output for the accelerator pedal (AP) position sensor.

The value indicates the accelerator pedal (AP) position.

Approximately 0.5 V = the accelerator pedal (AP) completely released.

Approximately 4.0 V = the accelerator pedal (AP) completely depressed.

ACCELERATOR PEDAL (AP) POSITION SENSOR, PULSE WIDTH MODULATION (PWM) AVERAGE VOLTAGE

Measurement range 0-320 V.

The mean PWM signal voltage from the accelerator pedal (AP) position sensor to the engine control module (ECM). The engine control module (ECM) derives the value from the digital output for the accelerator pedal (AP) position sensor.

The value indicates the accelerator pedal (AP) position.

Approximately 0.5 V = the accelerator pedal (AP) completely released.

Approximately 4.0 V = the accelerator pedal (AP) completely depressed.

HINT: The value must follow the parameter "Accelerator pedal (AP) position sensor, analog".

ACCELERATOR PEDAL (AP) POSITION SENSOR, PULSE WIDTH MODULATION (PWM)

Measurement range 0-100 %.

The PWM signal from the accelerator pedal (AP) position sensor to the engine control module (ECM). The engine control module (ECM) derives the value from the digital output for the accelerator pedal (AP) position sensor.

The value indicates the accelerator pedal (AP) position.

Approximately 5 %= the accelerator pedal (AP) completely released.

Approximately 80 %= the accelerator pedal (AP) completely depressed.

THROTTLE ANGLE

Measurement range 0-100 %.

The engine control module (ECM) calculates the value from potentiometer 1 for the throttle position (TP) sensor. The value indicates the throttle opening.

If a fault is detected in the throttle position (TP) sensor, potentiometer 1 by the engine control module (ECM), the value from the throttle position (TP) sensor, potentiometer 2 will be used to represent the throttle angle. This presumes that the function of throttle position (TP) sensor, potentiometer 2 is OK.

0 % = throttle shut.

100 % = throttle fully open.

HINT: The value must follow the parameter "Throttle angle, desired value" when the accelerator pedal (AP) is affected.

THROTTLE ANGLE, DESIRED VALUE

Measurement range 0-100 %.

The engine control module (ECM) calculates a target value for the throttle opening (throttle angle) using the accelerator pedal (AP) position sensor signals.

The value indicates what the throttle angle should be.

0 % = throttle shut.

100% = throttle fully open.

THROTTLE POSITION (TP) SENSOR, POTENTIOMETER 1

Measurement range 0-80 V.

The engine control module (ECM) derives the value from potentiometer 1 for the throttle position (TP) sensor.

The value must increase with increased throttle angle.

Approximately 0.5 V = throttle closed.

Approximately 4.0 V = wide open throttle (WOT).

THROTTLE POSITION (TP) SENSOR, POTENTIOMETER 2

Measurement range 0-80 V.

The engine control module (ECM) derives the value from potentiometer 2 for the throttle position (TP) sensor.

The value must decrease with an increased throttle angle.

Approximately 4.0 V = throttle closed.

Approximately 0.5 V = wide open throttle (WOT).

THROTTLE UNIT ADAPTATION

If necessary the engine control module (ECM) runs an adaptation of the throttle unit by guiding the throttle to the limit positions (open/closed) so that it " learns" the parameters of that actual throttle unit.

The status indicates if the adaptation has been run or not.

OK = Adaptation of the throttle unit has run.

NOT OK = Adaptation of the throttle unit has not run.

NOTE: The basic conditions must be met before an adaptation of the throttle unit can be carried out.

LEAKAGE FLOW OVER THROTTLE

Measurement range 0-655 kg/h.

The value indicates how much air passes through the throttle at closed throttle position (CTP). The engine control module (ECM) calculates the value from the mass air flow (MAF) sensor and the throttle position (TP) sensor signals.

The normal value is approximately 5 ± 4 kg/h.

NOTE: Other values apply if there is air leakage on the intake system.

CLUTCH PEDAL POSITION

Measurement range 0-100 %.

The engine control module (ECM) calculates the value from the clutch pedal sensor signal.

The value indicates the clutch pedal position.

When the clutch pedal released the value is 60-70 %. The value decreases as the clutch pedal is depressed.

CLUTCH POSITION SENSOR

The engine control module (ECM) calculates the value from the clutch pedal sensor signal.

The value indicates how the engine control module (ECM) interprets the clutch pedal position.

Active = clutch pedal depressed.

Not active = clutch pedal released.

BRAKE PEDAL POSITION (VIA THE BRAKE CONTROL MODULE (BCM)

Measurement range 0-100 %.

The engine control module (ECM) receives the value from the brake control module (BCM) via the Control area network (CAN).

The value indicates the brake pedal position.

When the brake pedal is not affected the value is 0 %. The value increases when the brake pedal is depressed.

BRAKE LAMP SWITCH

The engine control module (ECM) calculates the value from the brake lamp switch signal.

ON = brake lamp switch on.

OFF = brake lamp switch unaffected.

AIR CONDITIONING (A/C) PRESSURE

Measurement range -176 to +3277 kPa.

The engine control module (ECM) calculates the value from the signal from the air conditioning (A/C) pressure sensor.

The value indicates the pressure at the high-pressure side of the air conditioning (A/C) system.

The engine control module (ECM) calculates the pressure based on the signal from the air conditioning (A/C) pressure sensor. The pressure is given as a value relative to the atmospheric pressure.

AIR CONDITIONING (A/C) COMPRESSOR, ACTIVE

The signal transmitted by the control module for activating the air conditioning (A/C) compressor relay.

OFF = The engine control module (ECM) does not activate the air conditioning (A/C) compressor relay.

ON = The engine control module (ECM) activates the air conditioning (A/C) compressor relay.

TURBOCHARGER (TC) CONTROL VALVE

Measurement range 0-100 %.

The value indicates the deployment signal from the control module for deploying the turbocharger (TC) control valve, the amount the turbocharger (TC) control valve opens to adjust the turbo pressure.

0 % = no control (turbocharger (TC) control valve closed).

100 % = full control (the turbocharger (TC) control valve opens completely).

CANISTER PURGE (CP) VALVE

Measurement range 0-100 %

The value indicates the deployment signal from the control module for deploying the EVAP canister purge valve (the amount the valve opens to empty the canister).

0 % = no control (EVAP canister purge valve closed).

100% = full control (EVAP canister purge valve opens completely).

CANISTER PURGE (CP) VALVE, FLOW

Measurement range 0-25 kg/h

The value indicates the flow through the evaporative emission system (EVAP) valve and increases with increased flow.

RESET VALVE CAMSHAFT, INTAKE/EXHAUST

Measurement range 0-100 %

The pulse ratio transmitted by the control module to control the camshaft reset valve.

The value indicates control of the camshaft reset valve to control the camshaft shift angle.

The normal value varies depending on how much the camshaft is controlled.

CAMSHAFT SHIFT ANGLE, INTAKE/EXHAUST

Measurement range between -256° to +256°.

The engine control module (ECM) derives the value by comparing the camshaft position with the crankshaft position.

The value indicates the offset of the camshaft position in relation to the crankshaft TDC (0). (The camshaft 0-position = the camshaft position set alignment with the crankshaft TDC).

CAMSHAFT SHIFT ANGLE LEEWAY, INTAKE/EXHAUST

Measurement range between -256° to +256°.

The value indicates the difference between the "Camshaft shift angle" (actual shift angle) and the desired value for the camshaft shift angle (target value for the engine control module (ECM).

Ensure that the camshaft is operated by checking that the value of the "Camshaft shift angle" changes. Changing the "Camshaft shift angle" is achieved by changing the engine speed (RPM)/load.

The normal value varies depending on how far the camshaft is operated and the temperature/grade of the engine oil, although the value must never be higher/lower than between +/-10° for longer than 4 seconds.

HINT: Check the camshaft control function by choosing "Quick test camshaft control" in vehicle communication.

ADAPTATION CAMSHAFT, INTAKE/EXHAUST

Measurement range between -511 to +511°.

The value indicates how much the engine control module (ECM) has adapted the camshaft position, i. e. the deviation from the basic camshaft position set at the factory.

Normal value is between -8 and +8°.

The value must be checked when idling and with the engine at operating temperature.

LEAK DIAGNOSTIC UNIT PUMP

Certain markets only.

Measurement range 0-400 mA.

The engine control module (ECM) calculates the value from the pump in the leak diagnostic unit.

The value varies depending on the pressure in the fuel tank system. Higher pressure results in increased power consumption.

INJECTION PERIOD, BANK X

Measurement range 0.0-150 ms.

The control module controlled signal for injection period.

Normal value when the engine is idling at operating temperature: 2.0-4.0 ms

SHORT-TERM FUEL TRIM, BANK X

Measurement range 0-2.

The value displays how much the injection period needs to be corrected (from the preprogrammed injection period in the control module) to reach lambda=1. If the engine runs lean or rich (lambda deviates from 1), the short-term fuel trim injection period is increased or decreased so that lambda; =1. The average value of this parameter from different engine speed and load ranges is used for the different fuel trim adaptations (idling, lower part load and upper part load) so that the short-term fuel trim is always around 1.

Short-term fuel trim = the actual injection period required to reach lambda=1, divided by (/) the injection period pre-programmed in the engine control module (ECM) to reach lambda=1.

The normal value oscillates around 1, when fuel trim for each engine speed (RPM) / load range is ready.

Value over 1: The engine control module (ECM) increases the injection period (to prevent a lean fuel / air mix).

Value under 1: The engine control module (ECM) decreases the injection period (to prevent a rich fuel / air mix).

The parameter must be checked under stable conditions, such as stable engine speed (RPM) and load.

HINT: When lambda deviates from 1, the short-term fuel trim initially compensates at every engine speed (RPM) / load range (idling speed, lower part load and upper part load). The diagnostic trouble codes (DTCs) are erased, the adaptation values are reset. This means fuel trim will be high or low when driving in the low engine speed/load ranges before the trim is complete.

LONG-TERM FUEL TRIM BANK X, IDLE SPEED

Measurement range from -72 to +72 %.

Additive fuel trim (correcting the injection period), trim that occurs at idle speed. The value indicates how much the fuel trim has been corrected at idle speed so that the fuel trim value can again oscillate around 1.

In the event of an air leakage for example, the value will increase at idle speed (= longer injection time). This is to compensate the fuel / air mix for air capacity. Regardless of the load /engine speed, the same injection time is added. This means that the parameter value does not significantly affect the fuel / air mix at higher loads / engine speeds.

Normal value when the engine is idling: 0 ± 5 %.

Value over 0 %: The engine control module (ECM) increases the injection period (to prevent a lean fuel / air mix).

Value under 0 %: The engine control module (ECM) decreases the injection period (to prevent a rich fuel / air mix).

HINT: When diagnostic trouble codes (DTCs) are erased, the "long-term fuel trim" returns to 0%.

LONG-TERM FUEL TRIM BANK X, LOWER PART LOAD

Measurement range 0-2.

Multiplicative fuel trim (correcting the injection period), trim that occurs at lower part load (normal road driving). The value stored in the Engine control module (ECM) indicates how much the fuel trim in the lower part load range has been corrected so that the short-term fuel trim value can again oscillate around 1 at the lower part load.

In the event of low fuel pressure for example, the value will increase (= longer injection time). This is to compensate the fuel/air mix for the lack of fuel.

Normal value 1± 0.1. The lower part load range of the engine must be reached for the value to be updated (normal road driving).

Approximately 30 minutes of driving in the lower part load may be required before fuel trim is complete (complete = fuel trim oscillates around 1 at lower part load).

Value over 1: The engine control module (ECM) increases the injection period (to prevent a lean fuel / air mix).

Value under 1: The engine control module (ECM) decreases the injection period (to prevent a rich fuel / air mix).

HINT: When diagnostic trouble codes (DTCs) are erased, the "long-term fuel trim" returns to 1.

LONG-TERM FUEL TRIM BANK X, UPPER PART LOAD

Measurement range 0-2.

Multiplicative adaptation of short-term fuel trim - adaptation occurs at upper partial load (high speed/acceleration on the road). The value stored in the Engine control module (ECM) indicates how much the short-term fuel trim has been corrected in the upper partial load range so that the short-term fuel trim value can once again be around 1 at upper partial load.

In the event of low fuel pressure for example, the value will increase (= longer injection time). This is to compensate the fuel/air mix for the lack of fuel.

Normal value 1 ± 0.1. The upper part load range of the engine must be reached for the value to be updated (accelerating road driving).

Approximately 30 minutes of driving in the lower part load may be required before the fuel trim is complete (complete = fuel trim oscillates around 1 at upper part load).

Value over 1: The engine control module (ECM) increases the injection period (to prevent a lean fuel / air mix).

Value under 1: The engine control module (ECM) decreases the injection period (to prevent a rich fuel / air mix).

HINT: When diagnostic trouble codes (DTCs) are erased, the "long-term fuel trim" returns to 1.

LONG-TERM FUEL TRIM, BANK X

C/L= Closed Loop, fuel trim is active

O/L = Open Loop, fuel trim is not active

FRONT HEATED OXYGEN SENSOR (HO2S), BANK X

Measurement range 0-16.

Normal value is lambda=1.

At rich mixture is lambda < 1.

At lean mixture is lambda > 1.

REAR HEATED OXYGEN SENSOR (HO2S), BANK X

Measurement range -0.2 to +1.13.

Signal from rear heated oxygen sensor (HO2S) to the engine control module (ECM).

Normal value when the engine is running at even load is approximately 0.6 V.

The voltage may vary between -0.2 and 0.9 V. The voltage may, during engine braking for example, drop to -0.2 V.

FUEL PUMP (FP) RELAY

OFF = The engine control module (ECM) does not activate the fuel pump (FP) relay.

ON = The engine control module (ECM) activates the fuel pump (FP) relay via the central electronic module (CEM).

VEHICLE SPEED

Measurement range 0-319 km/h

The value displays the vehicle speed.

ENGINE COOLING FAN (FC)

Measurement range 0-100%

Signals transmitted by the engine control module (ECM) to the engine cooling fan (FC) control module to activate the engine cooling fan (FC).

16%=step 1

25%=step 2

39%=step 3

61%=step 4

89%=step 5

93%=step 6

CRUISE CONTROL RESUME

The cruise control must be on when reading this parameter.

OFF= resume button unaffected.

ON = resume button activated.

CRUISE CONTROL SET+

The cruise control must be on when reading this parameter.

OFF= SET+ unaffected.

ON = SET+ affected.

CRUISE CONTROL SET-

The cruise control must be on when reading this parameter.

OFF= SET- unaffected.

ON = SET- affected.

BOOST PRESSURE (ACTUAL VALUE)

Measurement range: 0-2000 hPa, absolute pressure (boost pressure- absolute zero pressure(0 hPa).

The Engine control module (ECM) receives information about the current boost pressure via the boost pressure sensor.

The actual value must correspond to the desired value ± 50hPa.

BOOST PRESSURE (DESIRED VALUE)

Measurement range: 0-2000 hPa, absolute pressure (boost pressure- absolute zero pressure(0 hPa).

The engine control module (ECM) receives information about the current throttle angle via the throttle position

sensor, speed (RPM), engine load, knocks etc. These parameters are used to calculate the boost pressure that is permitted in various operating conditions.

VEHICLE COMMUNICATION INFORMATION, ENGINE CONTROL MODULE (ECM) (B5254T2; 2005-2007)

DESCRIPTION OF ACTIVATION

HINT: Not all the components/functions described need to be implemented in the control module. This varies between different systems and markets.

PARAMETERS, VALUE

THROTTLE POSITION (TP) SENSOR, POTENTIOMETER 1 (V)

The parameter can be read off to check the function when activating the "Throttle unit".

Measurement range: 0 - 80 V.

The engine control module (ECM) derives the value from potentiometer 1 for the throttle position (TP) sensor.

The value must increase with increased throttle angle.

Approximately 0.5 V = throttle closed.

Approximately 4.0 V = wide open throttle (WOT).

THROTTLE POSITION (TP) SENSOR, POTENTIOMETER 2 (V)

The parameter can be read off to check the function when activating the "Throttle unit".

Measurement range: 0-80 V.

The engine control module (ECM) derives the value from potentiometer 2 for the throttle position (TP) sensor.

The value must decrease with an increased throttle angle.

Approximately 4.0 V = throttle closed.

Approximately 0.5 V = wide open throttle (WOT).

COMPONENT / FUNCTION

INJECTOR X

The injector opens and closes at high frequency. A clicking or buzzing noise is heard from the valve.

The engine must be switched off at activation.

THROTTLE UNIT

The throttle in the throttle unit opens depending on which activation has been selected (50, 75 or 100 %).

Read off "Throttle position (TP) sensor, potentiometer 1" or "Throttle position (TP) sensor, potentiometer 2" to check the function.

The engine must be switched off at activation.

AIR CONDITIONING (A/C) RELAY

The air conditioning (A/C) relay is activated and powers the air conditioning (A/C) compressor magnetic clutch.

A clear click is heard from the air conditioning (A/C) relay and from the magnetic clutch for the air conditioning (A/C) compressor.

ENGINE COOLING FAN (FC)

The speed of the engine cooling fan (FC) changes depending on which activation is selected.

The fan can be heard.

LEAK DIAGNOSTIC UNIT, VALVE

Certain markets only.

A clicking noise is heard from the valve in the leak diagnostic unit at activation.

EVAPORATIVE EMISSION SYSTEM (EVAP) VALVE

The evaporative emission system (EVAP) valve opens and closes at a certain frequency.

There is a weak click from the EVAP valve.

TURBOCHARGER (TC) CONTROL VALVE

The turbocharger (TC) control valve opens and closes at a certain frequency.

There is a weak click from the turbocharger (TC) control valve.

DESCRIPTION OF DETAILED DIAGNOSTIC TROUBLE CODE INFORMATION READOUT

CONTENT

Select type of description:

- see **DESCRIPTION OF FROZEN VALUES**
- see **STATUS IDENTIFIER, DESCRIPTION**
- see **COUNTERS, DESCRIPTION**

DESCRIPTION OF FROZEN VALUES

EXPLANATION

HINT: Not all described parameters are implemented in the control module. This varies between systems and markets.

Bank 1: indicates cylinders 1-3 on 6-cylinder engines and all cylinders on 5-cylinder engines. The rear heated oxygen sensor of a vehicle with closed loop control following the Y concept (two front and one rear heated oxygen sensor) is designated "Bank 1".

Bank 2: indicates cylinders 4-6 on 6-cylinder engines.

ENGINE SPEED (RPM)

The engine control module (ECM) calculates engine speed from the impulse sensor signal.

BOOST PRESSURE (HPA)

The value is calculated from the boost pressure sensor and indicates the pressure in the induction system after the turbocharger but before the throttle.

The engine control module (ECM) calculates boost pressure from the boost pressure sensor. The pressure is relative to atmospheric pressure.

ENGINE TEMPERATURE (°C)

The engine control module (ECM) calculates temperature from the engine temperature sensor signal.

ENGINE TEMPERATURE, START (°C)

The engine control module (ECM) calculates temperature from the engine temperature sensor signal. The value indicates the temperature of the engine upon engine start in the operating cycle in which the diagnostic trouble code (DTC) was generated.

CALCULATED LOAD (%)

The value, calculated by the engine control module, indicates engine efficiency. The engine control module (ECM) calculates the value from air mass, engine speed, boost pressure, throttle angle, etc. A value over 100% indicates turbocharging (overpressure).

FUEL PRESSURE (PA)

The engine control module (ECM) calculates the pressure from the fuel pressure sensor signal.

The parameter indicates absolute pressure.

SPEED (KM/H)

The value indicates vehicle speed.

The engine control module (ECM) receives information on vehicle speed from the brake control module (BCM) via CAN communication.

IGNITION ANGLE (°BTDC)

The value indicates the ignition angle for cylinder 1.

ATMOSPHERIC PRESSURE (PA)

The value indicates atmospheric pressure at the engine control module (ECM).

The engine control module (ECM) calculates the value from the integrated atmospheric pressure sensor.

The normal value at 0 meters above sea level is 1013 hPa.

OUTSIDE TEMPERATURE (°C)

The engine control module (ECM) calculates the temperature from the outside temperature sensor signal.

INTAKE AIR TEMPERATURE (°C)

The engine control module (ECM) calculates the temperature from the intake air temperature sensor.

EVAP VALVE (%)

The value indicates the control module output signal for EVAP valve regulation, i. e. how much the EVAP valve should open to purge the canister.

0 % = no regulation (EVAP valve closed).

100 % = full regulation (EVAP valve fully open).

THROTTLE ANGLE (%)

The engine control module (ECM) calculates the value from the throttle position sensor. The value is calculated linearly from the throttle position sensor's output signal (0-5V) and indicates how much the throttle is open.

Approx. 6-14 % = idling (0% throttle angle, desired value).

Approx. 85-100 % = throttle fully open (100% throttle angle, desired value).

ACCELERATOR PEDAL POSITION SENSOR, PWM (%)

PWM signal from the accelerator pedal position sensor to the engine control module (ECM). The control module calculates the value from the accelerator pedal position sensor's digital output.

The value indicates the position of the accelerator pedal.

Approx. 8 % = accelerator pedal fully released.

Approx. 88 % = accelerator pedal fully depressed.

ACCELERATOR PEDAL POSITION SENSOR, ANALOG (%)

Analog signal from the accelerator pedal position sensor to the engine control module (ECM). The control module calculates the value from the accelerator pedal position sensor's analog output.

The value indicates the position of the accelerator pedal.

Approx. 8 % = accelerator pedal fully released.

Approx. 88 % = accelerator pedal fully depressed.

THROTTLE ANGLE, DESIRED VALUE (%)

The value indicates the engine control module (ECM) calculated value for throttle opening (throttle angle).

The parameter value cannot be directly compared to the actual value for the throttle angle.

0% = idling.

100% = throttle fully open.

FUEL TRIM, RAPID ADJUSTMENT, BANK X (%)

Rapid adjustment is the continual adaptation of the fuel/air mixture during operation.

Bank 2 only applies to 6-cylinder engines.

HINT: Fuel trim returns to 0% once diagnostic trouble codes (DTCs) have been cleared.

FUEL TRIM, SLOW ADJUSTMENT, BANK X (%)

Slow adjustment is the fuel trim value that adjusts the fuel/air mixture for a longer period of time and factors in component aging, tolerances, etc.

Bank 2 only applies to 6-cylinder engines.

HINT: Fuel trim returns to 0% once diagnostic trouble codes (DTCs) have been cleared.

POWER SUPPLY, ENGINE CONTROL MODULE (ECM) (V)

The value indicates the power supplied to the engine control module (ECM).

TIME AFTER ENGINE START (S)

The value indicates how much time has elapsed between engine start and diagnostic trouble code (DTC) generation.

DESCRIPTION OF PARAMETERS

HINT: Not all the parameters described need to be implemented in the control module. This varies between different systems and markets.

HINT: Bank 1: indicates cylinders 1-3 on 6 cylinder engines and all cylinders on 5 cylinder engines. The rear heated oxygen sensor (HO2S) on cars with fuel trim using the Y-concept (two front heated oxygen sensors (HO2S) and one rear heated oxygen sensors (HO2S) is called "Bank 1".

HINT: Bank 2: indicates cylinders 4-6 on 6-cylinder engines.

PARAMETERS, VALUE

ENGINE SPEED (RPM)

Measurement range: 0-10400 RPM.

The engine control module (ECM) derives the engine speed (RPM) from the engine speed (RPM) sensor signal.

The idle speed varies depending on the engine coolant temperature (ECT).

IDLING SPEED, DIFFERENCE DESIRED VALUE (RPM)

Measurement range: between -1280-1270 RPM.

The value indicates the idle speed deviation from the engine control module (ECM) desired value (target value).

BATTERY VOLTAGE (V)

Measurement range: 0-17.95 V.

The normal value is 13.5-14.5 V when the generator (GEN.) is charging.

The value indicates the voltage from the system relay to the engine control module (ECM).

ENGINE COOLANT TEMPERATURE (ECT) (°C)

Measurement range: -48 to +143 °C.

The engine control module (ECM) derives the temperature from the engine coolant temperature (ECT) sensor signal.

INTAKE AIR TEMPERATURE (IAT) (°C)

Measurement range: -48 to +143 °C.

The engine control module (ECM) calculates the temperature from the temperature sensor for the intake air.

The temperature sensor is integrated in the boost pressure sensor.

OUTSIDE TEMPERATURE (°C)

Measurement range: -40 to +110 °C.

The engine control module (ECM) derives the temperature from the outside temperature sensor signal.

ATMOSPHERIC PRESSURE (PA)

Measurement range: 0-5120 hPa.

The value indicates atmospheric pressure at the engine control module (ECM).

The sensor is integrated in the engine control module (ECM).

Normal value at sea level is 1, 013 hPa.

IGNITION ADVANCE (°BTDC)

Measurement range: -96 to +95.3° before top dead center (BTDC).

The value is calculated from the engine speed (RPM) sensor signal.

The value when idling varies depending on the engine coolant temperature (ECT).

BOOST PRESSURE (HPA)

Measurement range: 0-2550 hPA.

The value is calculated from the boost pressure. It indicates the pressure in the intake system downstream of the turbocharger (TC).

The engine control module (ECM) calculates the boost pressure from the boost pressure sensor. The pressure is relative to atmospheric pressure.

TURBOCHARGER (TC) CONTROL VALVE (%)

Measurement range: 0-100%.

The value indicates the deployment signal from the control module for deploying the turbocharger (TC) control valve, the amount the turbocharger (TC) control valve opens to adjust the turbo pressure.

0% = no control (turbocharger (TC) control valve closed).

100% = full control (the turbocharger (TC) control valve opens completely).

MASS AIR FLOW (KG/H)

Measurement range: 0-1020 kg/h.

The value indicates the mass air flow that passes through the mass air flow (MAF) sensor.

The engine control module (ECM) calculates the value based on the signal from the mass air flow (MAF) sensor.

Normal value with the engine at operating temperature and idling, neutral and air conditioning (A/C) switched off: approximately 12-20 kg/h.

NOTE: Other values apply if the generator (GEN.) is under load, if for example, high beam is on, the heated rear windshield is on etc.

MASS AIR FLOW, CORRECTION VALUE

Measurement range: 0-4.

The value is a stored average of the correction factor of the mass air flow that the engine draws in.

Mass air flow, correction factor= The control module's calculated desired value for the mass air flow divided by (/) the actual measured mass air flow.

Normal range: 1 (±0.2).

ACCELERATOR PEDAL (AP) POSITION SENSOR, ANALOG (V)

Measurement range: 0-320 V.

Analog signal from the accelerator pedal (AP) position sensor to the engine control module (ECM). The control module derives the value from the analog output for the accelerator pedal (AP) position sensor.

The value indicates the accelerator pedal (AP) position.

Approximately 0.5 V = the accelerator pedal (AP) completely released.

Approximately 4.0 V = the accelerator pedal (AP) completely depressed.

THROTTLE ANGLE (%)

Measurement range: 0-100%.

The engine control module (ECM) calculates the value from potentiometer 1 for the throttle position (TP)

sensor. The value indicates the throttle opening.

If a fault is detected in the throttle position (TP) sensor, potentiometer 1 by the engine control module (ECM), the value from the throttle position (TP) sensor potentiometer 2 will be used to represent the throttle angle.

0% = throttle shut.

100% = throttle fully open.

HINT: The value must follow the parameter "Throttle angle, desired value" when the accelerator pedal (AP) is affected.

ACCELERATOR PEDAL (AP) POSITION SENSOR, PULSE WIDTH MODULATION (PWM) (%)

Measurement range: 0-100%.

The PWM signal from the accelerator pedal (AP) position sensor to the engine control module (ECM). The control module derives the value from the digital output for the accelerator pedal (AP) position sensor.

The value indicates the accelerator pedal (AP) position.

Approximately 5% = the accelerator pedal (AP) is completely released.

Approximately 80% = the accelerator pedal (AP) is fully depressed.

THROTTLE ANGLE, DESIRED VALUE (%)

Measurement range: 0-100%.

The engine control module (ECM) calculates a target value for the throttle opening (throttle angle).

The value indicates what the throttle angle should be.

0% = throttle shut.

100% = throttle fully open.

THROTTLE POSITION (TP) SENSOR, POTENTIOMETER 1 (V)

Measurement range: 0-80 V.

The engine control module (ECM) derives the value from potentiometer 1 for the throttle position (TP) sensor.

The value must increase with increased throttle angle.

Approximately 0.5 V = throttle closed.

Approximately 4.0 V = wide open throttle (WOT).

THROTTLE POSITION (TP) SENSOR, POTENTIOMETER 2 (V)

Measurement range: 0-80 V.

The engine control module (ECM) derives the value from potentiometer 2 for the throttle position (TP) sensor.

The value must decrease with an increased throttle angle.

Approximately 4.0 V = throttle closed.

Approximately 0.5 V = wide open throttle (WOT).

LEAKAGE FLOW OVER THE THROTTLE (KG/H)

Measurement range: 0-655 kg/h.

The value indicates how much air passes through the throttle at closed throttle position (CTP). The engine control module (ECM) calculates the value from the mass air flow (MAF) sensor and the throttle position (TP) sensor signals.

AIR CONDITIONING (A/C) PRESSURE (KPA)

Measurement range: -176 to +3277 kPa.

The engine control module (ECM) calculates the value from the signal from the air conditioning (A/C) pressure sensor.

The value indicates the pressure at the high-pressure side of the air conditioning (A/C) system.

The engine control module (ECM) calculates the pressure based on the signal from the air conditioning (A/C) pressure sensor. The pressure is given as a value relative to the atmospheric pressure.

EVAPORATIVE EMISSION SYSTEM (EVAP) VALVE (%)

Measurement range: 0-100%.

The value indicates the deployment signal from the control module for deploying the evaporative emission system (EVAP) valve (the amount the valve opens to empty the canister).

0% = no control (Evaporative emission system (EVAP) valve closed).

100% = full control (Evaporative emission system (EVAP) valve opens completely).

EVAP, FLOW (KG/H)

Measurement range: 0-25 kg/h.

The engine control module (ECM) calculates the flow through the evaporative emission system (EVAP) valve.

This value increases with increased flow.

INJECTION PERIOD BANK X (MS)

Measurement range: 0.0-150 ms.

The signal transmitted by the engine control module (ECM) for injection period.

Normal value when the engine is idling at operating temperature: 1.0-3.0 ms

SHORT-TERM FUEL TRIM, BANK X

Measurement range: 0-2.

The value displays how much the injection period needs to be corrected (from the preprogrammed injection period in the control module) to reach lambda=1. If the engine runs lean or rich (lambda deviates from 1), the short-term fuel trim injection period is increased or decreased so that lambda=1. The average value of this parameter from different engine speed and load ranges is used for the different fuel trim adaptations (idling, lower partial load and upper partial load) so that the short-term fuel trim is always around 1.

Short-term fuel trim = the actual injection period required to reach lambda=1, divided by (/) the injection period in preprogrammed in the control module to reach lambda=1.

The normal value oscillates around 1, when the lambda adaptations for each engine speed (RPM) / load range are ready.

Value over 1: the control module increases the injection period (to prevent a lean fuel / air mix).

Value under 1: the control module decreases the injection period (to prevent a rich fuel air mix).

The parameter must be checked under stable conditions, such as stable engine speed (RPM) and load.

HINT: When lambda deviates from 1, the short-term fuel trim initially compensates at every engine speed (RPM) / load range (idle speed and load). When erasing the diagnostic trouble codes (DTCs), the adaptation values will be reset. This means the short-term fuel trim will be high or low when driving in the low engine speed/load ranges before the adaptations are ready.

LONG-TERM FUEL TRIM BANK X, IDLE SPEED (%)

Measurement range: between -72 and +72%.

Additive adaptation of the short-term fuel trim (correcting the injection period), adaptation that occurs at idle speed. The value indicates how much the short-term fuel trim has been corrected at idle speed so that the short-term fuel trim value can again oscillate around 1.

In the event of an air leakage for example, the value will increase at idle speed (= longer injection time). This is to compensate the fuel / air mix for air capacity. Regardless of the load /engine speed, the same injection time is added. This means that the parameter value does not significantly affect the fuel / air mix at higher loads /

engine speeds.

Normal value when the engine is idling: 0 ±5%.

Value over 0%: the control module increases the injection period (to prevent a lean fuel / air mix).

Value less than 0%: the control module decreases the injection period (to prevent a rich fuel air mix).

HINT: When diagnostic trouble codes (DTCs) are erased, the adaptation returns to 0%.

LONG-TERM FUEL TRIM BANK X, LOWER PART LOAD

Measurement range: 0-2.

Multiplicative adaptation of the short-term fuel trim (correcting the injection period), adaptation that occurs at lower part load (normal road driving). The value stored in the control module indicates how much the short-term fuel trim in the upper part load range has been corrected so that the short-term fuel trim value can again oscillate around 1 at the lower part load. In the event of low fuel pressure for example, the value will increase (= longer injection time). This is to compensate the fuel/air mix for the lack of fuel. Normal value 1±0.1. The lower part load range of the engine must be reached for the value to be updated (normal road driving). Approximately 30 minutes of driving in the lower part load may be required before the adaptation is complete (complete = short-term fuel trim oscillates around 1 at lower part load). Value over 1: the control module increases the injection period (to prevent a lean fuel / air mix). Value under 1: the control module decreases the injection period (to prevent a rich fuel air mix).

HINT: When diagnostic trouble codes (DTCs) are erased, the adaptation returns to 1.

LONG-TERM FUEL TRIM BANK X, UPPER PART LOAD

Measurement range: 0-2.

Multiplicative adaptation of the short-term fuel trim (correcting the injection period), adaptation that occurs at lower part load (normal road driving). The value stored in the control module indicates how much the short-term fuel trim in the upper part load range has been corrected so that the short-term fuel trim value can again oscillate around 1 at the lower part load. In the event of low fuel pressure for example, the value will increase (= longer injection time). This is to compensate the fuel/air mix for the lack of fuel. Normal value 1±0.1. The lower part load range of the engine must be reached for the value to be updated (normal road driving). Approximately 30 minutes of driving in the lower part load may be required before the adaptation is complete (complete = short-term fuel trim oscillates around 1 at lower part load). Value over 1: the control module increases the injection period (to prevent a lean fuel / air mix). Value under 1: the control module decreases the injection period (to prevent a rich fuel air mix).

HINT: When diagnostic trouble codes (DTCs) are erased, the adaptation returns to 1.

FRONT HEATED OXYGEN SENSOR (HO2S), BANK X (^)

Measurement range: 0-16.

Normal value is lambda=1.

If the mixture is rich, lambda is less than 1.

If the mixture is lean, lambda is greater than 1.

REAR HEATED OXYGEN SENSOR (HO2S), BANK X (V)

Measurement range: -0.2 to +1.13.

The signal from the rear heated oxygen sensor (HO2S) to the engine control module (ECM).

Normal value when the engine is running at even load is approximately 0.6 V.

The voltage may vary between -0.2 and 0.9 V. The voltage may, during engine braking for example, drop to -0.2 V.

FUEL PRESSURE (PA)

Measurement range: 50-4680 kPa.

The parameter indicates absolute pressure.

The engine control module (ECM) derives the pressure from the fuel pressure sensor signal. When idling, with the engine at operating temperature and in neutral, the value should be approximately 400 kPa.

HINT: The value must follow "Fuel pressure, desired value".

FUEL PRESSURE, DESIRED VALUE (PA)

Measurement range: 0-6553.5 kPa.

The parameter indicates absolute pressure.

The engine control module (ECM) calculates the target value for "Fuel pressure". The value indicates what the fuel pressure should be.

FUEL TEMPERATURE (°C)

Measurement range: -40 to +215 °C.

The engine control module (ECM) derives the temperature from the fuel temperature sensor signal. The fuel temperature sensor is integrated in the fuel pressure sensor.

FUEL PUMP (FP), WORKLOAD (%)

Measurement range: 0-100%.

The value shows the PWM signal between the engine control module (ECM) and the fuel pump (FP) control module. A higher pulse ratio gives a higher fuel pressure. At 400 kPa the pulse ratio must be approximately 35% (±5%). The values are not relevant if the battery voltage is too low.

OIL LEVEL (%)

Measurement range 0-100%.

The value indicates the oil level signal pulse ratio from the PWM signal generated by the oil level sensor. The signal passes between the engine control module (ECM) and the oil level sensor. The value must be between 17-83% depending on the oil level.

BRAKE PEDAL POSITION (VIA THE BRAKE CONTROL MODULE (BCM)

Measurement range 0-100%.

The engine control module (ECM) receives the value from the brake control module (BCM) via the Control area network (CAN). The value indicates the brake pedal position.

When the brake pedal is not affected the value is approximately 0%. The value increases as the brake pedal is pressed.

SPEED (KM/H)

Measurement range: 0-319 km/h

The vehicle speed is shown from the brake control module (BCM) via the controller area network (CAN).

ENGINE COOLING FAN (FC) (%)

Measurement range: 0-100%

Pulse width modulation (PWM) signals transmitted by the engine control module (ECM) to the engine cooling fan (FC) control module to control the speed of the engine cooling fan (FC).

RESET VALVE CAMSHAFT, INTAKE / EXHAUST (CA)

Measurement range: 0-100%

The pulse ratio transmitted by the engine control module (ECM) to control the camshaft reset valve.

The value indicates control of the camshaft reset valve to control the camshaft position (angle).

The normal value when the camshaft is deployed and in the fixed position is approximately 50%. The value increases/decreases depending on control of the camshaft.

CAMSHAFT SHIFT ANGLE, (INTAKE/ EXHAUST) (°)

Measurement range: between -256 CA and +256 CA.

The engine control module (ECM) calculates the value by comparing the position of the camshaft with the position of the crankshaft. The value indicates the angle of the camshaft. This is the offset of the camshaft 0 position in relation to the crankshaft TDC (0). (The camshaft 0-position = the set alignment of the camshaft position with the crankshaft.)

DESIRED VALUE FOR THE CAMSHAFT SHIFT ANGLE, INTAKE/EXHAUST

Measurement range: between -256 CA and +256 CA.

The value indicates the target value of the engine control module (ECM) for "Camshaft shift angle " (actual shift angle). The "Desired value for the camshaft shift angle" can be altered by changing the engine speed (RPM)/load.

CAMSHAFT SHIFT ANGLE LEEWAY, INTAKE/EXHAUST

Measurement range: between -256 CA and +256 CA.

The value indicates the difference between the "Camshaft shift angle" (actual shift angle) and the desired value for the camshaft shift angle (target value for the engine control module (ECM). Changing the "Camshaft shift angle" is achieved by changing the engine speed (RPM)/load. The normal value varies depending on how far the camshaft is operated and the temperature/grade of the engine oil, although the value must never deviate by more than between ± 10 degrees for longer than approximately 4 seconds.

CAMSHAFT ADAPTATION, INTAKE/EXHAUST (CA)

Measurement range: between -511 to +511 degrees.

The value indicates the camshaft deviation from the basic setting.

The value is 0 degrees when the camshaft position (angle) corresponds with the crankshaft position (angle). Normal value is 0 degrees ±8 degrees.

The value is updated following adaptation of the camshaft position (angle position). The adaptation is performed when the camshaft control is not active (fully returned camshaft).

MISFIRE COUNTER

The engine control module (ECM) calculates the overall total for the number of misfires affecting emissions or causing catalytic converter damage for all cylinders during a certain number of crankshaft revolutions.

The normal value is 0 (no misfiring).

MISFIRE COUNTER, CYL X

The value indicates the number of misfires for each cylinder during the present operating cycle.

The value is affected by misfires which affect emissions and cause catalytic converter damage.

The normal value is 0 (no misfiring).

The value is reset when the ignition is switched off.

PARAMETER, STATUS

COOLANT LEVEL SENSOR

The engine control module (ECM) calculates the status from the engine coolant level switch.

The status indicates the engine coolant level in the expansion tank.

THROTTLE UNIT ADAPTATION

If necessary the engine control module (ECM) runs an adaptation of the throttle unit by guiding the throttle to the limit positions (open/closed) so that it " learns" the parameters of that actual throttle unit.

The status indicates if the adaptation has been run or not.

OK = Adaptation of the throttle unit has run.

NOT OK = Adaptation of the throttle unit has not run.

NOTE: The basic conditions must be met before an adaptation of the throttle unit can be carried out.

AUTOMATIC TRANSMISSION

Only vehicles that have an automatic transmission.

The engine control module (ECM) calculates the status of the signal from the transmission control module (TCM) via CAN.

ON = the gear selector is in position "D" or another gear is selected.

OFF = the gear selector is in position "P" or "N"

CRUISE CONTROL RESUME

The cruise control must be on when reading this parameter.

OFF= resume button unaffected.

ON = resume button activated.

CRUISE CONTROL SET+

The cruise control must be on when reading this parameter.

OFF= SET+ unaffected.

ON = SET+ affected.

CRUISE CONTROL SET-

The cruise control must be on when reading this parameter.

OFF= SET- unaffected.

ON = SET- affected.

STOP LAMP SWITCH

The engine control module (ECM) calculates the value from the stop lamp switch.

ON = stop lamp switch on.

OFF = stop lamp switch unaffected.

AIR CONDITIONING (A/C) COMPRESSOR, ACTIVE

The signal transmitted by the engine control module (ECM) for activating the air conditioning (A/C) compressor relay.

OFF = The engine control module (ECM) does not activate the air conditioning (A/C) compressor relay.

ON = The engine control module (ECM) activates the air conditioning (A/C) compressor relay.

OIL PRESSURE SENSOR

The engine control module (ECM) calculates the value from the oil pressure switch signal.

ON = the oil pressure switch circuit is closed, signal to the driver information module (DIM) via CAN for lit oil pressure warning lamp.

OFF = the oil pressure switch circuit is open, signal to the driver information module (DIM) via CAN for oil pressure warning lamp not lit.

LONG-TERM FUEL TRIM, BANK X

C/L= Closed Loop, fuel trim is active

O/L = Open Loop, fuel trim is not active

FUEL PUMP (FP) RELAY

OFF = The engine control module (ECM) does not request fuel pump (FP) relay activation.

ON = The engine control module (ECM) requests fuel pump (FP) relay activation via CAN to the central electronic module (CEM).

BOOST PRESSURE (ACTUAL VALUE)

Measurement range: 0-2000 hPa, absolute pressure (boost pressure- absolute zero pressure (0 hPa).

The Engine control module (ECM) receives information about the current boost pressure via the boost pressure sensor.

The actual value must correspond to the desired value ± 50hPa.

BOOST PRESSURE (DESIRED VALUE)

Measurement range: 0-2000 hPa, absolute pressure (boost pressure- absolute zero pressure (0 hPa).

The engine control module (ECM) receives information about the current throttle angle via the throttle position sensor, speed (RPM), engine load, knocks etc. These parameters are used to calculate the boost pressure that is permitted in various operating conditions.

VEHICLE COMMUNICATION INFORMATION, ENGINE CONTROL MODULE (ECM) (B6294T; 2005-2006)

DESCRIPTION OF PARAMETERS

see **DESCRIPTION OF PARAMETERS**

VEHICLE COMMUNICATION INFORMATION, ENGINE CONTROL MODULE (ECM) (B6324S; 2007-2010)

DESCRIPTION OF ACTIVATIONS

HINT: Not all the components/functions described need to be implemented in the control module. This varies between different systems and markets.

PARAMETERS, VALUE

THROTTLE ANGLE (%)

Measurement range 0 - 100 %.

The engine control module (ECM) calculates the value from potentiometer 1 for the throttle position sensor. The value indicates the throttle opening. If the engine control module (ECM) detects a fault in the throttle position sensor potentiometer 1, the value from the throttle position sensor potentiometer 2 will be used to represent the throttle angle. This presumes that the function of throttle position sensor potentiometer 2 is OK.

0 % = throttle shut.

100 % = throttle fully open. This corresponds to an opening angle of approximately 84 degrees.

THROTTLE POSITION, CIRCUIT 1 (%)

Measurement range: -3 to +130 %.

Normal value: 0 - 100 %.

There is an electrical fault if the displayed value is outside the measurement range. The value must increase with increased throttle angle.

Approximately 0 % = throttle closed.

Approximately 100 % = wide open throttle (WOT). This corresponds to an opening angle of approximately 84 degrees.

THROTTLE POSITION, CIRCUIT 2 (%)

Measurement range: -4 to +140 %.

Normal value: 0 - 100 %.

There is an electrical fault if the displayed value is outside the measurement range. The value must increase with increased throttle angle.

Approximately 0 % = throttle closed.

Approximately 100 % = wide open throttle (WOT). This corresponds to an opening angle of approximately 84 degrees.

COMPONENT/FUNCTION

INJECTOR VALVES, CYLINDERS 1-6

Injector valves 1-6 open using the start button and close using the stop button.

Clicking heard from the injector valve.

The engine must be switched off.

AIR CONDITIONING (A/C) RELAY

Deactivated using the start button and activated using the stop button. Air conditioning A/C must be requested from the control panel.

A clicking noise is heard from the magnetic clutch for the air conditioning (A/C) compressor. If the temperature on the air conditioning (A/C) is set to cold, it will be switched off when the relay is deactivated.

ENGINE COOLING FAN (FC) 30/66/100 %

The fan is activated using the start button and stopped using the stop button.

There is audible fan noise.

LEAK DIAGNOSTIC UNIT, VALVE

Certain markets only.

A clicking noise is heard from the valve in the leak diagnostic unit at activation.

EVAPORATIVE EMISSION SYSTEM (EVAP) VALVE

The evaporative emission system (EVAP) valve opens and closes 5 times per second. Activated using the start button and stopped using the stop button.

There is an audible clicking sound from the EVAP valve.

THROTTLE UNIT 0/25/50/75/100%

Throttle in the throttle unit controlled.

The throttle opens to different positions depending on which activation is selected.

Read off "Throttle angle", "Throttle position, circuit 1" or "Throttle position, circuit 2" to check the function.

NOTE: The engine must be switched off at activation.

ACTUATOR VARIABLE INTAKE, UPPER

The throttle opens using the start button and closes using the stop button.

A noise is heard from the actuator.

ACTUATOR VARIABLE INTAKE, LOWER

The throttle opens using the start button and closes using the stop button.

A noise is heard from the actuator.

DESCRIPTION OF PARAMETERS

HINT: The engine cylinders are counted starting from the cylinder furthest from the flywheel (right-hand side of the vehicle in the direction of travel)

HINT: Bank 1: cylinder 1-3.

HINT: Bank 2: cylinder 4-6.

PARAMETERS, VALUE

ECU POWER SUPPLY (V)

Measurement range: 0 - 20 V.

The normal value is 13-14.5 V when the generator (GEN.) is charging.

The value indicates the voltage at the engine control module (ECM).

OUTSIDE TEMPERATURE (°C)

Measurement range: -40 to +120 °C.

The engine control module (ECM) derives the temperature from the outside temperature sensor signal.

ENGINE CONTROL MODULE (ECM), TEMPERATURE (°C)

Measurement range: -40 to +120 °C.

The engine control module (ECM) calculates the temperature from the internal temperature sensor signal in the control module.

AIR CONDITIONING (A/C) PRESSURE (PA)

Measurement range: 0 - 3100 kPa.

The value indicates the pressure at the high-pressure side of the air conditioning (A/C) system.

The engine control module (ECM) calculates the pressure based on the signal from the air conditioning (A/C) pressure sensor. The pressure is given as a value relative to the atmospheric pressure.

AIR CONDITIONING (A/C) COMPRESSOR, STATUS (%)

Measurement range: 0-100%.

The value shows the variable AC compressor's deployment (duty cycle).

ENGINE COOLANT TEMPERATURE (ECT) (°C)

Measurement range: -40 to +120 °C.

The engine control module (ECM) derives the temperature from the engine coolant temperature (ECT) sensor signal.

ATMOSPHERIC PRESSURE (PA)

Measurement range: 0 - 2267 hPa.

The value indicates atmospheric pressure at the engine control module (ECM).

Normal value at 0 meters above sea level is 1013 hPa.

INTAKE AIR TEMPERATURE (IAT) (°C)

Measurement range: -40 to +120 °C.

The engine control module (ECM) calculates the temperature from the temperature sensor for intake air (integrated in the mass air flow (MAF) sensor).

MANIFOLD ABSOLUTE PRESSURE (MAP) (PA)

Measurement range: 0 - 5000 hPa.

Normal pressure (atmospheric pressure at sea level) approximately 1013 hPa with ignition on (open throttle) and approximately 420 ± 30 hPa when idling (intake air temperature approximately 20 °C).

MASS AIR FLOW (G/S)

The value indicates the mass air flow that passes through the mass air flow (MAF) sensor.

The engine control module (ECM) calculates the value based on the signal from the mass air flow (MAF) sensor.

Normal value at idle is approx. 5-7 g/s.

FUEL TEMPERATURE (°C)

Measurement range: -40 to +120 °C.

The engine control module (ECM) derives the temperature from the fuel temperature sensor signal. The fuel temperature sensor is integrated in the fuel pressure sensor.

FUEL PRESSURE (PA)

The parameter indicates absolute pressure.

The engine control module (ECM) calculates the pressure from the fuel pressure sensor signal.

Normal value 480 ± 5 kPa when idling, in neutral and with the engine at operating temperature. The pressure falls with the ignition off.

FUEL PUMP (FP), WORKLOAD (%)

Measurement range: 0-100%.

Working range: 10 - 85 %.

Normal value: 50 % (± 10 %).

The value indicates the signal transmitted from the engine control module (ECM) to the fuel pump (FP) control module.

INJECTION TIME (MS)

Measurement range: 0 - 524 ms.

Engine control module (ECM) controlled signal for injection time.

EVAP VALVE, WORK LOAD (%)

Measurement range: 0-100%.

The value indicates the pulse width modulated (PWM) signal transmitted from the engine control module (ECM) to the evaporative emissions system (EVAP) valve.

0 % corresponds to closed valve, i. e. when there is no purging.

EVAPORATIVE EMISSIONS SYSTEM (EVAP) FLOW (G/S)

Measurement range: 0 - 0.85 g/s.

The value indicates the estimated flow through the evaporative emission system (EVAP) valve. Used as an input parameter during compensation for other parts of the system.

Normal value at idle is 0 g/s when there is no purging and 0.85 g/s during purging.

IGNITION ADVANCE (CA)

Measurement range: -20 to +62° CA BTDC.

Normal value when idling varies depending on the engine coolant temperature (ECT) etc.

VEHICLE SPEED

Measurement range: 0 - 255 km/h.

The value displays the vehicle speed.

HINT: in certain markets.

ENGINE SPEED (RPM)

Measurement range: 0-10, 400 RPM.

The engine control module (ECM) derives the engine speed (RPM) from the engine speed (RPM) sensor signal.

Idling speed varies depending on engine temperature. Normal value 650 ± 50 RPM with engine at operating temperature.

BRAKE PEDAL POSITION (VIA CAN) (%)

Measurement range: 0-100%.

The value indicates the position of the brake pedal, calculated from the signal transmitted from the brake control module (BCM).

When the brake pedal is not depressed the value is 0%. The value increases as the pedal is depressed.

ACCELERATOR PEDAL POSITION (VIA CAN) (%)

Measurement range: 0-100%.

Analog signal from the accelerator pedal (AP) position sensor to the engine control module (ECM).

The value indicates the accelerator pedal (AP) position.

Approximately 8 %= the accelerator pedal (AP) completely released.

Approximately 88 %= the accelerator pedal (AP) completely depressed.

The analog signal is usually used by the engine control module (ECM).

HINT: The value must follow the parameter "Accelerator pedal (AP), PWM.

ACCELERATOR PEDAL (AP) POSITION (%)

Measurement range: 0-100%.

PWM signal from the accelerator pedal (AP) position sensor to the engine control module (ECM).

The value indicates the accelerator pedal (AP) position.

Approximately 8 %= the accelerator pedal (AP) completely released.

Approximately 88 %= the accelerator pedal (AP) completely depressed.

The PWM signal is used if there is a fault with the analog signal.

HINT: The value must follow the parameter "Accelerator pedal (AP), analog.

THROTTLE POSITION, DESIRED VALUE (%)

Measurement range: 0-100%.

The value indicates the signal transmitted to the throttle unit from the engine control module (ECM).

0 % = throttle shut.

100 % = throttle fully open. This corresponds to an opening angle of approximately 84 degrees.

THROTTLE POSITION (%)

Measurement range: 0-100%.

The engine control module (ECM) calculates the value from potentiometer 1 for the throttle position sensor. The value indicates the throttle opening. If the engine control module (ECM) detects a fault in throttle position sensor potentiometer 1, the value from throttle position sensor potentiometer 2 will be used to represent the throttle angle. This presumes that the function of throttle position sensor potentiometer 2 is OK.

0 % = throttle shut.

100 % = throttle fully open. This corresponds to an opening angle of approximately 84 degrees.

HINT: Must follow the parameter "Throttle angle, desired value.

THROTTLE POSITION, CIRCUIT 1 (%)

Measurement range: -3 to +130 %.

Normal value 0 - 100 %.

There is an electrical fault if the displayed value is outside the measurement range. The value must increase with increased throttle angle.

Approximately 0 % = throttle closed.

Approximately 100 % = wide open throttle (WOT). This corresponds to an opening angle of approximately 84 degrees.

THROTTLE POSITION, CIRCUIT 2 (%)

Measurement range: -4 to +140 %.

Normal value 0 - 100 %.

There is an electrical fault if the displayed value is outside the measurement range. The value must increase with increased throttle angle.

Approximately 0 % = throttle closed.

Approximately 100 % = wide open throttle (WOT). This corresponds to an opening angle of approximately 84 degrees.

REAR HEATED OXYGEN SENSOR (HO2S), SIGNAL BANK X (V)

Measurement range: 0 - 5 V.

The signal from the rear heated oxygen sensor (HO2S) to the engine control module (ECM).

Normal value when the engine is running at even load is approximately 0.6 V.

FRONT HEATED OXYGEN SENSOR (HO2S), SIGNAL BANK X

Measurement range: 0 - 2.

Normal value is lambda=1.

At rich mixture is lambda < 1.

At lean mixture is lambda > 1.

FRONT LAMBDA CONTROL SLOW, BANK X

The parameter displays the adaptation factor of the lambda probe.

Measurement range: 0 - 2.

Compensates/multiplies the injection period at the relevant load so that the lambda value can be correctly reached.

Normal value 1.

There are 36 adaptation windows per bank. Which window is active depends on the load and the engine speed. Operates together with "Front heated oxygen sensor control fast, bank x".

FRONT LAMBDA CONTROL FAST, BANK X

The parameter displays the compensation factor of the lambda probe.

Measurement range: 0 - 2.

lambda value compensation increases or reduces the injection period depending on the deviation.

Normal value 1.

Works together with "Front lambda control slow, bank x".

ENGINE COOLING FAN (FC) (%)

Measurement range: 0-100%.

Engine control module (ECM) PWM signal to the engine cooling fan (FC) control module to activate the engine cooling fan (FC).

RESET VALVE CAMSHAFT, INLET BANK X/ EXHAUST BANK X (CA)

Measurement range: 0-100%.

The signal transmitted by the engine control module (ECM) to control the camshaft reset valve.

The value indicates the average current for the PWM signal through the camshaft reset valve for controlling the camshaft shift angle (angle position).

The normal value when the camshaft is deployed and in the fixed position is 400 - 900 mA. The value increases/decreases depending on control of the camshaft.

CAMSHAFT SHIFT ANGLE -INLET BANK X/ -EXHAUST BANK X (CA)

The engine control module (ECM) calculates the value using the signals from the engine speed (RPM) sensor (crankshaft position) and the camshaft position (CMP) sensor (camshaft position).

The value indicates how much the camshaft is deployed. When the camshaft is in its 0-position, the angle is 0° CA. When the camshaft is fully deployed, the angle is approx. 45° CA.

Normal value at idle, engine at operating temperature, approximately 0° CA.

CA = (crankshaft degrees)

HINT: The value must follow the parameter "Camshaft shift angle, inlet/exhaust, desired value".

CAMSHAFT SHIFT ANGLE -INLET/ -EXHAUST, DESIRED VALUE (CA)

The value indicates the engine control module (ECM) target value for "Camshaft shift angle -inlet bank x/ -exhaust bank x".

CAMSHAFT ADAPTION -INLET BANK X/ -EXHAUST BANK X (CA)

The value indicates the camshaft deviation from the basic setting by calculating the position of the camshaft in relation to the reference positions from the crankshaft.

The value is 0° when the camshaft position (angle) corresponds to the crankshaft position (angle).

Normal value for intake camshaft: 75° CA (+/- 8° CA)

Normal value for exhaust camshaft: 120° CA (+/- 8° CA)

The value is updated following adaptation of the camshaft position. The adaptation is carried out when the camshaft control is not active (fully returned camshaft).

MISFIRE COUNTER EMISSIONS IMPACT / CATALYTIC CONVERTER DAMAGE, TOTAL

The value indicates the number of misfires for all cylinders during the present operating cycle.

The value is reset with ignition off.

Normal value is 0 (= no misfire).

MISFIRE COUNTER, AVERAGE

The engine control module (ECM) calculates the average number of misfires in 10 operating cycles, all cylinders.

The value is affected by misfires which affect emissions and cause catalytic converter damage.

The value is reset when erasing diagnostic trouble codes.

Normal value is 0 (= no misfire).

MISFIRE COUNTER CYLINDER X, AVERAGE

The engine control module (ECM) calculates the average number of misfires in 10 operating cycles, each cylinder.

The value is affected by misfires which affect emissions and cause catalytic converter damage.

The value is reset when erasing diagnostic trouble codes.

Normal value is 0 (= no misfire).

PARAMETER, STATUS

GEAR POSITION

Only vehicles equipped with an automatic transmission.

The engine control module (ECM) calculates the status of the signal from the directly connected cable from the transmission control module (TCM).

P/N engaged = gear selector is in "Park" or "Neutral".

P/N disengaged = gear selector position is not in "Park" or "Neutral".

GEAR POSITION (VIA CAN)

Only vehicles equipped with an automatic transmission.

the engine control module (ECM) calculates the status of the signal from the transmission control module (TCM) via CAN.

P/N engaged = gear selector is in "Park" or "Neutral".

P/N disengaged = gear selector position is not in "Park" or "Neutral".

POWER SUPPLY MODE

The value indicates the status of the power supply mode.

- Key removed
- Key recently removed
- Key approved
- Ignition off after Accessory position
- Accessory position
- Accessory position after Ignition on
- Ignition on
- Running
- Start attempt

IGNITION SWITCH POSITION (VIA CAN)

The engine control module calculates the status of the signal from the central electronic module via CAN communication.

STARTER RELAY

The status indicates if the engine control module requested activation of the starter relay.

Active = Engine control module activates starter relay.

Not active = Engine control module does not activate starter relay.

CRUISE CONTROL,

Activated = on the cruise control keypad depressed.

Not activated = on the cruise control keypad not depressed.

CRUISE CONTROL,

Activated = on the cruise control keypad depressed.

Not activated = on the cruise control keypad not depressed.

CRUISE CONTROL, ON/OFF

Activated = on the cruise control keypad depressed.

Not activated = on the cruise control keypad not depressed.

CRUISE CONTROL,

Activated = on the cruise control keypad depressed.

Not activated = on the cruise control keypad not depressed.

CRUISE CONTROL,

Activated = on the cruise control keypad depressed.

Not activated = on the cruise control keypad not depressed.

BRAKE LIGHT SWITCH

The engine control module (ECM) calculates the value from the brake light switch signal.

Activated = brake light switch actuated.

Not activated = brake light switch unaffected.

DESCRIPTION OF READING OFF OF EXTENDED DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

see **DESCRIPTION OF READING OFF OF EXTENDED DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION**

VEHICLE COMMUNICATION INFORMATION, ENGINE CONTROL MODULE (ECM) (B8444S; 2005-2011)

DESCRIPTION OF ACTIVATIONS

HINT: Not all the components/functions described need to be implemented in the control module. This varies between different systems and markets.

PARAMETERS, VALUE

THROTTLE ANGLE (%)

Measurement range 0 -100%.

The engine control module (ECM) calculates the value from potentiometer 1 for the throttle position (TP) sensor. The value indicates the throttle opening. If a fault is detected in the throttle position (TP) sensor, potentiometer 1 by the engine control module (ECM), the value from the throttle position (TP) sensor, potentiometer 2 will be used to represent the throttle angle. This presumes that the function of throttle position (TP) sensor, potentiometer 2 is OK.

0% = throttle shut.

100% = wide open throttle (WOT). This corresponds to an opening angle of approximately 84 degrees.

