Courtesy of VOLVO CARS CORPORATION

Applies to cars without accessory side trim

- Detach the wing extension. Carefully pry off the wing extension using a weatherstrip tool
- Pull the wing extension up to the highest point until the three catches at the lower edge and the two clips slightly higher up have released.

Fig. 319: Removing Bumper Left Hand Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the left-hand panel on the bumper by carefully pull off the left-hand lower edge until the clip at the bottom on the inside releases. Continue pulling until the clips around the panel release.

Fig. 320: Pushing Wheel Arch Lining Aside
Courtesy of VOLVO CARS CORPORATION

- Push the wheel arch lining to one side. Secure with a tie strap or similar.

Fig. 321: Engine Splash Guard
Courtesy of VOLVO CARS CORPORATION

- Remove the engine splash guard (1) by removing the screws (2).

Fig. 322: Removing Front Skid Plate
Courtesy of VOLVO CARS CORPORATION

- Remove the front skid plate. First remove the six screws (1) on the underneath
- With the assistance of a colleague, pull the skid plate forwards. Pull one of the corners until the mounting lug on that side of the skid plate releases from the sub-frame. Then pull off the other corner. The underside of the bumper cover may need to be carefully pushed down at the same time
- Open the cover for the radiator expansion tank
- Thread a hose onto the engine coolant drain nipple
- Open the drain nipple. Drain off the coolant.

Fig. 323: Identifying Pipe Elbow
Courtesy of VOLVO CARS CORPORATION

- Pull off and push the pipe elbow to one side so that the fuel pipe can be positioned.

Fig. 324: Identifying Power Steering Pipes And Plastic Hose
Courtesy of VOLVO CARS CORPORATION

- Remove the power steering pipes and the plastic hose from their clips to make installing the fuel pipe easier. In order to push the upper power steering pipe to one side, the rubber coated clamp on the upper side of the front edge of the sub-frame may need to be removed.

Fig. 325: Identifying Fuel Pipe And Clips
Courtesy of VOLVO CARS CORPORATION

- Install the fuel pipe using the four pre-installed clips (1) (from the kit) on the sub-frame. Insert the fuel pipe between the disconnected pipes and the sub-frame. Press the fuel pipe into place using the clips in the front edge of the sub-frame and in the bottom in the clips (2) that secured the plastic hose. Due to limited space, the fuel pipe needs to be worked slightly in order to position it.

Fig. 326: Identifying Plastic Hose Clips
Courtesy of VOLVO CARS CORPORATION

- Reinstall the power steering pipes. Press the plastic hose into place on the outside of the fuel pipe. Reinstall the rubber coated clamp if this has been removed
- Check that the fuel pipe does not catch on the sub-frame. Check that the fuel pipe does not rub against pipes or screw heads for the suspension.

Fig. 327: Supporting Sub-Frame
Courtesy of VOLVO CARS CORPORATION

- Reinstall the pipe elbow
- Install the jack (1) under the front edge of the sub-frame
- Take the weight off the sub-frame
- Remove the screw (2) and the washer (3) from the left front mounting on the sub-frame.

Fig. 328: Identifying Heater And Bracket
Courtesy of VOLVO CARS CORPORATION

- Install the heater (1) on the bracket (2.) Use the screws (3) from the kit. Tighten.

Fig. 329: Identifying Fuel Hose Clamp & Inlet
Courtesy of VOLVO CARS CORPORATION

- Slide the heater up to the installation position
- Take a small hose clamp for the fuel line from the kit. Install the hose clamp on the fuel hose (1) from the fuel pipe on the sub-frame
- Press the fuel line on the inlet (2) on the fuel pump (FP). Tighten.

Fig. 330: Installing Bracket
Courtesy of VOLVO CARS CORPORATION

- Take a new screw (1) from the kit. Secure the heater to the left-hand front corner of the sub-frame. Do not tighten fully yet
- Take the metal bracket and two nuts from the kit
- Install one of the mounting lugs for the metal bracket on the stud (2) on the heater. Install the nut. Finger tighten
- Install the other mounting lug for the bracket on the stud (3). Install the nut
- Tighten the heater to the sub-frame and the bracket. Tighten the screw (1). Tighten to **105 Nm (78 lbf. ft)** . Angle-tighten to 120° or **max. 280 Nm (206 lbf. ft.)**
- Remove the protective cover from the pre-routed connector (4). Press in the catch on the top. Pull off the cover
- Connect the cable from the heater to the connector.

Fig. 331: Identifying Pipe Joint Cover
Courtesy of VOLVO CARS CORPORATION

- Take the chafe protection and the short fuel pipe from the kit. Install the chafe protection on the pipe.

Fig. 332: Identifying Fuel Line Placement
Courtesy of VOLVO CARS CORPORATION

- Insert the end of the short fuel pipe that is bent in two different directions, under the power steering and the anti-roll bar, over the right-hand rear corner of the sub-frame.

Fig. 333: Identifying Hose Clamp, Short Fuel Line & Fuel Pipe On Sub-Frame
Courtesy of VOLVO CARS CORPORATION

- Take a hose clamp from the kit. Thread the hose clamp onto the short fuel line on the fuel pipe on the sub-frame
- Connect the short fuel pipe to the fuel line. Slide the pipe into the fuel line. Slide the pipe in so far that the two pipes are in contact with each other. This prevents air pockets from forming
- Squeeze the hose clamp together.

Illustration A

Fig. 334: Identifying Tie Strap & Protective Tube
Courtesy of VOLVO CARS CORPORATION

- Take a tie strap from the kit. Clamp the protective tube at the fuel pipe so that it is securely installed.

Illustration B

Fig. 335: Identifying Hose Clamp & Fuel Line
Courtesy of VOLVO CARS CORPORATION

- Take a hose clamp from the kit. Thread the hose clamp onto the fuel line up to the fuel pump (FP) that was routed previously. Connect the fuel line to the short fuel pipe. Slide the pipe into the fuel line. Slide the pipe so far in that the two pipes are in contact with each other. This prevents air pockets from forming
- Ensure that the fuel pipe is routed correctly and does not squeeze the plastic hose or rub against the sub-frame or other components
- Squeeze the hose clamp together.

NOTE: Fuel lines and fuel pipes must be at least 15 mm (19/32") from brake pipes.

Fig. 336: Identifying Tie Strap And Fuel Pipe Clamp On Plastic Hose
Courtesy of VOLVO CARS CORPORATION

- Take a tie strap from the kit and clamp the fuel pipe at the plastic hose.

Fig. 337: Identifying Double Clamp And Fuel Line
Courtesy of VOLVO CARS CORPORATION

- Take a double clamp from the kit and clamp the fuel line for the parking heater at the ordinary fuel line.

Fig. 338: Removing Air Cleaner Intake Manifold
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws (1) from the intake manifold for the air cleaner (ACL)
- Remove the intake pipe. Place the intake manifold to one side.

Fig. 339: Hose Clamp
Courtesy of VOLVO CARS CORPORATION

- Fully disconnect the hose clamp (1)
- Remove the vacuum valve with hoses and the line (2) from the mounting at the rear lower edge, on the right-hand side of the air filter. Move it away from the gearbox
- Pull off the air cleaner (ACL) from the mounting on top of the front member. Disconnect the air cleaner (ACL) from the pipe to the turbocharger (TC). Unless the pipe to the air cleaner (ACL) has been removed before, carefully heating it with a hot-air gun can help to release it
- Place the air cleaner (ACL) to one side. Position it so that the space by the gearbox is exposed.

Fig. 340: Spring Strut Stay Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws (1) for the spring strut stay on the left-hand side to access the quick-release connector in the cowl panel.

Fig. 341: Shim Between Mounting And Spring Strut Turret
Courtesy of VOLVO CARS CORPORATION

- Pull the spring strut stay up on the left-hand side. Position a shim between the mounting and the spring strut turret.

Fig. 342: Heating Hoses
Courtesy of VOLVO CARS CORPORATION

- Disconnect the quick-release connector on the left heating hose (1) for the passenger compartment heater. Press in the circlip on the quick-release connector opposite the two arrows. Turn the circlip in the direction of the arrows at the same time. Turn the quick-release connector a little and pull it out
- Disconnect the heater hose (2) on the left-hand side of the cylinder head
- Place the heater hose to one side. It will not be reused.

Fig. 343: Hoses Routed Over Gearbox
Courtesy of VOLVO CARS CORPORATION

- Thread the heater hoses from the kit down along the front left mounting of the sub-frame
- Route the hoses over the gearbox as illustrated
- If necessary, disconnect the thick coolant hose at the cylinder head. This facilitates the installation of the new coolant hose
- The hose (1) is connected to the left-hand side of the cylinder head using a hose clamp. Tighten the hose clamp. Connect the hose (2) to the left-hand hose connector in the cowl panel.

Fig. 344: Identifying Heater Hoses
Courtesy of VOLVO CARS CORPORATION

- Connect the two heater hoses (1) to the heater using the hose clamps from the kit. Tighten the hoses.
- Tighten the drain nipple on the radiator. Remove the hose
- Reinstall the engine splash guard. Tighten to **25 Nm (18 lbf. ft.)**
- Reinstall the front skid plate. Tighten to **50 Nm (37 lbf. ft.)**
- Bend the wing liner back into position. Install the small plate. Install the nuts. Tighten
- Press the wing extension back into place
- Take rivets from the kit. Rivet the front edge/lower edge of the wing lining
- Reinstall the bumper panel
- Reinstall the wheel. Tighten the screws. Tighten to **140 Nm (103 lbf. ft)** .

Fig. 345: Engine Compartment Fuse Holder
Courtesy of VOLVO CARS CORPORATION

- Open the cover on the fuse holder in the engine compartment. Install a 25A fuse in position 1
- Reinstall the cover
- Then tighten the left-hand mounting for the spring strut stay. Tighten the screws. Tighten to **50 Nm (37 lbf. ft.)** .

- Fill with coolant. Reinstall the expansion tank cap
- Reinstall the air cleaner (ACL). Connect any disconnected lines or hoses
- Reinstall the intake manifold on the front cover plate between the headlamps. Tighten the screws. Tighten to **10 Nm (7 lbf. ft)**
- Start the engine and bleed the cooling system
- Program the software. See the service information in VIDA (Volvo Scan Tool)
- Test the function of the heater according to separate instructions.

FUEL DRIVEN HEATER 912-B (B5254T2; 2003-2007) (AW50/51 AWD; AW55-50/51SN; 2005-2007)

FUEL DRIVEN HEATER 912-B (2003, 2004)

NOTE: This accessory requires software unique to the car.

Fig. 346: Removing Front Floor Hatch
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Remove the front floor hatch. First lift up slightly and then pull the hatch loose from its mountings at the front edge.

Fig. 347: Removing Front Storage Compartments
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Lift out the front storage compartment.

NOTE: **Removing the right-hand seat in the second row of seats (steps 3-8) applies to all cars. For cars with three rows of seats, the left-hand and center seats in the middle row must also be removed.**

Fig. 348: Prying Right-Hand Rear Mounting Of Cover Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the panel on the right rear mounting on the right-hand front seat. Pry up the rear edge of the panel slightly and then pull backwards and upwards.

Fig. 349: Prying Away Cover Panel Over Joint Between Door Sills On Right-Hand Side, At Lower Edge, Using A Weatherstrip Tool
Courtesy of VOLVO CARS CORPORATION

- Slide the seats in the first row as far forwards as possible
- Carefully pry off and remove the panel above the joint between the right-hand door sills.

Fig. 350: Pushing Up Catch On Top Side
Courtesy of VOLVO CARS CORPORATION

- Remove the panel for the front right seat mounting on the right-hand seat in the second row. Press down the catch (1) on top and detach the panel by pulling it forward. Remove the screw underneath.

Fig. 351: Removing Front Seat Mountings
Courtesy of VOLVO CARS CORPORATION

- Remove the panel for the front seat mountings for the right-hand seat/middle seat in the second row. Press down the catches (1) on top and detach the panel by pulling it forward. Remove the screw for the right-hand seat.

Fig. 352: Removing Rear Seat Mounting Cover
Courtesy of VOLVO CARS CORPORATION

- Fold the rear backrest forwards on the right-hand seat in the second row
- Remove the covers (1) for the rear seat mountings on the right-hand seat by prying them off the rear edge. Remove the screws.

Fig. 353: Removing Seal Trim
Courtesy of VOLVO CARS CORPORATION

- Remove the sill trim panel for the right-hand rear door. Pull off the rear edge until the clips release. Continue forwards until the remaining clips have released
- Unhook the sill trim panel from the B-post panel. Place the sill trim panel in the cargo compartment
- Remove the seat.

CAUTION: Be careful when lifting the seats out of the passenger compartment. Ensure that the mountings do not damage the door panels.

Applies to cars with three rows of seats

- Remove the corresponding panels and screws as in steps 3-8, on the left-hand side, and for the left-hand and middle seats in the second row
- Remove the left-hand and center seats.

CAUTION: Be careful when lifting the seats out of the passenger compartment. Ensure that the mountings do not damage the door panels.

Fig. 354: Seat Mountings
Courtesy of VOLVO CARS CORPORATION

Applies to cars with three rows of seats

- Remove the vents on the right and left-hand sides.

Illustration A applies to cars with two rows of seats

Fig. 355: Pushing Carpet And Insulation Aside
Courtesy of VOLVO CARS CORPORATION

- Push the floor carpet to one side and secure it using the seat belt on the left-hand side
- Carefully push the insulation to one side so that the cover for the fuel tank unit is accessible.

CAUTION: Take care with the insulation. It will break off easily.

Illustration applies to cars with three rows of seats

Fig. 356: Removing Insulation Panels
Courtesy of VOLVO CARS CORPORATION

- Push the floor carpet and insulation panel to one side
- Position a screwdriver or similar to hold the carpet in place
- Remove the air duct
- Remove both insulation panels.

Fig. 357: Removing Fuel Tank Unit Cover
Courtesy of VOLVO CARS CORPORATION

- Remove the four screws in the cover for the fuel tank unit
- Carefully pry off the cover. Use a weatherstrip tool.

Fig. 358: Identifying Front Mounting & Fuel Filter Screws
Courtesy of VOLVO CARS CORPORATION

Fig. 359: Identifying Rear Mounting Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the four screws (1) in the front and rear mountings for the fuel tank so that the fuel tank lowers slightly. This allows the suction pipe for the fuel tank to be installed. If necessary, remove the screw (2) for the fuel filter to lower the fuel tank further.

Fig. 360: Identifying Drill Hole Area And Dimensions
Courtesy of VOLVO CARS CORPORATION

- Drill out the terminal (1) in the fuel tank unit. Use a **4 mm (5/32")** diameter drill bit.

NOTE: Use a compressed air power drill with a greased bit.

Fig. 361: Installing Pipe And Cable Assembly
Courtesy of VOLVO CARS CORPORATION

- Insert the pipe (1) from the kit into the connection (2). Press the pipe down until it is against the connection
- Take the fuel line and electrical cable from the kit. Apply masking tape on the end of the part of the fuel line that is to be inserted down through the hole in the floor (the end with the short free cable end)
- Insert the entire cable assembly (3) between the floor and the fuel tank out to the right.

Fig. 362: Installing Quick-Release Connector
Courtesy of VOLVO CARS CORPORATION

- Press the quick-release connector (1) onto the connection until a click is heard. Check that the quick-release connector is secure.

Fig. 363: Routing And Connecting Cable
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Carefully push up the end of the insulation.
- Position a spacer underneath.
- Route the cable that was previously routed along with the fuel line under the seat member. Connect the cable to the front connector (1) in the connector bridge (2)
- **Applies to cars with two rows of seats:** Remove the spacer and fold down the insulation

- Position the cable in the holder in the fuel tank unit cover
- Reinstall the cover for the fuel tank unit. Secure the cover using the four screws.

- Reinstall the insulation panels
- **Applies to cars with three rows of seats:** Reinstall the air duct
- Fold back the carpet
- **Applies to cars with three rows of seats:** Reinstall the vents under the outer seats
- Reinstall the seats.

CAUTION: Be careful when lifting the seats into the passenger compartment. Ensure that the mountings do not damage the door panels.

- Secure the seats. Tighten the screws. Tighten to **48 Nm (35 lbf. ft.)**
- Reinstall the panels and covers over the seat mountings
- Reinstall the panels over the joint between the door sills.

Applies to cars with two rows of seats

- Reinstall the front storage compartment
- Reinstall the front floor hatch.

Fig. 364: Identifying Fuel Hose & Cable Harness At Rear Edge Of Fuel Tank
Courtesy of VOLVO CARS CORPORATION

- Route the fuel hose and cable harness (1) at the rear edge of the fuel tank. Route it along the right-hand side of the fuel tank and forwards. Let it hang down.

Fig. 365: Detaching Fuel Rail At Front Edge
Courtesy of VOLVO CARS CORPORATION

- Disconnect the rail for the fuel line. Insert a small screwdriver in the small hole between the rail and the yellow clip. Slide the clip in the same direction as the oval hole in the rail. The rear black clip has a small collar on the clip. Position the screwdriver against the collar and slide it forwards.

Fig. 366: Identifying Cable At Front Edge & Right-Hand Side Of Fuel Tank
Courtesy of VOLVO CARS CORPORATION

- Take the fuel pump (FP) and cable from the kit. Slide the cable up at the front edge on the right-hand side of the fuel tank
- Route the cable so that is next to the existing cable in the cut-out on top of the fuel tank. Then position the cable on the right-hand side of the wiring which runs to the engine compartment
- Pull up the wiring so that the fuel pump (FP) is positioned as approximately as illustrated.

Fig. 367: Identifying Brake Pipe Clamp
Courtesy of VOLVO CARS CORPORATION

- Remove the brake pipe (1) from the clamp
- Take the fuel pump (FP) and bracket. Position the bracket on top of the bracket for the fuel tank mounting, aligned with the small holes for the rivets
- Take two metal rivets (2) from the kit. Rivet the fuel pump bracket to the bracket for the fuel tank mounting.

Fig. 368: Identifying Double Clamp & Fuel Lines From Fuel Pump
Courtesy of VOLVO CARS CORPORATION

- Take the double clamp from the kit. Secure the two fuel lines from the fuel pump (FP) to each other, opposite the two blue markings on the fuel lines
- Press the brake pipe back into the clamp
- Tighten the four screws securing the fuel tank. Tighten the screw for the fuel filter if it was loosened. Tighten the screws. Tighten to **24 Nm (18 lbf. ft)**
- Connect the connector (1) from the pre-routed power cable to the fuel pump (FP)

- Connect the quick-release connector (2) on the pre-routed fuel line to the fuel pump (FP).

Fig. 369: Identifying Brake Pipe Fuel Line
Courtesy of VOLVO CARS CORPORATION

- Take a double clamp from the kit. Clamp the fuel line to the brake pipe at point (1).

Fig. 370: Identifying Fuel Pump Hose
Courtesy of VOLVO CARS CORPORATION

- Press into place the fuel hose from the recently installed fuel pump (FP). Press into place in the bottom of the rail and forwards, in the cut-out furthest to the right.

NOTE: The marking on the fuel hose must be opposite the point where the fuel hose goes into the rail.

- Slide back the retaining clip for the rail. Press the rail against the car body. Ensure that the rail is securely installed.

Fig. 371: Identifying Rail Retaining Clip
Courtesy of VOLVO CARS CORPORATION

Fig. 372: Identifying Drill Hole Area And Dimensions
Courtesy of VOLVO CARS CORPORATION

- Remove the left front wheel
- Drill out the five rivets (1) holding the wheel arch lining and the rivets (2) in the lower edge of the bumper. Use a **6 mm (1/4")** diameter drill bit.

Remove:

- any rivet remains
- the plastic nuts (3) holding the wheel arch lining in place
- the small protective panel.

Applies to cars with accessory side trim

NOTE: The side trim on the front wing must not be removed.

- Only move the mounting lugs on the front wing side trim to one side so that the edge of the wheel arch lining can be exposed.

Fig. 373: Removing Side Trim
Courtesy of VOLVO CARS CORPORATION

Applies to cars without accessory side trim

- Detach the wheel arch extension. Carefully pry off the wheel arch extension using a weatherstrip tool
- Pull the wheel arch extension up to the highest point until the three catches at the lower edge and the two clips slightly higher up have released.

Fig. 374: Removing Bumper Left Hand Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the left-hand panel on the bumper by carefully pull off the left-hand lower edge until the clip at

the bottom on the inside releases. Continue pulling until the clips around the panel release.

Fig. 375: Pushing Wheel Arch Lining Aside
Courtesy of VOLVO CARS CORPORATION

- Push the wheel arch lining to one side. Secure with a tie strap or similar.

Fig. 376: Engine Splash Guard
Courtesy of VOLVO CARS CORPORATION

- Remove the engine splash guard (1) by removing the screws (2).

Fig. 377: Removing Front Side Plate
Courtesy of VOLVO CARS CORPORATION

- Remove the front skid plate. First remove the six screws (1) on the underneath
- With the assistance of a colleague, pull the skid plate forwards. Pull one of the corners until the mounting lug on that side of the skid plate releases from the sub-frame. Then pull off the other corner. The underside of the bumper cover may need to be carefully pushed down at the same time
- Open the cover for the radiator expansion tank
- Thread a hose onto the engine coolant drain nipple
- Open the drain nipple. Drain off the coolant.

Fig. 378: Identifying Pipe Elbow
Courtesy of VOLVO CARS CORPORATION

- Pull off and push the pipe elbow to one side so that the fuel pipe can be positioned.

Fig. 379: Identifying Power Steering Pipes And Plastic Hose
Courtesy of VOLVO CARS CORPORATION

- Remove the power steering pipes and the plastic hose from their clips to make installing the fuel pipe easier. In order to push the upper power steering pipe to one side, the rubber coated clamp on the upper side of the front edge of the sub-frame may need to be removed.

Fig. 380: Identifying Fuel Pipe And Clips
Courtesy of VOLVO CARS CORPORATION

- Install the fuel pipe using the four pre-installed clips (1) (from the kit) on the sub-frame. Insert the fuel pipe between the disconnected pipes and the sub-frame. Press the fuel pipe into place using the clips in the front edge of the sub-frame and in the bottom in the clips (2) that secured the plastic hose. Due to limited space, the fuel pipe needs to be worked slightly in order to position it.

Fig. 381: Identifying Plastic Hose Clips
Courtesy of VOLVO CARS CORPORATION

- Reinstall the power steering pipes. Press the plastic hose into place on the outside of the fuel pipe. Reinstall the rubber coated clamp if this has been removed
- Check that the fuel pipe does not catch on the sub-frame. Check that the fuel pipe does not rub against pipes or screw heads for the suspension.

Fig. 382: Supporting Sub-Frame
Courtesy of VOLVO CARS CORPORATION

- Reinstall the pipe elbow
- Install the jack (1) under the front edge of the sub-frame
- Take the weight off the sub-frame
- Remove the screw (2) and the washer (3) from the left front mounting on the sub-frame.

Fig. 383: Identifying Heater And Bracket
Courtesy of VOLVO CARS CORPORATION

- Install the heater (1) on the bracket (2.) Use the screws (3) from the kit. Tighten.

Fig. 384: Identifying Fuel Hose Clamp & Inlet
Courtesy of VOLVO CARS CORPORATION

- Slide the heater up to the installation position
- Take a small hose clamp for the fuel line from the kit. Install the hose clamp on the fuel hose (1) from the fuel pipe on the sub-frame
- Press the fuel line on the inlet (2) on the fuel pump (FP). Tighten.

Fig. 385: Installing Bracket
Courtesy of VOLVO CARS CORPORATION

- Take a new screw (1) from the kit. Secure the heater to the left-hand front corner of the sub-frame. Do not tighten fully yet
- Take the metal bracket and two nuts from the kit
- Install one of the mounting lugs for the metal bracket on the stud (2) on the heater. Install the nut. Finger tighten
- Install the other mounting lug for the bracket on the stud (3). Install the nut
- Tighten the heater to the sub-frame and the bracket. Tighten the screw (1). Tighten to **105 Nm (78 lbf. ft)** . Angle-tighten to 120° or **max. 280 Nm (206 lbf. ft.)**
- Remove the protective cover from the pre-routed connector (4). Press in the catch on the top. Pull off the cover
- Connect the cable from the heater to the connector.

Fig. 386: Identifying Pipe Joint Cover
Courtesy of VOLVO CARS CORPORATION

- Take the chafe protection and the short fuel pipe from the kit. Install the chafe protection on the pipe.

Fig. 387: Identifying Fuel Line Placement
Courtesy of VOLVO CARS CORPORATION

- Insert the end of the short fuel pipe that is bent in two different directions, under the power steering and the anti-roll bar, over the right-hand rear corner of the sub-frame.

Fig. 388: Identifying Hose Clamp, Short Fuel Line & Fuel Pipe On Sub-Frame
Courtesy of VOLVO CARS CORPORATION

- Take a hose clamp from the kit. Thread the hose clamp onto the short fuel line on the fuel pipe on the sub-frame
- Connect the short fuel pipe to the fuel line. Slide the pipe into the fuel line. Slide the pipe in so far that the two pipes are in contact with each other. This prevents air pockets from forming
- Squeeze the hose clamp together.

Illustration A

Fig. 389: Identifying Tie Strap & Protective Tube
Courtesy of VOLVO CARS CORPORATION

- Take a tie strap from the kit. Clamp the protective tube at the fuel pipe so that it is securely installed.

Illustration B

Fig. 390: Identifying Hose Clamp & Fuel Line
Courtesy of VOLVO CARS CORPORATION

- Take a hose clamp from the kit. Thread the hose clamp onto the fuel line up to the fuel pump (FP) that was routed previously. Connect the fuel line to the short fuel pipe. Slide the pipe into the fuel line. Slide the pipe so far in that the two pipes are in contact with each other. This prevents air pockets from forming
- Ensure that the fuel line is routed correctly and does not obstruct the plastic hose or rub against the sub-frame or other components
- Squeeze the hose clamp together.

NOTE: Fuel lines and fuel pipes must be at least 15 mm (19/32") from brake pipes.

Fig. 391: Identifying Tie Strap And Fuel Pipe Clamp On Plastic Hose
Courtesy of VOLVO CARS CORPORATION

- Take a tie strap from the kit and clamp the fuel pipe at the plastic hose.

Fig. 392: Identifying Double Clamp And Fuel Line
Courtesy of VOLVO CARS CORPORATION

- Take a double clamp from the kit and clamp the fuel line for the parking heater at the ordinary fuel line.

Fig. 393: Identifying ACL Screws, Hose Clamp And Connector
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws (1) from the intake manifold for the air cleaner (ACL)
- Remove the intake pipe. Place the intake manifold to one side
- Disconnect the hose clamp (2)
- Remove the connector (3) from the intake manifold for the turbocharger (TC)
- Pull off the air cleaner (ACL) from its mounting in the left-hand front member.

Fig. 394: Accessing Heater Hose
Courtesy of VOLVO CARS CORPORATION

- Pull the air cleaner (ACL) (1) up from its mounting on top of the front member. Turn it around in the intake hose. Move it away from the gearbox. Secure with string or similar. Depending on the version, more hoses or connectors may need to be detached from around the air cleaner (ACL)
- Disconnect the quick-release connector on the left heating hose (2) for the passenger compartment heater. Press in the circlip on the quick-release connector opposite the two arrows. Turn the circlip in the direction of the arrows at the same time. Turn the quick-release connector a little and pull it out

- Disconnect the heater hose (3) on the left-hand side of the cylinder head
- Place the heater hose to one side. It will not be reused.

Fig. 395: Identifying Hose And Hose Clamp
Courtesy of VOLVO CARS CORPORATION

- Thread the heater hoses from the kit down along the front left mounting of the sub-frame
- Route the hoses over the gearbox as illustrated
- Disconnect the thick coolant hose at the cylinder head. This facilitates the installation of the new coolant hose
- The hose (1) is connected to the left-hand side of the cylinder head using a hose clamp. Tighten the hose clamp. Connect the hose (2) to the left-hand hose connector in the cowl panel
- Take the plastic hose clamp (3) from the kit. Press the hose clamp into the top hole in the bracket on the gearbox
- Install the hose routed to the cowl panel in the clamp. Close the clamp.

Fig. 396: Identifying Heater Hoses

Courtesy of VOLVO CARS CORPORATION

- Connect the two heater hoses (1) to the heater using the hose clamps from the kit. Tighten the hoses.

- Tighten the drain nipple on the radiator. Remove the hose
- Reinstall the engine splash guard. Tighten to **25 Nm (18 lbf. ft.)**
- Reinstall the front skid plate. Tighten to **50 Nm (37 lbf. ft.)**
- Bend back the wheel arch lining. Install the small plate. Install the nuts. Tighten
- Press the wheel arch extension into place
- Take rivets from the kit. Rivet the front edge/lower edge of the wheel arch lining
- Reinstall the bumper panel
- Reinstall the wheel. Tighten the screws. Tighten to **140 Nm (103 lbf. ft)** .

Fig. 397: Engine Compartment Fuse Holder
Courtesy of VOLVO CARS CORPORATION

- Open the cover on the fuse holder in the engine compartment. Install a 25A fuse in position 1
- Reinstall the cover.

- Fill with coolant. Reinstall the expansion tank cap
- Reinstall the air cleaner (ACL). Connect any disconnected lines or hoses
- Reinstall the intake manifold on the front cover plate between the headlamps. Tighten the screws. Tighten to **10 Nm (7 lbf. ft)**
- Start the engine and bleed the cooling system
- Program the software. See the service information in VIDA (Volvo Scan Tool)
- Test the function of the heater according to separate instructions.

LOCATION OF DECALS (2003-2008)

LOCATION OF DECALS

INSIDE FUEL TANK FILLER FLAP

Fig. 398: Identifying Warning Label
Courtesy of VOLVO CARS CORPORATION

Fig. 399: Locating Warning Label
Courtesy of VOLVO CARS CORPORATION

UNDERSIDE OF BONNET

Fig. 400: Identifying Decals
Courtesy of VOLVO CARS CORPORATION

If there is already a decal on the heater:

Remove the decal from the heater and secure it at the specified location under the bonnet.

Fig. 401: Identifying Decal On Right Side Of Hood
Courtesy of VOLVO CARS CORPORATION

Fig. 402: Identifying Decal On Left Side Of Hood
Courtesy of VOLVO CARS CORPORATION

Courtesy of VOLVO CARS CORPORATION

PASSENGER COMPARTMENT CONNECTOR KIT (2005-2012)

PASSENGER COMPARTMENT CONNECTOR KIT (2005-2009)

Fig. 404: Right-Hand Side Sound Barrier
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position 0.
- Remove the right-hand side panel of the center console by pulling it away starting at the front edge and then backwards until all clips have released.
- Remove the sound barrier on the right-hand side by first removing the two screws and then prizing it away at the top edge.

Fig. 405: Prying Right-Hand Rear Mounting Of Cover Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the cover panel on the right-hand rear mounting of the right-hand front seat. Prize it up slightly at the rear edge and then pull it back/upwards.

Fig. 406: Prying Away Cover Panel Over Joint Between Door Sills On Right-Hand Side, At Lower Edge, Using A Weatherstrip Tool
Courtesy of VOLVO CARS CORPORATION

- Carefully prize away the cover panel over the joint between the door sills on the right-hand side, at the lower edge, using a weatherstrip tool. Remove the cover panel.

Fig. 407: Right-Hand Front Door's Sill Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Detach the right-hand front door's sill trim panel. Pull it away starting at the front edge until the clip there has released. Continue backwards until the remaining clips have released.
- Unhook it from the B-pillar panel and place it to one side.

Fig. 408: Passenger Seat Rubber Grommet
Courtesy of VOLVO CARS CORPORATION

- Push the carpet to one side by the right-hand front seat.
- Press out the rubber grommet (1) under the insulation mat.

Fig. 409: Installing Connector And Bracket
Courtesy of VOLVO CARS CORPORATION

- Remove the lower piece of tape, which is fitted where the bracket shall be screwed in.
- Take the bracket and screw from the kit. Install the bracket in the existing weld nut, from where the piece of tape was removed.
- Turn the bracket so that it is fitted as illustrated.
- Install the connector loosely and check that it is fitted on straight, with the internal power connector forwards.
- Tighten the bracket to **10 Nm (7 lbf. ft.)** .
- If the car is equipped with a child seat mounting then the bracket for the passenger compartment

connector socket must be fitted over this and secured with an M6 screw. Tightening torque **10 Nm (7 lbf. ft.)** .

Fig. 410: Reinstalling Carpet
Courtesy of VOLVO CARS CORPORATION

- Fold the carpet back over the bracket.
- Make a hole in the carpet opposite the upper mounting hole in the bracket using a double ended scriber.

Fig. 411: Identifying Screws, Passenger Compartment Connector Socket & Double Ended Scriber
Courtesy of VOLVO CARS CORPORATION

- Take a screw and the passenger compartment connector socket from the kit. Tighten the passenger compartment connector socket to the bracket in the upper mounting.
- Insert the double ended scriber into the lower mounting for the passenger compartment connector socket. Make a hole in the carpet opposite the lower hole on the bracket.
- Tighten the lower mounting for the passenger compartment connector socket using a screw from the kit.

Fig. 412: Identifying Carpet Knife, Cut Slit In Carpet & Front Of Locking Sleeve
Courtesy of VOLVO CARS CORPORATION

- Press a locking sleeve (from the kit) onto the passenger compartment connector socket. Slide the locking sleeve as far along the terminal for the passenger compartment connector socket as possible.
- Take a carpet knife and cut a slit in the carpet just in front of the locking sleeve. Make the cut as long as the diameter of the locking sleeve.

NOTE: Do not damage any wiring and hoses under the carpet.

- Remove the passenger compartment connector socket from the bracket.

Fig. 413: Detach Left-Hand Headlamp By Pulling Up Two Locking Pins
Courtesy of VOLVO CARS CORPORATION

- Detach the left-hand headlamp by pulling up the two locking pins and then carefully pulling away the headlamp forwards.

Fig. 414: Carefully Prize Up Catch On Connector For Headlamp With A Screwdriver
Courtesy of VOLVO CARS CORPORATION

- Carefully prize up the catch on the connector for the headlamp using a screwdriver.
- Pull the catch up completely, detach the connector and place the headlamp to one side.

CABLE JOINTS AND JUNCTION CONNECTOR UNDER LEFT-HAND HEADLAMP PLATE

Fig. 415: Identifying Tie Strap For Cable
Courtesy of VOLVO CARS CORPORATION

Applies to cars with 8-cylinder engine where engine block heater is installed

- Remove the tie strap securing the cable to the front socket. Pull the cable forward.

Fig. 416: Removing Locking Sleeve
Courtesy of VOLVO CARS CORPORATION

Applies to cars with 8-cylinder engine where engine block heater is installed

- Remove the locking sleeve over the joint on the cables for the engine block heater. Pull the cables away from each other.

Fig. 417: Removing Cable
Courtesy of VOLVO CARS CORPORATION

Applies to cars with 6-cylinder engine where engine block heater is installed

- Remove the tie strap securing the cable to the front engine block heater socket.
- Pull the cable forward.
- Remove the locking sleeve over the joint on the cables for the engine block heater and pull the cables away from each other.

Fig. 418: Identifying O-Ring
Courtesy of VOLVO CARS CORPORATION

- Grease in the O-ring on the connector for the front engine block heater socket and both connectors on the branch connector from the kit using low temperature grease **P/N 1161427** .

NOTE: Do not get any grease on the surfaces of the connector.

Fig. 419: Identifying Branch Connector
Courtesy of VOLVO CARS CORPORATION

- Connect the cable for the front socket to socket (1) on the branch connector. Firmly press the connector in and press in a locking sleeve from the kit over the joint.
- Connect the long cable for the passenger compartment connector socket from the kit to any connector (2 or 3) on the branch connector. Firmly press the connector in and press in a locking sleeve from the kit over the joint.
- Connect the cable for the engine block heater to the remaining connector on the branch connector. Firmly press the connector in and press in a locking sleeve from the kit over the joint.

Fig. 420: Positioning Branch Connector
Courtesy of VOLVO CARS CORPORATION

- Position the branch connector with the cables underneath the plate under the headlamp. The two parallel sockets must be turned forward and the cable from the front engine block heater socket turned backward.

Applies to cars with 8-cylinder engine

- Route the new cable for the passenger compartment connector socket on to the brake fluid reservoir the same way as the existing cable for the engine block heater.

Applies to cars with 6-cylinder engine

- Route the cable as shown in Illustration 18.

- Take a screw, nut and washer from the kit. Secure the branch connector in the hole in the plate (1).
- Take a new tie strap from the kit and replace the tie strap removed in steps 12 and 14 respectively.

Fig. 421: Routing Cable

Courtesy of VOLVO CARS CORPORATION

- Route the cable for the passenger compartment connector socket under the left-hand headlamp. Route it backwards along the left-hand side of the air filter and between air filter and fuse holder. Continue to route it backwards, under the ABS system and up between the cable duct and brake fluid reservoir.

NOTE: Check that the cable does not chafe against sharp edges or moving parts in the engine compartment.

Fig. 422: Identifying Installation Clips
Courtesy of VOLVO CARS CORPORATION

Applies to cars with 8-cylinder engine

- Detach the cable from the engine block heater from the two clips above the brake fluid reservoir.

Fig. 423: Installing Clips
Courtesy of VOLVO CARS CORPORATION

Applies to cars with 6-cylinder engine

- Take two clips from the kit and install them on the edge of the plate at the front edge of the panel above the windscreen wiper arms.

Fig. 424: Installing Clips
Courtesy of VOLVO CARS CORPORATION

- Take two new clips from the kit and press them onto the edge of the plate in front of the panel over the windscreen wiper shafts.

Fig. 425: Installing Cable
Courtesy of VOLVO CARS CORPORATION

- Press the cable for the passenger compartment connector socket into the four clips.
- Guide the cable down on the right-hand side of the cable duct and down through the engine compartment.

Fig. 426: Installing Cable With Tie Straps
Courtesy of VOLVO CARS CORPORATION

Applies to cars with 8-cylinder engine

- Take two tie straps from the kit and clamp the cable for the heater which was detached earlier, to the newly routed cable for the passenger compartment connector socket.

Fig. 427: Clamping Routed Cable In At Water Evacuation Pipe
Courtesy of VOLVO CARS CORPORATION

- Clamp the routed cable in at the water evacuation pipe using two tie straps from the kit.

NOTE: **Do not clamp the cable so that it is in direct contact with brake pipes, fuel lines or AC pipes.**

Fig. 428: Removing Wheel
Courtesy of VOLVO CARS CORPORATION

- Remove the right-hand front wheel for easier access for routing the cable to the passenger compartment connector socket.

Fig. 429: Wheel Protective Cover
Courtesy of VOLVO CARS CORPORATION

- Remove the two plastic nuts securing the small protective panel in the right-hand wheel housing. Remove the panel.

Fig. 430: Engine Splash Guard And Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the six screws and the engine splash guard.

Fig. 431: Removing Pressed Out Rubber Grommet
Courtesy of VOLVO CARS CORPORATION

- Take the prepunched washer from the engine compartment insulation and remove the pressed out rubber grommet.

Fig. 432: Cutting Rubber Grommet
Courtesy of VOLVO CARS CORPORATION

- Take the rubber grommet and cut away the very top.

Fig. 433: Installing Clip
Courtesy of VOLVO CARS CORPORATION

- Press in a clip from the kit on the edge of the plate on the right-hand side of the wheel housing, under the bending rubber hose of the water evacuation pipe.

Fig. 434: Installing Radiation Shield
Courtesy of VOLVO CARS CORPORATION

- Take the radiation shield from the kit and cut it to a length of 300 mm (11 13/16").
- Pull the radiation shield onto the end of the cable.

Fig. 435: Installing Rubber Grommet
Courtesy of VOLVO CARS CORPORATION

- Grease in the rubber grommet using low temperature grease **P/N 1161427** in order to make it easier to insert the cable and rubber grommet into the hole in the cowl panel.
- Guide the cable into the rubber grommet.

Fig. 436: Guiding Cable into Cowl Wall
Courtesy of VOLVO CARS CORPORATION

- Guide the cable into the hole in the cowl wall and press the rubber grommet into place in the hole, either by pulling it into place from inside the passenger compartment, or carefully pressing it into place with a long large screwdriver/wide end of a short pry bar.

NOTE: These must not be sharp or they can damage the cables/rubber grommet.

- Adapt the length of the cable from the rubber grommet, at the installed clip and out in the engine compartment.

Fig. 437: Inserting Cable Into Clamp
Courtesy of VOLVO CARS CORPORATION

- Press the cable for the passenger compartment connector socket into the installed clip. Make sure that the cable with the radiation shield is firmly pressed into the clip and does not slide out.

CAUTION: Check that the cable is routed so that it does not come into contact with the alternator belt, or chafe against sharp edges in the engine compartment.

- Reinstall the small protective panel in the wheel housing.
- Remount the wheel and tighten the bolts to **140 Nm (103 lbf. ft.)** .
- Reinstall the engine splash guard and torque tighten the screws to **25 Nm (18.5 lbf. ft.)** .
- Connect and reinstall the left-hand headlamp.

Fig. 438: Tightening Radiation Shield With Grey Tie Straps
Courtesy of VOLVO CARS CORPORATION

- Take the grey tie straps from the kit and tighten the radiation shield to the cable

Fig. 439: Identifying Cable At Passenger Compartment Connector Socket
Courtesy of VOLVO CARS CORPORATION

- Route the cable from the engine compartment through the hole in the carpet.

- Grease in the O-ring with low temperature grease **P/N 1161427** .

NOTE: Make sure that no grease gets onto the connector surfaces.

- Connect the cable to the passenger compartment connector socket. Press a locking sleeve (from the kit) over the joint.
- Fold the carpet back into position and install the passenger compartment connector socket using both the screws.

Reinstall:

- the sound barrier
- the sill trim panel
- the cover panel in the lower edge of the B-pillar panel
- the cover panel for the seat's mounting
- the center console's right-hand side panel.

PASSENGER COMPARTMENT CONNECTOR SOCKET B8444S (B8444S; 2005-2008)

PASSENGER COMPARTMENT CONNECTOR SOCKET

Fig. 440: Right-Hand Side Sound Barrier
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition switch to position 0.
- Remove the center console's right-hand side panel by first pulling it away starting at the front edge and then backwards until all the clips have released.
- Remove the sound barrier on the right-hand side by first removing the two screws and then prizing it away at the top edge.

Fig. 441: Prying Right-Hand Rear Mounting Of Cover Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the cover panel on the right-hand rear mounting of the right-hand front seat. Prize it up slightly at the rear edge and then pull it back/upwards.

Fig. 442: Prying Away Cover Panel Over Joint Between Door Sills On Right-Hand Side, At Lower Edge, Using A Weatherstrip Tool
Courtesy of VOLVO CARS CORPORATION

- Carefully prize away the cover panel over the joint between the door sills on the right-hand side, at the lower edge, using a weatherstrip tool. Remove the cover panel.

Fig. 443: Right-Hand Front Door's Sill Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Detach the right-hand front door's sill trim panel. Pull it away starting at the front edge until the clip there has released. Continue backwards until the remaining clips have released.
- Unhook it from the B-pillar panel and place it to one side.

Fig. 444: Passenger Seat Rubber Grommet
Courtesy of VOLVO CARS CORPORATION

- Push the carpet to one side by the right-hand front seat.
- Press out the rubber grommet (1) under the insulation mat.

Fig. 445: Installing Bracket And Connector
Courtesy of VOLVO CARS CORPORATION

- Remove the lower piece of tape, which is fitted where the bracket shall be screwed in.
- Take the bracket and screw from the kit. Install the bracket in the existing weld nut, from where the piece of tape was removed.
- Turn the bracket so that it is fitted as illustrated.
- Install the connector loosely and check that it is fitted on straight, with the internal power connector forwards.
- Tighten the bracket to **10 Nm (7 lbf. ft.)** .
- If the car is equipped with a child seat mounting then the bracket for the passenger compartment connector socket must be fitted over this and secured with an M6 screw. Tightening torque **10 Nm (7 lbf. ft.)** .

Fig. 446: Reinstalling Carpet
Courtesy of VOLVO CARS CORPORATION

- Fold the carpet back over the bracket.

- Make a hole in the carpet opposite the upper mounting hole in the bracket using a double ended scriber.

Fig. 447: Identifying Screws, Passenger Compartment Connector Socket & Double Ended Scriber
Courtesy of VOLVO CARS CORPORATION

- Take a screw and the passenger compartment connector socket from the kit. Tighten the passenger compartment connector socket to the bracket in the upper mounting.
- Insert the double ended scriber into the lower mounting for the passenger compartment connector socket. Make a hole in the carpet opposite the lower hole on the bracket.
- Tighten the lower mounting for the passenger compartment connector socket using a screw from the kit.

Fig. 448: Identifying Carpet Knife, Cut Slit In Carpet & Front Of Locking Sleeve
Courtesy of VOLVO CARS CORPORATION

- Press a locking sleeve (from the kit) onto the passenger compartment connector socket. Slide the locking sleeve as far along the terminal for the passenger compartment connector socket as possible.
- Take a carpet knife and cut a slit in the carpet just in front of the locking sleeve. Make the cut as long as the diameter of the locking sleeve.

NOTE: Do not damage any wiring and hoses under the carpet.

- Remove the passenger compartment connector socket from the bracket.

Fig. 449: Detach Left-Hand Headlamp By Pulling Up Two Locking Pins
Courtesy of VOLVO CARS CORPORATION

- Detach the left-hand headlamp by pulling up the two locking pins and then carefully pulling away the headlamp forwards.

Fig. 450: Carefully Prize Up Catch On Connector For Headlamp With A Screwdriver
Courtesy of VOLVO CARS CORPORATION

- Carefully prize up the catch on the connector for the headlamp with a screwdriver.
- Pull the catch up completely, detach the connector and place the headlamp to one side.

Fig. 451: Identifying Tie Strap
Courtesy of VOLVO CARS CORPORATION

Applies to cars with engine block heater installed

- Remove the tie strap securing the cable to the front socket. Pull the cable forward.

Fig. 452: Removing Locking Sleeve
Courtesy of VOLVO CARS CORPORATION

Applies to cars with engine block heater installed

- Remove the locking sleeve over the joint on the cables for the engine block heater. Pull the cables away from each other.

Fig. 453: Identifying O-Ring
Courtesy of VOLVO CARS CORPORATION

- Grease in the O-ring on the connector for the front socket and both connectors on the branch connector from the kit using low temperature grease (part no. 1161417-9).

NOTE: Do not get any grease on the surfaces of the connector.

Fig. 454: Identifying Branch Connector
Courtesy of VOLVO CARS CORPORATION

- Connect the cable for the front socket to socket (1) on the branch connector. Firmly press the connector in and press in a locking sleeve from the kit over the joint.
- Connect the long cable for the passenger compartment connector socket from the kit to any connector (2 or 3) on the branch connector. Firmly press the connector in and press in a locking sleeve from the kit over the joint.
- Connect the cable for the engine block heater to the remaining connector on the branch connector. Firmly press the connector in and press in a locking sleeve from the kit over the joint.

Fig. 455: Installing Branch Connector Under Plate Beneath Headlamp
Courtesy of VOLVO CARS CORPORATION

- Fit the branch connector with the cables on the underside of the plate beneath the headlamp, with the two sockets turned forwards and the cable from the front socket turned backwards. The new cable for the passenger compartment connector socket must be routed the same way as the existing cable for the engine block heater, on to the brake fluid reservoir.
- Take a screw, nut and washer from the kit. Secure the branch connector in the hole in the plate (1).

Fig. 456: Routing Cable
Courtesy of VOLVO CARS CORPORATION

- Route the cable to the passenger compartment connector socket the same way as the cable for the engine block heater under the plate, beneath the left-hand headlamp. Route it backwards along the left-hand side of the air cleaner and between the air cleaner and fuse holder. Continue to route it backwards, under the ABS system and up between the cable duct and brake fluid reservoir.

NOTE: Check that the cable does not chafe against sharp edges or moving parts

in the engine compartment.

Fig. 457: Identifying Installation Clips
Courtesy of VOLVO CARS CORPORATION

- Detach the cable from the engine block heater from the two clips above the brake fluid reservoir.

Fig. 458: Installing Clips
Courtesy of VOLVO CARS CORPORATION

- Take two new clips from the kit and press them into the edge of the plate in front of the panel over the windscreen wiper shafts.

Fig. 459: Installing Cable
Courtesy of VOLVO CARS CORPORATION

- Press the cable for the passenger compartment connector socket into the four clips.
- Guide the cable down on the right-hand side of the cable duct and down through the engine compartment.

Fig. 460: Reinstalling Cable With Tie Straps
Courtesy of VOLVO CARS CORPORATION

- Take two tie straps from the kit and clamp the cable for the heater which was detached earlier, to the newly routed cable for the passenger compartment connector socket.

Fig. 461: Clamping Routed Cable In At Water Evacuation Pipe
Courtesy of VOLVO CARS CORPORATION

- Clamp the routed cable in at the water evacuation pipe using two tie straps from the kit.

NOTE: Do not clamp the cable against brake pipes, fuel lines or air conditioning (A/C) pipes.

Fig. 462: Removing Wheel
Courtesy of VOLVO CARS CORPORATION

- Remove the right-hand front wheel for easier access for routing the cable to the passenger compartment connector socket.

Fig. 463: Wheel Protective Cover
Courtesy of VOLVO CARS CORPORATION

- Remove the two plastic nuts securing the small protective panel in the right-hand wheel housing. Remove the panel.

Fig. 464: Engine Splash Guard And Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the six screws from the engine splash guard.

Fig. 465: Removing Pressed Out Rubber Grommet
Courtesy of VOLVO CARS CORPORATION

- Take the prepunched washer from the engine compartment insulation and remove the pressed out rubber grommet.

Fig. 466: Cutting Rubber Grommet
Courtesy of VOLVO CARS CORPORATION

- Take the rubber grommet and cut away the very top.

Fig. 467: Installing Clip
Courtesy of VOLVO CARS CORPORATION

- Press in a clip from the kit on the edge of the plate on the right-hand side of the wheel housing, under the bending rubber hose of the water evacuation pipe.

Fig. 468: Installing Radiation Shield
Courtesy of VOLVO CARS CORPORATION

- Take the radiation shield from the kit and cut it to a length of 300 mm (11 13/16").
- Pull the radiation shield onto the end of the cable.

Fig. 469: Installing Rubber Grommet
Courtesy of VOLVO CARS CORPORATION

- Grease in the rubber grommet using low temperature grease part no. 1161417-9 in order to make it easier to install the rubber grommet in the hole in the cowl wall.
- Guide the cable into the rubber grommet.