THROTTLE POSITION, CIRCUIT 1 (%)

Measurement range -3 - +130%.

Normal value 0 - 100%.

There is an electrical fault if the displayed value is outside the measurement range. The value must increase with increased throttle angle.

Approximately 0% = throttle closed.

Approximately 100% = wide open throttle (WOT). This corresponds to an opening angle of approximately 84 degrees.

THROTTLE POSITION, CIRCUIT 2 (%)

Measurement range -4 - +140%.

Normal value 0 - 100%.

There is an electrical fault if the displayed value is outside the measurement range. The value must increase with increased throttle angle.

Approximately 0% = throttle closed.

Approximately 100% = wide open throttle (WOT). This corresponds to an opening angle of approximately 84 degrees.

COMPONENT/FUNCTION

INJECTOR VALVE, CYLINDER 1-8

Injector valve 1-8 opens using the start button and closes using the stop button.

Clicking heard from the injector valve.

The engine must be switched off.

AIR CONDITIONING (A/C) RELAY

Deactivated using the start button and activated using the stop button. Air conditioning A/C must be requested from the control panel.

A clicking noise is heard from the magnetic clutch for the air conditioning (A/C) compressor. If the temperature on the air conditioning (A/C) is set to cold, it will be switched off when the relay is deactivated.

ENGINE COOLING FAN (FC) 30/66/100 %

The fan is activated using the start button and stopped using the stop button.

There is audible fan noise.

LEAK DIAGNOSTIC UNIT, VALVE

Certain markets only.

A clicking noise is heard from the valve in the leak diagnostic unit at activation.

EVAPORATIVE EMISSION SYSTEM (EVAP) VALVE

The evaporative emission system (EVAP) valve opens and closes 5 times per second. Activated using the start button and stopped using the stop button.

There is an audible clicking sound from the EVAP valve.

THROTTLE UNIT 0/25/50/75/100%

Throttle in the throttle unit controlled.

The throttle opens to different positions depending on which activation is selected.

Read off "Throttle angle", "Throttle position, circuit 1" or "Throttle position, circuit 2" to check the function.

NOTE: The engine must be switched off at activation.

VALVE VARIABLE INLET

The valve opens using the start button and closes using the stop button.

A clicking noise is heard from the valve.

DESCRIPTION OF PARAMETERS

HINT: The engine cylinders are counted starting from the cylinder furthest from the flywheel (right-hand side of the vehicle in the direction of travel)

HINT: Bank 1 (cylinder row nearest the front): cylinders 1, 3, 5 and 7.

HINT: Bank 2 (cylinder row furthest to the rear, nearest the passenger compartment): cylinders 2, 4, 6, and 8.

PARAMETERS, VALUE

BATTERY VOLTAGE (V)

Measurement range 0-20 V.

The normal value is 13-14.5 V when the generator (GEN.) is charging.

The value indicates the voltage at the engine control module (ECM).

OUTSIDE TEMPERATURE (°C)

Measurement range -40 to +120 °C.

The engine control module (ECM) derives the temperature from the outside temperature sensor signal.

ENGINE CONTROL MODULE (ECM), TEMPERATURE (°C)

Measurement range -40 to +120 °C.

The engine control module (ECM) calculates the temperature from the internal temperature sensor signal in the control module.

AIR CONDITIONING (A/C) PRESSURE (PA)

Measurement range 0 to +3100 kPa.

The engine control module (ECM) calculates the value from the signal from the air conditioning (A/C) pressure sensor.

The value indicates the pressure at the high-pressure side of the air conditioning (A/C) system.

The engine control module (ECM) calculates the pressure based on the signal from the air conditioning (A/C) pressure sensor. The pressure is given as a value relative to the atmospheric pressure.

AIR CONDITIONING (A/C) COMPRESSOR, STATUS (%)

Measurement range 0 to 100%.

The value shows the variable AC compressor's deployment (duty cycle).

ENGINE COOLANT TEMPERATURE (ECT) (°C)

Measurement range -40 to +120 °C.

The engine control module (ECM) derives the temperature from the engine coolant temperature (ECT) sensor signal.

ATMOSPHERIC PRESSURE (PA)

Measurement range 0-2267 hPa.

The value indicates atmospheric pressure at the engine control module (ECM).

Normal value at 0 meters above sea level is 1013 hPa.

INTAKE AIR TEMPERATURE (IAT) (°C)

Measurement range -40 to +120 °C.

The engine control module (ECM) calculates the temperature from the temperature sensor for intake air (integrated in the mass air flow (MAF) sensor).

MANIFOLD ABSOLUTE PRESSURE (MAP) (PA)

Measurement range 0-5000 hPa.

Normal pressure (atmospheric pressure at sea level) approximately 1013 hPa with ignition on (open throttle) and approximately 420 ± 30 hPa when idling (intake air temperature approximately 20 °C).

MASS AIR FLOW (G/S)

The value indicates the mass air flow that passes through the mass air flow (MAF) sensor.

The engine control module (ECM) calculates the value based on the signal from the mass air flow (MAF) sensor.

FUEL TEMPERATURE (°C)

Measurement range -40 to +120 °C.

The engine control module (ECM) derives the temperature from the fuel temperature sensor signal. The fuel temperature sensor is integrated in the fuel pressure sensor.

FUEL PRESSURE (PA)

The parameter indicates absolute pressure.

The engine control module (ECM) calculates the pressure from the fuel pressure sensor signal.

Normal value 480 ± 5 kPa when idling, in neutral and with the engine at operating temperature. The pressure falls with the ignition off.

FUEL PUMP (FP), WORKLOAD (%)

Measurement range 0 -100 %.

Operating range 10 - 85 %. Normal value 50 % (±10 %).

The value indicates the signal transmitted from the engine control module (ECM) to the fuel pump (FP) control module.

EVAP VALVE (%)

Measurement range 0 -100 %.

The value indicates the pulse width modulated (PWM) signal transmitted from the engine control module (ECM) to the evaporative emissions system (EVAP) valve.

0 % corresponds to closed valve, i. e. when there is no purging.

EVAPORATIVE EMISSIONS SYSTEM (EVAP) FLOW (G/S)

Measurement range 0 - 0.85 g/s.

The value indicates the estimated flow through the evaporative emission system (EVAP) valve. Used as an input parameter during compensation for other parts of the system.

Normal value at idle is 0 g/s when there is no purging and 0.85g/s during purging.

IGNITION ADVANCE (CA)

Measurement range -20 to +62 CA BTDC.

Normal value when idling varies depending on the engine coolant temperature (ECT) etc.

VEHICLE SPEED (KM/H)

Measurement range 0 - 255 km/h.

The value displays the vehicle speed.

HINT: Miles per hour in certain markets.

ENGINE SPEED (RPM)

Measurement range 0-10400 RPM.

The engine control module (ECM) derives the engine speed (RPM) from the engine speed (RPM) sensor signal.

Idling speed varies depending on engine temperature. Normal value 650 ± 50 RPM with engine at operating temperature.

BRAKE PEDAL POSITION (VIA CAN) (%)

Measurement range 0 -100 %.

The value indicates the position of the brake pedal, calculated from the signal transmitted from the brake control module (BCM).

When the brake pedal is not depressed the value is 0%. The value increases as the pedal is depressed.

ANALOG ACCELERATOR PEDAL (AP) (%)

Measurement range 0 -100 %.

Analog signal from the accelerator pedal (AP) position sensor to the engine control module (ECM).

The value indicates the accelerator pedal (AP) position.

Approximately 8 %= the accelerator pedal (AP) completely released.

Approximately 88 %= the accelerator pedal (AP) completely depressed.

The analog signal is usually used by the engine control module (ECM).

HINT: The value must follow the parameter "Accelerator pedal (AP), PWM".

ACCELERATOR PEDAL POSITION, PWM (%)

Measurement range 0 -100 %.

PWM signal from the accelerator pedal (AP) position sensor to the engine control module (ECM).

The value indicates the accelerator pedal (AP) position.

Approximately 8 %= the accelerator pedal (AP) completely released.

Approximately 88 %= the accelerator pedal (AP) completely depressed.

The PWM signal is used if there is a fault with the analog signal.

HINT: The value must follow the parameter "Accelerator pedal (AP), analog".

THROTTLE ANGLE, DESIRED VALUE (%)

Measurement range 0 -100 %.

The value indicates the signal transmitted to the throttle unit from the engine control module (ECM).

0 % = throttle shut.

100 % = throttle fully open. This corresponds to an opening angle of approximately 84 degrees.

THROTTLE ANGLE (%)

Measurement range 0 -100 %.

The engine control module (ECM) calculates the value from potentiometer 1 for the throttle position (TP) sensor. The value indicates the throttle opening. If a fault is detected in the throttle position (TP) sensor, potentiometer 1 by the engine control module (ECM), the value from the throttle position (TP) sensor, potentiometer 2 will be used to represent the throttle angle. This presumes that the function of throttle position (TP) sensor, potentiometer 2 is OK.

0 % = throttle shut.

100 % = throttle fully open. This corresponds to an opening angle of approximately 84 degrees.

HINT: Must follow the parameter "Throttle angle, desired value".

THROTTLE POSITION, CIRCUIT 1 (%)

Measurement range -3 to +130 %.

Normal value 0 - 100 %.

There is an electrical fault if the displayed value is outside the measurement range. The value must increase with increased throttle angle.

Approximately 0 % = throttle closed.

Approximately 100 % = wide open throttle (WOT). This corresponds to an opening angle of approximately 84 degrees.

THROTTLE POSITION, CIRCUIT 2 (%)

Measurement range -4 to +140 %.

Normal value 0 - 100 %.

There is an electrical fault if the displayed value is outside the measurement range. The value must increase with increased throttle angle.

Approximately 0 % = throttle closed.

Approximately 100 % = wide open throttle (WOT). This corresponds to an opening angle of approximately 84 degrees.

REAR HEATED OXYGEN SENSOR (HO2S), SIGNAL BANK X (V)

Measurement range 0-5 V.

The signal from the rear heated oxygen sensor (HO2S) to the engine control module (ECM).

Normal value when the engine is running at even load is approximately 0.6 V.

FRONT HEATED OXYGEN SENSOR (HO2S), SIGNAL BANK X

Measurement range 0 - 2.

Normal value is lambda=1.

At rich mixture is lambda < 1.

At lean mixture is lambda>1.

LONG-TERM FUEL TRIM, BANK X

The parameter displays the adaptation factor of the lambda probe.

Measurement range 0 - 2.

Compensates/multiplies the injection period at the relevant load so that the lambda value can be correctly reached.

Normal value 1.

There are 36 adaptation windows per bank. Which window is active depends on the load and the engine speed. Operates together with "Short-term fuel trim, bank x".

SHORT-TERM FUEL TRIM, BANK X

The parameter displays the compensation factor of the lambda probe.

Measurement range 0 - 2.

lambda value compensation increases or reduces the injection period depending on the deviation.

Normal value 1.

Operates together with "Long-term fuel trim, bank x".

ENGINE COOLING FAN (FC) (%)

Measurement range 0 -100%

Engine control module (ECM) PWM signal to the engine cooling fan (FC) control module to activate the engine cooling fan (FC).

RESET VALVE CAMSHAFT, INLET BANK X/ EXHAUST BANK X (CA)

Measurement range 0 -100 %.

The signal transmitted by the engine control module (ECM) to control the camshaft reset valve.

The value indicates the average current for the PWM signal through the camshaft reset valve for controlling the camshaft shift angle (angle position).

The normal value when the camshaft is deployed and in the fixed position is 400 - 900 mA. The value increases/decreases depending on control of the camshaft.

CAMSHAFT SHIFT ANGLE -INLET BANK X/ -EXHAUST BANK X (CA)

The engine control module (ECM) calculates the value using the signals from the engine speed (RPM) sensor (crankshaft position) and the camshaft position (CMP) sensor (camshaft position).

The value indicates how much the camshaft is deployed. When the camshaft is in its 0-position (camshaft not deployed), the angle is 0 CA. When the camshaft is fully deployed, the angle is 45 CA.

Normal value at idle, engine at operating temperature, approximately 0 CA.

CA = Crank Angle. (crankshaft degrees)

HINT: The value must follow the parameter "Camshaft shift angle, inlet/exhaust, desired value".

CAMSHAFT SHIFT ANGLE -INLET/ -EXHAUST, DESIRED VALUE (CA)

The value indicates the engine control module (ECM) target value for "Camshaft shift angle -inlet bank x/ -exhaust bank x".

CAMSHAFT ADAPTION -INLET BANK X/ -EXHAUST BANK X (CA)

The value indicates the camshaft deviation from the basic setting by calculating the position of the camshaft in relation to the reference positions from the crankshaft.

The value is 0° when the camshaft position (angle) corresponds to the crankshaft position (angle).

The normal value is

- inlet camshaft: 75° CA (+/-8° CA)

- exhaust camshaft: 120° CA (+/-8° CA)

The value is updated following adaptation of the camshaft position. The adaptation is carried out when the camshaft control is not active (fully returned camshaft).

MISFIRE COUNTER EMISSIONS IMPACT / CATALYTIC CONVERTER DAMAGE, TOTAL

The value indicates the number of misfires for all cylinders during the present operating cycle.

The value is reset with ignition off.

Normal value is 0 (= no misfire).

MISFIRE COUNTER, AVERAGE

The engine control module (ECM) calculates the average number of misfires in 10 operating cycles, all cylinders.

The value is affected by misfires which affect emissions and cause catalytic converter damage.

The value is reset when erasing diagnostic trouble codes.

Normal value is 0 (= no misfire).

MISFIRE COUNTER CYLINDER X, AVERAGE

The engine control module (ECM) calculates the average number of misfires in 10 operating cycles, each cylinder.

The value is affected by misfires which affect emissions and cause catalytic converter damage.

The value is reset when erasing diagnostic trouble codes.

Normal value is 0.

OIL LEVEL SENSOR

Measurement range 0-100 %.

The value indicates the pulse ratio from the pulse width modulation signal generated by the oil level sensor sent to the engine control module.

The value must be between 17-83% depending on the oil level.

PARAMETER, STATUS

POSITION GEAR SELECTOR

Only vehicles equipped with an automatic transmission.

The engine control module calculates the status of the signal from the directly connected cable from the transmission control module.

P/N engaged = gear selector position is in "; "; or "; .

P/N disengaged = gear selector position is not in "; "; or "; .

POSITION GEAR SELECTOR

Only vehicles equipped with an automatic transmission.

the engine control module calculates the status of the signal from the transmission control module via CAN.

P/N engaged = gear selector position is in "; "; or "; .

P/N disengaged = gear selector position is not in "; "; or "; .

IGNITION SWITCH (VIA CAN)

The engine control module calculates the status of the signal from the central electronic module via CAN communication.

STARTER RELAY

The status indicates if the engine control module requested activation of the starter relay.

Active = Engine control module activates starter relay.

Not active = Engine control module does not activate starter relay.

IMMOBILIZER, START PERMITTED

YES = Immobilizer permits start.

No = Immobilizer does not permit start.

CRUISE CONTROL,

Activated = depressed on the keypad of cruise control.

Not activated = not depressed on the keypad of cruise control.

CRUISE CONTROL,

Activated = depressed on the keypad of cruise control.

Not activated = not depressed on the keypad of cruise control.

CRUISE CONTROL,

Activated = depressed on the keypad of cruise control.

Not activated = not depressed on the keypad of cruise control.

CRUISE CONTROL,

Activated = depressed on the keypad of cruise control.

Not activated = not depressed on the keypad of cruise control.

CRUISE CONTROL,

Activated = depressed on the keypad of cruise control.

Not activated = not depressed on the keypad of cruise control.

STOP LAMP SWITCH

The engine control module (ECM) calculates the value from the stop lamp switch signal.

Activated = stop lamp switch affected.

Not activated = brake light switch not actuated.

DESCRIPTION OF PARAMETERS, QUICK TEST OF THE FUEL TANK SYSTEM

CONDITIONS

ECU POWER SUPPLY (V)

The value indicates the voltage supply from the system relay to the engine control module (ECM).

ATMOSPHERIC PRESSURE (PA)

The value indicates the ambient pressure. The Engine control module (ECM) receives a signal from the atmospheric pressure sensor.

HINT: The sensor is integrated in the Engine control module (ECM).

FUEL LEVEL (L)

The value shows the fuel level in the tank. The Engine control module (ECM) receives a signal from fuel level sensor.

HINT: The sensor is connected to the Central electronic module (CEM) and information is sent to the Engine control module (ECM) via CAN.

AMBIENT TEMPERATURE (°C)

The value indicates the ambient temperature. The Engine control module (ECM) receives a signal from the outside temperature sensor.

HINT: The sensor is connected to the Central electronic module (CEM) and information is sent to the Engine control module (ECM) via CAN.

TEST STATUS

FUEL TANK SYSTEM QUICK TEST

Shows the current status of the quick test (In progress/Not in progress)

TEST PHASE

Shows the current phase of the leak diagnosis. For more information, see "Test phases, quick test tank system".

FUEL TANK PRESSURE (PA)

The value indicates the calculated tank pressure. The Engine control module (ECM) calculates the average pressure with the help of the measured power consumption on the leak diagnostic unit's pump. The pressure will

rise from 0 Pa to approx. 4500 Pa during the test.

HINT: The calculated pressure can differ from the measured pressure by ±15 %. This is normal.

TEST RESULT

DMTL, TEST RESULT

Shows the test result on the leak diagnostic unit (DMTL).

If "Fault found" is shown, the Engine control module (ECM) has generated a diagnostic trouble code (DTC) for the fault. Fault tracing should be started/continued.

TANK SYSTEM, TEST RESULT

Shows the test result for the fuel tank system.

If "Minor leak found" or "Major leak found" is shown the Engine control module (ECM) has generated a diagnostic trouble code (DTC) for the fault. Fault tracing should be started/continued.

ESTIMATED LEAK (MM)

The value shows the diameter of the leak. The Engine control module (ECM) calculates the diameter with the help of measurements made during testing.

HINT: The parameter should be used to get an understanding of how close to the diagnostic trouble code limit the system is. If the estimated size of the leak is very close to the diagnostic trouble code limit, fault tracing should probably be carried out despite the test result for the tank system showing "No leakage found", especially if the diagnostic trouble code (DTC) for leakage was initially generated.

DESCRIPTION OF READING OFF EXTENDED DIAGNOSTIC TROUBLE CODE INFORMATION

CONTENTS

Select type of description.

- see **DESCRIPTION OF STATUS IDENTIFIER**
- see **DESCRIPTION OF COUNTER**
- see **DESCRIPTION OF FROZEN VALUES**

TEST PHASES, QUICK TEST FUEL TANK SYSTEM

REFERENCE

Reference phase for leakage, and operating check of the leak diagnostic unit (DMTL), is in progress.

If no fault is detected during this phase, the check for major leakage starts.

If a fault is detected during this phase the test is stopped and the parameter "DMTL, test status" shows "Fault Found". The diagnostic trouble code (DTC) for the detect fault is stored in the Engine control module (ECM).

MAJOR LEAK

Investigation of the fuel tank system in progress.

If no fault is detected during this phase, the check for minor leakage starts.

If leakage is detected during this phase the test is stopped and the parameter "Tank system test result" shows "Major leak found". The diagnostic trouble code (DTC) is stored in the Engine control module (ECM).

MINOR LEAK

Investigation of the fuel tank system in progress.

If leakage is detected during this phase the test is stopped and the parameter "Tank system test result" shows "Minor leak found". The diagnostic trouble code (DTC) is stored in the Engine control module (ECM).

NOT IN PROGRESS

Leakage diagnosis not in progress. Quick-test tank system has not started, has been finished, or has been blocked.

CHECK FOR AIR LEAKS IN THE INTAKE SYSTEM (B5254T2; B6294T; 2003-2004)

CHECKING FOR AIR LEAKAGE IN THE INTAKE SYSTEM

CHECKING FOR AIR LEAKAGE

Fig. 1: Checking For Air Leakage
Courtesy of VOLVO CARS CORPORATION

Carry out check for air leakage according to **CHECK FOR AIR LEAKS IN THE INTAKE SYSTEM** .

CHECKING CAMSHAFT ADJUSTMENT (B5254T2; B6294T; 2003-2004)

CHECKING CAMSHAFT ADJUSTMENT

REMOVING COMPONENTS

Fig. 2: Identifying Underhood Components
Courtesy of VOLVO CARS CORPORATION

Remove:

- battery negative terminal.
- plastic hoses turbocharger (TC)/charge air cooler (CAC) and air cleaner (ACL)/turbocharger (TC)

  Remove the clamp to intake manifold at turbocharger (TC) 1, 2, 3 and turn the pipe upper section to the firewall.

  (Only B6284 T)

- plastic pipe over engine.

  (Only B52X4 T)

- cross member.
- right front wheel.
- plastic nuts for cover in fender liner.
- camshaft position sensor (CMP) housing and trigger wheel.
- camshaft rear edge cover.
- upper camshaft belt cover.

Lift up servo reservoir, place over engine.

NOTE: Ensure that the oil does not run out of the ventilation hole in the filler cap.

Remove:

- hose between expansion tank and water cooler by the reservoir. Seal the hose with lock grip pliers.
- auxiliaries belt.

- front camshaft belt cover.
- **Continue**

  Refer to **POSITION THE ENGINE ACCORDING TO MARKING**

POSITION THE ENGINE ACCORDING TO MARKING

Fig. 3: Identifying Crankshaft And Camshaft Alignment Marks
Courtesy of VOLVO CARS CORPORATION

Place upper camshaft belt cover.

Turn crankshaft clockwise until the markings on the crankshaft and camshaft pulleys correspond.

Turn crankshaft a further 1/4 turn clockwise and then back again until the markings correspond.

Remove:

- upper camshaft belt cover.
- **Continue**

Refer to **INSTALLING CRANKSHAFT ADJUSTMENT TOOL**

INSTALLING CRANKSHAFT ADJUSTMENT TOOL

Fig. 4: Identifying Adjustment Special Tool 999 5451
Courtesy of VOLVO CARS CORPORATION

Remove:

- starter motor mounting screws.

Pull out the starter motor and put to one side.

Remove:

- blind cover plug for hole for adjustment tool.

Turn the crankshaft slightly clockwise. Install camshaft adjustment tool see **9995451** , ensure that it bottoms against the cylinder block.

Turn the crankshaft back counter-clockwise until it stops against the adjustment tool.

Check that the marking on the crankshaft timing gear pulley corresponds with the marking on the oil pump.

Select the appropriate engine variant:

1. B6304 S

   Refer to **INSTALLING CAMSHAFT ADJUSTMENT TOOL, B6304 S**

2. B52X4 T and B6284 T

   Refer to **INSTALLING CAMSHAFT ADJUSTMENT TOOL, B52X4 T AND B6284 T**

3. B52X4 S

   Refer to **INSTALLING CAMSHAFT ADJUSTMENT TOOL, B52X4 S**

INSTALLING CAMSHAFT ADJUSTMENT TOOL, B6304 S

Fig. 5: Identifying Camshaft Adjustment Tool 9995452 Installed
Courtesy of VOLVO CARS CORPORATION

Install:

- camshaft adjustment tool see **9995452** at the rear edge of the camshafts.

Screw the section onto the intake side camshaft first.

Turn the intake side camshaft carefully clockwise with the camshaft adjustment tool until the exhaust side camshaft adjustment section can be held in place.

The tool sections should be parallel.

Are the tool sections parallel?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **ADJUSTING THE CAMSHAFT ADJUSTMENT LIGHT SWITCH**

INSTALLING CAMSHAFT ADJUSTMENT TOOL, B52X4 T AND B6284 T

Fig. 6: Identifying Camshaft Adjustment Tool 9995452 Installed
Courtesy of VOLVO CARS CORPORATION

Install:

- camshaft adjustment tool see **9995452** at the rear edge of the camshafts.

Screw the section onto the exhaust side camshaft first.

Turn the exhaust side camshaft carefully clockwise with the camshaft adjustment tool until the intake side camshaft adjustment section can be held in place.

The tool sections should be parallel.

Are the tool sections parallel?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **ADJUSTING THE CAMSHAFT ADJUSTMENT LIGHT SWITCH**

INSTALLING CAMSHAFT ADJUSTMENT TOOL, B52X4 S

Fig. 7: Identifying Camshaft Adjustment Tool 9995452 Installed
Courtesy of VOLVO CARS CORPORATION

Screw the adjuster sections together to one section.

Hold camshaft adjustment tool see **9995452** at the rear edge of the camshafts.

Are the tool sections parallel?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **ADJUSTING THE CAMSHAFT ADJUSTMENT LIGHT SWITCH**

ADJUSTING THE CAMSHAFT ADJUSTMENT LIGHT SWITCH

For camshaft adjustment, see **REPLACING THE CAMSHAFT SEALS / VARIABLE VALVE TIMING (VVT) UNIT**

REPLACING THE CAMSHAFT SEALS / VARIABLE VALVE TIMING (VVT) UNIT

Special tools:

see **9512050**

see **9995450**

see **9995451**

see **9995452**

see **9995651**

see **9995718**

see **9995719**

see **9995919**

NOTE: **As the illustrations in the information are used for different model years and / or models, certain variations may occur. However, the essential information in the illustrations is always correct.**

REMOVING THE CAMSHAFT SEAL

Fig. 8: Identifying Underhood Components
Courtesy of VOLVO CARS CORPORATION

The abbreviation VVT stands for:

Variable

Valve

Timing.

NOTE: **Crankshaft or camshafts must not, under any circumstances , be rotated more than is listed below. Failure to follow these instructions may cause damage to the valves.**

Remove:

- the cable from the battery negative terminal. See **BATTERY, DISCONNECTING** .
- the charge air pipe over the engine.

Seal the openings.

- the upper camshaft belt cover.
- the cover over the ignition coils.
- lift the solenoid valves away from the air cleaner (ACL) cover.
- the air intake hose for the turbocharger (TC) from the air cleaner (ACL) cover.

Put to one side.

- the upper torque rod bracket.
- the camshaft position (CMP) sensor housing.
- the trigger wheel.
- the rear cover for the intake camshaft.
- the servo reservoir and the expansion tank.

Lift up and place on top of the engine.

NOTE: **Take care not to spill servo oil from the bleed hole in the cap.**

Place paper wipe around the reservoir and then cover with a plastic bag as protection.

Spilled servo oil is highly inflammable.

- 3 nuts for the cable duct at the right suspension turret.

Lift the duct away from the screws.

- the auxiliaries belt.
- the front camshaft belt cover.

POSITION THE ENGINE ACCORDING TO THE MARKING

Fig. 9: Identifying Crankshaft And Camshafts Markings
Courtesy of VOLVO CARS CORPORATION

Raise the car.

Remove:

- the right front wheel.
- the nuts for the cover in the fender liner.

Install the upper camshaft belt cover.

Turn the crankshaft clockwise until the markings on the crankshaft and camshaft pulley correspond.

Turn the crankshaft a further 1/4 of a turn clockwise, then back counter-clockwise until the markings correspond.

The markings are shown in the illustration.

Remove the upper camshaft belt cover.

REMOVING THE CAMSHAFT BELT

Fig. 10: Identifying Belt Tensioner
Courtesy of VOLVO CARS CORPORATION

Slacken off the belt tensioner.

Slacken off the belt tensioner center screw slightly.

Hold the center screw still and turn the tensioner eccentric clockwise with a 6 mm (15/64") Allen key to "10 o'clock".

Remove the camshaft belt from the belt tensioner, camshaft pulley and idler pulley.

REMOVING THE TIMING GEAR PULLEY WITH THE VARIABLE VALVE TIMING (VVT) UNIT

Fig. 11: Identifying Camshaft Adjustment Tool 9995452 Installed
Courtesy of VOLVO CARS CORPORATION

Use camshaft adjustment tool:

- Install camshaft adjustment tool see **9995452** at the rear edge of the camshafts.

First screw in the part of the tool intended for the exhaust camshaft.

INSTALL THE ADJUSTMENT TOOLS

Fig. 12: Identifying Camshaft Adjustment Tool 9995452 Installed
Courtesy of VOLVO CARS CORPORATION

Screw the camshaft adjustment tools together

- Carefully turn the exhaust camshaft clockwise with the camshaft adjustment tool until the intake camshaft tool can be applied.
- Screw the camshaft adjustment tools together as shown in the illustration.

REMOVE THE TIMING GEAR PULLEY

Fig. 13: Identifying Timing Gear Pulley, Center Screw And Plug
Courtesy of VOLVO CARS CORPORATION

Remove

- **Exhaust camshaft pulley:**

- The plug at the front edge of the variable valve timing (VVT) unit (TORX 55).

  The center screw from the variable valve timing (VVT) unit (TORX 55).

  Carefully pull out the timing gear pulley with the variable valve timing (VVT) unit.

Intake camshaft pulley:

Remove the screws and remove the timing gear pulley.

REPLACE THE CAMSHAFT SEAL

Fig. 14: Identifying Front Camshaft Seal And Special Tool 999 5651
Courtesy of VOLVO CARS CORPORATION

Replacing the camshaft seal:

- Carefully press in tool see **9995651** between the sealing ring and the camshaft.

  Carefully pry out the seals.

Fig. 15: Identifying Camshaft Special Tools 99 5718 And 999 5719
Courtesy of VOLVO CARS CORPORATION

Install a new seal:

- Grease the new seal.
- Install the new seal for the intake camshaft using drift see **9995719** .
- Install the new seal for the exhaust camshaft using drift see **9995718** .

REMOVE THE ENGINE COOLING FAN (FC)

Fig. 16: Identifying Air Intake Hose And Connector Disconnected
Courtesy of VOLVO CARS CORPORATION

Remove:

- detach the brake vacuum hose from the intake.
- the air duct for the control module box and the air cleaner (ACL) air intake hose.
- the connectors, relays and canister purge (CP) valve from the fan shroud.

  Place the wiring to one side.

- the screws for the fan shroud and the relay holder mounting.

Lift up the relay holder and remove the upper hose between the charge air cooler and the intake.

Seal the openings.

Slacken off the screw clip on the throttle body (TB) (electronic throttle module) so that the charge air pipe can be pressed backwards.

Press the charge air pipe backward and lift up the engine cooling fan (FC) with its cover.

As shown in the illustration.

SECURE THE CRANKSHAFT POSITION

Fig. 17: Identifying Adjustment Special Tool 999 5451
Courtesy of VOLVO CARS CORPORATION

Install the adjustment tool.

Pull the charge air pipe forward

Remove the 3 starter motor screws for the starter motor mounting.

Place the starter motor to one side.

Remove the blind cover plug and the sealing washer.

Turn the crankshaft clockwise slightly to avoid the camshaft adjustment tool being in the wrong position.

Install camshaft adjustment tool: see **9995451** .

Ensure that the camshaft adjustment tool reaches down to the cylinder block.

Turn the crankshaft back counter-clockwise until it stops against the drift.

Check that the marking on the crankshaft timing gear pulley corresponds with the marking on the oil pump.

REINSTALL

Fig. 18: Identifying Markings On Crankshaft Belt Pulley, Timing Belt Pulley, Oil Pump, And Upper Timing Belt Cover
Courtesy of VOLVO CARS CORPORATION

Install the variable valve timing (VVT) unit with the toothed belt pulley:

Slacken off, but do not remove, the screws which secure the timing gear pulley to the variable valve timing (VVT) unit.

Press the timing gear pulley and variable valve timing (VVT) unit on to the camshaft.

Install the center screw which secures the variable valve timing (VVT) unit to the camshaft.

NOTE: Do not tighten yet.

Install the upper camshaft belt cover.

Turn the timing gear pulley clockwise until the screws at the oval holes are in the limit position.

Continue turning clockwise until the timing gear pulley marking is 1 cog before the marking on the upper timing cover.

Fig. 19: Identifying Timing Gear Pulley, Center Screw And Plug
Courtesy of VOLVO CARS CORPORATION

Check that the timing gear pulley is still in the limit position in the oval holes.

Tighten the center screw in the variable valve timing (VVT) unit to **120 Nm (88 lb. ft)** .

Check that the variable valve timing (VVT) unit does not rotate when tightening.

Install the center plug. Tighten to **35 Nm (26 lb. ft)** .

Install the timing gear pulley on the intake camshaft:

Install the timing gear pulley on the intake camshaft with two screws, but **do not tighten** .

Check that the markings on the timing gear pulley and the upper timing cover correspond.

INSTALLING THE TIMING BELT

Fig. 20: Reinstalling Timing Belt
Courtesy of VOLVO CARS CORPORATION

Install the timing belt:

Tighten the center screw on the camshaft belt tensioner to **5 Nm (4 lb. ft)** .

Turn the variable valve timing (VVT) unit clockwise until stop.

Hold the variable valve timing (VVT) unit secure at the clockwise limit position when the belt is being installed.

As shown in the illustration.

Install the belt in the following order:

- Install the camshaft belt over the pulley on the crankshaft.

Then install the belt as follows

- 1. Idler pulley.
- 2. Intake cam pulley.
- 3. Exhaust cam pulley.
- 4. Water pump.
- 5. Belt tensioner.

NOTE: **Adjust the timing gear pulleys so that the screws are not at a limit position in the oval holes.**

TIGHTEN THE TIMING BELT

Fig. 21: Identifying Needle Position At Varying Temperatures
Courtesy of VOLVO CARS CORPORATION

Adjust the belt tensioner:

NOTE: **This adjustment is to be made with a cold engine.**

A suitable temperature is 20°C/68°F.

At a higher temperature, for example with a warm engine or a higher ambient temperature, the needle is further to the right.

The illustration shows the needle position when adjusting the camshaft belt tensioner at different engine temperatures.

Fig. 22: Identifying Belt Between Intake Camshaft Pulley, Idler Pulley And Crankshaft
Courtesy of VOLVO CARS CORPORATION

Tighten the timing belt as follows:

Hold the belt tensioner center screw secure and turn the belt tensioner eccentric counter-clockwise until the tensioner indicator passes the marked position.

Tighten the screws on the exhaust camshaft timing gear pulley to **10 Nm (7.4 lb. ft)** .

Install the screw missing on the intake camshaft belt pulley.

Tighten the screws on the intake camshaft timing gear pulley to **20 Nm (15 lb. ft)** .

NOTE: The variable valve timing (VVT) unit must not be released from the limit position until after the timing gear pulleys have been tightened.

Then turn the eccentric back so that the needle reaches the marked position corresponding to the relevant temperature.

Remember to hold the center screw secure at the same time.

At 20°C the needle must be centered in the window.

See the illustration above.

Hold the eccentric secure and tighten the center screw to **20 Nm (15 lb. ft)** .

Check that the indicator is in the correct position.

As shown in the illustration.

If the indicator is not in the correct position, a new alignment must be carried out.

Remove:

- the camshaft adjustment tools.
- the crankshaft stopper.

  Install the plug with a new sealing washer.

  Tighten to **40 Nm (29 lb. ft)** .

CHECKING THE MARKINGS AND BELT TENSION

Fig. 23: Pressing Belt To Check That Indicator On Tensioner Moves Easily
Courtesy of VOLVO CARS CORPORATION

Check:

- Press the belt to check that the indicator on the tensioner moves easily.
- Install the upper timing belt cover.
- Turn the crankshaft two turns and check that the markings on the crankshaft and camshaft pulley correspond.
- Check that the indicator on the belt tensioner is within the marked area.

REINSTALL

Fig. 24: Identifying Underhood Components
Courtesy of VOLVO CARS CORPORATION

Install:

- the front camshaft belt cover.

  Tighten to **12 Nm (8.8 ft. lb)** .

- the upper camshaft belt cover.

  Tighten to **8 Nm (6 lb. ft)** .

- the auxiliaries belt.
- the cable duct. 3 nuts.
- the expansion tank.
- the servo reservoir.

  Wipe clean.

  Check the level and top up as necessary.

  NOTE: Check that the hoses are correctly positioned.

- the starter motor.

  Tighten the screws at the transmission to **40 Nm (29 lb. ft)** .

  Tighten the support bracket screw to **25 Nm (18 lb. ft)**

- the engine cooling fan (FC).
- the hose between the charge air cooler and the intake.

  Remove the seals.

  Tighten the clamp on the charge air pipe at the throttle body (TB).

- screw the relay bracket and the fan shroud into place.
- the canister purge (CP) valve, relays and connectors.
- the air ducts.
- the brake vacuum hose.
- the trigger wheel.

  Tighten to **17 Nm (12 lb. ft)** .

- the camshaft position (CMP) sensor housing and a new cover.

  Tighten the screws.

- the torque rod bracket.

  Tighten to **50 Nm (37 lb. ft)** .

- the upper torque rod.

  Tighten to **35 Nm (26 lb. ft)** . Angle-tighten **90 degrees** .

- the cover over the ignition coils.

  Tighten to **8 Nm (6 lb. ft)** .

- the charge air pipe over the engine.

  Remove the seals.

- the air cleaner (ACL) cover and the intake air hose.
- the solenoid valves on the air cleaner (ACL) cover.
- the cable to the battery negative terminal. See **BATTERY, DISCONNECTING** .
- The cover in the fender liner.

- The front wheel.

CHECKING WORK

Check the engine function by test driving the car.

Wipe clean and check the engine compartment.

Wipe the steering wheel and the gear selector lever.

REPLACING THE REAR SEAL

Fig. 25: Identifying Underhood Components
Courtesy of VOLVO CARS CORPORATION

The following components must be removed when replacing the rear seal:

- the solenoid valves.

  Lift out from the air cleaner (ACL) cover.

- the air hose from the air cleaner (ACL) to the turbocharger (TC). Place to one side.

  Seal the hose.

- place the air cleaner (ACL) cover to one side.
- the charge air pipe over the engine.

  Seal the openings.

- the cover over the ignition coils.
- the upper torque rod bracket.
- the camshaft position (CMP) sensor housing.

- the trigger wheel.

REPLACING THE REAR CAMSHAFT SEAL

Fig. 26: Identifying Special Tool Extractor 999 5919
Courtesy of VOLVO CARS CORPORATION

Remove and replace the seal:

Carefully pull out the old seal.

Use extractor see **9995919** .

REPLACING THE REAR CAMSHAFT SEAL

Fig. 27: Identifying Drift
Courtesy of VOLVO CARS CORPORATION

Install new seals:

Grease and install the new seal.

Use drift see **9995450** .

NOTE: **The seal is normally pressed in so that it is level with the internal beveled edge.**

If the shaft journal is showing signs of wear, the seal can be pressed in 2 mm (0.079 in) deeper by turning the drift socket.

REINSTALL

Fig. 28: Identifying Underhood Components
Courtesy of VOLVO CARS CORPORATION

Install:

- the trigger wheel.

  Tighten to **17 Nm (12 lb. ft)** .

- the camshaft position (CMP) sensor housing and a new cover.

  Tighten to **10 Nm (7.4 lb. ft)** .

- the torque rod bracket.

  Tighten to **50 Nm (37 lb. ft)** .

- the upper torque rod.

  Tighten to **35 Nm (26 lb. ft)** . Angle-tighten **90 degrees** .

  Use bevel protractor: see **9512050**

- the cover over the ignition coils.

  Tighten to **8 Nm (6 lb. ft)** .

- the charge air pipe over the engine.

  Remove the seals.

- the air cleaner (ACL) cover and the intake air hose.
- the solenoid valves on the air cleaner (ACL) cover.
- connect the battery negative terminal. See **BATTERY, DISCONNECTING** .

Check the engine compartment and wipe it clean.

CHECKING THE ENGINE

Check the engine function by test driving the car.

Wipe the steering wheel and gear selector lever clean.

CHECKING COMPRESSION (B5254T2; B6294T; 2003-2004)

CHECKING COMPRESSION

CHECKING COMPRESSION

Fig. 29: Identifying Compression Testing
Courtesy of VOLVO CARS CORPORATION

Carry out a compression test according to **COMPRESSION TEST** .

CHECKING ENGINE COOLANT TEMPERATURE (ECT) SENSOR (B5254T2; B6294T; 2003-2004)

CHECKING THE ENGINE COOLANT TEMPERATURE (ECT) SENSOR

CHECKING THE ENGINE COOLANT TEMPERATURE (ECT) SENSOR

- Check that engine coolant temperature (ECT) sensor displays a temperature within its permitted range compared to the temperature which the engine is determined to have

  HINT: The comparison should be made both with the engine cold and with the engine at operating temperature. Or at the temperature where the problem occurs.

  HINT: Check the engine coolant temperature (ECT) sensor. Check for contact resistance and oxidation.

  Other information:

- For resistance values, see **COMPONENT SPECIFICATIONS**
- For information about signals on 5 cylinder engines, see **SIGNAL DESCRIPTION**
- For information about signals on 6 cylinder engines, see **SIGNAL SPECIFICATION**
- To access or replace the engine coolant temperature (ECT) sensor, see **ENGINE COOLANT TEMPERATURE (ECT) SENSOR, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Remedy as necessary.

CHECKING ENGINE SPEED (RPM) SENSOR INTERFERENCE (B5254T2; B6294T; 2003-2004)

CHECKING ENGINE SPEED (RPM) SENSOR INTERFERENCE

CHECKING ENGINE SPEED (RPM) SENSOR INTERFERENCE

Fig. 31: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

The engine speed (RPM) sensor is sensitive to interference from surrounding power cables, for example the starter motor cable, or similar cables with high amperage. This occurs when starting the engine for example.

Interference can cause difficulty in starting the engine, the engine does not start at all, the tachometer flickers at start attempts etc.

Causes of interference can be:

- surrounding power cables, for example a faulty routed starter motor cable
- incorrectly routed transmission bolted joints for the engine.

Checking the power cable

Check for incorrectly routed power cables (routed too close to the engine speed (RPM) sensor).

Checking the bolted joints

When removing and installing the transmission it is important that all the bolts for the engine are correctly tightened. Incorrectly tightened bolts can cause poor ground connection and interfere with the engine speed (RPM) sensor. Check that all the bolts from the transmission to the engine are correctly tightened.

Remedy as necessary

CHECKING FOR AIR LEAKAGE IN THE EXHAUST SYSTEM (B5254T2; B6294T; 2003-2004)

CHECKING FOR AIR LEAKAGE IN THE EXHAUST SYSTEM

CHECKING FOR AIR LEAKAGE

Fig. 32: Checking For Air Leakage In Exhaust System
Courtesy of VOLVO CARS CORPORATION

Carry out check for air leakage according to **CHECKING FOR AIR LEAKAGE IN THE EXHAUST SYSTEM** .

CHECKING FUEL AND RESIDUAL PRESSURES (B5254T2; 2003-2007)

CHECKING THE FUEL PRESSURE AND RESIDUAL PRESSURE IN THE WORKSHOP (2005-2007)

CHOOSING A METHOD FOR TAKING A READING

NOTE: For vehicles with demand activated fuel pumps (FP), perform Quick test of fuel pump (FP) using VIDA (Volvo scan tool).

The fuel pressure can be measured with the car stationary or while being driven. Residual pressure is measured with the car stationary.

When the car is being driven, see **TAKING FUEL PRESSURE READINGS WHILE DRIVING THE CAR** .

- **Continue**

  Refer to **MEASURING THE LINE PRESSURE**

MEASURING THE LINE PRESSURE

- Connect the pressure gauge according to **CONNECTING FUEL PRESSURE GAUGE**
- Remove the soundproofing panel
- Remove the fuel pump (FP) relay (CMI 12 in the passenger compartment)
- Connect a cable to the relay base as shown in the illustration.

  Read off the line pressure from the pressure gauge. The line pressure must be 375-395 kPa

  Check the residual pressure if the fuel pressure is OK.

  Remedy as necessary

  Other information

  - For the location of and to replace the fuel pump (FP) relay, For -2004, see **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** or For 2005-, see **CENTRAL ELECTRONIC MODULE (CEM), REPLACING**
  - For the location of and to replace the fuel pump (FP), see **RIGHT SIDE FUEL PUMP WITH LEVEL SENSOR**
  - see **REPLACING THE FUEL FILTER**
  - To disconnect the pressure gauge, see **DISCONNECTING FUEL PRESSURE GAUGE** .

Fig. 33: Identifying Pressure Gauge
Courtesy of VOLVO CARS CORPORATION

Is the rest pressure to be checked?

- **YES**

  Refer to **CHECKING THE RESIDUAL PRESSURE**

- **NO**

  OKAY: Troubleshooting has been completed.

CHECKING THE RESIDUAL PRESSURE

- Switch off the ignition
- Disconnect the cable between the terminals on the relay base
- Reinstall the fuel pump (FP) relay.

  The line pressure must not fall below 200 kPa within 20 minutes of the fuel pump (FP) being shut-off.

  Remedy as necessary

Other information

- see **INJECTOR/PULSE DAMPER, REPLACEMENT**
- For the location of and to replace the fuel pump (FP) relay, For -2004, see **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** or For 2005-, see **CENTRAL ELECTRONIC MODULE (CEM), REPLACING**
- For the location of and to replace the fuel pump (FP), see **RIGHT SIDE FUEL PUMP WITH LEVEL SENSOR**
- To disconnect the pressure gauge, see **DISCONNECTING FUEL PRESSURE GAUGE** .

Fig. 34: Identifying Pressure Gauge
Courtesy of VOLVO CARS CORPORATION

CHECKING THE FUEL PRESSURE AND RESIDUAL PRESSURE IN THE WORKSHOP (2003, 2004)

CHOOSING A METHOD FOR TAKING A READING

NOTE: **For vehicles with demand activated fuel pumps (FP), perform Quick test of fuel pump (FP) using VIDA (Volvo scan tool).**

The fuel pressure can be measured with the car stationary or while being driven. Residual pressure is measured with the car stationary.

When the car is being driven, see **TAKING FUEL PRESSURE READINGS WHILE DRIVING THE CAR** .

- **Continue**

  Refer to **MEASURING THE LINE PRESSURE**

MEASURING THE LINE PRESSURE

- Connect the pressure gauge according to **CONNECTING FUEL PRESSURE GAUGE**
- Remove the soundproofing panel
- Remove the fuel pump (FP) relay (CMI 12 in the passenger compartment)
- Connect a cable to the relay base as shown in the illustration.

  Read off the line pressure from the pressure gauge. The line pressure must be 375-395 kPa

  Check the residual pressure if the fuel pressure is OK.

CHECKING IGNITION SPARK (B5254T2; B6294T; 2003-2004)

CHECKING IGNITION SPARK

CHECKING IGNITION SPARK

Fig. 39: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Do not disconnect ignition coil, let wiring remain in place.
- Install a new spark plug in the ignition coil, place it against the engine.
- Ignition on

CAUTION: Never activate an ignition coil that is installed on the engine.

Engine damage may be caused if there is a fuel in the cylinder.

Check carefully that the coil that is removed is activated.

Cylinder order is calculated from the camshaft gears.

Activate the relevant ignition coil.

Fig. 40: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 41: Identifying Spark Plug
Courtesy of VOLVO CARS CORPORATION

Is there a spark?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **REPLACING COMPONENT**

REPLACING COMPONENT

CAUTION: Avoid touching the pins in the control module and the corresponding connector on the cable harness. There is a risk of static discharge which could damage the control module. Discharge yourself and tools to be used by holding the tool's metal part and touching a body part on the car just before starting to work.

Check the connectors to the ignition coil and Engine Control Module (ECM) for damage to pins and connections as well as for oxidation and contact resistance.

Check the voltage supply cable to the ignition coil's connector #4. The voltage must be battery voltage with the ignition on (ignition position II).

Check the ground cable between the ignition coil's connector #3 and ground connection. Check the cable for open circuit and short-circuit to voltage.

If no malfunction is found:

Try a new ignition coil.

Other information

- see **REPLACING IGNITION COILS**
- see **CHECKING WIRING AND TERMINALS**

Fig. 42: Identifying Ignition Coil
Courtesy of VOLVO CARS CORPORATION

REPLACING IGNITION COILS

REMOVING IGNITION COILS

Fig. 43: Identifying Charge Air Pipe
Courtesy of VOLVO CARS CORPORATION

Remove

- the charge air pipe over the engine. Seal the openings.

Fig. 44: Identifying Ignition Coils, Connector And Mounting Screw
Courtesy of VOLVO CARS CORPORATION

- the upper timing belt cover
- the cover over the ignition coils

  Disconnect the ignition coil connector

- the mounting screw. Pull up the coil.

INSTALLING IGNITION COILS

Fig. 45: Identifying Ignition Coils, Connector And Mounting Screw
Courtesy of VOLVO CARS CORPORATION

Install the new coil.

Align the coil and press it down. Install the screw. Tighten to **10 Nm** .

Press in the connector until a clicking sound is heard.

Install the cover over the ignition coil.

Install the upper timing belt cover.

Fig. 46: Identifying Charge Air Pipe
Courtesy of VOLVO CARS CORPORATION

Remove the seals from the charge air pipe. Reinstall the charge air pipe over the engine.

CHECKING IGNITION SPARK (B6294T; 2003-2004)

CHECKING IGNITION SPARK

CHECKING IGNITION SPARK

Fig. 47: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Do not disconnect ignition coil, let wiring remain in place.
- Install a new spark plug in the ignition coil, place it against the engine.
- Ignition on

CAUTION: Never activate a ignition coil which is installed on the engine.

Engine damage may be caused if there is a fuel in the cylinder.

Check carefully that only the dismounted coil is activated.

Cylinder order is calculated from the camshaft gears.

Activate the relevant ignition coil.

Fig. 48: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 49: Identifying Spark Plug
Courtesy of VOLVO CARS CORPORATION

Is there a spark?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **REPLACING COMPONENT**

REPLACING COMPONENT

Fig. 50: Identifying Ignition Coil
Courtesy of VOLVO CARS CORPORATION

Try a new ignition coil.

Other information:

- To replace the ignition coil, see **REPLACING IGNITION COIL** .

CHECKING INJECTORS (B5254T2; B6294T; 2003-2004)

CHECKING INJECTORS

CHECKING THE SPARK PLUGS

- Remove all spark plugs, note which cylinder each spark plug was removed from.

Fig. 51: Identifying Spark Plug
Courtesy of VOLVO CARS CORPORATION

Check the color of the spark plug

Other information:

- To remove the spark plugs, see **REPLACING SPARK PLUGS** .

Is any spark plug lighter than the others?

- **YES**

  Refer to **REPLACING THE COMPONENT**

- **NO**

  OKAY: Troubleshooting has been completed.

REPLACING THE COMPONENT

Fig. 52: Identifying Injector
Courtesy of VOLVO CARS CORPORATION

Try a new injector on the relevant cylinder.

- For B5xx4T, see **INJECTOR/PULSE DAMPER, REPLACEMENT**
- For B6xx4T, see **INJECTOR / PULSATION DAMPER, REPLACING** .

CHECKING SOFTWARE (B6324S, TF-80SC; B6324S, TF-80SC AWD; 2007)

CHECKING SOFTWARE

CHECKING SOFTWARE

HINT: Stated symptom can be solved by upgrading the software in Transmission Control Module (TCM), Engine control module (ECM), and Differential Electronic Module (DEM).

NOTE: If the control modules mentioned above contain diagnostic trouble codes that may cause a similar symptom, first troubleshoot and fix these diagnostic trouble codes.

Go to the tab SOFTWARE and order an upgrade for each software.

HINT: All three control modules can be upgraded at the same time, on the condition that they do not already contain the latest software.

Make sure that the new software solved the symptom using the relevant verification procedure.

CHECKING SPARK PLUGS (B5254T2; B6294T; 2003-2004)

CHECKING SPARK PLUGS

CHECKING SPARK PLUGS

Fig. 53: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off

- Remove all spark plugs

  Check the spark plugs for cracking in the porcelain, the spark gap and for carbon and other deposits if uncertain replace the spark plugs

Fig. 54: Identifying Spark Plug
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **REPLACING COMPONENT**

- **NO**

  OKAY: Troubleshooting has been completed.

REPLACING COMPONENT

Fig. 55: Identifying Spark Plug
Courtesy of VOLVO CARS CORPORATION

Replace all spark plugs according to **REPLACING SPARK PLUGS** .

CHECKING THE AIR CONDITIONING (A/C) SYSTEM (B5254T2; B6294T; 2003-2004)

CHECKING THE AIR CONDITIONING (A/C) SYSTEM

CHECKING COMPONENTS AND WIRING

Fig. 56: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Activate the air conditioning (A/C) relay

  Check that the magnetic clutch is activated, a noise from the magnetic clutch should be clearly heard.

Fig. 57: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 58: Identifying A/C Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

Was the magnetic clutch activated?

- **YES**

  Refer to **CHECKING COMPONENT**

- **NO**

  Refer to **CHECKING THE WIRING AND THE RELAY**

CHECKING COMPONENT

Try a new air conditioning (A/C) pressure sensor.

Check the compressor and magnetic clutch if the fault is not in the air conditioning (A/C) pressure sensor.

Other information:

- For information about signals on 5-cylinder engines, see **SIGNAL DESCRIPTION** .
- For information about signals on 6-cylinder engines, see **SIGNAL SPECIFICATION** .

Fig. 59: Identifying Ohms Display
Courtesy of VOLVO CARS CORPORATION

Fig. 60: Identifying A/C Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

CHECKING THE WIRING AND THE RELAY

Check the cable between A/C relay base terminal 3 and the magnetic clutch for an open-circuit according to **OPEN-CIRCUIT, PERMANENT FAULTS**

HINT: With the ignition on and the cable connected between 1 and 3 in the A/C relay base, the magnetic clutch should be activated.

Other information:

- A/C relay base terminal 1 is supplied with power from the system relay via fuse 11B/16
- A/C relay base terminal 3 is connected to the magnetic clutch
- For information about signals on 5-cylinder engines, see **SIGNAL DESCRIPTION** .
- For information about signals on 6-cylinder engines, see **SIGNAL SPECIFICATION** .

Fig. 61: Identifying A/C Relay
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 62: Identifying Belt Routing
Courtesy of VOLVO CARS CORPORATION

Fig. 63: Identifying Connector(s) Reinstallation
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Reinstall connectors, components etc.
- Start the engine.
- Air conditioning (A/C) switch on
- Start the blower fan

Check that the pressure increases in the air conditioning (A/C) system when the air conditioning (A/C) compressor engages.

Also check if cold air blows into the passenger compartment when at the coolest setting.

NOTE: The air conditioning (A/C) pressure is given in volts for values, see

COMPONENT SPECIFICATIONS .

Fig. 64: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 65: Identifying A/C Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

Does the pressure in air conditioning (A/C) system change?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CHECKING THE ENGINE COOLING FAN (FC) AND COOLING SYSTEM (B5254T2; B6294T; 2003-2004)

CHECKING THE ENGINE COOLING FAN (FC) AND COOLING SYSTEM

CHECKING THE ENGINE COOLING FAN (FC) AND COOLING SYSTEM

Check the coolant level.

Missing coolant may be due to:

- leakage in the cooling system
- the coolant has boiled.

Leakage in the cooling system can be caused by:

- leakage in the radiator, heater unit, hoses etc.
- defective cylinder head gasket.

If the coolant has boiled it may be due to:

- a defective expansion tank cap
- defective thermostat
- a defective engine cooling fan (FC)
- a blocked radiator.

Checking the expansion tank cap

Disconnect the hose between the expansion tank and the radiator.

Pressure test the expansion tank. The pressure is given on the cap (normally 150 kPa).

Checking the thermostat

Start the engine. Allow the engine to idle. Read off the engine coolant temperature (ECT).

Check that the thermostat opens at approximately 90 °C. Hold the hose from the thermostat housing to the radiator, the hose at the radiator becomes hot when the thermostat is opened.

Remedy as necessary.

Other information:

- The cooling system boils at approximately 130 °C.

Was a fault detected?

- **YES**

OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE ENGINE COOLING FAN (FC)**

CHECKING THE ENGINE COOLING FAN (FC)

NOTE: **The electric cooling fan may have a post-running time of up to approx. 6 minutes after the engine has been shut off. The time for the electric cooling fan's post-running depends on the engine's temperature, temperature in the engine compartment as well as the pressure level in the AC system.**

Fig. 66: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.
- Activate the engine cooling fan (FC) using the VCT2000 (or appropriate scan tool).

If the electric cooling fan cannot be activated in all selectable speeds:

- There is no malfunction in the electric cooling fan.
- Check the engine temperature sensor.
- Check the AC pressure sensor.

Remedy as necessary.

Other information

- The electric cooling fan can be activated at different speeds. Possible speeds for the electric cooling fan is dependent on model year and engine.

Fig. 67: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the engine cooling fan (FC) working?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING COMPONENTS AND CONNECTIONS**

CHECKING COMPONENTS AND CONNECTIONS

Fig. 68: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- If the electric cooling fan cannot be activated in all selectable speeds:
- Check the fuse, power supply cable and ground lead for the engine cooling fan (FC).
- Check the wiring between the engine control module (ECM) and the engine cooling fan (FC) module. Check for damage.
- Check the connectors to the engine cooling fan (FC) control module and Engine Control Module (ECM). Check for damage to pins and connections.

Remedy as necessary.

Then check:

- Function of engine cooling fan.

- Ignition on.
- Activate the engine cooling fan (FC) using the VCT2000 (or appropriate scan tool).

Other information

- see **CHECKING WIRING AND TERMINALS**

Fig. 69: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the engine cooling fan (FC) working?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **IF NO MALFUNCTION HAS BEEN FOUND**

IF NO MALFUNCTION HAS BEEN FOUND

If no malfunction has been found in any of the diagnostic tests, report the result of the troubleshooting to the sales company/importer according to normal report procedure.

CHECKING THE ON-BOARD REFUELING VAPOR RECOVERY VALVE (B5254T2; B6294T; 2003-2004)

CHECKING THE ON-BOARD REFUELING VAPOR RECOVERY VALVE

GENERAL INFORMATION ABOUT THE ON-BOARD REFUELING VAPOR RECOVERY VALVE

The on-board refueling vapor recovery valve closes the tank nozzle when the tank is being filled to prevent overfilling. When the fuel tank is filled and is full the on-board refueling vapor recovery valve changes position and creates a back pressure which stops the filling automatically.

If the on-board refueling vapor recovery valve sticks the fuel tank will overfill and then the evaporative emission system (EVAP) canister fills up. When the evaporative emission system (EVAP) canister is filled with fuel too much fuel will enter the engine when the evaporative emission system (EVAP) valve opens. The engine cannot compensate for the large fuel flow and the engine will stop. This occurs when idling.

The clearest symptom that the on-board refueling vapor recovery valve is sticking is that the engine stalls when idling after filling with fuel. This usually occurs for a short period after filling the tank and then the symptom decreases quickly. It can also cause uneven idling.

The corrective action in event of the on-board refueling vapor recovery valve sticking is to replace the fuel tank.

Checking the on-board refueling vapor recovery valve

The on-board refueling vapor recovery valve itself cannot be checked.

The check is made of the volumetric efficiency of the evaporative emission system (EVAP) canister.

If the evaporative emission system (EVAP) canister is full it can indicate that the on-board refueling vapor

recovery valve is sticking.

Checking the volumetric efficiency of the evaporative emission system (EVAP) canister

- Disconnect the hose from the fuel tank beside the evaporative emission system (EVAP) valve
- Pull the hose down level with the bottom of the engine
- Check if fuel comes out of hose.

If fuel comes from the hose it indicates that the evaporative emission system (EVAP) canister is over full.

Remedy as necessary.

Other information:

- To replace the fuel tank, see **FUEL TANK, REPLACING**.
- **Continue**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

FUEL TANK, REPLACING

- See **FUEL SYSTEM - REMOVAL, REPLACEMENT AND INSTALLATION**

CHECKING THE STATUS OF THE PEDAL POSITION SENSOR (B5254T2; 2003-2007)

CHECKING THE STATUS OF THE PEDAL POSITION SENSOR

CHECKING THE STATUS OF THE PEDAL POSITION SENSOR

Fig. 70: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

A number conditions must be met for cruise control to be controlled by the engine control module (ECM). Some of these conditions are speed, the clutch and the brake pedal must not be depressed and certain diagnostic trouble codes (DTCs) must not be stored.

The clutch and brake pedal position sensors are checked to determine if they are in a position where the engine control module (ECM) allows cruise control.

NOTE: **On cars with automatic transmissions, the parameter for the brake pedal position sensor displays "Active" (the brake pedal position sensor allows the cruise control to function).**

- Ignition on

- Using the VCT2000 (or appropriate scan tool), check if the clutch pedal position sensor and the brake pedal position sensor are in the " Active" position when the pedals are in the unaffected positions.

Check that the status changes when the pedals are depressed.

The brake pedal and the clutch pedal must be in the "Active" position for the engine control module (ECM) to allow cruise control.

Fig. 71: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

CHECKING THE STATUS OF THE PEDAL POSITION SENSOR (B6294T; 2003-2006)

CHECKING THE STATUS OF THE PEDAL POSITION SENSOR

see **CHECKING THE STATUS OF THE PEDAL POSITION SENSOR**

CHECKING THE THERMOSTAT (B5254T2; B6294T; 2003-2004)

CHECKING THE THERMOSTAT

READING OFF THE ENGINE COOLANT TEMPERATURE (ECT)

Fig. 72: Identifying Belt Routing
Courtesy of VOLVO CARS CORPORATION

- Start the engine. Run the engine until the engine coolant temperature (ECT) reaches approximately 100 ° C
- When the engine coolant temperature (ECT) is 100 °C, activate the engine cooling fan (FC) with the engine running
- Wait for 90 seconds
- Switch off the engine cooling fan (FC).

  Read off the engine coolant temperature (ECT). If it is 85 °C or lower when the fan stops, the thermostat is defective.

Fig. 73: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **REPLACING THE COMPONENT**

- **NO**

  OKAY: Troubleshooting has been completed.

REPLACING THE COMPONENT

Fig. 74: Identifying Thermostat
Courtesy of VOLVO CARS CORPORATION

Replace the thermostat.

- For B5xx4Tx -2004, see **REPLACING THE THERMOSTAT AND/OR ENGINE COOLANT TEMPERATURE SENSOR**
- For B6xx4T, see **THERMOSTAT, REPLACING** .

CHECKING THREE-WAY CATALYTIC CONVERTER (TWC) AND EXHAUST SYSTEM (B5254T2; B6294T; 2003-2004)

CHECKING THE THREE-WAY CATALYTIC CONVERTER (TWC) AND EXHAUST SYSTEM

CHECKING THE THREE-WAY CATALYTIC CONVERTER (TWC) AND EXHAUST SYSTEM

- Check the three-way catalytic converter (TWC) and exhaust system for blocked components
- Replace blocked components if necessary.

READINESS CODE (B5254T2; 2003-2007)

READINESS CODE

READ THE READINESS CODE

Read off diagnostic trouble codes (DTCs) and the readiness status.

If readiness is "OK" and no diagnostic trouble codes are stored, two cycles have run, i. e. the system's diagnostic functions have run two times without detecting a fault.

HINT: Readiness is reset (to "NOT OK") when the diagnostic trouble codes are cleared or if power is cut off to the engine control module (ECM).

US government information (US only)

The United States Environmental Protection Agency (EPA) has issued a guidance letter, "Performing Onboard Diagnostic System checks as Part of a Vehicle Inspection and Maintenance Program" (EPA420-R-01-015 June 2001), that incorporates various implementation issues associated with OBD-I/M testing. One being that the EPA has revised the readiness criteria to allow states to not reject MY 1996-2000 vehicles with two or fewer unset readiness codes, or MY 2001 and newer vehicles with no more than one unset readiness code. As mentioned herein this is suggested practice. Each individual state may abide by this guidance or enforce state regulations suited to their individual environmental needs. Please consult your State Department of Motor Vehicle for your current I/M testing regulations and procedures.

Select the appropriate remedy depending on this status:

1. If diagnostic trouble codes (DTCs) are stored

   Refer to **DIAGNOSTIC TROUBLE CODE (DTC) STORED**

2. If readiness is "NOT OK".

   Refer to **READ THE DIAGNOSTIC STATUS FOR READINESS**

3. If readiness is "OK" and no diagnostic trouble codes (DTCs) are stored.

   OKAY: Troubleshooting has been completed.

Fig. 75: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

READ THE DIAGNOSTIC STATUS FOR READINESS

Read off the status of the diagnostic functions.

Select the appropriate remedy depending on this status:

1. Readiness for probe diagnostics, diagnostics for heated oxygen sensor (HO2S) preheating three-way catalytic converter (TWC) diagnostics "NOT READY".

   Refer to **CARRY OUT TRIP**

2. Readiness for leak diagnostics "NOT READY".

   Refer to **QUICK TEST OF THE FUEL TANK SYSTEM**

HINT: The diagnostic for evaporative emission control is included in readiness for leak diagnostics.

Fig. 76: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

CARRY OUT TRIP

Perform a TRIP following, see **VERIFYING REPAIRS** so that the engine control module (ECM) executes a diagnosis for diagnostic functions.

- **Continue**

  Refer to **READ THE READINESS CODE**

QUICK TEST OF THE FUEL TANK SYSTEM

Run a quick test of the fuel tank system via the vehicle communication socket.

The engine must be run to operating temperature and then left idling for a few minutes before the diagnostic function for EVAP control can be run.

DIAGNOSTIC TROUBLE CODE (DTC) STORED

Fault-trace and remedy stored diagnostic trouble codes (DTCs).

READINESS CODE (B6294T; 2003-2006)

READINESS CODE

see **READINESS CODE**

READING OUT PERMANENT DIAGNOSTIC TROUBLE CODES (B6324S5; 2011-2012)

READING OUT PERMANENT DIAGNOSTIC TROUBLE CODES (USA/CDN)

VISUAL CHECK OF MIL-LIGHT

NOTE: This service only applies to vehicles the USA and Canada, for model year 2010 and later, and only in certain versions.

Before read-out of permanent diagnostic trouble codes is started, Engine control module (ECM) and Transmission control module (TCM) shall be free from diagnostic trouble codes that activate the MIL-light.

Therefore, check if the MIL-light is on.

HINT: The MIL-light is always on at ignition on. Therefore, check with the engine idling.

NOTE: If the MIL-light is on, diagnostic trouble codes are stored. Remedy these diagnostic trouble codes (DTCs) first.

Select action depending on the MIL-light's status:

1. MIL-light on.

   OKAY: Troubleshooting has been completed.

2. MIL-light not on.

   Refer to **READING OUT PERMANENT DIAGNOSTIC TROUBLE CODES (USA/CDN)**

3. Information about permanent diagnostic trouble codes.

   Refer to **INFORMATION ABOUT PERMANENT DIAGNOSTIC TROUBLE CODES**

READING OUT PERMANENT DIAGNOSTIC TROUBLE CODES (USA/CDN)

- Ignition switch position II.

  Use the VCT2000 (or appropriate scan tool) to read-out permanent diagnostic trouble codes.

  NOTE: If any of the control modules have the status "Communication failure" it may be due to the control module not answering. Try to restart the read-

out. If this does not help, then normal trouble code read-out should be performed on all systems as well as troubleshooting according to standard procedures.

Select one of the following options:

1. Done

   OKAY: Troubleshooting has been completed.

2. Information about permanent diagnostic trouble codes.

   Refer to **INFORMATION ABOUT PERMANENT DIAGNOSTIC TROUBLE CODES**

Fig. 77: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

INFORMATION ABOUT PERMANENT DIAGNOSTIC TROUBLE CODES

INFORMATION ABOUT PERMANENT DIAGNOSTIC TROUBLE CODES

NOTE: This service only applies to vehicles the USA and Canada, for model year 2010 and later, and only in certain versions.

Problems that impact emissions, and that are found by the control module's diagnostic system, from model year 2010, generate extra diagnostic trouble codes in parallel with the traditional diagnostic trouble codes. The diagnostic trouble codes are called permanent diagnostic trouble codes, stored in a separate diagnostic trouble code memory and have the same designation as the traditional diagnostic trouble codes.

The difference between the permanent and the traditional diagnostic trouble codes is that the permanent cannot be erased with an external diagnostics tool, e. g., VIDA (Volvo scan tool). The permanent diagnostic trouble codes in the control module are erased automatically when the diagnostic system has performed relevant diagnoses, and ensured that there no longer are any emission-related malfunctions in the system.

The purpose of introducing permanent diagnostic trouble codes is to meet a government regulation. By this requirement you prevent that emission-related problems with their diagnostic trouble codes can be hidden temporarily, e. g., at an inspection, by only erasing diagnostic trouble codes and this also turning off the MIL-light.

Emission-related diagnoses are available in Engine control module (ECM) and in Transmission control module (TCM), and thus you can only find permanent diagnostic trouble codes in these two control modules.

Perform the following procedure in this order to ensure that emission-related problems have been solved correctly and that the diagnostics system is free from diagnostic trouble codes.

- Troubleshoot and solve and problems according to traditional procedure.
- Erase diagnostic trouble codes (DTCs).

NOTE: This erases the traditional trouble code memory and turns off the MIL-light. However, the permanent diagnostic trouble code remains.

- Make sure that the control module's diagnostic system can run the diagnosis/diagnoses again for relevant diagnostic trouble code.

  HINT: The requirements for running a diagnosis may vary between different diagnoses. Certain diagnoses only require ignition position II, while others require that the vehicle is driven on road according to a specific driving procedure. For detailed information on what is required for a certain diagnosis, see Diagnostic trouble code information for each trouble code.

Before the permanent diagnostic trouble code disappears from the diagnostic trouble code memory, the vehicle must have undergone a so-called simplified general drive cycle. This means the following:

- Engine idling for at least 2 minutes.
- Vehicle speed over 40 km/h (25 mph) for at least 5 minutes.
- Total time with engine on for at least 10 minutes.

NOTE: The above conditions also apply to diagnoses with simpler running conditions.

When the diagnosis has been run, the diagnostic system has either assessed the system as:

1. Trouble-free.

   The permanent diagnostic trouble code is now erased. The vehicle is ready for delivery to customer.

2. Incorrect.

   The permanent diagnostic trouble code remains. The traditional diagnostic trouble code is stored again. After another diagnosis has been run with problems, the MIL-light will turn on, however, first in the next driving cycle.

- **Continue**

  Refer to **READING OUT PERMANENT DIAGNOSTIC TROUBLE CODES (USA/CDN)**

READING OUT PERMANENT DIAGNOSTIC TROUBLE CODES (B8444S; 2010-2011)

READING OUT PERMANENT DIAGNOSTIC TROUBLE CODES (USA/CDN)

see **READING OUT PERMANENT DIAGNOSTIC TROUBLE CODES (USA/CDN)**

ENGINE PERFORMANCE

Ignition And Control Systems - Symptom Verification

INFORMATION AND VERIFICATION, CRUISE CONTROL

INFORMATION AND VERIFICATION, CRUISE CONTROL

SYMPTOM AND FUNCTION DESCRIPTION

The following conditions must be met before the engine control module will allow cruise control to be permitted.

- Speed above 30 km/h. Max 200 km/h.
- Cruise control switch on.
- The clutch and brake pedal must not be depressed.

Verification

To verify that the symptom is in the vehicle, test drive the vehicle and check that cruise control works properly.

When test driving, check:

- appears in the display on the combined instrument panel when the cruise control switch is on.
- That the speed locks when **+** or **-** are used and that then appears in the display on the combined instrument panel.
- Disengagement occurs correctly.

Temporary disengagement if:

- Depress the **0** button on the steering wheel.
- Depress the brake or clutch pedal.
- The speed decreases below 25-30 km/h on an upward slope.
- Gear selector in **N** .
- Wheel spin or wheel lock-up.
- Speed increase longer than 1 minute.

In the event of temporary disengagement, **CRUISE-ON** still appears in the combined instrument display.

To disengage cruise control, depress **0** button on the steering wheel or depress brake or clutch pedal then goes out in the display on the combined instrument panel.

HVAC

Power transmission

HVAC

AC-SYSTEM, OIL, REFILLING

WARNING: Never mix different types of oils. Always use the correct type of compressor oil.

CAUTION: When installing a completely new air conditioning system: Check that there is oil in the compressor. The other components should contain no oil.

NOTE: Too much lubricating oil will impair refrigeration. Too little lubricating oil will damage the compressor.

OIL LEAKS

The oil must be topped up when repairing a leak or when replacing a component. The quantity required for the component in question will depend on whether leakage has taken place slowly or quickly.

Slow leakage (longer than 24 hours)

With a slow leak, there is normally minimal risk of oil loss.

Rapid leakage (e. g. hose rupture)

Rapid leakage often means that lubricating oil escapes with the refrigerant.

COMPRESSOR OIL, GENERAL INFORMATION

Frequent inspections or compressor oil changes do not normally have to be carried out if the above leak has not occurred or if the vehicle is used in professional circumstances.

The compressor oil absorbs moisture for as long as it is in contact with air.

Therefore, always use the necessary amount of oil and discard the remainder or close the oil reservoir tightly after use.

DRAINING/REFILLING OIL

When draining oil from the compressor, inspect for the following:

- the oil changes color to red

- the oil contains metal residues
- the clarity/translucency of the oil

Draining the oil on the air conditioning compressor without drain plug occurs via the pressure and intake side openings after the pulley and the clutch plate have been rotated 4-5 turns and with the openings facing downwards.

Filling oil in air conditioning compressors without drain plugs occurs via the pressure side's opening.

REPLACING OIL

Change the oil in the compressor (reusing the compressor) or replace with the same amount that was in the old one (new compressor) according to the tables below. Carry out a performance test of the air conditioning system. See **CLIMATE CONTROL SYSTEM, CHECK** .

When replacing components, the following oil volumes must be found in the new components or must be injected in the system through the service valve, except for the compressor (see service information for Compressor below):

Receiver drier (integrated with condenser)	0 cm^3
Evaporator	50 cm^3
Condenser	30 cm^3
Tube	10 cm^3
Hose	20 cm^3

Preparatory work for transferring the oil in the compressor:

- Measure the volume of the oil drained from the compressor
- Replace the volume of drained oil according to the tables below:

Reusing the compressor	
Drained oil	**Filling of oil**
> or =70 cm^3	Replace the volume of drained oil with the corresponding quantity
<70 cm^3 oil	fill with 70 cm^3 of oil.

New compressor	
Drained oil	**Filling of oil**
> or =70 cm^3	replace the drained oil volume with the same amount that was drained from the old compressor.
<70 cm^3 oil	fill with 70 cm^3 of oil.

NOTE: Filling/draining/vacuum pumping stations have a reservoir for injecting oil. This

can be used before filling with refrigerant and after vacuum pumping.

SIGNAL SPECIFICATION

Fig. 3: Control Module Terminals
Courtesy of VOLVO CARS CORPORATION

NOTE: **It is important to connect the breakout box and check the ground terminals before taking readings.**

Two breakout boxes are required to take readings from the SRS control module.

NOTE: **The terminals for connector C are split between breakout boxes 1 and 2.**

From model year 2003, the connectors are numbered 1-84.

- Terminals #1A-#28A correspond to terminals #1-#28
- Terminals #1B-#28B correspond to terminals #29-#56
- #1C-#28C correspond to #57-#84

TROUBLESHOOTING USING DICE ERROR FRAME FINDER

TROUBLESHOOTING USING DICE ERROR FRAME FINDER

Interference, intermittent faults, wrong messages on CAN-net (chattering modules), ground faults, and loose connections, etc., are examples of faults that can be detected using the tool DiCE Error Frame Finder during troubleshooting. The tool registers fault messages used on the CAN-net. Fault messages may be caused by short intermittent malfunctions on the CAN-net or by a control module sending fault messages. DiCE Error Frame Finder can only be used to detect CAN-faults of intermittent nature. If network does not work, use a multimeter to measure. Typical behavior for DiCE Error Frame Finder when a problem has occurred is that the blue LED flashes several times with short pauses, and then stops and then starts flashing again.

- Ignition on.

- Insert special tool 951 3010 (memory card) in DiCE Error Frame Finder (Volvo diagnostic tool).
- Connect DiCE (Volvo diagnostic tool) to the diagnostics socket.
- Note the blue LED-indicator. The indicator flashes to show detection of fault messages.

NOTE: Certain interference may occur without any real fault

1. Firmwire status, green. When the green light flashes with 4 second intervals DiCE is in fault indication mode.
2. CAN HS, yellow. When the yellow light flashes or is on constantly there is a data flow on CAN HS.
3. Fault code indicator, blue. When the blue light flashes with brief flashes DiCE indicates that there are fault code signals on CAN LS or CAN HS.
4. CAN LS, red/orange. When the red/orange light flashes or is on constantly there is a data flow on CAN LS.

Cable fault

- Shake the cables lightly and pull lightly on the connections during the check to locate any fault. Note the blue LED-indicator.

"Chatting" control modules

- "Chatting" control modules may be difficult to find and troubleshooting may take time. Let the vehicle stand with DiCE connected for an extended time period. Afterwards, activate functions to provoke a malfunction. It may take up to several hours before the fault messages are sent. When the indicator starts to flash, remove the fuse for one control module at a time until the indicator stops flashing. When the indicator stops flashing, restore the fuse for the relevant control module and check that the indicator starts to flash again. Then it is likely that the problem is identified.

Remedy wiring as necessary.

HVAC

AIR QUALITY SENSOR, REPLACING

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATIONS

Remove the plenum chamber. See **COWL, REPLACING**

Open the damper for the air intake.

REMOVING THE AIR QUALITY SENSOR

Fig. 1: Identifying Air Quality Sensor Removal
Courtesy of VOLVO CARS CORPORATION

Turn the sensor approximately 60° counter-clockwise (see the illustration).

Slightly pull out the sensor and cable to access the connector.

Disconnect the connector.

INSTALLING THE AIR QUALITY SENSOR

Fig. 2: Identifying Air Quality Sensor Removal
Courtesy of VOLVO CARS CORPORATION

Connect the connector.

Insert as much of the cable through the hole as possible.

Position the sensor and seal (the flat side must face upwards) in the groove. The sensor can only be positioned one way in the groove (see the illustration).

Turn the sensor approximately 60° clockwise until it will not turn any further. Check that the air quality sensor is securely in place.

Ensure that the cable is as far in as possible.

Close the damper for the air intake.

Install the plenum chamber. See **COWL, REPLACING** .

CABIN AIR FILTER

Volvo - S60, S80 (1999-06), V70 (2001-07), XC70 (2003-07) & XC90

REMOVAL & INSTALLATION

NOTE: **Manufacturer's terminology for this filter may be passenger compartment air cleaner, cabin air filter, particulate filter, pollen filter, or multi filter.**

CABIN AIR FILTER

Removal

1. Remove the soundproofing panel from under glove box. See **SOUNDPROOFING PANEL**.
2. Remove the screws for the passenger compartment air cleaner cover. See **Fig. 1**. Remove the cover.
3. Remove passenger compartment air cleaner by pulling downward and out.

Fig. 1: Removing Passenger Compartment Air Cleaner

Courtesy of VOLVO CARS OF NORTH AMERICA.

Installation

NOTE: **There are 2 alternative positions for the air cleaner. See Fig. 2. The pollen filter (standard) must be installed in the smaller compartment (1). The multi filter (cars with an air quality sensor) must be installed in the wider compartment (2). Install either the pollen filter or the multi filter. Both filters must not be installed together.**

1. Install the passenger compartment air cleaner and cover. Install the screws. The front left screw must not be tightened to more than 7 INCH Lbs. (0.8 N.m).
2. Install the soundproofing panel.

Fig. 2: Installing Passenger Compartment Air Cleaner
Courtesy of VOLVO CARS OF NORTH AMERICA.

SOUNDPROOFING PANEL

NOTE: **The back of the soundproofing panel is secured to the dashboard with clips and sits in a groove at the front.**

Removal & Installation, Except XC 90

1. Remove the 2 screws from soundproofing panel under glove box. Pull the clips straight down.
2. Pull the soundproofing panel backwards into the car.
3. Lift out the soundproofing panel. To install, reverse removal procedure.

Removal & Installation, XC 90

1. Remove the underdash side panel. See **Fig. 3**.
2. Remove the 2 screws.

G00213204

Fig. 3: Removing Soundproofing Panel (XC 90)
Courtesy of VOLVO CARS OF NORTH AMERICA.

3. Remove the underdash soundproofing panel. To install, reverse removal procedure.

HVAC

Climate Units - Cleaning, Inspection And Adjustment

CLIMATE UNITS (2003-12)

REFRIGERANT, FILLING

IMPORTANT INFORMATION ABOUT FILLING WITH REFRIGERANT

NOTE: **Refrigerant must only be filled via the service valve (TXV system) on the high pressure (HP) side.**

HINT: A specification decal in the engine compartment lists the refrigerant capacity of the air conditioning (A/C) system.

Fig. 1: Filling With Refrigerant
Courtesy of VOLVO CARS CORPORATION

NOTE: **The most common cause of failed filling on the high pressure side is incorrect vacuum pumping or because the pressure in the filling unit is not high enough, or a combination of these two.**

NOTE: **The filling unit should preferably have a heating unit for refrigerant. This is so that the pressure in the filling unit is higher than in the system that is to be filled.**

NOTE: **When filling with refrigerant, compensate for the volume in the filling hoses before closing the filler valve.**

AIR QUALITY SENSOR, CHECKING

NOTE: **As the graphics in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the graphics is always correct.**

REMOVING THE AIR QUALITY SENSOR

Remove the plenum chamber. See **COWL, REPLACING** .

CHECKING THE AIR QUALITY SENSOR

Start the car engine with the ECC automatic button in the ON position.

Fig. 2: Spraying Opening Of Air Quality Sensor
Courtesy of VOLVO CARS CORPORATION

Spray a little rust solvent or windshield washer fluid from a spray bottle into the opening for the air quality sensor.

NOTE: Use only a small amount of rust solvent or windshield washer fluid.

Fig. 3: Identifying Open Air Intake Damper
Courtesy of VOLVO CARS CORPORATION

If the air quality sensor and the other electronics are fault free, the damper for the air intake should close very soon.

If the air quality sensor is fault free, the damper for the air intake will gradually open after approximately 15 seconds.

INSTALLING THE AIR QUALITY SENSOR

Wipe away any excess rust solvent or windshield washer fluid around the sensor.

Install the plenum chamber. See **COWL, REPLACING** .

NOTE: Cover the air intake to the passenger compartment when the engine compartment or the car is being treated with wax or preserving agent.

CLIMATE SYSTEM, PERFORMANCE TEST

PERFORMANCE TEST

CONDITIONS

- Bonnet closed
- Doors and windows closed
- Start the engine.
- Engine speed 1500 RPM.

Fig. 4: Blower Switch Fan Set To 50%
Courtesy of VOLVO CARS CORPORATION

Fig. 5: Identifying Temperature Selectors For Maximum Cooling
Courtesy of VOLVO CARS CORPORATION

- Turn the temperature selector(s) to maximum cooling
- Set the air distribution selector to the **Ventilation** position
- Set the recirculation switch to the **On position**
- Set the air conditioning (A/C) button to the **On position**
- Set the blower fan switch to 50%.

Fig. 6: Checking Temperature At Center Dashboard Vents
Courtesy of VOLVO CARS CORPORATION

- Position a thermometer at the center dashboard vents
- Allow the system to stabilize itself for at least 8 minutes.

Recorded operating conditions °C (°F)			
Ambient air temperature measured in front of the car	20°C (68°F)	30°C (86°F)	40°C (104°F)
Temperature of the expelled air measured at the center panel vents	6-9°C (43-48°F)	10-13°C (50-55°F)	14-16°C (57-60°F)

ENGINE COOLANT HEATER, TEST RUNNING

TEST DRIVING

Fig. 7: Identifying Engine Coolant Heater
Courtesy of VOLVO CARS CORPORATION

NOTE: The additional heater will not start if the engine coolant temperature (ECT) is in excess of approximately 75°C.

Checking the quantity of fuel

Engine on: The heater always starts and the quantity of fuel in the tank is checked for 1 minute. If the quantity of fuel is greater than 4 liters the heater continues to run, otherwise it shuts down.

Engine off: The quantity of fuel is checked before starting.

Warning text in the driver information module

Warning text is displayed in the driver information module if:

the quantity of fuel is too low.

-the battery voltage is too low.

Conditions for starting:

- outside temperature < +3°C
- the engine is running
- quantity of fuel > 4 liters
- no diagnostic trouble codes (DTCs) stored that would prevent starting
- airbag not deployed.

Activate the heater.

When the heater is activated, allow it to run for a few minutes and check that:

- the heater starts and runs normally
- the heater does not smoke abnormally
- there is no mechanical noise from the fuel pump (FP), water pump or combustion fan
- there is no leakage from either the fuel lines and terminals or the coolant hoses and terminals
- the coolant hoses from the heater are warm.

Stop the heater.

In warm weather (above 20°C) the heater may run unevenly. This is due to the fuel vaporizing. The heater is not normally intended to operate in such high temperatures.

If the car is not equipped with the trip computer function the heater starts in VIDA Car communication Section 36 Engine coolant heater.

FUEL-POWERED PREHEATER, CHECKING

Special tools	
	**T9997413 Fuel hose** **Tool number:** T9997413 **Tool description:** Fuel hose **Tool boards:**
	T9997412 Fuel hose **Tool number:** T9997412 **Tool description:** Fuel hose **Tool boards:**

Materials	
Designation	**Part number**
Freeze spray	1161731
Hose clamp	978401
Universal oil	1161657

NOTE: **Some variation may occur. However, the essential information in the graphics is always correct.**

Fig. 8: Identifying Air Baffle & Splash Guard
Courtesy of VOLVO CARS CORPORATION

CHECK

Fig. 9: Freeze Spray, 1161731
Courtesy of VOLVO CARS CORPORATION

Look for signs of leakage on the connections for the fuel lines (2 and 3) between the fuel tank and additional heater.

HINT: Use: Freeze spray, 1161731 at the quick-release connections and start the additional heater to induce any leaks.

Fig. 10: Identifying Fuel Pump
Courtesy of VOLVO CARS CORPORATION

Look for signs of leakage around the fuel pump.

Remedy, if necessary, and continue to the next step.

Fig. 11: Identifying Fuel-Powered Preheater
Courtesy of VOLVO CARS CORPORATION

Lower the additional heater. See **ENGINE COOLANT HEATER, REPLACING**

Fig. 12: Universal Oil, 1161657
Courtesy of VOLVO CARS CORPORATION

WARNING: **Be prepared to collect escaping fluid.**

see **9997413**

Install the rubber hose section in the car's fuel connection on the heater.

Slide it into the bottom so that it touches the internal nylon hose (1).

HINT: Use: Universal oil, 1161657 to facilitate the procedure.

Tighten the hose clamp 4-5 mm on the fuel hose (2). **Use:** Hose clamp, 978401

Fig. 13: Universal Oil, 1161657
Courtesy of VOLVO CARS CORPORATION

Install the opposite hose section in the car's fuel line that was on the heater.

Slide it in so that it touches the corresponding internal hose in the car's fuel hose, approx. 25 mm (1).

HINT: Use: Universal oil, 1161657 to facilitate the procedure.

Detach the hose clamp and move it over to the car's fuel line (2 and 3). **Use:** Hose clamp, 978401

Fig. 14: Identifying Special Tool 9997413
Courtesy of VOLVO CARS CORPORATION

Tighten the hose clamp 15-20 mm on the fuel hose.

Run the additional heater. See **ENGINE COOLANT HEATER, TEST RUNNING**

In the event of air bubbles, see the next step.

Fig. 15: Identifying Fuel Pump Inspection Hatch (1 Of 2)
Courtesy of VOLVO CARS CORPORATION

The fuel pump's inspection hatch is located under the vehicle's rear seat.

Fig. 16: Identifying Fuel Pump Inspection Hatch (2 Of 2)
Courtesy of VOLVO CARS CORPORATION

WARNING: **Be prepared to collect escaping fluid.**

Fig. 17: Identifying Special Tool 9997412
Courtesy of VOLVO CARS CORPORATION

see **9997412**

Run the additional heater. See **ENGINE COOLANT HEATER, TEST RUNNING**

In the event of air bubbles:

- Replace the suction pipe.
- Run the additional heater. See **ENGINE COOLANT HEATER, TEST RUNNING**

If there are **no** air bubbles, see the next step.

Fig. 18: Identifying Fuel Pump
Courtesy of VOLVO CARS CORPORATION

Check the connection at the additional heater fuel pump.

see **9997412**

Run the additional heater. See **ENGINE COOLANT HEATER, TEST RUNNING**

In the event of air bubbles:

- Replace the fuel line between the suction pipe and additional heater fuel pump.
- Run the additional heater. See **ENGINE COOLANT HEATER, TEST RUNNING**

If there are **no** air bubbles, see the next step.

- Continue to check the connections on the fuel line up to the additional heater.
- see **9997413**

LEAK TRACING, FLUORESCENT TRACING AGENT/UV LAMP

- Leak trace according to **LEAK TRACING, FLUORESCENT TRACING AGENT/UV LAMP**.

LEAK TRACING, FLUORESCENT TRACING AGENT/UV LAMP

REGULATIONS

Filling and leak tracing the climate control system using fluorescent tracing agent and a UV lamp.

Fig. 19: Battery And Jumper Cables
Courtesy of VOLVO CARS CORPORATION

NOTE: **The coloring agent may discolor the car paintwork. Therefore extreme caution must be taken when handling the tracing agent.**

NOTE: **Carefully follow the manufacturers instructions when handling the UV lamp and the tracing agent.**

NOTE: **After filling with the tracing agent, the decal supplied by the manufacturer / supplier must be applied at the point indicated.**

NOTE: **When leak tracing, always use the protective goggles supplied with the equipment. The goggles make the color more visible.**

LEAK TRACING WITH A UV LAMP

Fig. 20: Identifying Leak Trace Method With UV Lamp
Courtesy of VOLVO CARS CORPORATION

- Connect the UV lamp.
- Leak trace using the UV lamp
- The fluorescent tracing agent is green when leak tracing with a UV lamp.

NOTE: This light green color may be mistaken for leaked or spilled coolant which Volvo uses in its products.

The method for leak tracing using fluorescent tracing agent is the same for both factory filled and aftermarket filled climate control systems.

REFRIGERANT, DRAINING

NOTE: As the graphics in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the graphics is always correct.

DRAINING REFRIGERANT

Fig. 21: Identifying Recycling Unit Attached To Service Valve
Courtesy of VOLVO CARS CORPORATION

NOTE: When draining the refrigerant from the air conditioning (A/C) system, the ambient temperature must be above 20°C

The engine must be switched off.

Connect the recycling unit to the service valves on both the high-pressure (HP) and low-pressure (LP) sides. This is the quickest way to drain the refrigerant.

Check the amount of oil (if any) that has run out when draining the refrigerant. The recycling unit must be equipped with an oil separator. The oil separator must be of a type that allows the amount of oil in the refrigerant to be measured.

VACUUM PUMPING

VACUUM PUMPING

VACUUM PUMPING REFRIGERANT

CAUTION: Check and, if necessary, top up with new compressor oil according to REFRIGERANT, SAFETY REGULATIONS before vacuum-pumping the car's

climate control system.

Fig. 22: Identifying Recycling Unit Attached To Service Valve
Courtesy of VOLVO CARS CORPORATION

- During vacuum pumping, the vacuum pump can be connected to the service valves for both the high pressure (HP) and low pressure (LP) sides
- Operate the vacuum pump for at least 50 minutes.

VACUUM TEST

The vacuum must be checked after vacuum pumping.

- The vacuum gauge's value may only increase by 0.2 mbar one dash (0.1-0.3 mbar) during a period of 4 minutes.

NOTE: The vacuum test is not a substitute for leak tracing.

CLIMATE UNITS (B5254T2; 2003-07)

FAULT TRACING CLIMATE UNITS

Special tools	
	T9814092 MANOMETER STAND **Tool number:** T9814092 **Tool description:** MANOMETER STAND **Tool boards:**

WARNING: Follow the safety instructions for work on the air conditioning system. See SAFETY INFORMATION AIR CONDITIONING SYSTEM

NOTE: First read the instructions covering slow and fast leaks. See OIL AIR CONDITIONING (A/C) SYSTEM, FILLING

See information about the A/C-system. See **AIR CONDITIONING (AC) SYSTEM, GENERAL INSTRUCTIONS**

NOTE: Always plug the pipes and connections when working on the climate control system.

OVERVIEW A/C COMPONENTS

5. Climate control unit
6. Air quality sensor
7. Multifilter/filter

OVERVIEW OF THE A/C SYSTEM

Fig. 27: Identifying Overview Of A/C System
Courtesy of VOLVO CARS CORPORATION

Refrigerant path

1. Compressor
2. Condenser
3. Cooling fan
4. Receiver drier
5. Expansion valve
6. Evaporator
7. Blower fan

Explanations:

- **A** - High pressure, hot liquid

- **B** - Low pressure, cold liquid
- **C** - Low pressure, cold gas
- **D** - High pressure, hot gas
- **Dark arrow** - Hot air
- **Light arrow** - Cold air

Troubleshooting consists of three sub procedures in total with a number of steps in each. Not all steps need to be performed if the fault has been rectified before.

FAULT TRACING STEP 1 OF 3

General check

1. Set the car to room temperature (approx. 20 C°).
2. Connect VIDA diagnostic and download the AC check software 30745960 and check:
    - Evaporator temperature sensor
    - Temperature sensor passenger compartment
    - Ambient temperature sensor
    - Sun sensor
3. Check the damper motors
    - manually - temperature/temperature sides, defroster, ventilation, floor & recirculation
    - with VIDA diagnosis
4. Check blower fan speeds.
5. Check passenger compartment filter cleanliness.
6. Check distance between drive plate and pulley.

Fig. 28: Checking Distance Between Drive Plate And Pulley
Courtesy of VOLVO CARS CORPORATION

7. Check the drive/auxiliaries belt.

8. Check the cleanliness of the condenser.

FAULT TRACING STEP 2 OF 3

Carry out a performance test on the climate control system. See **CLIMATE SYSTEM, PERFORMANCE TEST**.

FAULT TRACING STEP 3 OF 3

Fig. 29: Identifying High Pressure Side (HT) And Low Pressure Side (LT) Service Valves
Courtesy of VOLVO CARS CORPORATION

Fig. 30: Identifying Special Tool 9814092
Courtesy of VOLVO CARS CORPORATION

Fig. 31: Identifying Pressure Measurement Tool
Courtesy of VOLVO CARS CORPORATION

Pressure measurement

Use special tool: **T9814092**

- The pressure is measured on the high resp. low pressure side service valves.
- Before connecting the manometer to the car's service valves both the knobs must be turned clockwise (-) to the limit position.
- Connect the manometer to the service valves, hang from the bonnet opening, start and run the engine at idle.
- Inner adjustment of the climate control follows the same procedure as step 2 performance test.

Read off the values after the A/C has stabilized or after approx. 8 min.

XC90 ALL (EXCL. B6324S & B8444SX) A/C COMPRESSORS WITH CONSTANT STROKE VOLUME. TXV VALVE SYSTEM.

Outside temperature (C°)	Low pressure (LT) (bar)	High pressure (HT) (bar)	Panel temperature (C°)
15, 5	Min:0.5 Max:3.0	Min:8.5 Max:12.0	Approx. 6.0
21, 0	Min:0.5 Max:3.0	Min:10.5 Max:17.5	Approx. 8.0
26, 5	Min:0.5 Max:3.0	Min:12.5 Max:19.0	Approx. 9.0
32, 0	Min:0.5 Max:3.5	Min:14.0 Max:22.0	Approx. 11.0
38, 8	Min:0.5 Max:3.5	Min:16.0 Max:23.0	Approx. 14.0

XC90 (B6324SX & B8444SX) A/C COMPRESSORS WITH VARIABLE STROKE VOLUME. TXV VALVE SYSTEM.

Outside temperature (C°)	Low pressure (LT) (bar)	High pressure (HT) (bar)	Panel temperature (C°)
15, 5	Min:1.5 Max:2.3	Min:9.5 Max:13.0	Approx. 6.0
21, 0	Min:1.5 Max:2.3	Min:12.5 Max:17.5	Approx. 8.0
26, 5	Min:1.5 Max:2.3	Min:14.0 Max:20.5	Approx. 9.0

32, 0	Min:0.5 Max:3.5	Min:16.0 Max:24.0	Approx. 11.0
38, 8	Min:0.5 Max:3.5	Min:18.5 Max:25.5	Approx. 14.0

Explanations:

- If the pressure values are outside the stated values (see above) the reason must be established.
- **F** = Fixed displacement- resp. **V** = Variable displacement compressor
- 6 x tables represent all the different fault symptoms on Volvo Car Company A/C systems with two service valves, with tips, results and action in order of priority.

Table 1 Faults	Possible cause in order of priority
	**All** 1. Compressor magnetic clutch slips or does not engage, adjust/replace magnetic clutch. See **MAGNET CLUTCH AC COMPRESSOR, REPLACING** 2. Expansion valve is blocked in open position, replace expansion valve. See **EXPANSION VALVE, REPLACING** 3. Compressor damaged, replace compressor. See **COMPRESSOR, REPLACING**

Table 2 Faults	Possible cause in order of priority
Low pressure (**LT**) too **low** High pressure (**HT**) **high** (**C**) or **normal** (	**1, 3, 4: "F", 2: All** 1. Evaporator temperature sensor defective, replace temperature sensor evaporator. See **TEMPERATURE SENSOR EVAPORATOR, REPLACING** 2. Receiver drier filled with moisture, replace receiver drier. See **RECEIVER DRIER, REPLACING** From and including chassis no 196988-:**RECEIVER DRIER, REPLACING** 3. Expansion valve is blocked in closed position, replace

 (**A**)	expansion valve. See **EXPANSION VALVE, REPLACING** 4. Blockage in refrigerant pipe/hose between receiver drier and expansion valve, remove the cause of the blockage (cleaning).

Table 3 Faults	Possible cause in order of priority
Low pressure (**LT**) **normal** (**A**) or too **low** (**B**) High pressure (**HT normal** 	**All** 1. Inflow of warm air into evaporator (passenger compartment), defective temperature damper motor, replace damper motor. **L. H. D -2004** : **DAMPER MOTOR TEMPERATURE, REPLACING** Alternatively defective damper. See **DAMPER MOTOR MODULE (DMM) TEMPERATURE, REPLACING** 2. Inflow of warm air into evaporator (passenger compartment), defective recirculation damper motor, replace damper motor. For -2004, see **DAMPER MOTOR RECIRCULATION, REPLACING** For 2005- see **DAMPER MOTOR MODULE (DMM) RECIRCULATION, REPLACING**

Table 4 Faults	Possible cause in order of priority
Low pressure (**LT**) **high** (**C**) or **normal** (**A**)	**All** 1. Possible normal operating pressure at **high** ambient temperature above

High pressure (**HT**) too **high**  	43°C (109°F) 2. Impurities in the condenser, clean/vacuum/rinse impurities from the front. 3. Too much refrigerant (30-35% more than the prescribed amount), drain and refill. See **REFRIGERANT, DRAINING** 4. Blockage in refrigerant pipe/hose between A/C compressor, condenser and receiver drier, remove the cause of the blockage (cleaning) **NOTE:** **The blockage should only be in the area around the (HT) service connection.**

Table 5 Faults	Possible cause in order of priority
Low pressure (**LT**) **high** (**C**) or **normal** (**A**) High pressure (**HT**) too **high**  	**1-3: All, 4-5: "V"** 1. Possible normal operating pressure at **low** ambient temperature below 5 C° (41°F). 2. Too **little** refrigerant (below nominal amount), drain and refill. See **REFRIGERANT, DRAINING** 3. Blockage in refrigerant pipe/hose between A/C compressor and condenser or condenser and receiver drier, remove the cause of the blockage (cleaning). 4. Blockage in low or high pressure side between receiver drier and evaporator, remove the cause of the blockage (cleaning). 5. Expansion valve is blocked in closed position or blocked, replace expansion valve. See **EXPANSION VALVE, REPLACING**

Table 6 Faults	Possible cause in order of priority
Low pressure (**LT**) High pressure (**HT**) displays same values	**1.3: All, 2.4: "V"** 1. Car switched off, no A/C compressor work is

	underway, system pressure/residual pressure. 2. A/C compressor not running 3. Compressor's magnetic clutch is defective replace magnetic clutch. See **MAGNETIC CLUTCH COMPRESSOR, REPLACING** 4. Compressor damaged, replace compressor. See **COMPRESSOR, REPLACING**

DAMPER MOTOR RECIRCULATION, REPLACING

NOTE: **As the graphics in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the graphics is always correct.**

REMOVING THE RECIRCULATION DAMPER MOTOR

Fig. 32: Identifying Control Module Mechanism And Damper Arms
Courtesy of VOLVO CARS CORPORATION

Remove:

- the glove compartment. See **GLOVE COMPARTMENT, REPLACING**
- the screw from the bracket.

Remove:

- the bracket from the mounting by inserting the tip of a screwdriver between the mounting and the metal on the fan housing
- the lever from the motor. Ensure that the levers do not release from the heater unit.

Remove:

- the switch
- the motor.

INSTALLING THE RECIRCULATION DAMPER MOTOR

Position:

- the motor on the bracket
- the bracket and motor.

Press the upper mounting into place.

Install the screw for the bracket.

Place the arms from the heater unit onto the motor levers and press into place. Do not damage the arms.

Install:

- the switch
- the glove compartment. See **GLOVE COMPARTMENT, REPLACING** .

Carry out self-adjustment of the damper motor end positions. This is carried out via VIDA communication.

DAMPER MOTOR TEMPERATURE, REPLACING

NOTE: **As the graphics in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the graphics is always correct.**

DAMPER MOTOR TEMPERATURE PASSENGER SIDE, REPLACING

REMOVING THE PASSENGER SIDE TEMPERATURE DAMPER MOTOR

Remove:

- the glove compartment. See **GLOVE COMPARTMENT, REPLACING**
- the screws
- the motor
- the switch.

INSTALLING THE PASSENGER SIDE TEMPERATURE DAMPER MOTOR

Position the motor.

Turn the shaft on the motor so that the motor can be positioned.

Install:

- the screws
- the switch.

Carry out self-adjustment of the damper motor end positions. This is carried out via VIDA communication.

Install the glove compartment. See **GLOVE COMPARTMENT, REPLACING** .

DAMPER MOTOR TEMPERATURE DRIVER'S SIDE, REPLACING

REMOVING THE DRIVER'S SIDE TEMPERATURE DAMPER MOTOR

Fig. 33: Identifying Control Module And Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the soundproofing panel. See **SOUNDPROOFING PANEL, REPLACING**
- the switch from the damper motor.

Slacken off the screws.

Pull out the damper motor slightly.

Position the point of a screwdriver between the arms on the lever control. Pry the arms away from the ball on the damper motor lever.

Remove the damper motor.

INSTALLING THE DRIVER'S SIDE TEMPERATURE DAMPER MOTOR

Position the damper motor.

Install the mechanism lever on the ball on the damper motor lever.

Insert the tip of a screwdriver behind the lever on the mechanism and the tip of, for example, a pair of round-nosed pliers behind the lever on the damper motor. Press the ball into place on the mechanism.

Position the damper motor. Tighten the screws.

Install:

- the switch
- the soundproofing panel. See **SOUNDPROOFING PANEL, REPLACING** .

Carry out self-adjustment of the damper motor end positions. This is carried out via VIDA communication.

FUEL PIPE, AUXILIARY HEATER, ADDITIONAL INSULATION

NOTE: The graphics in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the graphics is always correct.

PREPARATORY WORK

Remove:

- the splash guard under the engine
- the lower air guide on the bumper shell
- the splash guard (XC90 only).

REMOVING THE FUEL PIPE

Fig. 34: Identifying Fuel Pipe And Clip On Inside Right Part Of Subframe
Courtesy of VOLVO CARS CORPORATION

Fig. 35: Identifying Fuel Pipe Lifted Out Of Clip
Courtesy of VOLVO CARS CORPORATION

Lift the fuel pipe from the clip on the inside right part of the subframe and the top of the subframe below the belt pulley.

Fig. 36: Identifying Front Subframe Clips
Courtesy of VOLVO CARS CORPORATION

Fig. 37: Identifying Subframe Clips
Courtesy of VOLVO CARS CORPORATION

Cut off the 4 tie straps on the front of the subframe. Cut away the tie straps only. Leave the clips in place.

Fig. 38: Identifying Duct Released From Front Subframe
Courtesy of VOLVO CARS CORPORATION

On certain vehicles, the duct for cool air to the control module box must be released from the clip (1) on the front of the subframe.

INSTALLING ADDITIONAL INSULATION

Fig. 39: Identifying Insulation Positioned At Fuel Heater Connection To Fuel Pipe
Courtesy of VOLVO CARS CORPORATION

Carefully pull down the fuel pipe at the auxiliary heater.

Position the insulation. Start at the fuel heater connection to the fuel pipe.

NOTE: Make sure that insulation seams lie back toward the subframe.

Do not overtighten the tie straps around the insulation.

Secure the insulation using tie straps.

Cut off any excess from the tie straps.

Fig. 40: Identifying Insulation Positioned To Wrap Fuel Pipe
Courtesy of VOLVO CARS CORPORATION

Fig. 41: Identifying Insulation Wrapped and Secured With Tie Straps
Courtesy of VOLVO CARS CORPORATION

Secure the insulation using tie straps.

NOTE: **Use several tie straps in spots with sharp curves to ensure that the insulation is properly secured.**

Cut off any excess from the tie straps.

Fig. 42: Identifying Tie Straps Inserted In Clips In Subframe
Courtesy of VOLVO CARS CORPORATION

Insert tie straps in the two clips in the subframe by the auxiliary heater but do not tighten them yet.

Fig. 43: Identifying Insulation Secured With Tie Straps
Courtesy of VOLVO CARS CORPORATION

Secure the insulation using tie straps.

Cut off any excess from the tie straps.

Fig. 44: Identifying Insulation Secured With Tie Straps
Courtesy of VOLVO CARS CORPORATION

Secure the insulation using tie straps.

NOTE: **For easier access to the fuel pipe, move aside the AC hose on variants in which it is in the way.**

Cut off any excess from the tie straps.

Fig. 45: Identifying Tie Straps Inserted In Clips In Right Part Of Subframe
Courtesy of VOLVO CARS CORPORATION

Insert tie straps in the two clips in the right part of the subframe but do not tighten them yet.

Secure the insulation using tie straps.

Cut off any excess from the tie straps.

Fig. 46: Identifying Fuel Pipe Insulation
Courtesy of VOLVO CARS CORPORATION

Continue fitting insulation over the fuel pipe up and over the subframe.

Fig. 47: Identifying Fuel Pipe Clipped To Subframe
Courtesy of VOLVO CARS CORPORATION

Press the fuel pipe into the clip on the top of the subframe.

Secure the insulation using tie straps.

NOTE: The fuel pipe is partly accessible from the right wheel housing when the fender liner is moved up.

Cut off any excess from the tie straps.

Fig. 48: Identifying Insulation Secured With Tie Straps
Courtesy of VOLVO CARS CORPORATION

Continue fitting insulation over the fuel pipe.

Secure the insulation using tie straps.

NOTE: **It is extremely important to secure insulation where the fuel pipe swings down and goes back.**

Cut off any excess from the tie straps.

Fig. 49: Identifying Fuel Pipe Pressed To Clips
Courtesy of VOLVO CARS CORPORATION

Press the fuel pipe into the clips.

Fit a tie strap on each side of the clips with the opening inward. This ensures that the clip holds the fuel pips in place.

Fig. 50: Identifying Insulation Secured With Tie Straps
Courtesy of VOLVO CARS CORPORATION

Secure the insulation using tie straps.

Cut off any excess from the tie straps.

Cut off any excess insulation hose at the fuel hose.

Press the fuel pipe into the clips.

Reinstall the pipe in its original position against the front edge of the subframe.

Tighten the remaining tie straps in the clips (x4).

FINISHING

Install:

- the lower air guide on the bumper shell
- the splash guard (XC90 only)
- the splash guard under the engine

OVERVIEW OF THE A/C SYSTEM

Fig. 55: Identifying Overview Of A/C System
Courtesy of VOLVO CARS CORPORATION

Refrigerant path

1. Compressor
2. Condenser
3. Cooling fan
4. Receiver drier
5. Expansion valve
6. Evaporator
7. Blower fan

Explanations:

- **A** - High pressure, hot liquid
- **B** - Low pressure, cold liquid
- **C** - Low pressure, cold gas
- **D** - High pressure, hot gas
- **Dark arrow** - Hot air
- **Light arrow** - Cold air

Troubleshooting consists of three sub procedures in total with a number of steps in each. Not all steps need to be performed if the fault has been rectified before.

FAULT TRACING STEP 1 OF 3

General check

1. Set the car to room temperature (approx. 20°C).
2. Connect VIDA diagnostic and download the AC check software 30745960 and check:

- Evaporator temperature sensor
- Temperature sensor passenger compartment
- Ambient temperature sensor
- Sun sensor

3. Check the damper motors
   - manually - temperature/temperature sides, defroster, ventilation, floor & recirculation
   - with VIDA diagnosis
4. Check blower fan speeds.
5. Check passenger compartment filter cleanliness.
6. Checking distance between drive plate and pulley

Fig. 56: Checking Distance Between Drive Plate And Pulley
Courtesy of VOLVO CARS CORPORATION

7. Check the drive/auxiliaries belt.
8. Check the cleanliness of the condenser.

FAULT TRACING STEP 2 OF 3

Carry out a performance test on the climate control system. See **CLIMATE SYSTEM, PERFORMANCE TEST**.

FAULT TRACING STEP 3 OF 3

Fig. 57: Identifying High Pressure Side (HT) And Low Pressure Side (LT) Service Valves
Courtesy of VOLVO CARS CORPORATION

Fig. 58: Identifying Special Tool 9814092
Courtesy of VOLVO CARS CORPORATION

Fig. 59: Identifying Pressure Measurement Tool
Courtesy of VOLVO CARS CORPORATION

Pressure measurement

Use special tool: **T9814092**

- The pressure is measured on the high resp. low pressure side service valves.
- Before connecting the manometer to the car's service valves both the knobs must be turned clockwise (-) to the limit position.
- Connect the manometer to the service valves, hang from the bonnet opening, start and run the engine at idle.
- Inner adjustment of the climate control follows the same procedure as step 2 performance test.

Read off the values after the A/C has stabilized or after approx. 8 min.

XC90 ALL (EXCL. B6324S & B8444SX) A/C COMPRESSORS WITH CONSTANT STROKE VOLUME. TXV VALVE SYSTEM.

Outside temperature (C°)	Low pressure (LT) (bar)	High pressure (HT) (bar)	Panel temperature (C°)
15.5	Min: 0.5 Max: 3.0	Min: 8.5 Max: 12.0	Approx. 6.0
21.0	Min: 0.5 Max: 3.0	Min: 10.5 Max: 17.5	Approx. 8.0
26.5	Min: 0.5 Max: 3.0	Min: 12.5 Max: 19.0	Approx. 9.0
32.0	Min: 0.5 Max: 3.5	Min: 14.0 Max: 22.0	Approx. 11.0
38.8	Min: 0.5 Max: 3.5	Min: 16.0 Max: 23.0	Approx. 14.0

XC90 (B6324SX & B8444SX) A/C COMPRESSORS WITH VARIABLE STROKE VOLUME. TXV VALVE SYSTEM.

Outside temperature (C°)	Low pressure (LT) (bar)	High pressure (HT) (bar)	Panel temperature (C°)
15.5	Min: 1.5 Max: 2.3	Min: 9.5 Max: 13.0	Approx. 6.0
21.0	Min: 1.5 Max: 2.3	Min: 12.5 Max: 17.5	Approx. 8.0
26.5	Min: 1.5 Max: 2.3	Min: 14.0 Max: 20.5	Approx. 9.0

32.0	Min: 0.5 Max: 3.5	Min: 16.0 Max: 24.0	Approx. 11.0
38.8	Min: 0.5 Max: 3.5	Min: 18.5 Max: 25.5	Approx. 14.0

Explanations:

- If the pressure values are outside the stated values (see above) the reason must be established.
- **F** = Fixed displacement- resp. **V** = Variable displacement compressor
- 6x tables represent all the different fault symptoms on Volvo Car Company A/C systems with two service valves, with tips, results and action in order of priority.

Table 1 Faults	Possible cause in order of priority
	**All** 1. Compressor magnetic clutch slips or does not engage, adjust/replace magnetic clutch. See **ELECTROMAGNETIC CLUTCH** 2. Expansion valve is blocked in open position, replace expansion valve. See **EXPANSION VALVE, REPLACING** 3. Compressor damaged, replace compressor. See **AC COMPRESSOR, REPLACEMENT**

Table 2 Faults	Possible cause in order of priority
Low pressure (**LT**) too **low** High pressure (**HT**) **high** (**C**) or **normal** (**A**) 	**1, 3, 4: "F", 2: All** 1. Evaporator temperature sensor defective, replace temperature sensor evaporator. See **TEMPERATURE SENSOR EVAPORATOR, REPLACING** 2. Receiver drier filled with moisture, replace receiver drier. See **RECEIVER DRIER, REPLACING** 3. Expansion valve is blocked in closed position, replace expansion valve. See **EXPANSION VALVE, REPLACING** 4. Blockage in refrigerant pipe/hose between receiver drier and expansion valve, remove the cause of the blockage (cleaning).

Table 3 Faults	Possible cause in order of priority
Low pressure (**LT**) **normal** (**A**) or too **low** (**B**) High pressure (**HT normal**	**All** 1. Inflow of warm air into evaporator (passenger compartment), defective temperature damper

	motor, replace damper motor. See **DAMPER MOTOR MODULE (DMM) TEMPERATURE, REPLACING** Alternatively defective damper. 2. Inflow of warm air into evaporator (passenger compartment), defective recirculation damper motor, replace damper motor. see **DAMPER MOTOR MODULE (DMM) RECIRCULATION, REPLACING**

Table 4 Faults	Possible cause in order of priority
Low pressure (**LT**) **high** (**C**) or **normal** (**A**) High pressure (**HT**) too **high** 	**All** 1. Possible normal operating pressure at **high** ambient temperature above 43°C (109°F) 2. Impurities in the condenser, clean/vacuum/rinse impurities from the front. 3. Too much refrigerant (30-35% more than the prescribed amount), drain and refill. See **REFRIGERANT, DRAINING** 4. Blockage in refrigerant pipe/hose between A/C compressor, condenser and receiver drier, remove the cause of the blockage (cleaning) **NOTE:** **The blockage should only be in the area around the (HT) service connection.**

Table 5 Faults	Possible cause in order of priority
Low pressure (**LT**) **high** (**C**) or **normal** (**A**) High pressure (**HT**) too **high** 	**1-3: All, 4-5: "V"** 1. Possible normal operating pressure at **low** ambient temperature below 5°C (41°F). 2. Too **little** refrigerant (below nominal amount), drain and refill. See **REFRIGERANT, DRAINING** 3. Blockage in refrigerant pipe/hose between A/C compressor and condenser or condenser and receiver drier, remove the cause of the blockage (cleaning). 4. Blockage in low or high pressure side

	between receiver drier and evaporator, remove the cause of the blockage (cleaning). 5. Expansion valve is blocked in closed position or blocked, replace expansion valve. See **EXPANSION VALVE, REPLACING**

Table 6 Faults	Possible cause in order of priority
Low pressure (**LT**) High pressure (**HT**) displays same values 	**1.3: All, 2.4: "V"** 1. Car switched off, no A/C compressor work is underway, system pressure/residual pressure. 2. A/C compressor not running. 3. Compressor's magnetic clutch is defective replace magnetic clutch. See **ELECTROMAGNETIC CLUTCH** 4. Compressor damaged, replace compressor. See **AC COMPRESSOR, REPLACEMENT**

CLIMATE CONTROL SYSTEM, GENERAL (2003-12)

CLIMATE CONTROL SYSTEM, CLEANING

Special tools	
	**T9814105 Aircomatic II unit** **Tool number:** T9814105 **Tool description:** AIRCOMATIC II UNIT **Tool boards:**

Materials:	
Designation	**Part number**
Cleaning agent	1161836
Cleaning agent (USA/CAN)	1161837

NOTE: Removal steps in this procedure may contain installation details.

Fig. 69: Identifying Climate Control System Removal
Courtesy of VOLVO CARS CORPORATION

Remove, see **AIR CLEANER PASSENGER COMPARTMENT, REPLACING**

Do not reinstall the new pollen filter yet.

Vacuum the filter housing.

Reinstall the filter housing cover loosely with 2 screws.

Fig. 70: Identifying Side Panel Clip
Courtesy of VOLVO CARS CORPORATION

Checking the drain hose.

Fig. 71: Identifying Driver Side Panel Removal
Courtesy of VOLVO CARS CORPORATION

Fig. 72: Identifying Compressed Air Blown Through Drain Hose
Courtesy of VOLVO CARS CORPORATION

Carefully blow using the compressed air gun through the drain hose.

Reinstall the hose properly and secure with cable tie.

Reinstall the panels in reverse order.

Start the engine and allow to idle.

Fig. 73: Identifying MCC Control
Courtesy of VOLVO CARS CORPORATION

MCC control:

- Set the fan speed selector to the lowest speed/first position
- Move the air distribution selector to "Ventilation" position.
- Set the recirculation button to "On"
- Set the heater selectors to the 2 O'clock position

- Set the air conditioning (A/C) button to "On" position.

Fig. 74: Identifying ECC Control
Courtesy of VOLVO CARS CORPORATION

ECC control:

- Set the fan speed selector to the lowest speed/first position
- Move the air distribution selector to "Ventilation" position.
- Set the recirculation button to "On". Cars with air quality sensor (AQS) to "man"
- Set the heater selectors to 22°C (72°F)
- Set the air conditioning (A/C) button to "On" position.

Fig. 75: Identifying Explanations On Cleaner Display
Courtesy of VOLVO CARS CORPORATION

Explanations on cleaner's display:

- Start and stop button (1)
- Cleaning in progress, blue lamp (2)

- Cleaning complete, green lamp (3)
- Low level of cleaning fluid, yellow lamp (4)
- High level of cleaning fluid, yellow lamp (5)
- High temperature, red lamp (6)

Fig. 76: Identifying Special Tool Placed On Passenger Floor With Pipe In Forward Direction
Courtesy of VOLVO CARS CORPORATION

NOTE: Always follow the manufacturer's instructions when using the equipment.

Shake the bottle of cleaning agent.

Use: Cleaning agent, 1161836

Use: Cleaning agent (USA/CAN), 1161837

Empty the entire contents of the bottle into see **9814105**

Place see **9814105** on the passenger floor (left-hand drive), place the pipe in the forward direction.

Place some paper under and in front of the cleaner or allow stand it on a rubber mat.

Rout the wiring for the cleaner via the door's weatherstrip to an electrical socket.

Fig. 77: Identifying Explanations On Cleaner Display
Courtesy of VOLVO CARS CORPORATION

Start the cleaner (1), blue lamp illuminates (2).

Close the door carefully.

Ensure that all other doors are closed during treatment.

Allow it to run until the green lamp illuminates (3) (after approx. 15-20 minutes) and the treatment is complete.

Remove:

- The cable from the electrical socket
- The cable from the cleaner
- The cleaner from the car

It is normal that a small amount of fluid remains in the bottom of the cleaner after treatment, remove the pipe and discard the remaining fluid.

An odor is present for a few days after cleaning, which is usual.

Install the new filter. See **AIR CLEANER PASSENGER COMPARTMENT, REPLACING**

CCM-0001: BLOWER FAN MOTOR. SIGNAL TOO LOW (2003-04)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 1: Identifying Blower Fan Motor & Connector
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) CCM-0001 is stored if the control module registers that the diagnostic signal from the blower fan power unit is below 1.28 V and the control current to the blower fan power unit is below 0.42 mA.

Substitute Value

- The control module will not allow the blower fan motor to start while the fault persists
- The air conditioning (A/C) compressor is not allowed to start.

Possible Source

- Short-circuit to ground in the motor signal cable
- Short-circuit to supply voltage in the signal cable
- Open-circuit in the diagnostic signal cable

- Short-circuit to ground in the diagnostic signal cable
- Defective blower fan motor or power unit.

Fault symptom[s]

- Blower fan not operating
- Air flow problem
- No cooling from the air conditioning (A/C) system.

SIGNAL TOO LOW

CHECKING THE BLOWER FAN

Fig. 2: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check that the blower fan functions by turning the blower fan knob to maximum fan speed.

Is the blower fan working?

- **YES**

Refer to **CHECKING THE WIRING**

- **NO**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Fig. 3: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

CAUTION: The blower fan motor power unit is very sensitive to short-circuits and excess current. Do not damage the power unit when taking readings. Take readings with the power unit connector disconnected

when checking the wiring.

Check if the fuse for the climate control module (CCM) is defective. If the fuse is defective, check:

- the signal cable between the fuse and the power unit terminal #A2. Check for a short-circuit to ground
- the signal cable between the power unit terminal #B2 and the blower fan motor positive terminal. Check for a short-circuit to ground.

Check the control signal cable between control module terminal #A3 and power unit terminal #A1. Check for a short-circuit to supply voltage.

Check the diagnostic signal cable between control module terminal #A2 and power unit terminal #A3. Check for an open-circuit. Check for a short-circuit to ground.