Fig. 470: Guiding Cable Into Cowl Wall
Courtesy of VOLVO CARS CORPORATION

- Guide the cable into the hole in the cowl wall and press the rubber grommet into place in the hole, either by pulling it into place from inside the passenger compartment, or carefully pressing it into place with a long large screwdriver/wide end of a short pry bar.

NOTE: These must not be sharp or they can damage the cables/rubber grommet.

- Adapt the length of the cable from the rubber grommet, at the installed clip and out in the engine compartment.

Fig. 471: Inserting Cable Into Clamp
Courtesy of VOLVO CARS CORPORATION

- Press the cable for the passenger compartment connector socket into the installed clip. Make sure that the cable with the radiation shield is firmly pressed into the clip and does not slide out.

CAUTION: Check that the cable is routed so that it does not come into contact with the alternator belt, or chafe against sharp edges in the engine compartment.

- Reinstall the small protective panel in the wheel housing.
- Remount the wheel and tighten the bolts to **140 Nm (103 lbf. ft.)** .
- Reinstall the engine splash guard and torque tighten the screws to **25 Nm (18.5 lbf. ft.)** .
- Connect and reinstall the left-hand headlamp.

Fig. 472: Securing Radiation Strap With Grey Tie Straps
Courtesy of VOLVO CARS CORPORATION

- Take the grey tie straps from the kit and tighten the radiation shield to the cable

Fig. 473: Identifying Cable At Passenger Compartment Connector Socket
Courtesy of VOLVO CARS CORPORATION

- Route the cable from the engine compartment through the hole in the carpet.
- Grease in the O-ring with low temperature grease (part no. 1161417-9).

NOTE: Make sure that no grease gets onto the connector surfaces.

- Connect the cable to the passenger compartment connector socket. Press a locking sleeve (from the kit) over the joint.
- Fold the carpet back into position and install the passenger compartment connector socket using both the screws.

Reinstall:

- the sound barrier
- the sill trim panel
- the cover panel in the lower edge of the B-pillar panel
- the cover panel for the seat's mounting
- the center console's right-hand side panel.

PASSENGER COMPARTMENT SOCKET 230 V (B6294T; 2003-2006)

PASSENGER COMPARTMENT SOCKET 230V, B6294T

Fig. 474: Right-Hand Side Sound Barrier
Courtesy of VOLVO CARS CORPORATION

- Remove the right-hand side panel from the center console. Pull off the panel at the front edge. Then continue backwards until all the clips release
- Remove the right-hand side soundproofing panel. First remove the two screws. Then pry off the panel at the top edge.

Fig. 475: Right-Hand Front Door's Sill Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the sill trim panel for the right-hand front door. Pull the front edge until the clip releases. Then continue backwards until the remaining clips have released
- Pull away the front edge to the right to access the edge of the carpet.

Fig. 476: Folding Carpet Aside
Courtesy of VOLVO CARS CORPORATION

- Fold the carpet to one side by the right-hand front seat.

Fig. 477: Installing Bracket
Courtesy of VOLVO CARS CORPORATION

- Remove the lower piece of tape. The tape is situated where the bracket is to be screwed into place
- Take the bracket and screw from the kit. Install the bracket in the existing weld nut under the recently removed piece of tape
- Turn the bracket so that it is positioned as illustrated
- Loosely install the connector. Check that the connector is straight, with the power connector at the front
- Tighten the bracket. Tighten to **10 Nm (7 lbf. ft.)**
- If the car has a child seat mounting bracket, the passenger compartment socket bracket must be positioned above this. Secure using the M6 screw. Tighten to **10 Nm (7 lbf. ft.)** .

Fig. 478: Folding Carpet Back
Courtesy of VOLVO CARS CORPORATION

- Fold the carpet back over the bracket
- Make a hole in the carpet opposite the upper mounting hole in the bracket using a double ended scriber.

Fig. 479: Identifying Screws, Passenger Compartment Connector Socket & Double Ended Scriber
Courtesy of VOLVO CARS CORPORATION

- Take the passenger compartment socket and a screw from the kit. Tighten the passenger compartment socket to the bracket in the upper mounting
- Insert the double ended scriber into the lower mounting for the passenger compartment socket. Make a hole in the carpet opposite the lower hole on the bracket
- Tighten the lower mounting for the passenger compartment connector socket using a screw from the kit.

Fig. 480: Identifying Carpet Knife, Cut Slit In Carpet & Front Of Locking Sleeve
Courtesy of VOLVO CARS CORPORATION

- Press a locking sleeve (from the kit) onto the passenger compartment socket. Slide the locking sleeve as far along the terminal for the passenger compartment socket as possible
- Take a carpet knife and cut a slit in the carpet just in front of the locking sleeve. The cut must be as long as the diameter of the locking sleeve.

NOTE: Do not damage wiring or hoses under the carpet.

- Remove the passenger compartment socket from the bracket.

Fig. 481: Detach Left-Hand Headlamp By Pulling Up Two Locking Pins
Courtesy of VOLVO CARS CORPORATION

- Remove the left-hand headlamp by pulling up the two cotter pins and then carefully pulling the headlamp forwards.

Fig. 482: Carefully Prize Up Catch On Connector For Headlamp With A Screwdriver
Courtesy of VOLVO CARS CORPORATION

- Carefully pry up the catch on the headlamp connector using a screwdriver
- Pull up the lock completely. Disconnect the connector. Place the headlamp to one side.

Fig. 483: Identifying Tie Straps
Courtesy of VOLVO CARS CORPORATION

Applies to cars with an engine block heater

- Remove the two tie straps that hold the cable to the front engine block heater socket. Route the cable.

Fig. 484: Removing Locking Sleeve
Courtesy of VOLVO CARS CORPORATION

Applies to cars with an engine block heater

- Remove the locking sleeve over the joint on the wiring for the engine block heater. Disconnect the wiring from each other.

Fig. 485: Identifying O-Ring
Courtesy of VOLVO CARS CORPORATION

- Take a junction connector from the kit. Grease the O-ring using low temperature grease (P/N 1161417-9). Grease the O-ring on the connector for the front engine block heater socket.

NOTE: Do not get any grease on the contact surfaces of the connector.

Fig. 486: Identifying Branch Connector
Courtesy of VOLVO CARS CORPORATION

- Take the long cable for the passenger compartment socket from the kit. Route it down the left-hand side of the left side member
- Connect the front engine block heater socket cable to socket (1) on the junction connector
- Connect the wiring for the engine block heater and passenger compartment connector socket to either socket (2) or (3) on the junction cable
- Press the three locking sleeves (from the kit) over the cable splices. The larger locking sleeve must be on the socket (1).

Fig. 487: Screw, Nut, Washer, Tie Strap, And Branch Connector -- 6-Cylinder Engine
Courtesy of VOLVO CARS CORPORATION

- Position the junction connector with the wiring on the underneath of the plate under the headlamp, with the two sockets pointing forward and the cable from the front engine block heater socket pointing backward
- Take the screw and the nut from the kit. Tighten the junction connector in the hole in the plate (1)

- Take a tie strap from the kit and secure the wiring at point (2)
- Connect the connector to the headlamp and reinstall it.

Fig. 488: Engine Splash Guard
Courtesy of VOLVO CARS CORPORATION

- Remove the engine splash guard (1) by removing the screws (2).

Fig. 489: Removing Rubber Grommet
Courtesy of VOLVO CARS CORPORATION

- Press out the pre-punched engine compartment insulation
- Remove the rubber grommet (1) from the cowl panel and cut off the top.

INSTALLING ELECTRICAL CABLE

Fig. 490: Electrical Cable Secured With Tie Straps
Courtesy of VOLVO CARS CORPORATION

- Route the cable for the passenger compartment socket over the left front corner of the sub-frame, where the cable to the engine block heater runs
- Press four tie straps (1) from the kit onto the holes in the sub-frame. Position the cable in the clamps but do not tighten them yet.

Illustration A

Fig. 491: Routing Cable
Courtesy of VOLVO CARS CORPORATION

- Take the insulation (1) from the kit. Thread it onto the cable
- Take the rubber grommet from the kit. Thread the cable through it
- Route the cable into the passenger compartment as illustrated
- Adjust the length of the cable to the rubber grommet.

Illustration B

Fig. 492: Securing Cable
Courtesy of VOLVO CARS CORPORATION

- Pull back the cable leaving the insulation in position. Secure the upper end of the insulation. Use the two tie straps (2) from the kit
- Grease the side of the rubber grommet facing inwards into the passenger compartment. Use low-temperature grease
- Route the cable into the passenger compartment. Carefully pull the rubber grommet into position from inside the passenger compartment by pulling the cable for the passenger compartment connector socket.

Illustration A

- Clamp the cable at the servo pipe using a tie strap (3) from the kit
- Adjust the cable in the four tie straps in point and tighten them.

- Reinstall the engine splash guard. Tighten the screws. Tighten to **25 Nm (17 lbf. ft)** .

Fig. 493: Identifying Cable At Passenger Compartment Connector Socket
Courtesy of VOLVO CARS CORPORATION

- Insert the cable from the engine compartment through the hole in the carpet
- Grease the O-ring using low temperature grease, (P/N 1161417-9).

NOTE: Ensure that no grease gets onto the connector surfaces.

- Connect the cable to the passenger compartment connector socket. Press a locking sleeve (from the kit) over the joint
- Fold the carpet back into position and install the passenger compartment socket using both the screws.

Reinstall:

- the soundproofing panel
- the sill trim panel
- the right side panel for the center console.

PASSENGER COMPARTMENT SOCKET 230V (B5254T2; 2003-2007)

PASSENGER COMPARTMENT SOCKET 230V

Fig. 494: Right-Hand Side Sound Barrier
Courtesy of VOLVO CARS CORPORATION

- Remove the right-hand side panel from the center console. Pull off the panel at the front edge. Then continue backwards until all the clips release
- Remove the right-hand side soundproofing panel. First remove the two screws. Then pry off the panel at the top edge.

Fig. 495: Right-Hand Front Door's Sill Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the sill trim panel for the right-hand front door. Pull the front edge until the clip releases. Then continue backwards until the remaining clips have released
- Unhook the sill trim panel from the B-post panel and from the panel at the lower edge of the B-post panel.

Fig. 496: Folding Carpet Back
Courtesy of VOLVO CARS CORPORATION

- Fold the carpet to one side by the right-hand front seat.

Fig. 497: Installing Bracket
Courtesy of VOLVO CARS CORPORATION

- Remove the lower piece of tape. The tape is situated where the bracket is to be screwed into place
- Take the bracket and screw from the kit. Install the bracket in the existing weld nut under the recently removed piece of tape
- Turn the bracket so that it is positioned as illustrated
- Loosely install the connector. Check that the connector is straight, with the power connector at the front
- Tighten the bracket. Tighten to **10 Nm (7 lbf. ft.)**
- If the car has a child seat mounting bracket, the passenger compartment socket bracket must be positioned above this. Secure using the M6 screw. Tighten to **10 Nm (7 lbf. ft.)** .

Fig. 498: Reinstalling Carpet
Courtesy of VOLVO CARS CORPORATION

- Fold the carpet back over the bracket
- Make a hole in the carpet opposite the upper mounting hole in the bracket using a double ended scriber.

Fig. 499: Identifying Screws, Passenger Compartment Connector Socket & Double Ended Scriber
Courtesy of VOLVO CARS CORPORATION

- Take the passenger compartment socket and a screw from the kit. Tighten the passenger compartment socket to the bracket in the upper mounting
- Insert the double ended scriber into the lower mounting for the passenger compartment socket. Make a hole in the carpet opposite the lower hole on the bracket
- Tighten the lower mounting for the passenger compartment connector socket using a screw from the kit.

Fig. 500: Identifying Carpet Knife, Cut Slit In Carpet & Front Of Locking Sleeve
Courtesy of VOLVO CARS CORPORATION

- Press a locking sleeve (from the kit) onto the passenger compartment socket. Slide the locking sleeve as far along the terminal for the passenger compartment socket as possible
- Take a carpet knife and cut a slit in the carpet just in front of the locking sleeve. The cut must be as long as the diameter of the locking sleeve.

NOTE: Do not damage wiring or hoses under the carpet.

- Remove the passenger compartment socket from the bracket.

Fig. 501: Engine Splash Guard
Courtesy of VOLVO CARS CORPORATION

- Remove the engine splash guard (1) by removing the screws (2).

Fig. 502: Identifying Rubber Grommet Inside Insulation
Courtesy of VOLVO CARS CORPORATION

- Press out the pre-punched engine compartment insulation
- Remove the rubber grommet (1) from the cowl panel and cut off the top
- Take the cable from the kit. Insert the cable through the rubber grommet and into the passenger compartment.

Fig. 503: Identifying Engine Block Heater Connectors & Front Engine Block Heater Socket
Courtesy of VOLVO CARS CORPORATION

If an engine block heater is installed:

- Remove the connectors for the engine block heater and the front engine block heater socket from the bracket on the steering gear.

Fig. 504: Identifying Branch Connector On Bracket, Screw And Nut
Courtesy of VOLVO CARS CORPORATION

If an engine block heater is not installed:

- Remove the nut from the right-hand side of the steering gear
- Install the bracket and a new nut from the kit
- Tighten the nut. Tighten to **50 Nm (35 lbf. ft.)**
- Install the junction connector on the bracket using the screw and nut from the kit.

Fig. 505: Identifying O-Ring
Courtesy of VOLVO CARS CORPORATION

- Grease the O-rings on the junction connector and cable from the front engine block heater socket. Use low temperature grease, (P/N 1161417-9).

NOTE: Ensure that no grease gets onto the connector surfaces.

Fig. 506: Identifying Engine Block Heater Cable & Socket On Junction Connector
Courtesy of VOLVO CARS CORPORATION

- Take the heat shield sleeve and the two tie straps from the kit. Thread the heat shield sleeve onto the cable routed to the passenger compartment connector socket
- Pull the heat shield sleeve up to the rubber grommet for the passenger compartment. Tighten the two tie straps
- Connect the cable from the passenger compartment connector socket to the socket (1) on the junction connector
- Connect the cable from the engine block heater to the socket (2) on the junction connector
- Connect the cable from the front engine block heater socket to the socket (3) on the junction connector
- Press the locking sleeves (from the kit) over the cable splices. The larger locking sleeve must be on the socket (3).

NOTE: **Ensure that the cable does not rub against any sharp edges etc. The cable must not be secured to the fuel lines, air conditioning (A/C) pipes or brake pipes.**

- Reinstall the engine splash guard. Tighten the screws. Tighten to **25 Nm (17 lbf. ft.)** .

Fig. 507: Identifying Cable At Passenger Compartment Connector Socket
Courtesy of VOLVO CARS CORPORATION

- Insert the cable from the engine compartment through the hole in the carpet
- Grease the O-ring using low temperature grease, (P/N 1161417-9).

NOTE: Ensure that no grease gets onto the connector surfaces.

- Connect the cable to the passenger compartment connector socket. Press a locking sleeve (from the kit) over the joint
- Fold the carpet back into position and install the passenger compartment socket using both the screws.

Reinstall:

- the soundproofing panel
- the sill trim panel
- the right side panel for the center console.

RELAY, B6294, B8444 (B6294T; 2003-2006) (B8444S; 2005-2008)

RELAY

Fig. 508: Right-Hand Side Sound Barrier
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition switch to position 0.
- Remove the right-hand side panel of the center console by pulling it away starting at the front edge and then backwards until all clips have released.
- Remove the sound barrier on the right-hand side by first removing the two screws and then prizing it away at the top edge.

Fig. 509: Prying Right-Hand Rear Mounting Of Cover Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the cover panel on the right-hand rear mounting of the right-hand front seat. Prize it up slightly at the rear edge and then pull it back/upwards.

Fig. 510: Prying Away Cover Panel Over Joint Between Door Sills On Right-Hand Side, At Lower Edge, Using A Weatherstrip Tool
Courtesy of VOLVO CARS CORPORATION

- Carefully prize away the cover panel over the joint between the door sills on the right-hand side, at the lower edge, using a weatherstrip tool. Remove the cover panel.

Fig. 511: Right-Hand Front Door's Sill Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Detach the right-hand front door's sill trim panel. Pull it away starting at the front edge until the clip there has released. Continue backwards until the remaining clips have released.
- Unhook it from the B-pillar panel and place it to one side.

Fig. 512: Passenger Compartment Connector Socket Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the screws to the passenger compartment connector socket and detach it from the bracket behind the carpet.
- Remove the locking sleeve and detach the cable from the passenger compartment connector socket.

Fig. 513: Passenger Seat Rubber Grommet
Courtesy of VOLVO CARS CORPORATION

- Push the carpet to one side by the right-hand front seat.
- Press out the rubber grommet (1) under the insulation mat.

Fig. 514: Pushing Up Catch On Top Side
Courtesy of VOLVO CARS CORPORATION

- Remove the panel in the right-hand front seat mounting, on the right-hand seat in the second row of seats. Push up the catch (1) on the top side and pull the panel forward.

Fig. 515: Removing Cover Panel
Courtesy of VOLVO CARS CORPORATION

- Fold the backrest forward on the right-hand seat in the second row of seats as far as possible. Push the seat forward as far as possible. (On cars with two rows of seats the second row is fixed.)
- Remove the cover panel (1) for the right-hand rear seat mounting by prizing it away at the rear edge.

Fig. 516: Seat Belt Mounting Locking Tab
Courtesy of VOLVO CARS CORPORATION

- Disconnect the top edge of the sill trim panel. Disconnect the seat belt from the end mounting by carefully pressing the locking tab with a weatherstrip tool, as illustrated, so that the seat belt releases from the end mounting.

Fig. 517: Removing Sill Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the sill trim panel by pulling it away completely at the rear edge until the clips there have released. Continue forwards until the remaining clips have released.

Applies to cars with two rows of seats

- On cars with two rows of seats, the seat cannot be pushed forward. To remove the sill trim panel, start by folding the backrest forward as the sill trim panel is pulled away at the rear edge. Following which, move the backrest back to raise the seat cushion, and so increase space for removing the sill trim panel. It is secured firmly, so ensure that the sill trim panel and adjoining components are not damaged during

removal.

Illustration A

Fig. 518: Removing Two Center Floor Hatches By Lifting Them Slightly
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Remove the two center floor hatches by lifting them slightly and then pulling them away from their mountings at the front edge. If the rear center floor hatch is equipped with grocery bag holder on the underside then the floor hatch is secured with a belt on each short side of the storage box. These must be detached.
- Remove the storage box.

Illustration B

Fig. 519: Folding Up Center Rear Floor Hatch
Courtesy of VOLVO CARS CORPORATION

Applies to cars with three rows of seats and integrated carrier bag holder on the underside of the center floor hatch

- Fold up the center rear floor hatch (1).
- Detach the two straps on the underlying panel. Lift up the rear edge of the panel, fold the floor hatch back and lift out the floor hatch with the panel.

Applies to cars with three rows of seats without an integrated carrier bag holder

- Lift up the center rear floor hatch at the rear edge and lift it out.

Applies to all models

- Remove the right-hand side floor hatch (2).

Fig. 520: Front Storage Box
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Remove the front storage box.

Fig. 521: Folding Side Panel From Right-Hand Side Of Cargo Compartment
Courtesy of VOLVO CARS CORPORATION

- Remove the folding side panel from the right-hand side of the cargo compartment.

Fig. 522: Detach Left-Hand Headlamp By Pulling Up Two Locking Pins
Courtesy of VOLVO CARS CORPORATION

- Detach the left-hand headlamp by pulling up the two locking pins and then carefully pulling the headlamp away forwards.

Fig. 523: Carefully Prize Up Catch On Connector For Headlamp With A Screwdriver
Courtesy of VOLVO CARS CORPORATION

- Carefully prize up the catch on the connector for the headlamp using a screwdriver.
- Pull the catch up completely, detach the connector and place the headlamp to one side.

Fig. 524: Screw, Nut, Washer, Tie Strap And Branch Connector -- V8 Engine
Courtesy of VOLVO CARS CORPORATION

Applies to cars with V8 engine

- Remove the branch connector with the cables from the underside of the plate beneath the headlamp. Remove the screw, nut and washer (1) and tie strap (2), and pull the branch connector forward.

Fig. 525: Screw, Nut, Washer, Tie Strap, And Branch Connector -- 6-Cylinder Engine
Courtesy of VOLVO CARS CORPORATION

Applies to cars with 6-cylinder engine

- Remove the branch connector with the cables from the underside of the plate beneath the headlamp by removing the screw and the nut (1).
- Cut away the tie strap (2).

Fig. 526: Removing Locking Sleeves Over Joints On Branch Connector
Courtesy of VOLVO CARS CORPORATION

- Remove the locking sleeves over the joints on the branch connector and pull the cables away from it.
- Place the branch connector to one side, it shall not be re-used.

Fig. 527: Identifying O-Ring
Courtesy of VOLVO CARS CORPORATION

- Take the relay with cable from the kit.
- Grease in the O-ring on the connector for the front socket and both connectors on the relay using low temperature grease (part no. 1161417-9).

NOTE: Do not get any grease on the surfaces of the connector.

Fig. 528: Sockets And Relay -- All Models
Courtesy of VOLVO CARS CORPORATION

- Connect the cable (1) from the front socket to the relay.
- Connect the cables to the engine block heater and passenger compartment connector socket to either of the sockets (2) or (3) on the relay and press them in firmly.

Fig. 529: Sockets And Relay -- V8 Engine
Courtesy of VOLVO CARS CORPORATION

Applies to cars with V8 engine

- Take three locking sleeves from the kit and press them in over the cable joints.

Fig. 530: Sockets And Relay -- 6-Cylinder Engine
Courtesy of VOLVO CARS CORPORATION

Applies to cars with 6-cylinder engine

- Take three locking sleeves from the kit and press them in over the cable joints.
- Take a tie strap (1) from the kit and clamp the electrical cable securely with the ground cable to one of the cables for the engine block heater/passenger compartment connector socket.

Fig. 531: Screw, Nut, Washer, Tie Strap, And Branch Connector -- V8 Engine
Courtesy of VOLVO CARS CORPORATION

Applies to cars with V8 engine

- Take the relay with cables and fit it on the underside of the plate beneath the headlamp. Fit the relay with the side against the plate that allows the connector to be accessible.
- Take a screw, washer and nut (1) from the kit. Tighten the relay to the plate.
- Guide the relay's ground cable (2) down on the left-hand side of the side member.
- The long thin cable (3) from the relay is routed the same way as the cables for the heater and the passenger compartment connector socket, to enable later connection to the Accessory Electronic Module (AEM) in the cargo compartment.
- Clamp the ground cable with the cable to the front socket using a tie strap from the kit.

Fig. 532: Screw, Nut, Washer, Tie Strap And Branch Connector -- 6-Cylinder Engine
Courtesy of VOLVO CARS CORPORATION

Applies to cars with 6-cylinder engine

- Take the relay with cables and place it on the underside of the plate (1). Fit the relay with the side against the plate that allows the connector to be accessible.
- Take a screw, washer and nut (2) from the kit. Tighten the relay to the plate.
- Clamp the cable for the front socket at point (3) in the plastic eye for the bumper cover's mounting.
- Guide the thin cable with the ground cable from the relay down to the same location as the cables for the engine block heater/passenger compartment connector socket.
- Clamp all cables together at point (4) with a tie strap from the kit.

V8 ENGINE

Fig. 533: Cable Routing
Courtesy of VOLVO CARS CORPORATION

- Route the cable to the Accessory Electronic Module (AEM) the same way as the cable for the passenger compartment connector socket under the plate, beneath the left-hand headlamp. Route it backwards along the left-hand side of the air cleaner and between the air cleaner and fuse holder. Continue to route it backwards, under the ABS system and up between the cable duct and brake fluid reservoir.
- Check that the cable does not chafe against sharp edges or moving parts in the engine compartment.
- Route it along the cable for the passenger compartment connector socket over to the right-hand side of the car and down through the engine compartment.
- Clamp the cable securely the whole way with the cable for the passenger compartment connector socket using tie straps from the kit.

Fig. 534: Removing Wheel
Courtesy of VOLVO CARS CORPORATION

- Remove the right-hand front wheel for easier access for routing the cable to the Accessory Electronic Module (AEM).

Fig. 535: Wheel Protective Cover
Courtesy of VOLVO CARS CORPORATION

- Remove the two plastic nuts which hold the small protective panel in the right-hand wheel housing, and remove the panel.

Fig. 536: Engine Splash Guard And Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the six screws and the engine splash guard.

Fig. 537: Ground Cable And Screw
Courtesy of VOLVO CARS CORPORATION

- Detach the existing ground cable for the front socket on the underside of the left-hand frame member.
- Route the ground cable on from the relay. Connect both ground cables to the existing ground terminal and tighten the ground screw firmly.

Fig. 538: Cable Routing
Courtesy of VOLVO CARS CORPORATION

- Detach the cable for the passenger compartment connector socket from the clip in the edge of the plate, at the bending rubber hose for the water drainage.
- Route the rubber grommet with cable out to the passenger compartment connector socket from the passenger compartment.
- Remove the rubber grommet from the cable and place it to one side. There is a new rubber grommet on the routed cable.

Fig. 539: Cutting Rubber Grommet
Courtesy of VOLVO CARS CORPORATION

- Cut away the very top of the rubber grommet.

Fig. 540: Installing Cable Into Rubber Grommet
Courtesy of VOLVO CARS CORPORATION

- Grease in the rubber grommet using low temperature grease part no. 1161417-9 in order to make it easier to install the rubber grommet in the hole in the cowl.
- Guide the cable into the rubber grommet.

Fig. 541: Routing Cable
Courtesy of VOLVO CARS CORPORATION

- Guide both cables into the hole in the cowl and press the rubber grommet into place in the hole, either by pulling it into place from inside the passenger compartment, or carefully pressing it into place with a long large screw driver/wide end of a short pry bar.

NOTE: These must not be sharp or they can damage the cables/rubber grommet

- Adapt the length of the cable from the rubber grommet, at the installed clip and out in the engine compartment.

Fig. 542: Inserting Cable Into Clamp
Courtesy of VOLVO CARS CORPORATION

- Press the cables for the passenger compartment connector socket/Accessory Electronic Module (AEM) into the installed clip. Make sure that the cable with the radiation shield is firmly pressed into the clip and does not slide out.

CAUTION: Check that the cables are routed so that they do not come into contact with the alternator belt, or chafe against sharp edges in the engine compartment.

- Clamp the cable for the Accessory Electronic Module (AEM) with the thick cable using tie straps from the kit.
- Reinstall the small protective panel in the wheel housing.
- Reinstall the engine splash guard and torque tighten the screws to **25 Nm (18.5 lbf. ft.)** .
- Remount the wheel and tighten the bolts to **140 Nm (103 lbf. ft.)** .
- Connect and reinstall the left-hand headlamp.

6-CYLINDERS

Fig. 543: Engine Splash Guard
Courtesy of VOLVO CARS CORPORATION

- Remove the screws (2) and the engine splash guard (1).

Fig. 544: Electrical Cable Secured With Tie Straps
Courtesy of VOLVO CARS CORPORATION

- Route the electrical cables down from the relay.
- Take four tie straps from the kit and clamp the thin electrical cable (not the ground cable) to the cable for the passenger compartment connector socket.

Fig. 545: Ground Cable
Courtesy of VOLVO CARS CORPORATION

- Detach the existing ground cable for the front socket on the underside of the left-hand frame member.
- Route the ground cable on to the relay. Connect both ground cables to the existing ground terminal.

Illustration A

Fig. 546: Identifying Rubber Grommet
Courtesy of VOLVO CARS CORPORATION

- Pull the cable with rubber grommet (1) away from the passenger compartment connector socket.
- Pull the whole cable out from the hole in the cowl wall. Remove the rubber grommet from the cable. There is a new one on the routed electrical cable.

Illustration B

Fig. 547: Identifying Rubber Grommet And Tie Strap
Courtesy of VOLVO CARS CORPORATION

- Cut away the top of the new rubber grommet (1).
- Guide the passenger compartment connector socket's cable in through the new rubber grommet.
- Grease in the rubber grommet with low temperature grease (part no. 1161417-9) on the side turned into the passenger compartment.
- Adapt the cables up to the grommet. Guide the cables into the hole in the cowl wall.
- Carefully pull the rubber grommet into position from inside the passenger compartment by pulling in the cable for the passenger compartment connector socket.
- Clamp in the electrical cable with the servo pipe using a tie strap (2) from the kit.

Fig. 548: Cable Clamped In At Air Duct
Courtesy of VOLVO CARS CORPORATION

- Route the cables for the passenger compartment connector socket and the Accessory Electronic Module (AEM).

- Guide the Accessory Electronic Module (AEM) cable harness down between the carpet and the door sill towards the floor as far as possible. Route it along the right-hand side of the car, on to the door opening for the right-hand rear door.
- Route the cable by the right-hand seat mounting on the right-hand seat in the second row of seats.
- Pull away the mat from the front edge of the right-hand side panel in the cargo compartment.
- Route the cable on the right-hand side of the air duct towards the front edge of the rear wheel housing. Clamp it in at the air duct using two tie straps (1) from the kit.
- Route the cable on the rear of the air duct and out at the front edge of the wheel housing.

Applies to cars with three rows of seats, Illustration A

Fig. 549: Identifying Cable At Rear Edge Of Right-Hand Side Panel
Courtesy of VOLVO CARS CORPORATION

- Guide in a wire (1) at the rear edge of the right-hand side panel and along its inside, above the load securing eyelet brackets, and on to the front edge of the side panel.

Illustration B

Fig. 550: Identifying Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Tape the cable harness (2) to the wire and route it on from the rear edge of the side panel.

Fig. 551: Cable Routing
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Route the cable on the left-hand side of the seat belt's mounting at the front edge of the wheel housing, inside the carpet at the front edge of the side panel, between the side panel and the rear cargo floor support, to the Accessory Electronic Module (AEM).

Fig. 552: Removing Panel By Pulling It Straight Up And Unhook It From Side Panel (1 Of 2)
Courtesy of VOLVO CARS CORPORATION

Applies to all models

- Remove the two screws in the Accessory Electronic Module (AEM) bracket and lift up the whole unit. Cut away the tie straps as necessary.

Fig. 553: Removing Panel By Pulling It Straight Up And Unhook It From Side Panel
Courtesy of VOLVO CARS CORPORATION

- Disconnect the large connector on the Accessory Electronic Module (AEM). First press in the catch (A). Pull the black locking handle (B) in the direction of the arrow until a click is heard.
- Disconnect the connector from the accessory electronic module.

Fig. 554: Black Terminal Pin By Inserting A Pointed Object Into Hole In Other End
Courtesy of VOLVO CARS CORPORATION

- Remove the black catch holding the black connector socket in place in the connector by pulling in the direction of the arrow.
- Remove the black connector socket. Insert a pointed object in the hole on the other end of the connector. Press the connector socket out.

Fig. 555: Identifying Routed Cable To AEM Module's Connector In Position 5
Courtesy of VOLVO CARS CORPORATION

- Connect the pre-routed cable to terminal 5 of the Accessory Electronic Module (AEM) connector.

NOTE: **The numerical markings can be found on the top and bottom of the connector. However, the markings are extremely small so be careful when installing the cable.**

Fig. 556: Seat Belt Proper Routing
Courtesy of VOLVO CARS CORPORATION

- Reinstall the connector in the socket and refit it in the Accessory Electronic Module (AEM).
- Reinstall the Accessory Electronic Module (AEM) with bracket.
- Reinstall the storage box and floor hatches.
- Reinstall the folding panel on the rear right-hand side.
- Reinstall the sill trim panel in the right-hand rear door.
- Press the seat belt into the end mounting.

NOTE: **A clear click is heard when the seat belt has locked correctly with the end mounting.**

NOTE: **Also check that the seat belt has locked correctly with the end mounting by looking at the reverse of the end mounting.**

The position of the lock tab against the end mounting with the seat belt fully inserted must be:

A= Correct locked position. B= If the lock tab does not lock correctly against the end mounting, see A, replace the end mounting with a new one.

NOTE: **Check that the seat belt is secure by jerking it hard in an upwards direction.**

- Fold the carpet back on the front right-hand side, connect the cable for the passenger compartment connector socket and reinstall it.
- Reinstall the front sill trim panel.
- Reinstall the panel in the lower edge of the B-pillar panel.
- Reinstall the panels over the seat mountings.
- Reinstall the sound barrier and the center console's side panel on the right-hand side.

- Program the software in accordance with the service information.

REMOTE START, FUEL-DRIVEN HEATER (2003-2008)

CARS EQUIPPED WITH SRS/SIPS (AIRBAG)

see **CARS EQUIPPED WITH SRS/SIPS (AIRBAG)**

CAUTION

see **CAUTION**

REMOTE START, FUEL-DRIVEN HEATER

NOTE: This accessory requires software unique to the car.

Fig. 557: Removing Two Center Floor Hatches By Lifting Them Slightly
Courtesy of VOLVO CARS CORPORATION

- Remove the two center floor hatches by lifting them slightly and then pulling them away from their mountings at the front edge. If the rear center floor hatch is equipped with grocery bag holder on the underside then the floor hatch is secured with a belt on each short side of the storage box. These must be detached.
- Remove the storage box.

Fig. 558: Folding Up Center Rear Floor Hatch
Courtesy of VOLVO CARS CORPORATION

Applies to cars with three rows of seats and integrated carrier bag holder on the underside of the center floor hatch

- Fold up the center rear floor hatch (1).
- Detach the two straps on the underlying panel. Lift up the rear edge of the panel, fold the floor hatch back and lift out the floor hatch with the panel.

Applies to cars with three rows of seats without an integrated carrier bag holder

- Lift up the center rear floor hatch at the rear edge and lift it out.
- Remove the right-hand side floor hatch (2).

Fig. 559: Front Storage Box
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Remove the front storage box.

Fig. 560: Folding Side Panel From Right-Hand Side Of Cargo Compartment
Courtesy of VOLVO CARS CORPORATION

- Remove the folding side panel from the right-hand side of the cargo compartment.

Fig. 561: Pull Off Top Edge Of Right-Hand D Pillar Panel
Courtesy of VOLVO CARS CORPORATION

- Carefully pull off the top edge of the right-hand D pillar panel. Continue down until the three clips have released.
- Remove the panel by pulling it straight up and unhook it from the side panel. If applicable, disconnect the connector for the D pillar loudspeaker.

Fig. 562: Removing Panel By Pulling It Straight Up And Unhook It From Side Panel (1 Of 2)
Courtesy of VOLVO CARS CORPORATION

Fig. 563: Removing Module

XC90

see **XC90**

TIMER RELAY FOR THE ELECTRICAL ENGINE BLOCK HEATER B5254T2 (B5254T2; 2003)

TIMER RELAY FOR THE ELECTRICAL ENGINE BLOCK HEATER

NOTE: This accessory requires software unique to the car.

Fig. 564: Detach Left-Hand Headlamp
Courtesy of VOLVO CARS CORPORATION

- Remove the left-hand headlamp by pulling up the two cotter pins and then carefully pulling the headlamp forwards.

Fig. 565: Carefully Prize Up Catch On Connector For Headlamp
Courtesy of VOLVO CARS CORPORATION

- Carefully pry up the catch on the connector for the headlamp using a screwdriver
- Pull up the catch completely, disconnect the connector. Place the headlamp to one side.

Fig. 566: Engine Splash Guard
Courtesy of VOLVO CARS CORPORATION

- Remove the engine splash guard (1) by first removing the screws (2).

Illustration A applies to cars with an engine block heater and passenger compartment connector socket

Fig. 567: Removing Locking Sleeve
Courtesy of VOLVO CARS CORPORATION

- Remove the locking sleeve over the cable splice on the cable (1) for the front engine block heater socket. Pull off the cable.

Illustration B applies to cars with an engine block heater only

Fig. 568: Removing Locking Sleeve
Courtesy of VOLVO CARS CORPORATION

- Remove the locking sleeve over the cable splice on the cable (1) for the front engine block heater socket. Pull off the cable.

Fig. 569: Electrical Cable Secured With Tie Straps
Courtesy of VOLVO CARS CORPORATION

- Cut off the four tie straps holding the cable for the front engine block heater socket at the sub-frame. Leave the clips in the sub-frame
- Remove the cable from the sub-frame. Allow the cable to hang.

Fig. 570: Identifying O-Ring
Courtesy of VOLVO CARS CORPORATION

- Take the thick extension cable, relay and locking sleeves from the kit
- Lubricate the O-rings on the cable for the front engine block heater socket, relay and extension cable using low temperature grease.

NOTE: Do not get any grease on the surfaces of the connector.

Fig. 571: Installing Cable And Relay
Courtesy of VOLVO CARS CORPORATION

- Press the cable (1) from the front engine block heater socket and extension cable (2) into the relay.

Fig. 572: Removing Locking Sleeves
Courtesy of VOLVO CARS CORPORATION

- Press the two locking sleeves (from the kit) over the cable splices
- Take two tie straps (1) from the kit. Secure the electric cable with the ground lead at the cable splice with the electrical cable for the engine block heater.

Fig. 573: Positioning Wiring Under Plate
Courtesy of VOLVO CARS CORPORATION

- Position the wiring and relay on the under side of the plate (1). Position the relay with the side against the plate to release the switch
- Take the screw, washer and nut (2) from the kit. Tighten the relay to the plate
- Connect the long cable for the front engine block heater socket on the reverse of the relay. Secure the cable in the hole at the rear edge of the plate for the headlamp mounting (3), and in the plastic lug for the bumper cover strip mounting (4)
- Press in the wiring as far in the wheel arch as possible so that it does not catch on the headlamp
- Route the extension cable down and the thin cable with the ground lead from the relay so that it follows

the cable for the front engine block heater socket.

Fig. 574: Identifying Front Socket Cable Above Front Edge Of Subframe
Courtesy of VOLVO CARS CORPORATION

- Route the wiring down from the relay
- Take four tie straps from the kit. Secure the thick and thin wiring (not the ground lead) at the points where the thick cable was previously secured.

Fig. 575: Ground Cable
Courtesy of VOLVO CARS CORPORATION

- Disconnect the existing ground lead for the front engine block heater socket underneath the left-hand front member
- Route the ground lead to the relay. Connect both ground leads to the existing ground terminal.

Fig. 576: Installing Connector Socket Cable, Rubber Grommet And Heat Reflector
Courtesy of VOLVO CARS CORPORATION

Applies to cars with an engine block heater and passenger compartment connector socket

- Lubricate the O-ring on the connector for the thick cable from the relay. Use low temperature grease, (P/N 1161417-9)
- Press the thick cable (1) from the relay into the junction connector. Press the existing locking sleeve over the cable splice
- Remove the locking sleeve from over the cable splice for the passenger compartment connector socket cable (2). Pull off from the junction connector
- Cut off the two tie straps on the heat deflector (3). Pull off from the cable
- Pull off the rubber grommet (4) from the cowl panel and remove from the cable
- Place the rubber grommet to one side. It will not be reused. A new rubber grommet is on the thin cable for the relay.

Fig. 577: Installing Rubber Grommet And Tie Straps
Courtesy of VOLVO CARS CORPORATION

Applies to cars with an engine block heater and passenger compartment connector socket

- Cut off the top (1) of the rubber grommet for the small cable. Insert the cable into the passenger compartment connector socket
- Insert the thin cable from the relay in the hole in the cowl panel, together with the cable for the passenger compartment connector socket. Press the rubber grommet into place
- Reinstall the heat deflector on the cable passenger compartment connector socket. Secure at the top edge together with the cable from the relay. Use two tie straps (2) from the kit
- Lubricate the O-ring on the junction connector using low temperature grease, (P/N 1161417-9)
- Press the cable for the passenger compartment connector socket into the junction connector. Press the locking sleeve over the cable splice
- Clamp the thin cable at using a tie strap (3) from the kit.

Fig. 578: Installing Rubber Grommets
Courtesy of VOLVO CARS CORPORATION

Applies to cars with only an electrical engine block

- Press the thick cable (1) from the relay into the switch on the cable for the engine block heater. Press the existing locking sleeve over the cable splice
- Remove the stamped engine compartment insulation (2) and the rubber grommet (3) underneath
- Place the rubber grommet to one side. It will not be reused. A new rubber grommet is on the thin cable for the relay
- Insert the thin cable in the hole in the cowl panel and in the passenger compartment. Press the rubber grommet (4) with the cable into the cowl panel
- Take two tie straps from the kit. Secure the thin cable from the relay at the thick cable (5).

- Reinstall the engine splash guard. Tighten the screws. Tighten to **25 Nm (18 lbf. ft.)**
- Connect the connector to the headlamp and reinstall it. Ensure that the headlamp lock pin is positioned correctly, the short thin cable innermost and the long wide cable outermost.

Fig. 579: Right-Hand Side Sound Barrier
Courtesy of VOLVO CARS CORPORATION

- Remove the right-hand side panel from the center console. Pull off the panel starting at the front edge. Then pull backwards until all the clips release
- Remove the right-hand side soundproofing panel. First remove the two screws. Then pry off the panel at the top edge.

Fig. 580: Prying Right-Hand Rear Mounting Of Cover Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the panel on the right rear mounting on the right-hand front seat. Pry up the rear edge of the panel slightly and then pull backwards and upwards.

Fig. 581: Prying Away Cover Panel Over Joint Between Door Sills On Right-Hand Side, At Lower Edge, Using A Weatherstrip Tool
Courtesy of VOLVO CARS CORPORATION

- Carefully pry off the panel above the joint between the right-hand door sills, at the lower edge using a weatherstrip tool. Remove the panel.

Fig. 582: Right-Hand Front Door's Sill Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Detach the sill trim panel for the right-hand front door. Pull off the panel starting at the front edge until the clip releases. Continue backwards until the remaining clips have released
- Unhook the sill trim panel from the B-post panel.

Fig. 583: Pushing Up Catch On Top Side
Courtesy of VOLVO CARS CORPORATION

- Remove the panel in the right-hand front seat mounting on the right-hand seat in the second row. Push up the catch (1) on the top. Pull the panel forward.

Fig. 584: Removing Cover Panel
Courtesy of VOLVO CARS CORPORATION

- Fold the backrest on the right-hand seat in the second row forward as far as possible. Slide the front seat forward as far as possible. (On cars with two rows of seats, the second row is secured.)
- Remove the cover (1) for the right rear seat mounting by prying off the front edge.

Illustration A

Fig. 585: Removing Sill Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the sill trim panel for the right-hand rear door. Pull the rear edge until the clips release. Continue forwards until the remaining clips have released.

Applies to cars with two rows of seats

- On cars with two rows of seats the seat cannot be slid forwards. To remove the sill trim panel; Start by folding the backrest forward when pulling the rear edge of sill trim panel loose. Then reposition the backrest to raise the seat cushion and provide more room to remove the sill trim panel. The sill trim panel is securely positioned. Do not damage the panel and surrounding components.

Illustration B

Fig. 586: Identifying Sill Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Unhook the sill trim panel from the B-post panel. Position the panel in the second/third row of seats.

Illustration A

Fig. 587: Removing Two Center Floor Hatches By Lifting Them Slightly
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Remove the two center floor hatches. First lift up slightly and then pull them loose from the mountings at the front edge.

If the rear center floor hatch is equipped with a carrier bag holder on the lower side, the floor hatch is secured by a strap on each of the shorter sides of the storage box. These must be removed.

- Remove the storage box underneath.

Illustration B

Fig. 588: Folding Up Center Rear Floor Hatch
Courtesy of VOLVO CARS CORPORATION

Applies to cars with three rows of seats and integrated carrier bag holder on the under side of the center floor hatch

- Fold up the center rear floor hatch (1)
- Detach the two straps from the panel underneath. Lift up the panel at the rear edge. Fold the floor hatch back towards the panel and lift out the floor hatch and the panel.

Applies to cars with three rows of seats without integrated carrier bag holders

- Lift up the center rear floor hatch at the rear edge and lift it out.
- Remove the right and left-hand side floor hatches (2).

Illustration C

Fig. 589: Front Storage Box
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Remove the front storage compartment.

Fig. 590: Folding Side Panel From Right-Hand Side Of Cargo Compartment
Courtesy of VOLVO CARS CORPORATION

- Remove the folding side panel from the right-hand side in the cargo compartment.

Fig. 591: Identifying Passenger Compartment Connector Socket Screws
Courtesy of VOLVO CARS CORPORATION

Applies to cars with a passenger compartment connector socket

- Remove the screws for the passenger compartment connector socket. Disconnect the passenger compartment connector socket from the bracket inside the carpet
- Remove the locking sleeve and disconnect the cable from the passenger compartment connector socket.

Fig. 592: Folding Carpet Aside
Courtesy of VOLVO CARS CORPORATION

- Push the carpet on the right-hand side to one side to access the cable from the relay (routed previously).

Fig. 593: Cable Clamped In At Air Duct
Courtesy of VOLVO CARS CORPORATION

- Insert the cable harness between the carpet and the door sill towards the carpet as far as it will go. Route it along the right-hand side of the car up to the door opening for the right-hand rear door
- Pull the cable up to the right-hand seat mounting on the right-hand seat in the second row of seats
- Pull away the carpet from the front edge of the right-hand side panel in the cargo compartment
- Route the cable on the right-hand side of the air duct towards the front edge of the rear wheel arch. Clamp the cable at the air duct using two tie straps (1) from the kit
- Route the cable on the reverse of the air duct and out along the front edge of the wheel arch.

Applies to cars with three rows of seats Illustration A

Fig. 594: Identifying Cable At Rear Edge Of Right-Hand Side Panel
Courtesy of VOLVO CARS CORPORATION

- Insert a cable (1) at the rear edge of the right-hand side panel and along the inside of the panel, above the mountings for the load securing eyelets and to the front edge of the side panel.

Illustration B

Fig. 595: Identifying Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Tape the cable harness (2) to the wire and pull it out of the rear edge of the side panel.

Fig. 596: Cable Routing
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Route the cable on the left-hand side of the seat belt mounting at the front edge of the wheel arch, inside the carpet at the front edge of the side panel, between the side panel and the rear of the cargo floor support, to the accessory electronic module (AEM).

Fig. 597: Removing Panel By Pulling It Straight Up And Unhook It From Side Panel (1 Of 2)
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws from the bracket for the accessory electronic module (AEM) and lift up the entire unit. Cut off the tie straps if necessary.

Fig. 598: Removing Panel By Pulling It Straight Up And Unhook It From Side Panel
Courtesy of VOLVO CARS CORPORATION

- Disconnect the large connector from the accessory electronic module (AEM). First press in the catch (A). Pull the black locking handle (B) in the direction of the arrow until a click is heard. Disconnect the connector
- Disconnect the connector from the accessory electronic module.

Fig. 599: Black Terminal Pin By Inserting A Pointed Object Into Hole In Other End
Courtesy of VOLVO CARS CORPORATION

- Remove the black catch holding the black switch in place in the connector by pulling in the direction of the arrow
- Remove the black switch. Insert a pointed object in the hole on the other end of the connector. Press the switch out.

Fig. 600: Identifying Routed Cable To AEM Module's Connector In Position 5
Courtesy of VOLVO CARS CORPORATION

- Connect the pre routed cable to terminal 5 in the accessory electronic module (AEM) connector.

NOTE: **The numerical markings can be found on the top and bottom of the connector. However, the markings are extremely small so be careful when installing the cable.**

- Reinstall the black switch in the connector. Lock into place using the catch
- Press the connector into the accessory electronic module (AEM). Secure using the black locking handle
- Reinstall the accessory electronic module (AEM) and the bracket and clamp the wiring with the tie strap from the kit
- Reinstall the folding panel on the right-hand side in the cargo compartment
- Reinstall the right-hand side floor hatch
- Reinstall the storage boxes
- Reinstall the rear floor hatch(es)
- Reinstall the carpet at the front edge of the right-hand side panel
- Reinstall the sill trim panels in the doors on the right-hand side and the panel over the cable splice between them
- Reinstall the panel and cover on the right-hand mountings on the right-hand seat on the second row of seats
- Reinstall the panel on the right rear mounting on the right-hand front seat
- Fold the carpet back on the right front side
- Reinstall the passenger compartment connector socket if applicable
- Reinstall the soundproofing panel and the right-hand side panel on the center console
- Program the software according to the service information in VIDA (Volvo scan tool).

TIMER RELAY FOR THE ELECTRICAL ENGINE BLOCK HEATER B6294T

(B6294T; 2003)

TIMER RELAY FOR THE ELECTRICAL ENGINE BLOCK HEATER

NOTE: This accessory requires software unique to the car.

Fig. 601: Detach Left-Hand Headlamp
Courtesy of VOLVO CARS CORPORATION

- Remove the left-hand headlamp by pulling up the two cotter pins and then carefully pulling the headlamp forwards.

Fig. 602: Carefully Prize Up Catch On Connector For Headlamp With A Screwdriver
Courtesy of VOLVO CARS CORPORATION

- Carefully pry up the catch on the connector for the headlamp using a screwdriver
- Pull up the catch completely, disconnect the connector. Place the headlamp to one side.

Fig. 603: Identifying Cable Ties
Courtesy of VOLVO CARS CORPORATION

Applies to cars with only an electrical engine block

- Cut off the tie straps (1). Route the cable underneath the plate under the headlamp
- Remove the locking sleeve over the cable terminal and separate the switches.

Fig. 604: Screw, Nut, Washer, Tie Strap, And Branch Connector -- 6-Cylinder Engine
Courtesy of VOLVO CARS CORPORATION

Applies to cars with an engine block heater and passenger compartment connector socket

- Remove the junction connector with the wiring from the under side of the plate underneath the headlamp. First remove the screw and the nut (1)
- Cut off the tie strap (2)
- Remove the locking sleeve over the cable splices. Pull off the wiring
- Place the floor junction connector to one side as it will not be reused.

Fig. 605: Identifying O-Ring
Courtesy of VOLVO CARS CORPORATION

- Take the relay and the locking sleeves from the kit
- Grease the O-rings on the cable for the front engine block heater socket and relay. Use low temperature grease, (P/N 1161417-9).

NOTE: Do not get any grease on the contact surfaces of the connector.

Fig. 606: Installing Relay
Courtesy of VOLVO CARS CORPORATION

Applies to cars with only an electrical engine block

- Press the cable (1) from the front engine block heater socket and the cable (2) into the relay.

Fig. 607: Installing Locking Sleeves
Courtesy of VOLVO CARS CORPORATION

Applies to cars with only an electrical engine block

- Press the two locking sleeves (from the kit) over the cable splices
- Take two tie straps (1) from the kit. Secure the electric cable with the ground lead at the cable splice with the electrical cable for the engine block heater.