Remedy as necessary.

Other information:

- To access or replace the control module, see **CLIMATE CONTROL MODULE (CCM), REPLACING**
- To access the control module or connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access or replace the power unit, see **BLOWER FAN MOTOR/POWER UNIT, REPLACING**
- With the ignition on and the power unit connector disconnected, the voltage between power unit connector terminal #A2 (control module side) and ground must be approximately 13.5 V
- For other values, see **SIGNAL SPECIFICATION**
- see **CHECKING WIRING AND TERMINALS** .

CHECKING THE WIRING

Fig. 7: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

CAUTION: The blower fan motor power unit is very sensitive to short-circuits and excess current. Do not damage the power unit when taking readings. Take readings with the power unit connector disconnected when checking wiring.

Check the signal cable between the fuse and the power unit terminal #A2. Check for an intermittent short-circuit to ground.

Check the signal cable between power unit terminal #B2 and blower fan motor positive terminal. Check for an intermittent short-circuit to ground.

Check the control signal cable between control module terminal #A3 and power unit terminal #A1. Check for an intermittent short-circuit to supply voltage.

Check the diagnostic signal cable between control module terminal #A2 and power unit terminal #A3. Check for an intermittent open-circuit. Check for a short-circuit to ground.

NOTE: If the battery voltage has been interrupted, the blower fan speed must be calibrated. First turn the blower fan speed control to maximum speed and then to minimum speed.

Remedy as necessary.

Other information:

- To access or replace the control module, see **CLIMATE CONTROL MODULE (CCM), REPLACING**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access or replace the power unit, see **BLOWER FAN MOTOR/POWER UNIT, REPLACING**
- With the ignition on and the power unit connector disconnected, the voltage between power unit connector terminal #A2 (control module side) and ground must be approximately 13.5 V
- For other values, see **SIGNAL SPECIFICATION**
- see **CHECKING WIRING AND TERMINALS** .

  Refer to **INFORMATION**

VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 11: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 12: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect the connectors, install the components, etc.
- Ignition on.
- Read the diagnostic trouble codes.

  If the status of the diagnostic trouble code has changed to an intermittent fault this indicates that the fault has been rectified.

Fig. 13: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Has the status of the diagnostic trouble code changed?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-0001: CONFIGURATION FAULT. NON-APPROVED VALUE (2005-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-0001

Condition

Fig. 14: Climate Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects an incorrect configuration parameter in the Car Configuration File.

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I and II.

Substitute Value

- None.

Possible Source

- Incorrect configuration parameter.

Fault symptom[s]

- Misting on the windows and/or door mirrors.
- The function button is not working.
- Blower fan not operating.

- The front seat heating does not function.
- Functions in the infotainment system do not work.

NON-APPROVED: VALUE

CHECKING DATA FOR CAR CONFIGURATION

Fig. 15: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  The climate control module (CCM) has registered that a parameter in the data for car configuration is incorrect.

Check which parameter is incorrect by clicking on the VCT2000 symbol.

The reason for the parameter being incorrect may be that the climate control module (CCM) has been replaced incorrectly.

Switching the climate control module (CCM) between different cars can result in the data in the car configuration being incorrectly adapted.

If this is the case, remedy by replacing the climate control module (CCM) in the correct way.

Other information:

- see **CLIMATE CONTROL, LOCATION OF COMPONENTS**
- see **CLIMATE CONTROL MODULE (CCM), REPLACING**

Fig. 16: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **CHECKING LIN BUS**

CHECKING LIN BUS

IDENTIFICATION

HINT: After replacing the climate control module (CCM), the LIN bus must be checked to identify which damper motors are installed and to identify their function and positions.

Fig. 17: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

Click the VCT2000 symbol to activate the check.

Fig. 18: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 19: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 20: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Check that the relevant diagnostic trouble code (DTC) has switched status from permanent to intermittent fault.

Fig. 21: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Has the status of the diagnostic trouble code (DTC) changed?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-0002: BLOWER FAN MOTOR. SIGNAL TOO HIGH (2003-04)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 22: Identifying Blower Fan Motor & Connector
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) CCM-0002 is stored if the control module registers that the diagnostic signal from the blower fan power unit is above 10 V and the control current to the blower fan power unit is above 8.56 mA.

Substitute Value

- The blower fan cannot start while the fault persists
- The air conditioning (A/C) compressor is not allowed to start.

Possible Source

- Blocked blower fan motor
- Open-circuit in the signal cable
- Open-circuit in the ground lead for the fan motor
- Short-circuit to supply voltage in the ground lead for the blower fan motor
- Short-circuit to ground in the control signal cable
- Open-circuit in the control signal cable

- Short-circuit to supply voltage in the diagnostic signal cable
- Defective blower fan motor or power unit
- Contact resistance.

Fault symptom[s]

- The blower fan does not operate
- Air flow problem
- No cooling from the air conditioning (A/C) system.

SIGNAL TOO HIGH

CHECKING THE BLOWER FAN

Fig. 23: Identifying Ignition ON

Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check that the blower fan functions. Turn the blower fan knob to maximum fan speed.

Is the blower fan working?

- **YES**

  Refer to **CHECKING THE CONNECTORS AND CABLES**

- **NO**

  Refer to **CHECKING THE CONNECTORS**

CHECKING THE CONNECTORS

Fig. 24: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connectors on the climate control module (CCM) (terminals #A2, #A3) and the power unit.

Check for contact resistance and oxidation. In particular, check for any damage

- Reinstall the components, reconnect the connectors etc.
- Ignition on.

NOTE: **If the battery voltage has been interrupted, the blower fan speed must be calibrated. First turn the blower fan speed control to maximum speed and then to minimum speed.**

Check that the blower fan motor functions. Turn the blower fan speed switch.

If the blower fan is now working the cause of the fault was loose connections in the connectors.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access and replace the control module, see **CLIMATE CONTROL MODULE (CCM), REPLACING**
- To access and replace the power unit, see **BLOWER FAN MOTOR/POWER UNIT, REPLACING**.

Courtesy of VOLVO CARS CORPORATION

Fig. 26: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 27: Connector, Black (2-Pin)
Courtesy of VOLVO CARS CORPORATION

Is the blower fan motor functioning?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

CAUTION: The blower fan motor power unit is very sensitive to short-circuits and

excess current. Do not damage the power unit when taking readings. Take readings with the power unit connector disconnected when checking the wiring.

Checking the engine cooling fan (FC) motor

Check that the blower fan rotor can rotate freely in the climate control system and that nothing is blocking it. Check by hand whether the blower fan rotor can rotate freely.

Checking the wiring

Check the ground lead between the power unit terminal #A4 and the ground terminal. Check for a short-circuit to supply voltage.

Check the control signal cable between control module terminal #A3 and power unit terminal #A1. Check for an open-circuit. Check for a short-circuit to ground.

Check the diagnostic signal cable between control module terminal #A2 and power unit terminal #A3. Check for a short-circuit to supply voltage.

NOTE: **If the battery voltage has been interrupted, the blower fan speed must be calibrated. First turn the blower fan speed control to maximum speed and then to minimum speed.**

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access and replace the control module, see **CLIMATE CONTROL MODULE (CCM), REPLACING**
- To access and replace the power unit, see **BLOWER FAN MOTOR/POWER UNIT, REPLACING**

BLOWER FAN MOTOR/POWER UNIT, REPLACING

FAN MOTOR

REMOVAL

Fig. 37: Detaching Floor Carpet At Front
Courtesy of VOLVO CARS CORPORATION

Remove:

- the sill trim panel. See **FRONT DOOR SILL TRIM PANEL**
- the soundproofing panel. See **SOUNDPROOFING PANEL, REPLACING**
- side panel on the center console. See **REPLACING THE SIDE PANEL**
- the glove compartment. See **GLOVE COMPARTMENT, REPLACING**
- any mounting hooks for child seats
- detach the drain hoses from the engine and the filter housing. Move the drain hoses to one side
- detach the floor carpet at the front. Fold the carpet back.

Fig. 38: Identifying Blower Fan Motor Screws
Courtesy of VOLVO CARS CORPORATION

Engine

Remove:

- disconnect the connector
- the 5 screws for the blower fan motor
- detach and remove the blower fan motor.

ENGINE

Fig. 39: Connector Cover From Motor
Courtesy of VOLVO CARS CORPORATION

Remove:

- the connector
- detach the cover from the motor
- the 2 screws on top
- press and pull out the motor and fan hub. Use a screwdriver for example.

INSTALLATION

Install in reverse order.

POWER UNIT

REMOVAL

Fig. 40: Blower Fan Motor With Fan Hub
Courtesy of VOLVO CARS CORPORATION

Remove:

- the blower fan motor with the fan hub as above, see **FAN MOTOR**

Remove:

- the power unit, 2 screws.

INSTALLATION

Install in reverse order.

CCM-0002: EVAPORATOR TEMPERATURE SENSOR. SIGNAL TOO HIGH/SIGNAL MISSING (2005-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-0002

Condition

Fig. 41: Identifying Evaporator Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects a short-circuit to supply voltage in the signal, or an open-circuit in the signal between the control module and the evaporator temperature sensor.

The climate control module (CCM) uses the signal to control the A/C compressor.

At temperatures below 5.5°C the compressor is not permitted to operate because of the risk of freezing.

In normal operation (engine running and A/C selected) the control module can regulate the compressor in the following way based on the evaporator temperature:

- 10°C air conditioning (A/C) compressor on
- 5.5°C air conditioning (A/C) compressor off.

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I and II.

Substitute Value

- The control module assumes a replacement value equivalent to 0°C. The compressor will not then be permitted to operate
- The normal value during operation (engine running and A/C selected) is 5.5-10°C. If the climate control system has not been operating and the engine has cooled, the temperature must correspond to the ambient temperature.

Possible Source

- There is a short-circuit to supply voltage in the signal between the evaporator temperature sensor and the climate control module (CCM)
- Open-circuit in the signal between the evaporator temperature sensor and the climate control module (CCM)
- Contact resistance, oxidation or loose connections in the connectors
- The evaporator temperature sensor does not function.

Fault symptom[s]

- No cooling from the air conditioning (A/C) system.
- Irregular cooling from the air conditioning (A/C) system.
- The air conditioning (A/C) compressor does not start, or runs sporadically.

SIGNAL TOO HIGH/SIGNAL MISSING

CHECKING THE EVAPORATOR TEMPERATURE

Fig. 42: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check that the evaporator temperature is within its permitted range. If the climate control system has not been running and the engine has cooled down, the temperature must be the same as the outside temperature.

  If the temperature is now OK, the fault was caused by contact resistance or loose connections.

  Read off the evaporator temperature by clicking on the VCT2000 symbol.

Fig. 43: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Are the temperatures correct?

- **YES**

  Refer to **CHECKING THE CONNECTORS AND WIRING**

- **NO**

  Refer to **CHECKING THE COMPONENT AND WIRING**

CHECKING THE CONNECTORS AND WIRING

Fig. 44: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector for the climate control module (CCM).

  Check the signal cable between the climate control module (CCM) and the evaporator temperature sensor. Check for a short-circuit to supply voltage.

  Take a reading on the connector for the climate control module (CCM) between terminals #5 (#29) and #16 (#40).

  Check the ground lead between the climate control module (CCM) and the evaporator temperature sensor. Check for a short-circuit to supply voltage.

  Take a reading on the connector for the climate control module (CCM) between terminals #13 (#37) and #16 (#40).

  The voltage must be approximately 0 V.

  Check the signal and ground cables between the climate control module (CCM) and the evaporator temperature sensor. Check for an intermittent open-circuit.

Take a reading between terminals #5 (#29) and #13 (#37) on the connector for the climate control module (CCM).

Check the connectors for contact resistance and oxidation.

Remedy as necessary.

- **Continue**

  Refer to **INFORMATION**

CHECKING THE COMPONENT AND WIRING

Fig. 47: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector for the climate control module (CCM).

  Check the signal cable between the climate control module (CCM) and the evaporator temperature sensor. Check for a short-circuit to supply voltage.

  Take a reading on the connector for the climate control module (CCM) between terminals #5 (#29) and #16 (#40).

  Check the ground lead between the climate control module (CCM) and the evaporator temperature sensor. Check for a short-circuit to supply voltage.

  Take a reading on the connector for the climate control module (CCM) between terminals #13 (#37) and

#16 (#40).

The voltage must be approximately 0 V.

Check the signal and ground cables between the climate control module (CCM) and the evaporator temperature sensor. Check for an open-circuit.

Take a reading between terminals #5 (#29) and #13 (#37) on the connector for the climate control module (CCM).

The resistance must correspond to the resistance for the evaporator temperature sensor.

Check the connectors for contact resistance and oxidation.

Check that the climate control module (CCM) is receiving a correct value from the evaporator temperature sensor by measuring its resistance and comparing with the values in the table.

Remedy as necessary.

Other information:

- see **CONNECTING THE BREAKOUT BOX**
- see **SIGNAL SPECIFICATION**
- see **CLIMATE CONTROL, LOCATION OF COMPONENTS**
- see **CLIMATE CONTROL MODULE (CCM), REPLACING**

Are the temperatures correct?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-0003: BLOWER FAN MOTOR PASSENGER COMPARTMENT TEMPERATURE SENSOR. FAULTY SIGNAL (2003-04)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 52: Identifying Digital Climate Controls Faceplate
Courtesy of VOLVO CARS CORPORATION

If the control module registers that the pulses from the fan motor's pulse sensor fall below a certain frequency, DTC CEM-0003 is stored.

The fan is located on the reverse of the control module. The fan's function is to supply the passenger compartment temperature sensor with air from the passenger compartment to prevent the sensor's measurement values being affected by heat from the surrounding electronics. The fan activates when the passenger compartment temperature exceeds -10°C (14°F).

DTC CCM-0003 can only be diagnosed for Climate control module (CCM) in ECC versions.

Substitute Value

- The pulse sensor for the blower fan motor is switched off.

Possible Source

- Blocked blower fan motor.
- Open circuit on cables between control module and fan motor.
- Cables between the control module and fan motor short-circuited to voltage/ground.
- Damaged fan motor.

Fault symptom[s]

- Cabin temperature does not correspond to value set
- Poor heating in compartment

FAULTY SIGNAL

CHECKING THE BLOWER FAN MOTOR FOR THE PASSENGER COMPARTMENT TEMPERATURE SENSOR

Fig. 53: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Read off the number of pulses from the blower fan motor to the passenger compartment temperature sensor.

  The value must be approximately 12 pulses.

Fig. 54: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the value correct?

- **YES**

  Refer to **CHECKING CONNECTORS AND WIRING**

- **NO**

  Refer to **CHECKING THE FAN MOTOR AND THE PASSENGER COMPARTMENT TEMPERATURE SENSOR**

CHECKING THE FAN MOTOR AND THE PASSENGER COMPARTMENT TEMPERATURE SENSOR

Fig. 55: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Check that the fan is functioning by applying a small, thin piece of paper in front of the ventilation grille for the passenger compartment temperature sensor.

NOTE: **The fan is only activated at passenger compartment temperatures in excess of -10°C (14°F).**

If the paper is sucked against the grille, the fan is working.

Is the fan working?

- **YES**

Refer to **CHECKING CONNECTORS AND WIRING**

- **NO**

  Refer to **CHECKING COMPONENTS AND CONNECTORS**

CHECKING COMPONENTS AND CONNECTORS

- Ignition off
- Disconnect the climate control module (CCM).

  Check that the fan rotates freely and is not blocked by any objects.

  Check the fan connector. Check for contact resistance and oxidation.

  NOTE: From and including w50 2001, the fan is connected directly to connector C with no wiring in-between.

  Try replacing the fan if no other fault is found.

  Remedy as necessary.

  Other information:

  - To access or replace the control module, see **CLIMATE CONTROL MODULE (CCM), REPLACING**
  - To access or replace the blower fan motor, see **BLOWER FAN MOTOR PASSENGER COMPARTMENT TEMPERATURE SENSOR, REPLACING**

- For other values, see **SIGNAL SPECIFICATION**
- see **CHECKING WIRING AND TERMINALS** .

- **Continue**

  Refer to **VERIFICATION**

CHECKING CONNECTORS AND WIRING

NOTE: From and including w50 2001, the fan is connected directly to connector C with no wiring in-between.

Check the wiring between the climate control module (CCM) and fan motor. Check for an intermittent short-circuit to ground and supply voltage.

Check the wiring for the control module. Check for an intermittent open-circuit.

Check connector C. Check for contact resistance and loose connections.

Other information:

- To access or replace the control module, see **CLIMATE CONTROL MODULE (CCM), REPLACING**
- To access or replace the blower fan motor, see **BLOWER FAN MOTOR PASSENGER COMPARTMENT TEMPERATURE SENSOR, REPLACING**
- For other values, see **SIGNAL SPECIFICATION**
- see **CHECKING WIRING AND TERMINALS** .

- **Continue**

  Refer to **INFORMATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 57: Identifying Ignition ON

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on
- Use a thin piece of paper in front of the fan to, see whether the fan is blowing (on the reverse of the control module).

  The fan is functioning if the paper moves.

Is the fan working?

- **YES**

VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-0003: EVAPORATOR TEMPERATURE SENSOR. SIGNAL TOO LOW (2005-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-0003

Condition

Fig. 59: Identifying Evaporator Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects a short-circuit to ground in the signal between the climate control module (CCM) and the evaporator temperature sensor.

The climate control module (CCM) uses the signal to control the A/C compressor.

At temperatures below 5.5°C the compressor is not permitted to operate because of the risk of freezing.

In normal operation (engine running and A/C selected) the control module can regulate the compressor in the following way based on the evaporator temperature:

- 10°C air conditioning (A/C) compressor on
- 5.5°C air conditioning (A/C) compressor off.

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I and II.

Substitute Value

- The control module assumes a replacement value equivalent to 0°C. The compressor will not then be permitted to operate.
- The normal value during operation (engine running and A/C selected) is 5.5-10°C. If the climate control system has not been operating and the engine has cooled, the temperature must correspond to the ambient temperature.

Possible Source

- There is a short-circuit to ground in the signal between the evaporator temperature sensor and the climate control module (CCM)
- The evaporator temperature sensor does not function.

Fault symptom[s]

- No cooling from the air conditioning (A/C) system.
- Irregular cooling from the air conditioning (A/C) system.
- The air conditioning (A/C) compressor does not start, or runs sporadically.

SIGNAL TOO LOW

CHECKING THE EVAPORATOR TEMPERATURE

Fig. 60: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check that the evaporator temperature is within its permitted range. If the climate control system has not been running and the engine has cooled down, the temperature must be the same as the outside temperature.

  The fault is intermittent if the outside temperature is now correct.

  Read off the evaporator temperature by clicking on the VCT2000 symbol.

Fig. 61: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Are the temperatures correct?

- **YES**

  Refer to **CHECKING THE WIRING**

- **NO**

  Refer to **CHECKING THE COMPONENT AND WIRING**

CHECKING THE WIRING

Fig. 62: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector for the climate control module (CCM).

  Check the signal cable between the climate control module (CCM) and the evaporator temperature sensor. Check for an intermittent short-circuit to ground.

  Take a reading on the connector for the climate control module (CCM) between terminals #5 (#29) and #16 (#40).

  Remedy as necessary.

  Other information:

  - see **CONNECTING THE BREAKOUT BOX**
  - see **SIGNAL SPECIFICATION**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-0004: COMPRESSOR. FAULTY SIGNAL (2003-04)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

If the air conditioning (A/C) compressor has been in operation for its maximum run time, it is disengaged for 3 minutes. The run time is a function of the outside temperature. It then starts again. Diagnostic trouble code (DTC) CCM-0004 is stored if this happens 3 times. The counter is reset if the ignition key is turned to position 1. The A/C compressor can then run again.

Substitute Value

- None.

Possible Source

- The CAN-bus displays an incorrect configuration ID.
- Low coolant level.
- Low pressure in the air conditioning (A/C) system.

Fault symptom[s]

- The air conditioning (A/C) system does not operate.
- The air conditioning (A/C) compressor does not start, or runs sporadically.
- Sporadic cooling from the air conditioning (A/C) system.

FAULTY SIGNAL

CHECKING THE REFRIGERANT

Check the level of the refrigerant and that there are no leaks in the climate control system.

Remedy as necessary.

NOTE: Always disconnect the battery lead when working on the climate control system. See BATTERY, REPLACING .

Other information

- For visual and physical checks, see **VISUAL AND PHYSICAL CHECK**
- To fill with refrigerant, see **REFRIGERANT, FILLING**
- For vacuum pumping, see **VACUUM PUMPING**
- To leak trace using an electronic leak tracer, see **LEAK TRACING, ELECTRONIC LEAK TRACER**
- To leak trace using fluorescent tracing agent and an UV flashlight, see **LEAK TRACING, FLUORESCENT TRACING AGENT/UV LAMP**
- To fill with fluorescent tracing agent, see **FILLING WITH FLUORESCENT TRACING AGENT WITH THE REFRIGERANT** .

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  FAULT NOT FOUND: Troubleshooting has been completed.

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 70: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 71: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

NOTE: **Wait at least 1 minute before "Ignition on". This is to allow the climate control module (CCM) to carry out a new diagnostic.**

- Reinstall the connectors, components etc.
- Ignition on
- Read off diagnostic trouble codes (DTCs).

The fault is no longer present if the status of the diagnostic trouble code (DTC) has changed to intermittent.

Fig. 72: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Does the status change?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-0004: PASSENGER COMPARTMENT TEMPERATURE SENSOR. SIGNAL TOO HIGH/SIGNAL MISSING (2005-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-0004

Condition

Fig. 73: Identifying Interior Temperature Sensor Air Inlet
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects an open-circuit in the signal between the climate control module (CCM) and the passenger compartment temperature sensor, or a short-circuit to supply voltage in the signal.

The climate control module (CCM) uses the signal to control the passenger compartment temperature.

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I and II.

The diagnostic trouble code (DTC) can only be diagnosed for the electronic climate control module (CCM)

(ECC).

Substitute Value

- The control module adopts a substitute value corresponding to 25°C
- The normal value is the passenger compartment temperature.

Possible Source

- There is a short-circuit to supply voltage in the signal between the passenger compartment temperature sensor and the climate control module (CCM)
- Open-circuit in the signal between the passenger compartment temperature sensor and the climate control module (CCM)
- Contact resistance, oxidation or loose connections in the connectors
- The passenger compartment temperature sensor is not functioning.

Fault symptom[s]

- The passenger compartment temperature does not correspond to the set position.

SIGNAL TOO HIGH/SIGNAL MISSING

CHECKING PASSENGER COMPARTMENT TEMPERATURE SENSOR

Fig. 74: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Check that the value from the sensor is within its permitted range. Use a thermometer.

  Alternately blow hot and cold air onto the sensor. Check that the value displayed on the sensor changes.

Shine a light through the grille over the passenger compartment temperature sensor. Check for anything that could obstruct the airflow through the pipe.

Do not damage the sensor. The sensor is located just inside the grille.

Remedy as necessary.

Other information:

- see **CLIMATE CONTROL MODULE (CCM), REPLACING**

Fig. 75: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 76: Identifying Interior Temperature Sensor Air Inlet
Courtesy of VOLVO CARS CORPORATION

Is the sensor value correct?

- **YES**

  Refer to **FAULT-TRACING INFORMATION**

- **NO**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

The fault is probably a defective passenger compartment temperature sensor. This type of fault means that the

entire control module must be replaced. The passenger compartment temperature sensor cannot be replaced separately.

Replace the control module. See **CLIMATE CONTROL MODULE (CCM), REPLACING**

- **Continue**

  Refer to **CHECKING LIN BUS**

FAULT-TRACING INFORMATION

The fault has probably occurred as a result of a damaged power circuit in the climate control system. If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults may be caused by interference at start up of the control module. Intermittent faults may also be caused by other types of intermittent faults. The fault is evaluated depending on how it occurs. If the fault recurs, replace the control module.

- **Continue**

  Refer to **INFORMATION**

LIMIT POSITIONS FOR DAMPER MOTOR SELF-ADJUSTMENT

CHOICE OF CLIMATE CONTROL

1. Electronic climate control. Refer to **LIMIT POSITIONS FOR DAMPER MOTOR SELF-ADJUSTMENT**.
2. Manual climate control (MCC). Refer to **LIMIT POSITIONS FOR DAMPER MOTOR SELF-ADJUSTMENT**

LIMIT POSITIONS FOR DAMPER MOTOR SELF-ADJUSTMENT

HINT: Carry out self adjustment to define the shutter motor limit positions after replacing the control module or shutter motors, and when a shutter motor or link has been removed.

Fig. 77: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Activate the self-adjustment. Wait at least 30 seconds.

  Ignition off for at least 1 minute.

  Start the engine.

  Refer to **VERIFICATION**

CCM-0005: EVAPORATOR TEMPERATURE SENSOR. SIGNAL TOO HIGH (2003-04)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

Fig. 86: Identifying Evaporator Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

If control unit registers that signal from evaporator temperature sensor is more than 97% of excitation voltage (approximately 5 V), diagnostic trouble code CCM-0005 is displayed.

Substitute Value

- Control unit assumes a substitute value equivalent to approximately 0°C (32°F).

Possible Source

- Signal wire has open circuit or short circuit to voltage supply
- Contact resistance, oxidation or loose contact in connector
- Ground connection has open circuit or short circuit to voltage supply
- Defective evaporator temperature sensor.

Fault symptom[s]

- No cool air from A/C-system
- A/C compressor does not work or works intermittently
- Intermittent function of A/C-system.

SIGNAL TOO HIGH

CHECKING THE EVAPORATOR TEMPERATURE

Fig. 87: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check that the evaporator temperature is within its permitted range. If the climate control system has not been running and the engine has cooled down, the temperature should be the same as the outside temperature.

  If temperature is now OK the fault was caused by loose connections in the connectors.

Fig. 88: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Are the temperatures correct?

- **YES**

  Refer to **CHECKING CONNECTORS AND WIRING**

- **NO**

  Refer to **CHECKING THE EVAPORATOR TEMPERATURE SENSOR**

CHECKING THE EVAPORATOR TEMPERATURE SENSOR

Fig. 89: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check that the control module receives a correct value from the evaporator temperature sensor by measuring its resistance and comparing with the values in the table.

  Measure the resistance between control module terminals #B1 (#1) and #B15 (#15). This value must correspond with the resistance of the evaporator temperature sensor.

  Other information:

  - To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
  - To access or replace the control module, see **DASHBOARD ENVIRONMENT PANEL (INCLUDING CLIMATE CONTROL MODULE (CCM)), REPLACING**

- For resistance values, see **COMPONENT RESISTANCE VALUES** .

Fig. 90: Breakout Box

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-0005: PASSENGER COMPARTMENT TEMPERATURE SENSOR. SIGNAL TOO HIGH/SIGNAL MISSING (2005-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-0005

Condition

Fig. 102: Identifying Interior Temperature Sensor Air Inlet
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects a short-circuit to ground in the signal between the climate control module (CCM) and the passenger compartment temperature sensor.

The climate control module (CCM) uses the signal to control the passenger compartment temperature.

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I and II.

The diagnostic trouble code (DTC) can only be diagnosed for the electronic climate control module (CCM) (ECC).

Substitute Value

- The control module adopts a substitute value corresponding to 25°C
- The normal value is the passenger compartment temperature.

Possible Source

- There is a short-circuit to ground in the signal between the passenger compartment temperature sensor and the climate control module (CCM)
- The passenger compartment temperature sensor is not functioning.

Fault symptom[s]

- The passenger compartment temperature does not correspond to the set position.

SIGNAL TOO HIGH/SIGNAL MISSING

see **SIGNAL TOO HIGH/SIGNAL MISSING**

CCM-0006: BLOWER FAN MOTOR PASSENGER COMPARTMENT TEMPERATURE SENSOR. SIGNAL TOO HIGH/SIGNAL MISSING (2005-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-0006

Condition

Fig. 103: Identifying Interior Temperature Sensor Air Inlet
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects an open-circuit in the power supply cable to the blower fan for the passenger compartment temperature sensor, or an open-circuit in the ground lead from the blower fan to the control module.

The function of the blower fan is to supply the passenger compartment temperature sensor with air from the passenger compartment. This prevents the sensor reading from being affected by heat from the surrounding electronics.

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I and II.

The diagnostic trouble code (DTC) can only be diagnosed for the electronic climate control module (CCM) (ECC).

Substitute Value

- None.

Possible Source

- Open-circuit in the power supply cable between the climate control module (CCM) and the blower fan for the passenger compartment temperature sensor
- Open-circuit in the ground lead between the blower fan for the passenger compartment temperature sensor and the climate control module (CCM)
- Contact resistance, oxidation or loose connections in the connectors
- The blower fan for the passenger compartment temperature sensor is not functioning.

Fault symptom[s]

- The passenger compartment temperature does not correspond to the set position.
- Poor heating in the passenger compartment.

SIGNAL TOO HIGH/SIGNAL MISSING

CHECKING THE FAN MOTOR AND THE PASSENGER COMPARTMENT TEMPERATURE SENSOR

Fig. 104: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Check that the fan is functioning. Place a small, thin piece of paper in front of the ventilation grille for the passenger compartment temperature sensor.

  If the paper is sucked against the grille, the fan is working.

NOTE: **The fan is only activated at passenger compartment temperatures in excess of -10°C (14°F).**

Is the fan working?

- **YES**

  Refer to **CHECKING CONNECTORS AND WIRING**

- **NO**

  Refer to **CHECKING COMPONENTS AND CONNECTORS**

CHECKING COMPONENTS AND CONNECTORS

Fig. 105: Identifying Ignition ON

Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the climate control module (CCM).

  Check that the fan rotates freely and is not blocked by any objects.

  Check the fan connector. Check for contact resistance and oxidation.

  NOTE: From and including w50 2001, the fan is connected directly to connector C with no wiring in-between.

  Try replacing the fan if no other fault is found.

  Remedy as necessary.

  Other information:

  - To access and replace the control module, see **CLIMATE CONTROL MODULE (CCM), REPLACING**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-0006: EVAPORATOR TEMPERATURE SENSOR. SIGNAL TOO LOW (2003-04)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 108: Identifying Evaporator Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) CCM-0006 is stored if the control module registers that the signal from the evaporator temperature sensor is below 2% of the supply voltage (approximately 5 V).

Condition

- The control module adopts a substitute value corresponding to approximately 0 °C.

Possible Source

- Short-circuit to ground in the signal cable
- Defective evaporator temperature sensor.

Fault symptom[s]

- No cooling from the air conditioning (A/C) system
- The air conditioning (A/C) compressor does not start, or runs sporadically
- Irregular cooling from the air conditioning (A/C) system.

SIGNAL TOO LOW

CHECKING THE EVAPORATOR TEMPERATURE

Fig. 109: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check that the evaporator temperature is within its permitted range. If the climate control system has not been running and the engine has cooled down, the temperature must be the same as the outside temperature.

  If the temperature is now, OK the fault was caused by an intermittent short-circuit to ground.

Fig. 110: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Are the temperatures correct?

- **YES**

  Refer to **CHECKING THE WIRING**

- **NO**

  Refer to **CHECKING RESISTANCE VALUES**

CHECKING RESISTANCE VALUES

Fig. 111: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check that the climate control module (CCM) is receiving a correct value from the evaporator temperature sensor by measuring its resistance and comparing with the values in the table.

  Measure the resistance between climate control module (CCM) connector terminals #B1 (#1) and #B15 (#15). This value must correspond with the resistance of the evaporator temperature sensor.

  Other information:

  - To access or replace the control module, see **CLIMATE CONTROL MODULE (CCM), REPLACING**
  - To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
  - To access or replace the evaporator temperature sensor, see **TEMPERATURE SENSOR EVAPORATOR, REPLACING**
  - For the resistance values, see **COMPONENT RESISTANCE VALUES**
  - For other values, see **SIGNAL SPECIFICATION**
  - see **CHECKING WIRING AND TERMINALS** .

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-0007: PASSENGER COMPARTMENT TEMPERATURE SENSOR. FAULTY SIGNAL (2003-04)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 122: Identifying Interior Temperature Sensor Air Inlet
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) CCM-0007 is stored if the control module registers that the signal from the

passenger compartment temperature sensor is above 97% or below 2% of supply voltage (approximately 5 V).

Substitute Value

- The control module adopts a substitute value corresponding to approximately 25 °C.

Possible Source

- Defective power circuit
- Defective passenger compartment temperature sensor.

Fault symptom[s]

- The passenger compartment temperature does not correspond to the set value.

FAULTY SIGNAL

CHECKING THE PASSENGER COMPARTMENT TEMPERATURE SENSOR

Fig. 123: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Check that the temperature corresponds to the ambient temperature.

  Alternately blow hot and cold air onto the sensor. Check that the value displayed on the sensor changes.

  Shine a light through the grille over the passenger compartment temperature sensor. Check for anything that could obstruct the airflow through the pipe.

  Take care not to damage the sensor. The sensor is located just inside the grille.

Remedy as necessary.

Other information:

- To access or replace the climate control system, see **CLIMATE CONTROL MODULE (CCM), REPLACING** .

Fig. 124: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 125: Identifying Interior Temperature Sensor Air Inlet
Courtesy of VOLVO CARS CORPORATION

Is the sensor value correct?

- **YES**

  Refer to **FAULT-TRACING INFORMATION**

- **NO**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

The fault is probably a defective passenger compartment temperature sensor. This type of fault means that the entire control module must be replaced. The passenger compartment temperature sensor cannot be replaced separately.

Replace the control module. See **CLIMATE CONTROL MODULE (CCM), REPLACING** .

- **Continue**

  Refer to **LIMIT POSITIONS FOR DAMPER MOTOR SELF-ADJUSTMENT**

FAULT-TRACING INFORMATION

The fault has probably occurred as a result of a defective power circuit in the climate control system. If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up of the control module or may be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs. If the fault recurs, replace the control module.

- **Continue**

Refer to **INFORMATION**

LIMIT POSITIONS FOR DAMPER MOTOR SELF-ADJUSTMENT

CHOICE OF CLIMATE CONTROL

1. Electronic climate control (ECC). Refer to **LIMIT POSITIONS FOR DAMPER MOTOR SELF-ADJUSTMENT**.
2. Manual climate control (MCC)/Standard (STD). Refer to **LIMIT POSITIONS FOR DAMPER MOTOR SELF-ADJUSTMENT**.

LIMIT POSITIONS FOR DAMPER MOTOR SELF-ADJUSTMENT

HINT: After replacing the control module or shutter motors, and when a shutter motor or link has been removed, carry out self adjustment to define the shutter motor limit positions.

Fig. 126: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

Activate the self-adjustment. Wait at least 30 seconds.

Ignition off for at least 1 minute.

Start the engine.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-0008: SUN SENSOR. SIGNAL TOO HIGH (2003-04)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 133: Identifying Sun Sensor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) CCM-0008 is stored if the control module registers that the signal from the sun sensor is above 98% of supply voltage (approximately 5 V).

The diagnostic trouble code (DTC) can only be diagnosed for the electronic climate control module (CCM) (ECC).

Substitute Value

- The control module adopts a substitute value corresponding to approximately 20% (200 W/m^2) of maximum solar heat.

Possible Source

- Contact resistance, oxidation or loose connections in the connectors
- Open-circuit in the signal cable between the control module and the sun sensor
- Short-circuit to supply voltage in the signal cable between the control module and the sun sensor
- Short-circuit to supply voltage in the ground lead between the control module and the sun sensor

- Open-circuit in the ground lead between the control module and the sun sensor
- Defective sun sensor.

Fault symptom[s]

- The passenger compartment temperature is not reduced when sun intensity is high.

SIGNAL TOO HIGH

CHECKING THE FUNCTION

Fig. 134: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

Check the sun sensor signal: Vary the intensity of the light that it detects. Cover the sun sensor with your hand to obtain the minimum signal, approximately 0 W/m^2 .

Then aim a strong light source (for example a flashlight) at the sun sensor from close range to increase the signal.

HINT: If the signal from the sun sensor is a steady 200 W/m^2 either there is an open-circuit in the cable or the sun sensor is defective.

Click on the VCT2000 symbol to read off the sun intensity.

Fig. 135: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 136: Identifying Sun Sensor
Courtesy of VOLVO CARS CORPORATION

NOTE: **The graphic only shows the method. The appearance of the sun sensor can vary between different models.**

Does the value change?

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-000D: RECIRCULATION DAMPER MOTOR. SIGNAL TOO LOW (2003-04)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 189: Identifying Left Temperature Damper Motor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) CCM-000D is stored if the control module registers too low a signal from the recirculation damper motor.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in the signal cable between the control module and the damper motor
- Open-circuit in the signal cable between the control module and the damper motor
- Contact resistance, oxidation or loose connections in the connectors

- Defective damper motor.

Fault symptom[s]

- Air flow problem.

SIGNAL TOO LOW

CHECKING DAMPER MOTOR CONTROL

Fig. 190: Belt Routing/Engine Idling - Volvo

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-0011: CONTROL MODULE. INTERNAL FAULT (2005-12)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-0011

Condition

Fig. 257: Climate Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects an internal memory fault.

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I and II.

Substitute Value

- None.

Possible Source

- Internal memory fault in the climate control module (CCM).

Fault symptom[s]

- The customer settings for the climate disappear.

INTERNAL FAULT

REPLACING THE COMPONENT

The climate control module (CCM) has registered an internal fault.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults may be caused by interference at start up of the climate control module (CCM). Intermittent faults may also be caused by other types of intermittent faults. The fault is evaluated depending on how it occurs. If the fault recurs, replace the climate control module (CCM).

Replace the climate control module (CCM) in the event of a permanent fault:

see **CLIMATE CONTROL MODULE (CCM), REPLACING**

Remedy as necessary.

Fig. 258: Identifying Manual Climate Control Module
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

CCM-0011: LEFT TEMPERATURE DAMPER MOTOR. SIGNAL TOO HIGH (2003-04)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 259: Identifying Left Temperature Damper Motor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) CCM-0011 is stored if the control module registers too high a signal from the left temperature damper motor.

Substitute Value

- The control module does not allow the damper motor to be activated while the fault persists.

Possible Source

- Short-circuit to ground in the signal cable
- Defective damper motor.

Fault symptom[s]

- The passenger compartment temperature does not correspond to the set value.

SIGNAL TOO HIGH

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

Check which of the following alternatives apply when reading off diagnostic trouble codes (DTCs) for the climate control module (CCM).

Alternative 1

If the diagnostic trouble code (DTC) is stored with one or more other diagnostic trouble codes (DTCs), and the diagnostic trouble code (DTC) for direction control, this indicates a fault in the matrix network governing direction control.

The damper motors are connected in series in the matrix network governing direction control. In the event of a fault in the network, a diagnostic trouble code (DTC) will be stored for all damper motors which are in motion at the same time. Refer to **CHECKING THE WIRING**

The following are probable fault causes:

- short-circuit between the wiring in the matrix network
- short-circuit to supply voltage
- short-circuit to ground
- damaged damper motor.

Check if the diagnostic trouble code (DTC) has been stored with any of the following diagnostic trouble codes (DTCs):

- CCM-0012
- CCM-0013
- CCM-0014
- CCM-0015
- CCM-0016

- CCM-0017
- CCM-0018

Alternative 2

Check whether the diagnostic trouble code (DTC) has only been stored with the diagnostic trouble codes (DTCs) for direction control, CCM-0017 and CCM-0018. Refer to **CHECKING COMPONENTS AND WIRING**.

CHECKING COMPONENTS AND WIRING

Check the signal cable between control module terminal #B18 and damper motor terminal #1. Check for a short-circuit to ground.

Check the damper motor resistance. The resistance must be 46 ohms. Take readings between the damper motor terminal pins.

Remedy as necessary.

Other information:

- see **CONNECTING THE BREAKOUT BOX** .
- see **CLIMATE CONTROL MODULE (CCM), REPLACING** .
- see **DAMPER MOTOR TEMPERATURE, REPLACING** .
- see **SIGNAL SPECIFICATION** .
- see **CHECKING WIRING AND TERMINALS** .

  Refer to **EQUIPMENT**

CHECKING THE WIRING

Fig. 263: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect connector B on the climate control module (CCM).
- Ignition on

  Check the matrix wiring. Check for a short-circuit to supply voltage. Check for a short-circuit to ground.

  Take readings between the following terminals on connector B and ground:

  - #B11 (#11)
  - #B12 (#12)
  - #B13 (#13)
  - #B14 (#14)

Check whether there is an internal short-circuit in the matrix cables. Take pairs of readings between all the terminals #B11-#B14 on connector B.

Other information:

- see **CONNECTING THE BREAKOUT BOX** .
- see **CLIMATE CONTROL MODULE (CCM), REPLACING** .
- see **DAMPER MOTOR TEMPERATURE, REPLACING** .
- see **SIGNAL SPECIFICATION** .
- see **CHECKING WIRING AND TERMINALS** .

Was a fault detected?

- **YES**

  Refer to **EQUIPMENT**

- **NO**

  Refer to **CHECKING THE COMPONENT**

CHECKING THE COMPONENT

Fig. 265: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on

  Check the damper motors. Check for internal short-circuits as follows:

- Remove the soundproofing panel to access the damper motor connectors.
- Erase the diagnostic trouble codes (DTCs) for the climate control module (CCM).
- First disconnect the connector from a damper motor. Leave the other damper motors connected.

NOTE: Take care when disconnecting the connectors for the damper motors to prevent loose connections.

- Activate the controls (right and left-hand temperature knobs, defroster, air distribution selector, recirculation) on the climate control module (CCM) to operate all the damper motors.
- Read off the diagnostic trouble codes (DTCs) from the climate control module (CCM). If the diagnostic trouble codes (DTCs) have not recurred, there is an internal fault in the disconnected damper motor.
- If the diagnostic trouble codes (DTCs) recur, continue fault tracing. Reconnect the disconnected damper motor and disconnect the next damper motor. Repeat the procedure by erasing all diagnostic trouble codes (DTCs) and running the damper motors until the faulty damper motor has been identified.

Other information:

- see **CONNECTING THE BREAKOUT BOX** .
- see **CLIMATE CONTROL MODULE (CCM), REPLACING** .
- see **DAMPER MOTOR TEMPERATURE, REPLACING** .
- see **SIGNAL SPECIFICATION** .

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-0012: RIGHT TEMPERATURE DAMPER MOTOR. SIGNAL TOO HIGH (2003-04)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 278: Identifying Left Temperature Damper Motor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) CCM-0012 is stored if the control module registers too high a signal from the right temperature damper motor.

Substitute Value

- The control module does not allow the damper motor to be activated while the fault persists.

Possible Source

- Short-circuit to ground in the signal cable
- Defective damper motor.

Fault symptom[s]

- The passenger compartment temperature does not correspond to the set value.

SIGNAL TOO HIGH

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

Check which of the following alternatives apply when reading off diagnostic trouble codes (DTCs) for the climate control module (CCM).

Alternative 1

If the diagnostic trouble code (DTC) is stored with one or more other diagnostic trouble codes (DTCs), and the diagnostic trouble code (DTC) for direction control, this indicates a fault in the matrix network governing direction control.

The damper motors are connected in series in the matrix network governing direction control. In the event of a fault in the network, a diagnostic trouble code (DTC) will be stored for all damper motors which are in motion at the same time. Refer to **CHECKING THE WIRING**.

The following are probable fault causes:

- short-circuit between the wiring in the matrix network
- short-circuit to supply voltage
- short-circuit to ground
- damaged damper motor.

Check if the diagnostic trouble code (DTC) has been stored with any of the following diagnostic trouble codes (DTCs):

- CCM-0011
- CCM-0013
- CCM-0014
- CCM-0015
- CCM-0016
- CCM-0017
- CCM-0018

Alternative 2

Check whether the diagnostic trouble code (DTC) has only been stored with the diagnostic trouble codes (DTCs) for direction control, CCM-0017 and CCM-0018. Refer to **CHECKING COMPONENTS AND WIRING**.

CHECKING COMPONENTS AND WIRING

Check the signal cable between control module terminal #B19 and damper motor terminal #1. Check for a short-circuit to ground.

Check the damper motor resistance. The resistance must be 46 ohms. Take readings between the damper motor terminal pins.

Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-0013: RECIRCULATION DAMPER MOTOR. SIGNAL TOO HIGH. PERMANENT FAULT (2003-04)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 297: Identifying Left Temperature Damper Motor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) CCM-0013 is stored if the control module registers too high a signal from the recirculation damper motor.

Substitute Value

- The control module does not allow the damper motor to be activated while the fault persists.

Possible Source

- Short-circuit to ground in the signal cable
- Defective damper motor.

Fault symptom[s]

- Air flow problem.

SIGNAL TOO HIGH

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

Check which of the following alternatives apply when reading off diagnostic trouble codes (DTCs) for the climate control module (CCM).

Alternative 1

If the diagnostic trouble code (DTC) is stored with one or more other diagnostic trouble codes (DTCs), and the diagnostic trouble code (DTC) for direction control, this indicates a fault in the matrix network governing direction control.

The damper motors are connected in series in the matrix network governing direction control. In the event of a fault in the network, a diagnostic trouble code (DTC) will be stored for all damper motors which are in motion at the same time. Refer to **CHECKING THE WIRING**

The following are probable fault causes:

- short-circuit between the wiring in the matrix network
- short-circuit to supply voltage
- short-circuit to ground
- damaged damper motor.

Check to, see if the diagnostic trouble code (DTC) has been stored with any of the following diagnostic trouble codes (DTCs):

- CCM-0011
- CCM-0012
- CCM-0014
- CCM-0015
- CCM-0016
- CCM-0017
- CCM-0018

Alternative 2

Check whether the diagnostic trouble code (DTC) has only been stored with the diagnostic trouble codes (DTCs) for direction control, CCM-0017 and CCM-0018. Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Check the signal cable between control module terminal #B21 and damper motor terminal #1. Check for a short-circuit to ground.

Check the damper motor resistance. The resistance must be 46 ohms. Take readings between the damper motor terminal pins.

Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-0014: DAMPER MOTOR, FLOOR AND VENTILATION. SIGNAL TOO HIGH (2003-04)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 316: Identifying Left Temperature Damper Motor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) CCM-0014 is stored if the control module registers too high a signal from the floor/ventilation damper motor.

Substitute Value

- The control module does not allow the damper motor to be activated while the fault persists.

Possible Source

- Short-circuit to ground in the signal cable
- Defective damper motor.

Fault symptom[s]

- Air flow problem.

SIGNAL TOO HIGH

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

Check which of the following alternatives apply when reading off diagnostic trouble codes (DTCs) for the climate control module (CCM).

Alternative 1

If the diagnostic trouble code (DTC) is stored with one or more other diagnostic trouble codes (DTCs), and the diagnostic trouble code (DTC) for direction control, this indicates a fault in the matrix network governing direction control.

The damper motors are connected in series in the matrix network governing direction control. In the event of a fault in the network, a diagnostic trouble code (DTC) will be stored for all damper motors which are in motion at the same time. Refer to **CHECKING THE WIRING**

The following are probable fault causes:

- short-circuit between the wiring in the matrix network
- short-circuit to supply voltage
- short-circuit to ground
- damaged damper motor.

Check if the diagnostic trouble code (DTC) has been stored with any of the following diagnostic trouble codes (DTCs):

- CCM-0011
- CCM-0012
- CCM-0013
- CCM-0015
- CCM-0016
- CCM-0017
- CCM-0018

Alternative 2

Check whether the diagnostic trouble code (DTC) has only been stored with the diagnostic trouble codes (DTCs) for direction control, CCM-0017 and CCM-0018. Refer to **CHECKING COMPONENTS AND WIRING**.

CHECKING COMPONENTS AND WIRING

Check the signal cable between control module terminal #B22 and damper motor terminal #1. Check for a short-circuit to ground.

Check the damper motor resistance. The resistance must be 46 ohms. Take readings between the damper motor terminal pins.

Remedy as necessary.

Other information:

- see **CONNECTING THE BREAKOUT BOX** .
- see **CLIMATE CONTROL MODULE (CCM), REPLACING** .
- see **DAMPER MOTOR TEMPERATURE, REPLACING** .
- see **SIGNAL SPECIFICATION** .

- Ignition off
- Disconnect connector B on the climate control module (CCM).
- Ignition on

  Check the matrix wiring. Check for a short-circuit to supply voltage. Check for a short-circuit to ground.

  Take readings between the following terminals on connector B and ground:

  - #B11 (#11)
  - #B12 (#12)
  - #B13 (#13)
  - #B14 (#14)

Check whether there is an internal short-circuit in the matrix cables. Take pairs of readings between all the terminals #B11-#B14 on connector B.

Other information:

- Ignition on

  Check the damper motors. Check for internal short-circuits as follows:

- Remove the soundproofing panel to access the damper motor connectors.
- Erase the diagnostic trouble codes (DTCs) for the climate control module (CCM).
- First disconnect the connector from a damper motor. Leave the other damper motors connected.

NOTE: Take care when disconnecting the connectors for the damper motors to prevent loose connections.

- Activate the controls (right and left-hand temperature knobs, defroster, air distribution selector, recirculation) on the climate control module (CCM) to operate all the damper motors.
- Read off the diagnostic trouble codes (DTCs) from the climate control module (CCM). If the diagnostic trouble codes (DTCs) have not recurred, there is an internal fault in the disconnected damper motor.
- If the diagnostic trouble codes (DTCs) recur, continue fault tracing. Reconnect the disconnected damper motor and disconnect the next damper motor. Repeat the procedure by erasing all diagnostic trouble codes (DTCs) and running the damper motors until the faulty damper motor has been identified.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-0015: DAMPER MOTOR DEFROSTER. SIGNAL TOO HIGH (2003-04)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 335: Identifying Left Temperature Damper Motor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) CCM-0015 is stored if the control module registers too high a signal from the defroster damper motor.

Substitute Value

- The control module does not allow the damper motor to be activated while the fault persists.

Possible Source

- Short-circuit to ground in the signal cable
- Defective damper motor.

Fault symptom[s]

- Air flow problem.

SIGNAL TOO HIGH

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

Check which of the following alternatives apply when reading off diagnostic trouble codes (DTCs) for the climate control module (CCM).

Alternative 1

If the diagnostic trouble code (DTC) is stored with one or more other diagnostic trouble codes (DTCs), and the diagnostic trouble code (DTC) for direction control, this indicates a fault in the matrix network governing direction control.

The damper motors are connected in series in the matrix network governing direction control. In the event of a fault in the network, a diagnostic trouble code (DTC) will be stored for all damper motors which are in motion at the same time. Refer to **CHECKING THE WIRING**

The following are probable fault causes:

- short-circuit between the wiring in the matrix network
- short-circuit to supply voltage
- short-circuit to ground
- damaged damper motor.

Check if the diagnostic trouble code (DTC) has been stored with any of the following diagnostic trouble codes (DTCs):

- CCM-0011
- CCM-0012
- CCM-0013
- CCM-0014
- CCM-0016
- CCM-0017
- CCM-0018

Alternative 2

Check whether the diagnostic trouble code (DTC) has only been stored with the diagnostic trouble codes (DTCs) for direction control, CCM-0017 and CCM-0018. Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Check the signal cable between control module terminal #B20 and damper motor terminal #1. Check for a short-circuit to ground.

Check the damper motor resistance. The resistance must be 46 ohms. Take readings between the damper motor terminal pins.

Remedy as necessary.

Other information:

CCM-0016: AIR DISTRIBUTION DAMPER MOTOR. SIGNAL TOO HIGH (2003-04)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 354: Identifying Left Temperature Damper Motor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) CCM-0016 is stored if the climate control module (CCM) registers too high a signal from the air distribution damper motor.

Substitute Value

- The control module does not allow the damper motor to be activated while the fault persists.

Possible Source

- Short-circuit to ground in the signal cable
- Defective damper motor.

Fault symptom[s]

- Air flow problem.

SIGNAL TOO HIGH

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

Check which of the following alternatives apply when reading off diagnostic trouble codes (DTCs) for the climate control module (CCM).

Alternative 1 Refer to **CHECKING THE WIRING**

If the diagnostic trouble code (DTC) is stored with one or more other diagnostic trouble codes (DTCs), and the diagnostic trouble code (DTC) for direction control, this indicates a fault in the matrix network governing direction control.

The damper motors are connected in series in the matrix network governing direction control. In the event of a fault in the network, a diagnostic trouble code (DTC) will be stored for all damper motors which are in motion at the same time.

The following are probable fault causes:

- short-circuit between the wiring in the matrix network
- short-circuit to supply voltage
- short-circuit to ground
- damaged damper motor.

Check to, see if the diagnostic trouble code (DTC) has been stored with any of the following diagnostic trouble codes (DTCs):

- CCM-0011
- CCM-0012
- CCM-0013
- CCM-0014
- CCM-0015
- CCM-0017
- CCM-0018

Alternative 2 Refer to **CHECKING COMPONENTS AND WIRING**

Check whether the diagnostic trouble code (DTC) has only been stored with the diagnostic trouble codes (DTCs) for direction control, CCM-0017 and CCM-0018.

CHECKING COMPONENTS AND WIRING

Check the signal cable between control module terminal #B22 and damper motor terminal #1. Check for a short-circuit to ground.

Check the damper motor resistance. The resistance must be 46 ohms. Take readings between the damper motor terminal pins.

Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

HVAC

Climate Units - Diagnostic Trouble Codes And Associated Procedures

CCM-0017: DAMPER MOTOR DIRECTION CONTROL. SIGNAL TOO LOW (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 1: Climate Control Module
Courtesy of VOLVO CARS CORPORATION

The control module stores diagnostic trouble code (DTC) CCM-0017 after it has detected the diagnostic trouble code (DTC) 5 times within a 10 second interval. After diagnostic trouble code (DTC) CCM-0017 has been stored 5 times, diagnostic trouble code (DTC) CCM-0018 is also stored.

If one or more damper motors is in motion when diagnostic trouble code (DTC) CCM-0017 is stored, a diagnostic trouble code (DTC) for the appropriate damper motor will also be stored (CCM-0011-CCM-0016).

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the signal cable
- Short-circuit to supply voltage in the ground lead.

Fault symptom[s]

- Air flow problem
- The passenger compartment temperature does not correspond to the set value.

SIGNAL TOO LOW

FAULT-TRACING INFORMATION

INFORMATION

The diagnostic trouble code (DTC) is an information trouble code and never occurs alone. Therefore fault-trace for another diagnostic trouble code (DTC).

CCM-0018: DAMPER MOTOR DIRECTION CONTROL. SIGNAL TOO HIGH (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 2: Climate Control Module
Courtesy of VOLVO CARS CORPORATION

If the control module has detected diagnostic trouble code (DTC) CCM-0017 five times, diagnostic trouble code (DTC) CCM-0018 is stored the sixth time.

Substitute Value

- None.

Possible Source

- Defective damper motor control.

Fault symptom[s]

- Air flow problem
- The passenger compartment temperature does not correspond to the set value.

SIGNAL TOO HIGH

FAULT-TRACING INFORMATION

INFORMATION

The diagnostic trouble code (DTC) is an information trouble code and never occurs alone. Therefore fault-trace for another diagnostic trouble code (DTC).

CCM-0019: FUNCTION BUTTON. ACTIVATED TOO LONG (2003-2004)

ACTIVATED TOO LONG

CHECKING THE FUNCTION

Check that the functions that can be controlled via the climate control system are working.

Also check that the LEDs in the buttons light and go out when the buttons are pressed.

Are the function buttons OK?

- **YES**

  Refer to **FAULT-TRACING INFORMATION**

- **NO**

  Refer to **CHECKING THE COMPONENT**

CHECKING THE COMPONENT

Fig. 3: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check manually whether any of the climate control knobs are stuck or have locked in the depressed position. Check that the button LEDs light and go out when the button is pressed.

  Checking lower electrical switch

  Read off the activation for the lower electrical switch and check that the values switch between ON and OFF as the button is pressed for each switch.

  NOTE: Note the following about activating the lower switch.

  - **Adjustable head restraints. After four activations in quick succession**

the function is blocked for approximately 2 minutes. After the blocking period, the activation can be carried out again. The head restraints are folded back manually

- **Auxiliary lamps. The switch for the auxiliary lamps cannot be controlled using this function**
- **STC/DSTC. To activate and deactivate STC/DSTC, the switch must be held in for at least 0.5 seconds**
- **Private locking of the trunk lid. The Private locking function for the trunk lid can only be activated with the master key in position II**
- **Temporary disengagement of detectors (Deadlock position). The temporary disengagement of the detectors can only be activated with the master key in position I**
- **Rear A/C. Rear A/C can only be activated when the engine is running.**

Remedy as necessary.

Other information:

- To access or replace the control module, see **CLIMATE CONTROL MODULE (CCM), REPLACING** .

Fig. 4: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

FAULT-TRACING INFORMATION

The fault is probably because a switch has been activated too long during individual operating cycles. No further corrective action is required if the diagnostic trouble code (DTC) does not recur.

- **Continue**

  Refer to **INFORMATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 5: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 6: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

NOTE: **Wait at least 1 minute before "Ignition on". This is to allow the climate control module (CCM) to carry out a new diagnostic.**

- Reinstall the connectors, components etc.
- Ignition on
- Read off diagnostic trouble codes (DTCs).

  The fault is no longer present if the status of the diagnostic trouble code (DTC) has changed to intermittent.

Fig. 7: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Does the status change?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

INFORMATION

FAULT-TRACING INFORMATION

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.

It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 8: Climate Control Module
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) CCM-0019 is stored if the control module registers that one of the function buttons on the climate control assembly has been in active mode (pressed in) continuously for more than 3 minutes.

Substitute Value

- The function button is disconnected.

Possible Source

- The function button has stuck in the pressed in position
- Involuntary activation of the function button

- Defective function button.

Fault symptom[s]

- Buttons/control knobs on center console (Climate)/No/reduced/incorrect function

CCM-001A: BLOWER FAN KNOB. FAULTY SIGNAL (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 9: Identifying Manual Climate Control Module
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) CCM-001A is stored if the control module registers that the signal from the fan knob is in excess of 99% or less than 1% of supply voltage (approximately 5 V).

Substitute Value

- The control module adopts a value corresponding to half of the maximum fan knob output.

Possible Source

- Defective potentiometer
- Short-circuit to supply voltage or ground in the potentiometer.

Fault symptom[s]

- Buttons/control knobs on center console (Climate)/No/reduced/incorrect function

FAULTY SIGNAL

CHECKING THE BLOWER FAN CONTROL

Check that the blower fan control is functioning by changing the speed of the blower fan.

Does the fan speed change?

- **YES**

  Refer to **FAULT-TRACING INFORMATION**

- **NO**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

The fault has probably occurred as a result of a defective potentiometer or a short-circuit in the potentiometer. This type of fault means that the climate control module (CCM) must be replaced. The potentiometer cannot be replaced independently.

Other information:

- To access or replace the control module, see **CLIMATE CONTROL MODULE (CCM), REPLACING** .

- **Continue**

  Refer to **VERIFICATION**

FAULT-TRACING INFORMATION

The fault has probably occurred as a result of a defective potentiometer or an intermittent short-circuit in the potentiometer. If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up of the control module or may be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs. If the fault recurs, replace the control module.

- **Continue**

Refer to **INFORMATION**

VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 10: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect connectors, install components, etc.
- Ignition on.

Check blower switch signal by turning blower switch between minimum and maximum settings.

The value should vary between 0.05 and 4.95 V.

Fig. 11: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Value OK?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

INFORMATION

FAULT-TRACING INFORMATION

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.

It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

CCM-001B: LOWER SWITCH. ID MISSING (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 12: Identifying Climate Control Module (CCM)
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) CCM-001B is stored if the control module registers that the identity of a lower switch is missing compared with the switch identities included in the Car Configuration File.

Substitute Value

- The control module assumes different values depending on which switch identity is missing.

Possible Source

- Defective switch
- Switch missing
- Fault in the Car Configuration File.

Fault symptom[s]

- Buttons/control knobs on center console (Climate)/No/reduced/incorrect function

ID MISSING

CHECKING THE FUNCTION

Fig. 13: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Engine running.

  Check that all the functions can be activated via the lower switch.

  HINT: Where applicable, the LED on the lower switch must be lit when the function is activated.

Are all functions activated?

- **YES**

  Refer to **FAULT-TRACING INFORMATION**

- **NO**

  Refer to **CHECKING THE COMPONENT**

CHECKING THE COMPONENT

Fig. 14: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

NOTE: **The switches can be placed in any position in the climate control assembly (without internal order). The position of the switches must be taken into account when fault-tracing with VCT2000.**

The switch that is furthest to the left in the climate control assembly corresponds to no. 1 in VCT2000. VCT2000 then follows the numbering in order to the switch furthest to the right, which is designated no. 7.