Fig. 608: Sockets And Relay -- All Models
Courtesy of VOLVO CARS CORPORATION

Applies to cars with an engine block heater and passenger compartment connector socket

- Connect the cable (1) from the front engine block heater socket to the relay
- Connect the wiring for the engine block heater and passenger compartment connector socket to either socket (2) or (3) on the relay.

Fig. 609: Sockets And Relay -- 6-Cylinder Engine
Courtesy of VOLVO CARS CORPORATION

Applies to cars with an engine block heater and passenger compartment connector socket

- Press the three locking sleeves (from the kit) over the cable splices
- Secure the cable and the ground lead at one of the cables for the engine block heater/passenger compartment connector socket using a tie strap (1) from the kit.

Fig. 610: Screw, Nut, Washer, Tie Strap And Branch Connector -- 6-Cylinder Engine
Courtesy of VOLVO CARS CORPORATION

- Position the wiring and relay on the under side of the plate (1). Position the relay with the side against the plate to release the switch
- Take a screw, washer and nut (2) from the kit. Tighten the relay to the plate
- Secure the cable for the front engine block heater socket at point (3) in the plastic lug for the bumper cover mounting
- Insert the thin cable with the ground lead from the relay in the same position as the engine block

heater /passenger compartment connector socket wiring
- Secure all wiring at point (4) using a tie strap from the kit.

Fig. 611: Right-Hand Side Sound Barrier
Courtesy of VOLVO CARS CORPORATION

- Remove the right-hand side panel from the center console. Pull off the panel starting at the front edge. Then pull backwards until all the clips release
- Remove the right-hand side soundproofing panel. First remove the two screws. Then pry off the panel at the top edge.

Fig. 612: Prying Right-Hand Rear Mounting Of Cover Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the panel from the right rear mounting on the right-hand front seat. Pry up the rear edge of the panel slightly and then pull backwards and upwards.

Fig. 613: Prying Away Cover Panel Over Joint Between Door Sills On Right-Hand Side, At Lower Edge, Using A Weatherstrip Tool
Courtesy of VOLVO CARS CORPORATION

- Carefully pry off the panel above the joint between the right-hand door sills, at the lower edge using a weatherstrip tool. Remove the panel.

Fig. 614: Right-Hand Front Door's Sill Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Detach the sill trim panel for the right-hand front door. Pull off the panel starting at the front edge until the clip releases. Continue backwards until the remaining clips have released
- Unhook the sill trim panel from the B-post panel.

Fig. 615: Pushing Up Catch On Top Side
Courtesy of VOLVO CARS CORPORATION

- Remove the panel in the right-hand front seat mounting on the right-hand seat in the second row. Push up the catch (1) on the top. Pull the panel forward.

Fig. 616: Removing Cover Panel
Courtesy of VOLVO CARS CORPORATION

- Fold the backrest on the right-hand seat in the second row forward as far as possible. Slide the front seat forward as far as possible. (On cars with two rows of seats, the second row is secured.)
- Remove the cover (1) for the right rear seat mounting by prying off the rear edge.

Illustration A

Fig. 617: Removing Sill Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the sill trim panel for the right-hand rear door. Pull the rear edge until the clips release. Continue forwards until the remaining clips have released.

Applies to cars with two rows of seats

- On cars with two rows of seats the seat cannot be slid forwards. To remove the sill trim panel; Start by folding the backrest forward when pulling the rear edge of sill trim panel loose. Then reposition the backrest to raise the seat cushion and provide more room to remove the sill trim panel. It is securely positioned. Do not damage the panel and surrounding components.

Illustration B

Fig. 618: Identifying Sill Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Unhook the sill trim panel from the B-post panel. Position the panel in the second/third row of seats.

Illustration A

Fig. 619: Removing Two Center Floor Hatches By Lifting Them Slightly
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Remove the two center floor hatches. First lift up slightly and then pull them loose from the mountings at the front edge.

If the rear center floor hatch is equipped with a carrier bag holder on the lower side, the floor hatch is secured by a strap on each of the shorter sides of the storage box. These must be removed.

- Remove the storage box underneath.

Illustration B

Fig. 620: Folding Up Center Rear Floor Hatch
Courtesy of VOLVO CARS CORPORATION

Applies to cars with three rows of seats and integrated carrier bag holder on the under side of the center floor hatch

- Fold up the center rear floor hatch (1)
- Detach the two straps from the panel underneath. Lift up the panel at the rear edge. Fold the floor hatch back towards the panel and lift out the floor hatch and the panel.

Applies to cars with three rows of seats without integrated carrier bag holders

- Lift up the center rear floor hatch at the rear edge and lift it out.

Applies to all models

- Remove the right and left-hand side floor hatches (2).

Fig. 621: Front Storage Box
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Remove the front storage compartment.

Fig. 622: Folding Side Panel From Right-Hand Side Of Cargo Compartment
Courtesy of VOLVO CARS CORPORATION

- Remove the folding side panel from the right-hand side in the cargo compartment.

Fig. 623: Identifying Passenger Compartment Connector Socket Screws
Courtesy of VOLVO CARS CORPORATION

Applies to cars with a passenger compartment connector socket

- Remove the screws for the passenger compartment connector socket. Disconnect the passenger compartment connector socket from the bracket inside the carpet
- Remove the locking sleeve and disconnect the cable from the passenger compartment connector socket.

Fig. 624: Passenger Seat Rubber Grommet
Courtesy of VOLVO CARS CORPORATION

- Push the carpet at the front right hand side to one side
- Press out the rubber grommet in the cowl panel (1).

Fig. 625: Engine Splash Guard
Courtesy of VOLVO CARS CORPORATION

- Remove the engine splash guard (1) by first removing the screws (2).

Fig. 626: Electrical Cable Secured With Tie Straps
Courtesy of VOLVO CARS CORPORATION

- Route the wiring down from the relay.

Applies to cars with an engine block heater and passenger compartment connector socket

- Take four tie straps from the kit. Secure the thin cable (not the ground lead) at the cable for the passenger compartment connector socket.

Applies to cars with only an electrical engine block

- Press the four tie-straps with clips (from the kit) into the holes on the inside of the sub-frame
- Secure the cable (not the ground lead) using tie straps.

Fig. 627: Ground Cable
Courtesy of VOLVO CARS CORPORATION

- Disconnect the existing ground lead for the front engine block heater socket underneath the left-hand

front member

- Route the ground lead to the relay. Connect both ground leads to the existing ground terminal.

Illustration A

Fig. 628: Installing Rubber Grommets
Courtesy of VOLVO CARS CORPORATION

Applies to cars without a passenger compartment connector socket

- Remove the stamped section of the engine compartment insulation (1) on the right-hand side and the rubber grommet (2) from underneath
- Place the rubber grommet to one side. There is a new rubber grommet on the routed cable
- Lubricate the rubber grommet (3) using low temperature grease on the side facing in towards the passenger compartment
- Route the cable along the power steering pipes and up to the hole in the cowl as illustrated
- Insert the cable in the hole. Press the rubber grommet into place
- Clamp the cable at the servo pipe using a tie strap (4) from the kit.

Illustration B

Fig. 629: Identifying Rubber Grommet
Courtesy of VOLVO CARS CORPORATION

Applies to cars with a passenger compartment connector socket

- Pull off the cable and rubber grommet (1) for the passenger compartment connector socket
- Pull out the entire cable from the hole in the cowl panel. Remove the rubber grommet from the cable. There is a new rubber grommet on the routed cable.

Illustration C

Fig. 630: Identifying Rubber Grommet And Tie Strap
Courtesy of VOLVO CARS CORPORATION

Applies to cars with a passenger compartment connector socket

- Cut off the top of the new rubber grommet (1)
- Thread the cable for the passenger compartment connector socket into the new rubber grommet

- Lubricate the rubber grommet using low temperature grease on the side facing in towards the passenger compartment
- Adjust the wiring up to the grommet. Insert the wiring into the hole in the cowl panel
- Carefully route the rubber grommet into position from inside the passenger compartment by pulling the cable for the passenger compartment connector socket
- Clamp the cable at the power steering pipe using a tie strap (2) from the kit.

- Reinstall the engine splash guard. Tighten the screws. Tighten to **25 Nm (18 lbf. ft.)**
- Connect the connector to the headlamp and reinstall it. Ensure that the headlamp lock pin is positioned correctly, the short thin cable innermost and the long wide cable outermost.

Fig. 631: Cable Clamped In At Air Duct
Courtesy of VOLVO CARS CORPORATION

- Insert the cable harness between the carpet and the door sill towards the carpet as far as it will go. Route it along the right-hand side of the car up to the door opening for the right-hand rear door
- Pull the cable up to the right-hand seat mounting on the right-hand seat in the second row of seats
- Pull away the carpet from the front edge of the right-hand side panel in the cargo compartment
- Route the cable on the right-hand side of the air duct towards the front edge of the rear wheel arch. Clamp the cable at the air duct using two tie straps (1) from the kit
- Route the cable on the reverse of the air duct and out along the front edge of the wheel arch.

Applies to cars with three rows of seats Illustration A

Fig. 632: Identifying Cable At Rear Edge Of Right-Hand Side Panel
Courtesy of VOLVO CARS CORPORATION

- Insert a cable (1) at the rear edge of the right-hand side panel and along the inside of the panel, above the mountings for the load securing eyelets and to the front edge of the side panel.

Illustration B

Fig. 633: Identifying Cable Harness
Courtesy of VOLVO CARS CORPORATION

- Tape the cable harness (2) to the wire and pull it out of the rear edge of the side panel.

Fig. 634: Cable Routing
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Route the cable on the left-hand side of the seat belt mounting at the front edge of the wheel arch, inside the carpet at the front edge of the side panel, between the side panel and the rear of the cargo floor support, to the accessory electronic module (AEM).

Fig. 635: Removing Panel By Pulling It Straight Up And Unhook It From Side Panel (1 Of 2)
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws from the bracket for the accessory electronic module (AEM) and lift up the entire unit. Cut off the tie straps if necessary.

Fig. 636: Removing Panel By Pulling It Straight Up And Unhook It From Side Panel
Courtesy of VOLVO CARS CORPORATION

- Disconnect the large connector from the accessory electronic module (AEM). First press in the catch (A). Pull the black locking handle (B) in the direction of the arrow until a click is heard. Disconnect the connector
- Disconnect the connector from the accessory electronic module.

Fig. 637: Black Terminal Pin By Inserting A Pointed Object Into Hole In Other End
Courtesy of VOLVO CARS CORPORATION

- Remove the black catch holding the black switch in place in the connector by pulling in the direction of the arrow
- Remove the black switch. Insert a pointed object in the hole on the other end of the connector. Press the switch out.

Fig. 638: Identifying Routed Cable To AEM Module's Connector In Position 5
Courtesy of VOLVO CARS CORPORATION

- Connect the pre routed cable to terminal 5 in the accessory electronic module (AEM) connector.

NOTE: **The numerical markings can be found on the top and bottom of the connector. However, the markings are extremely small so be careful when installing the cable.**

- Reinstall the black switch in the connector. Lock into place using the catch
- Press the connector into the accessory electronic module (AEM). Secure using the black locking handle
- Reinstall the accessory electronic module (AEM) and the bracket and clamp the wiring with the tie strap from the kit
- Reinstall the folding panel on the right-hand side in the cargo compartment
- Reinstall the right-hand side floor hatch
- Reinstall the storage boxes
- Reinstall the rear floor hatch(es)
- Reinstall the carpet at the front edge of the right-hand side panel
- Reinstall the sill trim panels in the doors on the right-hand side and the panel over the cable splice between them
- Reinstall the panel and cover on the right-hand mountings on the right-hand seat on the second row of seats
- Reinstall the panel on the right rear mounting on the right-hand front seat
- Fold the carpet back on the right front side
- Reinstall the passenger compartment connector socket if applicable
- Reinstall the soundproofing panel and the right-hand side panel on the center console
- Program the software according to the service information in VIDA (Volvo scan tool).

FUEL-DRIVEN HEATER V8 (B8444S; 2005-2011)

FUEL-DRIVEN HEATER

NOTE: This accessory requires software unique to the car.

Fig. 639: Removing Front Floor Hatch
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Remove the front floor hatch. Lift it up approx. 50 mm and then pull it out from its mountings in the front edge.

Fig. 640: Removing Front Storage Box
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Lift out the front storage box.

NOTE: **Removal of the right-hand seat in the second row applies to all cars. For cars with three rows of seats, the left-hand seat and center seat of the second row must also be removed.**

Fig. 641: Prying Right-Hand Rear Mounting Of Cover Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the panel on the right rear mounting on the right-hand front seat. Pry up the rear edge of the panel slightly and then pull rearwards and upwards.

Fig. 642: Prying Away Cover Panel Over Joint Between Door Sills On Right-Hand Side, At Lower Edge, Using A Weatherstrip Tool
Courtesy of VOLVO CARS CORPORATION

- Slide the seats of the first row as far forward as possible.
- Carefully pry loose and remove the panel over the joint between the door sills on the right side.

Fig. 643: Pushing Up Catch On Top Side
Courtesy of VOLVO CARS CORPORATION

- Remove the panel for the right front seat mounting of the second row's right-hand seat by pressing down the catch (1) on top and pulling the panel forward. Remove the screw underneath.

Fig. 644: Removing Front Seat Mountings
Courtesy of VOLVO CARS CORPORATION

- Remove the panel for the front seat mountings of the second row's right-hand seat/center seat by pressing down the catches (1) on top and pulling the panel forward. Remove the screw for the right-hand seat.

Fig. 645: Removing Rear Seat Mounting Cover
Courtesy of VOLVO CARS CORPORATION

- Lower the backrest of the right-hand seat in the second row.
- Remove the cover (1) of the rear seat mountings of the right-hand seat by prying the rear edge loose. Remove the screws.

Fig. 646: Removing Sill Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Undo the sill panel of the right rear door. Pull the rear edge until the clips release. Continue forward until the remaining clips release.
- Unhook the sill trim panel from the B-post panel. Place the sill trim panel in the cargo compartment.
- Remove the seat.

CAUTION: Exercise care when lifting the seats out of the passenger compartment so the mountings do not damage the door panels.

Fig. 647: Seat Mountings
Courtesy of VOLVO CARS CORPORATION

Applies to cars with three rows of seats

- Remove the corresponding panels and screws on the left-hand side and for the left-hand and center seat of the second row.
- Unplug the connector for the center console.
- Remove the left-hand and center seat.

CAUTION: Exercise care when lifting the seats out of the passenger compartment so the mountings do not damage the door panels.

- Remove the air nozzles on the right and left-hand side.

Applies to cars with two rows of seats

Fig. 648: Pushing Aside Floor Mat And Insulation

Courtesy of VOLVO CARS CORPORATION

- Bend aside the floor mat and secure it with the seat belt on the left-hand side.
- Carefully bend aside the styrofoam insulation to provide access to the cover of the tank unit.

CAUTION: Take care. The styrofoam insulation comes off easily.

Fig. 649: Removing Insulation Panels
Courtesy of VOLVO CARS CORPORATION

Applies to cars with three rows of seats

- Bend aside the floor mat and the insulating mat.
- Use a screwdriver or the like to hold the mat in place.
- Remove the right-hand section of the air duct.
- Remove both panels of styrofoam insulation.

Fig. 650: Removing Tank Unit Cover
Courtesy of VOLVO CARS CORPORATION

- Remove the four nuts in the tank unit cover.
- Carefully pry loose the cover using a weatherstrip tool.

Fig. 651: Identifying Front Mounting & Fuel Filter Screws
Courtesy of VOLVO CARS CORPORATION

The tank should be lowered in order to facilitate the installation of the suction line.

- Remove the two screws (1) in the fuel tank front mountings. If necessary, screw out the screw (2) to the fuel filter.

Fig. 652: Identifying Rear Mounting Screws
Courtesy of VOLVO CARS CORPORATION

- Unscrew the two screws (1) holding the tank's rear mounting, screw them out as far as possible without removing them.

Fig. 653: Identifying Drill Area And Dimensions
Courtesy of VOLVO CARS CORPORATION

- Drill out the connection (1) in the tank unit with a **4 mm (5/32")** diameter drill bit. Apply Vaseline to the drill bit to prevent shavings falling into the fuel tank.

CAUTION: Use a compressed air power drill. An electric power drill must not be used due to the risk of sparks.

Fig. 654: Installing Fuel Line Assembly
Courtesy of VOLVO CARS CORPORATION

- Insert the pipe (1) from the kit into the connection (2). Press the pipe down until it is in contact with the connection. If necessary, use a hammer and drift to drive down the pipe.
- Take the fuel line with electrical line from the kit. Affix protective tape over the hole on the end of the fuel line that is to be inserted through the hole in the floor (the one with the short, unconnected line end).
- Guide the whole line assembly (3) between the floor and the fuel tank out to the right-hand side of the car.

Fig. 655: Installing Quick-Release Connector
Courtesy of VOLVO CARS CORPORATION

- Press the quick-release connector (1) onto the connection until a click is heard. Check that the quick-release connector is secure.

Fig. 656: Routing And Installing Cable
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Carefully bend up the end of the styrofoam insulation.
- Place a spacer underneath.
- Route the line previously routed together with the fuel line under the seat frame and connect it to the front connector (1) in the contact bridge (2).

Applies to cars with two rows of seats

- Remove the spacer and bend down the styrofoam insulation.
- Place the line in the holder in the tank unit cover.
- Reinstall the tank unit cover and secure with the four nuts.
- Refit the styrofoam insulation panels.

Applies to cars with three rows of seats

- Reinstall the air duct.
- Fold back the carpet.

Applies to cars with three rows of seats

- Reinstall the air nozzles under the outer seats.
- Reinstall the seats.

CAUTION: Exercise care when lifting the seats into the passenger compartment so the mountings do not damage the door panels.

- Plug in the connector for the center console.
- Install the mounting screws for the seats and torque tighten them to **48 Nm (35 lbf. ft.)** .
- Refit the panels and the covers over the seat mountings.
- Refit the panels over the joints between the door sills.

Applies to cars with two rows of seats

- Refit the front storage box.
- Refit the front floor hatch.

Fig. 657: Identifying Fuel Hose & Cable Harness At Rear Edge Of Fuel Tank
Courtesy of VOLVO CARS CORPORATION

- Route the fuel hose with wiring harness (1) forward in the rear edge of the fuel tank. Route it along the fuel tank's right side and forward. Let it hang down.

Fig. 658: Removing Fuel Line Rail
Courtesy of VOLVO CARS CORPORATION

- Undo the rail for the fuel line by inserting a small screwdriver in the small hole between the rail and the clips. Move the clips in the same direction as the oblong hole in the rail. The rear clip has a small spot on the clip where you position the screwdriver and move it forward.

Fig. 659: Identifying Cable At Front Edge & Right-Hand Side Of Fuel Tank
Courtesy of VOLVO CARS CORPORATION

- Take the fuel pump with line from the kit. Insert the line in the front edge of the fuel tank's right side.
- Route the fuel line so that is next to the existing fuel line in the cut-out on top of the fuel tank. Then position the fuel line on the right-hand side of the wiring which runs to the engine compartment.
- Pull up the wiring so that the fuel pump (FP) is positioned as approximately as illustrated.

Fig. 660: Identifying Brake Pipe Clamp
Courtesy of VOLVO CARS CORPORATION

- Remove the brake pipe (1) from the clamp.
- Take the fuel pump with bracket and place the bracket on the top of the fuel tank mounting bracket in front of the small holes for the blind rivets.
- Blind rivet the fuel pump bracket using two metal blind rivets (2).

Fig. 661: Identifying Double Clamp & Fuel Lines From Fuel Pump
Courtesy of VOLVO CARS CORPORATION

- Use a double clamp from the kit to clamp the two fuel lines from the fuel pump to each other at the two blue markings on the fuel lines.
- Press the brake pipe back into the clamp.
- Install the two screws holding the tank. Install the screw to the fuel filter if it was detached. Torque tighten the five screws to **24 Nm (18 lbf. ft.)** .
- Connect the connector (1) from the pre-routed power cable to the fuel pump (FP).

- Connect the quick-release connector (2) on the pre-routed fuel line to the fuel pump (FP).

Fig. 662: Identifying Brake Pipe Fuel Line
Courtesy of VOLVO CARS CORPORATION

- Clamp in the fuel line at the brake pipe using a double clamp (1).

Fig. 663: Installing Fuel Hose
Courtesy of VOLVO CARS CORPORATION

- Press into place the fuel hose from the recently installed fuel pump (FP). Press into place in the bottom of the rail and forwards, in the cut-out furthest to the right.

NOTE: **The marking on the fuel hose must be 25 mm inside the edge of the rail where the fuel hose enters the rail.**

Fig. 664: Removing Retaining Clip For The Fuel Rail
Courtesy of VOLVO CARS CORPORATION

- Slide back the retaining clip for the rail. Press the rail against the car body. Ensure that the rail is securely installed.

Fig. 665: Identifying Dill Area And Dimensions
Courtesy of VOLVO CARS CORPORATION

- Remove the left front wheel.
- Drill off the heads of the five blind rivets (1) holding in the wing liner using a **6 mm (1/4")** diameter drill bit.

Remove:

- the clip (2) in the lower edge of the bumper
- the plastic nuts (3) holding the wing liner in place

Fig. 666: Removing Wing Extension
Courtesy of VOLVO CARS CORPORATION

- Undo the wing extension by carefully prying loose the lower corner using a weatherstrip tool.
- Pull it loose up to the highest point of the wheel housing until the three catches in the lower edge and the two clips a little higher up have released.

Applies to cars with the accessory side decor

- Bend aside only the retaining lugs on the side decor of the front wing so that the edge of the wing liner can be released.

NOTE: Do not undo the side decor of the front wing.

Fig. 667: Removing Bumper Left Hand Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the bumper's left-hand panel by carefully pulling it away at the left-hand lower edge until the

two catches down on the inside release. Continue to pull until the clips release all around.

Fig. 668: Bending Aside Wheel Wing Liner
Courtesy of VOLVO CARS CORPORATION

- Bend aside the wing liner and secure it with a tie strap or the like.
- Remove the remains of the rivets.

Fig. 669: Removing Engine Splash Guard
Courtesy of VOLVO CARS CORPORATION

- Remove the six screws and the engine splash guard.

Fig. 670: Removing Skid Plate
Courtesy of VOLVO CARS CORPORATION

- Remove the front splash guard. First remove the six screws on the underside.
- Then lift the splash guard up so that the front/upper mounting's guide sleeve releases. Forcefully push the left-hand side of the skid plate forward towards the bumper cover. Push the corner forward until the splash guard's left-hand fixture mounting lug releases from the subframe.
- Repeat on the right-hand side.

Fig. 671: Sub-Frame
Courtesy of VOLVO CARS CORPORATION

- Insert the fuel pipe with the four pre-mounted clips (1) from the front, between the engine and the subframe. Press it in with the clips in the front edge of the subframe. There is not much space for inserting the fuel pipe and it requires bending and twisting slightly to reach its position.

Fig. 672: Installing Fuel Pipe
Courtesy of VOLVO CARS CORPORATION

- Press in the fuel pipe into the bottom of the two clips (1) that hold the servo pipes.
- Check that the fuel pipe does not catch on the subframe. Check that the fuel pipe does not rub against pipes or screw heads for the suspension.

Fig. 673: Identifying Circulation Pump
Courtesy of VOLVO CARS CORPORATION

- Unplug the connector (1) on the circulation pump.
- Install a sealing plug in the connector and secure the cable above the top of the panel (2) using a tie strap.

Fig. 674: Removing Hose Clamps Using Hose Pliers
Courtesy of VOLVO CARS CORPORATION

- Install hose pliers on the hose at each connection.
- Detach the hose clamps and remove the hoses.

Fig. 675: Supporting Sub-Frame
Courtesy of VOLVO CARS CORPORATION

- Install a workshop hoist (1) under the front edge of the subframe.
- Take the weight off the subframe.
- Remove the screw and circulation pump with bracket from the subframe mounting.

Fig. 676: Identifying Heater And Bracket
Courtesy of VOLVO CARS CORPORATION

- Install the heater (1) on the bracket (2) with two M8 screws (3). Tighten.

Fig. 677: Identifying Fuel Hose Clamp & Inlet
Courtesy of VOLVO CARS CORPORATION

- Take a small hose clamp for the fuel line from the kit. Install the clamp on the fuel hose (1) from the fuel pipe on the subframe.
- Remove the protective cap on the inlet (2).
- Raise the heater into its installation position.
- Press in the fuel line on the inlet (2) on the heater and squeeze the hose clamp together.

Fig. 678: Installing Bracket
Courtesy of VOLVO CARS CORPORATION

- Take a new screw (1) from the kit and tighten in the heater on the subframe mounting. Do not tighten hard yet.
- Take the metal bracket and two nuts from the kit.
- Position one of the metal bracket's retaining lugs on the stud (2) of the heater and fit the nut. Tighten loosely.
- Position the other retaining lug of the bracket on the stud (3) and fit the nut.
- Tighten the nuts.
- Torque tighten the screw (1) to **105 Nm (78 lbf. ft.)** . Then angle tighten it to **120°** or **max. 280 Nm (206 lbf. ft.)** .
- Remove the protective cap from the pre-routed connector (4). Press in the catch on the top and pull it off.
- Connect the cable from the heater to the connector.

Fig. 679: Installing Chafe Guard On Short Fuel Pipe
Courtesy of VOLVO CARS CORPORATION

- Thread the chafe guard onto the short fuel pipe.

Illustration A

Fig. 680: Short Fuel Pipe Illustration A
Courtesy of VOLVO CARS CORPORATION

- Insert the end of the short fuel pipe that is bent at two different levels (illustration A), under the steering gear and anti-roll bar, on the top of the subframe's right-hand rear corner (illustration B).

Illustration B

Fig. 681: Short Fuel Pipe Illustration B
Courtesy of VOLVO CARS CORPORATION

Fig. 682: Securing Short Fuel Pipe And Fuel Line
Courtesy of VOLVO CARS CORPORATION

- Take a hose clamp (1) and thread it on the short fuel line on the subframe.
- Connect the short fuel pipe to the fuel line. Slide the pipe into the fuel line. Slide the pipe in so far that the two pipes are in contact with each other. This prevents air pockets from forming.
- Squeeze the hose clamp together.
- Take a tie strap with clip and install the clip in the hole (2) on the subframe. Tighten the tie strap around the fuel line.

Fig. 683: Identifying Cable Tie And Hose Clamp
Courtesy of VOLVO CARS CORPORATION

- Thread a hose clamp on the fuel line.
- Connect the fuel line to the short fuel pipe.
- Tighten the hose clamp.
- Install two small tie straps in each end of the chafe guard. Check that the pipe does not chafe against the

anti-roll bar mounting.

Fig. 684: Securing Heater Fuel Line Using Double Clamps
Courtesy of VOLVO CARS CORPORATION

- Secure the heater's fuel line by the car's fuel lines using two double clamps. Check that the fuel line does not chafe against any sharp edges.

Fig. 685: Installing Edge Protection Strip
Courtesy of VOLVO CARS CORPORATION

- Install an edge protection strip on the panel edge where the heater hoses shall run from the engine compartment out to the heater.

Fig. 686: Identifying Heater Hoses
Courtesy of VOLVO CARS CORPORATION

- Connect the heater hoses to the heater.
- Tighten the hose clamps. Make sure that none of the hose clamps chafe against the heater hoses.
- Remove the hose pliers.

Fig. 687: Securing Hoses Using Tie Straps
Courtesy of VOLVO CARS CORPORATION

- Secure the hoses using a tie strap threaded through two holes in the member.

NOTE: Do not tighten so hard that the hoses are deformed.

- Reinstall the skid plate and torque tighten to **50 Nm (37 lbf. ft.)** .
- Reinstall the engine splash guard and torque tighten to **25 Nm (18 lbf. ft.)** .
- Fold back the wing liner. Install the nuts and tighten.

- Press the wing extension into place.
- Take blind rivets from the kit to rivet the front edge of the wing liner into place.
- Refit the bumper panel.
- Reinstall the clip in the lower edge of the bumper.
- Remount the wheel and tighten the bolts to **140 Nm (103 lbf. ft.)**
- Fill with fluid.
- Start the engine and bleed the cooling system.
- Program the software and test run the heater in accordance with the service information in VIDA (Volvo scan tool).

FUEL-DRIVEN HEATER, B6324 (B6324S, B6324S5, TF-80SC; B6324S, TF-80SC AWD; 2007-2012)

FUEL-DRIVEN HEATER

NOTE: This accessory requires software unique to the car.

Fig. 688: Disconnect Battery Negative Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition switch to position 0.
- Disconnect the battery negative lead.

NOTE: Wait at least five minutes before disconnecting the connectors or removing other electrical equipment.

Fig. 689: Removing Front Floor Hatch
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Remove the front floor hatch by first lifting it up a bit and then pulling it out of the mountings in the front edge.

Fig. 690: Removing Front Storage Box
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Lift out the front storage box.

NOTE: **Removal of the right-hand seat in the second row applies to all cars. For cars with three rows of seats, the left-hand seat and center seat of the second row must also be removed.**

Fig. 691: Prying Right-Hand Rear Mounting Of Cover Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the panel on the right rear mounting on the right-hand front seat. Pry up the rear edge of the panel slightly and then pull rearwards and upwards.

Fig. 692: Prying Away Cover Panel Over Joint Between Door Sills On Right-Hand Side, At Lower Edge, Using A Weatherstrip Tool
Courtesy of VOLVO CARS CORPORATION

- Slide the seats of the first row as far forward as possible.
- Carefully pry loose and remove the panel over the joint between the door sills on the right side.

Fig. 693: Pushing Up Catch On Top Side
Courtesy of VOLVO CARS CORPORATION

- Remove the panel for the right front seat mounting of the second row's right-hand seat by pressing down the catch (1) on top and pulling the panel forward. Remove the screw underneath.

Fig. 694: Removing Front Seat Mountings
Courtesy of VOLVO CARS CORPORATION

- Remove the panel for the front seat mountings of the second row's right-hand seat/center seat by pressing down the catches (1) on top and pulling the panel forward. Remove the screw for the right-hand seat.

Fig. 695: Seat Mounting Cover
Courtesy of VOLVO CARS CORPORATION

- Lower the backrest of the right-hand seat in the second row.
- Remove the cover (1) of the rear seat mountings of the right-hand seat by prying the rear edge loose. Remove the screws.

Fig. 696: Removing Sill Trim Panel
Courtesy of VOLVO CARS CORPORATION

- Undo the sill panel of the right rear door. Pull the rear edge until the clips release. Continue forward until the remaining clips release.
- Unhook the sill trim panel from the B-post panel. Place the sill trim panel in the cargo compartment.
- Remove the seat.

CAUTION: Exercise care when lifting the seats out of the passenger compartment so the mountings do not damage the door panels.

Applies to cars with three rows of seats

- Remove the corresponding panels and screws on the left-hand side and for the left-hand and center seat of the second row
- Remove the left-hand and center seat.

CAUTION: Exercise care when lifting the seats out of the passenger compartment so the mountings do not damage the door panels.

Fig. 697: Seat Mountings
Courtesy of VOLVO CARS CORPORATION

Applies to cars with three rows of seats

- Remove the air nozzles on the right and left-hand side.

Illustration A applies to cars with two rows of seats

Fig. 698: Bending Aside Floor Mat And Carpet
Courtesy of VOLVO CARS CORPORATION

- Bend aside the floor mat and secure it with the seat belt on the left-hand side.
- Carefully bend aside the styrofoam insulation to provide access to the cover of the tank unit.

CAUTION: Take care. The styrofoam insulation comes off easily.

Illustration B applies to cars with three rows of seats

Fig. 699: Removing Insulation Panels
Courtesy of VOLVO CARS CORPORATION

- Bend aside the floor mat and the insulating mat.
- Use a screwdriver or the like to hold the mat in place.
- Remove the air duct.
- Remove both panels of styrofoam insulation.

Fig. 700: Removing Tank Fitting Cover
Courtesy of VOLVO CARS CORPORATION

- Remove the four screws in the tank fitting cover.
- Carefully pry loose the cover using a weatherstrip tool.

Fig. 701: Identifying Front Mounting & Fuel Filter Screws
Courtesy of VOLVO CARS CORPORATION

Fig. 702: Identifying Rear Mounting Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the four screws (1) from the front and rear mountings of the fuel tank so that the tank is lowered a bit in order to fit a suction line to the fuel tank. If necessary, loosen and unscrew the fuel filter screw (2) to lower the fuel tank even more.

Fig. 703: Identifying Drill Area And Dimensions
Courtesy of VOLVO CARS CORPORATION

- Drill the connection (1) in the tank fitting with a **4 mm (5/32")** drill bit.

NOTE: Use a compressed air drill with a greased bit.

Fig. 704: Installing Fuel Line Assembly
Courtesy of VOLVO CARS CORPORATION

- Insert the pipe (1) from the kit down into the connection (2). Press the pipe down until it is flush with the connection.
- Take the fuel line with electrical line from the kit. Affix protective tape on the end of the fuel line that is to be inserted through the hole in the floor (the one with the short, unconnected line end).
- Insert the whole line assembly (3) between the floor and the fuel tank out to the right.

Fig. 705: Installing Quick-Release Connector
Courtesy of VOLVO CARS CORPORATION

- Press the quick-release connector (1) onto the connection until a click is heard. Check that the quick-release connector is secure.

Fig. 706: Routing And Installing Cable Line
Courtesy of VOLVO CARS CORPORATION

Applies to cars with two rows of seats

- Carefully bend up the end of the styrofoam insulation.
- Place a spacer underneath.
- Route the line previously routed together with the fuel line under the seat frame and connect it to the front connector (1) in the contact bridge (2).
- **Applies to cars with two rows of seats:** Remove the spacer and fold down the styrofoam insulation.
- Place the line in the holder in the tank unit cover.
- Refit the tank fitting cover and secure with the four screws.
- Refit the styrofoam insulation panels.
- **Applies to cars with three rows of seats:** Refit the air duct.
- Fold back the carpet.
- **Applies to cars with three rows of seats:** Refit the air nozzles under the outer seats.
- Reinstall the seats.

CAUTION: Exercise care when lifting the seats into the passenger compartment so the mountings do not damage the door panels.

- Secure the seats, tightening the screws to **48 Nm (35 lbf. ft.)** .
- Refit the panels and the covers over the seat mountings.
- Refit the panels over the joints between the door sills.

Applies to cars with two rows of seats

- Refit the front storage box.
- Refit the front floor hatch.

Fig. 707: Identifying Fuel Hose & Cable Harness At Rear Edge Of Fuel Tank
Courtesy of VOLVO CARS CORPORATION

- Route the fuel hose with wiring harness (1) forward in the rear edge of the fuel tank. Route it along the fuel tank's right side and forward. Let it hang down.

Fig. 708: Detaching Fuel Rail At Front Edge
Courtesy of VOLVO CARS CORPORATION

- Undo the rail for the fuel line by inserting a small screwdriver in the little hole between the rail and the yellow clip. Move the clip in the same direction as the oblong hole in the rail. The rear black clip has a little spot on the clip where you position the screwdriver and move it forward.

Fig. 709: Identifying Cable At Front Edge & Right-Hand Side Of Fuel Tank
Courtesy of VOLVO CARS CORPORATION

- Take the fuel pump with line from the kit. Insert the line in the front edge of the fuel tank's right side.
- Route the fuel line so that is next to the existing fuel line in the cut-out on top of the fuel tank. Then position the fuel line on the right-hand side of the wiring which runs to the engine compartment.
- Pull up the wiring so that the fuel pump (FP) is positioned as approximately as illustrated.

Fig. 710: Identifying Brake Pipe Clamp
Courtesy of VOLVO CARS CORPORATION

- Remove the brake pipe (1) from the clamp.
- Take the fuel pump with bracket and place the bracket on the top of the fuel tank mounting bracket in front of the small holes for the blind rivets.
- Use two metal pop rivets (2) from the kit to rivet the fuel pump bracket at the fuel tank mounting bracket.

Fig. 711: Identifying Double Clamp & Fuel Lines From Fuel Pump
Courtesy of VOLVO CARS CORPORATION

- Use a double clamp from the kit to clamp the two fuel lines from the fuel pump to each other at the two blue markings on the fuel lines.
- Press the brake pipe back into the clamp.
- Tighten the four screws that hold the tank in place. Tighten the screw of the fuel filter if this was loosened. Tighten the screws to **24 Nm (18 lbf. ft.)** .
- Connect the connector (1) from the pre-routed power cable to the fuel pump (FP).
- Connect the quick-release connector (2) on the pre-routed fuel line to the fuel pump (FP).

Fig. 712: Identifying Brake Pipe Fuel Line
Courtesy of VOLVO CARS CORPORATION

- Use a double clamp from the kit to clamp the fuel line at the fuel pipe at point (1).

Fig. 713: Identifying Fuel Pump Hose
Courtesy of VOLVO CARS CORPORATION

- Press into place the fuel hose from the recently installed fuel pump (FP). Press into place in the bottom of the rail and forwards, in the cut-out furthest to the right.

NOTE: The marking on the fuel hose must be opposite the point where the fuel hose goes into the rail.

- Slide back the retaining clip for the rail. Press the rail against the car body. Ensure that the rail is securely installed.

Fig. 714: Identifying Rail Retaining Clip
Courtesy of VOLVO CARS CORPORATION

Fig. 715: Identifying Drill Area And Dimensions
Courtesy of VOLVO CARS CORPORATION

- Remove the left front wheel.
- Drill out the five pop rivets (1) holding the fender liner in place and the pop rivet (2) in the bottom edge of the bumper. Use a **6 mm (1/4")** drill bit.

Remove:

- any rivet residue
- the plastic nuts (3) holding the fender liner in place
- the small protective plate.

Applies to cars with the accessory side decor

NOTE: Do not undo the side decor of the front fender.

- Bend aside only the retaining lugs on the side decor of the front fender so that the edge of the fender liner can be released.

Fig. 716: Removing Side Trim
Courtesy of VOLVO CARS CORPORATION

Applies to cars without the accessory side decor

- Undo the fender extension by carefully prying loose the lower corner using a weatherstrip tool.
- Pull it loose up to the highest point of the wheel housing until the three catches in the lower edge and the two clips a little higher up have released.

Fig. 717: Removing Left Bumper Panel
Courtesy of VOLVO CARS CORPORATION

- Remove the left bumper panel by carefully prying it loose in the left bottom edge until the clips on the bottom and inside release. Continue pulling until the clips all around release.

Fig. 718: Securing Wheel Fender Liner
Courtesy of VOLVO CARS CORPORATION

- Bend aside the fender liner and secure it with a tie strap or the like.

Fig. 719: Engine Splash Guard
Courtesy of VOLVO CARS CORPORATION

- Remove the protective engine plate (1) by removing the screws (2).

Fig. 720: Removing Front Skid Plate
Courtesy of VOLVO CARS CORPORATION

- Remove the front skid plate by first removing the six screws (1) on the bottom.
- With the aid of a helper, pull the skid plate forward. Pull one corner until one of the skid plate retaining lugs releases from the sub-frame. Then undo the other corner. At the same time, it may be necessary to carefully bend down the bottom edge of the bumper lining.
- Open the cap of the radiator expansion tank.
- Thread a hose onto the engine coolant drain nipple.
- Open the drain nipple. Drain off the coolant.

Fig. 721: Removing Lower Rear Torque Rod
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws from the lower rear torque rod and remove it.

Fig. 722: Torque Rod Mounting
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws of the torque rod mounting in the subframe and remove the mounting.

Fig. 723: Detaching Fuel Return Hose
Courtesy of VOLVO CARS CORPORATION

- Detach the fuel return hose from the clamp at the rear edge on the right inside part of the subframe.
- Remove the clamp. There is a new double clamp in the kit.

Fig. 724: Installing Fuel Pipe On Sub-Frame
Courtesy of VOLVO CARS CORPORATION

- Take the fuel pipe with the three pre-fitted clips (1) from the kit and install it on the subframe.
- Press the fuel pipe with clips into the front edge of the subframe. The pipe is a tight fit. You will need to twist and turn it somewhat to get it into place.
- Check that the fuel pipe does not catch on the subframe. Check that the fuel pipe does not rub against pipes or screw heads for the suspension.

Fig. 725: Removing Existing Fuel Return Hose
Courtesy of VOLVO CARS CORPORATION

- Remove the existing fuel return hose from the clamp.
- Press the newly routed fuel pipe into the bottom of the clamp and then press the return hose into place.

Illustrations A and B

Fig. 726: Installing Short Fuel Pipe Kit - Illustration A
Courtesy of VOLVO CARS CORPORATION

Fig. 727: Installing Short Fuel Pipe Kit - Illustration B
Courtesy of VOLVO CARS CORPORATION

- Take the short fuel pipe from the kit and (from the front) insert it under the steering gear and anti-roll bar and back toward the previously routed fuel line at the right rear mounting of the subframe. It is a tight fit. It may be necessary to twist and turn the pipe to get it into place.
- Thread a hose clamp onto the short hose end on the front pipe.
- Insert the front edge of the pipe in the rubber hose onto the front pipe. Fasten with the hose clamp.
- Press the fuel pipe with double clamp into the hose in the subframe.
- Press the fuel return hose in the other aperture in the double clamp.

Illustrations A and B

Fig. 728: Installing Short Fuel Pipe Kit - Illustration A
Courtesy of VOLVO CARS CORPORATION

Fig. 729: Installing Short Fuel Pipe Kit - Illustration B
Courtesy of VOLVO CARS CORPORATION

- Fit a new clamp (1) on the hose end of the previously routed fuel line at the subframe's right rear mounting-
- Attach the hose end to the short pipe and tighten the clamp.
- Clamp the fuel hose at the fuel return hose using the double clamp (2).
- Clamp the fuel at the fuel return hose using the tie strap (3)

Fig. 730: Installing Lower Torque Rod Mounting
Courtesy of VOLVO CARS CORPORATION

- Refit the lower torque rod mounting. Tighten the screws to **80 Nm (59 lbf. ft.)** .

Fig. 731: Installing Lower Torque Rod
Courtesy of VOLVO CARS CORPORATION

- Refit the lower torque rod. Tighten the screws to **80 Nm (59 lbf. ft.)** .

Fig. 732: Supporting Sub-Frame
Courtesy of VOLVO CARS CORPORATION

- Reinstall the pipe elbow.
- Position the workshop lift (1) under the front edge of the sub-frame.
- Take the weight off the subframe.
- Remove the screw (2) and the washer (3) from the left mounting on the sub-frame.

Fig. 733: Identifying Heater And Bracket
Courtesy of VOLVO CARS CORPORATION

- Fit the heater (1) on the bracket (2) with the screws (3) from the kit and tighten.

Fig. 734: Identifying Fuel Hose Clamp & Inlet
Courtesy of VOLVO CARS CORPORATION

- Raise the heater into its installation position.
- Take a small hose clamp for the fuel line from the kit. Install the clamp on the fuel hose (1) from the fuel pipe on the subframe.
- Press the fuel line on the inlet (2) on the fuel pump (FP). Tighten.

Fig. 735: Installing Bracket
Courtesy of VOLVO CARS CORPORATION

- Take a new screw (1) from the kit and secure the heater to the left front corner of the sub-frame. Do not tighten hard yet.
- Take the metal bracket and two nuts from the kit.
- Position one of the metal bracket's retaining lugs on the stud (2) of the heater and fit the nut. Tighten loosely.
- Position the other retaining lug of the bracket on the stud (3) and fit the nut.

- Tighten the heater to the sub-frame and bracket. Tighten the screw (1) to **105 Nm (78 lbf. ft.)** . Angle tighten to 120° or **max. 280 Nm (206 lbf. ft.)**
- Remove the protective cap from the pre-routed connector (4). Press in the catch on the top and pull it off.
- Connect the cable from the heater to the connector.

Fig. 736: Removing Air Cleaner Intake
Courtesy of VOLVO CARS CORPORATION

Remove:

- the two screws
- the air filter and put it aside.

Fig. 737: Removing Protective Cover
Courtesy of VOLVO CARS CORPORATION

- Remove the protective cover over the control module.

Fig. 738: Pressing In Catches For The Air Filter Control Module
Courtesy of VOLVO CARS CORPORATION

- Press in the catches on the connectors of the air filter control module, turn the handles and remove the connectors.

Fig. 739: Removing Connector And Hose Clamp
Courtesy of VOLVO CARS CORPORATION

- Unplug the connector and remove the hose clamp from the air filter pipe.

Fig. 740: Removing Air Filter Box Cap And Filter
Courtesy of VOLVO CARS CORPORATION

- Undo the plastic nut (1) on the air filter's left-hand bracket and pull the air filter from the front member.
- Unplug any remaining connectors or hoses. Put the air filter aside.

Fig. 741: Removing Quick-Release Fitting
Courtesy of VOLVO CARS CORPORATION

- Remove the quick-release fitting on the passenger compartment heater's left-hand heater hose (1) by pressing the two catches of the lock ring in opposite directions. Twist the quick-release fitting slightly and pull it out.
- Detach the heater hose on the radiator pipe at the left rear edge of the cylinder head.
- Remove the heater hose. It will not be used again.

Fig. 742: Routing Heater Hose
Courtesy of VOLVO CARS CORPORATION

- Take the heater hoses from the kit. Route them down in the front edge of the transmission and though to the front edge of the left-hand wheel housing.
- Route the hoses back along the inside of the left front member and over the transmission. Continue routing them up toward the firewall.
- Using the quick-release fitting, connect the hose to the outlet in the firewall.
- Connect the other hose end to the radiator pipe (1) at the left rear edge of the cylinder head. Secure it with a hose clamp from the kit. Make sure that the hoses do not come into contact with moving parts or sharp edges in the engine compartment.

Fig. 743: Installing Holder Onto Bracket
Courtesy of VOLVO CARS CORPORATION

- Take the holder and screw for the heater hoses from the kit. Fasten the holder at the AC compressor bracket. Tighten the screw to **24 Nm (18 lbf. ft.)** .

Fig. 744: Installing Hoses In Respective Holders
Courtesy of VOLVO CARS CORPORATION

- Place the heater hoses and power steering hose in their respective holders.

Fig. 745: Identifying Heater Hoses
Courtesy of VOLVO CARS CORPORATION

- Connect the two heater hoses (1) to the heater using hose clamps from the kit and tighten.

- Tighten the drain nipple on the radiator. Remove the hose.
- Refit the front skid plate and tighten to **50 Nm (37 lbf. ft.)**
- Reposition the fender liner. Refit and tighten the small plate and plastic nuts.
- Press the fender extension into place.
- Use the pop rivets from the kit to rivet the front/lower edge of the fender liner into place.
- Refit the bumper panel.
- Remount the wheel and tighten the bolts to **140 Nm (103 lbf. ft.)**

- Fill with coolant. Reinstall the expansion tank cap.
- Refit the air filter and reconnect disconnected cables and hoses.
- Reinstall the air filter in the fender liner using the plastic nut.
- Refit the induction pipe on the front plate between the headlamps. Tighten the screws to **10 Nm (7 lbf. ft.)**
- Plug in the connectors of the air filter connector.
- Refit the cover over the air filter.
- Reconnect the battery negative lead
- Start the engine and bleed the cooling system. Check for leaks.
- Reinstall the engine splash guard and tighten the screws to **25 Nm (18 lbf. ft.)**
- Reinstall the engine cover.
- Program the software in accordance with the service information in VIDA (Volvo scan tool).
- Test the function of the heater according to separate instructions.

REMOTE START, ELECTRIC ENGINE BLOCK HEATER (2006-2011)

ACCESSORY ELECTRONIC MODULE (AEM)

see **ACCESSORY ELECTRONIC MODULE (AEM)**

CARS EQUIPPED WITH SRS/SIPS (AIRBAG)

see **CARS EQUIPPED WITH SRS/SIPS (AIRBAG)**

REMOTE START, ELECTRIC ENGINE BLOCK HEATER

Fig. 746: Identifying Ignition Switch OFF & Disconnected Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition switch to position 0.

- Disconnect the battery negative lead.

NOTE: **Wait at least three minutes before unplugging the connectors or removing other electrical equipment.**

Fig. 747: Detach Left-Hand Headlamp By Pulling Up Two Locking Pins
Courtesy of VOLVO CARS CORPORATION

- Detach the left-hand headlamp by pulling up the two locking pins and then carefully pulling away the headlamp forwards.

Fig. 748: Carefully Prize Up Catch On Connector For Headlamp With A Screwdriver
Courtesy of VOLVO CARS CORPORATION

- Carefully prize up the catch on the connector for the headlamp using a screwdriver.
- Pull the catch up completely, detach the connector and place the headlamp to one side.

Fig. 749: Screw, Nut, Washer, Tie Strap And Branch Connector -- V8 Engine
Courtesy of VOLVO CARS CORPORATION

Applies to cars with V8 engine

- Remove the branch connector with the cables from the underside of the plate beneath the headlamp. Remove the screw, nut and washer (1) and tie strap (2), and pull the branch connector forward.

Fig. 750: Screw, Nut, Washer, Tie Strap, And Branch Connector -- 6-Cylinder Engine
Courtesy of VOLVO CARS CORPORATION

Applies to cars with 5 and 6-cylinder engines

- Remove the branch connector with the cables from the underside of the plate beneath the headlamp by removing the screw and the nut (1).
- Cut away the tie strap (2).

Fig. 751: Removing Locking Sleeves Over Joints On Branch Connector
Courtesy of VOLVO CARS CORPORATION

- Remove the locking sleeves over the joints on the branch connector and pull the cables away from it.
- Place the branch connector to one side, it shall not be re-used.

Fig. 752: Identifying O-Ring
Courtesy of VOLVO CARS CORPORATION

- Take the relay with cable from the kit.
- Grease the O-ring on the connector for the front socket and both connectors on the relay using low temperature grease, part no. 1161417-9.

NOTE: Do not get any grease on the surfaces of the connector.

Fig. 753: Sockets And Relay -- All Models
Courtesy of VOLVO CARS CORPORATION

- Connect the cable (1) from the front socket to the relay.
- Connect the cables to the engine block heater and passenger compartment connector socket to either of the sockets (2) or (3) on the relay and press them in firmly.

Fig. 754: Sockets And Relay -- V8 Engine
Courtesy of VOLVO CARS CORPORATION

Applies to cars with V8 engine

- Take three locking sleeves from the kit and press them in over the cable joints.

Fig. 755: Sockets And Relay -- 6-Cylinder Engine
Courtesy of VOLVO CARS CORPORATION

Applies to cars with 5 and 6-cylinder engines

- Take three locking sleeves from the kit and press them in over the cable joints.
- Take a tie strap (1) from the kit and clamp the electrical cable securely with the ground cable to one of the cables for the engine block heater/passenger compartment connector socket.

Fig. 756: Screw, Nut, Washer, Tie Strap, And Branch Connector -- V8 Engine
Courtesy of VOLVO CARS CORPORATION

Applies to cars with V8 engine

- Take the relay with cables and fit it on the underside of the plate beneath the headlamp. Fit the relay with the side against the plate that allows the connector to be accessible.
- Take a screw, washer and nut (1) from the kit. Tighten the relay to the plate.
- Guide the relay's ground cable (2) down on the left-hand side of the side member.

- The long thin cable (3) from the relay is routed in the same direction as the cable for the heater and passenger compartment socket.
- Clamp the ground cable with the cable to the front socket using a tie strap from the kit.

Fig. 757: Screw, Nut, Washer, Tie Strap And Branch Connector -- 6-Cylinder Engine
Courtesy of VOLVO CARS CORPORATION

Applies to cars with 5 and 6-cylinder engines

- Take the relay with cables and place it on the underside of the plate (1). Fit the relay with the side against the plate that allows the connector to be accessible.
- Take a screw, washer and nut (2) from the kit. Tighten the relay to the plate.
- Clamp the cable for the front socket at point (3) in the plastic eye for the bumper cover's mounting.
- Guide the thin cable with the ground cable from the relay down to the same location as the cables for the engine block heater/passenger compartment connector socket.
- Clamp all cables together at point (4) with a tie strap from the kit.

V8 ENGINE

Fig. 758: Cable Routing
Courtesy of VOLVO CARS CORPORATION

- Route the cable in the same direction as the cable for the passenger compartment socket under the plate, under the left-hand headlamp. Route it backwards along the left-hand side of the air filter and between the air filter and the fuse holder. Continue to pull it backwards, under the ABS system and up between the cable duct and brake fluid reservoir.
- Check that the cable does not chafe against sharp edges or moving parts in the engine compartment.
- Route it along the cable for the passenger compartment connector socket over to the right-hand side of the car and down through the engine compartment.
- Clamp the cable securely the whole way with the cable for the passenger compartment connector socket using tie straps from the kit.

Fig. 759: Removing Wheel
Courtesy of VOLVO CARS CORPORATION

- Remove the right-hand front wheel to facilitate access for routing the cable.

Fig. 760: Wheel Protective Cover
Courtesy of VOLVO CARS CORPORATION

- Remove the two plastic nuts which hold the small protective panel in the right-hand wheel housing, and remove the panel.

Fig. 761: Engine Splash Guard And Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the six screws and the engine splash guard.

Fig. 762: Ground Cable And Screw
Courtesy of VOLVO CARS CORPORATION

- Detach the existing ground cable for the front socket on the underside of the left-hand frame member.
- Route the ground cable on from the relay. Connect both ground cables to the existing ground terminal and tighten the ground screw firmly.

Fig. 763: Cable Routing
Courtesy of VOLVO CARS CORPORATION

- Detach the cable for the passenger compartment connector socket from the clip in the edge of the plate, at the bending rubber hose for the water drainage.
- Route the rubber grommet with cable out to the passenger compartment connector socket from the passenger compartment.
- Remove the rubber grommet from the cable and place it to one side. There is a new rubber grommet on the routed cable.

Fig. 764: Cutting Rubber Grommet
Courtesy of VOLVO CARS CORPORATION

- Cut away the very top of the rubber grommet.

Fig. 765: Installing Cable Into Rubber Grommet
Courtesy of VOLVO CARS CORPORATION

- Grease in the rubber grommet using low temperature grease part no. 1161417-9 in order to make it easier to install the rubber grommet in the hole in the cowl.
- Guide the cable into the rubber grommet.

Fig. 766: Routing Cable
Courtesy of VOLVO CARS CORPORATION

- Guide both cables into the hole in the cowl wall and press the rubber grommet into place in the hole, either by pulling it into place from inside the passenger compartment, or carefully pressing it into place with a long large screwdriver/wide end of a short pry bar.

NOTE: These must not be sharp or they can damage the cables/rubber grommet

- Adapt the length of the cable from the rubber grommet, at the installed clip and out in the engine compartment.

Fig. 767: Inserting Cable Into Clamp
Courtesy of VOLVO CARS CORPORATION

- Press the cables for the passenger compartment connector socket into the installed clip. Make sure that the cable with the radiation shield is firmly pressed into the clip and does not slide out.

CAUTION: Check that the cables are routed so that they do not come into contact with the alternator belt, or chafe against sharp edges in the engine compartment.

- Clamp the cable at the thicker cable using tie straps from the kit.
- Reinstall the small protective panel in the wheel housing.
- Reinstall the engine splash guard and torque tighten the screws to **25 Nm (18.5 lbf. ft.)** .
- Remount the wheel and tighten the bolts to **140 Nm (103 lbf. ft.)** .
- Connect and reinstall the left-hand headlamp.

5 AND 6 CYLINDER ENGINES

Fig. 768: Engine Splash Guard
Courtesy of VOLVO CARS CORPORATION

- Remove the screws (2) and the engine splash guard (1).

Fig. 769: Electrical Cable Secured With Tie Straps

Courtesy of VOLVO CARS CORPORATION

- Route the electrical cables down from the relay.
- Take four tie straps from the kit and clamp the thin electrical cable (not the ground cable) to the cable for the passenger compartment connector socket.

Fig. 770: Ground Cable
Courtesy of VOLVO CARS CORPORATION

- Detach the existing ground cable for the front socket on the underside of the left-hand frame member.
- Route the ground cable to the relay. Connect both ground cables to the existing ground terminal.

Illustration A

Fig. 771: Identifying Rubber Grommet
Courtesy of VOLVO CARS CORPORATION

- Pull the cable with rubber grommet (1) away from the passenger compartment connector socket.

- Pull the whole cable out from the hole in the cowl wall. Remove the rubber grommet from the cable. There is a new one on the routed electrical cable.

Illustration B

Fig. 772: Identifying Rubber Grommet And Tie Strap
Courtesy of VOLVO CARS CORPORATION

- Cut away the top of the new rubber grommet (1).
- Guide the passenger compartment connector socket's cable in through the new rubber grommet.
- Grease the rubber grommet with low temperature grease (part no. 1161417-9) on the side turned into the passenger compartment.
- Adapt the cables up to the grommet. Guide the cables into the hole in the cowl wall.
- Carefully pull the rubber grommet into position from inside the passenger compartment by pulling in the cable for the passenger compartment connector socket.
- Clamp in the electrical cable with the servo pipe using a tie strap (2) from the kit.

FOR ALL CAR MODELS

Fig. 773: Dashboard End Panel
Courtesy of VOLVO CARS CORPORATION

Fig. 774: Identifying Removal Of Weatherstrip And Safety Clip
Courtesy of VOLVO CARS CORPORATION

Fig. 775: Identifying Screws And Soundproofing Panel Removed
Courtesy of VOLVO CARS CORPORATION

Fig. 776: Detaching Sill Trim Panel At Front Edge
Courtesy of VOLVO CARS CORPORATION

INSTALLING THE ANTENNA

Fig. 777: Cleaning Marked Surface On Inside Of Windscreen
Courtesy of VOLVO CARS CORPORATION

- Clean the marked surface on the inside of the windscreen using isopropanol P/N 1161721. Wipe dry.

Fig. 778: Identifying Protective Backing Tape
Courtesy of VOLVO CARS CORPORATION

- Remove the protective backing tape from the antenna mounting tape.

Fig. 779: Identifying Antenna
Courtesy of VOLVO CARS CORPORATION

- Press the antenna into place as close to the front edge of the roof panel as possible. Route the cable just above the edge of the roof panel.
- Carefully bend down the front edge of the roof panel and use pieces of butyl tape to secure the cable at the panel.

NOTE: Do not damage the roof panel.

Fig. 780: Identifying Cable Secure With Tie Straps
Courtesy of VOLVO CARS CORPORATION

- Secure the cable using three tie straps.

WARNING: Make sure that the routing of the antenna cable does not interfere with the function of the inflatable curtain.

INSTALLING THE RECEIVER UNIT

Fig. 781: Identifying Velcro Strip
Courtesy of VOLVO CARS CORPORATION

- Remove the Velcro from the kit and cut it in the center.

Fig. 782: Identifying Velcro Pieces Pressed Together
Courtesy of VOLVO CARS CORPORATION

- Press the Velcro pieces together.

Fig. 783: Washing Plane Surface Of Receiver
Courtesy of VOLVO CARS CORPORATION

- Clean the flat surface of the receiver unit using isopropanol P/N 1161721. Wipe dry.

Fig. 784: Identifying Protective Backing Tape Removed From Velcro Strips
Courtesy of VOLVO CARS CORPORATION

- Remove the protective backing tape from one of the Velcro pieces.

Fig. 785: Identifying Backing Removed From One Side Of Velcro Strips
Courtesy of VOLVO CARS CORPORATION

- Press the Velcro onto the receiver unit.

Fig. 786: Identifying Protective Backing Tape Removed From Other Velcro Piece
Courtesy of VOLVO CARS CORPORATION

- Remove the protective backing tape from the other Velcro piece.

Fig. 787: Cleaning Surface
Courtesy of VOLVO CARS CORPORATION

- Move the floor and insulating mat out of the way.
- Scrape away any sealant from the flat surface at the lower edge of the A-post where the receiver unit for the remote start is to be located.
- Clean the surface using isopropanol P/N 1161721. Wipe dry.

Fig. 788: Identifying Receiver Unit Secure To Panel Surface
Courtesy of VOLVO CARS CORPORATION

- Press the receiver unit securely onto the panel surface, **10 mm (25/64")** under the cable lead-in for the side door.

Fig. 789: Identifying Blower Fan Connector
Courtesy of VOLVO CARS CORPORATION

- Locate the connector for the blower fan and disconnect the connector.
- Connect the cable from the kit.

Fig. 790: Identifying Secondary Catch Of Black Six-Pin Connector
Courtesy of VOLVO CARS CORPORATION

- Carefully loosen the secondary catch of the black 6-pin connector using a small screwdriver.

Fig. 791: Identifying Red And Black Cable Of Six Pin Connector
Courtesy of VOLVO CARS CORPORATION

- Connect the red (R) cable from the timer relay to terminal 3, and the black (BK) cable to terminal 6 in the 6-pin connector.
- Press the secondary catch together on the connector.

SYNCHRONIZING THE TRANSMITTER - RECEIVER

Fig. 792: Identifying Connector, Antenna Cable And Receiver Unit
Courtesy of VOLVO CARS CORPORATION

1. Connect the battery's negative lead.
2. Install batteries in the transmitter battery compartment.
3. Connect the connector and antenna cable to the receiver unit.
4. Within 5 seconds, press the "OFF" button on the transmitter until the LED goes out. Synchronization has been carried out.

- Press the receiver unit onto the Velcro on the body plate if it has loosened.
- Tape up any cable excess from the timer relay and place it next to the receiver unit under the insulation mat.

Fig. 793: Identifying Safety Clip & A Pillar Panel
Courtesy of VOLVO CARS CORPORATION

- Install a new safety clip in the A pillar panel.

NOTE: It is important to use a new safety clip when installing.

- Press the A-pillar panel into place.

WARNING: It is important to install the safety clip/hook and panel correctly so that the IC system is not affected.

Reinstall:

- the dashboard end panel
- insulation and floor carpet.
- the sound proofing.
- Turn the ignition key to position II.

COMPRESSOR, REPLACING

NOTE: The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATORY WORK

IMPORTANT INFORMATION

WARNING: Follow the safety instructions for work on air conditioning systems. See: REFRIGERANT, SAFETY REGULATIONS .

NOTE: First read the instructions covering slow and fast leaks. See OIL AIR CONDITIONING (A/C) SYSTEM, FILLING .

NOTE: When replacing a compressor, always replace the O-rings in pipes and quick-release connectors.

NOTE: Always plug the pipes and connections when working on the climate control system.

PREPARATORY WORK

Disconnect the battery negative lead. See: **BATTERY, DISCONNECTING** .

Drain the refrigerant from the system. See **REFRIGERANT, DRAINING** .

REMOVAL

REMOVING COMPRESSOR

Fig. 1: Identifying Auxiliaries Belt And Special Tool 999 7109
Courtesy of VOLVO CARS CORPORATION

Remove the auxiliaries belt from the compressor. See:

- **Model year 03-04: AUXILIARIES BELT / BELT TENSIONER, REPLACING** (B5xx4xx) or: **REPLACING THE ACCESSORY DRIVE BELT / BELT TENSIONER** (B6xx4xx)
- **Model year 05- : AUXILIARIES BELT / BELT TENSIONER, REPLACING** (B5xx4Tx) or: **REPLACING THE ACCESSORY DRIVE BELT / BELT TENSIONER** (B6xx4xx).

Note the route of the belt.

Fig. 2: Low And High Pressure Hoses
Courtesy of VOLVO CARS CORPORATION

Remove the screws for the low and high pressure hoses for the compressor.

Fig. 3: Identifying Air Baffle And Splash Guard Under Engine
Courtesy of VOLVO CARS CORPORATION

NOTE: **Position the front lift arms so that they do not obstruct the sub-frame support plates.**

Raise the vehicle.

Remove:

- the protective cover under the engine
- the 2 x screws for the front splash guard. Press in the cover by pressing in the catches at the front edge. Pull the cover backwards.

Fig. 4: Removing Cable Conduit
Courtesy of VOLVO CARS CORPORATION

Remove the screw for the cable conduit. Remove the conduit from the sub-frame.

Detach the air duct for the control module box from the sub-frame.

Fig. 5: Removing Compressor
Courtesy of VOLVO CARS CORPORATION

Unscrew the low and high pressure hoses from the compressor and bend them to one side.

Disconnect the connector from the magnetic clutch for the compressor.

Remove the 4 x screws from the compressor.

Hold the cable conduit to one side. Remove the compressor from between the sub-frame and the body.

INSTALLATION

INSTALLING THE COMPRESSOR

NOTE: For tightening torques, see: TIGHTENING TORQUE .

Fig. 6: Installing Compressor
Courtesy of VOLVO CARS CORPORATION

If necessary, top up the compressor oil. See: **OIL AIR CONDITIONING (A/C) SYSTEM, FILLING** .

Hold the cable conduit to one side. Install the compressor between the sub-frame and the body.

Install the mounting screws and tighten.

NOTE: Always use new O-rings lubricated with compressor oil.

Install:

- the low and high pressure hoses. On certain models it may be easier to install and tighten the screws from above.
- the magnetic clutch connector.

Fig. 7: Identifying Cable Conduit On The Sub-Frame
Courtesy of VOLVO CARS CORPORATION

Install:

- the cable conduit on the sub-frame. Tighten.
- the air duct on the control module box on the sub-frame.

Fig. 8: Front Splash Guard
Courtesy of VOLVO CARS CORPORATION

Install:

- the protective cover under the engine
- the front splash guard.

Lower the vehicle.

Install the auxiliaries belt. See:

- **Model year 03-04: AUXILIARIES BELT / BELT TENSIONER, REPLACING** (B5xx4xx) or: **REPLACING THE ACCESSORY DRIVE BELT / BELT TENSIONER** (B6xx4xx)
- **Model year 05- : AUXILIARIES BELT / BELT TENSIONER, REPLACING** (B5xx4Tx) or: **REPLACING THE ACCESSORY DRIVE BELT / BELT TENSIONER** (B6xx4xx).

FINISHING

Install the battery negative lead according to: **BATTERY, DISCONNECTING** .

Vacuum pump side. See: **VACUUM PUMPING** .

Fill the system with refrigerant. See: **REFRIGERANT, FILLING** .

Leak trace the system. See:**LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** or: **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** .

CONDENSER, REPLACING

NOTE: The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATORY WORK

DRAINING THE REFRIGERANT AND REMOVING THE COMPONENTS

Fig. 9: Engine Under Cover
Courtesy of VOLVO CARS CORPORATION

WARNING: Follow the safety instructions for work on air conditioning systems. See: REFRIGERANT, SAFETY REGULATIONS .

NOTE: **First read the instructions covering slow and fast leaks. See: OIL AIR CONDITIONING (A/C) SYSTEM, FILLING .**

NOTE: **Always plug the pipes and connections when working on the climate control system.**

Drain the refrigerant from the system. See **REFRIGERANT, DRAINING** .

Raise the vehicle.

Removing the skidplate

Remove the 6 screws.

Lift and slide the protective plate forward.

NOTE: **There is a guide sleeve on the upper mounting for the plate. This must be lifted slightly so that the panel can be slid forward.**

Fig. 10: Oil Cooler
Courtesy of VOLVO CARS CORPORATION

Removing the oil cooler for the power steering

Remove:

- the screws to the oil cooler
- fold down the oil cooler.

REMOVAL

REMOVING THE COMPONENTS AND CONDENSER

Fig. 11: Right Hand A/C Pipe Connection
Courtesy of VOLVO CARS CORPORATION

Remove:

- right-hand A/C pipe connection with the screw, x 1
- the connector to the pressure sensor
- the pressure sensor
- right-hand lower mounting screw, x 1.

Fig. 12: Left Hand A/C Pipe
Courtesy of VOLVO CARS CORPORATION

Detach the left-hand A/C pipe from the clip/holder.

Remove the left-hand lower mounting screw, x 1.

Fig. 13: A/C Pipe Installation Screw
Courtesy of VOLVO CARS CORPORATION

Lower the vehicle.

Remove the left-hand A/C pipe with the screw, x 1.

Fig. 14: Air Baffle
Courtesy of VOLVO CARS CORPORATION

Remove the air baffle.

Fig. 15: Identifying Condenser Upper Mountings & Screws
Courtesy of VOLVO CARS CORPORATION

Remove the upper mountings on the condenser with the screws, x 2.

Raise the vehicle.

Remove the condenser straight down, press aside the A/C pipe slightly on the left-hand side while pulling the condenser down.

INSTALLATION

NOTE: For tightening torques, see TIGHTENING TORQUE

INSTALLING THE CONDENSER

Fill oil in the condenser, see: **OIL AIR CONDITIONING (A/C) SYSTEM, FILLING** .

NOTE: Always use new O-rings lubricated with compressor oil.

Install the condenser with the 2 x M6 lower mounting screws, and tighten.

Guide the left-hand A/C pipe to the condenser connection and in the clip/holder.

Install:

- the right-hand A/C pipe with the screw, 1 x M6, and tighten
- the pressure sensor, see: **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS**
- the connector
- the oil cooler for the power steering with the screws, 2 x M6, and tighten.

Lower the vehicle.

Install:

- the condenser's upper mounting screws, 2 x M6, and tighten
- the left-hand A/C pipe with the screw, 1 x M8, and tighten
- the air baffle on the condenser.

FINISHING

FILLING REFRIGERANT AND DETECTING LEAKS

Vacuum pump the air conditioning (A/C) system. See: **VACUUM PUMPING** .

Fill the system, see: **REFRIGERANT, FILLING** .

Leak trace the system. See:**LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** or: **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** .

INSTALLING THE SKID PLATE

Move the protective plate up in the bumper cover.

Press forward until the mounting brackets enter the subframe.

Fit the bolts, M10 x6.

EVAPORATOR REAR, REPLACING

REMOVAL

The illustrations in this service information are used for different model years and / or models. Some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATIONS

Remove:

- the rear climate control unit. See **CLIMATE CONTROL UNIT REAR, REPLACING**
- the rear expansion valve. See **EXPANSION VALVE REAR, REPLACING**.

NOTE: Always plug the pipes and connections when working on the climate control system.

REMOVING THE REAR EVAPORATOR

Fig. 16: Evaporator Housing Lower Cover
Courtesy of VOLVO CARS CORPORATION

Remove the 7 screws (see the illustration) and the lower cover from the evaporator housing on the rear climate control unit.

Open the snap fastener in the cover. Pull the cover straight out.

INSTALLING THE REAR EVAPORATOR

Ensure that the new insulation is correctly positioned on the evaporator. Also check the seal on the expansion valve.

Position the evaporator in the housing.

Install:

- the lower cover so that the snap fastener is secure. Install the 7 screws
- the rear expansion valve. See **EXPANSION VALVE REAR, REPLACING**
- the rear climate control module (CCM). See **CLIMATE CONTROL UNIT REAR, REPLACING**.

EVAPORATOR, REPLACING

REMOVAL

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE EVAPORATOR

Remove:

- the dashboard. See **DASHBOARD, REPLACING**
- the climate control unit. See **CLIMATE UNIT, REPLACING**.

Fig. 17: Front Seal For Refrigerant Pipe
Courtesy of VOLVO CARS CORPORATION

- the inner and outer seals for the pipe grommets.

Fig. 18: Identifying Heat Exchanger Retaining Clip And Pipe
Courtesy of VOLVO CARS CORPORATION

- the retaining clip and pipes from the heat exchanger.

Fig. 19: Identifying Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

- the sensor.

Fig. 20: Air Cleaner (ACL) And Cover
Courtesy of VOLVO CARS CORPORATION

- the 4 screws for the air cleaner (ACL) and cover.

Fig. 21: Identifying Central Electrical Unit
Courtesy of VOLVO CARS CORPORATION

- the 3 screws for the central electrical unit.

Fold out the central electrical unit. Remove the seal

Fig. 22: Identifying Blower Fan Motor And Cover
Courtesy of VOLVO CARS CORPORATION

Remove:

- the cover for the blower fan motor. The cover is secured by one screw
- the blower fan motor which is secured by four screws.

Fig. 23: Identifying Recirculation Motor Bracket Screw
Courtesy of VOLVO CARS CORPORATION

- the screw for the bracket for the recirculation motor.

Release the catches for the divisions of the upper and lower sections using a screwdriver and pipe wrench as shown in the illustration. Start at one end.

Fig. 24: Identifying Lower Section Of Evaporator
Courtesy of VOLVO CARS CORPORATION

Lift off the lower section.

Lift out the evaporator.

Fig. 25: Identifying Expansion Valve Block And Seal
Courtesy of VOLVO CARS CORPORATION

Remove:

- the expansion valve which is secured by two screws
- the expansion valve block
- the seal.

INSTALLING THE EVAPORATOR

NOTE: Use new O-rings lubricated with compressor oil.

Install:

- O rings on the evaporator pipe
- the expansion valve.

Position the evaporator in the upper fan housing.

Check that the seal sits in the correct groove at the expansion valve.

Install the lower fan housing and press so that the mounting lugs are in line with the upper half.

Ensure that the mounting lugs are correctly positioned.

Check that the seal sits in the correct groove at the expansion valve.

Press the upper fan housing into the lower.

Check that the upper fan housing is secured in the lower housing.

Install:

- new retaining clips around the fan housing so that the housing is sealed
- the central electrical unit seal
- the central electrical unit. Screw it into place
- the air cleaner (ACL) and cover
- new inner and outer seals for the pipe grommets around the heat exchanger-refrigerant pipe
- the climate control unit. See **CLIMATE UNIT, REPLACING**
- the dashboard in the car. See **DASHBOARD, REPLACING** .

EXPANSION VALVE REAR, REPLACING

REMOVAL

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATIONS

NOTE: Read the safety precautions for handling refrigerant. See REFRIGERANT, SAFETY REGULATIONS .

Drain the refrigerant from the system. See **REFRIGERANT, DRAINING** .

Remove the rear left side panel. See **SIDE PANEL CARGO COMPARTMENT, REPLACEMENT** .

NOTE: Always plug the pipes and connections when working on the climate control system.

REMOVING THE REAR EXPANSION VALVE

Fig. 26: Air Conditioning Junction Block
Courtesy of VOLVO CARS CORPORATION

Remove:

- the screw on the junction block for the air conditioning (A/C) pipes to the expansion valve
- the 2 screws for the expansion valve.

NOTE: the original O-rings for the expansion valve and the connecting air conditioning (A/C) pipes are violet and must be replaced with new yellow ones lubricated with compressor oil.

INSTALLING THE REAR EXPANSION VALVE

NOTE: For tightening torques, see GENERAL TIGHTENING TORQUE .

Install:

- the expansion valve using the 2 screws. Tighten. See **TIGHTENING TORQUE**
- the junction block with the air conditioning (A/C) pipes using the 1 M5 screw. Tighten.

Vacuum pump the air conditioning (A/C) system. See **VACUUM PUMPING** .

Fill the air conditioning (A/C) system with refrigerant. See **REFRIGERANT, FILLING** .

Leak trace the air conditioning (A/C) system. See **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** or **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** .

Install the rear left side panel. See **SIDE PANEL CARGO COMPARTMENT, REPLACEMENT** .

EXPANSION VALVE, REPLACING

REMOVAL

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATIONS

NOTE: Read the safety precautions for handling refrigerant. See REFRIGERANT, SAFETY REGULATIONS .

Drain the refrigerant from the system. See **REFRIGERANT, DRAINING** .

NOTE: Always plug the pipes and connections when working on the climate control system.

REMOVING EXPANSION VALVE

Fig. 27: Engine Stabilizer Brace
Courtesy of VOLVO CARS CORPORATION

Remove the engine stabilizer brace from the engine compartment.

Remove the mounting for the right-hand gutter.

Remove the gutter.

Fig. 28: Identifying Refrigerant Pipe Clamp On Side Member
Courtesy of VOLVO CARS CORPORATION

Open the clamp for the refrigerant pipe on the side member.

Fig. 29: Identifying Locking Bracket For Refrigerant Pipes
Courtesy of VOLVO CARS CORPORATION

Remove the heat shield over the expansion valve and remove the seal.

Remove the refrigerant pipe by slackening off the screw for the holder and pulling it back slightly.

Pull the refrigerant pipes off the expansion valve and place them carefully out of the way.

Fig. 30: Identifying Expansion Valve Screws
Courtesy of VOLVO CARS CORPORATION

Slacken off the two screws holding the expansion valve.

Remove the expansion valve.

INSTALLING THE EXPANSION VALVE

NOTE: Always use new O-rings lubricated with compressor oil.

Install:

- the O-rings on the pipe from the evaporator
- the expansion valve. Install and tighten the screws. See **TIGHTENING TORQUE**
- the O-rings on the pipes.

Position the pipes and the holder against the expansion valve. At the same time check that the pipes are correctly positioned on the holder at the member.

Install:

- the screw. Tighten the holder and the pipes on the expansion valve. See **TIGHTENING TORQUE**

- the seal and the heat shield. Screw the heat shield into place using the nuts.

Press the clamp together on the member.

Install:

- the mounting for the right-hand gutter
- the gutter
- the engine stabilizer brace in the engine compartment.

Vacuum pump the air conditioning (A/C) system. See **VACUUM PUMPING** .

Fill the air conditioning (A/C) system with refrigerant. See **REFRIGERANT, FILLING** .

Leak trace the air conditioning (A/C) system. See **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** or **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** .

MAGNET CLUTCH AC COMPRESSOR, REPLACING

Special tools:

see **9995596**

see **9995597**

see **9995598**

see **9995599**

see **9995600**

see **9995602**

see **9997193**

NOTE: The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATORY WORK

WARNING: Follow the safety instructions for work on air conditioning systems. See: REFRIGERANT, SAFETY REGULATIONS .

NOTE: First read the instructions covering slow and fast leaks. See OIL AIR

CONDITIONING (A/C) SYSTEM, FILLING .

NOTE: When replacing a compressor, always replace the O-rings in pipes and quick-release connectors.

NOTE: Always plug the pipes and connections when working on the climate control system.

Disconnect the battery negative lead. See: **BATTERY, DISCONNECTING** .

Drain the refrigerant from the system. See **REFRIGERANT, DRAINING** .

REMOVAL

REMOVING THE AUXILIARIES BELT

MY 2003-2004:

Remove the auxiliaries belt from the AC compressor according to: **AUXILIARIES BELT / BELT TENSIONER, REPLACING** .

Model year 2005-

Remove the auxiliaries belt from the AC compressor according to: **AUXILIARIES BELT / BELT TENSIONER, REPLACING** .

REMOVING AC COMPRESSOR

Fig. 31: Identifying AC Compressor Screws
Courtesy of VOLVO CARS CORPORATION

NOTE: The AC compressor is removed from below.

Loosen the screws, 2 pcs., for the AC compressor's low and high pressure hoses.

REMOVING THE PROTECTIVE COVER

NOTE: Install the front lift arms so that they do not block the sub-frame's support plates.

Raise the vehicle.

Loosen the protective cover under the engine by removing the screws, 7 pcs.

Fig. 32: Engine Under Cover Protective Panel
Courtesy of VOLVO CARS CORPORATION

Remove the 6 screws.

NOTE: There is a guide sleeve on the upper mounting for the plate. This must be lifted slightly so that the panel can be slid forward.

Lift and slide the protective panel forward.

Fig. 33: Identifying Cable Channel And Sub-Frame
Courtesy of VOLVO CARS CORPORATION

Remove the screw, 1 pc., for the cable channel and loosen the cable channel from the sub-frame.

On certain variants: remove or loosen the control module box's air channel from the sub-frame.

Fig. 34: Identifying Air Conditioning (A/C) Compressor
Courtesy of VOLVO CARS CORPORATION

Remove:

- low and high pressure hoses from the AC compressor and move them aside
- the connector for the AC compressor's magnet (solenoid) clutch
- the screws, 4 pcs., from the AC compressor.

Hold the cable channel to the side and remove the AC compressor by removing it between the sub-frame and the car body.

REMOVING THE DRIVE PLATE

Fig. 35: Loosening Drive Plate Screw With A Counter Hold
Courtesy of VOLVO CARS CORPORATION

Loosen the screw, 1 pc., for the drive plate using a counterhold: see **9995596** .

Fig. 36: Identifying Drive Plate
Courtesy of VOLVO CARS CORPORATION

Loosen the drive plate with a puller: see **9995597** .

NOTE: Keep the shims.

REMOVING BELT PULLEY'S LOCK RING

Fig. 37: Identifying Lock Ring Installation
Courtesy of VOLVO CARS CORPORATION

Remove the lock ring.

REMOVING THE PULLEY

Fig. 38: Identifying Belt Pulley & Puller
Courtesy of VOLVO CARS CORPORATION

Pull loose the belt pulley with a puller: see **9995598** and sleeve: see **9995599** .

REMOVING THE SOLENOID COIL

Fig. 39: Identifying Magnet Coil
Courtesy of VOLVO CARS CORPORATION

Remove the magnet coil.

INSTALLATION

INSTALLING THE SOLENOID COIL

Fig. 40: Identifying Magnet Coil
Courtesy of VOLVO CARS CORPORATION

Install the screws, 3 pcs., for the new magnet coil (solenoid). Tighten with 5 Nm.

INSTALLING THE PULLEY

Fig. 41: Identifying Belt Pulley & Puller
Courtesy of VOLVO CARS CORPORATION

Install the new belt pulley with a puller: see **9995598** and sleeve: see **9995600** .

NOTE: Install the tools behind the AC compressor mounts.

INSTALLING THE LOCK RING

Fig. 42: Identifying Lock Ring Installation
Courtesy of VOLVO CARS CORPORATION

Install the lock ring.

INSTALLING THE DRIVE PLATE

Fig. 43: Identifying Drive Plate Shims
Courtesy of VOLVO CARS CORPORATION

Install the shims.

Fig. 44: Tightening Screw Using With A Counter Hold
Courtesy of VOLVO CARS CORPORATION

Install:

- the drive plate
- the screw, 1 pc., using a counterhold: see **9997193** and tighten with 13 Nm.

CHECKING THE CLEARANCE

Fig. 45: Checking Turning Plate And Belt Pulley Clearance With Feeler Gauge
Courtesy of VOLVO CARS CORPORATION

Check the clearance between the turning plate and the belt pulley with a feeler gauge.

The clearance should be 0.3-0.5 mm.

0.3 mm clearance all the way round

It must not be possible to insert 0.6 mm at any point.

If clearance is not within given values, replace the shims.

The following dimensions are available:

0.2 mm

0.3 mm

1.0 mm.

INSTALLING THE AIR CONDITIONING (A/C) COMPRESSOR

Fig. 46: Identifying Air Conditioning (A/C) Compressor
Courtesy of VOLVO CARS CORPORATION

If necessary, fill oil in the AC compressor according to: **OIL AIR CONDITIONING (A/C) SYSTEM, FILLING** .

Hold the cable channel to the side and install the AC compressor by inserting it between the sub-frame and the car body.

Install the screws, 4 pcs. M8, for the AC compressor and tighten.

NOTE: Always use new O-rings lubricated with compressor oil.

Install:

- AC compressor's low and high pressure hoses. On certain vehicle models, it may be easier to install and tighten the screws from above
- the magnetic clutch connector.

Fig. 47: Identifying Sub-Frame Cable Channel
Courtesy of VOLVO CARS CORPORATION

Install the cable channel on the sub-frame and bolt it down.

On certain variants, the cable channel is mounted on the control module box and then on the sub-frame.

INSTALLING THE AUXILIARIES BELT

MY 2003-2004

Install the auxiliaries belt on the AC compressor according to: **AUXILIARIES BELT / BELT TENSIONER, REPLACING** .

MY 2005

Install the auxiliaries belt on the AC compressor according to: **AUXILIARIES BELT / BELT TENSIONER, REPLACING** .

INSTALLING THE BATTERY NEGATIVE CABLE

Fit the battery's negative cable in accordance with: **BATTERY, DISCONNECTING** .

REFRIGERANT AND LEAK DETECTION

Vacuum pump side. See: **VACUUM PUMPING** .

Fill the system with refrigerant according to: **REFRIGERANT, FILLING** .

Check for system leaks according to: **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** or according to: **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** .

FINISHING

Fig. 48: Identifying Protective Engine Cover Screws
Courtesy of VOLVO CARS CORPORATION

Install:

- the catches in the protective casing's front edge and press forward
- the screws, 2 pcs., for the front protective cover.

INSTALLING THE SPLASH GUARD

Install:

- the splash guard under the engine
- the screws, 7 pcs., and tighten.

Lower the vehicle.

NEEDLE JET / SERVICE VALVE, REPLACING

Special tools:

see **9511204**

see **9811994**

REMOVAL

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE NEEDLE JET / SERVICE VALVE

Fig. 49: Disconnecting Battery Lead
Courtesy of VOLVO CARS CORPORATION

Remove the battery lead. See **BATTERY, DISCONNECTING** .

Fig. 50: Identifying Needle Valve
Courtesy of VOLVO CARS CORPORATION

Remove the valve cap.

Drain the refrigerant from the system. See **REFRIGERANT, DRAINING** .

Remove the needle jet in the service valve. Use special tool see **9511204** .

INSTALLING THE NEEDLE JET / SERVICE VALVE

Install the needle jet. Use special tool see **9511204** .

Tighten the needle jet. Use special tool see **9811994** . Tighten to **6 Nm** .

NOTE: Use only your finger and thumb when tightening the needle jet to avoid damage to the valve seal.

Vacuum pump. See **VACUUM PUMPING** .

Fill the system with refrigerant. See **REFRIGERANT, FILLING** .

Test for leaks. See **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** or **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** .

Install the battery lead. See **BATTERY, DISCONNECTING** .

PIPE/HOSE COMPRESSOR, REPLACING

REMOVAL

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATIONS

WARNING: Follow the safety instructions for work on air conditioning systems. See REFRIGERANT, SAFETY REGULATIONS .

Read the instructions covering slow and fast leaks. See **OIL AIR CONDITIONING (A/C) SYSTEM, FILLING** .

Always plug the pipes and couplings when working on the climate control system.

Drain the refrigerant from the system. See **REFRIGERANT, DRAINING** .

REMOVING THE PIPE/HOSE FROM THE COMPRESSOR - CONDENSER

Fig. 51: Air Conditioning Pipe Installation Bolt
Courtesy of VOLVO CARS CORPORATION

Remove the charge air hose on the right-hand side.

Disconnect the pipe / hose from the compressor.

Remove:

- 1 screw from the hose / pipe coupling between the compressor and the condenser (see the illustration)
- the left-hand headlamp. See **LIGHTING - REMOVAL, REPLACEMENT AND INSTALLATION**
- the pipe from the retaining clip on the condenser. Carefully put the pipe to one side.

Fig. 52: Splash Guard Protective Plate And Screws
Courtesy of VOLVO CARS CORPORATION

- the splash guard under the car.

REMOVING THE PIPE/HOSE FROM THE COMPRESSOR - JUNCTION BLOCK ON THE SIDE MEMBER

Remove:

- the charge air hose on the right-hand side
- the pipe / hose from the compressor to the junction block.

INSTALLING THE PIPE/HOSE ON THE COMPRESSOR - CONDENSER

NOTE: For tightening torques, see GENERAL TIGHTENING TORQUE

NOTE: Always use new O-rings lubricated with compressor oil.

Position the pipe / hose in the mounting on the condenser and pipe coupling.

Install 1 M8 screw. Tighten.

Position the pipe and hose connection on the compressor.

Install:

- 1 M8 screw. Tighten
- the charge air hose on the right-hand side.

INSTALLING THE PIPE/HOSE PM THE COMPRESSOR - JUNCTION BLOCK ON THE SIDE MEMBER

Install the pipe / hose from the compressor to the junction block.

NOTE: Ensure that the pipe / hose is in front of the electrical ducts.

Install the charge air hose on the right-hand side.

FINISHING

Vacuum pump the air conditioning (A/C) system. See **VACUUM PUMPING** .

Fill the air conditioning (A/C) system with refrigerant. See **REFRIGERANT, FILLING** .

Leak trace the air conditioning (A/C) system. See **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** or **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** .

PIPES / HOSES, REPLACING

REMOVAL

The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATIONS (OPERATIONS COMMON TO ALL METHODS)

WARNING: Follow the safety instructions for work on air conditioning systems. See REFRIGERANT, SAFETY REGULATIONS .

NOTE: Read the instructions covering slow and fast leaks. See OIL AIR CONDITIONING (A/C) SYSTEM, FILLING .

Always plug the pipes and connections when working on the climate control system.

Drain the refrigerant from the air conditioning (A/C) system. See **REFRIGERANT, DRAINING** .

Remove:

- the battery lead. See **BATTERY, DISCONNECTING**
- the rear side panel. See **SIDE PANEL CARGO COMPARTMENT, REPLACEMENT** .

REMOVING PIPES / HOSES (OPERATIONS COMMON TO ALL METHODS)

Fig. 53: Identifying Servo Oil Reservoir And Expansion Tank
Courtesy of VOLVO CARS CORPORATION

Remove:

- the engine stabilizer brace in the engine compartment
- the servo oil reservoir. Place it on top of the engine
- the hose from the expansion tank using cutting nippers or Oetiker pincers
- the connector for the level sensor
- the connector at the cable duct
- the expansion tank and place it on top of the engine
- the outlet air pipe to the firewall from the control module box.

Fig. 54: Identifying Refrigerant Pipe Clamp On Side Member
Courtesy of VOLVO CARS CORPORATION

Open the clamp for the refrigerant pipe on the side member.

Remove:

- the plastic nut from the drainage duct to the gutter in the right-hand corner
- the drainage channel.

Fig. 55: Identifying Locking Bracket For Refrigerant Pipes
Courtesy of VOLVO CARS CORPORATION

- the heat shield for the expansion valve
- the screw and the pipe holder that secure the refrigerant pipes to the expansion valve.

Fig. 56: Identifying Expansion Valve Pipes
Courtesy of VOLVO CARS CORPORATION

Remove:

- the pipes from the expansion valve. Pull the pipe holder backwards
- the pipe lock from the pipe holder. Remove the lock and the holder.

To replace the pipes for the expansion valve - junction block on the side member, see **PIPES EXPANSION VALVE - JUNCTION POINT SIDE MEMBER, REPLACE**.

To replace the expansion valve in the receiver drier, see **PIPES RECEIVER DRIER - EXPANSION VALVE, REPLACING**.

To replace the junction block in the cowl, rear expansion valve, see **PIPE/HOSE JUNCTION BLOCK COWL - REAR EXPANSION VALVE, REPLACING**.

FINISHING WORK (OPERATIONS COMMON TO ALL METHODS)

Install the battery lead. See **BATTERY, DISCONNECTING** .

Vacuum pump the air conditioning (A/C) system. See **VACUUM PUMPING** .

Fill the air conditioning (A/C) system with refrigerant. See **REFRIGERANT, FILLING** .

Leak trace the air conditioning (A/C) system. See **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** or **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** .

Install the rear side panel. See **SIDE PANEL CARGO COMPARTMENT, REPLACEMENT** .

PIPES EXPANSION VALVE - JUNCTION POINT SIDE MEMBER, REPLACE

REMOVING PIPES FROM THE EXPANSION VALVE - JUNCTION BLOCK ON THE SIDE MEMBER

Fig. 57: Identifying Hose/Pipe From Member To Compressor
Courtesy of VOLVO CARS CORPORATION

Remove:

- the hose / pipe from the member to the compressor
- the pipe from the receiver drier to the expansion valve from the mounting at the junction block
- the pipe from the member at the pipe coupling.

Detach the pipe at the expansion valve.

Position the front section of the pipe above the front cover plate.

Pull the rear edge of the pipe up and out. Remove the pipe.

Fig. 58: Identifying Pipe Above Front Cover Plate
Courtesy of VOLVO CARS CORPORATION

INSTALLING PIPES FOR THE EXPANSION VALVE - JUNCTION BLOCK ON THE SIDE MEMBER

Position the refrigerant pipe against the firewall.

Install the front section of the pipe.

NOTE: Use new O-rings lubricated with compressor oil.

Install:

- the pipe on the member at the pipe connection using 1 M8 screw. Tighten
- the hose / pipe from the member to the compressor
- the pipe lock on the pipe holder
- the pipe on the expansion valve using 1 M6 screw. Tighten
- the heat shield for the expansion valve
- the drainage channel and the plastic nut
- the clamp for the refrigerant pipe
- the outlet air pipe

- the expansion tank
- the connector at the cable duct
- the switch for the level sensor
- the hose on the expansion valve
- the servo oil reservoir
- the engine stabilizer brace in the engine compartment.

Carry out finishing work. See **FINISHING WORK (OPERATIONS COMMON TO ALL METHODS)**.

PIPES RECEIVER DRIER - EXPANSION VALVE, REPLACING

REMOVING PIPES FROM THE RECEIVER DRIER PIPE - EXPANSION VALVE

Fig. 59: Identifying Tube Removal Procedures (1 Of 2)
Courtesy of VOLVO CARS CORPORATION

Remove:

- the pipe for the expansion valve - junction block. See **PIPES EXPANSION VALVE - JUNCTION POINT SIDE MEMBER, REPLACE**
- the protective panel and the right-hand outer panel on the bumper.

Detach the pipe coupling from the receiver drier.

Position the pipe at the front.

Pull the rear edge of the pipe up and out. Remove the pipe.

Fig. 60: Identifying Tube Removal Procedures (2 Of 2)
Courtesy of VOLVO CARS CORPORATION

INSTALLING THE PIPES FOR THE RECEIVER DRIER PIPE - EXPANSION VALVE

Fig. 61: Receiver Drier Pipes
Courtesy of VOLVO CARS CORPORATION

Position:

- the front section of the pipes in the engine compartment
- the rear section of the pipes against the firewall.

NOTE: Use new O-rings lubricated with compressor oil.

Connect the pipe to the receiver drier.

Install:

- the hose / pipe from the member to the compressor
- the pipe lock on the pipe holder
- the pipe on the expansion valve using 1 M6 screw. Tighten
- the heat shield for the expansion valve
- the drainage channel and the plastic nut
- the clamp for the refrigerant pipe
- the outlet air pipe

- the expansion tank
- the connector at the cable duct
- the switch for the level sensor
- the hose on the expansion valve
- the servo oil reservoir
- the engine stabilizer brace in the engine compartment.

Carry out finishing work. See **FINISHING WORK (OPERATIONS COMMON TO ALL METHODS)**.

PIPE/HOSE JUNCTION BLOCK COWL - REAR EXPANSION VALVE, REPLACING

REMOVING THE PIPE / HOSE FROM THE JUNCTION BLOCK ON THE COWL - REAR EXPANSION VALVE

Remove:

- the left front seat. See **UPHOLSTERY BACK REST, REPLACING** (-2004) or **FRONT SEAT, REPLACING** (2005-)
- the dashboard. See **DASHBOARD, REPLACING** .

Angle out the climate control unit. See **CLIMATE UNIT, REPLACING**.

Remove the rear sill trim panel. See **SILL TRIM PANEL, REPLACING** .

Lift the rear floor carpet and the lower floor surface to one side.

Remove the rear side panel. See **SIDE PANEL CARGO COMPARTMENT, REPLACEMENT** .

Detach the connection at the junction block in the engine room for the rear pipes.

Remove the heat deflector and the seal on the cowl panel.

Disconnect the terminal at the rear air conditioning (A/C) unit.

INSTALLING THE PIPE / HOSE ON THE JUNCTION BLOCK ON THE COWL - REAR EXPANSION VALVE

Fig. 62: Installing A/C Pipe Hoses
Courtesy of VOLVO CARS CORPORATION

Position the pipe / hose against the cowl panel. Route the pipe into the passenger compartment along the left-hand side of the center console and on along the right-hand side to the rear air conditioning (A/C) unit.

Secure the pipe at the various mounting points (see the illustration).

Connect the pipe at the rear air conditioning (A/C) unit.

Install:

- the heat deflector and the seal on the cowl panel.

Fig. 63: Engine Compartment Junction Block Connection
Courtesy of VOLVO CARS CORPORATION

- the connection at the junction block in the engine room for the rear pipes (see the illustration).
- the rear floor carpet and the lower floor surface
- the rear sill trim panel. See **SILL TRIM PANEL, REPLACING**
- the climate control unit. See **CLIMATE UNIT, REPLACING**
- the dashboard. See **DASHBOARD, REPLACING**
- the left front seat. See **UPHOLSTERY BACK REST, REPLACING** (-2004) or **FRONT SEAT, REPLACING** (2005-).

Carry out finishing work. See **FINISHING WORK (OPERATIONS COMMON TO ALL METHODS)**.

PIPES RECEIVER DRIER, REPLACING

REMOVAL

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATIONS

Fig. 64: Identifying Drier Hoses And Condenser
Courtesy of VOLVO CARS CORPORATION

WARNING: **Follow the safety instructions for work on air conditioning (A/C) systems. See REFRIGERANT, SAFETY REGULATIONS .**

NOTE: **Read the instructions covering slow and fast leaks. See OIL AIR CONDITIONING (A/C) SYSTEM, FILLING .**

NOTE: **Always plug the pipes and connections when working on the climate control system.**

REMOVING RECEIVER DRIER PIPE

Drain the refrigerant from the system. See **REFRIGERANT, DRAINING** .

Fig. 65: Splash Guard. Protective Plate And Screws
Courtesy of VOLVO CARS CORPORATION

Remove the splash guard under the car.

Fig. 66: Identifying Receiver/Dryer Pipe Coupling
Courtesy of VOLVO CARS CORPORATION

Detach the pipe coupling from the receiver.

Slacken off the tensioner screw in the mounting for the bracket a few turns.

Remove the right-hand headlamp. See **LIGHTING - REMOVAL, REPLACEMENT AND INSTALLATION** .

Disconnect the pipe coupling form the top of the receiver. Lift the pipe out of the mounting.

INSTALLING THE PIPE FOR THE RECEIVER / DRIER

NOTE: Use new O-rings lubricated with compressor oil.

Position the pipe on the mounting in the bracket. Position the pipe coupling on the receiver.

Tighten the tensioner screw for the mounting in the bracket a few turns. Tighten to **10 Nm** .

Secure the pipe coupling from the condenser to the receiver. Tighten to **10 Nm** .

Vacuum pump. See **VACUUM PUMPING** .

Fill the system with refrigerant. See **REFRIGERANT, FILLING** .

Test for leaks. See **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** or **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** .

Install the right-hand headlamp. See **LIGHTING - REMOVAL, REPLACEMENT AND INSTALLATION** .

Fig. 67: Splash Guard. Protective Plate And Screws
Courtesy of VOLVO CARS CORPORATION

Install the splash guard under the car.

RECEIVER DRIER, REPLACING

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVAL

DRAINING COOLANT AND REMOVING COMPONENTS

WARNING: Follow the safety instructions for work on air conditioning systems. See: REFRIGERANT, SAFETY REGULATIONS .

NOTE: First read the instructions covering slow and fast leaks. See OIL AIR CONDITIONING (A/C) SYSTEM, FILLING .

NOTE: Always plug the pipes and connections when working on the climate control system.

Drain the refrigerant from the system. See **REFRIGERANT, DRAINING** .

REMOVING THE AIR BAFFLE

Fig. 68: Air Baffle
Courtesy of VOLVO CARS CORPORATION

Remove the air baffle.

REMOVING THE SKID PLATE

Fig. 69: Skid Plate
Courtesy of VOLVO CARS CORPORATION

Raise the vehicle.

Remove the 6 screws.

Lift and slide the splash guard forward.

NOTE: **There is a guide sleeve on the upper mounting for the plate. This must be lifted slightly so that the panel can be slid forward.**

REMOVAL

REMOVING THE PRESSURE SENSOR

Fig. 70: Right-Hand A/C Pipe Connection
Courtesy of VOLVO CARS CORPORATION

Remove:

- right-hand A/C pipe connection sleeve, x 1
- the connector of the pressure sensor
- the pressure sensor.

Fig. 71: Receiver Drier Installation Screw
Courtesy of VOLVO CARS CORPORATION

Remove the lower screw, x 1, holding the drier in place.

Fig. 72: Identifying Condenser Upper Mountings & Screws
Courtesy of VOLVO CARS CORPORATION

Lower the vehicle.

Remove the upper right-hand mounting screw, x 1, on the rear side of the condenser.

REMOVING THE RECEIVER DRIER

Fig. 73: Upper Right-Hand Mounting Screw
Courtesy of VOLVO CARS CORPORATION

Remove:

- the upper right-hand mounting screw, x 1, on the condenser.
- the drier by alternately pulling the drier up and carefully moving it sideways across the car.

NOTE: If the drier filter is jammed then it can be carefully pried away from the connection/lower mounting on the condenser using a slotted screwdriver.

INSTALLATION

NOTE: For tightening torques, see: TIGHTENING TORQUE .

INSTALLING THE DRIER AND COMPONENTS

Fill compressor oil in the drier, see: **OIL AIR CONDITIONING (A/C) SYSTEM, FILLING** .