Read off the identities of the switches. Check that the read off identity corresponds to the switch marking for its position in the dashboard environment panel. The switch is defective or missing if the identity does not correspond.

Fig. 15: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

CCM-001C: LOWER SWITCH. FAULTY ID (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 19: Identifying Climate Control Module (CCM)
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) CCM-001C is stored if the control module registers an non-permissible switch identity compared with the permitted switch identities included in the Car Configurable File.

Substitute Value

- None.

Possible Source

- Switch replaced with a switch with incorrect identity

- Defective switch
- Fault in the Car Configuration File
- Two or more switches with the same ID.

Fault symptom[s]

- Buttons/control knobs on center console (Climate)/No/reduced/incorrect function

FAULTY ID

CHECKING THE FUNCTION

Fig. 20: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Engine running.

  Check that all the functions can be activated via the lower switch.

  HINT: Where applicable, the LED on the lower switch must be lit when the function is activated.

Are all functions activated?

- **YES**

  Refer to **FAULT-TRACING INFORMATION**

- **NO**

  Refer to **CHECKING THE SWITCH IDENTITY**

CHECKING THE SWITCH IDENTITY

Fig. 21: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

NOTE: **The switches can be placed in any position in the climate control assembly (without internal order). The position of the switches must be taken into account when fault-tracing with VCT2000.**

The switch that is furthest to the left in the climate control assembly corresponds to no. 1 in VCT2000. VCT2000 then follows the numbering in order to the switch furthest to the right, which is designated no. 7.

Read off the identities of the switches. Check that the read off identity corresponds to the switch marking for its position in the dashboard environment panel. If the identity does not correspond to the marking, this indicates a defective switch.

Remedy as necessary.

Fig. 22: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING THE SWITCH STATUS**

CHECKING THE SWITCH STATUS

Fig. 23: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

NOTE: **The switches can be placed in any position in the climate control assembly (without internal order). The position of the switches must be taken into account when fault-tracing with VCT2000.**

The switch that is furthest to the left in the climate control assembly corresponds to no. 1 in VCT2000. VCT2000 then follows the numbering in order to the switch furthest to the right, which is designated no. 7.

Read off the status of the switches. Check that the read off status is OK for each switch. If the status is not OK, this indicates that the function of the switch is not in the Car Configuration.

Fig. 24: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **INFORMATION**

- **NO**

  FAULT NOT FOUND: Troubleshooting has been completed.

INFORMATION

The fault is probably because the functionality of the button is not in Car Configuration. This is remedied by ordering and downloading the missing functionality.

- **Continue**

  Refer to **VERIFICATION**

FAULT-TRACING INFORMATION

The fault has probably occurred as a result of a defect or intermittent defect or a missing switch. If the fault is intermittent, it has been registered previously but is no longer present.

Intermittent faults can be caused by interference at start up of the control module or may be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs.

It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

CCM-001D: LEFT TEMPERATURE KNOB. FAULTY SIGNAL (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 28: Identifying Manual Climate Control Module
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) CCM-001D is stored if the control module registers that the signal from the left-hand temperature control is in excess of 99% or less than 1% of the supply voltage (approximately 5 V).

Substitute Value

- The control module adopts a value corresponding to half of the maximum temperature control output.

Possible Source

- Defective potentiometer

- Short-circuit to supply voltage or ground in the potentiometer.

Fault symptom[s]

- Buttons/control knobs on center console (Climate)/No/reduced/incorrect function

FAULTY SIGNAL

REPLACING THE COMPONENT

The fault has probably occurred as a result of a defective potentiometer or a short-circuit in the potentiometer. If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up of the control module or may be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs. If the fault recurs, replace the control module.

If the fault persists, replace the climate control module (CCM). The potentiometer cannot be replaced as a separate part.

Other information:

- To access or replace the control module, see **CLIMATE CONTROL MODULE (CCM), REPLACING** .

CCM-001F: AIR QUALITY SENSOR. SIGNAL TOO HIGH (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 39: Air Quality Sensor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) CCM-001F is stored if the control module registers that the signal from the air quality sensor has a pulse length which exceeds 97% of the period.

Diagnostic trouble code (DTC) CCM-001F can only be diagnosed for electronic climate control modules (CCM) (ECC version) with air quality sensors.

Substitute Value

- The control module does not permit the recirculation shutter to close in the air quality sensor mode while the fault persists
- No air quality function.

Possible Source

- Open-circuit in the signal cable between the control module and the air quality sensor
- Short-circuit to supply voltage in the signal cable between the control module and the air quality sensor
- Defective air quality sensor.

Fault symptom[s]

- Poor air quality in the passenger compartment.

SIGNAL TOO HIGH

CHECKING THE FUNCTION

Fig. 40: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Check that the value from the air quality sensor is within the permitted range.

NOTE: The blower fan must be running.

Expose the fresh air intake to windshield washer fluid, gasoline vapor or similar.

The value should be between 4% and 96%.

Fig. 41: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 42: Air Quality Sensor
Courtesy of VOLVO CARS CORPORATION

Is this value within its permitted range?

- **YES**

  Refer to **CHECKING THE CONNECTORS AND CABLES**

- **NO**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING THE CONNECTORS AND CABLES

Check the climate control module (CCM) and air quality sensor connectors. Check for contact resistance and oxidation. Check for loose connections.

Check the cable between control module terminal #B3 (#3) and air quality sensor terminal #3. Check for an intermittent open-circuit. Check for an intermittent short-circuit to supply voltage.

Check the cable between control module terminal #B5 (#5) and air quality sensor terminal #5. Check for an intermittent open-circuit. Check for an intermittent short-circuit to supply voltage.

Check the cable between control module terminal #B16 and air quality sensor terminal #1. Check for an intermittent open-circuit. Check for an intermittent short-circuit to ground.

Other information:

- To access and replace the control module, see **CLIMATE CONTROL MODULE (CCM), REPLACING**
- To access or replace the air quality sensor, see **AIR QUALITY SENSOR, REPLACING**
- For other values, see **SIGNAL DESCRIPTION, CLIMATE CONTROL MODULE (CCM), CONNECTOR B**
- see **CHECKING WIRING AND TERMINALS** .

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

INFORMATION

FAULT-TRACING INFORMATION

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.

It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

AIR-QUALITY: SENSOR, REPLACING

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATIONS

Remove the plenum chamber. See **COWL, REPLACING**

Open the damper for the air intake.

REMOVING THE AIR QUALITY SENSOR

Fig. 50: Identifying Air Quality Sensor Removal
Courtesy of VOLVO CARS CORPORATION

Turn the sensor approximately 60° counter-clockwise (see the illustration).

Slightly pull out the sensor and cable to access the connector.

Disconnect the connector.

INSTALLING THE AIR QUALITY SENSOR

Fig. 51: Identifying Air Quality Sensor Removal
Courtesy of VOLVO CARS CORPORATION

Connect the connector.

Insert as much of the cable through the hole as possible.

Position the sensor and seal (the flat side must face upwards) in the groove. The sensor can only be positioned one way in the groove (see the illustration).

Turn the sensor approximately 60° clockwise until it will not turn any further. Check that the air quality sensor is securely in place.

Ensure that the cable is as far in as possible.

Close the damper for the air intake.

Install the plenum chamber. See **COWL, REPLACING** .

SIGNAL DESCRIPTION, CLIMATE CONTROL MODULE (CCM), CONNECTOR C

There is no breakout box for this connector.

NOTE: **From and including w50 2001, the fan is connected directly to connector C with no wiring in-between.**

CCM-0020: AIR QUALITY SENSOR. SIGNAL TOO LOW (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 52: Air Quality Sensor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) CCM-0020 is stored if the control module registers that the signal from the air quality sensor has a pulse length which is less than 3% of the period.

The diagnostic trouble code (DTC) CCM-0020 can only be diagnosed for electronic climate control modules (CCM) (ECC versions) with air quality sensors.

Substitute Value

- The control module does not permit the recirculation shutter to close in the air quality sensor mode while the fault persists
- No air quality sensor function.

Possible Source

- Short-circuit to ground in the signal cable between the control module and the air quality sensor.

Fault symptom[s]

- Poor air quality in the passenger compartment.

SIGNAL TOO LOW

CHECKING THE FUNCTION

Fig. 53: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Check that the value from the air quality sensor is within the permitted range.

NOTE: The blower fan must be running.

Expose the fresh air intake to windshield washer fluid, gasoline vapor or similar.

The value should be between 4% and 96%.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

INFORMATION

FAULT-TRACING INFORMATION

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.

It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

CCM-0020: FUNCTION BUTTON. ACTIVATED TOO LONG (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-0020

Condition

Fig. 64: Climate Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects that a function button on the dashboard environment panel has been activated for longer than two minutes.

The climate control module (CCM) can detect a maximum of two buttons being pressed simultaneously. If more than two buttons are activated for too long simultaneously, the functionality for all the buttons may be lost.

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I and II.

Substitute Value

- The climate control module (CCM) does not permit the button function to be activated before the button has returned to the normal position.

Possible Source

- One or more function buttons are stuck in the pressed-in position
- Unintentionally long activation of the function button.

Fault symptom[s]

- Buttons/control knobs on center console (Climate)/No/reduced/incorrect function

ACTIVATED TOO LONG

CHECKING THE COMPONENT

Fig. 65: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Read off which switch was activated when the diagnostic trouble code (DTC) was set by clicking on the VCT2000 symbol.

  Check if the switch is sticking due to dirt. Check if there is an obstruction preventing the switch from returning.

Check that the functions that can be controlled via the switch on the climate control module (CCM) are working.

Also check that the LEDs in the switches light and go out when the buttons are pressed.

The keypad must be replaced if the switch does not spring back and the fault is not due to dirt or an external object.

Other information:

- see **CLIMATE CONTROL MODULE (CCM), REPLACING**

Fig. 66: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **FAULT-TRACING INFORMATION**

FAULT-TRACING INFORMATION

The fault is probably because a switch has been activated for too long during individual operating cycles. No further corrective action is required if the diagnostic trouble code (DTC) does not recur.

- **Continue**

  Refer to **INFORMATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 67: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 68: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

NOTE: **Wait at least 1 minute before "Ignition on". This is to allow the climate control module (CCM) to carry out a new diagnostic.**

- Reinstall the connectors, components etc.
- Ignition on
- Read off diagnostic trouble codes (DTCs).

The fault is no longer present if the status of the diagnostic trouble code (DTC) has changed to intermittent.

Fig. 69: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Does the status change?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

INFORMATION

FAULT-TRACING INFORMATION

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.

It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

CCM-0021: AIR QUALITY SENSOR. INTERNAL FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 70: Air Quality Sensor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) CCM-0021 is stored if the control module registers that the signal from the air quality sensor has a pulse length which is between 48% and 50% of the period.

The diagnostic trouble code (DTC) CCM-0021 can only be diagnosed for electronic climate control modules (CCM) (ECC version) with air quality sensors.

Substitute Value

- The control module does not permit the recirculation shutter to close in the air quality sensor mode while the fault persists
- No air quality sensor function.

Possible Source

- Internal fault in the circuit for the air quality sensor function.

Fault symptom[s]

- Poor air quality in the passenger compartment.

INTERNAL FAULT

CHECKING THE FUNCTION

The climate control module (CCM) has registered an internal fault in the air quality sensor. If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference at start up of the control module or may be a different type of fault which occurs on different occasions. The fault is evaluated depending on how it occurs. If the fault recurs, replace the air quality sensor.

In the event of a permanent fault, replace the air quality sensor. See **AIR QUALITY SENSOR, REPLACING**.

Fig. 71: Air Quality Sensor
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied:

Fig. 72: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 73: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reconnect the connectors, reinstall components etc.
- Ignition on
- Check that the value from the air quality sensor is within the permitted range.

  The value should be between 4% and 96%.

Fig. 74: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 75: Air Quality Sensor
Courtesy of VOLVO CARS CORPORATION

Are the values correct?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-0022: AIR QUALITY SENSOR. FAULTY ID (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 76: Air Quality Sensor
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) CCM-0022 is stored if the control module registers that the signal from the air quality sensor has a pulse length which is above 3% of the period and that the car configuration parameter states that there should not be an air quality sensor.

The diagnostic trouble code (DTC) CCM-0022 can only be diagnosed for electronic climate control modules (CCM) (ECC version) with air quality sensors.

Substitute Value

- The control module does not permit the recirculation shutter to close in the air quality sensor mode while the fault persists
- No air quality sensor function.

Possible Source

- The climate control system should not have an air quality sensor
- Fault in the car configuration file.

Fault symptom[s]

- Poor air quality in the passenger compartment.

FAULTY IDENTIFICATION

CHECKING THE COMPONENT

The air quality sensor function is not in the Car Configuration file. To update the climate control system with this function, the Car Configuration file must be updated. This is carried out by downloading the software with this function into the car.

Fig. 77: Air Quality Sensor
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied:

Fig. 78: Identifying Ignition ON

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-0030: LEFT HEATER PAD. FAULTY SIGNAL (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-0030

Condition

Fig. 82: Identifying Left Seat Heating Module (SHM)
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects a fault in the heater pad for the left seat heating module (SHM).

The climate control module (CCM) communicates with the left seat heating module (SHM) via LIN bus 1.

The seat heating module (SHM) transmits information to the climate control module (CCM) about status and current temperature.

The diagnostic trouble code (DTC) can be diagnosed at ignition switch position II.

Substitute Value

- The climate control module (CCM) does not allow activation of the seat heater.

Possible Source

- Open-circuit in the cable between the seat heating module (SHM) and the heater pad
- There is a short-circuit to supply voltage in the cable between the seat heating module (SHM) and the heater pad
- There is a short-circuit to ground in the cable between the seat heating module (SHM) and the heater pad.

Fault symptom[s]

- The front seat heating does not function.

FAULTY SIGNAL

CHECKING HEATER ELEMENTS

Fig. 83: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Checking components and connectors

  Check the connectors. Check for contact resistance. Check for oxidation. Check for loose connections.

  Check the heating loop in the seat. Take readings between:

  - terminals #1 and #4 on connector B for the seat heating module (SHM). Check for an open-circuit
  - terminal #1 on connector B and chassis ground. Check for a short-circuit to ground
  - terminal #1 on connector B and terminal #4 on connector A. Check for a short-circuit to supply voltage.

Check the heating loop in the backrest. Take readings between:

- terminals #1 and #2 on connector C for the seat heating module (SHM). Check for an open-circuit
- terminal #1 on connector C and chassis ground. Check for a short-circuit to ground
- terminal #1 on connector C and terminal #4 on connector A. Check for a short-circuit to supply voltage.

Remedy as necessary.

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects an internal fault in the right-hand seat heating module (SHM).

The climate control module (CCM) communicates with the right seat heating module (SHM) via LIN bus 2.

The seat heating module (SHM) transmits information to the climate control module (CCM) about status and current temperature.

The diagnostic trouble code (DTC) can be diagnosed at ignition switch position II.

Substitute Value

- The climate control module (CCM) does not allow activation of seat heating.

Possible Source

- Internal fault in the right-hand seat heating module (SHM).

Fault symptom[s]

- The front seat heating does not function.

INTERNAL FAULT

REPLACING THE COMPONENT

The climate control module (CCM) has registered an internal fault in the right-hand seat heating module (SHM).

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults may be caused by interference at start up of the right-hand seat heating module (SHM). Intermittent faults may also be caused by other types of intermittent faults. The fault is evaluated depending on how it occurs. Replace the right-hand seat heating module (SHM) if the fault recurs.

Replace the right-hand seat heating module (SHM) if the fault is permanent:

see **SEAT HEATING MODULE (SHM), REPLACING**

Remedy as necessary.

FAULT-TRACING INFORMATION

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

CCM-0040: AIR QUALITY SENSOR. INTERNAL FAULT (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-0040

Condition

Fig. 106: Identifying Air Quality Sensor (AQS)
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects a fault in the air quality sensor (AQS).

The climate control module (CCM) communicates with the air quality sensor (AQS) and via LIN bus 2.

The air quality sensor (AQS) sends information to the climate control module (CCM) about status.

The diagnostic trouble code (DTC) can only be diagnosed for the climate control module (CCM) of electronic climate control (ECC) equipped with the air quality sensor (AQS).

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I and II.

Substitute Value

- None.

Possible Source

- The air quality sensor (AQS) is not functioning.

Fault symptom[s]

- Poor air quality in the passenger compartment.

INTERNAL FAULT

REPLACING THE COMPONENT

The climate control module (CCM) has registered an internal fault in the air quality sensor (AQS).

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults may be caused by interference at start up of the air quality sensor (AQS). Intermittent faults may also be caused by other types of intermittent faults. The fault is evaluated depending on how it occurs. Replace the air quality sensor (AQS) if the diagnostic trouble code (DTC) recurs.

Replace the air quality sensor (AQS) if the fault is permanent:

see **AIR QUALITY SENSOR, REPLACING**

Remedy as necessary.

FAULT-TRACING INFORMATION

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

CCM-0050: BLOWER FAN KNOB. FAULTY SIGNAL (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-0050

Condition

Fig. 108: Identifying Manual Climate Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) registers that the signal from the fan knob exceeds 99%, or is less than 1% of supply voltage (approximately 5 V).

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I and II.

Substitute Value

- The climate control module (CCM) adopts a value corresponding to half of the maximum fan knob output.

Possible Source

- Defective potentiometer
- Short-circuit to supply voltage or ground in the potentiometer.

Fault symptom[s]

- The blower fan only runs at one speed.
- Buttons/control knobs on center console (Climate)/No/reduced/incorrect function

FAULTY SIGNAL

REPLACING THE COMPONENT

The fault has probably occurred as a result of a defective potentiometer or a short-circuit in the potentiometer. If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults may be caused by interference at start up of the control module. Intermittent faults may also be caused by other types of intermittent faults. The fault is evaluated depending on how it occurs. If the fault recurs, replace the control module.

If the fault persists, replace the climate control module (CCM). The potentiometer cannot be replaced as a separate part.

Other information:

- To access and replace the control module, see **CLIMATE CONTROL MODULE (CCM), REPLACING** .

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-0051: TEMPERATURE CONTROL LEFT. FAULTY SIGNAL (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-0051

Condition

Fig. 113: Identifying Manual Climate Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) registers that the signal from the temperature control for the left-hand side exceeds 99%, or is less than 1% of supply voltage (approximately

5 V).

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I and II.

Substitute Value

- The climate control module (CCM) adopts a value corresponding to half of the maximum output of the temperature control.

Possible Source

- Defective potentiometer
- Short-circuit to supply voltage or ground in the potentiometer.

Fault symptom[s]

- The passenger compartment temperature does not correspond to the set value.
- Buttons/control knobs on center console (Climate)/No/reduced/incorrect function

FAULTY SIGNAL

REPLACING THE COMPONENT

The fault has probably occurred as a result of a defective potentiometer or a short-circuit in the potentiometer. If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults may be caused by interference at start up of the control module. Intermittent faults may also be caused by other types of intermittent faults. The fault is evaluated depending on how it occurs. If the fault recurs, replace the control module.

If the fault persists, replace the climate control module (CCM). The potentiometer cannot be replaced as a separate part.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-0060: DAMPER MOTOR DEFROSTER. INTERNAL FAULT (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-0060

Condition

Fig. 134: Identifying Damper Motor Module (DMM)
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects a fault in the damper motor module (DMM) defroster.

The climate control module (CCM) communicates with the damper motor module (DMM) defroster via the LIN bus 2.

The damper motor module (DMM) transmits information to the climate control module (CCM) about status.

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I and II.

Substitute Value

- None.

Possible Source

- Internal fault in the damper motor module (DMM) defroster
- Incorrect calibration due to loss of power.

Fault symptom[s]

- The passenger compartment temperature does not correspond to the set position.
- Air flow problem.

INTERNAL FAULT

REPLACING THE COMPONENT

The climate control module (CCM) has registered an internal fault in the damper motor module (DMM) for the defroster.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults may be caused by interference at start up of the damper motor module (DMM). Intermittent faults may also be caused by other types of intermittent faults. The fault is evaluated depending on how it occurs. Replace the damper motor module (DMM) if the fault recurs.

Replace the damper motor module (DMM) for the defroster if the fault is permanent:

For -2004, see **DAMPER MOTOR DEFROSTER, REPLACING** . For 2005-, see **DAMPER MOTOR MODULE (DMM) DEFROSTER, REPLACING**

Remedy as necessary.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-0062: LEFT TEMPERATURE DAMPER MOTOR. INTERNAL FAULT

(2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-0062

Condition

Fig. 152: Identifying Damper Motor Module (DMM)
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects a fault in the damper motor module (DMM) temperature left.

The climate control module (CCM) communicates with the damper motor module (DMM) temperature left via LIN bus 1.

The damper motor module (DMM) transmits information to the climate control module (CCM) about status.

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I and II.

Substitute Value

- None.

Possible Source

- Internal fault in the damper motor module (DMM) temperature left
- Incorrect calibration due to loss of power.

Fault symptom[s]

- The passenger compartment temperature does not correspond to the set position.
- Air flow problem.

INTERNAL FAULT

REPLACING THE COMPONENT

The climate control module (CCM) has registered an internal fault in the damper motor module (DMM) for temperature left.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults may be caused by interference at start up of the damper motor module (DMM). Intermittent faults may also be caused by other types of intermittent faults. The fault is evaluated depending on how it occurs. Replace the damper motor module (DMM) if the fault recurs.

Replace the damper motor module (DMM) for temperature left If the fault is permanent:

For -2004, see **DAMPER MOTOR TEMPERATURE, REPLACING** . For 2005-, see **DAMPER MOTOR MODULE (DMM) TEMPERATURE, REPLACING**

Remedy as necessary.

CALIBRATING THE CLIMATE CONTROL MODULE (CCM)

CAUTION: When activating this function, calibration of the Climate Control Module (CCM) starts. After carrying out calibration read off of the diagnostic trouble codes (DTCs) starts. To ensure that diagnostics for the Climate Control Module (CCM) have been carried out, delay for 30 seconds before reading out diagnostic trouble codes (DTCs) after calibration.

NOTE: Climate Control Module (CCM) and damper motors can be affected by the temperature. The vehicle should have normal room temperature when performing this service.

Fig. 156: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

Carry out calibration as follows:

- Ignition on.
- Click on the VCT2000 symbol. Wait until calibration has been carried out and diagnostic trouble codes (DTCs) read out.
- Ignition off.

This function controls the components that communicate with the Climate Control Module (CCM) via LIN bus 1 and LIN bus 2. In the event of a fault in any of the LIN buses, diagnostic trouble codes (DTCs) CCM-0070 to CCM-0071 will be stored depending on the fault. These diagnostic trouble codes (DTCs) can only be stored in conjunction with this diagnostic function.

If any of these diagnostic trouble codes (DTCs) recur, recalibrate to check if the problem was overcome. If the diagnostic trouble code (DTC) recurs, fault-trace the relevant diagnostic trouble code (DTC).

Fig. 157: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

Has the status of the diagnostic trouble code (DTC) changed?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-0063: RIGHT TEMPERATURE DAMPER MOTOR. INTERNAL FAULT

(2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-0063

Condition

Fig. 161: Identifying Damper Motor Module (DMM)
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects a fault in the damper motor module (DMM) temperature right.

The climate control module (CCM) communicates with the damper motor module (DMM) temperature right via LIN bus 2.

The damper motor module (DMM) transmits information to the climate control module (CCM) about status.

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I and II.

The diagnostic trouble code (DTC) can only be diagnosed for the electronic climate control module (CCM) (ECC).

Substitute Value

- None.

Possible Source

- Internal fault in the damper motor module (DMM) for temperature right
- Incorrect calibration due to loss of power.

Fault symptom[s]

- The passenger compartment temperature does not correspond to the set position.
- Air flow problem.

INTERNAL FAULT

REPLACING THE COMPONENT

The climate control module (CCM) has registered an internal fault in the damper motor module (DMM) for temperature right.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults may be caused by interference at start up of the damper motor module (DMM). Intermittent faults may also be caused by other types of intermittent faults. The fault is evaluated depending on how it occurs. Replace the damper motor module (DMM) if the fault recurs.

Replace the damper motor module (DMM) for temperature right if the fault is permanent:

For -2004, see **DAMPER MOTOR TEMPERATURE, REPLACING** . For 2005-, see **DAMPER MOTOR MODULE (DMM) TEMPERATURE, REPLACING** .

Remedy as necessary.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-0064: AIR DISTRIBUTION DAMPER MOTOR. INTERNAL FAULT (2005-

2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-0064

Condition

Fig. 170: Identifying Damper Motor Module (DMM)
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects a fault in the damper motor module (DMM) air distribution.

The climate control module (CCM) communicates with the damper motor module (DMM) air distribution via LIN bus 1.

The damper motor module (DMM) transmits information to the climate control module (CCM) about status.

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I and II.

Substitute Value

- None.

Possible Source

- Internal fault in the damper motor module (DMM) air distribution
- Incorrect calibration due to loss of power.

Fault symptom[s]

- Misting on the windows and/or door mirrors.
- Air flow problem.

INTERNAL FAULT

REPLACING THE COMPONENT

The climate control module (CCM) has registered an internal fault in the damper motor module (DMM) for air distribution.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults may be caused by interference at start up of the damper motor module (DMM). Intermittent faults may also be caused by other types of intermittent faults. The fault is evaluated depending on how it occurs. Replace the damper motor module (DMM) if the fault recurs.

Replace the damper motor module (DMM) for air distribution if the fault is permanent:

For -2004, see **DAMPER MOTOR AIR DISTRIBUTION, REPLACING** . For 2005-, see **DAMPER MOTOR MODULE (DMM) AIR DISTRIBUTION, REPLACING**

Remedy as necessary.

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-0070: CONFIGURATION FAULT. FAULTY IDENTIFICATION (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-0070

Condition

Fig. 179: Climate Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects that components on LIN bus 1 and LIN bus 2 do not correspond with the components included in the Car Config File.

The climate control module (CCM) receives information about the Car Config File from the central electronic module (CEM) via the CAN network.

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I and II.

The diagnostic trouble code (DTC) can only be diagnosed in conjunction with activation of a diagnostic function.

Substitute Value

- None.

Possible Source

- Components on LIN bus 1 or LIN bus 2 are missing
- Components on LIN bus 1 or LIN bus 2 are incorrectly installed.

Fault symptom[s]

- Misting on the windows and/or door mirrors.
- Air flow problem.
- Temperature control/Uneven temperature
- The passenger compartment temperature does not correspond to the set position.
- No recirculation.

FAULTY IDENTIFICATION

CHECKING COMPONENTS ON LIN BUS

Fig. 180: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  The climate control module (CCM) has registered that the number of control modules on LIN bus 1 or 2 does not correspond with the number of control modules occupied in the car configuration.

  If a control module is missing according to the car configuration, check that the control module is installed and correctly connected.

  Check also whether any control modules are connected that are not occupied in the car configuration.

  If the diagnostic trouble code (DTC) is stored together with CCM-0072, the fault can be due to several damper motor modules (DMM) having the same identity. In such cases, remedy by identifying the damper motor.

  Read out which control modules/sensors are on LIN bus 1 and 2 and compare this to the car configuration. Which control modules and sensors are to be found and which alternatives can be presented in the car configuration can be read in the tables below.

  LIN-BUS: 1

Control module/sensor	On LIN bus 1
Damper Motor Position Sensor recirculation	Always
Damper motor, temperature left	Always
Left seat heating	If the vehicle is equipped with seat heating

  LIN-BUS: 2

Control module/sensor	On LIN bus 2
Damper motor, temperature, right	Always
Defroster damper motor	If the vehicle is equipped with ECC
Seat heater, right.	If the vehicle is

	equipped with seat heating

CAR CONFIGURATION

Parameter	Alternative
Steering	
Climate control system	ECC ECC/AQS ECC, rear AC MCC
Seat heating calibration	No Low 28C/82F-High 35C/95F Low 30C/86F-High 36C/97F Low 31C/88F-High 37C/99F Low 32C/90F-High 38C/100F Low 33C/91F-High 39C/102F Low 34C/93F-High 40C/104F Low 35C/95F-High 41C/106F Low 36C/97F-High 43C/109F
	Pollen filter Air Quality

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-0071: DAMPER MOTOR. FAULTY POSITION (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-0071

Condition

Fig. 189: Identifying Damper Motor Module (DMM)
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects that the limit positions for a damper motor module (DMM) do not correspond to the anticipated limit positions.

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I and II.

The diagnostic trouble code (DTC) can only be diagnosed in conjunction with activation of a diagnostic function.

Substitute Value

- None.

Possible Source

- Blocked damper.
- Climate control unit calibrated at incorrect temperature.

- Internal fault in the Damper motor module (DMM).

Fault symptom[s]

- Misting on the windows and/or door mirrors.
- Air flow problem.
- The passenger compartment temperature does not correspond to the set position.
- No recirculation.

INCORRECT POSITION

CHECKING THE COMPONENT

Fig. 190: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  The climate control module (CCM) has registered that one or more damper motor modules (DMM) have an incorrect number of steps between the end positions during damper regulation.

  Check which damper motor has an incorrect number of steps between the end positions by:

  - Read out the actual range to identify the number of stages between the upper and lower end positions measured by the damper motor module (DMM).
  - Read out the preset range to identify the number of stages between the upper and lower end positions stored by the damper motor module (DMM).
  - Compare these values to check the tolerances.

  The defective damper motor has been identified if the actual range of any of the damper motors is outside the preset range by more than the tolerance.

  Check that the damper motor is correctly installed.

  Check that the damper is not blocked and that is has not become stuck. Look, for example, for a screw, cable or foam rubber gasket.

  Refer to **IDENTIFICATION**

IDENTIFICATION

HINT: Identification of damper motors requires that the relevant damper motor is run to the limit positions. These runs can take up to 30 seconds. When identifying the damper motors it is important that a battery charger is connected.

- Ignition off.
- Reinstall the connectors, components etc.

NOTE: **Ensure that nothing is physically preventing the damper from moving to its limit positions. If something is blocking the damper, an identification can cause problems which are extremely difficult to correct.**

Climate Control Module (CCM) and damper motors can be affected by the temperature. The vehicle should have normal room temperature when performing this service.

Carry out identification as follows:

- Ignition on.
- Click on the VCT2000 symbol. Wait until identification has been carried out.

- Ignition off.

- **Continue**

  Refer to **CALIBRATION**

CALIBRATION

WARNING: When activating this function, calibration of the Climate Control Module (CCM) starts. After carrying out calibration read off of the diagnostic trouble codes (DTCs) starts. To ensure that diagnostics for the Climate Control Module (CCM) have been carried out, delay for 30 seconds before reading out diagnostic trouble codes (DTCs) after calibration.

NOTE: Climate Control Module (CCM) and damper motors can be affected by the temperature. The vehicle should have normal room temperature when performing this service.

Carry out calibration as follows:

- Ignition on.
- Click on the VCT2000 symbol. Wait until calibration has been carried out and diagnostic trouble codes (DTCs) read out.
- Ignition off.

This function controls the components that communicate with the Climate Control Module (CCM) via LIN bus 1 and LIN bus 2. In the event of a fault in any of the LIN buses, diagnostic trouble codes (DTCs) CCM-0070 to CCM-0071 will be stored depending on the fault. These diagnostic trouble codes (DTCs) can only be stored in conjunction with this diagnostic function.

CHECKING THE COMPONENT

Fig. 198: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

The climate control module (CCM) has registered that one or more damper motor modules (DMM) have an incorrect number of steps between the end positions during damper regulation.

Check which damper motor has an incorrect number of steps between the end positions by:

- Read out the actual range to identify the number of stages between the upper and lower end positions measured by the damper motor module (DMM).
- Read out the preset range to identify the number of stages between the upper and lower end positions stored by the damper motor module (DMM).
- Compare these values to check the tolerances.

The defective damper motor has been identified if the actual range of any of the damper motors is outside the preset range by more than the tolerance.

Check that the damper motor is correctly installed.

Check that the damper is not blocked and that is has not become stuck. Look, for example, for a screw, cable or foam rubber gasket.

CCM-0074: DAMPER MOTOR, DEFROSTER INTERNAL FAULT (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-0074

Condition

The climate control module (CCM) communicates with the damper motor module (DMM) defroster via the LIN bus 2.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Damper motor module (DMM) defroster does not go to desired position.

Substitute Value

- None.

Possible Source

- Internal fault in Damper motor module (DMM) defroster.

Fault symptom[s]

- Defog/defrost/Windshield defog/defrost/Slow to clear/uneven clearing
- Defog/defrost/Windshield defog/defrost/Does not work

CCM-0074: DAMPER MOTOR, DEFROSTER INTERNAL FAULT (L. H. D; 2005-2012)

FAULT-TRACING

FAULT-TRACING INFORMATION

Use the following information and general checks during fault-tracing.

NOTE: Check that the fuses are intact. For locations, see the instruction manual, cover for fuse box, fuse ratings or similar.

1. Check, if possible, relevant functions in the vehicle using buttons/controls/test drives to determine the status of the fault.

   NOTE: If the vehicle does not show any of the given symptoms in the diagnostic trouble code information (DTC), this may mean that the fault is intermittent or that the control module is not detecting the fault at this moment.

2. Use the diagnostic trouble code's **frozen values** , **status identifiers** and **counter** to determine the

operating conditions when the fault was detected, the fault's current status and any degree of intermittence of the fault.

3. Check and fault-trace according to **the fault causes** that are specified in the **diagnostic trouble code (DTC) information** .
4. Use **VIDA (Volvo Scan Tool) Vehicle communication** . Read off the parameters, activate components and functions, carry out quick tests and checking routines for the diagnostic trouble codes to identify the fault.
5. Check relevant components according to **Component specifications** .
6. Check relevant signals using **wiring diagrams** , **signal specification** and **breakout box** .

Remedy as necessary.

DESCRIPTION OF FROZEN VALUES

EXPLANATION

Not all the parameters that are described need to be implemented in the control module. These vary from system to system.

The number of parameters can also vary between diagnostic trouble codes (DTCs).

Frozen values are parameter values that are stored when a diagnostic trouble code (DTC) is stored.

ENGINE RUNNING, STATUS

The status displays whether the engine was running when the diagnostic trouble code (DTC) was stored.

No = the engine was not running

Yes = the engine was running

PASSENGER COMPARTMENT TEMPERATURE, VALUE

Measurement range: -60-192 °C.

The climate control module (CCM) obtains the value on the control area network (CAN).

OUTSIDE TEMPERATURE, VALUE

Measurement range: -128-124 °C.

The climate control module (CCM) obtains the value on the control area network (CAN).

BATTERY VOLTAGE, CENTRAL ELECTRONIC MODULE (CEM), VALUE

Measurement range: 5-30 V.

Normal value when the generator (GEN) is charging: 13.0-14.5 V.

The parameter indicates the supply voltage to the central electronic module (CEM) when the diagnostic trouble code (DTC) was stored.

The climate control module (CCM) obtains the value on the control area network (CAN).

DISTANCE, VALUE

Measurement range: 0-1, 000, 000 km.

The parameter indicates the mileage when the diagnostic trouble code (DTC) was stored.

The climate control module (CCM) obtains the value on the control area network (CAN).

INCORRECT CAR CONFIGURATION PARAMETER, VALUE

The parameter indicates which parameter in the car configuration data is incorrect.

The climate control module (CCM) obtains the value from the central electronic module (CEM) on the Control area network (CAN).

EVAPORATOR TEMPERATURE, VALUE

Measurement range -100- 100 °C.

If the air conditioning (A/C) has not been activated and the engine has cooled, the value must correspond to the ambient temperature.

The climate control module (CCM) obtains the value from the evaporator temperature sensor.

PASSENGER COMPARTMENT TEMPERATURE SENSOR

Measurement range -40- 90 °C.

The value must correspond to the ambient temperature.

The parameter indicates the value from the passenger compartment temperature sensor.

STATUS OF THE KEYPAD

The parameter indicates whether the climate control module (CCM) detects that buttons on the keypad were pressed or not when the diagnostic trouble code (DTC) was stored.

Not pressed = the button is not pressed in

Pressed = the button is pressed in

STATUS OF LEDS

The parameter indicates whether the climate control module (CCM) recognizes that the LEDs for buttons on the keypad should be lit or not when the diagnostic trouble code (DTC) was stored.

Not lit = the LED must not be lit

Lit = the LED must be lit

STATUS, SEAT HEATER RIGHT FRONT

The parameter indicates the status of the seat heating module (SHM) right front when the diagnostic trouble code (DTC) was stored.

The climate control module (CCM) receives the information via LIN communication.

OK, heating off = seat heating module (SHM) functioning, heating off.

OK, heating on = seat heating module (SHM) functioning, heating on.

Incorrect status 1 = incorrect heater pad.

Incorrect status 2 = incorrect temperature sensor.

Incorrect status 3 = seat heating module (SHM) overheated.

Incorrect status 4 = communication fault.

Incorrect status 5 = other faults.

Incorrect status 6 = seat heating module (SHM) internal fault.

STATUS, SEAT HEATER LEFT FRONT

The parameter indicates the status of the seat heating module (SHM) left front when the diagnostic trouble code (DTC) was stored.

The climate control module (CCM) receives the information via LIN communication.

OK, heating off = seat heating module (SHM) functioning, heating off.

OK, heating on = seat heating module (SHM) functioning, heating on.

Incorrect status 1 = incorrect heater pad.

Incorrect status 2 = incorrect temperature sensor.

Incorrect status 3 = seat heating module (SHM) overheated.

Incorrect status 4 = communication fault.

Incorrect status 5 = other faults.

Incorrect status 6 = seat heating module (SHM) internal fault.

DESIRED TEMPERATURE LEFT SEAT HEATER, VALUE

Measurement range 0-60 °C.

The parameter indicates the value of the desired seat temperature that the climate control module (CCM) transmits to the seat heating module (SHM).

The climate control module (CCM) calculates the value based on activation of the seat heater button.

DESIRED TEMPERATURE RIGHT SEAT HEATER, VALUE

Measurement range 0-60 °C.

The parameter indicates the value of the desired seat temperature that the climate control module (CCM) transmits to the seat heating module (SHM).

The climate control module (CCM) calculates the value based on activation of the seat heater button.

AQS SIGNAL, STATUS

The parameter displays the signal from the air quality sensor (AQS) when the diagnostic trouble code (DTC) was stored. The climate control module (CCM) uses the signal to regulate the damper motor module (DMM) recirculation.

Off = no increase or reduction in pollutant level.

Level 1 = slow increase in pollutant level.

Level 2 = medium increase in pollutant level.

Level 3 = rapid increase in pollutant level.

AIR-QUALITY: SENSOR (AQS), STATUS

The parameter displays the status of the air quality sensor (AQS) when the diagnostic trouble code (DTC) was stored.

Warm-up phase = the sensor is being heated by the heater element.

Faulty heater pad.

Faulty sensor.

Calibration commenced.

FAULT INFORMATION, STATUS

The parameter indicates the status of the damper motor module (DMM) when the diagnostic trouble code (DTC) was stored.

The climate control module (CCM) receives the information via LIN communication.

Faulty status 1 = faulty Hall sensor in the damper motor.

Faulty status 2 = fault when storing the position of the damper motor.

Incorrect status 3 = unexpected stop when operating the damper motor.

Faulty status 4 = over voltage or overheating in the damper motor.

Faulty status 5 = communication fault in the LIN bus.

Faulty status 6 = hardware fault in the driver circuit.

Faulty status 7 = hardware fault in the driver circuit.

Faulty status 8 = voltage drop in the damper motor.

CONTROL MODULES ON LIN BUS 1, STATUS

The parameter indicates which control modules the climate control module (CCM) detects as being installed on LIN bus 1.

Not installed = the climate control module (CCM) cannot communicate with the control module.

Installed = the climate control module (CCM) is able to communicate with the control module.

CONTROL MODULES ON LIN BUS 2, STATUS

The parameter indicates which control modules the climate control module (CCM) detects as being installed on LIN bus 2.

Not installed = the climate control module (CCM) cannot communicate with the control module.

Installed = the climate control module (CCM) is able to communicate with the control module.

CONFIGURED CONTROL MODULES FOR LIN BUS 1, STATUS

The parameter indicates which control modules are configured to be present on LIN bus 1.

Should not exist = the control module must not be on LIN bus 1.

Should exist = the control module must be on LIN bus 1.

CONFIGURED CONTROL MODULES FOR LIN BUS 2, STATUS

The parameter indicates which control modules are configured to be present on LIN bus 2.

Should not exist = the control module must not be on LIN bus 2.

Should exist = the control module must be on LIN bus 2.

IDENTIFICATION OF THE DAMPER MOTOR MODULE (DMM), LIN BUS 1, STATUS

The parameter indicates the status after identification of the damper motors.

Temporary ID not OK = the climate control module (CCM) has been unable to allocate the damper motors a temporary ID during identification.

Defroster not OK = failed identification of the damper motor module (DMM) defroster.

Recirculation not OK = failed identification of the damper motor module (DMM) recirculation.

Temperature left not OK = failed identification of the damper motor module (DMM) temperature left.

Temperature right not OK = failed identification of the damper motor module (DMM) temperature right.

Air distribution not OK = failed identification of the damper motor module (DMM) air distribution.

OK = identification ok.

IDENTIFICATION OF THE DAMPER MOTOR MODULE (DMM), LIN BUS 2

The parameter indicates the status after identification of the damper motors.

Temporary ID not OK = the climate control module (CCM) has been unable to allocate the damper motors a temporary ID during identification.

Defroster not OK = failed identification of the damper motor module (DMM) defroster.

Recirculation not OK = failed identification of the damper motor module (DMM) recirculation.

Temperature left not OK = failed identification of the damper motor module (DMM) temperature left.

Temperature right not OK = failed identification of the damper motor module (DMM) temperature right.

Air distribution not OK = failed identification of the damper motor module (DMM) air distribution.

OK = identification ok.

POWER SUPPLY, VALUE

The parameter indicates the power supply to the climate control module (CCM) when the diagnostic trouble code (DTC) was stored.

Measurement range 0-50 V.

Normal value approximately 12 V (battery voltage).

CCM-0075: DAMPER MOTOR INTERNAL FAULT (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-0075

Condition

Climate control module (CCM) communicates with Damper motor module (DMM) recirculation and via LIN-bus 2.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Damper motor module (DMM) recirculation does not go to desired position.

Substitute Value

- None.

Possible Source

- Internal fault in the Damper motor module (DMM) recirculation.

Fault symptom[s]

- Climate control system/Unusual odor

CCM-0076: DAMPER MOTOR, TEMPERATURE LEFT INTERNAL FAULT (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-0076

Condition

Climate control module (CCM) communicates with Damper motor module (DMM) temperature left via LIN-bus 1.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Damper motor module (DMM) temperature left does not go to desired value.

Substitute Value

- None.

Possible Source

- Internal fault in Damper motor module (DMM) temperature left.

Fault symptom[s]

- Temperature control/Uneven temperature

CCM-0077: DAMPER MOTOR, TEMPERATURE RIGHT INTERNAL FAULT (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-0077

Condition

Climate control module (CCM) communicates with Damper motor module (DMM) temperature right via LIN-bus 2.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Damper motor module (DMM) temperature right does not go to desired position.

Substitute Value

- None.

Possible Source

- Internal fault in Damper motor module (DMM) temperature right.

Fault symptom[s]

- Temperature control/Uneven temperature

CCM-0078: DAMPER MOTOR DISTRIBUTION INTERNAL FAULT (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-0078

Condition

The climate control module (CCM) communicates with the damper motor module (DMM) air distribution via LIN-bus 1.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Damper motor module (DMM) air distribution does not go to desired position.

Substitute Value

- None.

Possible Source

- Internal fault in the Damper motor module (DMM) air distribution.

Fault symptom[s]

- Blower fan/Does not work

CCM-0090: LOWER SWITCH. FAULTY ID (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-0090

Condition

Fig. 230: Identifying Climate Control Module (CCM)
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) registers a non-permissible switch identity compared to the permitted switch identities included in the Car Config File.

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I and II.

Substitute Value

- None.

Possible Source

- Switch replaced with a switch with incorrect identity
- Defective switch
- Fault in the Car Configuration File
- Two or more switches with the same ID.

Fault symptom[s]

- Buttons/control knobs on center console (Climate)/No/reduced/incorrect function

FAULTY ID

CHECKING THE FUNCTION

Fig. 231: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Engine running.

  Check that all the functions can be activated via the lower switch.

  HINT: Where applicable, the LED on the lower switch must be lit when the function is activated.

Are all functions activated?

- **YES**

Refer to **FAULT-TRACING INFORMATION**

- **NO**

  Refer to **CHECKING THE SWITCH IDENTITY**

CHECKING THE SWITCH IDENTITY

Fig. 232: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

NOTE: **The switches can be placed in any position in the climate control assembly (without internal order). The position of the switches must be taken into account when fault-tracing with VCT2000.**

The switch furthest to the left in the climate control assembly corresponds to no. 1 in VCT2000. VCT2000 then follows the numbering in order to the switch furthest to the right, which is designated no. 7.

Read off the identities of the switches. Check that the read off identity corresponds to the switch marking for its position in the dashboard environment panel. If the identity does not correspond to the marking, this indicates a defective switch.

Remedy as necessary.

Fig. 233: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING THE SWITCH STATUS**

CHECKING THE SWITCH STATUS

Fig. 234: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

NOTE: **The switches can be placed in any position in the climate control assembly (without internal order). The position of the switches must be taken into account when fault-tracing with VCT2000.**

The switch furthest to the left in the climate control assembly corresponds to no. 1 in VCT2000. VCT2000 then follows the numbering in order to the switch furthest to the right, which is designated no. 7.

Read off the status of the switches. Check that the read off status is OK for each switch. If the status is not

OK, this indicates that the function of the switch is not in the Car Configuration.

Fig. 235: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **INFORMATION**

- **NO**

  Refer to **INFORMATION**

INFORMATION

The fault is probably because the functionality of the button is not in Car Configuration. This is remedied by ordering and downloading the missing functionality.

- **Continue**

  Refer to **VERIFICATION**

FAULT-TRACING INFORMATION

The fault is probably the result of a damaged, intermittently defective or missing switch. If the fault is intermittent, it has been registered previously but is no longer present.

Intermittent faults may be caused by interference at start up of the control module. Intermittent faults may also be caused by other types of intermittent faults. The fault is evaluated depending on how it occurs.

- **Continue**

  Refer to **INFORMATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 236: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 237: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

NOTE: **Wait at least 1 minute before "Ignition on". This is to allow the climate control module (CCM) to carry out a new diagnostic.**

- Reinstall the connectors, components etc.
- Ignition on
- Read off diagnostic trouble codes (DTCs).

The fault is no longer present if the status of the diagnostic trouble code (DTC) has changed to intermittent.

Fig. 238: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Does the status change?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

INFORMATION

FAULT-TRACING INFORMATION

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.

It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

CCM-0091: LOWER SWITCH. ID MISSING (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-0091

Condition

Fig. 239: Identifying Climate Control Module (CCM)
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) registers that the identity of a lower switch is missing compared to the switch identities included in the Car Config File.

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I and II.

Substitute Value

- The climate control module (CCM) assumes different values depending on which switch identity is missing.

Possible Source

- Defective switch
- Switch missing
- Fault in the Car Configuration File.

Fault symptom[s]

- Buttons/control knobs on center console (Climate)/No/reduced/incorrect function

ID MISSING

CHECKING THE FUNCTION

Fig. 240: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Engine running.

  Check that all the functions can be activated via the lower switch.

  HINT: Where applicable, the LED on the lower switch must be lit when the function is activated.

Are all functions activated?

- **YES**

  Refer to **FAULT-TRACING INFORMATION**

- **NO**

Refer to **CHECKING THE COMPONENT**

CHECKING THE COMPONENT

Fig. 241: Identifying Ignition ON

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

INFORMATION

FAULT-TRACING INFORMATION

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.

It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

CCM-00A0: BLOWER FAN MOTOR. SIGNAL TOO LOW (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-00A0

Condition

Fig. 246: Identifying Blower Fan Motor & Connector
Courtesy of VOLVO CARS CORPORATION

Diagnostic trouble code (DTC) is stored if the climate control module (CCM) registers that the diagnostic signal from the blower fan power unit is below 1.28 V and the control current to the blower fan power unit is below 0.42 mA.

Substitute Value

- The control module will not allow the blower fan motor to start while the fault persists
- The air conditioning (A/C) compressor is not allowed to start.

Possible Source

- Short-circuit to ground in the motor signal cable
- Short-circuit to supply voltage in the signal cable
- Open-circuit in the diagnostic signal cable
- Short-circuit to ground in the diagnostic signal cable
- Defective blower fan motor or power unit.

Fault symptom[s]

- Blower fan not operating.
- Air flow problem.
- No cooling from the air conditioning (A/C) system.

SIGNAL TOO LOW

CHECKING THE BLOWER FAN

Fig. 247: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check that the blower fan functions by turning the blower fan knob to maximum fan speed.

Is the blower fan working?

- **YES**

  Refer to **CHECKING THE WIRING**

- **NO**

  Refer to **CHECKING THE COMPONENT AND WIRING**

CHECKING THE COMPONENT AND WIRING

Fig. 248: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

CAUTION: The blower fan motor power unit is very sensitive to short-circuits and excess current. Do not damage the power unit when taking readings.

Take readings with the power unit connector disconnected when checking the wiring.

Check if the fuse for the climate control module (CCM) is defective. If the fuse is defective, check:

- the signal cable between the fuse and the power unit terminal #A2. Check for a short-circuit to ground
- the signal cable between the power unit terminal #B2 and the blower fan motor positive terminal. Check for a short-circuit to ground.

Check the control signal cable between control module terminal #A3 and power unit terminal #A1. Check for a short-circuit to supply voltage.

Check the diagnostic signal cable between control module terminal #A2 and power unit terminal #A3. Check for an open-circuit. Check for a short-circuit to ground.

Remedy as necessary.

Other information:

- To access and replace the control module, see **CLIMATE CONTROL MODULE (CCM), REPLACING**
- To access the control module or connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access or replace the power unit, see **BLOWER FAN MOTOR / POWER UNIT, REPLACING**
- With the ignition on and the power unit connector disconnected, the voltage between power unit connector terminal #A2 (control module side) and ground must be approximately 13.5 V
- For other values, see **SIGNAL SPECIFICATION**
- see **CONTENTS** .

FAULT-TRACING INFORMATION

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.

It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

HVAC

Climate Units - Diagnostic Trouble Codes And Associated Procedures

CCM-00A1: BLOWER FAN MOTOR. SIGNAL TOO HIGH (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-00A1

Condition

Fig. 1: Identifying Blower Fan Motor & Connector
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) registers that the diagnostic signal from the blower fan power unit is in excess of 10 V and the control current to the blower fan power unit is above 8.56 mA.

Substitute Value

- The blower fan cannot start while the fault persists
- The air conditioning (A/C) compressor is not allowed to start.

Possible Source

- Blocked blower fan motor
- Open-circuit in the signal cable
- Open-circuit in the ground lead for the blower fan motor
- Short-circuit to supply voltage in the ground lead for the blower fan motor
- Short-circuit to ground in the control signal cable
- Open-circuit in the control signal cable
- Short-circuit to supply voltage in the diagnostic signal cable
- Defective blower fan motor or power unit
- Contact resistance.

Fault symptom[s]

- Blower fan not operating.
- Air flow problem.
- No cooling from the air conditioning (A/C) system.

SIGNAL TOO HIGH

CHECKING THE BLOWER FAN

Fig. 2: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check that the blower fan functions by turning the blower fan knob to maximum fan speed.

Is the blower fan working?

- **YES**

  Refer to **CHECKING THE CONNECTORS AND CABLES**

- **NO**

  Refer to **CHECKING THE CONNECTORS**

CHECKING THE CONNECTORS

Fig. 3: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connectors on the climate control module (CCM) (terminals #A2, #A3) and the power unit. Check for contact resistance and oxidation. In particular, check for any damage
- Reinstall the components, reconnect the connectors etc.
- Ignition on.

NOTE: **If the battery voltage has been interrupted, the blower fan speed must be calibrated. First turn the blower fan speed control to maximum speed and then to minimum speed.**

Check that the blower fan motor functions: Turn the blower fan speed switch.

If the blower fan is now working the cause of the fault was loose connections in the connectors.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access and replace the control module, see **CLIMATE CONTROL MODULE (CCM), REPLACING** .
- To access or replace the power unit, see **BLOWER FAN MOTOR / POWER UNIT, REPLACING** .

Fig. 4: Connector, Green (16- Pin)
Courtesy of VOLVO CARS CORPORATION

Fig. 5: Connector, Black (2-Pin)
Courtesy of VOLVO CARS CORPORATION

Is the blower fan motor functioning?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE COMPONENT AND WIRING**

CHECKING THE COMPONENT AND WIRING

CAUTION: The blower fan motor power unit is very sensitive to short-circuits and excess current. Do not damage the power unit when taking readings.

Take readings with the power unit connector disconnected when checking the wiring.

Checking the engine cooling fan (FC) motor

Check the position of the fan in the climate control system to ensure that nothing is blocking the blower fan rotor. Check by hand whether the blower fan rotor can rotate freely.

Checking the wiring

Check the ground lead between the power unit terminal #A4 and the ground terminal. Check for a short-circuit to supply voltage.

Check the control signal cable between control module terminal #A3 and power unit terminal #A1. Check for an open-circuit. Check for a short-circuit to ground.

Check the diagnostic signal cable between control module terminal #A2 and power unit terminal #A3. Check for a short-circuit to supply voltage.

NOTE: If the battery voltage has been interrupted, the blower fan speed must be calibrated. First turn the blower fan speed control to maximum speed and then to minimum speed.

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access and replace the control module, see **CLIMATE CONTROL MODULE (CCM), REPLACING** .
- To access or replace the power unit, see **BLOWER FAN MOTOR / POWER UNIT, REPLACING**

- For other values, see **SIGNAL SPECIFICATION**
- For further information about the fuses, relays and ground terminals, see the appropriate service information.

- Ignition off.
- Connect the connectors, install the components, etc.
- Ignition on.
- Read the diagnostic trouble codes.

  If the status of the diagnostic trouble code has changed to an intermittent fault this indicates that the fault has been rectified.

Fig. 12: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Has the status of the diagnostic trouble code changed?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

INFORMATION

FAULT-TRACING INFORMATION

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.

It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

CCM-DD00: LIN BUS1. INCORRECT DATA (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-DD00

Condition

Fig. 13: Climate Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects that data that is sent on LIN bus 1 is incorrect.

The following components communicate with the climate control module (CCM) via LIN bus 1:

- damper motor module (DMM) air distribution
- damper motor module (DMM) temperature left
- seat heating module (SHM) left.

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I and II.

Substitute Value

- None.

Possible Source

- Incorrect data during communication on LIN bus 1.

Fault symptom[s]

- Misting on the windows and/or door mirrors.
- Air flow problem.
- Poor heating in the passenger compartment.
- The front seat heating does not function.
- Poor air quality in the passenger compartment.

INCORRECT DATA

CHECKING COMPONENTS

Fig. 14: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect connector A for the seat heating module (SHM) left
- Ignition on.

  The climate control module (CCM) has detected that a component on LIN bus 1 is transmitting incorrect data and disrupting communication on the LIN bus.

  Check the communication by disconnecting the seat heating module (SHM) left.

  If other control modules on LIN bus 1 now function, replace the seat heating module (SHM) left.

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING COMPONENTS**

CHECKING COMPONENTS

Fig. 15: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 16: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reconnect connector A for the seat heating module (SHM)
- Ignition on.

Check the components on the climate control unit as follows:

- Disconnect the connectors for the components one at a time
- Check whether the other components regain functionality, for example by activating seat heating
- If the functionality for the other components returns, the fault is probably in the disconnected components.

Remedy as necessary.

Other information:

- For further information about the connectors, fuses and relays, appropriate service information.

- **Continue**

  Refer to **IDENTIFYING COMPONENTS ON THE LIN NETWORK THAT BELONG TO THE CLIMATE CONTROL SYSTEM (CCM)**

IDENTIFYING COMPONENTS ON THE LIN NETWORK THAT BELONG TO THE CLIMATE CONTROL SYSTEM (CCM)

INFORMATION

- The control module must be identified after replacing the Damper Motor Module (DMM).

NOTE: Identification must only be carried out when replacing components on the LIN network that belong to the climate control system (CCM).

Have any of the components on the LIN network been replaced?

- **YES**

  Refer to **IDENTIFYING COMPONENTS ON THE LIN NETWORK THAT BELONG TO THE CLIMATE CONTROL SYSTEM (CCM)**

- **NO**

  Refer to **VERIFICATION**

IDENTIFYING COMPONENTS ON THE LIN NETWORK THAT BELONG TO THE CLIMATE CONTROL SYSTEM (CCM)

HINT: When identifying damper motors, each damper motor must be run to its limit position. These operations can take up to 30 seconds. When identifying the damper motors it is important that a battery charger is connected.

Fig. 17: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.

NOTE: **Climate Control Module (CCM) and damper motors can be affected by the temperature. The vehicle should have normal room temperature when performing this service.**

Carry out identification as follows:

- Ignition on.
- Click on the VCT2000 (Volvo Scan Tool) symbol. Wait until identification has been carried out.
- Ignition off.

Fig. 18: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **CALIBRATING THE CLIMATE CONTROL MODULE (CCM)**

CALIBRATING THE CLIMATE CONTROL MODULE (CCM)

CAUTION: When activating this function, calibration of the Climate Control Module (CCM) starts. After carrying out calibration read off of the diagnostic trouble codes (DTCs) starts. To ensure that diagnostics for the Climate Control Module (CCM) have been carried out, delay for 30 seconds before reading out diagnostic trouble codes (DTCs) after calibration.

NOTE: Climate Control Module (CCM) and damper motors can be affected by the temperature. The vehicle should have normal room temperature when performing this service.

Fig. 19: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

Carry out calibration as follows:

- Ignition on.
- Click on the VCT2000 (Volvo Scan Tool) symbol. Wait until calibration has been carried out and diagnostic trouble codes (DTCs) read out.
- Ignition off.

This function controls the components that communicate with the Climate Control Module (CCM) via LIN bus 1 and LIN bus 2. In the event of a fault in any of the LIN buses, diagnostic trouble codes (DTCs) CCM-0070 to CCM-0071 will be stored depending on the fault. These diagnostic trouble codes (DTCs) can only be stored in conjunction with this diagnostic function.

If any of these diagnostic trouble codes (DTCs) recur, recalibrate to check if the problem was overcome. If the diagnostic trouble code (DTC) recurs, fault-trace the relevant diagnostic trouble code (DTC).

Has the status of the diagnostic trouble code (DTC) changed?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

AIR-QUALITY: SENSOR, REPLACING

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATIONS

Remove the plenum chamber. See **COWL, REPLACING**

Open the damper for the air intake.

REMOVING THE AIR QUALITY SENSOR

Fig. 24: Identifying Air Quality Sensor Removal
Courtesy of VOLVO CARS CORPORATION

Turn the sensor approximately 60° counter-clockwise (see the illustration).

Slightly pull out the sensor and cable to access the connector.

Disconnect the connector.

INSTALLING THE AIR QUALITY SENSOR

Fig. 25: Identifying Air Quality Sensor Removal
Courtesy of VOLVO CARS CORPORATION

Connect the connector.

Insert as much of the cable through the hole as possible.

Position the sensor and seal (the flat side must face upwards) in the groove. The sensor can only be positioned one way in the groove (see the illustration).

Turn the sensor approximately 60° clockwise until it will not turn any further. Check that the air quality sensor is securely in place.

Ensure that the cable is as far in as possible.

Close the damper for the air intake.

Install the plenum chamber. See **COWL, REPLACING** .

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-DD01: LIN BUS1. SIGNAL TOO HIGH / SIGNAL TOO LOW (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-DD01

Condition

Fig. 26: Climate Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects a short-circuit to supply voltage or ground in LIN bus 1.

A short-circuit to supply voltage or ground in the LIN bus will affect communications and the function of all the components.

The climate control module (CCM) communicates with damper motors, air quality sensors and seat heating via two LIN buses.

The number of components in LIN bus 1 can vary depending on the vehicle equipment (ECC/MCC and options).

The following components communicate on LIN bus 1:

- damper motor air distribution
- damper motor, temperature left
- left seat heater.

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I and II.

Substitute Value

- None.

Possible Source

- Short-circuit to supply voltage in LIN bus 1
- Short-circuit to ground in LIN bus 1.