NOTE: Always use new O-rings lubricated with compressor oil.

Install:

- the drier by pressing it in and screwing in the upper screw at the service valve, x 1, see: **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS** and tighten
- upper right mounting screw, 1 x M6. **Use:** locking fluid, 1161075 and tighten. See: **TIGHTENING TORQUE**
- the air baffle around the condenser.

Raise the vehicle.

Install:

- the lower mounting screw to the drier, see: **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS**
- the pressure sensor. See: **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS**
- the connector
- the A/C pipe with the screw, 1 x M6, and tighten.

FINISHING

NOTE: For tightening torques, see: TIGHTENING TORQUE .

FILLING WITH REFRIGERANT AND LEAK TRACING

Vacuum pump the air conditioning (A/C) system. See: **VACUUM PUMPING** .

Fill the system. See: **REFRIGERANT, FILLING** .

Leak trace the system. See: **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** or: **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** .

INSTALLING THE SKID PLATE

Install and tighten the 6 x M10 screws crosswise.

AIR CONDITIONING (B6294T; 2003-2005)

COMPRESSOR, REPLACING

see **COMPRESSOR, REPLACING**

CONDENSER, REPLACING

NOTE: As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

NOTE: Chassis number limit, see below:

XC90 with chassis no. from and including 196988, see: CONDENSER, REPLACING.

PREPARATIONS

Read the safety regulations for handling refrigerant according to: **REFRIGERANT, SAFETY REGULATIONS** .

Read the instructions for slow and fast leaks according to: **OIL AIR CONDITIONING (A/C) SYSTEM, FILLING** .

Drain the refrigerant from the AC-system according to: **REFRIGERANT, DRAINING** .

NOTE: Always plug the pipes and connections when working on the climate control system.

REMOVING THE CONDENSER

Fig. 74: Link From The Hood Release Catch
Courtesy of VOLVO CARS CORPORATION

Remove:

- the battery lead according to: **BATTERY, DISCONNECTING**
- the left and right headlights according to: **LIGHTING - REMOVAL, REPLACEMENT AND INSTALLATION**
- the connector for the pressure sensor on the drier filter
- the link for the bonnet opener
- the pipe coupling from above to the left section of the condenser.

Remove:

- the pipe from the retaining clip and move it to one side
- the two upper mountings for the condenser.

Fig. 75: Splash Guard. Protective Plate And Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the splash guard under the car
- the bumper shell. See **CASING BUMPER FRONT, REPLACING**
- the seal on the condenser
- the pipe coupling from the receiver drier.

Fig. 76: Condenser 2 Lower Mounting Screws
Courtesy of VOLVO CARS CORPORATION

Slacken off the 2 lower mounting screws for the condenser.

Remove the condenser.

INSTALLING THE CONDENSER

NOTE: Always use new O-rings lubricated with oil.

Position the condenser.

Check that the condenser is in the correct position in relation to the air conditioning aggregate.

Tighten the lower 2 screws for the condenser.

Position the hose / pipe from the compressor in the mounting clips. Then place the hose / pipe in the pipe coupling on the left-hand side of the condenser.

NOTE: The hose / pipe must be secured to the retaining clip to ensure that it is correctly positioned before the protective panel is installed.

Fig. 77: Splash Guard. Protective Plate And Screws
Courtesy of VOLVO CARS CORPORATION

Install:

- the hose connector on the receiver drier and tighten
- the splash guard under the car
- the connector on the receiver drier
- the seal on the condenser.

Tighten:

- the upper mountings for the condenser
- the screw for the hose connector from the compressor on the left-hand side of the condenser.

Fig. 78: Link From The Hood Release Catch
Courtesy of VOLVO CARS CORPORATION

Install:

- the link for the bonnet release catch (see the illustration)
- the headlights acc to: **LIGHTING - REMOVAL, REPLACEMENT AND INSTALLATION**
- the bumper shell. See **CASING BUMPER FRONT, REPLACING** .

FINISHING

Install the battery cable. See **BATTERY, DISCONNECTING** .

Vacuum pump the air conditioning (A/C) system. See: **VACUUM PUMPING** .

Fill the AC-system with refrigerant according to: **REFRIGERANT, FILLING** .

Check the AC-system for leaks according to: **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** alternatively: **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** .

EVAPORATOR REAR, REPLACING

see **EVAPORATOR REAR, REPLACING**

EVAPORATOR, REPLACING

see **EVAPORATOR, REPLACING**

EXPANSION VALVE REAR, REPLACING

see **EXPANSION VALVE REAR, REPLACING**

EXPANSION VALVE, REPLACING

see **EXPANSION VALVE, REPLACING**

MAGNETIC CLUTCH COMPRESSOR, REPLACING

Special tools:

see **9995596**

see **9995598**

see **9995599**

see **9995600**

see **9995597**

see **9995602**

REMOVAL

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATIONS

WARNING: **Read the safety instructions for work on air conditioning systems. See REFRIGERANT, SAFETY REGULATIONS .**

Read the instructions covering slow and fast leaks. See **OIL AIR CONDITIONING (A/C) SYSTEM, FILLING** .

NOTE: **When replacing a compressor, always replace the O-rings in the pipes and quick-release connectors.**

NOTE: **Always plug the pipes and connections when working on the climate control system.**

Fig. 79: Identifying Clutch Plate And Counterhold
Courtesy of VOLVO CARS CORPORATION

Remove the compressor See **COMPRESSOR, REPLACING**.

REMOVING THE MAGNETIC CLUTCH COMPRESSOR

Fig. 80: Identifying Shims
Courtesy of VOLVO CARS CORPORATION

Slacken off the screw for the clutch plate. Use special tool see **9995596** .

Fig. 81: Identifying Snap Ring
Courtesy of VOLVO CARS CORPORATION

Remove the clutch plate. Use a puller, special tool see **9995597** .

Keep the shims.

Fig. 82: Identifying Puller And Socket
Courtesy of VOLVO CARS CORPORATION

Remove the snap ring.

Fig. 83: Identifying Magnet Coil
Courtesy of VOLVO CARS CORPORATION

Pull off the pulley. Use a puller, special tool see **9995598** and socket, special tool see **9995599** .

Remove the magnet coil.

INSTALLING THE MAGNETIC CLUTCH FOR THE COMPRESSOR

Fig. 84: Identifying Magnet Coil
Courtesy of VOLVO CARS CORPORATION

Install a new magnetic coil. Tighten. See **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS** .

Fig. 85: Identifying Puller And Socket
Courtesy of VOLVO CARS CORPORATION

Install a new pulley. Use a puller, special tool see **9995598** and socket, special tool see **9995600** .

NOTE: Position the tools behind the compressor mountings.

Fig. 86: Identifying Snap Ring
Courtesy of VOLVO CARS CORPORATION

Install the snap ring.

Fig. 87: Identifying Shims
Courtesy of VOLVO CARS CORPORATION

Install the shims.

Fig. 88: Identifying Clutch Plate And Counterhold
Courtesy of VOLVO CARS CORPORATION

Install the clutch plate. Install 1 screw using a counterhold, special tool see **9995596** . Tighten. See **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS** .

Fig. 89: Identifying Feeler Gauge Between Clutch Plate And Pulley
Courtesy of VOLVO CARS CORPORATION

Check the clearance between the clutch plate and pulley. Use a feeler gauge.

The clearance should be 0.3-0.5 mm.

There must be 0.3 mm clearance all the way around.

Replace the shims if the clearance is not within the given values. The following dimensions are available:

0.2 mm

0.3 mm

1.0 mm

Install the compressor. See **COMPRESSOR, REPLACING**.

NEEDLE JET / SERVICE VALVE, REPLACING

see **NEEDLE JET / SERVICE VALVE, REPLACING**

PIPE/HOSE COMPRESSOR, REPLACING

see **PIPE/HOSE COMPRESSOR, REPLACING**

PIPES / HOSES, REPLACING

see **PIPES / HOSES, REPLACING**

PIPES RECEIVER DRIER, REPLACING

see **PIPES RECEIVER DRIER, REPLACING**

RECEIVER DRIER, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

NOTE: **Chassis number limit, see below.**

XC90 with chassis no. from and including 196988, see: RECEIVER DRIER, REPLACING.

PREPARATIONS

Read the safety regulations for handling refrigerant according to: **REFRIGERANT, SAFETY REGULATIONS** .

Drain the refrigerant from the AC-system according to: **REFRIGERANT, DRAINING** .

Remove the right headlight according to: **LIGHTING - REMOVAL, REPLACEMENT AND INSTALLATION** .

REMOVING THE RECEIVER DRIER

Fig. 90: Splash Guard. Protective Plate And Screws
Courtesy of VOLVO CARS CORPORATION

Remove the splash guard under the car.

Fig. 91: Identifying Pipe Coupling & Condenser
Courtesy of VOLVO CARS CORPORATION

Remove:

- the connector for the pressure sensor
- the intermediate pipe according to: **PIPES RECEIVER DRIER, REPLACING**
- the pipe coupling from the condenser
- the screw for the bracket
- the receiver drier.

INSTALLING THE RECEIVER DRIER

NOTE: For tightening torques, see: GENERAL TIGHTENING TORQUE .

NOTE: Always use new O-rings lubricated with compressor oil.

Position the receiver drier in the bracket so that the pipe from the condenser is correctly positioned.

Install:

- the screw for the bracket
- the screw for the pipe coupling between the condenser and the receiver drier. Tighten.

Tighten the screw for the bracket.

Install:

- the intermediate pipe according to: **PIPES RECEIVER DRIER, REPLACING**
- the connector to the pressure sensor on the receiver drier.

Vacuum pump the air conditioning (A/C) system. See: **VACUUM PUMPING** .

Fill the AC-system with refrigerant according to: **REFRIGERANT, FILLING** .

Check the AC-system for leaks according to: **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** alternatively: **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** .

Install the right headlight according to: **LIGHTING - REMOVAL, REPLACEMENT AND INSTALLATION** .

Fig. 92: Splash Guard. Protective Plate And Screws
Courtesy of VOLVO CARS CORPORATION

Install the splash guard under the car.

AIR CONDITIONING (B8444S; 2006-2011)

COMPRESSOR, REPLACING

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATORY WORK

DRAINING THE AIR CONDITIONING (A/C) SYSTEM

WARNING: Follow the safety instructions for work on air conditioning systems. See: REFRIGERANT, SAFETY REGULATIONS .

Read the instructions covering slow and fast leaks. See: **OIL AIR CONDITIONING (A/C) SYSTEM, FILLING** .

CAUTION: Always use new O-rings lubricated with compressor oil.

NOTE: Always plug the pipes and connections when working on the climate control system.

Drain the air conditioning (A/C) system. See : **REFRIGERANT, DRAINING** .

Remove the drive belt. See: **AUXILIARIES BELT/BELT TENSIONER, REPLACEMENT** .

REMOVING THE ENGINE COOLING FAN

Remove the engine cooling fan (FC). See **ENGINE COOLING FAN (FC), REPLACING** .

REMOVAL

REMOVING ELECTRICAL CONNECTORS AND PIPES/HOSES TO THE COMPRESSOR

Fig. 93: Identifying Lower Coolant Hose/Connector
Courtesy of VOLVO CARS CORPORATION

Hang the lower coolant hose (1) to one side.

Remove:

- the 2 x connectors (2)
- the hose / pipe connections to the compressor and push them to one side.

HINT: Plug the terminals of the compressor using the transport plugs from the new compressor.

REMOVING THE COMPRESSOR

Fig. 94: Compressor Mounting Bolts
Courtesy of VOLVO CARS CORPORATION

Remove the lower mounting screw (1) at the pulley. The screw can be reached from underneath after the splash guard for the engine has been removed. The screw is in the right hand corner of the sub-frame.

NOTE: The screw cannot be removed from this position.

Remove:

- the screw (2) underneath the compressor hose / pipe terminals
- the upper mounting screw (3) at the pulley.

NOTE: This screw is longer than the other two screws.

Fig. 95: Removing Compressor
Courtesy of VOLVO CARS CORPORATION

Withdraw the compressor slightly. Remove the lower left-hand mounting screw.

Remove the compressor with the connectors turned outwards (as shown in the illustration).

INSTALLATION

NOTE: For tightening torques, see: TIGHTENING TORQUE .

INSTALLING THE COMPRESSOR

Fig. 96: Installing Compressor
Courtesy of VOLVO CARS CORPORATION

If necessary fill or check the oil in the compressor. See **OIL AIR CONDITIONING (A/C) SYSTEM, FILLING** .

Install the compressor with the connectors turned outwards (as shown in the illustration). Position the compressor in the sub-frame.

Install the lower, left hand mounting screw.

CAUTION: Ensure that the electrical cables are not trapped behind the compressor. The electrical cables must be pulled in tight to the compressor under the pipe / hose connectors.

Install:

- the compressor with 3 x M8 screws. Tighten
- the pipes/hoses to the compressor
- the connectors
- the lower coolant hose.

FINISHING

INSTALLING COMPONENTS

Install the drive belt. See: **AUXILIARIES BELT/BELT TENSIONER, REPLACEMENT** .

NOTE: Do not install the skid plate yet.

Install the engine cooling fan. See: **ENGINE COOLING FAN (FC), REPLACING** .

FUNCTION CHECK WITH LEAK TRACING

Vacuum pump the air conditioning (A/C) system. See: **VACUUM PUMPING** .

Fill the air conditioning (A/C) system with refrigerant. See: **REFRIGERANT, FILLING** .

Leak trace the air conditioning (A/C) system. See: **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** or **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** .

CHECKING THE PERFORMANCE

Carry out a performance test of the climate control unit. See **CLIMATE SYSTEM, PERFORMANCE TEST** .

CONDENSER, REPLACING

see **CONDENSER, REPLACING**

EVAPORATOR REAR, REPLACING

see **EVAPORATOR REAR, REPLACING**

EVAPORATOR, REPLACING

see **EVAPORATOR, REPLACING**

EXPANSION VALVE REAR, REPLACING

see **EXPANSION VALVE REAR, REPLACING**

EXPANSION VALVE, REPLACING

see **EXPANSION VALVE, REPLACING**

MAGNETIC CLUTCH COMPRESSOR, REPLACING

Special tools	
	T9997193 ANVIL BLOCK **Tool number:** T9997193 **Tool description:** ANVIL BLOCK

Tool boards:

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATORY WORK

REMOVING THE COMPRESSOR

WARNING: **Follow the safety instructions for work on air conditioning systems. See: REFRIGERANT, SAFETY REGULATIONS .**

Read the instructions for slow and fast leaks according to: **OIL AIR CONDITIONING (A/C) SYSTEM, FILLING** .

CAUTION: **When replacing a compressor, always replace the O-rings in the pipes and quick-release connectors.**

NOTE: **Always plug the pipes and connections when working on the climate control system.**

Remove the compressor. See **COMPRESSOR, REPLACING**.

REMOVAL

REMOVING THE DRIVE PLATE

Fig. 97: Removing Drive Plate
Courtesy of VOLVO CARS CORPORATION

Loosen the screw for the drive plate. see **9997193** .

Remove the drive plate by pulling it straight out.

NOTE: **Ensure that the shims between the compressor shaft and the drive plate do not come off.**

REMOVING THE PULLEY

Fig. 98: Identifying Snap Ring
Courtesy of VOLVO CARS CORPORATION

Remove:

- the snap ring
- the pulley.

REMOVING THE MAGNETIC COIL AND CABLE

NOTE: **Note the position of the solenoid coil cable in relation to the compressor housing.**

Fig. 99: Identifying Solenoid Coil Snap Ring
Courtesy of VOLVO CARS CORPORATION

Remove:

- the snap ring for the solenoid coil. See the illustration
- the solenoid coil
- the screw for the electrical cable for the solenoid coil
- the connector for the solenoid coil.

INSTALLATION

INSTALLING THE SOLENOID COIL AND THE ELECTRICAL CABLE

Fig. 100: Identifying Solenoid Coil Snap Ring
Courtesy of VOLVO CARS CORPORATION

Install:

- the solenoid coil as noted previously
- the snap ring for the solenoid coil. See the illustration
- the connector for the solenoid coil
- the screw for the electrical cable for the solenoid coil.

INSTALLING THE PULLEY

Fig. 101: Identifying Snap Ring
Courtesy of VOLVO CARS CORPORATION

Install:

- a new pulley
- the snap ring for the pulley.

INSTALLING THE DRIVE PLATE

Fig. 102: Installing Drive Plate
Courtesy of VOLVO CARS CORPORATION

see **9997193** and install the drive plate with the screw, 1 pc. Tighten according to: **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS** .

FINISHING

CHECKING CLEARANCE

Use a feeler gauge. Check the clearance between the turntable and the pulley. Measure at several points around the turntable.

The clearance must be between 0.4 and 0.6 mm. Replace the shims if the clearance does not lie within the given values.

INSTALLING THE COMPRESSOR

Install the compressor. See: **COMPRESSOR, REPLACING**.

Check the function.

NEEDLE JET / SERVICE VALVE, REPLACING

see **NEEDLE JET / SERVICE VALVE, REPLACING**

PIPE / HOSE COMPRESSOR, REPLACING

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATORY WORK

DRAINING THE AIR CONDITIONING (A/C) SYSTEM

WARNING: **Follow the safety instructions for work on air conditioning systems. See: REFRIGERANT, SAFETY REGULATIONS .**

Read the instructions covering slow and fast leaks. See: **OIL AIR CONDITIONING (A/C) SYSTEM, FILLING** .

NOTE: **Always plug the pipes and connections when working on the climate control system.**

CAUTION: **Always use new O-rings lubricated with compressor oil.**

Fig. 103: Splash Guard. Protective Plate And Screws
Courtesy of VOLVO CARS CORPORATION

Remove the splash guard under the vehicle (as shown in the illustration).

METHOD CONTENT

This method consists of:

- see **PIPE/HOSE BETWEEN THE COMPRESSOR AND THE CONDENSER (PRESSURE SIDE), REPLACE**
- see **PIPE/HOSE BETWEEN THE JUNCTION POINT ON THE SIDE MEMBER AND THE COMPRESSOR (SUCTION SIDE), REPLACE**.

PIPE/HOSE BETWEEN THE COMPRESSOR AND THE CONDENSER (PRESSURE SIDE), REPLACE

REMOVING THE PIPE/HOSE BETWEEN THE COMPRESSOR AND THE CONDENSER (PRESSURE SIDE)

Fig. 104: Link From The Hood Release Catch
Courtesy of VOLVO CARS CORPORATION

Remove:

- the left-hand headlamp. See **LIGHTING - REMOVAL, REPLACEMENT AND INSTALLATION**
- the 1x screw and 1x nut. Remove the link from the hood release catch (as shown in the illustration)
- the 1x screw from the hose/pipe connection between the compressor and the condenser
- the pipe from the mounting clip between the condenser and twist carefully to one side.

Fig. 105: Removing Hoses Away From Compressor
Courtesy of VOLVO CARS CORPORATION

Raise the car

Hang the lower coolant hose so that it is away from the air conditioning (A/C) compressor.

Remove:

- The air conditioning (A/C) compressor lower pipe/hose connection and place it to one side
- the 1x screw. Remove the upper pipe/hose connector for the air conditioning (A/C) compressor.

Lift the air conditioning (A/C) pipe (hose) off the holder on the sub-frame, above the coolant hose.

Remove the heated oxygen sensor (HO2S) cable from the air conditioning (A/C) pipe (hose).

Lower the vehicle.

Lift out the air conditioning pipe (A/C) (hose) through the engine compartment.

INSTALLING THE PIPE /HOSE BETWEEN THE COMPRESSOR AND THE CONDENSER (PRESSURE SIDE)

NOTE: For tightening torques, see: TIGHTENING TORQUE .

Fig. 106: Removing Hoses Away From Compressor
Courtesy of VOLVO CARS CORPORATION

Install the pipe/hose on the compressor in the mounting clip at the upper connection to the condenser and in the holder above the lower coolant hose (as shown in the illustration).

Install:

- the pipe connection 1 x M8. Ensure that the O-rings are securely positioned between the receiver and the pipe/hose. Tighten the screw
- the pipe connection at the compressor, 1 x M8. Ensure that the O-rings are securely positioned. Tighten the screw
- the heated oxygen sensor (HO2S) cable to the air conditioning (A/C) pipe (hose).

Carry out finishing work. See **FINISHING**.

PIPE/HOSE BETWEEN THE JUNCTION POINT ON THE SIDE MEMBER AND THE COMPRESSOR (SUCTION SIDE), REPLACE

REMOVING THE PIPE/HOSE BETWEEN THE JUNCTION POINT ON THE SIDE MEMBER AND THE COMPRESSOR (SUCTION SIDE)

Raise the car

Hang the lower coolant hose to one side.

Remove:

- the 1x screw. Remove the lower pipe /hose connector from the air conditioning (A/C) compressor. Lower the vehicle.
- the 1x screw. Remove the connection at the junction point on the right hand side member.

Lift up the air conditioning (A/C) pipe (hose).

INSTALLING THE PIPE/HOSE BETWEEN THE JUNCTION POINT ON THE SIDE MEMBER AND COMPRESSOR (SUCTION SIDE)

NOTE: For tightening torques, see: TIGHTENING TORQUE .

Install:

- the pipe/hose on the upper terminal to the junction point and to the air conditioning (A/C) compressor terminal
- the 1x M8 screw to the pipe terminal at the junction point. Ensure that the O-rings are securely positioned between the junction point and the pipe/hose. Tighten.

Raise the car

Install the pipe terminal at the compressor, 1 x M8. Ensure that the O-rings are securely positioned. Tighten.

Carry out finishing work. See **FINISHING**.

FINISHING

FUNCTION CHECK WITH LEAK TRACING

Fig. 107: Splash Guard. Protective Plate And Screws
Courtesy of VOLVO CARS CORPORATION

Vacuum pump the air conditioning (A/C) system. See: **VACUUM PUMPING** .

Fill the air conditioning (A/C) system with refrigerant. See: **REFRIGERANT, FILLING** .

Leak trace the air conditioning (A/C) system. See: **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** or **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** .

Install the splash guard under the vehicle (as shown in the illustration).

Carry out a performance test of the climate control unit. See **CLIMATE SYSTEM, PERFORMANCE TEST** .

PIPES / HOSES, REPLACING

see **PIPES / HOSES, REPLACING**

PIPES RECEIVER DRIER, REPLACING

see **PIPES RECEIVER DRIER, REPLACING**

RECEIVER DRIER, REPLACING

see **RECEIVER DRIER, REPLACING**

SOLENOID VALVE COMPRESSOR, REPLACING

NOTE: The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATORY WORK

DRAINING THE AIR CONDITIONING (A/C) SYSTEM

WARNING: Follow the safety instructions for work on air conditioning systems. See: REFRIGERANT, SAFETY REGULATIONS .

Read the instructions covering slow and fast leaks. See: **OIL AIR CONDITIONING (A/C) SYSTEM, FILLING** .

CAUTION: Always use new O-rings lubricated with compressor oil.

NOTE: The O-rings in the pipes and quick-release connectors must always be replaced when replacing the compressor.

NOTE: Always plug the pipes and connections when working on the climate control system.

Remove the compressor. See **COMPRESSOR, REPLACING**.

REMOVAL

REMOVING THE SOLENOID VALVE

Fig. 108: Removing Solenoid Valve
Courtesy of VOLVO CARS CORPORATION

CAUTION: Always ensure cleanliness when working with the solenoid valve and surrounding components.

NOTE: Position the compressor with the solenoid valve facing upwards to prevent leaking compressor oil.

Remove:

- the solenoid valve connector
- the 1x screw. Remove the electrical cable mounting for the solenoid valve. Note how the electrical cable was routed
- the snap ring.

HINT: Pry up the solenoid valve. Use a screwdriver (as shown in the illustration).

Pull the solenoid valve straight up. Remove the solenoid valve.

INSTALLATION

NOTE: For tightening torques, see: TIGHTENING TORQUE .

INSTALLING THE SOLENOID VALVE

HINT: Lubricate the O-rings on the solenoid valve. Use compressor oil.

Install:

- the solenoid valve by twisting backwards and forwards, under light pressure, until it bottoms enough for the groove for the snap ring to be visible.
- the snap ring
- the electrical cable for the solenoid valve in its mounting as noted. Tighten the screw
- the connector

FINISHING

INSTALLING THE COMPRESSOR AND TEST RUNNING

Install the compressor. See: **COMPRESSOR, REPLACING**.

Test run the compressor. Check the function.

AIR DISTRIBUTION (2003-2012)

AIR CLEANER PASSENGER COMPARTMENT, REPLACING

REMOVING THE PASSENGER COMPARTMENT AIR CLEANER (ACL)

Remove:

- the soundproofing panel. See **SOUNDPROOFING PANEL, REPLACING** .

Fig. 109: Identifying Cover Screws
Courtesy of VOLVO CARS CORPORATION

- the screws for the cover
- the cover.

Pull the air cleaner (ACL) downwards / away.

INSTALLING THE PASSENGER COMPARTMENT AIR CLEANER (ACL)

Fig. 110: Identifying Pollen And Multi Filter Compartments
Courtesy of VOLVO CARS CORPORATION

Install the air cleaner (ACL). There are 2 alternative positions for the air cleaner (ACL). See the illustration.

The pollen filter (standard) must be installed in the smaller compartment (1).

The multi filter (cars with an air quality sensor) must be installed in the wider compartment (2).

NOTE: Install either the pollen filter or the multi filter. Both filters must not be together.

Install:

- the screws. The front left screw must not be tightened to more than **0.8 Nm**
- the soundproofing panel. See **SOUNDPROOFING PANEL, REPLACING** .

AIR DUCTS PASSENGER COMPARTMENT, REPLACING

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

AIR DUCTS PANEL B-POST, REPLACING

REMOVING THE AIR DUCTS FROM THE B-POST PANEL

The air ducts are integrated in the B-post panel.

Remove:

- the B-post panel. See **PANEL B-POST, REPLACING**
- the air ducts.

INSTALLING THE AIR DUCTS IN THE B-POST PANEL

Install:

- the air ducts
- the B-post panel. See **PANEL B-POST, REPLACING** .

AIR DUCTS FOR THE VENTS DASHBOARD, REPLACING

REMOVING THE AIR DUCTS FOR THE VENTS IN THE DASHBOARD

Fig. 111: Removing Air Ducts
Courtesy of VOLVO CARS CORPORATION

The air ducts for the vents are accessed from the reverse of the dashboard.

Remove the dashboard. See **DASHBOARD, REPLACING** .

Unscrew the ducts.

INSTALLING THE AIR DUCTS FOR THE VENTS IN THE DASHBOARD

Thread each duct on to the air vents and/or air distribution unit.

Screw the ducts into place.

Install the dashboard. See **DASHBOARD, REPLACING** .

AIR DISTRIBUTION UNIT DASHBOARD LOUDSPEAKER, REPLACING

REMOVING THE AIR DISTRIBUTION UNIT FROM THE DASHBOARD

Remove:

- the dashboard. See **DASHBOARD, REPLACING**
- the screws.

Remove:

- the duct from the connections
- the air duct from the air distribution unit.

Twist off the air duct from the lower mounting.

Remove the 4 screws.

INSTALLING THE AIR DISTRIBUTION UNIT IN THE DASHBOARD

Fig. 112: Installing Distribution Unit
Courtesy of VOLVO CARS CORPORATION

Position the air distribution unit so that the connections to the adjacent ducts are correctly positioned.

Install:

- the 4 screws
- the connections
- the screws for the air ducts.

Ensure that all components are secure and that there is no risk of air leakage.

Install the dashboard. See **DASHBOARD, REPLACING** .

SEAL BETWEEN THE AIR DISTRIBUTION UNIT AND CENTRAL ELECTRICAL UNIT, REPLACING

Fig. 113: Floor Seals
Courtesy of VOLVO CARS CORPORATION

Remove the dashboard. See **DASHBOARD, REPLACING** .

Replace the seal.

Install the dashboard. See **DASHBOARD, REPLACING** .

AIR DUCT FRONT AND REAR ON VENT B-POST VENT, REPLACING

REMOVING THE FRONT AND REAR AIR DUCTS ON THE VENT ON THE B-POST

Fig. 114: Identifying Center Console Duct And Upper Mounting
Courtesy of VOLVO CARS CORPORATION

Remove:

- the front seat from the car. See **REMOVING THE FRONT SEAT** (-2004) or **FRONT SEAT, REPLACING** (2005-)
- the side panel on the center console
- the front sill trim panel. See **SILL TRIM PANEL, REPLACING**
- the front floor carpet.

Pull / bend the duct (1) at the center console. Detach the duct at the upper mounting.

Remove the duct (1) from the member.

Remove:

- the rear sill trim panel. See **SILL TRIM PANEL, REPLACING**
- the B-post panel. See **PANEL B-POST, REPLACING** .

Push the rear carpet to one side.

Remove the lower floor section.

Pull off the air duct.

INSTALLING THE FRONT AND REAR AIR DUCTS ON THE VENT ON THE B-POST

Install:

- the air duct
- the lower floor section
- the rear carpet
- the B-post panel. See **PANEL B-POST, REPLACING**
- the rear sill trim panel. See **SILL TRIM PANEL, REPLACING**
- the duct (1)
- the front floor carpet
- the front sill trim panel. See **SILL TRIM PANEL, REPLACING**
- the side panel on the center console
- the front seat. See **INSTALLING THE FRONT SEAT** (-2004) or **FRONT SEAT, REPLACING** (2005-).

AIR DUCTS FRONT TO VENT REAR, REPLACING

REMOVING THE FRONT AIR DUCTS FOR THE REAR VENT

Fig. 115: Identifying Center Console Duct And Upper Mounting
Courtesy of VOLVO CARS CORPORATION

Remove:

- the front seat from the car. See **REMOVING THE FRONT SEAT** (-2004) or **FRONT SEAT, REPLACING** (2005-)
- the side panel on the center console
- the soundproofing panel. See **SOUNDPROOFING PANEL, REPLACING**
- the front sill trim panel. See **SILL TRIM PANEL, REPLACING**
- the front floor carpet
- the rear air duct (1). See **REMOVING THE FRONT AND REAR AIR DUCTS ON THE VENT ON THE B-POST**.

Pull / bend the duct (3) at the center console. Detach the duct at the upper mounting.

Detach the duct from the cross member.

INSTALLING THE FRONT AIR DUCTS FOR THE REAR VENT

Install:

- the duct (3) in the cross member and the upper mounting
- the rear air duct (1). See **INSTALLING THE FRONT AND REAR AIR DUCTS ON THE VENT ON THE B-POST**
- the front floor carpet
- the front sill trim panel. See **SILL TRIM PANEL, REPLACING**
- the soundproofing panel. See **SOUNDPROOFING PANEL, REPLACING**
- the side panel on the center console
- the front seat. See **INSTALLING THE FRONT SEAT** (-2004) or **FRONT SEAT, REPLACING** (2005-).

AIR DUCT REAR FOR VENT REAR

REMOVING THE REAR AIR DUCT FOR THE REAR VENT

Fig. 116: Identifying Center Console Duct And Upper Mounting
Courtesy of VOLVO CARS CORPORATION

Position the front seat in the forward and highest position.

Pull off the air duct (4) by pulling it backwards.

INSTALLING THE REAR AIR DUCT FOR THE REAR VENT

Install the air duct.

Reinstall the seat in its original position.

AIR DUCT FOR VENT C-POST (SEVEN SEATER VERSION), REPLACING

REMOVING THE AIR DUCT FOR THE C-POST VENT

Fig. 117: Installing C-Post Panel
Courtesy of VOLVO CARS CORPORATION

Remove:

- the C-post panel. See **PANEL C-POST, REPLACING**
- the connector from the infotainment controls
- the air duct on the reverse.

INSTALLING THE AIR DUCT FOR THE C-POST VENT

Install:

- the air duct
- the connector
- the C-post panel. See **PANEL C-POST, REPLACING** .

VENTILATION VENTS PASSENGER COMPARTMENT, REPLACING

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

OUTER VENTS DASHBOARD, REPLACING

REMOVING THE OUTER VENTS FROM THE DASHBOARD

Fig. 118: Identifying Dashboard Outer Vents
Courtesy of VOLVO CARS CORPORATION

Remove the cover on the side of the dashboard.

Remove the catches from underneath and from the sides. Use a small screwdriver. At the same time press out the vent using a weatherstrip tool.

Press out the lower edge. Then detach the remainder.

INSTALLING THE OUTER VENTS IN THE DASHBOARD

Press the vent into place.

NOTE: Ensure that the vent is correctly connected to the air duct and all the catches have engaged

Check the function.

Install the cover on the side of the dashboard.

CENTER VENT AND VALVE HOUSING ON THE DASHBOARD, REPLACING

REMOVING THE CENTER VENT AND VALVE HOUSING FROM THE DASHBOARD

Fig. 119: Detaching Catches Closest To Weatherstrip Tool And Prying Out And Detaching Vent At Same Time
Courtesy of VOLVO CARS CORPORATION

Position a weatherstrip tool on the short side of the vent.

Release the catches closest to the weatherstrip tool using a small screwdriver. At the same time pry out the vent.

NOTE: Do not break off the small catches.

Disconnect the connector for the switch for the hazard warning signal flasher.

INSTALLING THE CENTER VENT AND VALVE HOUSING IN THE DASHBOARD

Connect the connector to the switch for the hazard warning flashers.

Press the vent and valve housing into place.

NOTE: Ensure that the vent is correctly connected to the air duct and all the catches have engaged.

Check the function.

VENTS B AND C-POST, REPLACING

Remove and install the vents. See **PANEL B-POST, REPLACING** and **PANEL C-POST, REPLACING** .

CLIMATE CONTROL UNIT (2003-2012)

CLIMATE UNIT, REPLACING

Special tools:

see **1158957**

REPLACING

The illustrations in this service information are used for different model years and / or models. Some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATIONS

NOTE: Read off data from the control module before replacing the control module. This is carried out via VIDA communication. After replacing the control module, the relevant parameters must be programmed into the new control module.

Read the safety precautions for handling refrigerant. See **REFRIGERANT, SAFETY REGULATIONS** .

Read the instructions covering slow and fast leaks. See **OIL AIR CONDITIONING (A/C) SYSTEM, FILLING** .

NOTE: Always plug pipes and connectors when working on the climate control system.

Drain the refrigerant from the air conditioning (A/C) system. See **REFRIGERANT, DRAINING** .

Remove the battery lead. See **BATTERY, DISCONNECTING** .

REMOVING THE CLIMATE CONTROL UNIT

WORK IN THE ENGINE COMPARTMENT

Fig. 120: Clamping Heating Hoses Using Lock Grip Pliers
Courtesy of VOLVO CARS CORPORATION

Clamp the heating hoses. Use lock grip pliers see **1158957** .

Detach the heating hoses from the heat exchanger by pressing in the hose coupling and twisting it out to the side. Then pull the hose out.

Plug the pipes for the heat exchanger.

Remove:

- the cover plate and the rubber seal for the lead-in
- the windshield wiper arm. See **WIPER MECHANISM WINDSHIELD, REPLACING**

Fig. 121: Identifying Screws
Courtesy of VOLVO CARS CORPORATION

- the 2 screws.

Fig. 122: Identifying Locking Bracket For Refrigerant Pipes
Courtesy of VOLVO CARS CORPORATION

Remove:

- the heat shield on the firewall above the expansion valve
- the striker plate for the refrigerant pipes
- the refrigerant pipes from the expansion valve.

WORK IN THE PASSENGER COMPARTMENT

Fig. 123: Identifying Screws For A-Post And Center Console
Courtesy of VOLVO CARS CORPORATION

Remove the dashboard and the center console. See **DASHBOARD, REPLACING** .

Protect the floor and sills.

Remove:

- the 4 screws to the left and right of the A-post
- the 2 screws between the door and the A-post. Tighten the screws a little so that they protrude from the member
- the 4 screws to the left and right of the center console.

Detach the steering column / steering shaft but leave it hanging in place. See **STEERING COLUMN,**

REPLACING .

Fig. 124: Identifying Climate Control Unit, Member, Air Ducts, Cable Duct, Tie Straps, And Drainage Channels
Courtesy of VOLVO CARS CORPORATION

- the air ducts from the heater assembly to the floor
- the floor drainage channels on the left and right-hand sides.

Pull the member and the climate control unit backwards a little.

Remove:

- the tie straps for the cable harness on the driver's side
- the cable duct above the climate control unit on both sides.

Fig. 125: Identifying Screws For Climate Control Unit And Member
Courtesy of VOLVO CARS CORPORATION

- the 2 screws from the member / climate control unit on the passenger side
- the 4 screws securing the climate control unit at the member on the left and right-hand sides
- the switch for the blower fan motor.

Fig. 126: Identifying Cable Ducts, Climate Control Unit, And T-Shaped Member
Courtesy of VOLVO CARS CORPORATION

- the cable duct behind / above the member mounting on the passenger side
- the cable duct above / behind the mounting for the member
- the T shaped member from the climate control unit.

Hold up the member and the cable duct on the passenger side. Remove the climate control unit on the passenger side.

NOTE: Two people are required for this job.

INSTALLING THE CLIMATE CONTROL UNIT

Fig. 127: Floor Seals
Courtesy of VOLVO CARS CORPORATION

Check and replace the floor seals if necessary.

Install the front seal for the refrigerant pipe.

Check and replace the O-rings.

Fig. 128: Front Seal For Refrigerant Pipe
Courtesy of VOLVO CARS CORPORATION

WORK IN THE PASSENGER COMPARTMENT

Install:

- the climate control unit in the car
- the member on the climate control unit.

NOTE: Two people are required for this job.

Install:

- the screws and the bracket on the member / climate control unit
- the cable duct and secure it.

Position the wiring for the radio and the climate control unit in the cable duct.

Locate the cable for the sensor on the dashboard and the cable for the light switch.

Position the member for the climate control unit against the firewall. Check the location in relation to the openings for the coolant and heat exchange pipes.

Press the member / climate control unit into position on the A-post against the firewall.

Secure the member / climate control unit loosely on the A-post using the screws.

Secure the member / climate control unit and console loosely using the screws.

Install the member on the A-post.

Tighten the screws on the center console.

Install:

- the air ducts
- the gutter
- the cable ducts and the tie straps
- the connector for the blower fan motor
- the 2 screws for the member / climate control unit on the passenger side
- the steering column. See **STEERING COLUMN, REPLACING**
- the dashboard and the center console. See **DASHBOARD, REPLACING** .

WORK IN THE ENGINE COMPARTMENT

Install:

- the striker plate for the refrigerant pipes
- the refrigerant pipes on the expansion valve
- the heat shield over the expansion valve
- the cover plate and the rubber seal for the lead-in for the heating hoses
- the heating hoses which will click when connected
- the 2 screws for the member for the dashboard
- the windshield wiper arm. See **WIPER MECHANISM WINDSHIELD, REPLACING**

FINISHING

Install the battery lead. See **BATTERY, DISCONNECTING** .

Vacuum pump the air conditioning (A/C) system. See **VACUUM PUMPING** .

Fill the air conditioning (A/C) system with refrigerant. See **REFRIGERANT, FILLING** .

Leak trace the air conditioning (A/C) system. See **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** or **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** .

CLIMATE CONTROL UNIT (L. H. D; 2003-2004)

BLOWER FAN MOTOR / POWER UNIT, REPLACING

see **BLOWER FAN MOTOR / POWER UNIT, REPLACING**

BLOWER FAN MOTOR PASSENGER COMPARTMENT TEMPERATURE SENSOR, REPLACING

see **BLOWER FAN MOTOR PASSENGER COMPARTMENT TEMPERATURE SENSOR, REPLACING**

BLOWER FAN MOTOR REAR, REPLACING

see **BLOWER FAN MOTOR REAR, REPLACING**

CLIMATE CONTROL UNIT REAR, REPLACING

see **CLIMATE CONTROL UNIT REAR, REPLACING**

DAMPER MOTOR AIR DISTRIBUTION, REPLACING

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE AIR DISTRIBUTION DAMPER MOTOR

Fig. 129: Removing Air Distribution Damper Motor
Courtesy of VOLVO CARS CORPORATION

Ignition off.

Remove:

- the glove compartment. See **GLOVE COMPARTMENT, REPLACING**
- the screws for the damper motor
- the damper motor
- the connector.

INSTALLING THE AIR DISTRIBUTION DAMPER MOTOR

Position the damper motor.

Turn the pulley so that the shaft journal on the damper motor goes in.

Position the motor.

Install:

- the screws for the motor
- the connector
- the glove compartment. See **GLOVE COMPARTMENT, REPLACING** .

DAMPER MOTOR DEFROSTER, REPLACING

REPLACING

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE DEFROSTER DAMPER MOTOR

NOTE: Applies only to cars with electronic climate control (ECC).

Fig. 130: Identifying Control Module And Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the soundproofing panel. See **SOUNDPROOFING PANEL, REPLACING**
- the glove compartment. See **GLOVE COMPARTMENT, REPLACING**
- the screws for the motor
- the motor
- the switch.

INSTALLING THE DEFROSTER DAMPER MOTOR

Position the motor.

Turn the shaft on the heater unit so that the motor can be installed.

Position the motor.

Install:

- the screws for the motor
- the switch
- the glove compartment. See **GLOVE COMPARTMENT, REPLACING**
- the soundproofing panel. See **SOUNDPROOFING PANEL, REPLACING** .

Carry out self-adjustment of the damper motor end positions. This is carried out via VIDA communication.

DAMPER MOTOR RECIRCULATION, REPLACING

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE RECIRCULATION DAMPER MOTOR

Fig. 131: Identifying Control Module Connector, Screws & Damper Arms
Courtesy of VOLVO CARS CORPORATION

Remove:

- the glove compartment. See **GLOVE COMPARTMENT, REPLACING**
- the screw from the bracket.

Remove:

- the bracket from the mounting by inserting the tip of a screwdriver between the mounting and the metal on the fan housing
- the lever from the motor. Ensure that the levers do not release from the heater unit.

Remove:

- the switch
- the motor.

INSTALLING THE RECIRCULATION DAMPER MOTOR

Position:

- the motor on the bracket
- the bracket and motor.

Press the upper mounting into place.

Install the screw for the bracket.

Place the arms from the heater unit onto the motor levers and press into place. Do not damage the arms.

Install:

- the switch
- the glove compartment. See **GLOVE COMPARTMENT, REPLACING** .

Carry out self-adjustment of the damper motor end positions. This is carried out via VIDA communication.

DAMPER MOTOR TEMPERATURE, REPLACING

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

DAMPER MOTOR TEMPERATURE PASSENGER SIDE, REPLACING

REMOVING THE PASSENGER SIDE TEMPERATURE DAMPER MOTOR

Remove:

- the glove compartment. See **GLOVE COMPARTMENT, REPLACING**
- the screws
- the motor
- the switch.

INSTALLING THE PASSENGER SIDE TEMPERATURE DAMPER MOTOR

Position the motor.

Turn the shaft on the motor so that the motor can be positioned.

Install:

- the screws
- the switch.

Carry out self-adjustment of the damper motor end positions. This is carried out via VIDA communication.

Install the glove compartment. See **GLOVE COMPARTMENT, REPLACING** .

DAMPER MOTOR TEMPERATURE DRIVER'S SIDE, REPLACING

REMOVING THE DRIVER'S SIDE TEMPERATURE DAMPER MOTOR

Fig. 132: Identifying Control Module And Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the soundproofing panel. See **SOUNDPROOFING PANEL, REPLACING**
- the switch from the damper motor.

Slacken off the screws.

Pull out the damper motor slightly.

Position the point of a screwdriver between the arms on the lever control. Pry the arms away from the ball on the damper motor lever.

Remove the damper motor.

INSTALLING THE DRIVER'S SIDE TEMPERATURE DAMPER MOTOR

Position the damper motor.

Install the mechanism lever on the ball on the damper motor lever.

Insert the tip of a screwdriver behind the lever on the mechanism and the tip of, for example, a pair of round-nosed pliers behind the lever on the damper motor. Press the ball into place on the mechanism.

Position the damper motor. Tighten the screws.

Install:

- the switch
- the soundproofing panel. See **SOUNDPROOFING PANEL, REPLACING** .

Carry out self-adjustment of the damper motor end positions. This is carried out via VIDA communication.

DRAIN HOSE ENGINE / FILTER HOUSING, REPLACING

see **DRAIN HOSE ENGINE / FILTER HOUSING, REPLACING**

HEAT EXCHANGER, REPLACING

see **HEAT EXCHANGER, REPLACING**

TEMPERATURE SENSOR EVAPORATOR, REPLACING

see **TEMPERATURE SENSOR EVAPORATOR, REPLACING**

CLIMATE CONTROL UNIT (L. H. D; 2005-2012)

BLOWER FAN MOTOR / POWER UNIT, REPLACING

As the illustrations in this service information are used for different model years and / or models, some variation

may occur. However, the essential information in the illustrations is always correct.

PREPARATIONS

Remove the dashboard. See **DASHBOARD, REPLACING** .

Detach the climate control unit and member and angle it out. See **CLIMATE UNIT, REPLACING**.

REMOVING THE FAN MOTOR FROM THE CLIMATE CONTROL UNIT

Fig. 133: Identifying Blower Fan Motor Screws
Courtesy of VOLVO CARS CORPORATION

NOTE: Do not detach the air conditioning (A/C) pipes or the engine coolant hoses.

Remove:

- the drain hoses from the engine and filter housing. Then move the drain hoses out of the way
- the connector.

Remove the 5 screws from the blower fan motor.

Detach and remove the blower fan motor and fan shroud.

REMOVING THE BLOWER FAN MOTOR

Fig. 134: Connector Cover From Motor
Courtesy of VOLVO CARS CORPORATION

Remove the connector.

Detach the cover for the blower fan motor.

Remove the 2 screws from the top of the blower fan motor.

Press and pull out the fan motor and fan hub. Use a screwdriver for example.

REMOVING THE POWER UNIT

Fig. 135: Blower Fan Motor With Fan Hub
Courtesy of VOLVO CARS CORPORATION

Remove:

- the blower fan motor and the fan hub. See **REMOVING THE BLOWER FAN MOTOR**
- the power unit which is secured with 2 screws.

INSTALLING THE POWER UNIT

Install the power unit using the 2 screws.

INSTALLING THE BLOWER FAN MOTOR

Install:

- the blower fan motor and the fan hub. Use the 2 screws
- the cover for the blower fan motor
- the connector for the power unit.

INSTALLING THE BLOWER FAN MOTOR ON THE CLIMATE CONTROL UNIT

Install:

- the blower fan motor and the cover on the climate control unit using the 5 screws
- the connector
- the drain hose
- the climate control unit. See **CLIMATE UNIT, REPLACING**
- the dashboard according to **DASHBOARD, REPLACING** .

BLOWER FAN MOTOR PASSENGER COMPARTMENT TEMPERATURE SENSOR, REPLACING

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE BLOWER FAN MOTOR PASSENGER COMPARTMENT TEMPERATURE SENSOR

Fig. 136: Fan Motor Passenger Compartment Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

Remove:

- the dashboard environment panel. See **CLIMATE CONTROL MODULE (CCM), REPLACING**
- the 2 screws.

INSTALLING THE BLOWER FAN MOTOR PASSENGER COMPARTMENT TEMPERATURE SENSOR

Position the blower fan motor.

Install:

- the 2 screws
- the dashboard environment panel. See **CLIMATE CONTROL MODULE (CCM), REPLACING**.

BLOWER FAN MOTOR REAR, REPLACING

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATIONS

Remove the rear left side panel. See **SIDE PANEL CARGO COMPARTMENT, REPLACEMENT** .

REMOVING THE REAR BLOWER FAN MOTOR

Fig. 137: Removing Rear Blower Fan Motor
Courtesy of VOLVO CARS CORPORATION

Remove the rubber seals and the cable terminals.

Remove the 3 screws for the blower fan motor (A).

INSTALLING THE REAR BLOWER FAN MOTOR

NOTE: For tightening torques, see GENERAL TIGHTENING TORQUE .

Install:

- the blower fan motor using the 3 M5 screws. Tighten
- the cable terminals and the rubber seals.

Check the function.

Install the rear left side panel. See **SIDE PANEL CARGO COMPARTMENT, REPLACEMENT** .

CLIMATE CONTROL UNIT REAR, REPLACING

The illustrations in this service information are used for different model years and / or models. Some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATIONS

Read the safety precautions for handling refrigerant. See **REFRIGERANT, SAFETY REGULATIONS** .

Drain the refrigerant from the system. See **REFRIGERANT, DRAINING** .

Remove the left-hand side panel in the cargo compartment. See **SIDE PANEL CARGO COMPARTMENT, REPLACEMENT** .

NOTE: Always plug the pipes and connections when working on the climate control system.

REMOVING THE REAR CLIMATE CONTROL UNIT

Fig. 138: Removing Climate Control Unit
Courtesy of VOLVO CARS CORPORATION

Remove:

- the nut on the junction block for the air conditioning (A/C) pipes to the expansion valve
- the drain hose at the bottom edge of the heater unit
- the connector
- the 3 screws (see the illustration).

INSTALLING THE REAR CLIMATE CONTROL UNIT

NOTE: For tightening torques, see TIGHTENING TORQUE .

Fig. 139: Installing Rear Climate Control Unit
Courtesy of VOLVO CARS CORPORATION

Position the heater.

Install:

- the 3 screws
- the connector
- the drain hose
- the air conditioning (A/C) pipes and the junction block against the expansion valve. Use 1 nut. Tighten. See **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS** .

Vacuum pump the air conditioning (A/C) system. See **VACUUM PUMPING** .

Fill the air conditioning (A/C) system with refrigerant. See **REFRIGERANT, FILLING** .

Leak trace the air conditioning (A/C) system. See **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** or **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** .

Install the left-hand side panel in the cargo compartment. See **SIDE PANEL CARGO COMPARTMENT, REPLACEMENT** .

DAMPER MOTOR MODULE (DMM) AIR DISTRIBUTION, REPLACING

REMOVAL

The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

NOTE: The damper motor module (DMM) for air distribution is only on the right-hand side of the car.

REMOVING THE DAMPER MOTOR MODULE (DMM) FOR AIR DISTRIBUTION

Fig. 140: Identifying Control Module Connector & Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the glove compartment. See **GLOVE COMPARTMENT, REPLACING**
- the switch

  HINT: Use a small electrician's screwdriver to pry up the switch by the lock. Depress the switch at the rear edge. Pull straight out.

- the 2 x screws
- the control module.

INSTALLATION

INSTALLING THE DAMPER MOTOR MODULE (DMM) FOR AIR DISTRIBUTION

Install:

- the control module in position. Adjust the shaft journal so that it goes in
- the 2 screws. Tighten alternately
- the switch. Ensure that it is correctly positioned
- the glove compartment. See **GLOVE COMPARTMENT, REPLACING** .

NOTE: Identify the damper motor module (DMM) for air distribution. See VIDA vehicle communication.

FINISHING

TESTING THE CLIMATE CONTROL SYSTEM

Carry out a performance test on the climate control unit. See: **CLIMATE SYSTEM, PERFORMANCE TEST** .

DAMPER MOTOR MODULE (DMM) DEFROSTER, REPLACING

REMOVAL

The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

NOTE: The damper motor module (DMM) for the defroster is only used in cars with electronic climate control (ECC). It is positioned on the right-hand side of the car.

REMOVING THE DAMPER MOTOR MODULE (DMM) FOR THE DEFROSTER

Fig. 141: Identifying Control Module And Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the soundproofing panel. See **SOUNDPROOFING PANEL, REPLACING**
- the glove compartment. See **GLOVE COMPARTMENT, REPLACING**
- the switch

  HINT: Use a small electrician's screwdriver to pry up the switch by the lock. Depress the switch at the rear edge. Pull straight out.

- the 2 x screws
- the control module.

INSTALLATION

INSTALLING THE DAMPER MOTOR MODULE (DMM) FOR THE DEFROSTER

Install:

- the control module in position. Adjust the shaft journal so that it goes in
- the 2 screws. Tighten alternately
- the switch. Ensure that it is correctly positioned
- the glove compartment. See **GLOVE COMPARTMENT, REPLACING**
- the soundproofing panel. See **SOUNDPROOFING PANEL, REPLACING** .

NOTE: Identify the damper motor module (DMM) for the defroster. See VIDA vehicle communication.

FINISHING

TESTING THE CLIMATE CONTROL SYSTEM

Carry out a performance test on the climate control unit. See: **CLIMATE SYSTEM, PERFORMANCE TEST** .

DAMPER MOTOR MODULE (DMM) RECIRCULATION, REPLACING

REMOVAL

The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE DAMPER MOTOR MODULE (DMM) FOR RECIRCULATION

Fig. 142: Identifying Control Module Connector, Screws & Damper Arms
Courtesy of VOLVO CARS CORPORATION

Remove:

- the glove compartment. See **GLOVE COMPARTMENT, REPLACING**
- the switch

  HINT: Use a small electrician's screwdriver to pry up the switch by the lock. Depress the switch at the rear edge. Pull straight out.

- the 2 x screws
- the control module.

Check the functionality of the control module mechanism (1). Check that the arms for the dampers (2) are

secure.

INSTALLATION

INSTALLING THE DAMPER MOTOR MODULE (DMM) FOR RECIRCULATION

Fig. 143: Identifying Control Module Connector, Screws & Damper Arms
Courtesy of VOLVO CARS CORPORATION

Install:

- the control module in position. Adjust the shaft journal in relation to the mechanism (1) so that it goes in
- the 2 screws. Tighten alternately
- the switch. Ensure that it is correctly positioned
- the glove compartment. See **GLOVE COMPARTMENT, REPLACING** .

NOTE: **Identify the damper motor module (DMM) for recirculation. See VIDA vehicle communication.**

FINISHING

TESTING THE CLIMATE CONTROL SYSTEM

Carry out a performance test on the climate control unit. See: **CLIMATE SYSTEM, PERFORMANCE TEST** .

DAMPER MOTOR MODULE (DMM) TEMPERATURE, REPLACING

REMOVAL

The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

NOTE: **The are 2 damper motor modules (DMM) for temperature, one on the right (white arm) and one on the left-hand side (black arm).**

REMOVING THE DAMPER MOTOR MODULE (DMM) FOR TEMPERATURE ON THE PASSENGER SIDE

Fig. 144: Identifying Control Module And Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the glove compartment. See **GLOVE COMPARTMENT, REPLACING**
- the switch

  HINT: Use a small electrician's screwdriver to pry up the switch by the lock. Depress the switch at the rear edge. Pull straight out.

- the 2 x screws
- the control module.

INSTALLATION

INSTALLING THE DAMPER MOTOR MODULE (DMM) FOR TEMPERATURE ON THE PASSENGER SIDE

Fig. 145: Identifying Control Module And Screws
Courtesy of VOLVO CARS CORPORATION

Install:

- the control module in position. Adjust the shaft journal so that it goes in
- the 2 screws. Tighten alternately
- the switch. Ensure that it is correctly positioned
- the glove compartment. See **GLOVE COMPARTMENT, REPLACING** .

NOTE: **Identify the damper motor module (DMM) for temperature. See VIDA vehicle communication.**

REMOVAL

REMOVING THE DAMPER MOTOR MODULE (DMM) FOR TEMPERATURE ON THE DRIVER'S SIDE

Fig. 146: Identifying Control Module And Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the soundproofing panel. See **SOUNDPROOFING PANEL, REPLACING**
- the connector from the control module

  HINT: Use a small electrician's screwdriver to pry up the switch by the lock. Depress the switch at the rear edge. Pull straight out.

  HINT: Pull the control module out slightly. Position the point of the electrician's screwdriver

between the arms on the control for the lever. Pry the arms away from the ball on the motor lever.

- the 2 x screws
- the control module.

INSTALLATION

INSTALLING THE DAMPER MOTOR MODULE (DMM) FOR TEMPERATURE ON THE DRIVER'S SIDE

Fig. 147: Identifying Control Module And Screws
Courtesy of VOLVO CARS CORPORATION

Install:

- the control module in position. Adjust the shaft journal so that it goes in
- the lever for the mechanism on the ball for the motor lever

HINT: Insert the point of the electrician's screwdriver behind the lever and round-nosed pliers or similar behind the motor lever. Press the ball onto the mechanism.

- the 2 screws. Tighten alternately
- the switch. Ensure that it is correctly positioned
- the soundproofing panel. See **SOUNDPROOFING PANEL, REPLACING** .

NOTE: Identify the damper motor module (DMM) for temperature. See VIDA vehicle communication.

FINISHING

TESTING THE CLIMATE CONTROL SYSTEM

Carry out a performance test on the climate control unit. See: **CLIMATE SYSTEM, PERFORMANCE TEST** .

DRAIN HOSE ENGINE / FILTER HOUSING, REPLACING

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE DRAIN HOSE FROM THE ENGINE / FILTER HOUSING

Fig. 148: Identifying Fan Motor Cover Hose
Courtesy of VOLVO CARS CORPORATION

Remove:

- the soundproofing panel on the passenger side. See **SOUNDPROOFING PANEL PASSENGER SIDE, REPLACING**
- the floor grommet
- the hoses from the blower fan motor cover.

INSTALLING THE DRAIN HOSE ON THE ENGINE / FILTER HOUSING

Press into place:

- the floor grommet
- the drain hose on the blower fan motor.

The drainage hose is marked by a colored stripe. When installing the marking must be aligned on the blower fan motor cover as shown in the illustration. This is to avoid twisting the hose.

Reinstall the floor carpet.

Install the soundproofing panel. See **SOUNDPROOFING PANEL PASSENGER SIDE, REPLACING** .

HEAT EXCHANGER, REPLACING

Special tools:

see **1158957**

The illustrations in this service information are used for different model years and / or models. Some variation may occur. However, the essential information is always correct.

PREPARATIONS

Fig. 149: Clamping Heating Hoses Using Lock Grip Pliers
Courtesy of VOLVO CARS CORPORATION

Remove:

- the heating loops in the engine compartment. Use special tool see **1158957** (pliers)
- the seal and the plate.

REMOVING THE HEAT EXCHANGER

Fig. 150: Identifying Heat Exchanger Retaining Clip And Pipe
Courtesy of VOLVO CARS CORPORATION

Remove:

- the soundproofing panel. See **SOUNDPROOFING PANEL, REPLACING**
- the screw for the heat exchanger
- the mounting brackets for the pipes.

Position plenty of paper under the heat exchanger and around the pipes.

Drain the coolant into a suitable container.

Detach the pipes and move them out of the way.

Pull out the heat exchanger.

INSTALLING THE HEAT EXCHANGER

NOTE: Always use new O-rings.

Install the heat exchanger carefully.

Screw the heat exchanger into place.

Install:

- the upper pipe
- the striker plate using round-nosed pliers.

Press in:

- the pipes using a screwdriver
- the catch using a pair of pliers.

Install:

- the lower pipe
- the striker plate using round-nosed pliers.

Press in:

- the pipe using a screwdriver
- the striker plate using round-nosed pliers.

Install:

- the seal and the plate
- the heating loops in the engine compartment.

Start the engine and the heating system.

Fill the cooling system with coolant.

Check that the pipe connectors do not leak.

Install the soundproofing panel. See **SOUNDPROOFING PANEL, REPLACING** .

TEMPERATURE SENSOR EVAPORATOR, REPLACING

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Included in this method are methods for:

- temperature sensor evaporator. See **TEMPERATURE SENSOR EVAPORATOR, REPLACING**

TEMPERATURE SENSOR EVAPORATOR, REPLACING

REMOVING THE TEMPERATURE SENSOR FOR THE EVAPORATOR

Fig. 151: Evaporator Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

Remove the soundproofing panel. See **SOUNDPROOFING PANEL, REPLACING** .

Pull off the temperature sensor.

Disconnect the connector from the sensor.

Work the sensor loose.

INSTALLING THE TEMPERATURE SENSOR FOR THE EVAPORATOR

Install the connector on the sensor.

Press the temperature sensor into place.

Install the soundproofing panel. See **SOUNDPROOFING PANEL, REPLACING** .

CONTROLS, HEATER UNIT (2003-2012)

CLIMATE CONTROL MODULE (CCM), REPLACING

The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information is always correct.

CLIMATE CONTROL MODULE (CCM), REPLACING

PREPARATIONS

Fig. 152: Identifying Ignition Key Off
Courtesy of VOLVO CARS CORPORATION

NOTE: **Read out the programmed data before replacing the climate control module. This is done in VIDA vehicle communication.**

After replacing the climate control module (CCM), the relevant parameters must be programmed.

Move the gear selector/gear selector lever to the rearmost position.

Ignition off.

Remove the key. The key must be removed to ensure that the ignition is not switched on by mistake.

WARNING: After the key has been removed wait three minutes before starting work.

REMOVING THE CLIMATE CONTROL MODULE (CCM)

Fig. 153: Detaching Panel At Gear Selector Lever
Courtesy of VOLVO CARS CORPORATION

Detach the panel at the gear selector lever as shown in the illustration.

Twist the panel so that it is as far from the center console as possible.

Fig. 154: Identifying Bracket Lower Screws & Infotainment Control Module (ICM)
Courtesy of VOLVO CARS CORPORATION

Remove the lower screws from the bracket.

Angle out the entire infotainment control module (ICM) and the dashboard environment panel as shown in the illustration.

Fig. 155: Identifying Infotainment Module Connectors And Screws
Courtesy of VOLVO CARS CORPORATION

Disconnect the connectors.

Turn the infotainment module with the dashboard environment panel.

Remove the four screws as shown in the illustration.

Fig. 156: Identifying Infotainment Control Module Removal
Courtesy of VOLVO CARS CORPORATION

Press the four clips and remove the infotainment control module by pulling it straight out as shown in the illustration.

Fig. 157: Identifying Dashboard Environment Panel Removal
Courtesy of VOLVO CARS CORPORATION

Slacken off the two screws at the lower edge of the dashboard environment panel.

Pull the dashboard environment panel straight out from the bracket.

INSTALLING THE CLIMATE CONTROL MODULE (CCM)

Fig. 158: Identifying Dashboard Environment Panel Screws & Infotainment Panel
Courtesy of VOLVO CARS CORPORATION

Install:

- the dashboard environment panel using the two screws
- the infotainment panel so that it hooks into the dashboard environment panel.

Screw the infotainment panel into place using the four screws.

Connect the connectors.

Angle in the upper section of the infotainment control module first. Then screw the lower edge into place using the two lower screws.

FRONT PANEL, REPLACING

REMOVING THE FRONT PANEL

Fig. 159: Front Panel
Courtesy of VOLVO CARS CORPORATION

Release the catches. Pull off the front panel.

The front panel has double-sided adhesive tape. Ensure that any remains of the tape are removed from the black panel.

INSTALLING THE FRONT PANEL

Remove the backing paper from the tape for the front panel.

Press the front panel into place.

ORDERING SOFTWARE FOR THE CLIMATE CONTROL MODULE (CCM)

Order the software. See 9438292 .

FINISHING

After replacing the climate control module (CCM), the following must be carried out:

- Reprogram the customer programmed data
- Carry out self-adjustment of the damper motors' end positions. This is done in VIDA vehicle

communication.

Test drive the car. Check that the engine and climate control system are functioning.

ENGINE COOLANT HEATER, FUEL DRIVEN (2003-2012)

CONTROL MODULE ENGINE COOLANT HEATER, REPLACING

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATIONS

Fig. 160: Disconnecting Battery Lead
Courtesy of VOLVO CARS CORPORATION

Remove the battery lead. See **BATTERY, DISCONNECTING** .

Remove the bumper cover. See **CASING BUMPER FRONT, REPLACING** .

REMOVING THE CONTROL MODULE FOR THE ENGINE COOLANT HEATER

Points to observe when replacing the control module:

- If moving a control module from one car to another, remember to note any diagnostic trouble code (DTC) (s) and operating times before removing the control module from the car
- Always check that the terminals or pins in the control module connectors are not bent or damaged. This may have been the cause of the fault.

Fig. 161: Positioning Screwdriver Between Control Module Connector And Its Locking Handle
Courtesy of VOLVO CARS CORPORATION

Cut off the tie strap holding the cable section to the control module.

Remove the control module. Remove the 2 nuts.

HINT: Slacken off the uppermost nut. Leave it in place, screwed in a few turns.

Pull the control module from the mounting.

Position a screwdriver between the control module connector and its locking handle (as shown in the illustration). Turn the screwdriver to release the catch.

Continue pulling the locking handle outwards until the connector comes away from the control module.

INSTALLING THE CONTROL MODULE FOR THE ENGINE COOLANT HEATER

Install the switch by pressing in the lock handle.

Position the control module. Tighten the nuts. See **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS** .

FINAL CHECK

Test run the engine coolant heater and check its function. See **ENGINE COOLANT HEATER, TEST RUNNING** .

Check that no diagnostic trouble codes (DTC) have been stored during the repair work.

Install:

- the bumper cover. See **CASING BUMPER FRONT, REPLACING**
- the battery lead. See **BATTERY, DISCONNECTING** .

ENGINE COOLANT HEATER, REPLACING

Special tools:

see **9512619**

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATIONS

Fig. 162: Disconnecting Battery Lead
Courtesy of VOLVO CARS CORPORATION

Remove the battery lead. See **BATTERY, DISCONNECTING** .

Remove the bumper cover. See **CASING BUMPER FRONT, REPLACING** .

REMOVING THE ENGINE COOLANT HEATER

Fig. 163: Identifying Clamps & Hoses
Courtesy of VOLVO CARS CORPORATION

Install hose clips on both the engine coolant hoses by the heat exchanger.

Position a container under the heater.

Remove:

- the hoses
- the connection to the fuel hose from above. Plug the pipe because of the risk of fuel spillage.

HINT: Use special tool see 9512619 (Oetiker pliers) to remove and to fasten the clamps.

HINT: Tape or hang the fuel hose on the side member.

Disconnect the connector from above. Angle out the sliding mount for proper access.

Fig. 164: Identifying Mounting Nut From Upper Edge Of Heater
Courtesy of VOLVO CARS CORPORATION

Slacken off the mounting nut from the upper edge of the heater.

Remove the two screws for the bracket. Unhook the heater from the upper mounting.

INSTALLING THE ENGINE COOLANT HEATER

Fig. 165: Identifying Mounting Nut From Upper Edge Of Heater
Courtesy of VOLVO CARS CORPORATION

Hook the heater in the bracket and the upper mounting. Install two screws in the bracket.

Install the nut in the upper mounting (as shown in the illustration).

Install:

- the hoses
- the fuel line
- the connector.

FINAL CHECK

Test run the heater. Check the function of the heater. See **ENGINE COOLANT HEATER, TEST RUNNING** .

Check for leakage in the engine coolant hoses or fuel lines.

Top up the coolant if necessary.

Check that no diagnostic trouble codes (DTC) have been stored during the repair work.

Install the bumper cover. See **CASING BUMPER FRONT, REPLACING**

FUEL INJECTION NOZZLE / FAN MOTOR / PRESSURE EQUALIZER, REPLACING

REMOVING THE FUEL INJECTION NOZZLE, BLOWER FAN MOTOR AND PRESSURE EQUALIZER

The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

Fig. 166: Control Module
Courtesy of VOLVO CARS CORPORATION

Remove:

- the heater. See **ENGINE COOLANT HEATER, REPLACING**
- the nut and the cover.

Remove the control module. See **CONTROL MODULE ENGINE COOLANT HEATER, REPLACING**.

Fig. 167: Identifying Fan Shroud Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the hose clamp from the intake hose
- the three screws from the fan shroud. Lift the fan shroud.

Fig. 168: Flame Sensor From Mounting
Courtesy of VOLVO CARS CORPORATION

Disconnect the fan motor connector.

Disconnect the flame sensor from the mounting.

FAN AND COMBUSTION CHAMBER

Fig. 169: Identifying Screwdriver (Round Object), Glow Plug And Combustion Unit
Courtesy of VOLVO CARS CORPORATION

Remove the glow plugs. See **GLOW PLUG ENGINE COOLANT HEATER, REPLACING**.

Insert a round object in the hole for the glow plug and press downwards so that the combustion unit is lifted up.

NOTE: Take care not to damage the thread, the edge or the nozzle unit.

A damaged nozzle unit can cause imbalance (combustion noise) and interruptions in the function. To avoid this it is important that an object with as large a diameter as possible is used. Do not insert the object too far.

COMBUSTION CHAMBER

Fig. 170: Combustion Chamber
Courtesy of VOLVO CARS CORPORATION

Release the combustion chamber: Slacken off the 3 screws from the mounting.

The engine mounting and blower fan motor (and holder) internal location is determined by a lug in the engine mounting. These can only be installed in one position.

FUEL INJECTION NOZZLE, ATOMIZER AND OUTER NOZZLE HEAD

Fig. 171: Fuel Injection Nozzle, Atomizer And Outer Nozzle Head
Courtesy of VOLVO CARS CORPORATION

Remove the screw holding the atomizer to the fan motor spindle.

NOTE: **Do not use the fan wheel as a counterhold when slackening off screws. This could damage the fan wheel.**

Remove:

- the atomizer
- the spacer
- the outer nozzle head
- the fuel injection nozzle.

NOTE: **Take care of the spacers and washers (1) and note their internal order.**

BLOWER FAN MOTOR AND MOTOR MOUNTING

Fig. 172: Blower Fan Motor And Motor Mounting
Courtesy of VOLVO CARS CORPORATION

Remove the 3 screws between the engine mounting and the other mounting.

Remove the mounting and the fuel line.

Remove the engine mounting.

NOTE: **Note the position of the engine mounting in relation to the fan motor. It is vital that the engine mounting is correctly installed.**

PRESSURE EQUALIZER WITH FUEL LINE

Fig. 173: Opening Fuel Line Mountings With Mallet & Screwdriver
Courtesy of VOLVO CARS CORPORATION

Open the mountings around the fuel line: Tap them carefully using a mallet and a screwdriver. Only open the mountings just enough to remove the fuel line.

Remove the pressure equalizer and the fuel line.

INSTALLING THE FUEL INJECTION NOZZLE, BLOWER FAN MOTOR AND PRESSURE EQUALIZER

PRESSURE EQUALIZER WITH FUEL LINE

Fig. 174: Identifying New Pressure Equalizer & Fuel Line
Courtesy of VOLVO CARS CORPORATION

Install the new pressure equalizer and fuel line.

NOTE: **It is important that the fuel line is in contact with the bottom of the motor mounting. Also ensure that its connector is in contact with the bottom of the cut-out on the mounting.**

Squeeze the mountings into place around the fuel line using a pair of pliers.

BLOWER FAN MOTOR AND MOTOR MOUNTING

Fig. 175: Blower Fan Motor And Motor Mounting
Courtesy of VOLVO CARS CORPORATION

Install:

- motor holder on a new motor
- the motor on the motor mounting. Tighten. See **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS** . Use thread sealant.

The fuel line must be lined up with the fan motor joint.

FUEL INJECTION NOZZLE, ATOMIZER AND OUTER NOZZLE HEAD

Fig. 176: Fuel Injection Nozzle, Atomizer And Outer Nozzle Head
Courtesy of VOLVO CARS CORPORATION

Install the fuel injection nozzle with washer (1).

Install:

- the outer nozzle head
- a conical spacer with the cone pointing towards the outer nozzle head
- the atomizer
- a **new** screw with all components on the shaft of the blower fan motor. Tighten. See **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS** . Use thread sealant.

HEAT EXCHANGER AND GLOW PLUG

Fig. 177: Heat Exchanger And Glow Plug
Courtesy of VOLVO CARS CORPORATION

Install the combustion chamber.

Assemble the fan shroud with the combustion unit and the heat exchanger.

Center the socket for the glow plug in the flame shield with the mounting on the heat exchanger.

Position the glow plug in the heat exchanger.

If the glow plug can be screwed in by hand the glow plug socket has been centered correctly. Tighten the glow plug. See **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS** .

FINISHING

Fig. 178: Control Module
Courtesy of VOLVO CARS CORPORATION

Connect the connector to the blower fan motor. The cables must be routed under the nozzle pipe.

Install the flame sensor.

NOTE: Ensure that no cables are routed under the flame sensor.

Install:

- the fan shroud using three screws
- the cover with the nut (see the illustration). Tighten. See **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS**
- the heater. See **ENGINE COOLANT HEATER, REPLACING**.

FUEL PIPE AUXILIARY HEATER, REPLACING

Special tools:

see **9512619**

The illustrations in this service information are used for different model years and / or models. Some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATIONS

Fig. 179: Splash Guard. Protective Plate And Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the splash guard under the engine
- the protective panel (see the illustration).

REMOVING THE FUEL LINE FOR THE ENGINE COOLANT HEATER

WARNING: **Protective gloves and protective goggles must be used for the following operations. This is due to the risk of fuel spillage.**

Fig. 180: Identifying Quick-Release Connector
Courtesy of VOLVO CARS CORPORATION

Remove:

- the quick-release connector at the rear edge of the sub-frame
- the hose clamp for the heater.

HINT: Use special tool see 9512619 (Oetiker pliers) to remove and to fasten the clamps.

Pull the pipe loose from the clip.

Fig. 181: Moving Clips Aside To Remove Fuel Line Cover
Courtesy of VOLVO CARS CORPORATION

Remove:

- the cover over the fuel line by moving the clips to one side (see the illustration).

Fig. 182: Identifying Quick-Release Connector And Fuel Hose Clamp
Courtesy of VOLVO CARS CORPORATION

- the quick-release connector and the hose clamp for the fuel hoses.

Plug the hoses.

Fig. 183: Quick-Release Connector And Hose Clamp For Fuel Hoses
Courtesy of VOLVO CARS CORPORATION

Remove:

- the rear seats. See **REMOVING THE CENTER SEAT (SECOND ROW)** and **REMOVING THE OUTER SEAT (SECOND ROW)**
- the right-hand side panel in the cargo compartment / third row of seats. See **SIDE PANEL CARGO COMPARTMENT, REPLACEMENT**
- the right-hand section of the air duct to the rear right-hand air vent in the C-post
- the insulation
- the four nuts
- the inspection hatch for the fuel tank unit.

Disconnect the quick-release connector (see the illustration). Pull off the fuel hose.

INSTALLING THE FUEL LINE FOR THE ENGINE COOLANT HEATER

Fig. 184: Identifying Quick-Release Connector And Fuel Hose Clamp
Courtesy of VOLVO CARS CORPORATION

Install the fuel line.

Connect the fuel line to the fuel pump (FP).

Check that the tilt angle on the fuel pump (FP) is 15°.

Connect the fuel line from the fuel pump (FP) and forward to the sub-frame and fuel line.

Install the fuel line on the clip and the fuel terminals.

FINAL CHECK

Test run the heater. Check the function of the heater. See **ENGINE COOLANT HEATER, TEST RUNNING** .

Check for leakage in the fuel lines and hoses.

Check that no diagnostic trouble codes (DTC) have been stored during the repair work.

Screw the inspection hatch for the fuel tank unit into place.

Fig. 185: Splash Guard. Protective Plate And Screws
Courtesy of VOLVO CARS CORPORATION

Install:

- the insulation
- the air duct for the vent on the right-hand C-post
- the right-hand side panel in the cargo compartment / third row of seats. See **SIDE PANEL CARGO COMPARTMENT, REPLACEMENT**
- the rear seats. See **INSTALLING THE CENTER SEAT (SECOND ROW)** and **INSTALLING THE OUTER SEAT (SECOND ROW)**
- the protective panel (see the illustration)
- the splash guard under the engine.

FUEL PUMP AUXILIARY HEATER, REPLACING

Special tools:

see **9512619**

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE FUEL PUMP (FP) FOR THE ENGINE COOLANT HEATER

Fig. 186: Identifying Quick-Release Connector And Fuel Hose Clamp
Courtesy of VOLVO CARS CORPORATION

WARNING: **Protective gloves and protective goggles must be used for the following operations. This is due to the risk of fuel spillage.**

The fuel pump (FP) is located against the front right-hand side of the fuel tank.

NOTE: Note the tilt angle on the fuel pump (FP), 15°. It is important for the pump function that the angle is correct (see the illustration).

Remove the quick-release connector and the hose clamp for the fuel hoses.

HINT: Use special tool see 9512619 (Oetiker pliers) to remove and to fasten the clamps.

Plug the hoses.

Disconnect the fuel pump connector.

Remove one nut retaining the pump holder.

INSTALLING THE FUEL PUMP (FP) FOR THE ENGINE COOLANT HEATER

Install the fuel pump (FP) unit nut and tighten the nut to an angle of 15°. Tighten. See **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS** .

Install:

- the connector
- the fuel lines.

Complete rustproofing.

FINAL CHECK

Test run the heater. Check the function of the heater. See **ENGINE COOLANT HEATER, TEST RUNNING** .

Check for leakage in the engine coolant hoses or fuel lines.

Check that no diagnostic trouble codes (DTC) have been stored during the repair work.

GLOW PLUG ENGINE COOLANT HEATER, REPLACING

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATIONS

Remove left-hand headlamp. See **LIGHTING - REMOVAL, REPLACEMENT AND INSTALLATION** .

REMOVING THE GLOW PLUGS FOR THE ENGINE COOLANT HEATER

Fig. 187: Removing Glow Plug
Courtesy of VOLVO CARS CORPORATION

Remove the protective socket.

Unscrew the glow plug.

INSTALLING THE GLOW PLUG FOR THE ENGINE COOLANT HEATER

Screw the glow plug into place. Tighten to **15 Nm** .

Reconnect the protective socket.

Check that no DTCs were stored during the repair.

FINAL CHECK

Start the engine and let it idle for a few seconds before starting the heater.

Test run the heater. Check the function of the heater. See **ENGINE COOLANT HEATER, TEST RUNNING** .

Check that no DTCs were stored during the repair.

Install the left-hand headlamp. See **LIGHTING - REMOVAL, REPLACEMENT AND INSTALLATION** .

HEAT EXCHANGER, REPLACING

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information is always correct.

REMOVING THE HEAT EXCHANGER

Fig. 188: Identifying Heat Exchanger
Courtesy of VOLVO CARS CORPORATION

Remove:

- the heater. See **ENGINE COOLANT HEATER, REPLACING**
- the control module. See **CONTROL MODULE ENGINE COOLANT HEATER, REPLACING**
- the water pump. See **WATER PUMP ENGINE COOLANT HEATER, REPLACING**
- the glow plug. See **GLOW PLUG ENGINE COOLANT HEATER, REPLACING**
- the cable harness.

Expose and replace the heat exchanger.

INSTALLING THE HEAT EXCHANGER

Install:

- the cable harness
- the glow plug. See **GLOW PLUG ENGINE COOLANT HEATER, REPLACING**
- the water pump. See **WATER PUMP ENGINE COOLANT HEATER, REPLACING**
- the control module. See **CONTROL MODULE ENGINE COOLANT HEATER, REPLACING**
- the heater. See **ENGINE COOLANT HEATER, REPLACING**.

NOTE: When installing, check that there is clearance between the fuel line and water hose.

FINAL CHECK

Test run the heater. Check the function of the heater. See **ENGINE COOLANT HEATER, TEST RUNNING** .

Check for leakage in the engine coolant hoses or fuel lines.

Top up the coolant if necessary.

Check that no diagnostic trouble codes (DTC) have been stored during the repair work.

OVERHEAT PROTECTION THERMOSTAT / FLAME SENSOR / ENGINE COOLANT TEMPERATURE SENSOR, REPLACING

REPLACING

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

REMOVING THE OVERHEAT PROTECTION, THERMOSTAT FLAME SENSOR AND COOLANT TEMPERATURE SENSOR

Fig. 189: Control Module
Courtesy of VOLVO CARS CORPORATION

Remove:

- the bumper cover. See **CASING BUMPER FRONT, REPLACING**
- the heater. See **ENGINE COOLANT HEATER, REPLACING**
- the nut and the cover.

Remove:

- the engine coolant temperature sensor (1) by working it loose
- the overheat protection thermostat (2) by slackening off a nut.

Fig. 190: Identifying Fan Shroud Screws
Courtesy of VOLVO CARS CORPORATION

- the control module. See **CONTROL MODULE ENGINE COOLANT HEATER, REPLACING**.

Remove:

- the hose clamp from the intake hose
- the three screws from the fan shroud. Lift the fan shroud out.

Fig. 191: Flame Sensor From Mounting
Courtesy of VOLVO CARS CORPORATION

Disconnect the fan motor connector.

Disconnect the flame sensor from the mounting.

Fig. 192: Cable Harness
Courtesy of VOLVO CARS CORPORATION

Replacing the entire cable harness:

Remove the entire cable harness for **all** sensors.

HINT: Replace the cable harness by removing it piece by piece. Replace in the same order with a new cable harness so that it is correctly positioned.

Cutting and splicing the cable harness:

To replace individual sensors, cut and splice the cable harness. See **SPLICING THE CABLES**.

INSTALLING THE OVERHEAT PROTECTION, THERMOSTAT FLAME SENSOR AND COOLANT TEMPERATURE SENSOR

Install:

- the new cable harness
- all the sensors and connectors
- the fan shroud
- the intake hose

- the control module. See **CONTROL MODULE ENGINE COOLANT HEATER, REPLACING**
- the overheat protection thermostat using a nut (1xM5). Tighten. See **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS**
- the engine coolant temperature sensor
- the cover with a nut. Tighten. See **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS**
- the heater. See **ENGINE COOLANT HEATER, REPLACING**.

FINAL CHECK

Test run the heater. Check the function of the heater. See **ENGINE COOLANT HEATER, TEST RUNNING** .

Check that no diagnostic trouble codes (DTC) have been stored during the repair work.

Install the bumper cover. See **CASING BUMPER FRONT, REPLACING** .

SPLICING THE CABLES

STRIP THE WIRE

Fig. 193: Identifying Cable Strip Length
Courtesy of VOLVO CARS CORPORATION

Peel 5.0mm / 0.2 in of the insulation off the 4 cable ends (13/64 inches) using pliers see **9512620** .

Fig. 194: Identifying Correct & Incorrect Wire End Twists
Courtesy of VOLVO CARS CORPORATION

Twist the strands on the stripped wire ends. Do NOT forget to do this on all four wire ends.

NOTE: Make sure the strands are twisted.

JOINING THE WIRE ENDS WITH THE SAME COLORS/ SINGLE OR MULTICOLORED

Fig. 195: Identifying Correct Cable Connection
Courtesy of VOLVO CARS CORPORATION

NOTE: Cable should always be connected color for color, single color to single color or multiple colors to multiple colors. The cables must NOT under any circumstances be incorrectly connected, always color for color.

Install the shrink tubing 951 2783 in the pressure tool see **9512785** in output "Green". Clamp the pliers enough to hold the shrink tubing.

Fig. 196: Crimping Examples
Courtesy of VOLVO CARS CORPORATION

NOTE: The sleeve must sit in the correct output of the pressure tool, position "Green".

Feed the end of the wire in the shrink tubing that is held by the pliers. Feed the wire into the shrink tubing until it stops, make sure that the wire insulation does not go near the clamp on the sleeve or the stripped wire will protrude outside the sleeve.

Fig. 197: Identifying Tight Shrink Tube Clamping
Courtesy of VOLVO CARS CORPORATION

Clamp the shrink tubing tightly.

Fig. 198: Crimping Cable Terminal
Courtesy of VOLVO CARS CORPORATION

Press the handles of the pliers fully together to obtain a correct joint, the pliers automatically release their grip afterwards.

Fig. 199: Identifying Shrink Tube Offset Measurement
Courtesy of VOLVO CARS CORPORATION

Feel by hand to make sure the shrink tubing is correctly installed.

Check that measurement B is 40mm (1-1/2 inches) between the joints from center to center.

Fig. 200: Crimped Wire
Courtesy of VOLVO CARS CORPORATION

NOTE: Remember the cable, color to color (with same color/ single or multi-colored).

When the first join is completed and checked, join the rest of the wire ends in the same way.

HEATING THE SHRINK TUBING

The shrink tubing ensures the electric wire is satisfactory and provides a safe join.

Hold a pad or other item behind the shrink tubing to avoid heat escaping.

HINT: Suitable setting of heat gun see 9512777 , air distribution switch in position 2 and potentiometer for temperature setting in position between 2 and 3.

Fig. 201: Heating Heat-Shrink Tubing
Courtesy of VOLVO CARS CORPORATION

Heat the sleeve using the hot air gun see **9512777** and suitable jet kit. Heat the shrink tubing rapidly to avoid heat escaping. It is very important that the shrink tubing is correctly shrunk around the wire. It should be tight at both ends.

NOTE: Adjust the heat shield if necessary.

WATER PUMP ENGINE COOLANT HEATER, REPLACING

As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATIONS

Remove:

- the bumper cover. See **CASING BUMPER FRONT, REPLACING**
- the control module. See **CONTROL MODULE ENGINE COOLANT HEATER, REPLACING**. Allow the cable harness to remain on the control module.

REMOVING THE WATER PUMP FOR THE ENGINE COOLANT HEATER

Fig. 202: Engine Coolant Heater Hose
Courtesy of VOLVO CARS CORPORATION

Install hose clips on both the engine coolant hoses by the heat exchanger.

Position a container under the heater.

Disconnect the hoses.

Fig. 203: Identifying Water Pump Mounting Nut
Courtesy of VOLVO CARS CORPORATION

Cut off the tie strap holding the protective cap over the control module. Lift off the protective cap.

Remove:

- the connector
- the nut for the water pump mounting. Hold the damper while removing the water pump.

NOTE: Note the position of the water pump on the holder.

INSTALLING THE WATER PUMP FOR THE ENGINE COOLANT HEATER

Position the water pump (according to the noted position) in the shutter using the shaped hoses.

Install:

- the water pump mounting using a nut (1xM6). Tighten. See **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS**
- the connector
- the protective cap

- a new tie strap.

Tighten the hose clamps for both the engine coolant hoses.

Install the control module. See **CONTROL MODULE ENGINE COOLANT HEATER, REPLACING**.

FINAL CHECK

Test run the heater. Check the function of the heater. See **ENGINE COOLANT HEATER, TEST RUNNING** .

Check for leakage in the engine coolant hoses or fuel lines.

Top up the coolant if necessary.

Check that no diagnostic trouble codes (DTC) have been stored during the repair work.

Install the bumper cover. See **CASING BUMPER FRONT, REPLACING** .

AIR CONDITIONING (B6324S; 2007-2010)

AC COMPRESSOR, REPLACEMENT

REPLACING

NOTE: Removal steps in this procedure may contain installation details.

WARNING: Follow the safety instructions for work on the air conditioning system. See REFRIGERANT, SAFETY REGULATIONS .

NOTE: First read the instructions covering slow and fast leaks. See OIL AIR CONDITIONING (A/C) SYSTEM, FILLING .

Drain the refrigerant from the AC system. See **REFRIGERANT, DRAINING**

Remove the following items:

- Air cleaner housing, see **AIR CLEANER HOUSING**
- The auxiliaries belt. See **AUXILIARY BELT** .

Fig. 204: Compressor Terminals
Courtesy of VOLVO CARS CORPORATION

NOTE: **Plug the terminals of the compressor using the transport plugs from the new compressor.**

Torque: M8

24 Nm

INSTALLING

To install, reverse the removal procedure.

Vacuum pump the air conditioning system. See **VACUUM PUMPING** .

Fill the air conditioning system with refrigerant. See **REFRIGERANT, FILLING** .

Leak-trace the air conditioning system. See **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** .

Carry out a performance test on the climate control system. See **CLIMATE SYSTEM, PERFORMANCE TEST** .

COOLANT PIPE JUNCTION BLOCK TO COMPRESSOR

REPLACING

NOTE: **Removal steps in this procedure may contain installation details.**

WARNING: **Follow the safety instructions for work on the air conditioning system. See REFRIGERANT, SAFETY REGULATIONS .**

NOTE: **First read the instructions covering slow and fast leaks. See OIL AIR CONDITIONING (A/C) SYSTEM, FILLING**

Drain the refrigerant from the air conditioning system. See **REFRIGERANT, DRAINING** .

Fig. 205: Air Box Cover
Courtesy of VOLVO CARS CORPORATION

Fig. 206: Identifying Air Condition Line
Courtesy of VOLVO CARS CORPORATION

INSTALLING

To install, reverse the removal procedure

Vacuum pump the AC system. See **VACUUM PUMPING** .

Fill the AC-system with refrigerant. See **REFRIGERANT, FILLING** .

Leak-trace the air conditioning system. See **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP**

Or, see **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** .

Carry out a performance test on the climate control system. See **CLIMATE SYSTEM, PERFORMANCE TEST** .

SIGNAL SPECIFICATION (2005-12)

SIGNAL SPECIFICATION

All the values given below are between the terminals stated in column 1 and terminal #A16 in column 2 (signal ground). This applies unless otherwise indicated in brackets.

NOTE: It is important to connect the breakout box and check the ground terminals before taking readings.

For further information about:

- connection of breakout box, see "Connecting breakout box, Climate Control Module (CCM)"
- checking the ground point, "Checking the voltage/ground connection, climate control module (CCM)".

There may be several connections and connectors between the control module and components.

U =	DC voltage in volts (V)	U_{AC} =	AC voltage in volts (V)
U_{bat} =	Battery voltage (V)	f =	Frequency in Hertz (Hz)
U_{low} =	Voltage approximately 0 V	t =	Time in seconds
PWM =	Pulse width modulated signal in	-	-

COMPONENT RESISTANCE VALUES

The resistance values assume a temperature of +20°C unless otherwise stated.

NOTE: **For the damper motors, a diode must be connected in series with each winding. This can have a great effect on the measurement value when resistance testing if measured using a tool other than VIDA (Volvo scan tool). The resistance given will be significantly higher than the value given in the table below.**

COMPONENT RESISTANCE VALUES TABLE

Component	Other
Evaporator temperature sensor	Resistance: -40°C = approximately 91.8 kohms -30°C = approximately 48.4 kohms -20°C = approximately 26.6 kohms -10°C = approximately 15.2 kohms 0°C = approximately 9.0 kohms 10°C = approximately 5.5 kohms 20°C = approximately 3.4 kohms 30°C = approximately 2.2 kohms 40°C = approximately 1.5 kohms 50°C = approximately 1.0 kohms 60°C = approximately 0.7 kohms 70°C = approximately 0.5 kohms 80°C = approximately 0.3 kohms 90°C = approximately 0.2 kohms

DESCRIPTION OF PARAMETERS. CLIMATE CONTROL MODULE CCM (2003-04)

DESCRIPTION OF PARAMETERS

The climate control system must be active for certain values to be updated.

NOTE: In the AUTO position, the electronic climate control module (CCM) governs functions which affect certain of the parameters listed below.

SUN INTENSITY, VALUE (ELECTRONIC CLIMATE CONTROL)

Measurement range: 0 - 1000 W/m^2

The climate control module (CCM) calculates the sun intensity based on the signal from the sun sensor.

The value is used as a compensation parameter to control the passenger compartment temperature.

EVAPORATOR TEMPERATURE, VALUE (ELECTRONIC CLIMATE CONTROL, MANUAL CLIMATE CONTROL)

Measurement range: -40 - 85°C

The climate control module (CCM) calculates the temperature based on the signal from the evaporator temperature sensor.

The value is used to control the air conditioning (A/C) compressor.

In normal operation (engine running and A/C selected) the control module can regulate the compressor in the following way:

- 10°C air conditioning (A/C) compressor on
- 6.5°C air conditioning (A/C) compressor off.

At temperatures below 6°C the compressor is not permitted to operate because of the risk of freezing.

TWILIGHT INTENSITY, VALUE

Measurement range: 0 - 15

The climate control module (CCM) calculates the twilight intensity based on the signal from the twilight sensor.

This value is transmitted to the central electronic module (CEM) via the control area network (CAN) to regulate the luminance of the buttons and combined instrument panel (DIM).

The value increases with increased and falls with diminished light intensity. The luminance of the buttons and combined instrument panel (DIM) will increase with increasing light intensity and fall with diminishing light intensity.

POWER SUPPLY, DELAYED X-SUPPLY, VALUE

Measurement range: 0 - 18 V

Normal value when the generator (GEN) is charging: 13.0 - 14.5 V

The value indicates the voltage at the climate control module (CCM). Delayed X-supply means that the power supply is maintained for 1 minute after the ignition is switched off. This is so that functions such as blower fan run-on and damper motor self-adjustment can be activated.

MATRIX VOLTAGE, VALUE

Incorrect f=165±50 Hz

Measurement range: 0 - 5 V

Matrix voltage means that the climate control module (CCM) supplies the damper motors with an impulse sequence via four common cables (connected in parallel). The impulse sequence consists of power supply and signal ground. This determines which direction the damper motors should move when activated. There is also a separate cable from the climate control module (CCM) to each damper motor. This cable controls the number of stages each damper motor should be moved based on the signal from the climate control module (CCM).

CABIN TEMPERATURE (ECC)

Measurement range: -40 - 85°C

The climate control module (CCM) calculates the temperature based on the signal from the passenger compartment temperature sensor.

The value is used to control the passenger compartment temperature and as the input signal to the central electronic module (CEM).

OUTSIDE TEMPERATURE

Measurement range: -10 - 80°C

The climate control module (CCM) obtains the value via the control area network (CAN) from the passenger door module (PDM) (left-hand drive) or the driver door module (DDM) (right-hand drive).

The value is used to control the passenger compartment temperature.

BLOWER FAN MOTOR POWER UNIT, DIAGNOSTIC SIGNAL, VALUE

The climate control module (CCM) generates an analogue signal. This is converted to a current which the power unit converts back to an analogue signal. The diagnostic signal is an extremely intense signal that cannot be used when checking the blower fan.

GUIDE CURRENT FOR THE BLOWER FAN MOTOR POWER UNIT, VALUE

Measurement range: 0 - 10 mA

The climate control module (CCM) calculates the value based on the signal from the control knob for the blower fan. With electronic climate control, the value is also affected by automatic climate control (AUTO position).

The value is used to control the power supply from the power unit to the blower fan motor.

LOWER SWITCH APPROVAL, STATUS

The status displays whether the identity of a certain switch is permissible or missing compared with the permitted switch identities in the Car Configuration File.

Ok = Switch permitted

Faulty = Switch not permitted

LOWER SWITCH, STATUS

Displays the status of a certain switch.

Off = Active signal

On = Signal not active

LOWER SWITCH IDENTITY, STATUS

The status displays the function of a certain switch. The functions are as follows:

Fold down head restraints

Folding power door mirrors

Private locking (boot lid)

STC

DSTC

Auxiliary lamps

Deadlock (temporary disengagement of the movement and tilt sensors in the alarm)

Reverse warning

Bi-fuel

Child-proof lock

Rear A/C

TEMPERATURE DAMPER MOTOR, LEFT POSITION, VALUE

Measurement range: 0 - 100%

The climate control module (CCM) calculates the value based on the stage movement of the damper motor.

TEMPERATURE DAMPER MOTOR, RIGHT POSITION, VALUE

Measurement range: 0 - 100%

The climate control module (CCM) calculates the value based on the stage movement of the damper motor.

RECIRCULATION DAMPER MOTOR POSITION, VALUE

Measurement range: 0 - 100%

The climate control module (CCM) calculates the value based on the stage movement of the damper motor.

FLOOR/VENTILATION DAMPER MOTOR POSITION, VALUE (ELECTRONIC CLIMATE CONTROL)

Measurement range: 0 - 100%

The climate control module (CCM) calculates the value based on the stage movement of the damper motor.

DEFROSTER DAMPER MOTOR POSITION, VALUE (ELECTRONIC CLIMATE CONTROL)

Measurement range: 0 - 100%

The climate control module (CCM) calculates the value based on the stage movement of the damper motor.

AIR DISTRIBUTION DAMPER MOTOR POSITION, VALUE (MANUAL CLIMATE CONTROL/STANDARD)

Measurement range: 0 - 100%

The climate control module (CCM) calculates the value based on the stage movement of the damper motor.

AIR DISTRIBUTION SELECTOR, DEFROSTER POSITION, STATUS (MANUAL CLIMATE CONTROL/STANDARD)

The status displays whether the signal from the air distribution selector for the climate control module (CCM) is active or not.

Off = Inactive

On = Active

AIR DISTRIBUTION SELECTOR, VENTILATION POSITION, STATUS (MANUAL CLIMATE CONTROL/STANDARD)

The status displays whether the signal from the air distribution selector for the climate control module (CCM) is active or not.

Off = Inactive

On = Active

AIR DISTRIBUTION SELECTOR, FLOOR POSITION, STATUS (MANUAL CLIMATE CONTROL/STANDARD)

The status displays whether the signal from the air distribution selector for the climate control module (CCM) is active or not.

Off = Inactive

On = Active

AIR DISTRIBUTION SELECTOR, FLOOR/DEFROSTER POSITION, STATUS (MANUAL CLIMATE CONTROL/STANDARD)

The status displays whether the signal from the air distribution selector for the climate control module (CCM) is active or not.

Off = Inactive

On = Active

TEMPERATURE DAMPER MOTOR, LEFT ACTIVATION, VALUE

Measurement range: 0 - U_{bat}

The climate control module (CCM) transmits a signal to the damper motor for stage movement.

TEMPERATURE DAMPER MOTOR, RIGHT ACTIVATION, VALUE

Measurement range: 0 - U_{bat}

The climate control module (CCM) transmits a signal to the damper motor for stage movement.

RECIRCULATION DAMPER MOTOR ACTIVATION, VALUE

Measurement range: 0 - U_{bat}

The climate control module (CCM) transmits a signal to the damper motor for stage movement.

FLOOR/VENTILATION DAMPER MOTOR ACTIVATION, VALUE (ELECTRONIC CLIMATE CONTROL)

Measurement range: 0 - U_{bat}

The climate control module (CCM) transmits a signal to the damper motor for stage movement.

DEFROSTER DAMPER MOTOR ACTIVATION, VALUE (ELECTRONIC CLIMATE CONTROL)

Measurement range: 0 - U_{bat}

The climate control module (CCM) transmits a signal to the damper motor for stage movement.

AIR DISTRIBUTION DAMPER MOTOR ACTIVATION, VALUE (MANUAL CLIMATE CONTROL/STANDARD)

Measurement range: 0 - U_{bat}

The climate control module (CCM) transmits a signal to the damper motor for stage movement.

AIR QUALITY SENSOR, VALUE (ELECTRONIC CLIMATE CONTROL)

Measurement range 0-100%

The climate control unit calculates the air quality using the signal from the air quality sensor. The value is used to control the position of the recirculation motor.

VEHICLE COMMUNICATION INFORMATION, CLIMATE CONTROL MODULE (CCM) (2005-12)

DESCRIPTION OF PARAMETERS

PARAMETERS, STATUS

LOWER SWITCH, STATUS

The status displays whether the identity of a certain switch is permissible or missing compared with the permitted switch identities in the Car Configuration File.

Ok = Switch permitted.

Faulty = Switch not permitted.

LOWER SWITCH IDENTITY

The status displays the function of a certain switch. The functions are as follows:

Adjustable head restraint

Retracting door mirrors

Private locking (trunk lid)

STC

DSTC

BLIS

Auxiliary lamps

Reduced alarm (temporary disengagement of the movement and tilt sensors in the alarm)

Back-up warning

Bi-fuel

Child-proof lock

Rear A/C

Four-C

Blind spot detection

Not defined

LOWER SWITCH LED

The parameter indicates whether the climate control module (CCM) recognizes whether the LED for lower switches should be lit or not.

Lit = the LED must be lit.

Not lit = the LED must not be lit.

LOWER SWITCH

The parameter indicates whether the climate control module (CCM) recognizes whether the button for each switch is pressed in or not.

Not pressed = the button is not pressed in.

Pressed = the button is pressed in.

STATUS, SEAT HEATER RIGHT FRONT

The parameter indicates the status of the right-hand front seat heating module (SHM).

The following statuses are available:

OK, heating off - Seat heating module (SHM) functioning, heating off.

OK, heating on - Seat heating module (SHM) functioning, heating on.

Incorrect status 1 - Incorrect heater pad, heating off.

Incorrect status 2 - Faulty temperature sensor, heating off.

Incorrect status 3 - Seat heating module (SHM) overheated, heating off.

Incorrect status 4 - Communication problems, heating off.

Incorrect status 5 - Other fault, heating off.

Incorrect status 6 - Internal fault, heating off.

STATUS, SEAT HEATER LEFT FRONT

The parameter indicates the status of the left front seat heating module (SHM).

The following statuses are available:

OK, heating off - Seat heating module (SHM) functioning, heating off.

OK, heating on - Seat heating module (SHM) functioning, heating on.

Incorrect status 1 - Incorrect heater pad, heating off.

Incorrect status 2 - Faulty temperature sensor, heating off.

Incorrect status 3 - Seat heating module (SHM) overheated, heating off.

Incorrect status 4 - Communication problems, heating off.

Incorrect status 5 - Other fault, heating off.

Incorrect status 6 - Internal fault, heating off.