Fault symptom[s]

- Misting on the windows and/or door mirrors.
- Air flow problem.
- Poor heating in the passenger compartment.
- The front seat heating does not function.
- Poor air quality in the passenger compartment.

SIGNAL TOO HIGH / SIGNAL TOO LOW

CHECKING THE CABLE

Fig. 27: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 28: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector for the climate control module (CCM)
- Ignition on.

  Check LIN bus 1. Check for a short-circuit to supply voltage.

  Take a reading on the connector for the climate control module (CCM) between terminals #12 (#36) and #1 (#25).

  If there is a short-circuit to supply voltage in LIN bus 1, continue fault-tracing by locating where the short-circuit has occurred as follows:

- Disconnect the connector on the climate control unit that connects LIN bus 1 from the climate control module (CCM) to other components on the climate control unit
- Check the section of LIN bus 1 that connects the climate control module (CCM) to the left-hand seat heating module (SHM) and the connector on the climate control unit. Take a reading on the connector for the climate control module (CCM) between terminals #12 (#36) and #1 (#25).

If the fault persists, fault-trace LIN bus 1 between the climate control module (CCM), the left-hand seat heating module (SHM) and the connector for the climate control unit. Check for a short-circuit to supply voltage.

If the fault is no longer present, fault-trace LIN bus 1 between the connector and the components of the climate control unit. Check for a short-circuit to supply voltage.

Remedy as necessary.

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING THE CABLE**

CHECKING THE CABLE

Fig. 30: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector for the climate control module (CCM).

Check LIN bus 1. Check for a short-circuit to ground.

Take a reading on the connector for the climate control module (CCM) between terminals #12 (#36) and #16 (#40).

If there is a short-circuit to ground in LIN bus 1, continue fault-tracing by locating where the short-circuit has occurred as follows:

- Disconnect the connector for the climate control unit that connects LIN bus 1 from the climate control module (CCM) to the other components on the climate control unit
- Check the section of LIN bus 1 that connects the climate control module (CCM) to the left-hand seat heating module (SHM) and the connector on the climate control unit. Take a reading on the connector for the climate control module (CCM) between terminals #12 (#36) and #16 (#40).

If the fault persists, fault-trace LIN bus 1 between the climate control module (CCM), the left-hand seat heating module (SHM) and the connector for the climate control unit. Check for a short-circuit to ground.

If the fault is no longer present, fault-trace LIN bus 1 between the connector and the components of the climate control unit. Check for a short-circuit to ground.

Remedy as necessary.

Other information:

- For further information about the connectors, fuses and relays, see the appropriate service information.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-DD02: LIN BUS1. FAULTY CHECK SUM (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-DD02

Condition

Fig. 35: Climate Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects that data that is sent on LIN bus 1 is incorrect.

The following components communicate with the climate control module (CCM) via LIN bus 1:

- damper motor module (DMM) air distribution
- damper motor module (DMM) temperature left
- seat heating module (SHM) left.

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I and II.

Substitute Value

- None.

Possible Source

- Incorrect data during communication on LIN bus 1.

Fault symptom[s]

- Misting on the windows and/or door mirrors.
- Air flow problem.
- Poor heating in the passenger compartment.
- The front seat heating does not function.
- Poor air quality in the passenger compartment.

FAULTY CHECK SUM

CHECKING COMPONENTS

Fig. 36: Identifying Ignition ON

Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  The climate control module (CCM) has diagnosed that two or more damper motor modules (DMM) have the same identity on LIN bus 1.

  This may be because one damper motor module (DMM) has been installed incorrectly.

  After replacing a damper motor module (DMM), it must be allocated a correct identity by the climate control module (CCM). This is performed during identification of the damper motors on the LIN bus.

  If a damper motor module (DMM) is installed that already has an identity allocated to it, this can lead to a conflict on the LIN bus.

  Remedy by correctly identifying the damper motor.

  Other information:

  - see **CLIMATE CONTROL, LOCATION OF COMPONENTS**
  - see **CLIMATE CONTROL MODULE (CCM), REPLACING**
  - For -2004, see **DAMPER MOTOR TEMPERATURE, REPLACING** For 2005-, see **DAMPER MOTOR MODULE (DMM) TEMPERATURE, REPLACING**

  - For -2004, see **DAMPER MOTOR RECIRCULATION, REPLACING** . For 2005-, see **DAMPER MOTOR AIR DISTRIBUTION, REPLACING** .

IDENTIFYING COMPONENTS ON THE LIN NETWORK THAT BELONG TO THE CLIMATE CONTROL SYSTEM (CCM)

INFORMATION

- The control module must be identified after replacing the Damper Motor Module (DMM).

  NOTE: Identification must only be carried out when replacing components on the LIN network that belong to the climate control system (CCM).

Have any of the components on the LIN network been replaced?

- **YES**

  Refer to **IDENTIFYING COMPONENTS ON THE LIN NETWORK THAT BELONG TO THE CLIMATE CONTROL SYSTEM (CCM)**

- **NO**

Refer to **VERIFICATION**

IDENTIFYING COMPONENTS ON THE LIN NETWORK THAT BELONG TO THE CLIMATE CONTROL SYSTEM (CCM)

HINT: When identifying damper motors, each damper motor must be run to its limit position. These operations can take up to 30 seconds. When identifying the damper motors it is important that a battery charger is connected.

Fig. 37: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.

NOTE: **Climate Control Module (CCM) and damper motors can be affected by the temperature. The vehicle should have normal room temperature when performing this service.**

Carry out identification as follows:

- Ignition on.
- Click on the VCT2000 (Volvo Scan Tool) symbol. Wait until identification has been carried out.
- Ignition off.

Fig. 38: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

Has the status of the diagnostic trouble code (DTC) changed?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-DD10: AIR QUALITY SENSOR (AQS). NO COMMUNICATION (2005-

2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-DD10

Condition

Fig. 44: Identifying Air Quality Sensor (AQS)
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects an open-circuit in the communication between the air quality sensor (AQS) and the climate control module (CCM) on LIN bus 1.

The diagnostic trouble code (DTC) can occur together with diagnostic trouble codes (DTCs) for other components on LIN bus 1 (CCM-DD10 - CCM-DD16) depending on where the open-circuit has occurred.

The diagnostic trouble code (DTC) can be diagnosed at ignition switch position II.

The diagnostic trouble code (DTC) can only be diagnosed for the electronic climate control module (CCM) (ECC).

Substitute Value

- None.

Possible Source

- Open-circuit on LIN bus 1 between the climate control module (CCM) and the air quality sensor (AQS)
- Contact resistance, oxidation or loose connections in the connectors.

Fault symptom[s]

- Poor air quality in the passenger compartment.

NO COMMUNICATION

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

Fig. 45: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  The diagnostic trouble code (DTC) may occur together with diagnostic trouble codes (DTCs) for other components that communicate with the climate control module (CCM) via LIN bus 1 and LIN bus 2.

  Check whether the diagnostic trouble code (DTC) has been stored together with other diagnostic trouble codes (DTCs) for other components on the climate control unit.

  Following options:

  1. The diagnostic trouble code (DTC) is stored together with diagnostic trouble codes (DTCs) for components in both LIN bus 1 and LIN bus 2 (CCM-DD10 - CCM-DD16, CCM-DD30 - CCM-DD34). Refer to **CHECKING THE CONNECTORS AND WIRING**
  2. The diagnostic trouble code (DTC) is stored together with diagnostic trouble codes (DTCs) for components only on LIN bus 1 (CCM-DD10 - CCM-DD16). Refer to **CHECKING LIN BUS 1 AND CONNECTOR**
  3. The diagnostic trouble code (DTC) is not together with diagnostic trouble codes (DTCs) for other components on LIN bus 1 and LIN bus 2. Refer to **CHECKING THE WIRING AND COMPONENT**

CHECKING THE CONNECTORS AND WIRING

Fig. 46: Identifying Ignition ON

Fig. 47: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector for the climate control module (CCM)
- Disconnect the connector for the central electronic module (CEM)
- Ignition on.

Checking the power supply and ground terminals

The following applies to components on the climate control unit that communicate with the climate control module (CCM) via LIN bus 1 and LIN bus 2:

- All components are jointly powered via a fuse from the central electronic module (CEM)
- All components are grounded via a common ground terminal.

Check the power supply to the components on the climate control unit by taking a reading on connector A for the central electronic module (CEM) between terminal #A44 (C44) and chassis ground.

Also check the fuse on the central electronic module (CEM).

Check the power supply cable between the central electronic module (CEM) and the connector for the climate control unit. Check for an open-circuit. Measure between terminal #1 on the connector for the climate control unit and chassis ground.

Check the ground terminal for the components on the climate control unit. Measure between the connector for climate control unit terminal #6 and chassis ground.

Check the connector for the climate control unit and connector A for the central electronic module (CEM). Check for contact resistance. Check for oxidation. Check for loose connections.

Checking LIN bus

Check both LIN bus 1 and LIN bus 2. Check for an open-circuit.

Take readings between:

- The connector for climate control module (CCM) terminal #12 (#36) and the connector for climate control unit terminal #2
- The connector for climate control module (CCM) terminal #7 (#31) and the connector for climate control unit terminal #5.

Check the wiring between the connector and the components on the climate control unit. Check for an open-circuit.

Remedy as necessary.

Other information:

- For further information about the connectors, fuses and relays, see the appropriate service information.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-DD12: LEFT-HAND SEAT HEATER. NO COMMUNICATION (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-DD12

Condition

Fig. 57: Identifying Left Seat Heating Module (SHM)
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects an open-circuit in the communication between the left seat heater and the climate control module (CCM) on LIN bus 1.

The diagnostic trouble code (DTC) can occur together with diagnostic trouble codes (DTCs) for other components on LIN bus 1 (CCM-DD10 - CCM-DD16) depending on where the open-circuit has occurred.

The diagnostic trouble code (DTC) can be diagnosed at ignition switch position II.

The diagnostic trouble code (DTC) can only be diagnosed for the climate control module (CCM) when seat heating is installed in the car.

Substitute Value

- None.

Possible Source

- Open-circuit on LIN bus 1 between the climate control module (CCM) and the left seat heater
- Contact resistance, oxidation or loose connections in the connectors.

Fault symptom[s]

- The front seat heating does not function.

NO COMMUNICATION

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

(2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-DD14

Condition

Fig. 66: Identifying Damper Motor Module (DMM)
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects an open-circuit in the communication between the damper motor recirculation and the climate control module (CCM) on LIN bus 1.

The diagnostic trouble code (DTC) can occur together with diagnostic trouble codes (DTCs) for other components on LIN bus 1 (CCM-DD10 - CCM-DD16) depending on where the open-circuit has occurred.

The diagnostic trouble code (DTC) can be diagnosed at ignition switch position II.

Substitute Value

- None.

Possible Source

- Open-circuit on LIN bus 1 between the climate control module (CCM) and the damper motor module (DMM) recirculation
- Contact resistance, oxidation or loose connections in the connectors.

Fault symptom[s]

- No recirculation.

NO COMMUNICATION

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

Fig. 67: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  The diagnostic trouble code (DTC) may occur together with diagnostic trouble codes (DTCs) for other components that communicate with the climate control module (CCM) via LIN bus 1 and LIN bus 2.

  Check whether the diagnostic trouble code (DTC) has been stored together with other diagnostic trouble codes (DTCs) for other components on the climate control unit.

  Following options:

  1. The diagnostic trouble code (DTC) is stored together with diagnostic trouble codes (DTCs) for components in both LIN bus 1 and LIN bus 2 (CCM-DD10 - CCM-DD16, CCM-DD30 - CCM-DD34). Refer to **CHECKING THE CONNECTORS AND WIRING**.
  2. The diagnostic trouble code (DTC) is stored together with diagnostic trouble codes (DTCs) for components only on LIN bus 1 (CCM-DD10 - CCM-DD16). Refer to **CHECKING LIN BUS 1 AND CONNECTOR**.
  3. The diagnostic trouble code (DTC) is not together with diagnostic trouble codes (DTCs) for other components on LIN bus 1 and LIN bus 2. Refer to **CHECKING THE WIRING AND COMPONENT**.

CHECKING THE CONNECTORS AND WIRING

Fig. 68: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 69: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector for the climate control module (CCM)
- Disconnect the connector for the central electronic module (CEM)
- Ignition on.

Checking the power supply and ground terminals

The following applies to components on the climate control unit that communicate with the climate control module (CCM) via LIN bus 1 and LIN bus 2:

- All components are jointly powered via a fuse from the central electronic module (CEM)
- All components are grounded via a common ground terminal.

Check the power supply to the components on the climate control unit by taking a reading on connector A for the central electronic module (CEM) between terminal #A44 (C44) and chassis ground.

Also check the fuse on the central electronic module (CEM).

Check the power supply cable between the central electronic module (CEM) and the connector for the climate control unit. Check for an open-circuit. Measure between terminal #1 on the connector for the climate control unit and chassis ground.

Check the ground terminal for the components on the climate control unit. Measure between the connector for climate control unit terminal #5 and chassis ground.

Check the connector on the climate control unit and connector A for the central electronic module (CEM). Check for contact resistance. Check for oxidation. Check for loose connections.

Checking LIN bus

Check both LIN bus 1 and LIN bus 2. Check for an open-circuit.

Take readings between:

- The connector for climate control module (CCM) terminal #12 (#36) and the connector for climate control unit terminal #2
- The connector for climate control module (CCM) terminal #7 (#31) and the connector for climate control unit terminal #5.

Check the wiring between the connector and the components on the climate control unit. Check for an open-circuit.

Remedy as necessary.

Other information:

- For further information about the connectors, fuses and relays, see the appropriate service information.

CHECKING LIN BUS 1 AND CONNECTOR

Fig. 71: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector for the climate control module (CCM).

  Check the climate control module (CCM) connector. Check for contact resistance. Check for oxidation. Check for loose connections.

  Check LIN bus 1 between the climate control module (CCM), the connector for the climate control unit and the seat heating module (SHM) left. Check for an open-circuit.

  Take readings between:

  - The connector for climate control module (CCM) terminal #12 (#36) and the connector for climate control unit terminal #2

- The connector for climate control module (CCM) terminal #12 (#36) and connector A for seat heating module (SHM) left terminal #2.

Check LIN bus 1 between the components (the damper motors and the air quality sensor (AQS) and the connector for the climate control unit. Check for an open-circuit.

Check the connector for the climate control unit. Check for contact resistance. Check for oxidation. Check for loose connections.

Remedy as necessary.

Other information:

- For further information about the connectors, fuses and relays, see the appropriate service information.

Refer to **VERIFICATION**

CHECKING THE WIRING AND COMPONENT

Fig. 73: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector for the damper motor module (DMM) for recirculation
- Ignition on.

  Check the connector. Check for contact resistance. Check for oxidation. Check for loose connections.

  Check that the damper motor module (DMM) is connected to power supply and ground.

  Measure the voltage on the connector for the damper motor module (DMM) between terminals #1 and #3

  Check LIN bus 1 by taking a reading between damper motor module (DMM) connector terminal #2 and the connector for climate control unit terminal #2. Check for an open-circuit.

Try replacing the damper motor module (DMM) if no fault is found.

Remedy as necessary.

Other information:

- For further information about the connectors, fuses and relays, see the appropriate service information.

IDENTIFYING COMPONENTS ON THE LIN NETWORK THAT BELONG TO THE CLIMATE CONTROL SYSTEM (CCM)

INFORMATION

- The control module must be identified after replacing the Damper Motor Module (DMM).

NOTE: **Identification must only be carried out when replacing components on the LIN network that belong to the climate control system (CCM).**

Have any of the components on the LIN network been replaced?

- **YES**

  Refer to **IDENTIFYING COMPONENTS ON THE LIN NETWORK THAT BELONG TO THE CLIMATE CONTROL SYSTEM (CCM)**

- **NO**

  Refer to **VERIFICATION**

IDENTIFYING COMPONENTS ON THE LIN NETWORK THAT BELONG TO THE CLIMATE CONTROL SYSTEM (CCM)

HINT: When identifying damper motors, each damper motor must be run to its limit position. These operations can take up to 30 seconds. When identifying the damper motors it is important that a battery charger is connected.

Fig. 76: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.

NOTE: **Climate Control Module (CCM) and damper motors can be affected by the temperature. The vehicle should have normal room temperature when performing this service.**

Carry out identification as follows:

- Ignition on.
- Click on the VCT2000 (Volvo Scan Tool) symbol. Wait until identification has been carried out.
- Ignition off.

Fig. 77: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **CALIBRATING THE CLIMATE CONTROL MODULE (CCM)**

CALIBRATING THE CLIMATE CONTROL MODULE (CCM)

CAUTION: When activating this function, calibration of the Climate Control Module (CCM) starts. After carrying out calibration read off of the diagnostic trouble codes (DTCs) starts. To ensure that diagnostics for the Climate Control Module (CCM) have been carried out, delay for 30 seconds before reading out diagnostic trouble codes (DTCs) after calibration.

NOTE: Climate Control Module (CCM) and damper motors can be affected by the temperature. The vehicle should have normal room temperature when performing this service.

Fig. 78: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

Carry out calibration as follows:

- Ignition on.
- Click on the VCT2000 (Volvo Scan Tool) symbol. Wait until calibration has been carried out and diagnostic trouble codes (DTCs) read out.
- Ignition off.

This function controls the components that communicate with the Climate Control Module (CCM) via LIN bus 1 and LIN bus 2. In the event of a fault in any of the LIN buses, diagnostic trouble codes (DTCs) CCM-0070 to CCM-0071 will be stored depending on the fault. These diagnostic trouble codes (DTCs) can only be stored in conjunction with this diagnostic function.

If any of these diagnostic trouble codes (DTCs) recur, recalibrate to check if the problem was overcome. If the diagnostic trouble code (DTC) recurs, fault-trace the relevant diagnostic trouble code (DTC).

Fig. 79: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 80: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 81: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Check that the relevant diagnostic trouble code (DTC) has switched status from permanent to intermittent fault.

  Check also that diagnostic trouble code (DTC) CCM-0070, CCM-0071 CCM-0072 or CCM-0073 has not been stored during identification of the damper motors.

  These diagnostic trouble codes (DTCs) can only be stored when identifying damper motors. They mean that the identification has failed for some reason.

Remedy by correctly identifying the damper motor. Fault-trace according to the relevant information.

Fig. 82: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Has the status of the diagnostic trouble code (DTC) changed?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-DD15: LEFT TEMPERATURE DAMPER MOTOR. NO COMMUNICATION

(2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-DD15

Condition

Fig. 83: Identifying Damper Motor Module (DMM)
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects an open-circuit in the communication between the climate control module (CCM) and the damper motor module (DMM) temperature left on LIN bus 1.

The diagnostic trouble code (DTC) can occur together with diagnostic trouble codes (DTCs) for other components on LIN bus 1 (CCM-DD10 - CCM-DD16) depending on where the open-circuit has occurred.

The diagnostic trouble code (DTC) can be diagnosed at ignition switch position II.

Substitute Value

- None.

Possible Source

- Open-circuit on LIN bus 1 between the climate control module (CCM) and the air quality sensor (AQS)
- Contact resistance, oxidation or loose connections in the connectors.

Fault symptom[s]

- The passenger compartment temperature does not correspond to the set position.

NO COMMUNICATION

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

Fig. 84: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

The diagnostic trouble code (DTC) may occur together with diagnostic trouble codes (DTCs) for other components that communicate with the climate control module (CCM) via LIN bus 1 and LIN bus 2.

Check whether the diagnostic trouble code (DTC) has been stored together with other diagnostic trouble codes (DTCs) for other components in the climate control unit.

Following options:

1. The diagnostic trouble code (DTC) is stored together with diagnostic trouble codes (DTCs) for components in both LIN bus 1 and LIN bus 2 (CCM-DD10 - CCM-DD16, CCM-DD30 - CCM-DD34). Refer to **CHECKING THE CONNECTORS AND WIRING**
2. The diagnostic trouble code (DTC) is stored together with diagnostic trouble codes (DTCs) for components only on LIN bus 1 (CCM-DD10 - CCM-DD16). Refer to **CHECKING LIN BUS 1 AND CONNECTOR**
3. The diagnostic trouble code (DTC) is not together with diagnostic trouble codes (DTCs) for other components on LIN bus 1 and LIN bus 2. Refer to **CHECKING THE WIRING AND COMPONENT**

CHECKING THE CONNECTORS AND WIRING

- Ignition off
- Disconnect the connector for the climate control module (CCM)
- Disconnect the connector for the central electronic module (CEM)
- Ignition on.

Checking the power supply and ground terminals

The following applies to components on the climate control unit that communicate with the climate control module (CCM) via LIN bus 1 and LIN bus 2:

- All components are jointly powered via a fuse from the central electronic module (CEM)
- All components are grounded via a common ground terminal.

Check the power supply to the components on the climate control unit by taking a reading on connector A for the central electronic module (CEM) between terminal #A44 (C44) and chassis ground.

Also check the fuse on the central electronic module (CEM).

Check the power supply cable between the central electronic module (CEM) and the connector for the climate control unit. Check for an open-circuit. Measure between terminal #1 on the connector for the climate control unit and chassis ground.

Check the ground terminal for the components on the climate control unit. Measure between the connector for climate control unit terminal #6 and chassis ground.

Check the connector for the climate control unit and connector A for the central electronic module (CEM). Check for contact resistance. Check for oxidation. Check for loose connections.

Checking LIN bus

Check both LIN bus 1 and LIN bus 2. Check for an open-circuit.

Take readings between:

- The connector for climate control module (CCM) terminal #12 (#36) and the connector for climate control unit terminal #2
- The connector for climate control module (CCM) terminal #7 (#31) and the connector for climate control unit terminal #5.

Check the wiring between the connector and the components on the climate control unit. Check for an open-circuit.

Remedy as necessary.

CCM-DD16: DAMPER MOTOR AIR DISTRIBUTION. NO COMMUNICATION

(2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-DD16

Condition

Fig. 100: Identifying Damper Motor Module (DMM)
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects an open-circuit in the communication between the climate control module (CCM) and the damper motor module (DMM) air distribution on LIN bus 1.

The diagnostic trouble code (DTC) can occur together with diagnostic trouble codes (DTCs) for other components on LIN bus 1 (CCM-DD10 - CCM-DD16) depending on where the open-circuit has occurred.

The diagnostic trouble code (DTC) can be diagnosed at ignition switch position II.

Substitute Value

- None.

Possible Source

- Open-circuit on LIN bus 1 between the climate control module (CCM) and the damper motor module (DMM) air distribution
- Contact resistance, oxidation or loose connections in the connectors.

Fault symptom[s]

- Misting on the windows and/or door mirrors.
- Air flow problem.

NO COMMUNICATION

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

Fig. 101: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  The diagnostic trouble code (DTC) may occur together with diagnostic trouble codes (DTCs) for other components that communicate with the climate control module (CCM) via LIN bus 1 and LIN bus 2.

  Check whether the diagnostic trouble code (DTC) has been stored together with other diagnostic trouble codes (DTCs) for other components on the climate control unit.

  Following options:

  1. The diagnostic trouble code (DTC) is stored together with diagnostic trouble codes (DTCs) for components in both LIN bus 1 and LIN bus 2 (CCM-DD10 - CCM-DD16, CCM-DD30 - CCM-DD34). Refer to **CHECKING THE CONNECTORS AND WIRING**
  2. The diagnostic trouble code (DTC) is stored together with diagnostic trouble codes (DTCs) for components only on LIN bus 1 (CCM-DD10 - CCM-DD16). Refer to **CHECKING LIN BUS 1 AND CONNECTOR**
  3. The diagnostic trouble code (DTC) is not together with diagnostic trouble codes (DTCs) for other components on LIN bus 1 and LIN bus 2. Refer to **CHECKING THE WIRING AND COMPONENT**

Has the status of the diagnostic trouble code (DTC) changed?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-DD20: LIN BUS 2. INCORRECT DATA (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-DD20

Condition

Fig. 117: Climate Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects that data that is sent on LIN bus 2 is incorrect.

The following components communicate with the climate control module (CCM) via LIN bus 2:

- damper motor module (DMM) defroster
- damper motor module (DMM) temperature right (only ECC)
- damper motor module (DMM) recirculation
- air quality sensor (AQS)
- seat heating module (SHM) right.

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I and II.

Substitute Value

- None.

Possible Source

- Incorrect data during communication on LIN bus 2.

Fault symptom[s]

- Misting on the windows and/or door mirrors.
- Air flow problem.
- Poor heating in the passenger compartment.
- The front seat heating does not function.
- Poor air quality in the passenger compartment.

INCORRECT DATA

CHECKING COMPONENTS

Fig. 118: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect connector A for the seat heating module (SHM) right
- Ignition on.

  The climate control module (CCM) has detected that a component on LIN bus 2 is transmitting incorrect data and disrupting communication on the LIN bus.

  Check the communication by disconnecting the seat heating module (SHM) right.

  If other control modules on LIN bus 2 now function, replace the seat heating module (SHM) right.

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING COMPONENTS**

CHECKING COMPONENTS

Fig. 119: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 120: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reconnect connector A for the seat heating module (SHM)
- Ignition on.

Check the components on the climate control unit as follows:

- Disconnect the connectors for the components one at a time
- Check whether the other components regain functionality, for example by activating seat heating
- If the functionality for the other components returns, the fault is probably in the disconnected components.

Remedy as necessary.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-DD21: LIN BUS 2. SIGNAL TOO HIGH/SIGNAL TOO LOW (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-DD21

Condition

Fig. 128: Climate Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects a short-circuit to supply voltage or ground in LIN bus 2.

A short-circuit to supply voltage or ground in the LIN bus will affect communications and the function of all the components.

The climate control module (CCM) communicates with the damper motors, air quality sensors and seat heating via two LIN buses.

The number of components in LIN bus 2 can vary depending on the vehicle equipment (ECC/MCC and options).

The following components communicate on LIN bus 2:

- damper motor module (DMM) defroster
- damper motor module (DMM) temperature right (only ECC)

- damper motor module (DMM) recirculation
- air quality sensor (AQS)
- seat heating module (SHM) right.

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I and II.

Substitute Value

- None.

Possible Source

- LIN bus 2 short-circuited to supply voltage
- LIN bus 2 short-circuited to ground.

Fault symptom[s]

- Misting on the windows and/or door mirrors.
- Poor heating in the passenger compartment.
- The front seat heating does not function.
- Poor air quality in the passenger compartment.

SIGNAL TOO HIGH / SIGNAL TOO LOW

CHECKING THE CABLE

Fig. 129: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 130: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector for the climate control module (CCM)
- Ignition on.

  Check LIN bus 2. Check for a short-circuit to supply voltage.

  Take a reading on the connector for the climate control module (CCM) between terminals #7 (#31) and #1 (#25).

  If there is a short-circuit to supply voltage in LIN bus 2, continue fault-tracing by locating where the short-circuit has occurred as follows:

- Disconnect the connector on the climate control unit that connects LIN bus 2 from the climate control module (CCM) to other components on the climate control unit
- Check the section of LIN bus 2 that connects the climate control module (CCM) to the right-hand seat heating module (SHM) and the connector on the climate control unit. Take a reading on the connector for the climate control module (CCM) between terminals #7 (#31) and #1 (#25).

If the fault persists, fault-trace LIN bus 2 between the climate control module (CCM), the right-hand seat heating module (SHM) and the connector on the climate control unit. Check for a short-circuit to supply voltage.

If the fault is no longer present, fault-trace LIN bus 2 between the connector and the components on the climate control unit. Check for a short-circuit to supply voltage.

Remedy as necessary.

Other information:

Has the status of the diagnostic trouble code (DTC) changed?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-DD22: LIN BUS 2. INCORRECT CHECK SUM (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-DD22

Condition

Fig. 137: Climate Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects that data that is sent on LIN bus 2 is incorrect.

The following components communicate with the climate control module (CCM) via LIN bus 2:

- damper motor module (DMM) defroster
- damper motor module (DMM) temperature right (only ECC)
- damper motor module (DMM) recirculation
- air quality sensor (AQS)
- seat heating module (SHM) right.

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I and II.

Substitute Value

- None.

Possible Source

- Incorrect data during communication on LIN bus 2.

Fault symptom[s]

- Misting on the windows and/or door mirrors.
- Air flow problem.
- Poor heating in the passenger compartment.
- The front seat heating does not function.
- Poor air quality in the passenger compartment.

FAULTY CHECK SUM

CHECKING COMPONENTS

Fig. 138: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  The climate control module (CCM) has diagnosed that two or more damper motor modules (DMM) have the same identity on LIN bus 2.

  This may be because one damper motor module (DMM) has been installed incorrectly.

  After replacing a damper motor module (DMM), it must be allocated a correct identity by the climate control module (CCM). This is performed during identification of the damper motors on the LIN bus.

  If a damper motor module (DMM) is installed that already has an identity allocated to it, this can lead to a conflict on the LIN bus.

Remedy by correctly identifying the damper motor.

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-DD30: RIGHT-HAND SEAT HEATER. NO COMMUNICATION (2005-

2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-DD30

Condition

Fig. 146: Identifying Left Seat Heating Module (SHM)
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects an open-circuit in the communication between the right-hand seat heater and the climate control module (CCM) on LIN bus 2.

The diagnostic trouble code (DTC) may occur together with diagnostic trouble codes (DTCs) for other components on LIN bus 2 (CCM-DD30 - CCM-DD34) depending on where the open-circuit has occurred.

The diagnostic trouble code (DTC) can be diagnosed at ignition switch position II.

The diagnostic trouble code (DTC) can only be diagnosed for the climate control module (CCM) when seat heating is installed in the car.

Substitute Value

- None.

Possible Source

- Open-circuit on LIN bus 2 between the climate control module (CCM) and the right-hand seat heating module (SHM)
- Contact resistance, oxidation or loose connections in the connectors.

Fault symptom[s]

- The front seat heating does not function.

NO COMMUNICATION

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

Fig. 147: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check that the fuse for the Seat heating module (SHM) is intact.

  The diagnostic trouble code (DTC) may occur together with diagnostic trouble codes (DTCs) for other components that communicate with the climate control module (CCM) via LIN bus 2.

  Check whether the diagnostic trouble code (DTC) has been stored together with other diagnostic trouble codes (DTCs) for other components on the climate control unit.

  Following options:

1. The diagnostic trouble code (DTC) is stored together with diagnostic trouble codes (DTCs) for components on LIN bus 2 (CCM-DD30-CCM-DD34). Refer to **CHECKING LIN BUS 2 AND CONNECTOR**
2. The diagnostic trouble code (DTC) is not stored together with diagnostic trouble codes (DTCs) for other components on LIN bus 2. Refer to **CHECKING THE WIRING AND COMPONENT**

CHECKING LIN BUS 2 AND CONNECTOR

Fig. 148: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector for the climate control module (CCM).

Check the climate control module (CCM) connector. Check for contact resistance. Check for oxidation.

Check for loose connections.

Check LIN bus 2 between the climate control module (CCM), the connector for the climate control unit and the seat heating module (SHM) right. Check for an open-circuit.

Take readings between:

- The connector for climate control module (CCM) terminal #7 (#31) and the connector for climate control unit terminal #5
- The connector for the climate control module (CCM) terminal #7 (#31) and connector A for the seat heating module (SHM) right terminal #2.

Remedy as necessary.

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects an open-circuit in the communication between the damper motor recirculation and the climate control module (CCM) on LIN bus 2.

The diagnostic trouble code (DTC) may occur together with diagnostic trouble codes (DTCs) for other components on LIN bus 2 (CCM-DD30 - CCM-DD34) depending on where the open-circuit has occurred.

The diagnostic trouble code (DTC) can be diagnosed at ignition switch position II.

Substitute Value

- None.

Possible Source

- Open-circuit on LIN bus 2 between the climate control module (CCM) and the damper motor module (DMM) recirculation
- Contact resistance, oxidation or loose connections in the connectors.

Fault symptom[s]

- No recirculation.

NO COMMUNICATION

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

Fig. 156: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  The diagnostic trouble code (DTC) may occur together with diagnostic trouble codes (DTCs) for other components that communicate with the climate control module (CCM) via LIN bus 1 and LIN bus 2.

  Check whether the diagnostic trouble code (DTC) has been stored together with other diagnostic trouble codes (DTCs) for other components on the climate control unit.

  Following options:

  1. The diagnostic trouble code (DTC) is stored together with diagnostic trouble codes (DTCs) for components in both LIN bus 1 and LIN bus 2 (CCM-DD10 - CCM-DD16, CCM-DD30 - CCM-DD34). Refer to **CHECKING THE CONNECTORS AND WIRING**.
  2. The diagnostic trouble code (DTC) is together with diagnostic trouble codes (DTCs) for components only on LIN bus 2 (CCM-DD30-CCM-DD34). Refer to **CHECKING LIN BUS 2 AND CONNECTOR**.
  3. The diagnostic trouble code (DTC) is not together with diagnostic trouble codes (DTCs) for other components on LIN bus 1 and LIN bus 2. Refer to **CHECKING THE WIRING AND COMPONENT**.

CHECKING THE CONNECTORS AND WIRING

Fig. 157: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 158: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector for the climate control module (CCM)
- Disconnect the connector for the central electronic module (CEM)
- Ignition on.

Checking the power supply and ground terminals

The following applies to components on the climate control unit that communicate with the climate control module (CCM) via LIN bus 1 and LIN bus 2:

- All components are jointly powered via a fuse from the central electronic module (CEM)
- All components are grounded via a common ground terminal.

Check the power supply to the components on the climate control unit by taking a reading on connector A for the central electronic module (CEM) between terminal #A44 (C44) and chassis ground.

Also check the fuse on the central electronic module (CEM).

Check the power supply cable between the central electronic module (CEM) and the connector for the climate control unit. Check for an open-circuit. Measure between terminal #1 on the connector for the climate control unit and chassis ground.

Check the ground terminal for the components on the climate control unit. Measure between the connector for climate control unit terminal #6 and chassis ground.

Check the connector for the climate control unit and connector A for the central electronic module (CEM). Check for contact resistance. Check for oxidation. Check for loose connections.

Checking LIN bus

Check both LIN bus 1 and LIN bus 2. Check for an open-circuit.

Take readings between:

- The connector for climate control module (CCM) terminal #12 (#36) and the connector for climate control unit terminal #2
- The connector for climate control module (CCM) terminal #7 (#31) and the connector for climate control unit terminal #5.

Check the wiring between the connector and the components on the climate control unit. Check for an open-circuit.

Remedy as necessary.

Refer to **CALIBRATING THE CLIMATE CONTROL MODULE (CCM)**

CALIBRATING THE CLIMATE CONTROL MODULE (CCM)

CAUTION: When activating this function, calibration of the Climate Control Module (CCM) starts. After carrying out calibration read off of the diagnostic trouble codes (DTCs) starts. To ensure that diagnostics for the Climate Control Module (CCM) have been carried out, delay for 30 seconds before reading out diagnostic trouble codes (DTCs) after calibration.

NOTE: Climate Control Module (CCM) and damper motors can be affected by the temperature. The vehicle should have normal room temperature when performing this service.

Fig. 167: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

Carry out calibration as follows:

- Ignition on.
- Click on the VCT2000 (Volvo Scan Tool) symbol. Wait until calibration has been carried out and diagnostic trouble codes (DTCs) read out.
- Ignition off.

This function controls the components that communicate with the Climate Control Module (CCM) via LIN bus 1 and LIN bus 2. In the event of a fault in any of the LIN buses, diagnostic trouble codes (DTCs) CCM-0070 to CCM-0071 will be stored depending on the fault. These diagnostic trouble codes (DTCs) can only be stored in conjunction with this diagnostic function.

If any of these diagnostic trouble codes (DTCs) recur, recalibrate to check if the problem was overcome. If the diagnostic trouble code (DTC) recurs, fault-trace the relevant diagnostic trouble code (DTC).

Fig. 168: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 169: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 170: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Check that the relevant diagnostic trouble code (DTC) has switched status from permanent to intermittent fault.

  Check also that diagnostic trouble code (DTC) CCM-0070, CCM-0071 CCM-0072 or CCM-0073 has not been stored during identification of the damper motors.

  These diagnostic trouble codes (DTCs) can only be stored when identifying damper motors. They mean that the identification has failed for some reason.

Remedy by correctly identifying the damper motor. Fault-trace according to the relevant information.

Fig. 171: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Has the status of the diagnostic trouble code (DTC) changed?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-DD32: RIGHT TEMPERATURE DAMPER MOTOR. NO

COMMUNICATION (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-DD32

Condition

Fig. 172: Identifying Damper Motor Module (DMM)
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects an open-circuit in the communication between the climate control module (CCM) and the damper motor module (DMM) temperature right on LIN bus 2.

The diagnostic trouble code (DTC) may occur together with diagnostic trouble codes (DTCs) for other components on LIN bus 2 (CCM-DD30 - CCM-DD34) depending on where the open-circuit has occurred.

The diagnostic trouble code (DTC) can be diagnosed at ignition switch position II.

The diagnostic trouble code (DTC) can only be diagnosed for the electronic climate control module (CCM) (ECC).

Substitute Value

- None.

Possible Source

- Open-circuit on LIN bus 2 between the climate control module (CCM) and the damper motor module (DMM) temperature right
- Contact resistance, oxidation or loose connections in the connectors.

Fault symptom[s]

- The passenger compartment temperature does not correspond to the set position.

NO COMMUNICATION

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

Fig. 173: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  The diagnostic trouble code (DTC) may occur together with diagnostic trouble codes (DTCs) for other components that communicate with the climate control module (CCM) via LIN bus 1 and LIN bus 2.

  Check whether the diagnostic trouble code (DTC) has been stored together with other diagnostic trouble codes (DTCs) for other components on the climate control unit.

  Following options:

  1. The diagnostic trouble code (DTC) is stored together with diagnostic trouble codes (DTCs) for components in both LIN bus 1 and LIN bus 2 (CCM-DD10 - CCM-DD16, CCM-DD30 - CCM-DD34). Refer to **CHECKING THE CONNECTORS AND WIRING**.
  2. The diagnostic trouble code (DTC) is together with diagnostic trouble codes (DTCs) for components only on LIN bus 2 (CCM-DD30-CCM-DD34). Refer to **CHECKING LIN BUS 2 AND CONNECTOR**.
  3. The diagnostic trouble code (DTC) is not together with diagnostic trouble codes (DTCs) for other components on LIN bus 1 and LIN bus 2. Refer to **CHECKING THE WIRING AND COMPONENT**.

  Refer to **VERIFICATION**

IDENTIFYING COMPONENTS ON THE LIN NETWORK THAT BELONG TO THE CLIMATE CONTROL SYSTEM (CCM)

INFORMATION

- The control module must be identified after replacing the Damper Motor Module (DMM).

NOTE: **Identification must only be carried out when replacing components on the LIN network that belong to the climate control system (CCM).**

Have any of the components on the LIN network been replaced?

- **YES**

  Refer to **IDENTIFYING COMPONENTS ON THE LIN NETWORK THAT BELONG TO THE CLIMATE CONTROL SYSTEM (CCM)**

- **NO**

  Refer to **VERIFICATION**

IDENTIFYING COMPONENTS ON THE LIN NETWORK THAT BELONG TO THE CLIMATE CONTROL SYSTEM (CCM)

HINT: When identifying damper motors, each damper motor must be run to its limit position. These operations can take up to 30 seconds. When identifying the damper motors it is important that a battery charger is connected.

Fig. 199: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.

NOTE: **Climate Control Module (CCM) and damper motors can be affected by the temperature. The vehicle should have normal room temperature when performing this service.**

Carry out identification as follows:

- Ignition on.
- Click on the VCT2000 (Volvo Scan Tool) symbol. Wait until identification has been carried out.
- Ignition off.

Fig. 200: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **CALIBRATING THE CLIMATE CONTROL MODULE (CCM)**

CALIBRATING THE CLIMATE CONTROL MODULE (CCM)

CAUTION: When activating this function, calibration of the Climate Control Module (CCM) starts. After carrying out calibration read off of the diagnostic trouble codes (DTCs) starts. To ensure that diagnostics for the Climate Control Module (CCM) have been carried out, delay for 30 seconds before reading out diagnostic trouble codes (DTCs) after calibration.

NOTE: Climate Control Module (CCM) and damper motors can be affected by the temperature. The vehicle should have normal room temperature when performing this service.

Fig. 201: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

Carry out calibration as follows:

- Ignition on.
- Click on the VCT2000 (Volvo Scan Tool) symbol. Wait until calibration has been carried out and diagnostic trouble codes (DTCs) read out.
- Ignition off.

This function controls the components that communicate with the Climate Control Module (CCM) via LIN bus 1 and LIN bus 2. In the event of a fault in any of the LIN buses, diagnostic trouble codes (DTCs) CCM-0070 to CCM-0071 will be stored depending on the fault. These diagnostic trouble codes (DTCs) can only be stored in conjunction with this diagnostic function.

If any of these diagnostic trouble codes (DTCs) recur, recalibrate to check if the problem was overcome. If the diagnostic trouble code (DTC) recurs, fault-trace the relevant diagnostic trouble code (DTC).

Fig. 202: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 203: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 204: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Check that the relevant diagnostic trouble code (DTC) has switched status from permanent to intermittent fault.

  Check also that diagnostic trouble code (DTC) CCM-0070, CCM-0071 CCM-0072 or CCM-0073 has not been stored during identification of the damper motors.

  These diagnostic trouble codes (DTCs) can only be stored when identifying damper motors. They mean that the identification has failed for some reason.

Remedy by correctly identifying the damper motor. Fault-trace according to the relevant information.

Fig. 205: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Has the status of the diagnostic trouble code (DTC) changed?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-DD34: AIR QUALITY SENSOR (AQS). NO COMMUNICATION (2005-

2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-DD34

Condition

Fig. 206: Identifying Air Quality Sensor (AQS)
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the climate control module (CCM) detects an open-circuit in the communication between the air quality sensor (AQS) and the climate control module (CCM) on LIN bus 2.

The diagnostic trouble code (DTC) may occur together with diagnostic trouble codes (DTCs) for other components on LIN bus 2 (CCM-DD30 - CCM-DD34) depending on where the open-circuit has occurred

The diagnostic trouble code (DTC) can be diagnosed at ignition switch position II.

The diagnostic trouble code (DTC) can only be diagnosed for the electronic climate control module (CCM) (ECC).

Substitute Value

- None.

Possible Source

- Open-circuit on LIN bus 2 between the climate control module (CCM) and the air quality sensor (AQS)
- Contact resistance, oxidation or loose connections in the connectors.

Fault symptom[s]

- Poor air quality in the passenger compartment.

NO COMMUNICATION

CHECKING THE DIAGNOSTIC TROUBLE CODES (DTCS)

Fig. 207: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  The diagnostic trouble code (DTC) may occur together with diagnostic trouble codes (DTCs) for other components that communicate with the climate control module (CCM) via LIN bus 1 and LIN bus 2.

  Check whether the diagnostic trouble code (DTC) has been stored together with other diagnostic trouble codes (DTCs) for other components on the climate control unit.

  Following options:

  1. The diagnostic trouble code (DTC) is stored together with diagnostic trouble codes (DTCs) for components in both LIN bus 1 and LIN bus 2 (CCM-DD10 - CCM-DD16, CCM-DD30 - CCM-DD34). Refer to **CHECKING THE CONNECTORS AND WIRING**
  2. The diagnostic trouble code (DTC) is together with diagnostic trouble codes (DTCs) for components only on LIN bus 1 (CCM-DD31-CCM-DD34). Refer to **CHECKING LIN BUS 2 AND CONNECTOR**
  3. The diagnostic trouble code (DTC) is not together with diagnostic trouble codes (DTCs) for other components on LIN bus 1 and LIN bus 2. Refer to **CHECKING THE WIRING AND COMPONENT**

CHECKING THE CONNECTORS AND WIRING

Fig. 208: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 209: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector for the climate control module (CCM)
- Disconnect the connector for the central electronic module (CEM)
- Ignition on.

Checking the power supply and ground terminals

The following applies to components on the climate control unit that communicate with the climate control module (CCM) via LIN bus 1 and LIN bus 2:

- All components are jointly powered via a fuse from the central electronic module (CEM)
- All components are grounded via a common ground terminal.

Check the power supply to the components on the climate control unit by taking a reading on connector A for the central electronic module (CEM) between terminal #A44 (C44) and chassis ground.

Also check the fuse on the central electronic module (CEM).

Check the power supply cable between the central electronic module (CEM) and the connector for the climate control unit. Check for an open-circuit. Measure between terminal #1 on the connector for the climate control unit and chassis ground.

Check the ground terminal for the components on the climate control unit. Measure between the connector for climate control unit terminal #6 and chassis ground.

Check the connector for the climate control unit and connector A for the central electronic module (CEM). Check for contact resistance. Check for oxidation. Check for loose connections.

Checking LIN bus

Check both LIN bus 1 and LIN bus 2. Check for an open-circuit.

Take readings between:

- The connector for climate control module (CCM) terminal #12 (#36) and the connector for climate control unit terminal #2
- The connector for climate control module (CCM) terminal #7 (#31) and the connector for climate control unit terminal #5.

Check the wiring between the connector and the components on the climate control unit. Check for an open-circuit.

Remedy as necessary.

Other information:

- For further information about the connectors, fuses and relays, see the appropriate service information.
- To connect the breakout box to the climate control module (CCM), see: **CONNECTING THE BREAKOUT BOX**
- To connect the breakout box, central electronic module (CEM), see: **CONNECTING THE BREAKOUT BOX**
- see **SIGNAL SPECIFICATION**
- see **CLIMATE CONTROL, LOCATION OF COMPONENTS**
- see **CLIMATE CONTROL MODULE (CCM), REPLACING**
- For -2004, see **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** . For 2005-, see **CENTRAL ELECTRONIC MODULE (CEM), REPLACING**

- **Continue**

  Refer to **VERIFICATION**

CHECKING LIN BUS 2 AND CONNECTOR

Fig. 211: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector for the climate control module (CCM).

  Check the climate control module (CCM) connector. Check for contact resistance. Check for oxidation. Check for loose connections.

  Check LIN bus 2 between the climate control module (CCM), the connector for the climate control unit and the seat heating module (SHM) left. Check for an open-circuit.

  Take readings between:

  - The connector for climate control module (CCM) terminal #7 (#31) and the connector for climate control unit terminal #5

- The connector for climate control module (CCM) terminal #7 (#31) and connector A for seat heating module (SHM) left terminal #2.

Check LIN bus 2 between the components (the damper motors and the air quality sensor (AQS) and the connector for the climate control unit. Check for an open-circuit.

Check the connector for the climate control unit. Check for contact resistance. Check for oxidation. Check for loose connections.

Remedy as necessary.

Other information:

- For further information about the connectors, fuses and relays, see the appropriate service information.
- see **CONNECTING THE BREAKOUT BOX**
- see **SIGNAL SPECIFICATION**
- see **CLIMATE CONTROL, LOCATION OF COMPONENTS**

Fig. 212: Connector, Green (16- Pin)
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **VERIFICATION**

CHECKING THE WIRING AND COMPONENT

Fig. 213: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the connector for the air quality sensor (AQS)
- Ignition on.

Check the connector for the air quality sensor (AQS). Check for contact resistance. Check for oxidation. Check for loose connections.

Check that the air quality sensor (AQS) is connected to the power supply and ground.

Measure the voltage at the connector for the air quality sensor (AQS) between terminals #1 and #3.

Check LIN bus 2 by taking a reading between sensor connector terminal #2 and the connector for climate

control unit terminal #5. Check for an open-circuit.

Try replacing the air quality sensor (AQS) if no fault is found.

Remedy as necessary.

Other information:

- For further information about the connectors, fuses and relays, see the appropriate service information.
- see **CONNECTING THE BREAKOUT BOX**
- see **SIGNAL SPECIFICATION**
- see **CLIMATE CONTROL, LOCATION OF COMPONENTS**
- see **CLIMATE CONTROL MODULE (CCM), REPLACING**
- see **AIR QUALITY SENSOR, REPLACING**

Has the status of the diagnostic trouble code (DTC) changed?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CCM-E001: CONTROL MODULE COMMUNICATION (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-E001

Condition

Fig. 219: Climate Control Module
Courtesy of VOLVO CARS CORPORATION

The control modules transmit and receive information via a standardized serial communication method - CAN (Control Area Network). The diagnostic trouble code (DTC) is stored if the control module registers serious interference on the low speed network (CAN communication blocked).

NOTE: **In the event of system communication problems, it is not possible to communicate with the control module. Therefore it will only be possible to read off the diagnostic trouble code (DTC) if the fault is intermittent.**

Substitute Value

- The control module shuts itself off ("bus-off").

HINT: The control module will remain shut off until the power supply is broken (15, 30, X). When the power supply is connected the control module will make a new attempt to communicate.

Possible Source

- Short-circuit between the control area network (CAN) wiring
- Open-circuit in the control area network (CAN) wiring
- Internal fault in the control module
- Internal fault in another control module in the same part of the control area network (CAN).

Fault symptom[s]

- Misting on the windows and/or door mirrors.
- The function button is not working.
- Blower fan not operating.
- The front seat heating does not function.
- Functions in the infotainment system do not work.

SIGNAL MISSING

see **SIGNAL MISSING**

CCM-E001: CONTROL MODULE COMMUNICATION. FAULTY COMMUNICATION (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-E001

Condition

Fig. 220: Climate Control Module
Courtesy of VOLVO CARS CORPORATION

The control modules transmit and receive information via a standardized serial communication method - CAN (Controller Area Network). The diagnostic trouble code (DTC) is stored if the control module registers serious interference (CAN communication blocked).

NOTE: **In the event of system communication problems, it is not possible to communicate with the control module. Therefore it will only be possible to read off the fault if it is intermittent.**

Substitute Value

- The control module shuts itself off ("bus-off").

  HINT: The control module will remain shut off until the power supply is broken (15, 30, X). When the power supply is connected the control module will make a new attempt to communicate.

Possible Source

- Short-circuit between the control area network (CAN) wiring
- Open-circuit in the control area network (CAN) wiring
- Internal fault in the control module

- Internal fault in another control module in the same part of the control area network (CAN).

NOTE: **In the event of missing CAN communication, but with the power supply still on, the climate control module (CCM) will function for a few minutes after the key has been removed (Limp-home function).**

Fault symptom[s]

- The climate control system functions after the key has been removed
- The lower row of buttons on the climate control system does not function
- The air conditioning (A/C) compressor does not start, or runs sporadically
- Misting on the windows and/or door mirrors
- Does not deadlock
- Does not open from deadlock
- Private locking of the trunk lid does not function. (S80, S60)
- Temporary disengagement of the detectors is not possible.

FAULTY COMMUNICATION

see **FAULTY COMMUNICATION**

CCM-E003: CONFIGURATION FAULT (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-E003

Condition

Fig. 221: Climate Control Module
Courtesy of VOLVO CARS CORPORATION

The control module compares its configuration ID with the signal configuration transmitted on the control area network (CAN) by the central electronic module (CEM). If the configuration IDs do not correspond the fault code is stored. The diagnostic trouble code (DTC) is also stored if the communication between the control module and the central electronic module (CEM) is interrupted.

NOTE: **In the event of an open-circuit in both the control area network (CAN) cables, it is not possible to communicate with the control module. Therefore it will only be possible to read off the diagnostic trouble code (DTC) if this type of fault is intermittent. When the diagnostic trouble code (DTC) is stored, the control module responds to the diagnostic commands. However normal control area network (CAN) communication does not work ("Expulsion mode").**

Substitute Value

- None.

Possible Source

- Faulty control area network (CAN) configuration ID. (The control module is not intended for this vehicle, for example, a used control module with different software/hardware)

- Open-circuit in the control area network (CAN) wiring between the control module and the central electrical module (CEM).

Fault symptom[s]

- Misting on the windows and/or door mirrors.
- The function button is not working.
- Blower fan not operating.
- The front seat heating does not function.
- Functions in the infotainment system do not work.

SIGNAL MISSING

see **SIGNAL MISSING**

CCM-E003: CONFIGURATION FAULT. FAULTY CONFIGURATION (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-E003

Condition

Fig. 222: Climate Control Module
Courtesy of VOLVO CARS CORPORATION

The control module compares its configuration ID with the signal configuration transmitted on the control area network (CAN) by the central electronic module (CEM). If the configuration IDs do not correspond the fault code is stored. The diagnostic trouble code (DTC) is also stored if the communication between the control module and the central electronic module (CEM) is interrupted.

NOTE: **In the event of open-circuit in both the control area network (CAN) cables, it is not possible to communicate with the control module. Therefore it will only be possible to read off the diagnostic trouble code (DTC) if this type of fault is intermittent. When the diagnostic trouble code (DTC) is stored, the control module responds to the diagnostic command, however normal control area network (CAN) communication does not work. ("Expulsion mode")**

Substitute Value

- Limp home function.

Possible Source

- Faulty control area network (CAN) configuration ID. (The node is not intended for this car (for example a used control module with different software/hardware)).

NOTE: **In the event of open-circuit in both the control area network (CAN) cables, it is not possible to communicate with the control module. Therefore it will only be possible to read off the diagnostic trouble code (DTC) if this type of fault is intermittent. Diagnostic information can be read off if there is an open-circuit in only one of the cables. The functionality of the control module may also remain, but with a possible reduction in performance.**

NOTE: **The control module responds to diagnostic data, however the CAN communication does not function.**

NOTE: **In the event of missing CAN communication, but with the power supply still on, the climate control module (CCM) will function for a few minutes after the key has been removed (Limp-home function).**

HINT: If the diagnostic trouble code (DTC) has also been stored for an open-circuit in the communication with other control modules on the control area network (CAN), the fault may be a common one (for example an open-circuit in one of the control area network (CAN) cables). To localize faults, refer to the appropriate service information.

Fault symptom[s]

- The climate control system functions after the key has been removed

- The lower row of buttons on the climate control system does not function
- No cooling from the air conditioning (A/C) system
- Misting on the windows and/or door mirrors
- Does not deadlock
- Does not open from deadlock
- Private locking of the trunk lid does not function. (S80, S60)
- Temporary disengagement of the detectors is not possible.

FAULTY CONFIGURATION (2003)

see **FAULTY CONFIGURATION (2003)**

FAULTY CONFIGURATION (2004)

see **FAULTY CONFIGURATION (2004)**

CCM-E010: POWER SUPPLY (2005-2012)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION CCM-E010

Condition

Fig. 223: Climate Control Module
Courtesy of VOLVO CARS CORPORATION

The diagnostic trouble code (DTC) is stored if the supply voltage to the climate control module (CCM) differs by more than 2 V from the supply voltage to the central electronic module (CEM).

The climate control module (CCM) receives information about supply voltage from the central electronic module (CEM) via the CAN network.

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I and II.

Substitute Value

- None.

Possible Source

- Short-circuit to ground in the cable harness
- Open-circuit in the cable harness
- Contact resistance
- Half-burned fuse to the climate control module (CCM).

Fault symptom[s]

- Misting on the windows and/or door mirrors.
- The function button is not working.
- Blower fan not operating.
- The front seat heating does not function.
- Functions in the infotainment system do not work.

SIGNAL MISSING

see **SIGNAL MISSING**

CCM-XXXX: UNKNOWN DIAGNOSTIC TROUBLE CODE (DTC) FOR THE CURRENT CONTROL MODULE VERSION (2005-2012)

UNKNOWN DIAGNOSTIC TROUBLE CODE (DTC) FOR THE PRESENT CONTROL MODULE VERSION

READING OFF DIAGNOSTIC TROUBLE CODES (DTC)

Fig. 224: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Read off the diagnostic trouble code (DTC) that is stored in the car.

  Make a note of the code. Report the code to VIDA (Volvo Scan Tool) customer support.

Fig. 225: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

CHECKING THE BLOWER MOTOR CONTROL (2003-2004)

CHECKING THE INTERIOR TEMPERATURE SENSOR (ECC)

CHECKING THE INTERIOR TEMPERATURE SENSOR SIGNAL

- Ignition on.

  Read the interior temperature and vary the temperature with the interior temperature sensor to, see if the value changes. Also check that the value is correct by comparing it with the values from the outside temperature sensor and interior temperature sensor, UEM or thermometer.

Fig. 226: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the temperature OK?

- **YES**

  FAULT NOT FOUND: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE COMPONENTS**

CHECKING THE COMPONENTS

The fault is probably caused by a defective measuring device in the climate control. With this type of fault, the climate control must be replaced because the interior temperature sensor cannot be replaced.

Additional information:

- To access/replace the climate control module (CCM).

CLIMATE CONTROL UNIT, REPLACING

Special tools:

see **1158957**

PREPARATIONS

NOTE: Read off data from the control module before replacing the control module. This is carried out via VIDA (Volvo Scan Tool) vehicle communication. After replacing the control module, the relevant parameters must be programmed into the new control module.

BEFORE STARTING WORK ON THE CLIMATE CONTROL SYSTEM

CAUTION: Follow the safety instructions for work on air conditioning systems, see REFRIGERANT, SAFETY REGULATIONS .

NOTE: First read the instructions covering slow and fast leaks. See OIL IN THE A/C SYSTEM .

NOTE: Always plug pipes and connectors when working on the climate control system.

REMOVAL

- First read section, see PREPARATIONS under, see **CLIMATE CONTROL UNIT, REPLACING**.
- **Work in the engine compartment**
- Disconnect the battery lead. See **BATTERY, REPLACING** .
- Drain the refrigerant from the system. See **REFRIGERANT, DRAINING** .

Fig. 227: Heater Hoses From Heat Exchanger
Courtesy of VOLVO CARS CORPORATION

- Clamp the heating hoses using lock grip pliers see **1158957**
- Disconnect the heater hoses from the heat exchanger by pressing in the hose connector. Turn it to the side so that the hose can be pulled out.
- Plug the pipes for the heat exchanger.
- the cover plate and the rubber seal for the lead-in.

Fig. 228: Identifying Windshield Wiper, Cowl, Gutter & Rain Protection
Courtesy of VOLVO CARS CORPORATION

Fig. 229: Identifying Center Console A-Post Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the windscreen wiper. See **WIPERS/WASHERS (2003-2004)**
- the cowl, gutter and rain protection. See **COWL, REPLACING**
- the cover for the connectors in the engine compartment-passenger compartment
- The screw for the member

Disconnect the connectors by screwing the connectors upwards so that the threads release. Then remove the connectors.

Additional work in the engine compartment on cars with air conditioning (A/C)

Fig. 230: Heat Deflector Plate On Firewall
Courtesy of VOLVO CARS CORPORATION

Remove the heat deflector plate on the bulkhead. See **REPLACING THE HEAT SHIELD FOR THE TXV VALVE** .

Fig. 231: Identifying Locking Bracket For Refrigerant Pipes
Courtesy of VOLVO CARS CORPORATION

Remove the locking bracket for the refrigerant pipes

- Disconnect the refrigerant pipes from the expansion valve

Work in the passenger compartment

Remove:

- The dashboard and center console. See **DASHBOARD AND RADIO PANEL**

NOTE: Move the front seat as far back as possible. Protect the floor and sills.

The climate control unit and the member from the bodywork

Remove:

- the steering column from the member: Remove the four screws which hold the steering column in place. Detach and fold down the steering column.

Fig. 232: Identifying Center Console A-Post Screws
Courtesy of VOLVO CARS CORPORATION

- the screws to the left and right of the A-post
- the screws to the left and right of the center console

Fig. 233: Air Ducts From Floor Heater Unit
Courtesy of VOLVO CARS CORPORATION

Remove:

- the air ducts from the floor heater unit
- the floor guttering on the left and right sides

Pull the member for the climate control unit backwards a little.

THE CLIMATE CONTROL UNIT FROM THE MEMBER IN THE PASSENGER COMPARTMENT

Fig. 234: Identifying Passenger Side Cable Duct Tie Straps
Courtesy of VOLVO CARS CORPORATION

Remove:

- the tie strap for the cable duct on the passenger side

Remove:

- the cable duct behind and above the climate control unit and on the driver's side

Fig. 235: Identifying Climate Control Unit & Connecting Member Screws (Left & Right)
Courtesy of VOLVO CARS CORPORATION

Remove:

- the 2 screws from the climate control unit-member on the passenger side
- the screws connecting the member to the climate control unit on the left and right-hand sides

Remove:

- the switch for the blower fan motor

Lift:

- the cable duct behind / above the member on the passenger side

- the cable duct above and behind the mounting for the member

Fig. 236: Identifying Climate Control Unit Member
Courtesy of VOLVO CARS CORPORATION

Loosen:

- the member from the climate control unit

Hold up the member and cable duct on the passenger side. Remove the climate control unit on the passenger side.

NOTE: Two people required.