BUTTON HEATED REAR WINDSHIELD/DOOR MIRRORS

The parameter indicates whether the climate control module (CCM) recognizes whether the button for the heated rear windshield/door mirrors is pressed in or not.

The button is on the keypad for the climate control module (CCM).

Not pressed = the button is not pressed in.

Pressed = the button is pressed in.

MAX DEFROSTER BUTTON

The parameter indicates whether the climate control module (CCM) recognizes whether the button for max defroster is pressed in or not.

The button is on the keypad for the climate control module (CCM).

Not pressed = the button is not pressed in.

Pressed = the button is pressed in.

AIR DISTRIBUTION DEFROSTER BUTTON

The parameter indicates whether the climate control module (CCM) recognizes whether the button for air distribution defroster is pressed in or not.

The button is on the keypad for the climate control module (CCM).

Not pressed = the button is not pressed in.

Pressed = the button is pressed in.

AIR DISTRIBUTION VENTILATION BUTTON

The parameter indicates whether the climate control module (CCM) recognizes whether the button for air distribution ventilation is pressed in or not.

The button is on the keypad for the climate control module (CCM).

Not pressed = the button is not pressed in.

Pressed = the button is pressed in.

AIR DISTRIBUTION FLOOR BUTTON

The parameter indicates whether the climate control module (CCM) recognizes whether the button for air distribution floor is pressed in or not.

The button is on the keypad for the climate control module (CCM).

Not pressed = the button is not pressed in.

Pressed = the button is pressed in.

A/C BUTTON

The parameter indicates whether the climate control module (CCM) recognizes whether the button for air conditioning (A/C) is pressed in or not.

The button is on the keypad for the climate control module (CCM).

Not pressed = the button is not pressed in.

Pressed = the button is pressed in.

SEAT HEATER LEFT FRONT BUTTON

The parameter indicates whether the climate control module (CCM) recognizes whether the button for the left front seat heater is pressed in or not.

The button is on the keypad for the climate control module (CCM).

Not pressed = the button is not pressed in.

Pressed = the button is pressed in.

SEAT HEATER RIGHT FRONT BUTTON

The parameter indicates whether the climate control module (CCM) recognizes whether the button for the right front seat heater is pressed in or not.

The button is on the keypad for the climate control module (CCM).

Not pressed = the button is not pressed in.

Pressed = the button is pressed in.

AUTO BUTTON

The parameter indicates whether the climate control module (CCM) recognizes whether the button for AUTO mode is pressed in or not.

The button is on the keypad for the climate control module (CCM).

Not pressed = the button is not pressed in.

Pressed = the button is pressed in.

RECIRCULATION BUTTON

The parameter indicates whether the climate control module (CCM) recognizes whether the button for recirculation is pressed in or not.

The button is on the keypad for the climate control module (CCM).

Not pressed = the button is not pressed in.

Pressed = the button is pressed in.

AQS LED

The parameter indicates whether the climate control module (CCM) recognizes whether the LED for the air quality sensor (AQS) should be lit or not.

The LED is on the keypad for the climate control module (CCM).

Not lit = the LED must not be lit.

Lit = the LED must be lit.

RECIRCULATION LED

The parameter indicates whether the climate control module (CCM) recognizes whether the LED for recirculation should be lit or not.

The LED is on the keypad for the climate control module (CCM).

Not lit = the LED must not be lit.

Lit = the LED must be lit.

AUTO LED

The parameter indicates whether the climate control module (CCM) recognizes whether the LED for AUTO should be lit or not.

The LED is on the keypad for the climate control module (CCM).

Not lit = the LED must not be lit.

Lit = the LED must be lit.

HEATED REAR WINDSHIELD LED

The parameter indicates whether the climate control module (CCM) recognizes whether the LED for the heated rear windshield/door mirrors should be lit or not.

The LED is on the keypad for the climate control module (CCM).

Not lit = the LED must not be lit.

Lit = the LED must be lit.

MAX DEFROSTER LED

The parameter indicates whether the climate control module (CCM) recognizes whether the LED for maximum defrosting should be lit or not.

The LED is on the keypad for the climate control module (CCM).

Not lit = the LED must not be lit.

Lit = the LED must be lit.

DEFROSTER LED

The parameter indicates whether the climate control module (CCM) recognizes whether the LED for air distribution defroster should be lit or not.

The LED is on the keypad for the climate control module (CCM).

Not lit = the LED must not be lit.

Lit = the LED must be lit.

VENTILATION LED

The parameter indicates whether the climate control module (CCM) recognizes whether the LED for air distribution ventilation should be lit or not.

The LED is on the keypad for the climate control module (CCM).

Not lit = the LED must not be lit.

Lit = the LED must be lit.

FLOOR LED

The parameter indicates whether the climate control module (CCM) recognizes whether the LED for floor air distribution should be lit or not.

The LED is on the keypad for the climate control module (CCM).

Not lit = the LED must not be lit.

Lit = the LED must be lit.

A/C ON LED

The parameter indicates whether the climate control module (CCM) recognizes whether the LED for A/C ON should be lit or not.

The LED is on the keypad for the climate control module (CCM).

Not lit = the LED must not be lit.

Lit = the LED must be lit.

A/C OFF LED

The parameter indicates whether the climate control module (CCM) recognizes whether the LED for A/C OFF should be lit or not.

The LED is on the keypad for the climate control module (CCM).

Not lit = the LED must not be lit.

Lit = the LED must be lit.

LEFT SEAT HEATER LOW LED

The parameter indicates whether the climate control module (CCM) recognizes whether the LED for left seat heater low should be lit or not.

The LED is on the keypad for the climate control module (CCM).

Not lit = the LED must not be lit.

Lit = the LED must be lit.

LEFT SEAT HEATER HIGH LED

The parameter indicates whether the climate control module (CCM) recognizes whether the LED for left seat heater high should be lit or not.

The LED is on the keypad for the climate control module (CCM).

Not lit = the LED must not be lit.

Lit = the LED must be lit.

RIGHT SEAT HEATER LOW LED

The parameter indicates whether the climate control module (CCM) recognizes whether the LED for right seat heater low should be lit or not.

The LED is on the keypad for the climate control module (CCM).

Not lit = the LED must not be lit.

Lit = the LED must be lit.

RIGHT SEAT HEATER HIGH LED

The parameter indicates whether the climate control module (CCM) recognizes whether the LED for right seat heater high should be lit or not.

The LED is on the keypad for the climate control module (CCM).

Not lit = the LED must not be lit.

Lit = the LED must be lit.

BLOWER FAN CONTROL, RED LED

The parameter indicates whether the climate control module (CCM) recognizes whether the red LED for the blower fan control should be lit or not.

Lit = the LED must be lit.

Not lit = the LED must not be lit.

BLOWER FAN CONTROL, GREEN LED

The parameter indicates whether the climate control module (CCM) recognizes whether the green LEDs for the blower fan control should be lit or not.

Not lit = the LED must not be lit.

1 lit = 1 LED must be lit.

2 lit = 2 LEDs must be lit.

3 lit = 3 LEDs must be lit.

4 lit = 4 LEDs must be lit.

5 lit = 5 LEDs must be lit.

6 lit = 6 LEDs must be lit.

7 lit = 7 LEDs must be lit.

AQS SIGNAL (ONLY ECC)

The parameter displays the signal from the air quality sensor (AQS). The climate control module (CCM) uses the signal to regulate the damper motor module (DMM) recirculation.

Off = no increase or reduction in pollutant level.

Level 1 = slow increase in pollutant level.

Level 2 = medium increase in pollutant level.

Level 3 = rapid increase in pollutant level.

PARAMETERS, VALUE

EVAPORATOR TEMPERATURE

The value indicates the temperature from the evaporator temperature sensor. The value is used by the climate control module (CCM) to regulate activation of the air conditioning (A/C) compressor.

Measurement range -100°C-100°C.

With the ignition off and a cold engine, the value must correspond with the ambient temperature.

When the engine is running and the A/C is activated, the climate control module (CCM) will regulate the compressor as follows:

- Compressor on at 10°C.
- Compressor off at 6°C.

PASSENGER COMPARTMENT TEMPERATURE SENSOR (ONLY ECC)

The parameter indicates the value from the passenger compartment temperature sensor. The climate control module (CCM) uses the signal to regulate the climate in the passenger compartment in the AUTO position.

Measurement range -40-90°C.

The value must correspond to the ambient temperature.

DESIRED POSITION, DAMPER MOTOR, DEFROSTER

The value indicates how much the damper for the defroster should be open to correspond to the desired climate control. The climate control module (CCM) transmits the value to the damper motor module (DMM) defroster via the LIN bus.

Measurement range 0-100%.

100% is full capacity.

0% corresponds to a fully closed damper and 100% corresponds to a fully open damper.

ACTUAL POSITION, DAMPER MOTOR, DEFROSTER

The value indicates how much the damper for the defroster is open. The climate control module (CCM) receives the value from the damper motor module (DMM) for the defroster via the LIN bus.

Measurement range 0-100%.

0% corresponds to a fully closed damper and 100% corresponds to a fully open damper.

DESIRED POSITION, DAMPER MOTOR, RECIRCULATION

The value indicates how much the damper for recirculation should be open to correspond to the desired climate control. The climate control module (CCM) transmits the value to the damper motor module (DMM) recirculation via the LIN bus.

Measurement range 0-100%.

0% corresponds to a fully closed damper and 100% corresponds to a fully open damper.

ACTUAL POSITION, DAMPER MOTOR, RECIRCULATION

The value indicates how much the damper for recirculation is open. The climate control module (CCM) receives the value from the damper motor module (DMM) recirculation via the LIN bus.

Measurement range 0-100%.

0% corresponds to a fully closed damper and 100% corresponds to a fully open damper.

DESIRED POSITION, DAMPER MOTOR, TEMPERATURE LEFT

The value indicates how much the damper for temperature left should be open to correspond to the desired climate control. The climate control module (CCM) transmits the value to the damper motor module (DMM) temperature left via the LIN bus.

Measurement range 0-100%.

0% corresponds to a fully closed damper and 100% corresponds to a fully open damper.

ACTUAL POSITION, DAMPER MOTOR, TEMPERATURE LEFT

The value indicates how much the damper for temperature left is open. The climate control module (CCM) receives the value from the damper motor module (DMM) temperature left via the LIN bus.

Measurement range 0-100%.

0% corresponds to a fully closed damper and 100% corresponds to a fully open damper.

DESIRED POSITION, DAMPER MOTOR, TEMPERATURE RIGHT

The value indicates how much the damper for temperature right should be open to correspond to the desired climate control. The climate control module (CCM) transmits the value to the damper motor module (DMM) for temperature right via the LIN bus.

Measurement range 0-100%.

0% corresponds to a fully closed damper and 100% corresponds to a fully open damper.

ACTUAL POSITION, DAMPER MOTOR, TEMPERATURE RIGHT

The value indicates how much the damper for temperature right is open. The climate control module (CCM) receives the value from the damper motor module (DMM) for temperature right via the LIN bus.

Measurement range 0-100%.

0% corresponds to a fully closed damper and 100% corresponds to a fully open damper.

DESIRED POSITION, DAMPER MOTOR, AIR DISTRIBUTION

The value indicates how much the damper for air distribution should be open to correspond to the desired climate control. The climate control module (CCM) transmits the value to the damper motor module (DMM) air distribution via the LIN bus.

Measurement range 0-100%.

0% corresponds to a fully closed damper and 100% corresponds to a fully open damper.

ACTUAL POSITION, DAMPER MOTOR, AIR DISTRIBUTION

The value indicates how much the damper for air distribution is open. The climate control module (CCM) receives the value from the damper motor module (DMM) air distribution via the LIN bus.

Measurement range 0-100%.

0% corresponds to a fully closed damper and 100% corresponds to a fully open damper.

REQUESTED BLOWER FAN SPEED

The value indicates how much the blower fan must blow to correspond to the desired climate control. The climate control module (CCM) controls the blower fan speed by transmitting a signal to the central electronic module (CEM).

Measurement range 0-100%.

0% corresponds to the blower fan switched off, 100% corresponds to maximum blower fan speed.

POWER SUPPLY

The value indicates the power supply to the climate control module (CCM).

Measurement range 0-50 V.

Normal value approximately 12 V (battery voltage).

DESCRIPTION OF READING OFF EXTENDED DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

CONTENTS

Select type of description.

- See **DESCRIPTION OF FROZEN VALUES**
- See **STATUS IDENTIFIER, DESCRIPTION**
- See **COUNTERS, DESCRIPTION**

HVAC

Climate Units - Symptom Related Diagnostic Procedures

CALIBRATING THE DAMPER MOTOR MODULE (DMM) (2005-12)

CALIBRATING THE DAMPER MOTOR MODULE (DMM)

CALIBRATING THE CLIMATE CONTROL MODULE (CCM)

CAUTION: When activating this function, calibration of the Climate Control Module (CCM) starts. After carrying out calibration read off of the diagnostic trouble codes (DTCs) starts. To ensure that diagnostics for the Climate Control Module (CCM) have been carried out, delay for 30 seconds before reading out diagnostic trouble codes (DTCs) after calibration.

NOTE: Climate Control Module (CCM) and damper motors can be affected by the temperature. The vehicle should have normal room temperature when performing this service.

Fig. 1: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

Carry out calibration as follows:

- Ignition on.
- Click on the VCT2000 symbol. Wait until calibration has been carried out and diagnostic trouble codes (DTCs) read out.
- Ignition off.

This function controls the components that communicate with the Climate Control Module (CCM) via LIN bus 1 and LIN bus 2. In the event of a fault in any of the LIN buses, diagnostic trouble codes (DTCs) CCM-0070 to CCM-0071 will be stored depending on the fault. These diagnostic trouble codes (DTCs) can only be stored in conjunction with this diagnostic function.

If any of these diagnostic trouble codes (DTCs) recur, recalibrate to check if the problem was overcome. If the diagnostic trouble code (DTC) recurs, fault-trace the relevant diagnostic trouble code (DTC).

- **NO**

  Refer to **READ OFF/PROGRAM PASSENGER COMPARTMENT VENTILATION FILTER COMPENSATION**

READ OFF/PROGRAM PASSENGER COMPARTMENT VENTILATION FILTER COMPENSATION

HINT: When the car is equipped with a passenger compartment ventilation filter the climate control system must be adapted to compensate for the air flow resistance it causes. This is carried out by

programming the climate control module for increased blower fan speed and air flow.

HINT: If the climate control module is not programmed for a passenger compartment ventilation filter although a filter is installed, the air flow into the passenger compartment will be too low. This can make it harder to demist the windows. If the climate control module is programmed for a passenger compartment ventilation filter and a filter is not installed, the air flow into the passenger compartment will be high. This can cause a high noise level from the blower fan.

Fig. 7: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Check whether the climate control unit is equipped with a passenger compartment ventilation filter. See **AIR CLEANER PASSENGER COMPARTMENT, REPLACING**
- Ignition on.

  Read off and check the status for the activation of passenger compartment ventilation filter compensation.

Default status = ON (activated).

Remedy as necessary.

Fig. 8: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

READ OFF/PROGRAM PASSENGER COMPARTMENT VENTILATION FILTER COMPENSATION

HINT: When the car is equipped with a passenger compartment ventilation filter the climate control system must be adapted to compensate for the air flow resistance it causes. This is carried out by programming the climate control module for increased blower fan speed and air flow.

HINT: If the climate control module is not programmed for a passenger compartment ventilation filter although a filter is installed, the air flow into the passenger compartment will be too low. This can make it harder to demist the windows. If the climate control module is programmed for a passenger compartment ventilation filter and a filter is not installed, the air flow into the passenger compartment will be high. This can cause a high noise level from the blower fan.

Fig. 9: Identifying Ignition ON

Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

- No diagnostic trouble codes are stored.

Possible Source

- Climate control module (CCM) interior filter incorrectly programmed.

CHECKING AIR CONDITIONING (A/C) (2003-04)

CHECKING AIR CONDITIONING (A/C)

CHECKING THE REFRIGERANT

If the level of the refrigerant is low in the climate control system, the cooling performance on the right-hand side of the passenger compartment is compromised.

Carry out a performance test. See **CLIMATE SYSTEM, PERFORMANCE TEST**.

Remedy as necessary.

NOTE: Always disconnect the battery lead when working on the climate control system. See BATTERY, REPLACING .

Other information

- For visual and physical checks, see **VISUAL AND PHYSICAL CHECK**
- To fill with refrigerant, see **REFRIGERANT, FILLING**
- For vacuum pumping, see **VACUUM PUMPING**
- To leak trace using an electronic leak tracer, see **LEAK TRACING, ELECTRONIC LEAK TRACER**
- To leak trace using fluorescent tracing agent and an UV flashlight, see **LEAK TRACING, FLUORESCENT TRACING AGENT/UV LAMP**
- To fill with fluorescent tracing agent, see **FILLING WITH FLUORESCENT TRACING AGENT WITH THE REFRIGERANT** .

CLIMATE SYSTEM, PERFORMANCE TEST

PERFORMANCE TEST

CONDITIONS

- Hood closed
- Doors and windows closed
- Start the engine
- Engine speed 1500 rpm.

Fig. 11: Blower Switch Fan Set To 50%
Courtesy of VOLVO CARS CORPORATION

Fig. 12: Identifying Temperature Selectors For Maximum Cooling
Courtesy of VOLVO CARS CORPORATION

- Turn the temperature selector(s) to maximum cooling
- Set the air distribution selector to the **Ventilation** position
- Set the recirculation switch to the **On position**
- Set the air conditioning (A/C) button to the **On position**
- Set the blower fan switch to 50%.

Fig. 13: Checking Temperature At Center Dashboard Vents
Courtesy of VOLVO CARS CORPORATION

- Position a thermometer at the center dashboard vents
- Allow the system to stabilize itself for at least 8 minutes.

Recorded operating conditions °C (°F)			
Ambient air temperature measured in front of the car	20°C (68°F)	30°C (86°F)	40°C (104°F)
Temperature of the expelled air measured at the center panel vents	6-9°C (43-48°F)	6-9°C (43-48°F)	6-9°C (43-48°F)

CHECKING AIR-CONDITIONING UNIT DRAINAGE (2003-04)

CHECKING AIR-CONDITIONING UNIT DRAINAGE

CHECKING DRAINAGE

HINT: If condensation, etc., cannot be drained from air-conditioning unit, the windows can mist up and may cause a bad smell inside the car.

Check that drain hose is correctly positioned, intact and not blocked. Hose is positioned in front of tunnel

bracket under air-conditioning unit.

Do the necessary corrective action.

Fig. 14: Air Ducts From Floor Heater Unit
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

- No diagnostic trouble codes are stored
- Fault is permanent.

Possible Source

- Blocked drainage of air conditioning unit.

CHECKING CLEANING OF EVAPORATOR (2003-04)

CHECKING CLEANING OF EVAPORATOR

Clean evaporator thoroughly.

TROUBLE-SHOOTING INFORMATION

Condition

- No diagnostic trouble codes are stored
- Fault is permanent.

Possible Source

- Evaporator has acquired a coating.

HINT: This type of coating has a "concrete" smell.

CHECKING INTERIOR FILTER (2003-04)

CHECKING PASSENGER COMPARTMENT VENTILATION FILTER

HINT: A blocked, dirty or wet passenger compartment ventilation filter can cause misting on the windshield or result in bad odor from the climate control system.

- Remove the soundproofing panel. See **AIR CLEANER PASSENGER COMPARTMENT, REPLACING** .

  Check whether the climate control unit is equipped with a passenger compartment ventilation filter. If a passenger compartment ventilation filter is installed, check that the filter is correctly installed, is intact, clean and dry.

  Remedy as necessary.

Fig. 15: Identifying Soundproofing Panel
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

- No diagnostic trouble codes are stored
- Fault is permanent.

Possible Source

- Interior filter blocked
- Damp interior filter.

CHECKING INTERIOR TEMPERATURE PROGRAMMING (2003-04)

CHECKING INTERIOR TEMPERATURE PROGRAMMING

PROGRAMMING THE INTERIOR TEMPERATURE

READING/PROGRAMMING THE INTERIOR TEMPERATURE

HINT: The interior temperature can be adjusted in relation to the interior temperature switch by programming a compensation value.

HINT: Interior temperature can be raised or lowered by maximum ±2°C (±4°F) from the normal value allowing the driver to select a desired setting.

Fig. 16: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Read and make a note of the programmed value and change as required.

  - 0 = -1.0°C/-2.0°F
  - 1 = -0.5°C/-1.0°F

- 2 = 0.0°C/0.0°F (preset value)
- 3 = +0.5°C/+1.0°F
- 4 = +1.0°C/+2.0°F.

Fig. 17: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

CHECKING LIN BUS TO CLIMATE CONTROL MODULE (CCM) (L. H. D; 2005-12)

CHECKING LIN BUS TO CLIMATE CONTROL MODULE (CCM)

CHECKING COMMUNICATION FAULTS

Problems with the Damper motor module (DMM) and Air quality sensor (AQS) can be because one or more of the units transmits messages on the LIN bus continuously. This means that the LIN bus is filled with messages, which, for example, can disrupt calibration of the damper motors.

The Climate control module (CCM) checks the messages in the two different LIN busses. If the Climate control module (CCM) believes that there has been a communication error on the LIB bus, a counter counts for the Damper motor module (DMM) which has sent the message.

Click the VCT2000 symbol to check if any of the Damper motor modules (DMM) have caused a new

communication error on the LIN bus.

The registered communication faults read out should be interpreted as follows:

- Less than 10 registered communication errors is considered normal.
- If any of the Damper motor modules (DMM) have more than 10, but less than 100, registered communication errors, the difference with the Damper motor module (DMM) that has the next most registered communication errors must be greater than 10.
- If any of the Damper motor modules (DMM) have more than 100 registered communication errors, the difference with the Damper motor module (DMM) that has the next most registered communication errors must be greater than 100.

If no Damper motor module (DMM) meets the requirements, replace it.

Other information:

- see **DAMPER MOTOR MODULE (DMM) TEMPERATURE, REPLACING**
- see **DAMPER MOTOR MODULE (DMM) DEFROSTER, REPLACING**
- see **DAMPER MOTOR MODULE (DMM) RECIRCULATION, REPLACING**
- see **DAMPER MOTOR MODULE (DMM) AIR DISTRIBUTION, REPLACING**

Fig. 18: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Was a damaged Damper motor module (DMM) found?

- **YES**

  Refer to **CHECKING THE FUNCTION**

- **NO**

  FAULT NOT FOUND: Troubleshooting has been completed.

CHECKING THE FUNCTION

After carrying out the repair, check that the fault no longer exists.

Perform a check of the climate control system.

- Ignition off.
- Restore components and connectors.
- Ignition switch position II.
- Set the climate control to AUTO and allow it to stabilize.
- Then go through the various settings for the climate control system using the switches on the Climate control module (CCM), see graphic, and allow the climate control to stabilize in each position.
- Return to AUTO and allow the vehicle to stand for a while.
- Then check that the customer symptoms no longer exist.

Click the VCT2000 symbol to check if any of the Damper motor modules (DMM) have caused a new communication error on the LIN bus. If the status is unchanged, the correct corrective action has been taken.

Fig. 19: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

CHECKING SEAT HEATING MODULE (SHM) (2007-12)

CHECKING SEAT HEATING MODULE (SHM)

CHECKING THE SEAT HEATING

The system for seat heating consists of three different parts:

- The task of the Seat heating module (SHM) is to check the function and to communicate with the Climate control module (CCM).
- Two heating elements.
- A temperature sensor.

On certain markets, it is not permitted to have seat heating in the vehicle. Check to, see if the vehicle has seat heating by clicking the VCT2000 symbol.

Fig. 24: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 25: Identifying Seat Heating Module (SHM)
Courtesy of VOLVO CARS CORPORATION

Does the vehicle have seat heating?

- **YES**

  Refer to **CHECKING SYMPTOMS**

CHECKING COMMUNICATION FAULTS

If the seat heating does not work, this may be because the Seat heating module (SHM) is damaged, that there is

no communication with the Seat heating module (SHM) or that the temperature sensor is damaged.

Check communication by clicking on the VCT2000 symbol and reading off the status for seat heating.

Fig. 26: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Could the status be read out?

- **YES**

  Refer to **CHECKING THE CONTROL MODULE**

- **NO**

  Refer to **CHECKING COMMUNICATION**

CHECKING THE CONTROL MODULE

Start by replacing the left Seat heating module (SHM) with the right Seat heating module (SHM) and checking that the affected side now works. If both Seat heating modules (SHM) are damaged, replace one with a new one and check the function of each.

Replace damaged control module.

Other information:

- see **SEAT HEATING MODULE (SHM), REPLACING**

Fig. 27: Identifying Seat Heating Module (SHM)
Courtesy of VOLVO CARS CORPORATION

Is the function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING HEATER ELEMENTS**

CHECKING HEATER ELEMENTS

Continue fault tracing by replacing the temperature sensor and the two heating elements in the damaged seat. Activate the seat heating. Check that the seat heats up.

Also check the function of the Seat heating module (SHM) which was installed from the start. If seat heating works, keep the original control module.

Other information:

- see **HEATER PAD BACKREST AND CUSHION, REPLACING**
- see **SEAT HEATING MODULE (SHM), REPLACING**

CHECKING COMMUNICATION

The fault is probably communication related.

Continue checking the LIN bus to the climate control module (CCM) to fault trace the communication.

CHECKING SYMPTOMS

Check if the vehicle has problems with both seat heating and climate unit or only the seat heating.

Does the vehicle only have problems with seat heating?

- **YES**

  Refer to **CHECKING COMMUNICATION FAULTS**

- **NO**

  Refer to **FAULT-TRACING INFORMATION**

FAULT-TRACING INFORMATION

This troubleshooting only applies to vehicles that have problems with the climate units and seat heating. Example of symptoms is uneven temperature of air supply for left and right sides of the passenger compartment as well as lost function for seat heating.

NOTE: Before starting this symptom troubleshooting, check that no relevant diagnostic trouble codes are stored for the vehicle's climate unit.

Climate control module (CCM) and seat heating module communicates via standardized serial communication - LIN (Local Interconnect Network). If Seat Heating Module (SHM) is damaged, this may cause problems with both climate unit and seat heating. Then it is not possible to perform calibration of Climate control module (CCM).

To check if Seat Heating Module (SHM) driver side is damaged, do the following:

Disconnect Seat Heating Module (SHM), driver's side.

Check if the climate unit works correctly.

If the climate unit works correctly without Seat Heating Module (SHM) driver's side connected, then Seat Heating Module (SHM) driver's side shall be replaced.

Do the same check on Seat heating module (SHM), passenger side.

Remedy as necessary.

Other information

- see **SEAT HEATING MODULE (SHM), REPLACING**

Fig. 28: Identifying Seat Heating Communication System

CHECKING SEAT HEATING MODULE (SHM) (2005-06)

CHECKING SEAT HEATING MODULE (SHM)

CHECKING THE SEAT HEATING

The system for seat heating consists of three different parts:

- The task of the Seat heating module (SHM) is to check the function and to communicate with the Climate control module (CCM).
- Two heating elements.
- A temperature sensor.

On certain markets, it is not permitted to have seat heating in the vehicle. Check to, see if the vehicle has seat heating by clicking the VCT2000 symbol.

Fig. 34: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 35: Identifying Seat Heating Module (SHM)
Courtesy of VOLVO CARS CORPORATION

Does the vehicle have seat heating?

- **YES**

  Refer to **CHECKING COMMUNICATION FAULTS**

CHECKING COMMUNICATION FAULTS

If the seat heating does not work, this may be because the Seat heating module (SHM) is damaged, that there is no communication with the Seat heating module (SHM) or that the temperature sensor is damaged.

Check communication by clicking on the VCT2000 symbol and reading off the status for seat heating.

Fig. 36: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Could the status be read out?

- **YES**

  Refer to **CHECKING THE CONTROL MODULE**

- **NO**

  Refer to **CHECKING COMMUNICATION**

CHECKING THE CONTROL MODULE

Start by replacing the left Seat heating module (SHM) with the right Seat heating module (SHM) and checking that the affected side now works. If both Seat heating modules (SHM) are damaged, replace one with a new one and check the function of each.

Replace damaged control module.

Other information:

- see **SEAT HEATING MODULE (SHM), REPLACING**

Fig. 37: Identifying Seat Heating Module (SHM)
Courtesy of VOLVO CARS CORPORATION

Is the function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

Refer to **CHECKING HEATER ELEMENTS**

CHECKING HEATER ELEMENTS

Continue fault tracing by replacing the temperature sensor and the two heating elements in the damaged seat. Activate the seat heating. Check that the seat heats up.

Also check the function of the Seat heating module (SHM) which was installed from the start. If seat heating works, keep the original control module.

Other information:

- see **HEATER PAD BACKREST AND CUSHION, REPLACING**
- see **SEAT HEATING MODULE (SHM), REPLACING**

CHECKING COMMUNICATION

The fault is probably communication related.

Continue checking the LIN bus to the climate control module (CCM) to fault trace the communication.

CHECKING SEAT HEATING MODULE (SHM)

CHECKING THE SEAT HEATING

The system for seat heating consists of three different parts:

- The task of the Seat heating module (SHM) is to check the function and to communicate with the Climate control module (CCM).
- Two heating elements.
- A temperature sensor.

On certain markets, it is not permitted to have seat heating in the vehicle. Check to, see if the vehicle has seat heating by clicking the VCT2000 symbol.

Fig. 38: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 39: Identifying Seat Heating Module (SHM)
Courtesy of VOLVO CARS CORPORATION

Does the vehicle have seat heating?

- **YES**

  see **CHECKING COMMUNICATION FAULTS**

CHECKING COMMUNICATION FAULTS

If the seat heating does not work, this may be because the Seat heating module (SHM) is damaged, that there is no communication with the Seat heating module (SHM) or that the temperature sensor is damaged.

Check communication by clicking on the VCT2000 symbol and reading off the status for seat heating.

Fig. 40: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Could the status be read out?

- **YES**

  see **CHECKING THE CONTROL MODULE**

- **NO**

see **CHECKING COMMUNICATION**

CHECKING THE CONTROL MODULE

Start by replacing the left Seat heating module (SHM) with the right Seat heating module (SHM) and checking that the affected side now works. If both Seat heating modules (SHM) are damaged, replace one with a new one and check the function of each.

Replace damaged control module.

Courtesy of VOLVO CARS CORPORATION

Is the function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  see **CHECKING HEATER ELEMENTS**

CHECKING HEATER ELEMENTS

Continue fault tracing by replacing the temperature sensor and the two heating elements in the damaged seat. Activate the seat heating. Check that the seat heats up.

Also check the function of the Seat heating module (SHM) which was installed from the start. If seat heating

works, keep the original control module.

Other information:

- see **SEAT HEATING MODULE (SHM), REPLACING**

CHECKING COMMUNICATION

The fault is probably communication related.

Continue checking the LIN bus to the climate control module (CCM) to fault trace the communication.

CHECKING START OF CLIMATE CONTROL MODULE (CCM) (B6324S; 2007-08)

CHECKING START OF CLIMATE CONTROL MODULE (CCM)

CHECKING SOFTWARE

Climate control module (CCM) may have problems starting correct after the engine has started. Solve this by downloading new software to Engine control module (ECM).

Possible to download new software to the module?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **INFORMATION**

VERIFICATION

Check that the Climate control module (CCM) starts correct after the engine has started.

Does the climate control system function as it should?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault must now be detected and remedied. As this is not the case, troubleshooting has failed.

Exit symptom symptom troubleshooting or try again.

Do you want to exit symptom troubleshooting?

- **YES**

  FAULT TRACING FAILED: The fault should have been detected and remedied. As this is not the case fault-tracing has failed. Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CHECKING THE AIR QUALITY SENSOR (2003-04)

CHECKING THE AIR QUALITY SENSOR

CHECKING THE FUNCTION

Fig. 42: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Check that the values from the air quality sensor are within the permitted range.

  Soak a cloth in windshield washer fluid. Wipe it in front of the sensor or in front of the fresh air intake for the passenger compartment.

  The value must be between 4% and 96% and the OSA- cover must close.

  Other information:

  - To access and replace the air quality sensor, see **AIR QUALITY SENSOR, REPLACING**.

Fig. 43: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 44: Air Quality Sensor
Courtesy of VOLVO CARS CORPORATION

FAULT-TRACING INFORMATION

Condition

- No diagnostic trouble codes (DTCs) stored.

Possible Source

- Climate control module incorrectly programmed for blower fan speed.

CHECKING THE AIR QUALITY SENSOR (2005-12)

CHECKING THE AIR QUALITY SENSOR

CHECKING THE FUNCTION

The Air quality sensor (AQS) sends signals to the Climate control module (CCM) if it detects increased amounts of contaminants in the outdoor air. When this occurs the climate control module (CCM) transmits a signal to the Damper motor module (DMM) for recirculation to close the fresh air damper and to use recirculated air.

To check that the Air quality sensor (AQS) works, carry out the following test:

- Click on the symbol for VCT2000 to read off the Damper motor module's (DMM) recirculation position and degree of recirculation.
- Spray a little rust solvent or windshield washer fluid into the air intake, using a spray bottle or similar.

NOTE: Use only a small amount of rust solvent or windshield washer fluid.

- Check that the Air quality sensor (AQS) reacts and starts to close the recirculation damper.
- Shut the read out.

The fresh air intake damper closes quickly if the Air quality sensor (AQS) and other electronics are fault-free. If the air quality sensor (AQS) is fault free, the damper for the fresh air intake will gradually open after approximately 15 seconds.

Other information:

- see **AIR QUALITY SENSOR, REPLACING**

Fig. 45: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 46: Applying Cleaner To Air Quality Sensor
Courtesy of VOLVO CARS CORPORATION

Is the function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE DAMPER MOTOR CONTROL**

CHECKING THE DAMPER MOTOR CONTROL

Check that Damper motor module (DMM) recirculation works by opening and closing the damper using the recirculation switch. Click VCT2000 to check the movement. If the Damper motor module (DMM) does not work, or the damper for recirculation does not work, continue to check diagnostic trouble codes (DTCs) or symptom fault-trace the Damper motor module (DMM).

In the event of a faulty Air quality sensor (AQS), replace it with a new one and check the function again.

Other information:

- see **AIR QUALITY SENSOR, REPLACING**

Fig. 47: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

AIR QUALITY SENSOR, REPLACING

NOTE: **As the graphics in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the graphics is always correct.**

PREPARATIONS

Remove the plenum chamber. See **COWL, REPLACING**

Open the damper for the air intake.

REMOVING THE AIR QUALITY SENSOR

Fig. 48: Identifying Air Quality Sensor Removal
Courtesy of VOLVO CARS CORPORATION

Turn the sensor approximately 60° counter-clockwise as shown.

Slightly pull out the sensor and cable to access the connector.

Disconnect the connector.

INSTALLING THE AIR QUALITY SENSOR

Fig. 49: Identifying Air Quality Sensor Removal
Courtesy of VOLVO CARS CORPORATION

Connect the connector.

Insert as much of the cable through the hole as possible.

Position the sensor and seal (the flat side must face upwards) in the groove. The sensor can only be positioned one way in the groove as shown.

Turn the sensor approximately 60° clockwise until it will not turn any further. Check that the air quality sensor is securely in place.

Ensure that the cable is as far in as possible.

Close the damper for the air intake.

Install the plenum chamber. See **COWL, REPLACING** .

CHECKING THE BLOWER FAN CONTROL (2003-04)

CHECKING THE BLOWER FAN CONTROL

CHECKING THE FUNCTION OF THE BLOWER FAN

Fig. 50: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Activate the blower fan: Turn the blower fan knob.

  Check whether the blower fan starts.

  1. The blower fan operates normally. Troubleshooting has been completed.
  2. The blower fan runs but at an incorrect speed (for example, half speed, full speed or constantly). Refer to **CHECKING THE CONTROL CURRENT**.
  3. The blower fan does not operate. Refer to **CHECKING COMPONENTS AND WIRING**.

CHECKING THE CONTROL CURRENT

Fig. 51: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check the control current from the climate control module to the power unit: Turn the fan speed knob between the minimum and maximum positions. The signal must vary between approximately 0 and 10 mA from the minimum to maximum positions.

  Try a new climate control unit if the control current is faulty.

  Remedy as necessary.

  Other information:

- To access or replace the climate control module, see **CLIMATE CONTROL MODULE (CCM), REPLACING**
- To access or replace the power unit, see **BLOWER FAN MOTOR/POWER UNIT, REPLACING** .

Fig. 52: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING THE WIRING**

CHECKING THE WIRING

CAUTION: The blower fan motor power unit is very sensitive to short-circuits and excess current. Do not damage the power unit when taking readings. Take readings with the power unit connector disconnected when checking the

wiring.

Check the signal cable between power unit terminal #B2 and the blower fan motor positive terminal. Check for a short-circuit to supply voltage.

Check the ground cable between power unit terminal #B1 and the blower fan motor negative terminal. Check for a short-circuit to ground.

Remedy as necessary.

Other information:

- To access the climate control module or connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access or replace the blower fan motor or power unit, see **BLOWER FAN MOTOR/POWER UNIT, REPLACING**
- For other values, see **SIGNAL SPECIFICATION**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 53: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **REPLACING THE POWER UNIT**

CHECKING COMPONENTS AND WIRING

CAUTION: The blower fan motor power unit is very sensitive to short-circuits and

excess current. Do not damage the power unit when taking readings. Take readings with the power unit connector disconnected when checking the wiring.

Check the function of the blower fan motor: Connect its positive terminal to battery voltage and the minus terminal to ground.

Check that fuse 26 in the in the fusebox in the passenger compartment is intact. If the fuse has blown, check the signal cable between fuse number 26 and power unit terminal #A2. Check for a short-circuit to ground.

If the fuse has blown, also check the signal cable between power unit terminal #B2 and the blower fan motor positive terminal. Check for a short-circuit to ground.

Check:

- the control signal cable between climate control module terminal #A3 and power unit terminal #A1
- the diagnostic signal cable between climate control module terminal #A2 and power unit terminal #A3.

check for an open-circuit. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.

Remedy as necessary.

Other information:

- To access the climate control module or connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access or replace the blower fan motor or power unit, see **BLOWER FAN MOTOR/POWER UNIT, REPLACING**
- For other values, see **SIGNAL SPECIFICATION**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 54: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

REPLACING THE POWER UNIT

Replace the power unit according to **BLOWER FAN MOTOR/POWER UNIT, REPLACING** .

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 55: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 56: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect the connectors, install the components, etc.
- Ignition on.
- Read the diagnostic trouble codes.

  If the status of the diagnostic trouble code has changed to an intermittent fault this indicates that the fault has been rectified.

Fig. 57: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Has the status of the diagnostic trouble code changed?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

TROUBLE-SHOOTING INFORMATION

Condition

- No diagnostic trouble codes are stored
- Fault is permanent.

Possible Source

- Motor signal wire has open circuit or short circuit to ground
- Control signal wire has open circuit or short circuit to voltage supply/ground
- Diagnostic signal wire has open circuit or short circuit to voltage supply/ground
- Motor ground wire has open circuit or short circuit to voltage supply
- Defective fan motor or power unit
- Fan motor blocked
- Contact resistance, oxidation or loose contact in connector.

CHECKING THE DAMPER MOTOR CONTROL (ELECTRONIC CLIMATE CONTROL (ECC)/MANUAL CLIMATE CONTROL (MCC)) (2003-04)

CHECKING THE DAMPER MOTOR CONTROL (ELECTRONIC CLIMATE CONTROL (ECC)/MANUAL CLIMATE CONTROL (MCC))

QUERY

Which type of climate control is the car equipped with?

1. Electronic climate control. Refer to **CHECKING THE DAMPER MOTOR SIGNAL**.
2. Manual climate control (MCC)/Standard (STD). Refer to **CHECKING THE DAMPER MOTOR CONTROL**.

CHECKING THE DAMPER MOTOR SIGNAL

Fig. 58: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Blower fan on
- Activate the damper motors using the knobs and buttons.

  Read off the positions for the different damper motors. The values listed below should be seen as guidelines for the positions which the damper motors should reach.

  - Right and left temperature damper motor and defroster, 0 - 100%
  - Recirculation damper motor, 40 - 100%
  - Floor and ventilation damper motor, floor only approximately 39%, vent only approximately 87%, both floor and vent approximately 71%.

Fig. 59: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Are the positions OK?

- **YES**

  Refer to **CHECKING THE MATRIX VOLTAGE**

- **NO**

  Refer to **REPLACING THE CLIMATE CONTROL MODULE**

CHECKING THE MATRIX VOLTAGE

- Ignition off
- Reinstall the components, reconnect the connectors etc.
- Ignition on.

  Activate the damper motors and listen to hear if the motors move.

  HINT: If none of the motors move, one or more voltage supply cables is disconnected.

Remedy as necessary.

Other information:

- To access or replace the climate control module, see **CLIMATE CONTROL MODULE (CCM), REPLACING**
- To access or replace the damper motors, see **DAMPER MOTOR TEMPERATURE, REPLACING** , **DAMPER MOTOR RECIRCULATION, REPLACING** and **DAMPER MOTOR DEFROSTER, REPLACING** .

Was a fault detected?

- **YES**

  Refer to **SELF-ADJUSTMENT**

- **NO**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

NOTE: The check covers one or more of the affected damper motors. The damper motor(s) affected by this fault-tracing should be apparent from previous checks.

Check the resistance of the windings in the damper motor(s). For the resistance values, see **COMPONENT RESISTANCE VALUES** .

Check the linkage and damper for wear and check that they do not stick.

- **Continue**

  Refer to **SELF-ADJUSTMENT**

REPLACING THE CLIMATE CONTROL MODULE

Replace the climate control module according to **CLIMATE CONTROL MODULE (CCM), REPLACING** .

Fig. 60: Climate Control Module
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **SELF-ADJUSTMENT**

CHECKING THE DAMPER MOTOR CONTROL

Fig. 61: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Blower fan on
- Activate the damper motors using the knobs and buttons.

  Read off the positions for the different damper motors. The values listed below should be seen as guidelines for the positions which the damper motors should reach.

  - Left and right temperature damper motors, 0 - 100%
  - Recirculation damper motor, 40 - 100%
  - Air distribution knob, 0 - 100%.

Fig. 62: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Are the positions OK?

- **YES**

  Refer to **CHECKING THE MATRIX VOLTAGE**

- **NO**

  Refer to **REPLACING THE CLIMATE CONTROL MODULE**

CHECKING THE MATRIX VOLTAGE

- Ignition off
- Reinstall the components, reconnect the connectors etc.
- Ignition on.

  Activate the damper motors and listen to hear if the motors move.

  HINT: If none of the motors move, one or more voltage supply cables is disconnected.

Remedy as necessary.

Other information:

- To access or replace the climate control module, see **CLIMATE CONTROL MODULE (CCM), REPLACING**
- To access or replace the damper motors, see **DAMPER MOTOR TEMPERATURE, REPLACING** , **DAMPER MOTOR RECIRCULATION, REPLACING** and **DAMPER MOTOR AIR DISTRIBUTION, REPLACING** .

Was a fault detected?

- **YES**

  Refer to **SELF-ADJUSTMENT**

- **NO**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

NOTE: The check covers one or more of the affected damper motors. The damper motor(s) affected by this fault-tracing should be apparent from previous checks.

Check the resistance of the windings in the damper motor(s). For the resistance values, see **COMPONENT RESISTANCE VALUES** .

Check the linkage and damper for wear and check that they do not stick.

- **Continue**

  Refer to **SELF-ADJUSTMENT**

REPLACING THE CLIMATE CONTROL MODULE

Replace the climate control module according to **CLIMATE CONTROL MODULE (CCM), REPLACING** .

Fig. 63: Identifying Manual Climate Control Module
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **SELF-ADJUSTMENT**

SELF-ADJUSTMENT

HINT: After replacing the control module or damper motor, and when a damper motor or link has been removed, carry out self adjustment to define the damper motor limit positions.

Fig. 64: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Reinstall the connectors, components etc.
- Ignition on.

  Activate self adjustment.

Fig. 65: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

SELF-ADJUSTMENT

HINT: After replacing the control module or damper motor, and when a damper motor or link has been removed, carry out self adjustment to define the damper motor limit positions.

Fig. 66: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Reinstall the connectors, components etc.
- Ignition on.

  Activate self adjustment.

Fig. 69: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect the connectors, install the components, etc.
- Ignition on.
- Blower motor on.

Check that damper motor position changes by changing control on climate control module (CCM). The values given below are the standard values that the damper motor positions should give.

NOTE: Blower motor must be in operation to activate the damper motors.

- Left/right temperature damper motor and defroster, 0-100%
- Recirculation damper motor, 40-100%

- Floor/ventilation damper motor, floor only approximately 39%, ventilation only approximately 87% and floor/ventilation approximately 71%.

Fig. 70: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Does damper motor work?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

TROUBLE-SHOOTING INFORMATION

Condition

- No diagnostic trouble codes are stored
- Fault is permanent.

Possible Source

- Signal wire has open circuit or short circuit to voltage supply/ground
- Blocked or defective damper motor
- Contact resistance, oxidation or loose contact in connector.

CHECKING THE DAMPER MOTOR MODULE (DMM) (L. H. D; 2005-12)

CHECKING THE DAMPER MOTOR MODULE (DMM)

CHECKING CONTROL MODULES

Fig. 71: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

The Damper motor module (DMM) consists of a control unit and a stepper motor. The climate control system can have up to 5 Damper motor modules (DMM), the amount depends on the version of climate control system. These Damper motor module (DMM) control recirculation, defroster, temperature left/right and air distribution.

- Ignition switch position II.

To check which control module/sensors are part of vehicle configuration and of Climate control module (CCM) expected/detected control modules/sensors, click on the symbol for VCT2000.

If a control module is missing according to the car configuration, check that the control module is installed and correctly connected.

Read off which control module/sensors are on LIN bus 1 and 2 and compare them with the vehicle configuration.

The control modules and sensors that are to be included and which can be presented in the vehicle configuration can be read out from the tables below.

LIN BUS 1.

Control module/sensor.	On LIN bus 1.
Damper motor module (DMM) air distribution.	Always.
Damper motor module (DMM) temperature left.	Always.
Left seat heating.	If the vehicle is equipped with seat heating.

LIN BUS 2

Control module/sensor.	On LIN bus 2.
Damper motor module (DMM) temperature right.	Always.
Damper motor module (DMM) defroster.	If the vehicle is equipped with ECC.
Damper motor module (DMM) recirculation.	If the vehicle is left-hand drive.
Seat heater, right.	If the vehicle is equipped with seat heating.
Air quality sensor (AQS).	If the vehicle is left-hand drive and equipped with an air quality sensor (AQS).

CAR CONFIGURATION

Parameter.	Options
Guide.	Left-hand drive.
Climate control.	Electronic climate control. ECC/AQS. ECC, rear AC. MCC.
Seat heating calibration.	No Low 28°C - High 35°C. Low 30°C - High 36°C. Low 31°C - High 37°C. Low 32°C - High 38°C. Low 33°C - High 39°C. Low 34°C - High 40°C. Low 35°C - High 41°C. Low 36°C - High 43°C.
Passenger compartment filter.	Pollen filter. Air quality sensor (AQS).

Fig. 72: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 73: Identifying Damper Motor Module (DMM)
Courtesy of VOLVO CARS CORPORATION

Was a damaged Damper motor module (DMM) found?

- **YES**

  Refer to **IDENTIFICATION OF DAMPER MOTORS**

- **NO**

  Refer to **CHECKING THE DAMPER MOTOR CONTROL**

CHECKING FUNCTIONS

- Ignition switch position II.

To check that identification and calibration rectified the fault, click VCT2000 and read out the expected and detected control modules/sensors. Check that all relevant units are present and that the customer symptoms that were present previously are now not present.

If a module is still missing, identify which one and replace it. After replacement, check whether the customer symptom remains.

If customer symptoms remain and all units are approved, continue with the next step of symptom fault-tracing.

Other information:

- see **DAMPER MOTOR MODULE (DMM) TEMPERATURE, REPLACING**
- see **DAMPER MOTOR MODULE (DMM) DEFROSTER, REPLACING**
- see **DAMPER MOTOR MODULE (DMM) RECIRCULATION, REPLACING**
- see **DAMPER MOTOR MODULE (DMM) AIR DISTRIBUTION, REPLACING**

Fig. 74: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Do you wish to continue with symptom fault tracing?

- **YES**

  Refer to **CHECKING THE DAMPER MOTOR CONTROL**

- **NO**

  OKAY: Troubleshooting has been completed.

CHECKING THE DAMPER MOTOR CONTROL

Fig. 75: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

The Damper motor module (DMM) has a preset value for the number of steps between the limit positions. If a damper motor module (DMM) is faulty, this can be seen by the actual range being outside the preset range by more than the tolerance.

- Ignition switch position II.

Click on the symbol for VCT2000 to read off the range for the Damper motor module (DMM). Then compare each actual range of the Damper motor module (DMM) with the preset range. The Damper motor module (DMM) recirculation values depend on whether the vehicle is left hand drive. The difference between preset and actual range must not be greater than the tolerance. If there is a Damper motor module (DMM) with a greater difference, the Damper motor module (DMM) is damaged or incorrectly calibrated. If a Damper motor module (DMM) displays the value 0 or 4095, this also means that the Damper motor module (DMM) is damaged or incorrectly calibrated.

Fig. 76: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 77: Identifying Damper Motor Module (DMM)
Courtesy of VOLVO CARS CORPORATION

Was a damaged Damper motor module (DMM) found?

- **YES**

  Refer to **CALIBRATING THE DAMPER MOTOR MODULE (DMM)**

- **NO**

  Refer to **CHECKING THE DAMPER MOTOR CONTROL**

CHECKING THE DAMPER MOTOR CONTROL

Fig. 78: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

There are several parameters that describe the status of each Damper motor module (DMM). To locate the

suspected damaged Damper motor module (DMM) from this data, an analysis should be carried out where all parameters are observed.

- Ignition switch position II.
- Blower fan on.

Click on VCT2000 to read off how many times a Damper motor module (DMM) has lost its position, the number of unexpected stops for each Damper motor module (DMM), the actual and desired positions of the Damper motor module (DMM) and how many times each Damper motor module (DMM) has been calibrated.

NOTE: If the number of calibrations does not appear, this means that the software in the vehicle does not support this service. Continue with fault tracing until complete and then download new software.