INSTALLATION

THE CLIMATE CONTROL UNIT ON THE PASSENGER COMPARTMENT MEMBER

Fig. 237: Floor Seals
Courtesy of VOLVO CARS CORPORATION

- Check and replace the floor seals if necessary

Fig. 238: Front Seal For Refrigerant Pipe
Courtesy of VOLVO CARS CORPORATION

Install:

- the front seal for the refrigerant pipe. Check and replace the O-rings.

Fig. 239: Identifying Climate Control Unit Member
Courtesy of VOLVO CARS CORPORATION

Position:

- the climate control unit in the car
- the member on the climate control unit

NOTE: Two people required.

Install:

- the screws and the bracket on the member for the climate control unit
- Install and secure the cable duct.

- Check and position the cables for the radio and the dashboard environment unit.
- Take out the cable for the sensor on the dashboard and light switch.
- Position the member for the climate control unit against the bulkhead
- Check the location in relation to the opening for the coolant and heat exchange pipes.
- Press the member for the climate control unit into position against the bulkhead A-post.
- Secure the member for the climate control unit against the A-post loosely with the screws.
- Secure the member for the climate control on the center console loosely using the screws.

Tighten:

- the member on the A-post
- the screws on the center console
- Install the air ducts.

OTHER WORK IN THE PASSENGER COMPARTMENT

- In reverse order

WORK IN THE ENGINE COMPARTMENT

- In reverse order

  Vacuum pump and test the system. See **REFRIGERANT, DRAINING**

  Fill the system with refrigerant. Check for leaks. See **REFRIGERANT, DRAINING** .

  Install the battery lead. See **BATTERY, REPLACING** .

ORDERING SOFTWARE

Order the software. See 9438271 .

FINISHING

After replacing the control module, the following must be carried out.

- Reprogram the customer programmed data.
- Carry out self-adjustment of the damper motor end positions.
- Test drive the car. Check that the function of the engine is OK.
- Then check that no diagnostic trouble codes have been stored during the replacement.

Information about programming the control module, damper motor self-adjustment and reading off diagnostic trouble codes can be found under VIDA (Volvo Scan Tool) vehicle communication.

HVAC

Climate Units - General Diagnostics And Tests

CHECKING THE POWER SUPPLY AND GROUND (2003-04)

CHECKING POWER SUPPLY AND GROUND. INTERMITTENT FAULT

CHECKING THE POWER SUPPLY AND GROUND FOR THE CONTROL MODULE

Check climate control module (CCM) terminal #A1 and relay 2/29 (passenger compartment relay box) connectors. Check for contact resistance and oxidation.

Check fuses 23 and 24 in the passenger compartment fusebox for the climate control module (CCM). Check for contact resistance and oxidation.

Check the power supply cable between fuse 23 and the control module terminal #A8. Check for an open-circuit.

Check the function of relay 2/29 by replacing it with a new relay.

Check the cable for power supply (extended X supply) between fuse 24 and relay 2/29 terminal #3. Check for an intermittent open-circuit.

Check the cable for power supply (extended X supply) between relay 2/29 terminal #1 and climate control module (CCM) terminal #A1. Check for an intermittent open-circuit.

Check power supply cable between fuse 23 and the climate control module (CCM) terminal #A8. Check for an intermittent open-circuit.

Check the ground lead between control module terminal #A16 and ground terminal 31/84. Check for an intermittent open-circuit. Check ground terminal 31/84. Check for contact resistance and oxidation.

Remedy as necessary.

Other information:

CHECKING POWER SUPPLY AND GROUND. PERMANENT FAULT

CHECKING THE POWER SUPPLY AND GROUND FOR THE CONTROL MODULE

Check climate control module terminal #A1 and relay 2/29 (passenger compartment relay box) connectors. Check for contact resistance and oxidation.

Check fuse 23 and 24 in the passenger compartment fusebox for the climate control module.

NOTE: **If the fuse is blown, check the circuit after the fuse for a short-circuit to ground before replacing the fuse. Then replace the fuse.**

Check the cable for power supply between fuse 23 in the passenger compartment fusebox and control module terminal #A8. Check for an open-circuit.

Check the function of relay 2/29 by replacing it with a new relay.

Check the cable for power supply (delayed X supply) between fuse 24 and relay 2/29 terminal #3. Check for an open-circuit. The voltage at the relay terminal must be battery voltage, measured to ground.

Check the cable for power supply (delayed X supply) between relay 2/29 terminal #1 and climate control module (CCM) terminal #A1. Check for an open-circuit. The voltage at the terminal must be battery voltage, measured to ground.

Check power supply cable between fuse 23 and the climate control module (CCM) terminal #A8. Check for an open-circuit.

Check the ground lead between climate control module (CCM) terminal # A16 and ground terminal 31/84. Check for an open-circuit. Check ground terminal 31/84. Check for contact resistance and oxidation.

Remedy as necessary.

Other information:

- To access or replace the control module, see **CLIMATE CONTROL MODULE (CCM), REPLACING**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For other values, see **SIGNAL DESCRIPTION, CLIMATE CONTROL MODULE (CCM), CONNECTOR A**
- see **CHECKING WIRING AND TERMINALS** .

CHECKING THE POWER SUPPLY AND GROUND TERMINAL (2005-12)

CHECKING THE SUPPLY VOLTAGE/GROUND TERMINAL

CHECKING THE POWER SUPPLY AND GROUND TERMINALS

Power supply, climate control module (CCM)

The climate control module (CCM) is powered via a power input on the control module.

Power input terminal #1 (#25) is +15-supplied via a relay and fuse from the central electronic module (CEM). In the event of an open-circuit, climate control functions cannot be activated.

Checking the power supply

Check the power supply cable from the central electronic module (CEM) to climate control module (CCM) terminal #1 (#25). Check for an open-circuit. Check for loose connections. Check for contact resistance. Check for oxidation. Check the fuse. The voltage must be approximately battery voltage.

Ground terminal, climate control module (CCM)

The climate control module (CCM) has a ground input. The ground input from the control module is power ground and is connected to the ground terminal in the car body.

Checking the ground terminal

Check the ground lead between climate control module (CCM) terminal #16 (#40) and the ground terminal. Check for an open-circuit. Check for loose connections. Check for contact resistance. Check for oxidation. With the ignition on, the drop in voltage between the ground connection and the ground terminal for the climate control module (CCM) must not be greater than 0.5 V.

Remedy as necessary.

- see **SIGNAL SPECIFICATION**
- see **CONTENTS**

CONNECTING THE BREAKOUT BOX, CLIMATE CONTROL MODULE (CCM) (2003-04)

CONNECTING THE BREAKOUT BOX

Special tools:

see **9511463**

see **9511428**

see **9511428**

GENERAL INFORMATION

Check that the male and female terminals on the connectors are undamaged and secure (cannot be pressed in). Check that the cables to the female terminals are secured to the terminal pins.

The breakout box is designed to facilitate reading off the control module input and output signals when the control module is connected, and the cable and component resistance when the control module is disconnected. The use of a breakout box reduces the risk of accidental short-circuited cables and damage to the connector pins.

CONNECTING THE BREAKOUT BOX

- Ignition off
- To expose the climate control module (CCM) connector, see **CLIMATE CONTROL MODULE (CCM), REPLACING**

- To expose the evaporator temperature sensor connector, see **TEMPERATURE SENSOR EVAPORATOR, REPLACING**
- To expose the sun sensor connector, see **SUN SENSOR / ALARM LED, REPLACING** .

Connect breakout box see **9511428** to the adapter.

Climate control module (CCM)

- Connect adapter see **9511463** to control module connectors A and B
- For connector A, terminals #A1-#A16 correspond to terminals #25-#40 on the breakout box
- For connector B, terminals #B1-#B22 correspond to terminals #1-#22 on the breakout box.

Evaporator temperature sensor

- Connect adapter see **9511463** to the evaporator temperature sensor connector
- Terminals #1-#5 on the connector correspond to terminals #26-#30 on the breakout box.

Sun sensor

- Connect adapter see **9511463** to the sun sensor connector
- Terminals #1-#5 on the connector correspond to terminals #26-#30 on the breakout box.

CONNECTING THE BREAKOUT BOX, CLIMATE CONTROL MODULE (CCM) (2005-12)

CONNECTING THE BREAKOUT BOX

Special tools:

see **9511463**

see **9511428**

see **9511508**

GENERAL INFORMATION

Check that the male and female terminals on the connectors are undamaged and secure (cannot be pressed in). Check that the cables to the female terminals are secured to the terminal pins.

The breakout box is designed to facilitate reading off the control module input and output signals when the control module is connected. The breakout box is designed to facilitate reading off the cable and component resistance when the control module is disconnected. The use of a breakout box reduces the risk of accidental short-circuited cables and damage to the connector pins.

CONNECTING THE BREAKOUT BOX

- Ignition off
- To expose the climate control module (CCM) connector, see **CLIMATE CONTROL MODULE (CCM), REPLACING**
- To expose the evaporator temperature sensor connector, see **TEMPERATURE SENSOR EVAPORATOR, REPLACING** .

Connect breakout box see **9511428** to the adapter.

Climate control module (CCM)

- Connect adapter see **9511463** to control module connectors A and B
- For connector A, terminals #A1-#A16 correspond to terminals #25-#40 on the breakout box
- For connector B, terminals #B1-#B22 correspond to terminals #1-#22 on the breakout box.

Evaporator temperature sensor

- Connect adapter see **9511508** to the evaporator temperature sensor connector
- Terminals #1-#5 on the connector correspond to terminals #26-#30 on the breakout box.

HVAC

Climate Units - General Information

HVAC GENERAL INFORMATION

AIR CONDITIONING (AC) SYSTEM, GENERAL INSTRUCTIONS

Any leakage must be repaired immediately in order to prevent moisture entering the system.

Ensure the work area is kept dry and clean. Moisture and dirt will reduce the efficiency of the air conditioning (A/C) system.

Store compressor oil in a sealed container (compressor oil absorbs water).

When working on A/C systems, for example when replacing components, open ends must always be plugged immediately after undoing pipe or hose connections. When installing new components, leave the protective plugs in the holes until the component is actually needed. If dirt may have entered any component it must be inspected and cleaned.

If the car has been damaged in a collision it is important that every component in the system is inspected. Special attention must be paid to brazed joints. Cracked or deformed components must not be repaired.

DESICCANT IN THE AIR RECEIVER/DRYER

The dryer must be replaced when repairing a major leak or replacing a component, or if moisture is suspected to have entered the system. The unit need not be replaced more often than on every third occasion if only minor work is carried out under favorable conditions. Favorable conditions are defined, for example, as a slow leak (over 24 hours) which is repaired immediately. When installing new components in a one-year-old car the receiver need not be replaced.

CAUTION: To avoid corrosion, the system must be filled immediately after installation.

If the car has been left standing for more than 24 hours without refrigerant in the system, the system must be flushed twice with approximately 200 grams of refrigerant. Between the two flushing operations, pump the system completely empty for at least 10 minutes.

NOTE: Return used refrigerant to the supplier who is responsible for safe disposal of environmentally harmful substances.

AIR QUALITY SENSOR

AIM:

To offer the customer a passenger compartment which is free of bad odors and pollutants.

General:

By placing an air quality sensor in the air intake it is possible to measure the amounts of polluted air, primarily from motor vehicles. The signal from the air quality sensor is used to exclude the pollutants by using the recirculation (REC) mode. An activated carbon filter is installed in the heater. This filter takes care of the pollutants in the couple of seconds before the recirculation shutter closes and on those occasions when recirculation cannot be used because of misting. The filter and the sensor are interdependent to provide the customer with as clean a passenger compartment as possible. The climate control system is equipped with a button to activate the system.

The filter:

By supplying a particle filter with activated carbon, gases entering the passenger compartment can be absorbed. The focus of exclusion is on the following substances: NO, NO2, HC (benzene, toluene, xylene), CO, ozone.

What can activated carbon absorb?

Cold start: Good absorption of petrol components is usually achieved.

Manure: Ammonia is badly absorbed, however some neutralization can be expected.

Exhausts: Good separation of uncombusted hydrocarbons and "diesel odor" is achieved.

Oil odor: Good.

Water treatment plants: Sulphuric acid cannot be dealt with.

Solvents Good.

Pulp mills: Many odorous substances. Some can be absorbed.

Odors are complicated and are difficult to explain in terms of concentrations and percentages. A filter will reduce odors and minimize strong odor changes and will therefore improve comfort. The car can never be completely odorless. In some cases the odor compounds may seem unexpected because the constituent substance compounds are modified.

Sensor:

The sensor registers NOxCO and HC. These are the most prominent compounds produced by motor vehicles. The sensor registers increases in concentrations, for example when a tunnel is entered or when driving behind a truck. The sensor learns the environment it is in and only reacts to the relevant increase in concentration. One point is that the sensor reacts to CO, a compound which activated charcoal filters cannot handle.

OIL AIR CONDITIONING (A/C) SYSTEM, FILLING

Special tools:

see **9511204**

TOPPING UP THE LUBRICATING OIL

WARNING: Do not mix oil types. Always use the correct type of compressor oil.

NOTE: Too much lubrication oil will impair cooling. Too little lubrication oil will damage the compressor.

The oil must be topped up when repairing a leak or when replacing a component. The quantity required for the component in question will depend on whether leakage has taken place slowly or quickly.

Model	Engine	Model Year	Oil, AC compressor R134a
XC90	All	All	**1161 627-3**

Slow leakage (longer than 24 hours)

With a slow leak, there is normally minimal risk of oil loss.

When installing new components the following procedures apply:

Rapid leakage (e. g. hose rupture)

Rapid leakage often means that lubricating oil escapes with the refrigerant.

When replacing components, the following oil volumes shall be found in the new components or shall be filled in the system through the service valve, except for the compressor:

Receiver drier	30 cm^3
Evaporator	50 cm^3
Condenser	30 cm^3
Tube	10 cm^3
Hose	10 cm^3

Compressor

Oil return when reusing compressor:

- measure the volume of the oil drained from the compressor
- replace the volume of drained oil according to the table below:

Drained oil	Filling with oil
> or = 70 cm^3 oil	Replace the volume of drained oil with the corresponding quantity.
< 70 cm^3 oil	Fill with 70 cm^3 of oil.

Oil return when replacing compressor:

- Drain the old compressor of oil, and measure the amount.
- Drain the new compressor of oil (the amount may be below specified value since it is not possible to drain all oil from the compressor).
- Use the table below to fill the new compressor with the right amount of oil.

Drained oil	Filling with oil
> or = 70 cm^3 oil	Replace the drained oil volume with the same amount that was drained from the old compressor.
< 70 cm^3 oil	Fill with 70 cm^3 of oil.

CAUTION: When installing completely new system: Check that there is oil in the compressor. The other components should contain no oil.

REPLACING THE RECEIVER DRIER

Replace the receiver drier in the following cases:

- when replacing the compressor (e. g., compressor breakdown)
- refrigerant leakage, where nearly 100% has leaked out of the system (the system has no pressure)
- when replacing any air conditioning (A/C) component outside the warranty period.

FILLING THE A/C SYSTEM WITH OIL

NOTE: On newer filling/draining/vacuum-pumping stations there is a reservoir for injecting oil. This can be used before filling with refrigerant and after vacuum-pumping without needing to remove the needle valve in the service valve.

NOTE: Fill with oil before vacuum-pumping.

FILLING WITH PAG OIL

When replacing pipes/hoses, oil can be filled through the service valve.

When filling the vehicle with PAG oil (for P/N, see spare parts catalog), carry out the following:

- Remove the needle valve in the service valve using valve tool see **9511204** .

Fig. 1: Identifying Needle Valve, Service Valve & Valve Tool (951 1204)
Courtesy of VOLVO CARS CORPORATION

Use the filling syringe (without plastic hose) supplied with the unit to top up the oil. Clean the syringe to avoid the possibility of mixing different types of oil.

- Check according to the table above. Measure how much oil is to be added. After topping up the oil, reinstall the needle valve.

NOTE: **Use only your thumb and index finger when tightening the service valve using valve needle tool see 9511204 . This is to prevent damage to the seal on the service valve.**

REFRIGERANT, OVERVIEW

Environmental legislation makes increasing demands on safe handling of refrigerant.

The refrigerant used by Volvo in the AC systems is designated R134a.

WARNING: **R134a must not be mixed with other refrigerants. R134a must not be used in air conditioning (A/C) systems for which other refrigerant types are specified.**

NOTE: **The statutory requirements for handling refrigerants can vary from country to country. It is important that national legislation, applying to handling of refrigerants for the country where the equipment is to be used, is followed. Read the safety regulations for handling refrigerant according to REFRIGERANT, SAFETY REGULATIONS before the equipment is used**

TRACING AGENT FLUORESCENT, PRODUCTION/AFTER MARKET

TRACING AGENT FLUORESCENT, PRODUCTION

Volvo has introduced a fluorescent tracing agent into production.

The tracing agent is impregnated in a free standing "Dry-Water"cylindrical filter in the drying agent in the dryer.

The tracing agent dissolves and mixes with the compressor oil in the climate control system. The tracing agent is light green in color. It is used to identify any leakage in the climate control system. If an UV lamp is used, it is easier to, see where the fluorescent tracing agent is leaking out.

The receiver drier is supplied without tracing agent for aftermarket orders.

To fill with refrigerant, see **REFRIGERANT, FILLING** .

Test for leaks. See **LEAK TRACING, FLUORESCENT TRACING AGENT/UV LAMP** or **LEAK TRACING, FLUORESCENT TRACING AGENT/UV LAMP** .

TRACING AGENT FLUORESCENT, AFTERMARKET

Volvo has introduced a fluorescent tracing agent for aftermarket use.

Facts about the tracing agent

- The tracing agent is in liquid form. It is mixed with the A/C compressor oil in the climate control system
- The tracing agent is light green in color. It is used to identify any leakage in the climate control system
- If an UV lamp is used, it is easier to, see where the fluorescent tracing agent is leaking out.

HVAC

Climate Units - General Safety Information

SAFETY INFORMATION

REFRIGERANT, SAFETY REGULATIONS

Always wear tight-fitting safety glasses if there is any risk for refrigerant leakage.

If refrigerant gets in the eyes rinse immediately in running water for 15 seconds. Seek medical assistance if you experience any problems after exposure (with vision etc.).

Protect exposed skin (hands) to avoid frostbite injuries.

If skin is exposed to refrigerant, flush the affected area with warm running water. Treat the injury as for frostbite.

Toxic gases may be generated if refrigerant comes into contact with a naked flame.

WARNING: **The toxic gases generated when the refrigerant is heated are hazardous to health. These gases have an irritating smell and can cause lung damage. The symptoms can continue for a long time after you have been in contact with the gases. The gases can cause lung damage even if the amount of gas in the air is too little to smell it.**

Do not keep gas bottles where the temperature can exceed 45° C.

WARNING: **Exposing a gas bottle to heat will cause the pressure in the bottle to increase with a correspondingly greater risk of an explosion occurring.**

NOTE: **Some countries have special legislation about working with air-conditioning systems. Only qualified technicians are to be allowed to work with the A/C system.**

AIR CONDITIONING SYSTEM, SAFETY INFORMATION

WARNING: **Only trained technicians may work with the air conditioning (A/C) system.**

WARNING: **Air conditioning (A/C) components can be extremely hot or cold.**

WARNING: **Always wear protective goggles and gloves made of fluoroelastomers**

when handling refrigerants. Leather or textile gloves are not suitable.

WARNING: **Check that the air conditioning (A/C) system is at room temperature before starting any repair work.**

WARNING: **If liquid refrigerant comes into contact with skin, it causes severe frostbite.**

WARNING: **Immediately rinse the area with water for 15 minutes. Seek medical attention.**

WARNING: **If refrigerant comes into contact with your eyes, immediately rinse the eyes with copious amounts of water for 15 minutes. Seek medical attention.**

WARNING: **If the refrigerant comes into contact with open flames or hot surfaces, it gives off poisonous gases (fluorine and phosgene).**

WARNING: **These poisonous gases are easily detected by their pungent odor, even in very small concentrations.**

WARNING: **The refrigerant is flammable and explosive.**

WARNING: **Ensure compliance with local regulations regarding work with air conditioning (A/C) systems.**

WARNING: **Make sure that refrigerant bottles are not exposed to temperatures greater than 45 °C.**

WARNING: **Make sure that the refrigerant bottles are properly closed.**

WARNING: **The poisonous gases generated when the refrigerant is heated are hazardous to your health.**

WARNING: **The gases have a pungent odor and can cause lung damage.**

WARNING: The symptoms can continue for a long time after exposure to the gases.

WARNING: The gases can cause lung damage, even if the amount of gas in the air is too small to be detected by its odor.

WARNING: Refrigerant in gas form has a higher density than air.

WARNING: Risk of asphyxiation if working near the floor or in a lubrication pit.

WARNING: Make sure there is proper ventilation when handling refrigerant.

WARNING: Never release refrigerant into the air.

WARNING: Only use special tools, equipment and lubricant that has been approved for the type of refrigerant used.

WARNING: The pressurized container in the service unit must never be overfilled.

WARNING: The refrigerant must have sufficient space to be able to expand if the temperature rises.

WARNING: Always follow the manufacturer's instructions for correct use of the service unit.

CAUTION: Do not mix oils for different refrigerants.

CAUTION: Never mix different types of refrigerants or equipment intended for such.

CAUTION: Refrigerants cause some plastics to break down. Only use seals suitable for the refrigerant in question.

CAUTION: If the air conditioning (A/C) compressor is damaged, the fixed opening pipe may become blocked by metal particles. Any type of blockage in the refrigerant circuit will damage the air conditioning (A/C) compressor beyond repair.

CAUTION: If the air conditioning system (A/C) is open for more than 2 hours, a new dryer filter must be installed and evacuation time must be increased by at least 2 hours.

NOTE: New air conditioning (A/C) compressors come pre-filled.

NOTE: The refrigerant oil in the new air conditioning (A/C) compressors contains teflon, which can appear as white particles. These will not damage the system.

HVAC

Climate Units - Installation Instructions, Accessories

ELECTRICAL ENGINE BLOCK HEATER 115V (B6294T; 2003)

ELECTRICAL ENGINE BLOCK HEATER 115V

CAUTION: Ensure that the cable for the engine block heater is not routed close to any rotating components or sharp edges.

Fig. 1: Cable And Protective Cover
Courtesy of VOLVO CARS CORPORATION

- Take the cable for the front engine block heater socket and the protective cover from the kit
- Thread the protective cover on to the cable.

Fig. 2: Connector And Holder

Courtesy of VOLVO CARS CORPORATION

- Take the holder for the connector from the kit. Press the connector into place in the bottom of the holder.

Fig. 3: Folding Cover Over Connector
Courtesy of VOLVO CARS CORPORATION

- Fold the cover over the connector. Press together so that the holes in the holder and cover align with each other.

Fig. 4: Identifying Front Intake Components
Courtesy of VOLVO CARS CORPORATION

- Take the mounting and screw for the grille from the kit. Tighten the mounting for the holder and cover.

Fig. 5: Installing Front Engine Block Heater Socket
Courtesy of VOLVO CARS CORPORATION

- Insert the cable for the front engine block heater socket through the center hole, second from the left in the grille
- Take the screw and the mounting plate from the kit. Insert the front engine block heater socket. Slide it to the right so that the distance between the mounting plate and the second rib in the grille is 10 mm (25/64"). This is so that the cable does not become trapped when folding the connector out or back in
- Route the cable to the left into the join between the two rubber seals for the radiator. Continue routing the cable along the left-hand side of the radiator and out between the front skid plate and the front edge of the sub-frame.

Fig. 6: Engine Splash Guard
Courtesy of VOLVO CARS CORPORATION

- Remove the engine splash guard (1) by first removing the screws (2).

Fig. 7: Locating Hose Clamps
Courtesy of VOLVO CARS CORPORATION

- Remove the draining nipple on the hose to the left of the oil cooler. Drain the coolant
- Remove the clamps (1) on the lower hose on the oil cooler. Remove the hose. Place the hose to one side. It will not be reused.

Fig. 8: Gearbox Right Front Corner Screw
Courtesy of VOLVO CARS CORPORATION

- Remove the screw (1) in the bottom cover on the right front corner of the gearbox
- Tighten the small bracket (from the kit) using the screw to the gearbox as illustrated. Tighten the screws. Tighten to **10 Nm (7 lbf. ft.)** .

Fig. 9: Hose Alignment Markings
Courtesy of VOLVO CARS CORPORATION

- Install the hoses (from the kit) on the heater. Align the white markings (1) with each other as illustrated.

Fig. 10: Hose Clamps
Courtesy of VOLVO CARS CORPORATION

- Position the four hose clamps (from the kit) on the hoses and heater
- Tighten the hose clamp (1). Position the hose clamp (2) as illustrated. Tighten the hose to the oil cooler.

Fig. 11: Rubber Coated Clamp
Courtesy of VOLVO CARS CORPORATION

- Position the rubber coated clamp (1) (from the kit) on the heater as illustrated.

Fig. 12: Blind Riveting Rubber Coated Clamp With Heater To Bracket In Bottom Cover Of Gearbox
Courtesy of VOLVO CARS CORPORATION

- Install the heater with the hoses to the oil cooler pipe
- Take a blind rivet (1) from the kit. Blind rivet the rubber coated clamp with the heater to the bracket in the bottom cover of the transmission
- Tighten the remaining hose clamps to the heater and oil cooler pipe.

Fig. 13: Identifying O-Ring
Courtesy of VOLVO CARS CORPORATION

- Route the previously routed cable for the front engine block heater socket above the front left corner of the sub-frame
- Grease the O-ring on the switch using low temperature grease, (P/N 1161417-9).

NOTE: Do not get any grease on the contact surfaces of the connector.

Fig. 14: Cable Clamped Using Tie Strap
Courtesy of VOLVO CARS CORPORATION

- Connect the cable connector to the connector on the engine block heater. Install a locking sleeve from the kit over the joint.

WARNING: Never break the power supply to the engine block heater by disconnecting this connector.

- Route the cable as illustrated. Clamp the cable using a tie strap from the kit at position (1).
- Fill with coolant. Test run the engine. Bleed the cooling system. Check for leakage
- Reinstall the engine splash guard. Tighten to **25 Nm (19 lbf. ft.)**

ELECTRIC ENGINE BLOCK HEATER 115V, B8444S (B8444S; 2005-2008)

ELECTRIC ENGINE BLOCK HEATER, 115V

PREPARATIONS

Fig. 15: Detach Left-Hand Headlamp By Pulling Up Two Locking Pins
Courtesy of VOLVO CARS CORPORATION

- Detach the left-hand headlamp by pulling up the two locking pins and then carefully pulling away the headlamp forwards.

Fig. 16: Carefully Prize Up Catch On Connector For Headlamp With A Screwdriver

Courtesy of VOLVO CARS CORPORATION

- Carefully prize up the catch on the connector for the headlamp using a screwdriver.
- Pull the catch up completely, detach the connector and place the headlamp to one side.

Fig. 17: Removing Upper Engine Strut
Courtesy of VOLVO CARS CORPORATION

- Remove the screw in the upper engine mounting. Remove the four screws holding the strut between the spring strut turrets and lift out the strut.

Fig. 18: Removing Rear Engine Cover
Courtesy of VOLVO CARS CORPORATION

- Remove the rear engine cover behind the intake manifold by pulling it away backwards. It is fitted with four rubber mountings.

INSTALLING THE FRONT ENGINE BLOCK HEATER SOCKET

APPLIES TO CARS FROM MODEL YEAR 2007-

Fig. 19: Identifying Surface To Clean Where Front Engine Block Heater Socket Is Secured
Courtesy of VOLVO CARS CORPORATION

- Clean the surface where the front engine block heater socket will be secured.

Fig. 20: Identifying Hole Drilled In Front Engine Block Heater Socket's Mounting Plate
Courtesy of VOLVO CARS CORPORATION

- Drill a hole for the guide to the front engine block heater socket's mounting plate.
- File down the edges of the holes.

Fig. 21: Identifying Hole Drilled For Tie Strap In Front Engine Block Heater Socket's Cable
Courtesy of VOLVO CARS CORPORATION

- Drill a hole for the tie strap for the front engine block heater socket's cable.
- File down the edges of the holes.

Fig. 22: Cutting Away Engine Block Heater Socket Mounting Plate Pins
Courtesy of VOLVO CARS CORPORATION

- Cut away the three pins on the front engine block heater socket's mounting plate.

Fig. 23: Identifying Drill Area And Dimensions
Courtesy of VOLVO CARS CORPORATION

- Drill a **5 mm (3/16 ")** diameter hole in the mounting plate.
- File down the edges of the holes.

- Assemble the front engine block heater socket using the parts from the kit, in accordance with illustrations A, B, C and D.

Illustration A

Fig. 24: Installing Kit Components
Courtesy of VOLVO CARS CORPORATION

Illustration B

Fig. 25: Connector And Holder
Courtesy of VOLVO CARS CORPORATION

Illustration C

Fig. 26: Folding Cover Over Connector
Courtesy of VOLVO CARS CORPORATION

Illustration D

Fig. 27: Mounting Plate
Courtesy of VOLVO CARS CORPORATION

APPLIES TO CARS FROM MODEL YEAR 2007-

Fig. 28: Front Engine Block Heater Socket
Courtesy of VOLVO CARS CORPORATION

- Install the front engine block heater socket with the guide pin in the large hole.
- Route the cable in so that it runs down on the inside of the left-hand bracket for the skid plate.
- Align the front engine block heater socket so that the long sides of the mounting plate are parallel with the edges of the surface into which the mounting plate shall be screwed.
- Mark out for drilling the hole for the screw for the mounting plate.

Fig. 29: Identifying 3/16 Inch Hole Drilled To Secure Front Engine Block Heater Socket's Mounting Plate
Courtesy of VOLVO CARS CORPORATION

- Drill a **5 mm (3/16 ")** diameter hole for the screw for securing the front engine block heater socket's mounting plate.

Fig. 30: Installing Front Engine Block Heater Socket
Courtesy of VOLVO CARS CORPORATION

- with a screw and nut in the drilled hole and tighten.

Fig. 31: Securing Engine Block Heater Socket
Courtesy of VOLVO CARS CORPORATION

- Secure the tie strap in the hole around the front cable.
- Fold in the connector so that the cable adopts the correct length in the tie strap before it is tightened.
- Tighten the tie strap.

Fig. 32: Identifying Cable Clamped At Pipe
Courtesy of VOLVO CARS CORPORATION

- Clamp the cable in at the pipe for the air conditioning using a double tie strap.
- Route the cable up on the inside of the side member and under the plate underneath the headlamp.

APPLIES TO CARS UP TO AND INCLUDING MODEL YEAR -2006

Fig. 33: Front Socket Cable
Courtesy of VOLVO CARS CORPORATION

- Guide the front socket's cable in through the center hole, next furthest to the left in the grille.

Fig. 34: Screw, Washer And Attaching Plate
Courtesy of VOLVO CARS CORPORATION

- Take a screw, washer and attaching plate from the kit and install the front socket. Push it as far as possible to the left and tighten it.
- Route the cable to the left, in through the rubber seal on the left-hand side of the radiator and under the plate on the underside of the headlamp.

INSTALLING THE HEATER

Fig. 35: Routing Cable
Courtesy of VOLVO CARS CORPORATION

- Route the cable back along the left-hand side of the air cleaner and between the air cleaner and fuse holder. Continue to route it backwards, under the ABS system and up between the cable duct and brake fluid reservoir.
- Check that the cable does not chafe against sharp edges or moving parts in the engine compartment.
- Clamp with tie straps from the kit.

NOTE: Do not clamp the cable against brake pipes, fuel lines or air conditioning (A/C) pipes.

- Open the cover for the radiator expansion tank.

Fig. 36: Installation Clips
Courtesy of VOLVO CARS CORPORATION

- Take two clips from the kit and install them in the edge of the plate at the front edge of the panel above

the windscreen wiper arms.

Fig. 37: Engine Splash Guard And Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the six screws and the engine splash guard.

Fig. 38: Removing Exhaust Manifold Joint Bolts
Courtesy of VOLVO CARS CORPORATION

- Remove the four nuts in the joints to the manifold and the two in the joint in the front edge of the front silencer.

Fig. 39: Removing Pipe Above Exhaust Manifold
Courtesy of VOLVO CARS CORPORATION

- Detach the pipe above the exhaust manifold from the clips in the brackets to the exhaust manifold's front mounting.
- Remove the four screws in the brackets
- Detach the heat deflector plate's two clips from the brackets.
- Remove the exhaust pipe and catalytic converters.

NOTE: Take care with the twisted parts of the exhaust manifold.

Fig. 40: Identifying Engine Block Drain Nipple
Courtesy of VOLVO CARS CORPORATION

- Detach the engine block drain nipple under the left-hand side of the rear manifold and drain the coolant.
- Tighten the nipple when the coolant is drained.

Illustration A

Fig. 41: Identifying Engine Block Plug
Courtesy of VOLVO CARS CORPORATION

- Remove the plug in the engine block under the left-hand side of the rear manifold.

Illustration B

Fig. 42: Service Tools
Courtesy of VOLVO CARS CORPORATION

- Use hexagon socket P/N 9512965, socket extension 120 mm (4 3/4 ") with spherical end, socket extension 500 mm (19 11/16 ") with spherical end and handle.

Illustration C

Fig. 43: Removing Plug
Courtesy of VOLVO CARS CORPORATION

- Apply a piece of butyl tape on the hexagon socket so that the plug does not fall away when it is unscrewed.

NOTE: Removing the plug requires significant force.

Fig. 44: Installing Heater
Courtesy of VOLVO CARS CORPORATION

- Take the heater from the kit.

HINT: Try to rotate the connector in the heater before installation to reduce any friction.

- Brush thread sealant P/N 1161056 on the threads.
- Install the heater in the engine block and manually screw it on as far as possible. It may be difficult to make the threads engage in the hole as the connector rotates stiffly in the threaded part of the heater.

Illustration A

Fig. 45: Service Tools
Courtesy of VOLVO CARS CORPORATION

- Take tool P/N 9814012, a 1/2 "- 3/8" adapter, the two socket extensions and a 1/2 " ratchet handle.

Illustration B

Fig. 46: Tightening The Heater To The Engine Block
Courtesy of VOLVO CARS CORPORATION

- Tighten the heater firmly to the engine block.

Fig. 47: Installing Cable
Courtesy of VOLVO CARS CORPORATION

- Press the cable to the engine block heater into the clips.
- Take the radiation shield from the kit and pull it on the end of the cable.
- Guide the cable down to the location where the engine block heater was installed.

Fig. 48: Identifying O-Ring
Courtesy of VOLVO CARS CORPORATION

- Grease in the O-ring on the connector for the heater's cable using low temperature grease (P/N 1161417-9).

NOTE: Do not get any grease on the surfaces of the connector.

Fig. 49: Installing Connector
Courtesy of VOLVO CARS CORPORATION

- Firmly press in the connector to the engine block heater.

Fig. 50: Installing Locking Sleeve
Courtesy of VOLVO CARS CORPORATION

- Press a locking sleeve (from the kit) over the cable splice.

Fig. 51: Installing Radiation Shield
Courtesy of VOLVO CARS CORPORATION

- Pull the radiation shield down so that it fully covers the connector.

Fig. 52: Installing Grey Tie Strap
Courtesy of VOLVO CARS CORPORATION

- Take the grey tie strap from the kit and tighten the radiation shield to the cable at the top edge.
- Connect and reinstall the left-hand headlamp.
- Reinstall the engine's rear protective cover.
- Reinstall the strut between the spring strut turrets.

  Torque tighten the four M10 screws to **50 Nm (37 lbf. ft.)** and the M12 screw to **80 Nm (59 lbf. ft.)** .

- Make sure that all sealing surfaces are thoroughly cleaned and reinstall the exhaust manifold with new gaskets and clamp nuts from the kit. Torque tighten to **25 Nm (18.5 lbf. ft.)** .

- Clamp the pipe above the bracket into its clips.
- Align the clips for the heat deflector plate's mounting in the bracket for the exhaust manifold's mounting.
- Tighten the bracket for the exhaust manifold's mounting to **25 Nm (18.5 lbf. ft.)** .
- Fill with coolant, drive to normal operating temperature and bleed the system. Check that there are no leaks.
- Top up with coolant as required.
- Reinstall the engine splash guard and torque tighten the screws to **25 Nm (18.5 lbf. ft.)** .

ELECTRIC ENGINE BLOCK HEATER 230V B8444S (B8444S; 2005-2008)

ELECTRIC ENGINE BLOCK HEATER 230V

Fig. 53: Detach Left-Hand Headlamp By Pulling Up Two Locking Pins
Courtesy of VOLVO CARS CORPORATION

- Detach the left-hand headlamp by pulling up the two locking pins and then carefully pulling away the headlamp forwards.

Fig. 54: Carefully Prize Up Catch On Connector For Headlamp With A Screwdriver
Courtesy of VOLVO CARS CORPORATION

- Carefully prize up the catch on the connector for the headlamp with a screwdriver.
- Pull the catch up completely, detach the connector and place the headlamp to one side.

Fig. 55: Remove Left-Hand Grille From Bumper By Carefully Prying It Away With A Weatherstrip Tool
Courtesy of VOLVO CARS CORPORATION

- Remove the left-hand grille from the bumper by carefully prizing it away with a weatherstrip tool.

Fig. 56: Measure Out For Drilling Front Socket Hole
Courtesy of VOLVO CARS CORPORATION

- Measure out for drilling the front socket hole as illustrated.
- Pre-drill the hole using a **3 mm (1/8")** bit.
- Drill out the hole. Use a **29 mm (1 1/8")** diameter hole saw.
- Remove any shavings.

Fig. 57: Cutting Out Discs
Courtesy of VOLVO CARS CORPORATION

- Take a utility knife and cut out the discs (1) in such a way that they are equally as high. The plastic nut for the front socket then has a flat surface to be tightened against.

Fig. 58: Left-Hand Grille Of Bumper
Courtesy of VOLVO CARS CORPORATION

- Saw or cut out for the front socket connector in the second hole from the left in the left-hand grille of the bumper.
- Smooth off the edges.
- Press the grille into the bumper.

Illustration A

Fig. 59: Identifying Blind Cover Plug
Courtesy of VOLVO CARS CORPORATION

- Take the front socket, protective cover and plastic nut from the kit.
- Fit the protective cover onto the front socket's connector. Turn the connector so that the cover is opened to the left-hand side of the car as illustrated.

Illustration B

Fig. 60: Identifying Plastic Nut
Courtesy of VOLVO CARS CORPORATION

- Install the plastic nut.
- Tighten the plastic nut firmly. Connect the cable to the front socket for counterholding when the plastic nut is tightened.
- Guide down the front socket ground cable on the left-hand side of the left-hand side member.

Fig. 61: Removing Upper Engine Strut
Courtesy of VOLVO CARS CORPORATION

- Remove the screw in the upper engine mounting. Remove the four screws holding the strut between the spring strut turrets and lift out the strut.

Fig. 62: Removing Rear Engine Cover
Courtesy of VOLVO CARS CORPORATION

- Remove the rear engine cover behind the intake manifold by pulling it away backwards. It is fitted with four rubber mountings.

Fig. 63: Identifying Drill Hole Area
Courtesy of VOLVO CARS CORPORATION

- Drill a hole in the front/lower edge of the side member with a **4 mm (5/32")** bit.
- Apply anti-corrosion agent and secure the ground cable with the enclosed **4.8 mm (3/16")** flanged screw and toothed washer (under the screw head).

NOTE: Connect the ground lead to the side member, not to the sub-frame.

- Secure the excess ground cable length with a tie strap from the kit.

Fig. 64: Engine Splash Guard And Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the six screws from the engine splash guard.

Fig. 65: Removing Exhaust Manifold Joint Bolts
Courtesy of VOLVO CARS CORPORATION

- Remove the four nuts in the joints to the manifold and the two in the joint in the front edge of the front silencer.

Fig. 66: Removing Pipe Above Exhaust Manifold
Courtesy of VOLVO CARS CORPORATION

- Detach the pipe above the exhaust manifold from the clips in the brackets to the exhaust manifold's front mounting.
- Remove the four screws in the brackets
- Detach the heat deflector plate's two clips from the brackets.
- Remove the exhaust pipe and catalytic converters.

NOTE: Take care with the twisted parts of the exhaust manifold.

Fig. 67: Identifying Engine Block Drain Nipple
Courtesy of VOLVO CARS CORPORATION

- Detach the engine block drain nipple under the left-hand side of the rear manifold and drain the coolant.
- Tighten the nipple when the coolant is drained.

Illustration A

Fig. 68: Identifying Engine Block Plug
Courtesy of VOLVO CARS CORPORATION

- Remove the plug in the engine block under the left-hand side of the rear manifold.

Illustration B

Fig. 69: Service Tools
Courtesy of VOLVO CARS CORPORATION

- Use hexagon socket part no. 9512965, socket extension 120 mm (4 3/4 ") with spherical end, socket extension 500 mm (19 11/16 ") with spherical end and handle.

Illustration C

Fig. 70: Installing Plug
Courtesy of VOLVO CARS CORPORATION

- Apply a piece of butyl tape on the hexagon socket so that the plug does not fall away when it is unscrewed.

NOTE: Removing the plug requires significant force.

Fig. 71: Installing Heater
Courtesy of VOLVO CARS CORPORATION

- Take the heater from the kit.

HINT: Try to rotate the connector in the heater before installation to reduce any friction.

- Brush thread sealant part no. 1161056 on the threads.
- Install the heater in the engine block and manually screw it on as far as possible. It may be difficult to make the threads engage in the hole as the connector rotates stiffly in the threaded part of the heater.

Illustration A

Fig. 72: Service Tools
Courtesy of VOLVO CARS CORPORATION

- Take tool part no. 9814012, a 1/2 "- 3/8" adapter, the two socket extensions and a 1/2 " ratchet handle.

Illustration B

Fig. 73: Tightening Heater Into Engine Block
Courtesy of VOLVO CARS CORPORATION

- Tighten the heater firmly to the engine block.

Fig. 74: Routing Cable
Courtesy of VOLVO CARS CORPORATION

- Take the jointing cable from the kit and route it under the plate beneath the left-hand headlamp. Continue to route it back along the left-hand side of the air cleaner and between the air cleaner and fuse holder. Route it further backwards, under the ABS system and up between the cable duct and brake fluid reservoir.
- Clamp it in with tie straps from the kit.
- Check that the cable does not chafe against sharp edges or moving parts in the engine compartment.

CAUTION: Do not clamp the cable against brake pipes, fuel lines or air conditioning (A/C) pipes.

Fig. 75: Installing Clips
Courtesy of VOLVO CARS CORPORATION

- Take two clips from the kit and install them in the edge of the plate at the front edge of the panel above the windscreen wiper arms.

Fig. 76: Installing Cable
Courtesy of VOLVO CARS CORPORATION

- Press the jointing cable into the clips.
- Take the radiation shield from the kit and pull it on the end of the cable.
- Guide the cable down to the location where the engine block heater was installed.

Fig. 77: Identifying O-Ring
Courtesy of VOLVO CARS CORPORATION

- Lubricate the O-ring on the connector for the heater's jointing cable and the cable to the front socket with low temperature grease (part no. 1161417-9).

NOTE: Do not get any grease on the surfaces of the connector.

Fig. 78: Installing Cable Joint Connector
Courtesy of VOLVO CARS CORPORATION

- Firmly press the jointing cable connector into the engine block heater connector.

Fig. 79: Installing Locking Sleeve
Courtesy of VOLVO CARS CORPORATION

- Press a locking sleeve (from the kit) over the cable splice.

Fig. 80: Installing Radiation Shield
Courtesy of VOLVO CARS CORPORATION

- Pull the radiation shield down so that it fully covers the connector.

Fig. 81: Installing Grey Tie Strap
Courtesy of VOLVO CARS CORPORATION

- Take the grey tie strap from the kit and tighten the radiation shield to the cable at the top edge.

Fig. 82: Branch Connector
Courtesy of VOLVO CARS CORPORATION

Applies when fitting passenger compartment connector at the same time

- If the car is equipped with passenger compartment connector then the branch connector is to be installed now.

  Connect:

  socket (1) in branch connector to the cable for the front socket.
  sockets (2, 3) in the branch connector to any of the cables for the engine block heater and branch connector.

Fig. 83: Installing Front Socket Cable Connector
Courtesy of VOLVO CARS CORPORATION

- Firmly press the front socket cable connector into the into the jointing cable connector.

Fig. 84: Installing Locking Sleeve
Courtesy of VOLVO CARS CORPORATION

- Press a locking sleeve (from the kit) over the cable splice.

Fig. 85: Securing Excess Cable
Courtesy of VOLVO CARS CORPORATION

- Collect any excess cable under the plate beneath the left-hand headlamp and clamp it into the existing hole using a tie strap from the kit.

- Connect and reinstall the left-hand headlamp.
- Reinstall the engine's rear protective cover.
- Reinstall the strut between the spring strut turrets.

  Torque tighten the four M10 screws to **50 Nm (37 lbf. ft.)** and the M12 screw to **80 Nm (59 lbf. ft.)** .

- Make sure that all sealing surfaces are thoroughly cleaned and reinstall the exhaust manifold with new

gaskets and clamp nuts from the kit. Torque tighten to **25 Nm (18.5 lbf. ft.)** .

- Clamp the pipe above the bracket into its clips.
- Align the clips for the heat deflector plate's mounting in the bracket for the exhaust manifold's mounting.
- Tighten the bracket for the exhaust manifold's mounting to **25 Nm (18.5 lbf. ft.)** .
- Fill with coolant, drive to normal operating temperature and bleed the system. Check that there are no leaks.
- Top up with coolant as required.
- Reinstall the engine splash guard and torque tighten the screws to **25 Nm (18.5 lbf. ft.)** .

ELECTRIC ENGINE BLOCK HEATER 230V (B6294T; 2003-2006)

ELECTRICAL ENGINE BLOCK HEATER 230V, B6294T

Fig. 86: Detach Left-Hand Headlamp By Pulling Up Two Locking Pins
Courtesy of VOLVO CARS CORPORATION

- Remove the left-hand headlamp by pulling up the two cotter pins and then carefully pulling the headlamp forwards.

Fig. 87: Carefully Prize Up Catch On Connector For Headlamp With A Screwdriver
Courtesy of VOLVO CARS CORPORATION

- Carefully pry up the catch on the connector for the headlamp using a screwdriver
- Pull up the catch completely, disconnect the connector. Place the headlamp to one side.

Fig. 88: Remove Left-Hand Grille From Bumper By Carefully Prying It Away With A Weatherstrip Tool
Courtesy of VOLVO CARS CORPORATION

- Carefully pry up the left-hand grille on the bumper up using a weatherstrip tool. Remove the grille.

Fig. 89: Measure Out For Drilling Front Socket Hole
Courtesy of VOLVO CARS CORPORATION

- Measure for drilling out the hole for the front engine block heater socket as illustrated
- Pre-drill the hole using a 3 mm (1/8") diameter drill bit
- Drill out the hole. Use a 29 mm (1 1/8") diameter hole saw
- Remove any shavings.

Fig. 90: Cutting Out Discs
Courtesy of VOLVO CARS CORPORATION

- Cut the tabs (1) using a utility knife so that they are the same height. This ensures a flat surface to tighten the plastic nut for the front engine block heater socket against.

Fig. 91: Left-Hand Grille Of Bumper
Courtesy of VOLVO CARS CORPORATION

- Make a cut out for the connector for the front engine block heater socket in the second hole from the left in the left-hand bumper grille
- Smooth off the edges
- Press the grille into the bumper.

Illustration A

Fig. 92: Identifying Blind Cover Plug
Courtesy of VOLVO CARS CORPORATION

- Take the front engine block heater socket, protective cover and plastic nut from the kit
- Install the protective cover on the front engine block heater socket connector. Turn the connector so that the cover opens on the left-hand side of the car as illustrated.

Illustration B

Fig. 93: Identifying Plastic Nut
Courtesy of VOLVO CARS CORPORATION

- Install the plastic nut
- Tighten the plastic nut properly. Connect the cable to the front engine block heater socket to use as a counterhold when tightening the plastic nut
- Insert the front engine block heater socket ground lead on the left-hand side of the left-hand side member.

Fig. 94: Installing Extension Cable
Courtesy of VOLVO CARS CORPORATION

- Insert the extension cable (1) (from the kit) on the left-hand side of the left-hand side member as illustrated
- Remove the cover on the expansion tank for the radiator.

Fig. 95: Engine Splash Guard
Courtesy of VOLVO CARS CORPORATION

- Remove the engine splash guard (1) by first removing the screws (2).

Fig. 96: Drilling A Hole In Front/Lower Edge Of Side Member With 4mm (5/32") Bit
Courtesy of VOLVO CARS CORPORATION

- Drill a hole at the front edge/lower edge of the side member using a 4 mm (5/32") diameter drill bit
- Rust-proof and secure the ground lead using the included 4.8 mm (3/16") diameter flanged screw and toothed washer (under the screw head).

NOTE: Connect the ground lead to the side member, not to the sub-frame.

Fig. 97: Locating Hose Clamps
Courtesy of VOLVO CARS CORPORATION

- Remove the draining nipple on the hose to the left of the oil cooler. Drain the coolant
- Remove the clamps (1) on the lower hose on the oil cooler. Remove the hose. Place the hose to one side. It will not reused.

Fig. 98: Hose Alignment Markings
Courtesy of VOLVO CARS CORPORATION

- Install the hoses (from the kit) on the heater. Align the white markings (1) with each other as illustrated.

Fig. 99: Gearbox Right Front Corner Screw
Courtesy of VOLVO CARS CORPORATION

- Remove the screw (1) in the bottom cover on the right front corner of the gearbox
- Tighten the small bracket (from the kit) using the screw to the gearbox as illustrated. Tighten the screws. Tighten to **10 Nm (7 lbf. ft.)** .

Fig. 100: Hose Clamps
Courtesy of VOLVO CARS CORPORATION

- Position the four hose clamps (from the kit) on the hoses and heater
- Tighten the hose clamp (1). Position the hose clamp (2) as illustrated. Tighten the hose to the oil cooler.

Fig. 101: Rubber Coated Clamp
Courtesy of VOLVO CARS CORPORATION

- Position the rubber coated clamp (1) (from the kit) on the heater as illustrated.

Fig. 102: Blind Riveting Rubber Coated Clamp With Heater To Bracket In Bottom Cover Of Gearbox
Courtesy of VOLVO CARS CORPORATION

- Install the heater with the hoses to the oil cooler pipe
- Take a blind rivet (1) from the kit. Blind rivet the rubber coated clamp with the heater to the bracket in the bottom cover of the gearbox
- Tighten the remaining hose clamps to the heater and oil cooler pipe.

Fig. 103: Identifying O-Ring
Courtesy of VOLVO CARS CORPORATION

- Route the previously routed extension cable inside the front left corner. Grease the O-ring on the switch using low temperature grease, (P/N 1161417-9).

NOTE: Do not get any grease on the contact surfaces of the connector.

Fig. 104: Cable Clamped Using Tie Strap
Courtesy of VOLVO CARS CORPORATION

- Connect the extension cable to the engine block heater
- Press a locking sleeve (from the kit) over the cable splice
- Tighten the cable as illustrated. Secure the cable using a tie strap from the kit at position (1) as illustrated.

Fig. 105: Identifying O-Ring
Courtesy of VOLVO CARS CORPORATION

- Grease the O-ring on the switch for the front engine block heater socket using low temperature grease, (P/N 1161417).

NOTE: Do not get any grease on the contact surfaces of the connector.

Fig. 106: Installing Locking Sleeve
Courtesy of VOLVO CARS CORPORATION

Applies to cars where only a single engine block heater is to be installed

- Connect the front engine block heater socket cable to the extension cable (routed earlier)
- Press a locking sleeve (from the kit) over the cable splice.

Fig. 107: Installing Cable Terminal Under Plate
Courtesy of VOLVO CARS CORPORATION

Applies to cars where only a single engine block heater is to be installed

- Position the cable terminal on the underside of the plate under the headlamp. Secure at points (1) and (2). Secure the ground lead at point (2) using tie straps from the kit.

Fig. 108: Installing Junction Connector
Courtesy of VOLVO CARS CORPORATION

Applies to cars where the engine block heater and passenger compartment connector socket must be mounted at the same time

- Grease the O-rings on the cable for the front engine block heater socket and connections on the junction connector. Use low temperature grease, (P/N 1161417-9) as before.

NOTE: Do not get any grease on the contact surfaces of the connector.

- Connect the front engine block heater socket cable to socket (1) on the junction connector
- Connect the wiring for the engine block heater and passenger compartment connector socket to either socket (2) or (3) on the junction cable
- Press the three locking sleeves (from the kit) over the cable splices.

Fig. 109: Screw, Nut, Washer, Tie Strap, And Branch Connector -- 6-Cylinder Engine
Courtesy of VOLVO CARS CORPORATION

Applies to cars where the engine block heater and passenger compartment connector socket must be mounted at the same time

- Position the junction connector with the wiring on the underneath of the plate under the headlamp, with the two sockets pointing forward and the cable from the front engine block heater socket pointing backward
- Take the screw and the nut from the kit. Tighten the junction connector in the hole in the plate (1)
- Take a tie strap from the kit and secure the wiring at point (2).

- Connect the connector to the headlamp and reinstall the headlamp
- Fill with coolant. Test drive the engine. Bleed the system. Check for leakage
- Reinstall the engine splash guard. Tighten the screws for engine splash guard. Tighten to **25 Nm (19 lbf. ft.)** .

ELECTRIC ENGINE BLOCK HEATER, 230V, 5-CYL (B5254T2; 2003-2007)

ELECTRIC ENGINE BLOCK HEATER, 230V, 5-CYL

UP TO AND INCLUDING MODEL YEAR -2006

PREPARATIONS

Fig. 110: Detach Left-Hand Headlamp By Pulling Up Two Locking Pins
Courtesy of VOLVO CARS CORPORATION

- Detach the left-hand headlamp by pulling up the two locking pins and then carefully pulling away the headlamp forwards.

Fig. 111: Carefully Prize Up Catch On Connector For Headlamp With A Screwdriver
Courtesy of VOLVO CARS CORPORATION

- Carefully prize up the catch on the connector for the headlamp with a screwdriver.
- Pull the catch up completely, detach the connector and place the headlamp to one side.

Fig. 112: Remove Left-Hand Grille From Bumper By Carefully Prying It Away With A Weatherstrip Tool
Courtesy of VOLVO CARS CORPORATION

- Remove the left-hand grille from the bumper by carefully prizing it away with a weatherstrip tool.

Fig. 113: Measure Out For Drilling Front Socket Hole
Courtesy of VOLVO CARS CORPORATION

- Measure out for drilling the front socket hole as illustrated.
- Pre-drill the hole using a **3 mm (1/8")** bit.
- Drill out the hole. Use a **29 mm (1 1/8")** diameter hole saw.
- Remove any shavings.

Fig. 114: Cutting Out Discs
Courtesy of VOLVO CARS CORPORATION

- Take a utility knife and cut out the discs (1) in such a way that they are equally as high. The plastic nut for the front socket then has a flat surface to be tightened against.

Fig. 115: Left-Hand Grille Of Bumper
Courtesy of VOLVO CARS CORPORATION

- Saw or cut out for the front socket connector in the second hole from the left in the left-hand grille of the bumper.
- Even off the edges.
- Press the grille into the bumper.

INSTALLING THE FRONT ENGINE BLOCK HEATER SOCKET

Illustration A

Fig. 116: Identifying Blind Cover Plug
Courtesy of VOLVO CARS CORPORATION

- Take the front intake, blind cover plug and plastic nut from the kit.
- Fit the blind cover plug on the front socket's connector and turn the connector so that the cover is opened to the left-hand side of the car as illustrated.

Illustration B

Fig. 117: Identifying Plastic Nut
Courtesy of VOLVO CARS CORPORATION

- Install the plastic nut.
- Tighten the plastic nut properly.
- Route the cable along the outside of the left-hand side member.

Fig. 118: Engine Splash Guard
Courtesy of VOLVO CARS CORPORATION

- Remove the engine splash guard (1) by first removing the screws (2).

Fig. 119: Drilling A Hole In Front/Lower Edge Of Side Member With 4mm (5/32") Bit
Courtesy of VOLVO CARS CORPORATION

- Drill a hole in the front/lower edge of the side member with a **4 mm (5/32")** bit.
- Apply anti-corrosion agent and secure the ground cable with the enclosed **4.8 mm (3/16")** flanged screw and toothed washer (under the screw head).

NOTE: Connect the ground cable to the side member, not to the subframe.

- Secure the excess ground cable with a tie strap.

FROM AND INCLUDING MODEL YEAR 2007-

PREPARATIONS

Fig. 120: Detach Left-Hand Headlamp By Pulling Up Two Locking Pins
Courtesy of VOLVO CARS CORPORATION

- Detach the left-hand headlamp by pulling up the two locking pins and then carefully pulling away the headlamp forwards.

Fig. 121: Carefully Prize Up Catch On Connector For Headlamp With A Screwdriver
Courtesy of VOLVO CARS CORPORATION

- Carefully prize up the catch on the connector for the headlamp with a screwdriver.
- Pull the catch up completely, detach the connector and place the headlamp to one side.

Fig. 122: Drilling Out Three Rivets From Front Edge Of Left Wing Liner
Courtesy of VOLVO CARS CORPORATION

Applies to cars with fuel-driven parking heater installed

- Drill out the three rivets from the front edge of the left wing liner.
- Remove the remains of the rivets.
- Move the wing liner aside and fasten it so that the parking heater is accessible.

Fig. 123: Clean Bumper Cover Where Front Engine Block Heater Socket Shall Be Secured
Courtesy of VOLVO CARS CORPORATION

- Clean the bumper cover where the front engine block heater socket shall be secured.

Fig. 124: Clip On Panel For Front Fog Lamp
Courtesy of VOLVO CARS CORPORATION

- Remove the clip on the panel for the front fog lamp.

Fig. 125: Removing Panel Over Fog Lamp By Carefully Prying It Loose From Bumper Shell With A Weatherstrip Tool
Courtesy of VOLVO CARS CORPORATION

- Remove the panel over the fog lamp by carefully prying it loose from the bumper shell with a weatherstrip tool. The panel is held in place with catches. The corner (1) of the other panel section must be pried loose since it overlaps the panel.

Fig. 126: Marking On Inside Of Panel
Courtesy of VOLVO CARS CORPORATION

- Cut out according to the existing marking on the inside of the panel for the protective cover for the front engine block heater socket.
- Test and cut until the protective cover fits.

Fig. 127: Drilling A 29 MM (1 1/8 inches) Diameter Hole Using A Hole Saw According To Existing Marking In Lower Edge Of Bumper Cover
Courtesy of VOLVO CARS CORPORATION

- Drill a **29 mm (1 1/8 ")** diameter hole using a hole saw according to the existing marking in the lower edge of the bumper cover. Pre-drill using a **3mm (1/8 ")** diameter drill bit.

NOTE: **It is important that the hole is drilled right in the center of the marking in order to correspond with the hole cut out earlier.**

- Even out the hole edges and remove the drill shavings.

Fig. 128: Front Fog Lamp Panel
Courtesy of VOLVO CARS CORPORATION

- Reinstall the front fog lamp panel.

Fig. 129: Clip Into Panel
Courtesy of VOLVO CARS CORPORATION

- Press the clip into the panel.

INSTALLING THE FRONT ENGINE BLOCK HEATER SOCKET

Fig. 130: Take Protective Cover From Kit And Press It Into Hole Cut In Bumper Cover
Courtesy of VOLVO CARS CORPORATION

- Take the protective cover from the kit and press it into the hole cut in the bumper cover.
- Take the cable for the front engine block heater socket with ground lead from the kit and thread them through the protective cover.

Fig. 131: Take Cable For Front Engine Block Heater Socket With Ground Lead From Kit & Thread Them Through Protective Cover
Courtesy of VOLVO CARS CORPORATION

Fig. 132: Rotate Connector For Front Engine Block Heater Socket So That Cover Opens Backwards
Courtesy of VOLVO CARS CORPORATION

Illustrations A and B

- Install the nut from the kit.
- Rotate the connector for the front engine block heater socket so that the cover opens backwards (Illustration B).
- Tighten the front engine block heater socket to the bumper cover.
- Plug the electrical connector into the front engine block heater socket. Use the connector as a counterhold when tightening.
- Remove the cover on the radiator expansion tank.

Fig. 133: Cable On Front Intake
Courtesy of VOLVO CARS CORPORATION

Applies to cars with fuel-driven parking heater installed

- Route the cable to the front intake with ground cable along the parking heater induction pipe. Secure them to the pipe with a double tie strap.
- Pull up the ground cable on the upper side of the plate where the connector to the fuel heater is located, and pull the thick cable underneath the plate.

Fig. 134: Drilling A Hole In Front/Top Edge Of Side Member With 4 MM (5/32") Bit
Courtesy of VOLVO CARS CORPORATION

Applies to cars with fuel-driven parking heater installed

- Drill a hole in the front/top edge of the side member with a **4 mm (5/32")** bit.
- Apply anti-corrosion agent to the edges of the holes and secure the ground cable with the enclosed **4.8 mm (3/16")** flanged screw and toothed washer.
- Secure the excess length of ground cable with a tie strap from the kit. Clamp it at the gray connectors of the parking heater.

Fig. 135: Continue Routing Thick Cable On Top Of Fuel Heater Along Cables There
Courtesy of VOLVO CARS CORPORATION

Applies to cars with fuel-driven parking heater installed

- Continue routing the thick cable on top of the fuel heater along the cables there. Then pull it under the plate where the connector for the fuel heater is, continuing underneath the side member, before the front mounting for the subframe.

Fig. 136: Drill A Hole In Front/Lower Edge Of Side Member With 4 MM (5/32") Bit
Courtesy of VOLVO CARS CORPORATION

- Drill a hole in the front/lower edge of the side member with a **4 mm (5/32")** bit.
- Apply anti-corrosion agent and secure the ground cable with the enclosed **4.8 mm (3/16")** flanged screw and toothed washer.

NOTE: Connect the ground cable to the side member, not to the subframe.

- Secure the excess ground cable length with a tie strap from the kit.

APPLIES TO ALL YEARS

Fig. 137: Identifying Heat Conducting Paste
Courtesy of VOLVO CARS CORPORATION

- Apply heat conducting paste (P/N 9499205), on the surfaces (1) of the heater body which are in contact with the cylinder block.

Fig. 138: Identifying O-Ring
Courtesy of VOLVO CARS CORPORATION

- Grease the O-ring on the connector for the heater's jointing cable with low temperature grease (part no. 1161417-9).

NOTE: Do not get any grease on the surfaces of the connector.

Applies to cars with stay for the turbocharger

Fig. 139: Identifying Stay Removal
Courtesy of VOLVO CARS CORPORATION

- Remove the stay.

Applies to cars up to and including model year -2004, with stay for the turbocharger,

Fig. 140: Identifying Engine Block Heater
Courtesy of VOLVO CARS CORPORATION

- Carefully clean the surface where the heater is to be located to provide good heat conduction to the cylinder block. Also clean the internal threads.
- Install the heater on the engine block as illustrated.

  HINT: To facilitate the installation of the heater on the engine block, first secure the tensioner (2) by the heater using a small piece of butyl tape, and then also secure the spacer sleeves (1 and 4) on each side of the tensioner using small pieces of butyl tape.

- Install the spacer washer (1), **(t =10 mm (25/64"))** , between the tensioner (2) and the mounting (3) in the engine block.
- Install the outer spacer washer (4), **(t =32 mm (1 1/4"))** , between the stay and the tensioner (2).
- Tighten the heater using the screws from the kit. Tighten to **16 Nm (12 lbf. ft.)** .
- Take the radiation protection and cable from the kit. Thread the radiation protection onto the cable and connect the cable to the heater.

Applies to cars from model year 2005-, with stay for the turbocharger

Fig. 141: Identifying Stay And Spacer
Courtesy of VOLVO CARS CORPORATION

Illustration A

- Knock off the spacer (1) from the stay. Grind off the welds if the spacer is securely fastened.

Illustration B

Fig. 142: Identifying Tensioner And Cylinder Block
Courtesy of VOLVO CARS CORPORATION

- Carefully clean the surface where the heater is to be located to provide good heat conduction to the cylinder block. Also clean the internal threads.

HINT: To facilitate the installation of the heater on the engine block, first secure the tensioner (2) by the heater using a small piece of butyl tape. Then also secure the spacer sleeve (1) on the rear side of the tensioner using a small piece of butyl tape.

NOTE: The bent section of the tensioner must point away from the heater.

- Install space washer (1)**(t=10 mm (25/64"))** between tensioner (2) and the mounting in the engine block (3). Install the outer spacer washer (4) **(t=32 mm (1 1/4"))** on the outside of the bracket.
- Thread through the long screw (5) so that everything is held together.

Illustration C

Fig. 143: Identifying Turbocharger And Screws
Courtesy of VOLVO CARS CORPORATION

- Thread the heater and the tensioner. Install the turbocharger stay and screw using the three screws as follows:

  Screw the turbocharger stay into place through the tensioner in the mounting in the engine block, with the long screw (1).

  Screw the turbocharger stay in the turbocharger with the short screw (2) and into the other mounting in the engine block with screw (3).
- Tighten the screws to **16 Nm (12 lbf. ft.)** .
- Take the radiation protection and cable from the kit. Thread the radiation protection onto the cable and connect the cable to the heater
- Install the locking sleeve on the heater's connector.

Applies to cars without stay for the turbocharger

Fig. 144: Identifying Engine Block Heater
Courtesy of VOLVO CARS CORPORATION

- Carefully clean the surface where the heater is to be located to provide good heat conduction to the cylinder block. Also clean the internal threads.
- Install the heater on the engine block as illustrated.

  HINT: To facilitate the installation of the heater on the engine block, first secure the tensioner (2) by the heater using a small piece of butyl tape and then also secure the spacer sleeve (1) on the rear side of the tensioner using a small piece of butyl tape.

- Install space washer (1)**(t=10 mm (25/64"))** between tensioner (2) and the mounting in the engine block (3). Install the outer spacer washer (4) **(t=32 mm (1 1/4"))** on the outside of the tensioner (2).
- Tighten the heater using the screws from the kit. Tighten to **16 Nm (12 lbf. ft.)** .
- Take the radiation protection and cable from the kit. Thread the radiation protection onto the cable and connect the cable to the heater.

Fig. 145: Identifying Heat Shield

Courtesy of VOLVO CARS CORPORATION

- Pull the radiation protection all the way up to the block heater, so that the joint and plastic casting is completely covered.

NOTE: It is important that the radiation protection covers the entire joint at the engine.

- Secure the radiation protection around the cable, to the block heater, using a gray, heat resistant tie strap at the lower edge of the radiation protection.

Only applies to TDI engines and immersion heaters

Fig. 146: Identifying Radiator Expansion Tank Cap
Courtesy of VOLVO CARS CORPORATION

- Open the cap for the radiator's expansion tank.
- Position a collection container under the engine and open the coolant cock.
- Drain the coolant and close the cock.

Only applies to TDI engines and immersion heaters

Fig. 147: Identifying Core Plug
Courtesy of VOLVO CARS CORPORATION

- Pull out the core plug using an extractor.

Only applies to TDI engines and immersion heaters

Fig. 148: Identifying Immersion Heater
Courtesy of VOLVO CARS CORPORATION

- Thread the O-ring onto the heater.
- Grease the O-ring using low temperature grease (P/N 1161427).
- Screw the immersion heater into the engine block. **Tighten to 3.5 Nm (2.6 lbf. ft.)** .
- Clamp the cable at the pipe on the right-hand side of the reverse of the sub-frame. Use the tie strap from the kit.

Fig. 149: Identifying Bracket And Nut From Right-Hand Side Of Steering Gear
Courtesy of VOLVO CARS CORPORATION

- Remove the existing nut from the steering gear.
- Install the bracket for mounting the branching connector and cables.
- Install the new supplied lock nut. Tighten to **48 Nm (36 lbf. ft.)** .

Applies if engine block heater and passenger compartment connector shall be fitted at the same time

Fig. 150: Identifying Front Socket, Passenger Compartment Socket & Engine Block Heater
Courtesy of VOLVO CARS CORPORATION

- Install the branching connector on the bracket with screw and nut from the kit.
- Grease the O-rings using low temperature grease (P/N 1161417-9).
- Connect the cables from the front socket (1), the passenger compartment socket (2) and the engine block heater (3) to the branching connector.
- Tighten the branching connector to the bracket for the steering gear.

CONNECTION AND FINISHING WORK

Fig. 151: Identifying Front Socket Cable Above Front Edge Of Subframe
Courtesy of VOLVO CARS CORPORATION

- Take four tie straps from the kit and press them into the holes on the inside of the subframe.
- Route the cable from the front socket above the front edge of the subframe and back to the cable from the engine block heater.
- Clamp the cable securely into the fitted tie straps.
- Grease the O-ring on the connector using low temperature grease (P/N 1161417-9).

Fig. 152: Identifying Cable At Right-Hand Pipe And Tie Strap
Courtesy of VOLVO CARS CORPORATION

- Route the cable from the engine block heater over oil cooler and to the bracket previously installed.
- Take the double clamp (1) from the kit and secure the cable at the left-hand hose on the oil cooler. Secure the cable at the right-hand pipe using a tie strap (2) from the kit.

Fig. 153: Identifying Front Socket Cable & Engine Block Heater Cable
Courtesy of VOLVO CARS CORPORATION

- Connect the cable from the front socket to the cable from the engine block heater, or to the branching connector.
- Press the locking sleeves (from the kit) over the cable splices.
- Take a clamp from the kit and press it into the hole on the previously installed bracket.
- Clamp the cable in at the bracket as illustrated.

NOTE: **The cable must not be secured to the drive shaft, to the fuel lines, air conditioning (A/C) pipes or brake pipes. Ensure that the cable is not rubbing against any sharp edges and that it is not too close to the turbocharger (TC) or exhaust pipe to prevent damage from radiant heat.**

- Reinstall the engine splash guard. Torque tighten the engine splash guard screws to **25 Nm (19 lbf. ft.)** .
- Connect the headlamp and reinstall it.

ELECTRIC ENGINE BLOCK HEATER, 5-CYL. 110V (B5254T2; 2003-2007)

ELECTRIC ENGINE BLOCK HEATER, 5-CYL. 110V

ASSEMBLING THE FRONT INTAKE

Fig. 154: Identifying Mounting Plates
Courtesy of VOLVO CARS CORPORATION

- Assemble the front intake according to figure D.

INSTALLING THE FRONT INTAKE

UP TO AND INCLUDING MODEL YEAR -2006 (CH-327999)

Fig. 155: Front Socket Cable
Courtesy of VOLVO CARS CORPORATION

- Guide the front socket's cable in through the center hole, next furthest to the left in the grille.

Fig. 156: Screw, Washer And Attaching Plate
Courtesy of VOLVO CARS CORPORATION

- Take a screw, washer and attaching plate from the kit and install the front socket. Push it as far to the left as possible and tighten it.
- Pull the cable to the left, in through the rubber seal on the left-hand side of the radiator, continue down by the left front side, on the right-hand side.

Fig. 157: Engine Splash Guard
Courtesy of VOLVO CARS CORPORATION

- Remove the engine splash guard (1) by first removing the screws (2).

FROM AND INCLUDING MODEL YEAR 2007- (CH 328000-)

Fig. 158: Identifying Surface To Clean Where Front Engine Block Heater Socket Is Secured
Courtesy of VOLVO CARS CORPORATION

- Clean the surface where the front engine block heater socket will be secured.

Fig. 159: Identifying Hole Drilled In Front Engine Block Heater Socket's Mounting Plate
Courtesy of VOLVO CARS CORPORATION

- Drill a hole for the guide to the front engine block heater socket's mounting plate.
- File down the edges of the holes.

Fig. 160: Identifying Hole Drilled For Tie Strap In Front Engine Block Heater Socket's Cable
Courtesy of VOLVO CARS CORPORATION

- Drill a hole for the tie strap for the front engine block heater socket's cable.
- File down the edges of the holes.

Fig. 161: Identifying Shaded Sections On Mounting Plate
Courtesy of VOLVO CARS CORPORATION

- Cut-off all shaded sections on the mounting plate so that only the cylinder shaped section remains.

Fig. 162: Identifying 3/16 Inch Diameter Drill Hole In Mounting Plate
Courtesy of VOLVO CARS CORPORATION

- Drill a **5 mm (3/16 ")** diameter hole in the mounting plate.
- File down the edges of the holes.

Fig. 163: Identifying Front Intake & Mounting Plate
Courtesy of VOLVO CARS CORPORATION

- Assemble the front intake as illustrated. The mounting plate (A) must not be used.

Fig. 164: Identifying Cable Route To Run Down Inside Of Left-Hand Bracket Of Skid Plate
Courtesy of VOLVO CARS CORPORATION

- Install the front engine block heater socket with the guide pin in the large hole.
- Route the cable in so that it runs down on the inside of the left-hand bracket for the skid plate.
- Align the front engine block heater socket so that the long sides of the mounting plate are parallel with the edges of the surface into which the mounting plate shall be screwed.
- Mark out for drilling the hole for the screw for the mounting plate.

Fig. 165: Identifying 3/16 Inch Hole Drilled To Secure Front Engine Block Heater Socket's Mounting Plate
Courtesy of VOLVO CARS CORPORATION

- Drill a hole with a **5 mm (3/16 ")** diameter drill bit for the screw for securing the front engine block heater socket's mounting plate.

Fig. 166: Identifying Front Engine Block Heater Socket & Screw
Courtesy of VOLVO CARS CORPORATION

- Secure the front engine block heater socket with a screw and nut in the drilled hole and tighten.

Fig. 167: Identifying Tie Strap Secured In Hole Around Front Engine Block Heater Socket's Cable
Courtesy of VOLVO CARS CORPORATION

- Secure the tie strap in the hole around the front engine block heater socket's cable.
- Fold in the connector so that the cable adopts the correct length in the tie strap before it is tightened.
- Tighten the tie strap.

Fig. 168: Identifying Cable Clamped At Pipe
Courtesy of VOLVO CARS CORPORATION

- Clamp the cable in at the pipe for the air conditioning using a double tie strap.

Fig. 169: Identifying Engine Splash Guard
Courtesy of VOLVO CARS CORPORATION

- Remove the engine splash guard.

Fig. 170: Identifying Cable Pulled Over Skid Plate, Above Corner Of Subframe & Down To Subframe
Courtesy of VOLVO CARS CORPORATION

- Pull the cable from the front intake over the skid plate, above the inside of the front left-hand side corner of the subframe, and down to the inside of the left-hand side of the subframe.
- Take the tie strap equipped with clip and press it into the hole on the top of the left-hand bracket for the skid plate.
- Tighten the cable with the tie-strap.

INSTALLING, ENGINE BLOCK HEATER

Fig. 171: Identifying Cable Pulled Above Subframe And Inside Of Left Front Mounting
Courtesy of VOLVO CARS CORPORATION

- Pull the cable above the subframe and on the inside of its left front mounting, along the left-hand side and up towards the engine.
- Clamp the cable using tie straps in the existing holes and with double clamps at pipes on the oil cooler.

CAUTION: Do not clamp the drive axle, and ensure that the cable does not chafe against sharp edges.

Fig. 172: Identifying Stay Removal
Courtesy of VOLVO CARS CORPORATION

Applies to cars with T stay, as illustrated

- Remove the stay.

Fig. 173: Identifying Heat Conducting Paste
Courtesy of VOLVO CARS CORPORATION

- Apply heat conducting paste, (P/N 9499205), on the surfaces (1) of the heater body that are in contact with the cylinder block.

CAUTION: The heat conducting paste must be applied as illustrated. This is to prevent damage from overheating.

Image A applies to cars with T stay, as illustrated

Fig. 174: Identifying Washer, Mounting Bracket, Hole & Space Washer Of Heater Bracket
Courtesy of VOLVO CARS CORPORATION

Image B applies to cars without T stay

Fig. 175: Identifying Heater & Bracket Assembly
Courtesy of VOLVO CARS CORPORATION

- Clean the area where the heater is to be installed. This ensures optimal heat conduction to the cylinder block. Also clean the internal threads.
- Connect the cable supplied to the heater.
- Install the heater on the engine block, as illustrated.
- Install spacer washer (1) **(t=10 mm (25/64"))** between the mounting bracket (2) and mounting hole (3) in the engine block. The outer spacer washer(4) **(t=32 mm (1 1/4"))** is inserted between the mounting bracket (2) and the T stay, if applicable.
- Tighten the heater using the screws from the kit. Tighten to **16 Nm (12 lbf. ft.)** .

APPLIES TO CARS WITH STAY FOR THE TURBOCHARGER FROM MODEL YEAR 2005-

NOTE:

- **XC90 CH 134000-**

Illustration A

Fig. 176: Identifying Stay And Spacer
Courtesy of VOLVO CARS CORPORATION

- Knock off the spacer (1) from the stay. Grind off the welds if the spacer is secured too tightly.

Illustration B

Fig. 177: Identifying Stay, Fasteners And Connector
Courtesy of VOLVO CARS CORPORATION

- Carefully clean the surface where the heater is to be located to provide good heat conduction to the engine block. Also clean the internal threads.

HINT: To facilitate the installation of the heater on the engine block, first secure the tensioner (2) by the heater using a small piece of butyl tape and then also secure the spacer sleeve (1) on the rear side of the tensioner using a small piece of butyl tape.

NOTE: The bent section of the tensioner must point away from the heater.

- Install space washer (1)**(t=10 mm (25/64"))** between tensioner (2) and the mounting in the engine block (3). Install the outer spacer washer (4) **(t=32 mm (1 1/4"))** on the outside of the bracket.
- Thread through the long screw (5) so that everything is held together.

Illustration C

Fig. 178: Identifying Stay And Screws
Courtesy of VOLVO CARS CORPORATION

- Thread the heater and the tensioner. Install the turbocharger stay and screw using the three screws as follows:

  Screw the turbocharger stay into place through the tensioner in the mounting in the engine block, with the long screw (1).

  Screw the turbocharger stay in the turbocharger with the short screw (2) and into the other mounting in the engine block with the screw (3).
- Tighten the screws to **16 Nm (12 lbf. ft.)** .
- Take the radiation protection and cable from the kit. Thread the radiation protection onto the cable and connect the cable to the heater
- Install the locking sleeve on the heater's connector.

Fig. 179: Identifying Decal
Courtesy of VOLVO CARS CORPORATION

Install:

- air baffle
- the splash guard. Tighten the screws to **25 Nm (18.5 lbf. ft.)** .
- the decal from the kit.

ELECTRIC ENGINE BLOCK HEATER, 110V, 6-CYL (2007-2012)

ELECTRIC ENGINE BLOCK HEATER, 110V, 6-CYL

Fig. 180: Identifying Surface To Clean Where Front Engine Block Heater Socket Is Secured
Courtesy of VOLVO CARS CORPORATION

- Clean the surface where the front engine block heater socket will be secured.

Fig. 181: Identifying Hole Drilled In Front Engine Block Heater Socket's Mounting Plate
Courtesy of VOLVO CARS CORPORATION

- Drill a hole for the guide to the front engine block heater socket's mounting plate.
- File down the edges of the holes.

Fig. 182: Identifying Hole Drilled For Tie Strap In Front Engine Block Heater Socket's Cable
Courtesy of VOLVO CARS CORPORATION

- Drill a hole for the tie strap for the front engine block heater socket's cable.
- File down the edges of the holes.

Fig. 183: Cutting Engine Block Mounting Plate Pins
Courtesy of VOLVO CARS CORPORATION

- Cut away the three pins on the front engine block heater socket's mounting plate.

Fig. 184: Identifying Drilling Area And Dimensions
Courtesy of VOLVO CARS CORPORATION

- Drill a **5 mm (3/16 ")** diameter hole in the mounting plate.
- File down the edges of the holes.

Fig. 185: Installing Kit Components
Courtesy of VOLVO CARS CORPORATION

Illustration A, B, C and D

- Assemble the front engine block heater socket with the parts from the kit as illustrated.

Fig. 186: Connector And Holder
Courtesy of VOLVO CARS CORPORATION

Fig. 187: Folding Cover Over Connector
Courtesy of VOLVO CARS CORPORATION

Fig. 188: Mounting Plate
Courtesy of VOLVO CARS CORPORATION

Fig. 189: Installing Block Heater Socket
Courtesy of VOLVO CARS CORPORATION

- Install the front engine block heater socket with the guide pin in the large hole.
- Route the cable in so that it runs down on the inside of the left-hand bracket for the skid plate.
- Align the front engine block heater socket so that the long sides of the mounting plate are parallel with the edges of the surface into which the mounting plate shall be screwed.
- Mark out for drilling the hole for the screw for the mounting plate.

Fig. 190: Identifying 3/16 Inch Hole Drilled To Secure Front Engine Block Heater Socket's Mounting Plate
Courtesy of VOLVO CARS CORPORATION

- Drill a hole with a **5 mm (3/16 ")** diameter drill bit for the screw for securing the front engine block heater socket's mounting plate.

Fig. 191: Securing Front Engine Block Heater Socket
Courtesy of VOLVO CARS CORPORATION

- Secure the front engine block heater socket with a screw and nut in the drilled hole and tighten.

Fig. 192: Securing Cable
Courtesy of VOLVO CARS CORPORATION

- Secure the tie strap in the hole around the front engine block heater socket's cable.
- Fold in the connector so that the cable adopts the correct length in the tie strap before it is tightened.
- Tighten the tie strap.

Fig. 193: Identifying Cable Clamped At Pipe
Courtesy of VOLVO CARS CORPORATION

- Clamp the cable in at the pipe for the air conditioning using a double tie strap.
- Remove the cover on the cooling system expansion tank.

Fig. 194: Identifying Engine Splash Guard
Courtesy of VOLVO CARS CORPORATION

- Remove the engine splash guard.

Fig. 195: Identifying Drain Nipple
Courtesy of VOLVO CARS CORPORATION

- Detach the nipple and drain the coolant.
- Retighten the nipple after the coolant has been drained.

Fig. 196: Rotating Coolant Pipe Catch
Courtesy of VOLVO CARS CORPORATION

- Rotate the catch on the coolant pipe that runs to thermostat housing anticlockwise, pull the hose out and drain the remaining coolant.

Fig. 197: Detaching Hose Clamp
Courtesy of VOLVO CARS CORPORATION

- Detach the hose clamp on the hose to the thermostat housing inside the intake manifold and remove the hose.

Fig. 198: Removed Hose Cutting Area
Courtesy of VOLVO CARS CORPORATION

- Cut the removed hose as illustrated. First cut to a dimension of **52 mm (1 1/16 ")** .
- Discard the small cut-off hose bend.

Fig. 199: Installing Coolant Hose
Courtesy of VOLVO CARS CORPORATION

- Reinstall the longer of the hose sections onto the thermostat housing's connection and tighten the hose clamp. Make sure that the cut-out in the upper hose-end fits into the corresponding pin in the pipe connection in the thermostat housing.

Fig. 200: Connecting Pipes
Courtesy of VOLVO CARS CORPORATION

- Remove the short hose-end and press it on the pipe that runs to the thermostat housing. Make sure that the cut-out in the hose connection is turned down and fits into the corresponding pin in the pipe connection.
- Rotate the catch on the pipe clockwise against the stop.
- Take a hose clamp from the kit and install it on the hose-end.

Fig. 201: Bracket Installation Screw
Courtesy of VOLVO CARS CORPORATION

- Take the engine block heater, bracket, rubber coated clamp and screw from the kit and assemble them as illustrated.
- Do not tighten the screw yet.

Fig. 202: Installing Hose Clamp
Courtesy of VOLVO CARS CORPORATION

- Take the hose clamp from the kit and fit it onto the engine block heater's upper connection.

Fig. 203: Positioning Block Heater
Courtesy of VOLVO CARS CORPORATION

- Position the engine block heater with bracket in the front edge of the oil sump and connect both hose-ends to the engine block heater's connections.
- Take a screw from the kit and tighten the bracket with engine block heater into the existing hole in the oil sump.

NOTE: **The screw is self-tapping so inserting it may be slow. Make sure that the screw is centered straight into the hole, so that the screw head is flat against the bracket.**

Fig. 204: Adjusting And Ensuring Proper Installation
Courtesy of VOLVO CARS CORPORATION

- Now adjust the engine block heater in the rubber coated clamp so that the hoses are properly fitted on the engine block heater's connections.
- Tighten the screw to the rubber coated clamp.

- Tighten the hose clamps to the engine block heater.

Fig. 205: Securing Hose With Tie Straps
Courtesy of VOLVO CARS CORPORATION

- Take five double tie straps from the kit and secure them on the pipe and hose to the thermostat housing as well as the lower hose to the radiator.
- Check that the cable does not chafe against sharp edges or moving parts in the engine compartment.

CAUTION: Do not clamp the cable directly to brake pipes, fuel lines, AC pipes or pipes to the power steering.

Fig. 206: Installing Tie Strap With Clip
Courtesy of VOLVO CARS CORPORATION

- Take a tie strap equipped with clip and press it into the hole on the top of the left-hand bracket for the skid plate.

Fig. 207: Identifying O-Ring
Courtesy of VOLVO CARS CORPORATION

- Grease in the O-ring on the connector on the cable to the front engine block heater socket, use low temperature grease **P/N 1161427** .

NOTE: Do not get any grease on the surfaces of the connector.

Fig. 208: Installing Locking Sleeve
Courtesy of VOLVO CARS CORPORATION

- Connect the cable in the engine block heater and press it in firmly.
- Press a locking sleeve from the kit over the cable splice.

Fig. 209: Securing Joint Cable With Tie Straps
Courtesy of VOLVO CARS CORPORATION

- Clamp the joint cable from the engine block heater into the recently installed tie straps. Clamp up all excess cable around the tie strap on the top of the skid plate bracket.
- If necessary, use another tie strap for clamping the cable behind the skid plate.

- Fill with coolant, run the engine to operating temperature, bleed the cooling system and check that there are no leaks.
- Top up the cooling system as required.
- Reinstall the engine splash guard and torque tighten the screws to **25 Nm (18.5 lbf. ft.)** .

ELECTRIC ENGINE BLOCK HEATER, 230V, 6-CYL (2007-2012)

ELECTRIC ENGINE BLOCK HEATER, 230V, 6-CYL

PREPARATIONS

Fig. 210: Detach Left-Hand Headlamp By Pulling Up Two Locking Pins
Courtesy of VOLVO CARS CORPORATION

- Detach the left-hand headlamp by pulling up the two locking pins and then carefully pulling away the headlamp forwards.

Fig. 211: Carefully Prize Up Catch On Connector For Headlamp With A Screwdriver
Courtesy of VOLVO CARS CORPORATION

- Carefully prize up the catch on the connector for the headlamp using a screwdriver.
- Pull the catch up completely, detach the connector and place the headlamp to one side.

Fig. 212: Drilling Out Three Rivets From Front Edge Of Left Wing Liner
Courtesy of VOLVO CARS CORPORATION

For cars with fuel-driven parking heater installed.

- Drill out the three rivets from the front edge of the left wing liner.

- Remove the remains of the rivets.
- Move the wing liner aside and fasten it so that the parking heater is accessible.

Fig. 213: Clean Bumper Cover Where Front Engine Block Heater Socket Shall Be Secured
Courtesy of VOLVO CARS CORPORATION

- Clean the surface on the bumper cover where the front engine block heater socket will be secured.

Fig. 214: Clip On Panel For Front Fog Lamp
Courtesy of VOLVO CARS CORPORATION

- Remove the clip on the panel for the front fog lamp.

Fig. 215: Removing Panel Over Fog Lamp By Carefully Prying It Loose From Bumper Shell With A Weatherstrip Tool
Courtesy of VOLVO CARS CORPORATION

- Remove the panel over the fog lamp by carefully prying it loose from the bumper shell with a weatherstrip tool. The panel is held in place with catches. The corner (1) of the other panel section must be pried loose since it overlaps the panel.

Fig. 216: Marking On Inside Of Panel
Courtesy of VOLVO CARS CORPORATION

- Cut out according to the existing marking on the inside of the panel for the protective cover for the front engine block heater socket.
- Test and cut until the protective cover fits.

Fig. 217: Drilling A 29 MM (1 1/8 inches) Diameter Hole Using A Hole Saw According To Existing Marking In Lower Edge Of Bumper Cover
Courtesy of VOLVO CARS CORPORATION

- Drill a **29 mm (1 1/8 ")** diameter hole using a hole saw according to the existing marking in the lower edge of the bumper cover. Pre-drill using a **3mm (1/8 ")** diameter drill bit.

NOTE: **It is important that the hole is drilled right in the center of the marking in order to correspond with the hole cut out earlier.**

- Even out the hole edges and remove the drill shavings.

Fig. 218: Front Fog Lamp Panel
Courtesy of VOLVO CARS CORPORATION

- Reinstall the front fog lamp panel.

Fig. 219: Clip Into Panel
Courtesy of VOLVO CARS CORPORATION

- Press the clip into the panel.

INSTALLING THE FRONT ENGINE BLOCK HEATER SOCKET

Fig. 220: Take Protective Cover From Kit And Press It Into Hole Cut In Bumper Cover
Courtesy of VOLVO CARS CORPORATION

- Press the protective cover (from the kit) into place in the hole cut in the bumper cover.
- Insert the cable for the front engine block heater socket together with the ground lead from the kit through the protective cover.

Fig. 221: Take Cable For Front Engine Block Heater Socket With Ground Lead From Kit & Thread Them Through Protective Cover
Courtesy of VOLVO CARS CORPORATION

Illustrations A and B

- Install the nut from the kit.
- Rotate the connector for the front engine block heater socket so that the cover opens backwards (Illustration B).
- Plug the electrical connector into the front engine block heater socket. Use the connector as a counterhold when tightening.
- Tighten the front engine block heater socket to the bumper cover.
- Remove the cover on the cooling system expansion tank.

Fig. 222: Rotate Connector For Front Engine Block Heater Socket So That Cover Opens Backwards
Courtesy of VOLVO CARS CORPORATION

Fig. 223: Drill A Hole In Front/Lower Edge Of Side Member With 4 MM (5/32") Bit
Courtesy of VOLVO CARS CORPORATION

- Drill a hole in the front/lower edge of the side member with a **4 mm (5/32")** bit.
- Apply anti-corrosion agent to the edges of the holes and secure the ground cable with the enclosed **4.8 mm (3/16")** flanged screw and toothed washer.

NOTE: Connect the ground cable to the side member, not to the subframe.

- Secure the excess ground cable length with a tie strap from the kit.
- Guide the cable for the front engine block heater socket up where the headlamp was located.

Fig. 224: Cable On Front Intake
Courtesy of VOLVO CARS CORPORATION

For cars with fuel-driven parking heater installed.

- Route the cable to the front intake and ground cable along the parking heater induction pipe. Secure them

to the pipe with a double tie strap.

- Route the cables to the underside of the bracket beneath the headlamp.

Fig. 225: Drilling A Hole In Front/Top Edge Of Side Member With 4 MM (5/32") Bit
Courtesy of VOLVO CARS CORPORATION

- Drill a hole in the front/top edge of the side member with a **4 mm (5/32")** bit.
- Apply anti-corrosion agent to the edges of the holes and secure the ground cable with the enclosed **4.8 mm (3/16")** flanged screw and toothed washer.
- Secure the excess length of ground cable with a tie strap from the kit. Clamp it at the grey connectors of the parking heater.

INSTALLING THE ENGINE BLOCK HEATER

Fig. 226: Identifying Engine Splash Guard
Courtesy of VOLVO CARS CORPORATION

- Remove the engine splash guard.

Fig. 227: Coolant Drain Nipple
Courtesy of VOLVO CARS CORPORATION

- Detach the nipple and drain the coolant.
- Retighten the nipple after the coolant has been drained.

Fig. 228: Rotating Coolant Pipe Catch
Courtesy of VOLVO CARS CORPORATION

- Turn the catch on the coolant pipe that runs to the thermostat housing anticlockwise and pull out the hose.

Fig. 229: Removing Hose Clamp
Courtesy of VOLVO CARS CORPORATION

- Detach the hose clamp on the hose to the thermostat housing inside the intake manifold and remove the hose.

Fig. 230: Removed Hose Cutting Area
Courtesy of VOLVO CARS CORPORATION

- Cut the removed hose as illustrated. First cut to a dimension of **52 mm (1 1/16 ")** .
- Discard the small cut-off hose bend.

Fig. 231: Installing Coolant Hose
Courtesy of VOLVO CARS CORPORATION

- Reinstall the longer of the hose sections onto the thermostat housing's connection and tighten the hose clamp. Make sure that the cut-out in the upper hose-end fits into the corresponding pin in the pipe connection in the thermostat housing.

Fig. 232: Connecting Pipe Connection
Courtesy of VOLVO CARS CORPORATION

- Remove the short hose-end and press it on the pipe that runs to the thermostat housing. Make sure that the cut-out in the hose connection is turned down and fits into the corresponding pin in the pipe connection.
- Rotate the catch on the pipe clockwise against the stop.
- Take a hose clamp from the kit and install it on the hose-end.

Fig. 233: Bracket Mounting Screw
Courtesy of VOLVO CARS CORPORATION

- Take the engine block heater, bracket, rubber coated clamp and screw from the kit and assemble them as illustrated.
- Do not tighten the screw yet.

Fig. 234: Installing Hose Clamp
Courtesy of VOLVO CARS CORPORATION

- Take a hose clamp from the kit and fit it onto the engine block heater's upper connection.

Fig. 235: Positioning Block Heater
Courtesy of VOLVO CARS CORPORATION

- Position the engine block heater with bracket in the front edge of the oil sump and connect both hose-ends to the engine block heater's connections.
- Take a screw from the kit and tighten the bracket with engine block heater into the existing hole in the oil sump.

NOTE: **The screw is self-tapping so inserting it may be slow. Make sure that the screw is centered straight into the hole, so that the screw head is flat against the bracket.**

Fig. 236: Positioning Block Heater
Courtesy of VOLVO CARS CORPORATION

- Now adjust the engine block heater in the rubber coated clamp so that the hoses are properly fitted on the engine block heater's connections.
- Tighten the screw to the rubber coated clamp.

- Tighten the hose clamps to the engine block heater.

Fig. 237: Securing Hose With Tie Straps
Courtesy of VOLVO CARS CORPORATION

- Take four double tie straps from the kit and secure them on the pipe and hose to the thermostat housing as well as the lower hose to the radiator.
- Check that the cable does not chafe against sharp edges or moving parts in the engine compartment.

CAUTION: Do not clamp the cable directly to brake pipes, fuel lines, AC pipes or pipes to the power steering.

Fig. 238: Installing Tie Strap With Clip
Courtesy of VOLVO CARS CORPORATION

- Take a tie strap equipped with clip and press it into the hole on the top of the left-hand bracket to the skid plate.

Fig. 239: Identifying O-Ring
Courtesy of VOLVO CARS CORPORATION

- Take the joint cable from the kit.
- Grease in the O-ring on the connector on the cable to the front engine block heater socket, use low temperature grease **P/N 1161427** .

NOTE: Do not get any grease on the surfaces of the connector.

Fig. 240: Installing Locking Sleeve
Courtesy of VOLVO CARS CORPORATION

- Connect the joint cable in the engine block heater and press it in firmly.
- Press a locking sleeve from the kit over the cable splice.

Fig. 241: Securing Cable With Tie Straps
Courtesy of VOLVO CARS CORPORATION

- Clamp the joint cable from the engine block heater into the recently installed tie straps and route it up to the location for the headlamp. The cable must be routed up on the outside of the left-hand side member.

Fig. 242: Installing Branch Connector
Courtesy of VOLVO CARS CORPORATION

Applies when fitting passenger compartment connector at the same time

- If the car is equipped with passenger compartment connector then the branch connector is to be installed now.

Connect:

- socket (1) on the branch connector to the cable for the front engine block heater socket.
- sockets (2, and 3) on the branch connector to any of the cables for the engine block heater and branch connector.

Illustration A

Fig. 243: Installing Locking Sleeve Over Cable Splice
Courtesy of VOLVO CARS CORPORATION

This cable joint must be secured under the headlamp's lower bracket (Illustration B).

- Connect the cable from the front engine block heater socket (1) to the recently routed joint cable (2) from the electric engine block heater and press the connectors together firmly.
- Press in a locking sleeve from the kit over the cable splice.
- Take tie straps (3) from the kit and clamp in the cable for the front engine block heater socket into the holes in the plates.
- Clamp the joint cable using a tie strap (4) into the hole in the plate.

Illustration B

Fig. 244: Installing Cable Under Plate
Courtesy of VOLVO CARS CORPORATION

- Take a tie strap from the kit and clamp the cable joint on the underside of the headlamp's lower bracket. Use the rear of the two holes in the bracket.

FINISHING WORK

- Connect and reinstall the left-hand headlamp.
- **For cars with fuel-driven heater:** Reposition the left wing liner and rivet it in place.
- Fill with coolant, run the engine to operating temperature, bleed the cooling system and check that there are no leaks.
- Top up the cooling system as required.
- Reinstall the engine splash guard and torque tighten the screws to **25 Nm (18.5 lbf. ft.)** .

ELECTRIC ENGINE BLOCK HEATER, 230V, 8 CYL (B8444S; 2005-2011)

ELECTRIC ENGINE BLOCK HEATER 230V, 8 CYL (2005-2009)

PREPARATIONS

Fig. 245: Detach Left-Hand Headlamp By Pulling Up Two Locking Pins
Courtesy of VOLVO CARS CORPORATION

- Detach the left-hand headlamp by pulling up the two locking pins and then carefully pulling away the headlamp forwards.

Fig. 246: Carefully Prize Up Catch On Connector For Headlamp With A Screwdriver
Courtesy of VOLVO CARS CORPORATION

- Carefully prize up the catch on the connector for the headlamp using a screwdriver.
- Pull the catch up completely, detach the connector and place the headlamp to one side.

INSTALLING THE FRONT ENGINE BLOCK HEATER SOCKET

UP TO AND INCLUDING MODEL YEAR -2006

Fig. 247: Remove Left-Hand Grille From Bumper By Carefully Prying It Away With A Weatherstrip Tool
Courtesy of VOLVO CARS CORPORATION

- Remove the left-hand grille from the bumper by carefully prizing it away with a weatherstrip tool.

Fig. 248: Measure Out For Drilling Front Socket Hole
Courtesy of VOLVO CARS CORPORATION

- Measure out for drilling the front socket hole as illustrated.
- Pre-drill the hole using a **3 mm (1/8")** bit.
- Drill out the hole. Use a **29 mm (1 1/8")** diameter hole saw.
- Remove any shavings.

Fig. 249: Cutting Out Discs
Courtesy of VOLVO CARS CORPORATION

- Take a utility knife and cut out the discs (1) in such a way that they are equally as high. The plastic nut for the front socket then has a flat surface to be tightened against.

Fig. 250: Left-Hand Grille Of Bumper
Courtesy of VOLVO CARS CORPORATION

- Saw or cut out for the front socket connector in the second hole from the left in the left-hand grille of the bumper.
- Even off the edges.
- Press the grille into the bumper.

Illustration A

Fig. 251: Identifying Blind Cover Plug
Courtesy of VOLVO CARS CORPORATION

- Take the front socket, protective cover and plastic nut from the kit.
- Fit the protective cover onto the front socket's connector. Turn the connector so that the cover is opened to the left-hand side of the car as illustrated.

Illustration B

Fig. 252: Identifying Plastic Nut
Courtesy of VOLVO CARS CORPORATION

- Install the plastic nut.
- Tighten the plastic nut firmly. Connect the cable to the front socket for counterholding when the plastic nut is tightened.
- Guide down the front socket ground cable on the left-hand side of the left-hand side member.

FROM AND INCLUDING MODEL YEAR 2007-

Fig. 253: Drilling Out Three Rivets From Front Edge Of Left Wing Liner
Courtesy of VOLVO CARS CORPORATION

Applies to cars with fuel-driven parking heater installed.

- Drill out the three rivets from the front edge of the left wing liner.
- Remove the remains of the rivets.
- Move the wing liner aside and fasten it so that the parking heater is accessible.

Fig. 254: Clean Bumper Cover Where Front Engine Block Heater Socket Shall Be Secured
Courtesy of VOLVO CARS CORPORATION

- Clean the bumper cover where the front engine block heater socket shall be secured.

Fig. 255: Clip On Panel For Front Fog Lamp
Courtesy of VOLVO CARS CORPORATION

- Remove the clip on the panel for the front fog lamp.

Fig. 256: Removing Panel Over Fog Lamp By Carefully Prying It Loose From Bumper Shell With A Weatherstrip Tool
Courtesy of VOLVO CARS CORPORATION

- Remove the panel above the front fog lamp by carefully prizing it loose from the bumper cover using a weatherstrip tool. The panel is secured all round with catches.

  The corner (1) of the second panel section must be pried loose as it overlaps the panel.

Fig. 257: Marking On Inside Of Panel
Courtesy of VOLVO CARS CORPORATION

- Cut out according to the existing marking on the inside of the panel for the protective cover for the front engine block heater socket.
- Test and cut until the protective cover fits.

Fig. 258: Drilling A 29 MM (1 1/8 inches) Diameter Hole Using A Hole Saw According To Existing Marking In Lower Edge Of Bumper Cover
Courtesy of VOLVO CARS CORPORATION

- Drill a **29 mm (1 1/8 ")** diameter hole using a hole saw according to the existing marking in the lower edge of the bumper cover. Pre-drill using a **3mm (1/8 ")** diameter drill bit.

NOTE: **It is important that the hole is drilled right in the center of the marking in order to correspond with the hole cut out earlier.**

- Even out the hole edges and remove the drill shavings.

Fig. 259: Front Fog Lamp Panel
Courtesy of VOLVO CARS CORPORATION

- Reinstall the front fog lamp panel.

Fig. 260: Clip Into Panel
Courtesy of VOLVO CARS CORPORATION

- Press the clip into the panel.

Fig. 261: Take Protective Cover From Kit And Press It Into Hole Cut In Bumper Cover
Courtesy of VOLVO CARS CORPORATION

- Take the protective cover from the kit and press it into the hole cut in the bumper cover.
- Take the cable for the front engine block heater socket with ground lead from the kit and thread them through the protective cover.

Fig. 262: Take Cable For Front Engine Block Heater Socket With Ground Lead From Kit & Thread Them Through Protective Cover
Courtesy of VOLVO CARS CORPORATION

Illustrations A and B

- Install the nut from the kit.
- Rotate the connector for the front engine block heater socket so that the cover opens backwards (Illustration B).
- Tighten the front engine block heater socket to the bumper cover.
- Plug the electrical connector into the front engine block heater socket. Use the connector as a counterhold when tightening.
- Remove the cover on the radiator expansion tank.

Fig. 263: Rotate Connector For Front Engine Block Heater Socket So That Cover Opens Backwards
Courtesy of VOLVO CARS CORPORATION

Fig. 264: Cable On Front Intake
Courtesy of VOLVO CARS CORPORATION

For cars with fuel-driven parking heater installed.

- Route the cable to the front intake with the ground cable along the parking heater induction pipe. Secure them to the pipe with a double tie strap.
- Route the cables to the underside of the bracket beneath the headlamp.

Applies to cars without fuel-driven parking heater

- Route the front intake cable to the underside of the bracket beneath the headlamp.

Fig. 265: Drilling A Hole In Front/Top Edge Of Side Member With 4 MM (5/32") Bit
Courtesy of VOLVO CARS CORPORATION

Applies to cars with fuel-driven parking heater installed.

- Drill a hole in the front/top edge of the side member with a **4 mm (5/32")** bit.

- Apply anti-corrosion agent to the edges of the holes and secure the ground cable with the enclosed **4.8 mm (3/16")** flanged screw and toothed washer.
- Secure the excess length of ground cable with a tie strap from the kit. Clamp it at the grey connectors of the parking heater.

Fig. 266: Drill A Hole In Front/Lower Edge Of Side Member With 4 MM (5/32") Bit
Courtesy of VOLVO CARS CORPORATION

- Drill a hole in the front/lower edge of the side member with a **4 mm (5/32")** bit.
- Apply anti-corrosion agent and secure the ground cable with the enclosed **4.8 mm (3/16")** flanged screw and toothed washer.

NOTE: Connect the ground cable to the side member, not to the subframe.

- Secure the excess ground cable length with a tie strap from the kit.

INSTALLING THE ENGINE BLOCK HEATER

Fig. 267: Engine Splash Guard And Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the six screws and the engine splash guard.

Fig. 268: Removing Exhaust Manifold Joint Bolts
Courtesy of VOLVO CARS CORPORATION

- Remove the four nuts in the joints to the manifold and the two in the joint in the front edge of the front silencer.

Fig. 269: Removing Pipe Above Exhaust Manifold
Courtesy of VOLVO CARS CORPORATION

- Detach the pipe above the exhaust manifold from the clips in the brackets to the exhaust manifold's front mounting.
- Remove the four screws in the brackets
- Detach the heat deflector plate's two clips from the brackets.

- Remove the exhaust pipe and catalytic converters.

NOTE: Take care with the twisted parts of the exhaust manifold.

Fig. 270: Identifying Engine Block Drain Nipple
Courtesy of VOLVO CARS CORPORATION

- Detach the engine block drain nipple under the left-hand side of the rear manifold and drain the coolant.
- Tighten the nipple when the coolant is drained.

Illustration A

Fig. 271: Identifying Engine Block Plug
Courtesy of VOLVO CARS CORPORATION

- Remove the plug in the engine block under the left-hand side of the rear manifold.

Illustration B

Fig. 272: Service Tools
Courtesy of VOLVO CARS CORPORATION

- Use hexagon socket **P/N 9512965** , socket extension **120 mm (4 3/4 ")** with spherical end, socket extension **500 mm (19 11/16 ")** with spherical end and handle.

Illustration C

Fig. 273: Installing Plug
Courtesy of VOLVO CARS CORPORATION

- Apply a piece of butyl tape on the hexagon socket so that the plug does not fall away when it is unscrewed.

NOTE: Removing the plug requires significant force.

Fig. 274: Installing Block Heater
Courtesy of VOLVO CARS CORPORATION

- Take the heater from the kit.

  HINT: Try to rotate the connector in the heater before installation to reduce any friction.

- Brush thread sealant **P/N 1161056** on the threads.
- Install the heater in the engine block and manually screw it on as far as possible. It may be difficult to make the threads engage in the hole as the connector rotates stiffly in the threaded part of the heater.

Illustration A

Fig. 275: Service Tools
Courtesy of VOLVO CARS CORPORATION

- Take tool **P/N 9814012** , a **1/2 "- 3/8"** adapter, the two socket extensions and a **1/2 "** ratchet handle.

Illustration B

Fig. 276: Tightening Heater Into Block
Courtesy of VOLVO CARS CORPORATION

- Tighten the heater firmly to the engine block.

Fig. 277: Removing Upper Engine Strut
Courtesy of VOLVO CARS CORPORATION

- Remove the screw in the upper engine mounting. Remove the four screws holding the strut between the spring strut turrets and lift out the strut.

Fig. 278: Removing Rear Engine Cover
Courtesy of VOLVO CARS CORPORATION

- Remove the rear engine cover behind the intake manifold by pulling it away backwards. It is fitted with four rubber mountings.

Fig. 279: Routing Cable
Courtesy of VOLVO CARS CORPORATION

- Take the joint cable from the kit and route it under the plate beneath the left-hand headlamp. Continue to route it back along the left-hand side of the air cleaner and between the air cleaner and fuse holder. Route it further backwards, under the ABS system and up between the cable duct and brake fluid reservoir.
- Clamp it in with tie straps from the kit.
- Check that the cable does not chafe against sharp edges or moving parts in the engine compartment.

CAUTION: Do not clamp the cable against brake pipes, fuel lines or air conditioning (A/C) pipes.

Fig. 280: Installing Clips
Courtesy of VOLVO CARS CORPORATION

- Take two clips from the kit and install them in the edge of the plate at the front edge of the panel above the windscreen wiper arms.

Fig. 281: Installing Cable
Courtesy of VOLVO CARS CORPORATION

- Press the joint cable into the clips.
- Take the radiation shield from the kit and pull it on the end of the cable.
- Guide the cable down to the location where the engine block heater was installed.

Fig. 282: Identifying O-Ring
Courtesy of VOLVO CARS CORPORATION

- Grease in the O-ring on the connector for the heater's joint cable and the cable to the front engine block heater socket with low temperature grease **P/N 1161427** .

NOTE: Do not get any grease on the surfaces of the connector.

Fig. 283: Installing Joint Cable Connector
Courtesy of VOLVO CARS CORPORATION

- Firmly press the joint cable connector into the engine block heater connector.

Fig. 284: Installing Locking Sleeve
Courtesy of VOLVO CARS CORPORATION

- Press a locking sleeve (from the kit) over the cable splice.

Fig. 285: Installing Radiation Shield
Courtesy of VOLVO CARS CORPORATION

- Pull the radiation shield down so that it fully covers the connector.

Fig. 286: Installing Cable
Courtesy of VOLVO CARS CORPORATION

- Take the grey tie strap from the kit and tighten the radiation shield to the cable at the top edge.

Fig. 287: Installing Branch Connector
Courtesy of VOLVO CARS CORPORATION

Applies when fitting passenger compartment connector at the same time

- If the car is equipped with passenger compartment connector then the branch connector is to be installed now.

  Connect:

  socket (1) in branch connector to the cable for the front socket.

  sockets (2, 3) in the branch connector to any of the cables for the engine block heater and branch connector.

- Route the cable up from the front engine block heater through the hole in the body, up to the underside of the plate under the headlamp.

  Connect:

  socket (1) in branch connector to the cable for the front socket.

  sockets (2, 3) in the branch connector to any of the cables for the engine block heater and branch connector.

Fig. 288: Connecting Cables
Courtesy of VOLVO CARS CORPORATION

- Route the cable up from the front engine block heater through the hole in the body, up to the underside of the plate under the headlamp.
- Firmly press the front socket cable connector into the into the joint cable connector.

Fig. 289: Installing Locking Sleeve
Courtesy of VOLVO CARS CORPORATION

- Press a locking sleeve (from the kit) over the cable splice.

Fig. 290: Securing Excess Cable
Courtesy of VOLVO CARS CORPORATION

- Collect any excess cable under the plate beneath the left-hand headlamp and clamp it into the existing hole using a tie strap from the kit.

FINISHING WORK

- Connect and reinstall the left-hand headlamp.
- Reinstall the engine's rear protective cover.
- Reinstall the strut between the spring strut turrets.

  Torque tighten the four M10 screws to **50 Nm (37 lbf. ft.)** and the M12 screw to **80 Nm (59 lbf. ft.)** .

- Make sure that all sealing surfaces are thoroughly cleaned and reinstall the exhaust manifold with new gaskets and clamp nuts from the kit. Torque tighten to **25 Nm (18.5 lbf. ft.)** .
- Clamp the pipe above the bracket into its clips.
- Align the clips for the heat deflector plate's mounting in the bracket for the exhaust manifold's mounting.
- Tighten the bracket for the exhaust manifold's mounting to **25 Nm (18.5 lbf. ft.)** .
- Fill with coolant, drive to normal operating temperature and bleed the system. Check that there are no leaks.
- Top up with coolant as required.
- Reinstall the engine splash guard and torque tighten the screws to **25 Nm (18.5 lbf. ft.)** .

For cars with fuel-driven parking heater installed.

- Rivet the wing liner to the bumper shell.

FUEL DRIVEN HEATER 912-B (2003-2008)

FUEL DRIVEN HEATER 912-B

NOTE: This accessory requires software unique to the car.

Fig. 291: Removing Front Floor Hatch
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Remove the front floor hatch. First lift up slightly and then pull the hatch loose from its mountings at the front edge.

Fig. 292: Removing Front Storage Compartment
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Lift out the front storage compartment.

NOTE: **Removing the right-hand seat in the second row of seats. For cars with three rows of seats, the left-hand and center seats in the middle row must also be removed. See point 9.**

Fig. 293: Prying Right-Hand Rear Mounting Of Cover Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the panel on the right rear mounting on the right-hand front seat. Pry up the rear edge of the panel slightly and then pull backwards and upwards.

Fig. 294: Prying Away Cover Panel Over Joint Between Door Sills On Right-Hand Side, At Lower Edge, Using A Weatherstrip Tool
Courtesy of VOLVO CARS CORPORATION

- Slide the seats in the first row as far forwards as possible
- Carefully pry off and remove the panel above the joint between the right-hand door sills.

Fig. 295: Pushing Up Catch On Top Side
Courtesy of VOLVO CARS CORPORATION

- Remove the panel for the front right seat mounting on the right-hand seat in the second row. Press down the catch (1) on top and detach the panel by pulling it forward. Remove the screw underneath.

Fig. 296: Removing Front Seat Mountings
Courtesy of VOLVO CARS CORPORATION

- Remove the panel for the front seat mountings for the right-hand seat/middle seat in the second row. Press down the catches (1) on top and detach the panel by pulling it forward. Remove the screw for the right-hand seat.

Fig. 297: Rear Seat Mounting Covers
Courtesy of VOLVO CARS CORPORATION

- Fold the rear backrest forwards on the right-hand seat in the second row
- Remove the covers (1) for the rear seat mountings on the right-hand seat by prying them off the rear edge. Remove the screws.

Fig. 298: Removing Seal Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the sill trim panel for the right-hand rear door. Pull off the rear edge until the clips release. Continue forwards until the remaining clips have released
- Unhook the sill trim panel from the B-post panel. Place the sill trim panel in the cargo compartment
- Remove the seat.

CAUTION: Be careful when lifting the seats out of the passenger compartment. Ensure that the mountings do not damage the door panels.

Applies to cars with three rows of seats

- Remove the corresponding panels and screws as in steps 3-8, on the left-hand side, and for the left-hand and middle seats in the second row
- Remove the left-hand and center seats.

CAUTION: Be careful when lifting the seats out of the passenger compartment. Ensure that the mountings do not damage the door panels.

Fig. 299: Seat Mountings
Courtesy of VOLVO CARS CORPORATION

Applies to cars with three rows of seats

- Remove the vents on the right and left-hand sides.

Illustration A applies to cars with two rows of seats

Fig. 300: Pushing Insulations And Moldings Aside
Courtesy of VOLVO CARS CORPORATION

- Push the floor carpet to one side and secure it using the seat belt on the left-hand side
- Carefully push the insulation to one side so that the cover for the fuel tank unit is accessible.

CAUTION: Take care with the insulation. It will break off easily.

Illustration B applies to cars with three rows of seats

Fig. 301: Removing Insulation Panels
Courtesy of VOLVO CARS CORPORATION

- Push the floor carpet and insulation panel to one side
- Position a screwdriver or similar to hold the carpet in place
- Remove the air duct
- Remove both insulation panels.

Fig. 302: Removing Fuel Tank Unit Cover
Courtesy of VOLVO CARS CORPORATION

- Remove the four screws in the cover for the fuel tank unit
- Carefully pry off the cover. Use a weatherstrip tool.

Fig. 303: Identifying Front Mounting & Fuel Filter Screws
Courtesy of VOLVO CARS CORPORATION

Fig. 304: Identifying Rear Mounting Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the four screws (1) in the front and rear mountings for the fuel tank so that the fuel tank lowers slightly. This allows the suction pipe for the fuel tank to be installed. If necessary, remove the screw (2) for the fuel filter to lower the fuel tank further.

Fig. 305: Identifying Drill Hole Area And Dimensions
Courtesy of VOLVO CARS CORPORATION

- Drill out the terminal (1) in the fuel tank unit. Use a **4 mm (5/32")** diameter drill bit.

NOTE: Use a compressed air power drill with a greased bit.

Fig. 306: Installing Pipe And Cable Assembly
Courtesy of VOLVO CARS CORPORATION

- Insert the pipe (1) from the kit into the connection (2). Press the pipe down until it is against the terminal
- Take the fuel line and electrical cable from the kit. Apply masking tape on the end of the part of the fuel line that is to be inserted down through the hole in the floor (the end with the short free cable end)
- Insert the entire cable assembly (3) between the floor and the fuel tank out to the right.

Fig. 307: Installing Quick-Release Connector
Courtesy of VOLVO CARS CORPORATION

- Press the quick-release connector (1) onto the connection until a click is heard. Check that the quick-release connector is secure.

Fig. 308: Routing And Connecting Cable
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Carefully push up the end of the insulation.
- Position a spacer underneath.
- Route the cable that was previously routed along with the fuel line under the seat member. Connect the cable to the front connector (1) in the connector bridge (2)
- **Applies to cars with two rows of seats:** Remove the spacer and fold down the insulation
- Position the cable in the holder in the fuel tank unit cover
- Reinstall the cover for the fuel tank unit. Secure the cover using the four screws.
- Reinstall the insulation panels
- **Applies to cars with three rows of seats:** Reinstall the air duct
- Fold back the carpet
- **Applies to cars with three rows of seats:** Reinstall the vents under the outer seats
- Reinstall the seats.

CAUTION: Be careful when lifting the seats into the passenger compartment. Ensure that the mountings do not damage the door panels.

- Secure the seats. Tighten the screws. Tighten to **48 Nm (35 lbf. ft.)**
- Reinstall the panels and covers over the seat mountings
- Reinstall the panels over the joint between the door sills.

Applies to cars with two rows of seats

- Reinstall the front storage compartment
- Reinstall the front floor hatch.

Fig. 309: Identifying Fuel Hose & Cable Harness At Rear Edge Of Fuel Tank
Courtesy of VOLVO CARS CORPORATION

- Route the fuel hose and cable harness (1) at the rear edge of the fuel tank. Route it along the right-hand side of the fuel tank and forwards. Let it hang down.

Fig. 310: Detaching Fuel Rail At Front Edge
Courtesy of VOLVO CARS CORPORATION

- Disconnect the rail for the fuel line. Insert a small screwdriver in the small hole between the rail and the yellow clip. Slide the clip in the same direction as the oval hole in the rail. The rear black clip has a small collar on the clip. Position the screwdriver against the collar and slide it forwards.

Fig. 311: Identifying Cable At Front Edge & Right-Hand Side Of Fuel Tank
Courtesy of VOLVO CARS CORPORATION

- Take the fuel pump (FP) and cable from the kit. Slide the cable up at the front edge on the right-hand side of the fuel tank
- Route the cable so that is next to the existing cable in the cut-out on top of the fuel tank. Then position the cable on the right-hand side of the wiring which runs to the engine compartment
- Pull up the wiring so that the fuel pump (FP) is positioned as approximately as illustrated.

Fig. 312: Identifying Brake Pipe Clamp
Courtesy of VOLVO CARS CORPORATION

- Remove the brake pipe (1) from the clamp
- Take the fuel pump (FP) and bracket. Position the bracket on top of the bracket for the fuel tank mounting, aligned with the small holes for the rivets
- Take two metal rivets (2) from the kit. Rivet the fuel pump bracket to the bracket for the fuel tank mounting.

Fig. 313: Identifying Double Clamp & Fuel Lines From Fuel Pump
Courtesy of VOLVO CARS CORPORATION

- Take the double clamp from the kit. Secure the two fuel lines from the fuel pump (FP) to each other, opposite the two blue markings on the fuel lines
- Press the brake pipe back into the clamp
- Tighten the four screws securing the fuel tank. Tighten the screw for the fuel filter if it was loosened. Tighten the screws. Tighten to **24 Nm (18 lbf. ft)**
- Connect the connector (1) from the pre-routed power cable to the fuel pump (FP)
- Connect the quick-release connector (2) on the pre-routed fuel line to the fuel pump (FP).

Fig. 314: Identifying Brake Pipe Fuel Line
Courtesy of VOLVO CARS CORPORATION

- Take a double clamp from the kit. Clamp the fuel line to the brake pipe at point (1).

Fig. 315: Identifying Fuel Pump Hose
Courtesy of VOLVO CARS CORPORATION

- Press into place the fuel hose from the recently installed fuel pump (FP). Press into place in the bottom of the rail and forwards, in the cut-out furthest to the right.

NOTE: The marking on the fuel hose must be opposite the point where the fuel hose goes into the rail.

- Slide back the retaining clip for the rail. Press the rail against the car body. Ensure that the rail is securely installed.

Fig. 316: Identifying Rail Retaining Clip
Courtesy of VOLVO CARS CORPORATION

Fig. 317: Identifying Drill Area And Dimensions
Courtesy of VOLVO CARS CORPORATION

- Remove the left front wheel
- Drill out the five rivets (1) holding the wheel arch lining and the rivets (2) in the lower edge of the bumper. Use a **6 mm (1/4")** diameter drill bit.

Remove:

- any rivet remains
- the plastic nuts (3) holding the wheel arch lining in place
- the small protective panel.

Applies to cars with accessory side trim

NOTE: The side trim on the front wing must not be removed.

- Only move the mounting lugs on the front wing side trim to one side so that the edge of the wing lining can be exposed.

Fig. 318: Removing Side Trim