The parameters that were read out should be interpreted as follows:

- The values for the number of lost positions for the control modules for temperature left and right should be the same.
- Also check to, see if any of the damper motors has a considerably greater number of lost positions than another. This is indicated by how difficult it is for the Damper motor module (DMM) to maintain its position.
- If a Damper motor module (DMM) stops unexpectedly a number of times, the motor has difficulty in reaching the position requested by the Climate control module (CCM).
- Also compare the desired position and actual position and check that the difference is not too great for any of the Damper motor modules (DMM). This is indicated by how difficult it is for the motor to reach the requested position.
- If a control module has many calibrations, it is probably damaged.

If a Damper motor module (DMM) has a combination of the above problems and has a serial number between:051101XXXXXX - 060430XXXXXX as well as 060801XXXXXX - 060930XXXXXX the replace the unit.

Even if only a combination of the above problems arise, the motor may still be damaged.

Was a damaged Damper motor module (DMM) found?

- **YES**

  Refer to **CALIBRATING THE DAMPER MOTOR MODULE (DMM)**

- **NO**

  Refer to **INFORMATION**

CHECKING FUNCTIONS

- Ignition switch position II.

To check that calibration rectified the fault, click VCT2000 and read off the range for the Damper motor module (DMM). Check that all units have the correct range and that the customer symptoms that were present previously are now not present.

If the range is still incorrect for any of the Damper motor modules (DMM), identify which control module it is and replace it. After replacement, check whether the customer symptom remains.

If customer symptoms remain and all units are approved, continue with the next step of symptom fault-tracing.

Other information:

- see **DAMPER MOTOR MODULE (DMM) TEMPERATURE, REPLACING**
- see **DAMPER MOTOR MODULE (DMM) DEFROSTER, REPLACING**
- see **DAMPER MOTOR MODULE (DMM) RECIRCULATION, REPLACING**
- see **DAMPER MOTOR MODULE (DMM) AIR DISTRIBUTION, REPLACING**

Fig. 81: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Do you wish to continue with symptom fault tracing?

- **YES**

  Refer to **CHECKING THE DAMPER MOTOR CONTROL**

- **NO**

  OKAY: Troubleshooting has been completed.

INFORMATION

The fault must now be detected and remedied. As this is not the case, the fault-tracing has failed.

Exit symptom fault-tracing or try again.

REPLACING THE CONTROL MODULE

Replace the located and damaged Damper motor module (DMM). After replacement, check that the customer symptom no longer remains.

If customer symptoms remain, check that the Climate control module (CCM) has the latest software. Check this by purchasing an upgrade for the Climate control module (CCM) and downloading it to the control module.

NOTE: **After downloading new software, all parameters are reset and further fault tracing becomes harder.**

After downloading, check whether the customer symptoms remains.

The fault must now be detected and remedied. If this is not the case, the fault-tracing has failed. Exit symptom fault-tracing or try again.

Other information:

- see **DAMPER MOTOR MODULE (DMM) AIR DISTRIBUTION, REPLACING**

IDENTIFICATION OF DAMPER MOTORS

CHECKING THE FUNCTION

Damper motor module (DMM) faults may be due to something obstructing the damper, which means that the Damper motor module (DMM) cannot calibrate itself. Check that the damper is not blocked and that is has not become stuck. Look, for example, for a screw, cable or foam rubber gasket. Check that the damper motor is correctly installed. Also check that the damper can move freely.

Fig. 82: Identifying Damper Motor Module (DMM)
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **IDENTIFYING THE DAMPER MOTOR MODULE (DMM)**

IDENTIFYING THE DAMPER MOTOR MODULE (DMM)

HINT: When identifying damper motors, each damper motor must be run to its limit position. These operations can take up to 30 seconds. When identifying the damper motors it is important that a battery charger is connected.

Fig. 83: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.

NOTE: **Climate Control Module (CCM) and damper motors can be affected by the temperature. The vehicle should have normal room temperature when performing this service.**

Carry out identification as follows:

- Ignition on.
- Click on the VCT2000 symbol. Wait until identification has been carried out.
- Ignition off.

Fig. 84: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **CALIBRATING THE CLIMATE CONTROL MODULE (CCM)**

CALIBRATING THE CLIMATE CONTROL MODULE (CCM)

CAUTION: **When activating this function, calibration of the Climate Control Module (CCM) starts. After carrying out calibration read off of the diagnostic trouble codes (DTCs) starts. To ensure that diagnostics for the Climate Control Module (CCM) have been carried out, delay for 30 seconds before reading out diagnostic trouble codes (DTCs) after calibration.**

NOTE: **Climate Control Module (CCM) and damper motors can be affected by the temperature. The vehicle should have normal room temperature when performing this service.**

Fig. 85: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

Carry out calibration as follows:

- Ignition on.
- Click on the VCT2000 symbol. Wait until calibration has been carried out and diagnostic trouble codes (DTCs) read out.
- Ignition off.

This function controls the components that communicate with the Climate Control Module (CCM) via LIN bus 1 and LIN bus 2. In the event of a fault in any of the LIN buses, diagnostic trouble codes (DTCs) CCM-0070 to CCM-0071 will be stored depending on the fault. These diagnostic trouble codes (DTCs) can only be stored in conjunction with this diagnostic function.

If any of these diagnostic trouble codes (DTCs) recur, recalibrate to check if the problem was overcome. If the diagnostic trouble code (DTC) recurs, fault-trace the relevant diagnostic trouble code (DTC).

Fig. 86: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

  Refer to **REPLACING THE CONTROL MODULE**

CHECKING THE DAMPER MOTOR MODULE (DMM)

CHECKING CONTROL MODULES

Fig. 91: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

The Damper motor module (DMM) consists of a control unit and a stepper motor. The climate control system can have up to 5 Damper motor modules (DMM), the amount depends on the version of climate control system. These Damper motor module (DMM) control recirculation, defroster, temperature left/right and air distribution.

- Ignition switch position II.

To check which control module/sensors are part of vehicle configuration and of Climate control module (CCM) expected/detected control modules/sensors, click on the symbol for VCT2000.

If a control module is missing according to the car configuration, check that the control module is installed and correctly connected.

Read off which control module/sensors are on LIN bus 1 and 2 and compare them with the vehicle configuration.

The control modules and sensors that are to be included and which can be presented in the vehicle configuration can be read out from the tables below.

LIN BUS 1.

Control module/sensor.	On LIN bus 1.
Damper motor module (DMM) air distribution.	Always.
Damper motor module (DMM) temperature left.	Always.
Left seat heating.	If the vehicle is equipped with seat heating.

LIN BUS 2

Control module/sensor.	On LIN bus 2.
Damper motor module (DMM) temperature right.	Always.
Damper motor module (DMM) defroster.	If the vehicle is equipped with ECC.
Damper motor module (DMM) recirculation.	If the vehicle is left-hand drive.
Seat heater, right.	If the vehicle is equipped with seat heating.
Air quality sensor (AQS).	If the vehicle is left-hand drive and equipped with an air quality sensor (AQS).

CAR CONFIGURATION

Parameter.	Options

Guide.	Left-hand drive.
Climate control.	Electronic climate control. ECC/AQS. ECC, rear AC. MCC.
Seat heating calibration.	No Low 28°C - High 35°C. Low 30°C - High 36°C. Low 31°C - High 37°C. Low 32°C - High 38°C. Low 33°C - High 39°C. Low 34°C - High 40°C. Low 35°C - High 41°C. Low 36°C - High 43°C.
Passenger compartment filter.	Pollen filter. Air quality sensor (AQS).

Do you wish to continue with symptom fault tracing?

- **YES**

  see **CHECKING THE DAMPER MOTOR CONTROL**

- **NO**

  OKAY: Troubleshooting has been completed.

CHECKING THE DAMPER MOTOR CONTROL

Fig. 95: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

The Damper motor module (DMM) has a preset value for the number of steps between the limit positions. If a damper motor module (DMM) is faulty, this can be seen by the actual range being outside the preset range by more than the tolerance.

- Ignition switch position II.

Click on the symbol for VCT2000 to read off the range for the Damper motor module (DMM). Then compare each actual range of the Damper motor module (DMM) with the preset range. The Damper motor module (DMM) recirculation values depend on whether the vehicle is left hand drive. The difference between preset and actual range must not be greater than the tolerance. If there is a Damper motor module (DMM) with a greater difference, the Damper motor module (DMM) is damaged or incorrectly calibrated. If a Damper motor module (DMM) displays the value 0 or 4095, this also means that the Damper motor module (DMM) is damaged or incorrectly calibrated.

Fig. 96: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 97: Identifying Damper Motor Module (DMM)
Courtesy of VOLVO CARS CORPORATION

Was a damaged Damper motor module (DMM) found?

- **YES**

  see **CHECKING THE DAMPER MOTOR CONTROL**

- **NO**

  see **CHECKING THE DAMPER MOTOR CONTROL**

Damper motor module (DMM) faults may be due to something obstructing the damper, which means that the Damper motor module (DMM) cannot calibrate itself. Check that the damper is not blocked and that is has not become stuck. Look, for example, for a screw, cable or foam rubber gasket. Check that the damper motor is correctly installed. Also check that the damper can move freely.

- **DONE**

  see **CHECKING FUNCTIONS**

CAUTION: When activating this function, calibration of the Climate Control Module (CCM) starts. After carrying out calibration read off of the diagnostic trouble codes (DTCs) starts. To ensure that diagnostics for the Climate Control Module (CCM) have been carried out, delay for 30 seconds before reading out diagnostic trouble codes (DTCs) after calibration.

NOTE: Climate Control Module (CCM) and damper motors can be affected by the temperature. The vehicle should have normal room temperature when performing this service.

Carry out calibration as follows:

- Ignition on.
- Click on the VCT2000 symbol. Wait until calibration has been carried out and diagnostic trouble codes (DTCs) read out.
- Ignition off.

This function controls the components that communicate with the Climate Control Module (CCM) via LIN bus 1 and LIN bus 2. In the event of a fault in any of the LIN buses, diagnostic trouble codes (DTCs) CCM-0070 to CCM-0071 will be stored depending on the fault. These diagnostic trouble codes (DTCs) can only be stored in conjunction with this diagnostic function.

If any of these diagnostic trouble codes (DTCs) recur, recalibrate to check if the problem was overcome. If the diagnostic trouble code (DTC) recurs, fault-trace the relevant diagnostic trouble code (DTC).

- **DONE**

see **CHECKING FUNCTIONS**

CHECKING THE DAMPER MOTOR CONTROL

Fig. 98: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

There are several parameters that describe the status of each Damper motor module (DMM). To locate the suspected damaged Damper motor module (DMM) from this data, an analysis should be carried out where all parameters are observed.

- Ignition switch position II.
- Blower fan on.

Click on VCT2000 to read off how many times a Damper motor module (DMM) has lost its position, the number of unexpected stops for each Damper motor module (DMM), the actual and desired positions of the Damper motor module (DMM) and how many times each Damper motor module (DMM) has been calibrated.

NOTE: **If the number of calibrations does not appear, this means that the software in the vehicle does not support this service. Continue with fault tracing until complete and then download new software.**

The parameters that were read out should be interpreted as follows:

- The values for the number of lost positions for the control modules for temperature left and right should be the same.
- Also check to, see if any of the damper motors has a considerably greater number of lost positions than another. This is indicated by how difficult it is for the Damper motor module (DMM) to maintain its position.
- If a Damper motor module (DMM) stops unexpectedly a number of times, the motor has difficulty in reaching the position requested by the Climate control module (CCM).
- Also compare the desired position and actual position and check that the difference is not too great for any of the Damper motor modules (DMM). This is indicated by how difficult it is for the motor to reach the requested position.
- If a control module has many calibrations, it is probably damaged.

If a Damper motor module (DMM) has a combination of the above problems and has a serial number between: 051101XXXXXX - 060430XXXXXX as well as 060801XXXXXX - 060930XXXXXX the replace the unit.

Even if only a combination of the above problems arise, the motor may still be damaged.

CHECKING THE ENGINE COOLING FAN (FC) (B5254T2; 2005-07)

CHECKING THE ENGINE COOLING FAN (FC)

NOTE: **The electric cooling fan may have a post-running time of up to approx. 6 minutes after the engine has been shut off. The time for the electric cooling fan's post-running depends on the engine's temperature, temperature in the engine compartment as well as the pressure level in the AC system.**

Fig. 102: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

- Ignition on.
- Activate the engine cooling fan (FC) by clicking the VCT2000 symbol.

  If the electric cooling fan can be activated in all selectable speeds:

  - There is no malfunction in the electric cooling fan.
  - Check the AC pressure sensor.

  Remedy as necessary.

  Other information:

  - The electric cooling fan can be activated at different speeds. Possible speeds for the electric cooling fan is dependent on model year and engine.

Fig. 103: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the engine cooling fan (FC) working?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING COMPONENTS AND CONNECTIONS**

CHECKING COMPONENTS AND CONNECTIONS

Fig. 104: Identifying Ignition In Off Position
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

If the electric cooling fan cannot be activated in all selectable speeds:

- Check the fuse, power supply cable and ground lead for the engine cooling fan (FC).
- Check the wiring between the engine control module (ECM) and the engine cooling fan (FC) module. Check for damage.
- Check the connectors to the engine cooling fan (FC) control module and Engine Control Module (ECM). Check for damage to pins and connections.

Remedy as necessary.

Then check:

- Function of engine cooling fan.

- Ignition on.
- Activate the engine cooling fan (FC) by clicking the VCT2000 symbol.

Other information:

- see **CHECKING WIRING AND TERMINALS**

CHECKING THE FAN FOR THE PASSENGER COMPARTMENT TEMPERATURE SENSOR (2003-04)

CHECKING THE FAN FOR THE PASSENGER COMPARTMENT TEMPERATURE SENSOR

REPLACING THE COMPONENT

Noise from the fan for the passenger compartment temperature sensor is caused by a defective component.

To replace fan motor for the passenger compartment temperature sensor, see **BLOWER FAN MOTOR PASSENGER COMPARTMENT TEMPERATURE SENSOR, REPLACING** .

Remedy as necessary

CHECKING THE INTERIOR HEAT (2003-04)

CHECKING THE INTERIOR HEAT

HINT: After a fault is detected, it is necessary to check that the symptom no longer exists.

HINT: Check interior heat as follows:

Fig. 110: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect the connectors, install the components etc.
- Ignition on.
- Start engine and let it warm up.
- Operate interior temperature switch to obtain maximum heat.
- Check that heat is coming from the air outlets and that high interior temperature is obtained.

CHECKING THE PASSENGER COMPARTMENT TEMPERATURE SENSOR (ELECTRONIC CLIMATE CONTROL (ECC)) (2003-04)

CHECKING THE PASSENGER COMPARTMENT TEMPERATURE SENSOR (ELECTRONIC

CLIMATE CONTROL (ECC))

CHECKING THE PASSENGER COMPARTMENT TEMPERATURE SENSOR SIGNAL

Fig. 111: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Read off the passenger compartment temperature (climate control module) and vary the temperature at the passenger compartment temperature sensor to check that the value changes. Also check that the value is within its permitted range: Compare the values from the outside temperature sensor and the passenger compartment temperature sensor (upper electronic module) or thermometer.

Fig. 112: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the temperature reading OK?

- **YES**

  FAULT NOT FOUND: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE COMPONENT**

CHECKING THE COMPONENT

Check that neither the grille nor the pipe for the passenger compartment temperature sensor are blocked.

Other information:

- To access or replace the climate control module, see **CLIMATE CONTROL MODULE (CCM), REPLACING** .

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING THE COMPONENT**

CHECKING THE COMPONENT

The fault has probably occurred as a result of a defective power circuit in the climate control system. This type of fault means that the climate control system unit must be replaced. The passenger compartment temperature sensor cannot be replaced independently.

Other information:

- To access or replace the climate control module, see **CLIMATE CONTROL MODULE (CCM), REPLACING** .

SELF-ADJUSTMENT

HINT: After replacing the control module or damper motor, and when a damper motor or link has been removed, carry out self adjustment to define the damper motor limit positions.

Fig. 113: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Reinstall the connectors, components etc.
- Ignition on.

  Activate self adjustment.

Fig. 114: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 115: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 116: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect the connectors, install the components, etc.
- Ignition on.

  Read the interior temperature and vary the temperature with the interior temperature sensor to, see if the value changes. Check that the value is normal using a thermometer.

Fig. 117: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

Fig. 118: Identifying Interior Temperature Sensor Air Inlet
Courtesy of VOLVO CARS CORPORATION

- No diagnostic trouble codes are stored
- Fault is permanent

NOTE: **If the interior temperature sensor air inlet is covered, the climate control module (CCM) will not receive the correct interior temperature value so the temperature cannot be correctly regulated. These types of error are not included in trouble-shooting.**

Possible Source

- Blocked blower motor
- Defective measuring instrument or interior temperature sensor.

CHECKING THE PROGRAMMING OF BLOWER MOTOR DELAY (2003-04)

CHECKING THE PROGRAMMING OF THE BLOWER FAN RUN-ON (ELECTRONIC CLIMATE CONTROL (ECC), MANUAL CLIMATE CONTROL (MCC))

EQUIPMENT

Which type of climate control is the car equipped with?

1. Electronic climate control. Refer to **DIAGNOSTICS NUMBER**
2. Manual climate control (MCC). Refer to **DIAGNOSTICS NUMBER**

DIAGNOSTICS NUMBER

  Read off the diagnostics number and check whether it is on the list.

  - A 9472874
  - A 9472876
  - A 9472898

- A 9472900
- A 9494243
- A 9488858
- A 9496615
- A 9494255
- A 9494256
- A 9496617.

Fig. 122: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Was the diagnostics number on the list?

- **YES**

  Refer to **READ OFF/PROGRAM THE BLOWER FAN RUN-ON (ELECTRONIC CLIMATE CONTROL, MANUAL CLIMATE CONTROL)**

- **NO**

  Refer to **READ OFF/PROGRAM THE BLOWER FAN RUN-ON (ELECTRONIC CLIMATE CONTROL, MANUAL CLIMATE CONTROL)**

READ OFF/PROGRAM THE BLOWER FAN RUN-ON (ELECTRONIC CLIMATE CONTROL, MANUAL CLIMATE CONTROL)

HINT: In certain circumstances it may be necessary to allow the blower fan to run on. This dries the evaporator and prevents bad odors which can otherwise be caused by residual water in the system.

Fig. 123: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Use the Programming function for to read off and program blower fan speed compensation. For further information about programming, see **DIAGNOSTIC FUNCTIONS** .

  Read off the programmed value and compare with the programmable values below.

  - 0 = No run-on

- 1 = Run-on (default value).

Program as necessary.

Fig. 124: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

READ OFF/PROGRAM THE BLOWER FAN RUN-ON (ELECTRONIC CLIMATE CONTROL, MANUAL CLIMATE CONTROL)

HINT: In certain circumstances it may be necessary to allow the blower fan to run on. This dries the evaporator and prevents bad odors which can otherwise be caused by residual water in the system.

Fig. 125: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on
- Use the Programming function for to read off and program blower fan speed compensation. For further information about programming, see **DIAGNOSTIC FUNCTIONS** .

  Read off the programmed value and compare with the programmable values below.

  - 0 = No run-on
  - 1 = Run-on (default value).

  Program as necessary.

Fig. 126: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

- No diagnostic trouble codes are stored.

Possible Source

- Climate control module (CCM) incorrectly programmed regarding blower motor delay.

CHECKING THE PROGRAMMING OF BLOWER MOTOR SPEED (2003-04)

CHECKING PROGRAMMING OF BLOWER MOTOR SPEED

READING/PROGRAMMING THE BLOWER MOTOR SPEED

HINT: Blower motor speed and air-distribution can be adjusted to air-conditioning AUTO-position. Adjustment is done by programming climate control module (CCM) which allows changes in air-distribution of approximately +/- 8 liters/second compared with normal position.

- 0= -1.0 V
- 1= -0.5 V
- 2= 0 V (preset value)
- 3= +0.5 V
- 4= +1.0 V.

HINT: If the climate control module (CCM) is programmed to a lower blower motor speed than normal (-V), interior air-distribution is reduced which can make de-misting of windows difficult.

HINT: If climate control module (CCM) is programmed to higher blower motor speed than normal (+V), an increased de-misting of windows is maintained but with a higher noise-level from the blower motor.

Fig. 127: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Checking the programming of blower motor speed.

  Do the necessary corrective action.

Fig. 128: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

- No diagnostic trouble codes are stored.

Possible Source

- Climate control module (CCM) blower motor speed incorrectly programmed.

CHECKING THE REAR AIR CONDITIONING (A/C) (2003-04)

CHECKING THE REAR AIR CONDITIONING (A/C)

FAULT-TRACING INFORMATION

The rear air conditioning (A/C) is activated using the switch on the dashboard environment panel. The climate control module (CCM) then transmits a signal to the rear electronic module (REM) which controls the power to the rear air conditioning (A/C) via a relay.

The only way to regulate cooling output for the third row of seats is to control the fan speed using the blower fan switch.

The front air conditioning, which is controlled by the climate control union (CCM) is directly connected to the rear air conditioning (A/C) using high and low pressure pipes and hoses.

Causes of non-function may be:

- Faulty switch on the dashboard environment panel
- The power stage in the rear air conditioning (A/C) is not working
- The blower fan switch for the rear air conditioning (A/C) is not working
- The fan in the rear air conditioning (A/C) is not working
- The expansion valve in the rear air conditioning (A/C) is not working
- Refrigerant leakage.

- **Continue**

  Refer to **CHECKING THE FAULT CAUSE**

CHECKING THE FAULT CAUSE

Fig. 129: Belt Routing/Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Engine running.

  Check whether the rear air conditioning (A/C) is not working due to mechanical or electrical faults by:

  - activating the rear air conditioning (A/C) via the switch on the dashboard environment panel
  - changing the position of the blower fan switch for the rear air conditioning (A/C) between the minimum and maximum positions and checking that the fan changes speed by listening to the noise it makes.

Is the fan working properly?

- **YES**

Refer to **CHECKING THE AIR CONDITIONING SYSTEM**

- **NO**

  Refer to **CHECKING THE SWITCH ON THE DASHBOARD ENVIRONMENT PANEL**

CHECKING THE AIR CONDITIONING SYSTEM

Fig. 130: Belt Routing/Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Engine running.

  The front air conditioning, which is controlled by the climate control union (CCM) is directly connected to the rear air conditioning (A/C) using high and low pressure pipes and hoses. Check for leakage or for low refrigerant level by lowering the temperature on the climate control module (CCM). If the cooling

effect is generally poor for both the front and rear sections of the passenger compartment, the cause of the fault is either leakage or low refrigerant level.

Is the cooling effect generally poor throughout the passenger compartment?

- **YES**

  Refer to **CHECKING THE REFRIGERANT LEVEL AND CHECKING FOR LEAKAGE**

- **NO**

  Refer to **CHECKING THE REAR EXPANSION VALVE**

CHECKING THE REFRIGERANT LEVEL AND CHECKING FOR LEAKAGE

Check the function of the climate control system. See **CLIMATE SYSTEM, PERFORMANCE TEST**.

Before working on the air conditioning system, read the safety instructions. See **REFRIGERANT, SAFETY REGULATIONS** .

If the function is not satisfactory and the cooling effect is still cool, leak trace the entire system. See **LEAK TRACING, FLUORESCENT TRACING AGENT/UV LAMP** .

NOTE: The XC90 already has tracing agent in the system.

Check the refrigerant pipe connections in the condenser and in the expansion valves.

Drain the system completely. See **REFRIGERANT, DRAINING** . Replace defective components.

Vacuum pump the entire system. See **VACUUM PUMPING** . Fill the system with 1300 g refrigerant. See **REFRIGERANT, FILLING** .

Check the performance again.

CHECKING THE REAR EXPANSION VALVE

Replace the rear expansion valve. See **EXPANSION VALVE REAR, REPLACING** .

CHECKING THE SWITCH ON THE DASHBOARD ENVIRONMENT PANEL

Fig. 131: Belt Routing/Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Engine running.

  Checking the signal

  When the rear air conditioning (A/C) is activated, a signal is sent from the climate control module (CCM) to the rear electronic module (REM). If all conditions are met to activate the rear air conditioning (A/C), for example the engine is running, the rear electronic module (REM) transmits a signal to the climate control module (CCM) indicating that the function is activated. The climate control module (CCM) uses this signal to light the LED in the switch on the dashboard environment panel.

  Press the switch for the rear air conditioning (A/C) on the dashboard environment panel and check that the LED lights or goes out

Does the LED light or go out?

- **YES**

  Refer to **CHECKING THE POWER SUPPLY AND GROUND TERMINAL**

- **NO**

  Refer to **CHECKING THE SWITCH ON THE DASHBOARD ENVIRONMENT PANEL**

CHECKING THE SWITCH ON THE DASHBOARD ENVIRONMENT PANEL

Fig. 132: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

Checking the switch

Press the switch for the rear air conditioning (A/C) on the dashboard environment panel. Check that it is working by reading off and changing the status between off and on.

To read off the status of the switch, click on the VCT2000 symbol.

NOTE: **The switches can be placed in any internal order. Select the correct switch position when reading off. Position 1 is the switch to the far left, position 7 furthest to the right.**

If the status of the switch does not change, the switch is probably defective.

Remedy as necessary.

Fig. 133: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE POWER SUPPLY AND GROUND TERMINAL**

CHECKING THE POWER SUPPLY AND GROUND TERMINAL

Fig. 134: Belt Routing/Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Engine running.

  Power supply, rear air conditioning (A/C)

  The rear air conditioning (A/C) is powered via a relay on the rear electronic module (REM).

  Checking the voltage

Check the power supply cable from the battery to the rear air conditioning (A/C). Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. Check the fuse. The voltage should be approximately battery voltage.

Ground terminal, rear air conditioning (A/C)

The rear air conditioning (A/C) has a ground input. The ground input from the unit is power ground and is connected to the ground terminal in the car body.

Checking ground terminal

Check the ground lead between the rear air conditioning (A/C) and the ground terminal. Check for an open-circuit. Check for loose connections. Check for contact resistance and oxidation. With the ignition on, the drop in voltage between the ground connection for the rear air conditioning (A/C) and the ground terminal must not be greater than 0.5 V.

Remedy as necessary.

Other information

- see **CHECKING WIRING AND TERMINALS** .

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING COMPONENTS**

CHECKING COMPONENTS

Fig. 135: Belt Routing/Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Engine running.

  Checking the blower fan switch

  Check that the blower fan switch is working by changing the fan speed between minimum and maximum. If the blower fan switch is working, the LED lights or goes out depending on the selected fan speed.

  If the LEDs do not light or go out, proceed as follows:

  - check the wiring and connectors between the power stage and the blower fan switch
  - check the blower fan switch by trying a new switch.

  Checking the engine cooling fan (FC) motor

The blower fan motor is powered by the power unit. The supply voltage must be between 2.5-12 V. If the blower fan motor sticks, the power unit will reduce the power to the fan.

Ensure that the fan is **not** powered. Check that it is not sticking.

WARNING: There is a risk of injury if the fan is powered during this test.

If the fan is sticking, check that there are no objects blocking it.

Check that the blower fan motor is powered as follows:

- activate the switch for the rear air conditioning (A/C) on the dashboard environment panel
- expose the fan and remove the rubber seal for the cable connectors
- using the switch, vary the blower fan speed between maximum and minimum. Measure the voltage between both cable connections on the fan motor.

  The supply voltage can vary between 2.5 -12 V.

  NOTE: Do not disconnect the cable connections to the fan motor when taking readings.

If the blower fan motor is powered but is not working, there is probably a fault in the motor.

Checking the power unit

The power stage receives a control voltage from the blower fan switch in the form of an input signal. The power stage uses this signal to control the power supply to the fan motor.

If the fan is not powered by the power unit, proceed as follows:

- check the cable and connectors between the power stage and the blower fan switch
- check the power stage switch by trying a new one.

Remedy as necessary.

Other information

- To access or replace the blower fan motor, see **BLOWER FAN MOTOR REAR, REPLACING** .

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CHECKING THE SUN SENSOR (2003-04)

CHECKING THE SUN SENSOR

CHECKING THE SUN SENSOR SIGNAL

Fig. 136: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check the solar heat signal by varying the light intensity at the sun sensor. Cover the sun sensor with your hand to reduce the signal. Then aim a strong light source (for example a flashlight) at the sun sensor from close range to obtain the maximum signal.

The value should vary between approximately 0 and 1, 000.

Fig. 137: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 138: Identifying Sun Sensor
Courtesy of VOLVO CARS CORPORATION

Are these values OK?

- **YES**

  FAULT NOT FOUND: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE WIRING**

CHECKING THE WIRING

Check the climate control module (CCM) (terminals #B4, #B5) and the sun sensor connectors. Check for contact resistance and oxidation.

Check the signal cable between climate control module (CCM) terminal #B4 and sun sensor terminal #1. Check for an open-circuit. Check for a short-circuit to supply voltage. Check for a short-circuit to ground.

Check the ground lead between climate control terminal #B5 and sun sensor terminal #5. Check for an open-circuit. Check for a short-circuit to supply voltage.

If the wiring is OK, try a new sun sensor.

Remedy as necessary.

Other information:

- To access the climate control module (CCM) or connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access or replace the sun sensor, see **SUN SENSOR/ALARM LED, REPLACING**
- For other values, see **SIGNAL DESCRIPTION, CLIMATE CONTROL MODULE (CCM), CONNECTOR B**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 139: Identifying Connector (F) Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 140: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

- No diagnostic trouble codes are stored
- Fault is permanent

NOTE: **If the solar sensor is covered, the climate control module (CCM) does not receive any signals regarding the solar intensity and there is therefore no temperature compensation. These types of error are not included in trouble-shooting.**

Possible Source

- Contact resistance, oxidation or loose contact in connector
- Signal wire has open circuit or short circuit to voltage supply/ground
- Ground connection has open circuit or short circuit to voltage supply
- Defective solar sensor.

CHECKING THE SWITCH, CLIMATE CONTROL MODULE (CCM) (2003-04)

CHECKING THE SWITCH, CLIMATE CONTROL MODULE (CCM)

ACTIVATING AND READING OFF THE SWITCH

Fig. 141: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check the switches on the climate control module (CCM) as follows:

  - Activate reading off the switch status
  - Hold the relevant switch pressed in and check that the status changes.

  Click the VCT2000 symbol to read off activating the switches.

Fig. 142: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Are the switches OK?

- **YES**

  FAULT NOT FOUND: Troubleshooting has been completed.

- **NO**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

The fault has probably occurred as a result of a defective switch. For switches located in the lower part of the dashboard environment panel, continue fault-tracing by replacing the switch to determine whether the fault is in the switch or the control module. Other switches are fixed to the climate control module (CCM) and cannot be replaced separately.

Other information:

- To access or replace the climate control module (CCM), see **CLIMATE CONTROL MODULE (CCM), REPLACING** .

CHECKING THE TWILIGHT SENSOR (2003-04)

CHECKING THE TWILIGHT SENSOR

CHECKING THE TWILIGHT SENSOR SIGNAL

Fig. 143: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check the twilight intensity signal by varying the light intensity at the twilight sensor. Cover the twilight sensor with a finger to obtain the minimum signal. Then aim a strong light source (for example a flashlight) at the twilight sensor from close range to obtain the maximum signal.

  The value should vary between approximately 0 and 15.

Fig. 144: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 145: Identifying Twilight Sensor
Courtesy of VOLVO CARS CORPORATION

Are these values OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

The fault has probably occurred as a result of a defective twilight sensor or a defective supply circuit in the climate control module. This type of fault means that the climate control system unit must be replaced. The twilight sensor cannot be replaced independently.

Other vinformation:

- To access or replace the climate control module, see **CLIMATE CONTROL MODULE (CCM), REPLACING** .

TROUBLE-SHOOTING INFORMATION

Condition

- No diagnostic trouble codes are stored
- Fault is permanent

NOTE: **If the nightfall sensor is covered, the climate control module (CCM) does not receive any signals regarding light intensity, and the brightness of the LED buttons cannot be regulated. These types of error are not included in trouble-shooting.**

Possible Source

- Defective measuring instrument
- Defective nightfall sensor.

CHECKING THE WINDOWS (2003-04)

CHECKING THE WINDOWS

HINT: A dirty inner side of window can mist up again more easily. Check and clean any dirt from the inside.

Do the necessary corrective action.

Fig. 146: Cleaning Inner Side Of Window
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

Fig. 147: Cleaning Inner Side Of Window
Courtesy of VOLVO CARS CORPORATION

- No diagnostic trouble codes are stored
- Fault is permanent.

Possible Source

- Dirt on inner side of window can cause mist build-up.

IDENTIFICATION OF DAMPER MOTORS (2005-12)

IDENTIFICATION OF DAMPER MOTORS

CHECKING THE FUNCTION

Damper motor module (DMM) faults may be due to something obstructing the damper, which means that the Damper motor module (DMM) cannot calibrate itself. Check that the damper is not blocked and that is has not become stuck. Look, for example, for a screw, cable or foam rubber gasket. Check that the damper motor is correctly installed. Also check that the damper can move freely.

Fig. 148: Identifying Damper Motor Module (DMM)
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **IDENTIFYING THE DAMPER MOTOR MODULE (DMM)**

IDENTIFYING THE DAMPER MOTOR MODULE (DMM)

HINT: When identifying damper motors, each damper motor must be run to its limit position. These operations can take up to 30 seconds. When identifying the damper motors it is important that a battery charger is connected.

Fig. 149: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.

NOTE: **Climate Control Module (CCM) and damper motors can be affected by the temperature. The vehicle should have normal room temperature when performing this service.**

Carry out identification as follows:

- Ignition on.
- Click on the VCT2000 symbol. Wait until identification has been carried out.

- Ignition off.

Fig. 150: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **CALIBRATING THE CLIMATE CONTROL MODULE (CCM)**

CALIBRATING THE CLIMATE CONTROL MODULE (CCM)

CAUTION: When activating this function, calibration of the Climate Control Module (CCM) starts. After carrying out calibration read off of the diagnostic trouble codes (DTCs) starts. To ensure that diagnostics for the Climate Control Module (CCM) have been carried out, delay for 30 seconds before reading out diagnostic trouble codes (DTCs) after calibration.

NOTE: Climate Control Module (CCM) and damper motors can be affected by the temperature. The vehicle should have normal room temperature when performing this service.

Fig. 151: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

Carry out calibration as follows:

- Ignition on.
- Click on the VCT2000 symbol. Wait until calibration has been carried out and diagnostic trouble codes (DTCs) read out.
- Ignition off.

This function controls the components that communicate with the Climate Control Module (CCM) via LIN bus 1 and LIN bus 2. In the event of a fault in any of the LIN buses, diagnostic trouble codes (DTCs) CCM-0070 to CCM-0071 will be stored depending on the fault. These diagnostic trouble codes (DTCs) can only be stored in

conjunction with this diagnostic function.

If any of these diagnostic trouble codes (DTCs) recur, recalibrate to check if the problem was overcome. If the diagnostic trouble code (DTC) recurs, fault-trace the relevant diagnostic trouble code (DTC).

Fig. 152: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

HVAC

Climate Units - Symptom Verification

INFORMATION AND VERIFICATION, TEMPERATURE CONTROL (2007-11)

INFORMATION AND VERIFICATION, TEMPERATURE CONTROL

Symptom and function description

The climate control unit cools or heats as well as dehumidifies the air in the passenger compartment.

The temperature selected corresponds to the physical experience with reference to the air speed, humidity, exposure to sun etc. which affect the interior and exterior of the vehicle.

For the air conditioning to work satisfactorily, the side windows and sun roof (if applicable) must be closed.

Location of the sensors

- The sun sensor is on top of the dashboard.
- The temperature sensor for the passenger compartment is behind the air conditioning (A/C) panel.

HINT: Do not cover or block the sensors with cloth or other objects

Acceleration

At full acceleration, the air conditioning (A/C) system switches off temporarily. You may feel a temporary temperature rise.

Verification

Access to the vehicle is necessary for the following checks.

Conditions

- Close the hood, doors, side windows and sun roof, if applicable.
- Start the engine.
- Engine speed should be approximately 1500 RPM.

Performance test

- Set the temperature control to max. cooling.
- Set the air distribution selector to "Ventilation".
- Set the recirculation button to "On".
- Set the A/C button to "On".

- Set the fan speed selector to 50%.

Reading the temperature

Allow the system to stabilize for at least 8 minutes.

Place the thermometer by the central panel vents.

READ OFF OPERATING CONDITIONS IN °C (°F).

Outdoor temperature in front of the vehicle.	20°C (68°F).	30°C (86°F).	40°C (104°F).
Temperature at central panel vents:	6-9°C (43-48°F).	6-9°C (43-48°F).	6-9°C (43-48°F).

INFORMATION AND VERIFICATION, TEMPERATURE CONTROL (2003-06)

INFORMATION AND VERIFICATION, TEMPERATURE CONTROL

Symptom and function description

The climate control unit cools or heats as well as dehumidifies the air in the passenger compartment. The vehicle is equipped with either manual (A/C) or automatic climate control (ECC).

ECC (option)

The temperature selected corresponds to the physical experience with reference to the air speed, humidity, exposure to sun etc. which affect the interior and exterior of the vehicle.

For the air conditioning to work satisfactorily, the side windows and sun roof (if applicable) must be closed.

Location of the sensors

- The sun sensor is on top of the dashboard.
- The temperature sensor for the passenger compartment is behind the air conditioning (A/C) panel.

HINT: Do not cover or block the sensors with cloth or other objects

Acceleration

At full acceleration, the air conditioning (A/C) system switches off temporarily. You may feel a temporary temperature rise.

Verification

Access to the vehicle is necessary for the following checks.

Conditions

- Close the hood, doors, side windows and sun roof, if applicable.
- Start the engine.
- Engine speed should be approximately 1500 RPM.

Performance test

- Set the temperature control to max. cooling.
- Set the air distribution selector to "Ventilation".
- Set the recirculation button to "On".
- Set the A/C button to "On".
- Set the fan speed selector to 50%.

Reading the temperature

Allow the system to stabilize for at least 8 minutes.

Place the thermometer by the central panel vents.

READ OFF OPERATING CONDITIONS IN °C (°F).

NOTE: **Identify the damper motor module (DMM) for recirculation using VIDA (Volvo scan tool).**

FINISHING

TESTING THE CLIMATE CONTROL SYSTEM

Carry out a performance test on the climate control unit. See: **CLIMATE SYSTEM, PERFORMANCE TEST**

DAMPER MOTOR MODULE (DMM), TEMPERATURE, REPLACING

The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

NOTE: **The are 2 damper motor modules (DMM) for temperature, one on the right (white arm) and one on the left-hand side (black arm).**

REMOVAL

REMOVING THE DAMPER MOTOR MODULE (DMM) FOR TEMPERATURE ON THE PASSENGER SIDE

Fig. 5: Identifying Control Module And Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the glove compartment. See **GLOVE COMPARTMENT, REPLACING**
- the switch

  HINT: Use a small electrician's screwdriver to pry up the switch by the lock. Depress the switch at the rear edge. Pull straight out.

- the 2 x screws
- the control module.

INSTALLATION

INSTALLING THE DAMPER MOTOR MODULE (DMM) FOR TEMPERATURE ON THE PASSENGER SIDE

Fig. 6: Identifying Control Module And Screws
Courtesy of VOLVO CARS CORPORATION

Install:

- the control module in position. Adjust the shaft journal so that it goes in
- the 2 screws. Tighten alternately
- the switch. Ensure that it is correctly positioned
- the glove compartment. See **GLOVE COMPARTMENT, REPLACING** .

NOTE: **Identify the damper motor module (DMM) for temperature using VIDA (Volvo scan tool).**

REMOVAL

REMOVING THE DAMPER MOTOR MODULE (DMM) FOR TEMPERATURE ON THE DRIVER'S SIDE

Fig. 7: Identifying Control Module And Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the soundproofing panel. See **SOUNDPROOFING PANEL, REPLACING**
- the connector from the control module

  HINT: Use a small electrician's screwdriver to pry up the switch by the lock. Depress the switch at the rear edge. Pull straight out.

  HINT: Pull the control module out slightly. Position the point of the electrician's screwdriver

between the arms on the control for the lever. Pry the arms away from the ball on the motor lever.

- the 2 x screws
- the control module.

INSTALLATION

INSTALLING THE DAMPER MOTOR MODULE (DMM) FOR TEMPERATURE ON THE DRIVER'S SIDE

Fig. 8: Identifying Control Module And Screws
Courtesy of VOLVO CARS CORPORATION

Install:

- the control module in position. Adjust the shaft journal so that it goes in
- the lever for the mechanism on the ball for the motor lever

HINT: Insert the point of the electrician's screwdriver behind the lever and round-nosed pliers or similar behind the motor lever. Press the ball onto the mechanism.

- the 2 screws. Tighten alternately
- the switch. Ensure that it is correctly positioned
- the soundproofing panel. See **SOUNDPROOFING PANEL, REPLACING** .

NOTE: Identify the damper motor module (DMM) for temperature using VIDA (Volvo scan tool).

FINISHING

TESTING THE CLIMATE CONTROL SYSTEM

Carry out a performance test on the climate control unit. See: **CLIMATE SYSTEM, PERFORMANCE TEST**

DASHBOARD ENVIRONMENT PANEL (INCLUDING CLIMATE CONTROL MODULE (CCM)), REPLACING

PREPARATIONS

NOTE: Read off data from the control module before replacing the control module. This is carried out via VIDA vehicle communication. After replacing the control module, the relevant parameters must be programmed into the new control module.

REPLACING DASHBOARD ENVIRONMENT PANEL

Fig. 9: Identifying Ignition Key Off
Courtesy of VOLVO CARS CORPORATION

Ignition off.

Remove the key.

NOTE: **The key must be removed to ensure that the ignition is not switched on by mistake.**

NOTE: **After the key has been removed: Wait 3minutes before starting work.**

Fig. 10: Identifying Panel Above Gear Selector & Weatherstrip Tool
Courtesy of VOLVO CARS CORPORATION

NOTE: **The gear selector must be in the rearmost position before the dashboard environment panel can be removed.**

Fig. 11: Identifying Panel Above Gear Selector And Weatherstrip Tool
Courtesy of VOLVO CARS CORPORATION

Remove:

- the two screws (2) on the lower edge of the panel.
- the panel (3).

NOTE: The radio component and the dashboard environment panel are complementary and are mounted at the join with hooked mountings.

Fig. 12: Angling Dashboard Environment Panel Outwards
Courtesy of VOLVO CARS CORPORATION

HINT: To facilitate removal: Angle the dashboard environment panel outwards so that it is possible to insert a couple of fingers between the center console and the dashboard environment panel.

HINT: Pull the dashboard environment panel downwards at the same angle.

HINT: The dashboard environment panel is correctly secured. Force is required to remove it.

- connectors.

Lift out the panel.

Install:

In reverse order.

Fig. 13: Identifying Component Taped On Back Of Dashboard Environment Panel
Courtesy of VOLVO CARS CORPORATION

NOTE: **If any of the outer hooks break off, this must be "rectified".**

Tape the 3.5mm thick component measuring 20 X 20mm to the reverse of the dashboard environment panel. Use double-sided adhesive tape.

Fix the other side of the piece with double-sided adhesive tape so that there is a solid anchorage when reinstalling against the center console.

FRONT PANEL, REPLACING

Fig. 14: Front Panel
Courtesy of VOLVO CARS CORPORATION

Removal

- Remove the dashboard environment panel. See **REPLACING DASHBOARD ENVIRONMENT PANEL**.
- Remove the panel for the switches. See **REPLACING CLIMATE CONTROL UNIT SWITCHES** .
- Remove the rear cover.

Front panel

- Release the catches. Pull off the front panel.

NOTE: **Be careful if the front panel is to be reused. The panel has double-sided adhesive tape on the reverse.**

Installation

- When reusing the front panel, check that the tape is intact and secures correctly. Replace the tape if necessary.
- For a new front panel, remove the masking tape from the double-sided adhesive tape and press the front panel into place.

Install in reverse order.

ORDERING SOFTWARE

Order the software. See 9438292 .

FINISHING

After replacing the control module, the following must be carried out.

- Reprogram the customer programmed data.
- Carry out self-adjustment of the damper motor end positions.
- Test drive the car. Check that the function of the climate control system is OK.
- Then check that no diagnostic trouble codes have been stored during the replacement.

Information about programming the control module, damper motor self-adjustment and reading off diagnostic trouble codes can be found under VIDA vehicle communication.

DASHBOARD ENVIRONMENT PANEL SWITCHES

Fig. 15: Dashboard Environment Panel Switches
Courtesy of VOLVO CARS CORPORATION

Remove:

- the switches. See **REPLACING CLIMATE CONTROL UNIT SWITCHES**

Install:

In reverse order.

FILLING WITH FLUORESCENT TRACING AGENT WITH THE REFRIGERANT

REGULATIONS

Filling and leak tracing the climate control system with tracing agent and an UV lamp from Bright Solutions

Inc.

NOTE: **The coloring agent may discolor the car paintwork. Therefore extreme caution must be taken when handling the tracing agent.**

NOTE: **Carefully follow the manufacturers instructions when handling the UV lamp and the tracing agent.**

NOTE: **After filling with the tracing agent, the decal supplied by the manufacturer / supplier must be applied at the point indicated.**

FILLING WITH FLUORESCENT TRACING AGENT

When replacing components in the climate control system, the component (for example the drier) can be filled with tracing agent.

Filling an empty climate control system with tracing agent when a leak cannot be localized

- Fill with 225g of refrigerant with fluorescent tracing agent according to the manufacturers instructions for leak tracing.

Fig. 16: Filling Climate Control System With Refrigerant Containing Tracing Agent
Courtesy of VOLVO CARS CORPORATION

If the climate control system is filled

- Drain off 225 g of refrigerant, see **REFRIGERANT, DRAINING**
- Fill the climate control system with refrigerant with tracing agent according to the manufacturers instructions
- Leak trace according to **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** .

If the amount of refrigerant in the climate control unit cannot be determined

- Drain the climate control system according to **REFRIGERANT, DRAINING**
- Fill the climate control system with refrigerant with tracing agent according to the manufacturers instructions
- Leak trace according to **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** .

SCREWED JOINT, TORQUE/ANGLE TIGHTENING

Special tools:

9512050

SCREWED JOINT

There are a great number of torque spanner systems available on the market where the spanner grip can be replaced with other types. These wench grips are normally ideally suited to torque tightening screwed joints in poorly accessible places.

There may be occasions when torque tightening of a screwed joint must be followed by angle tightening and space does not allow the use of protractor (part number **9512050**). In these cases, use either a nut, a screw head or a tool. These are usually hexagonal and each corner is **60°** . If there are twelve edges, each corner is **30°** .

Fig. 1: Identifying Marked Nut

To angle tighten, mark the material and nut for example as illustrated and then tighten so that the markings are

opposite each other.

LEAK DETECTION, TRACER AGENT

Fig. 1: Identifying UV Lamp, Cables & Battery
Courtesy of VOLVO CARS CORPORATION

NOTE: **The coloring agent may discolor the vehicle paintwork. Therefore extreme caution must be taken when handling the tracing agent.**

NOTE: **Carefully follow the manufacturers instructions when handling the UV lamp and the tracing agent.**

NOTE: **After filling with the tracing agent, the decal supplied by the manufacturer / supplier must be applied at the point indicated.**

NOTE: **When leak tracing, always use the protective goggles supplied with the equipment. The goggles make the color more visible.**

Fill the climate control system with fluorescent tracing agent. See **FLUORESCENT TRACING AGENT, FILLING** .

Fig. 2: Identifying UV Lamp & Coolant System
Courtesy of VOLVO CARS CORPORATION

Connect the UV lamp. See the manufacturer's instructions.

Leak trace using the UV lamp.

The fluorescent tracing agent is light green when leak tracing with a UV lamp.

NOTE: This light green color may be mistaken for leaked or spilled coolant which Volvo uses in its products.

The method for leak tracing using fluorescent tracing agent is the same for both factory filled and aftermarket filled climate control systems.

HVAC

Body and interior

HVAC

LEAK TRACING, ELECTRONIC LEAK TRACER

Special tools:

see **9511207**

LEAK TRACING WITH AN ELECTRONIC LEAK TRACER USING REFRIGERANT AS A TRACING AGENT

When fault tracing using refrigerant as a tracing agent, we recommend that leak tracer see **9511207** is used.

PREPARATIONS

NOTE: The engine must always be switched off when leak tracing.

An electronic leak tracer can be used if there is still refrigerant in the climate control system.

If the climate control system is empty and a visual or physical test has not identified the leak.

LEAK TRACING

- Fill the climate control system with 200 grams of refrigerant
- There must not be any strong smells or fumes in the engine compartment. These can affect the leak tracing
- Leak-trace using a leak tracer.

IF NO LEAKAGE IS FOUND

- Fill with the remaining amount of refrigerant
- Add fluorescent tracing agent according to **FILLING WITH FLUORESCENT TRACING AGENT WITH THE REFRIGERANT**
- If leakage is suspected, ask the customer to drive the car and then return for new leak tracing / repairs.

IF LEAKAGE IS DETECTED

- Remedy the cause of the leak
- Vacuum pump according to **VACUUM PUMPING**
- Add fluorescent tracing agent with the refrigerant according to **FILLING WITH FLUORESCENT TRACING AGENT WITH THE REFRIGERANT** .

Or:

- Fill with refrigerant according to **REFRIGERANT, FILLING**
- Leak trace according to **LEAK TRACING WITH AN ELECTRONIC LEAK TRACER USING REFRIGERANT AS A TRACING AGENT**.

Or:

- Leak trace according to **LEAK TRACING, FLUORESCENT TRACING AGENT / UV LAMP** .

OIL IN THE A/C SYSTEM

Special tools:

see **9511204**

ADDITION OF LUBRICATING OIL

WARNING: Oils should not be mixed. Always use the correct type of compressor oil.

NOTE: Too much lubricating oil will impair cooling. Too little lubricating oil will damage the compressor.

When repairing leaks, or when a component is replaced, lubricating oil must be added. The amount of oil for each component depends on whether the leak happened slowly or quickly.

Slow leak (more than 24 hours)

There is not normally a great risk of oil loss with a slow leak.

The following procedures apply when replacing the components:

Fast leak (hose burst for example)

A fast leak often means that lubricating oil is drawn out with the coolant.

- **HVAC OIL AMOUNT SPECIFICATIONS**

Receiver	$30cm^3$
Evaporator	$50cm^3$
Condenser	$30cm^3$
Pipe	$10cm^3$
Hose	$10cm^3$

Compressor

Preparatory stage for oil change

- Measure the volume of oil drained from the compressor
- Replace the drained oil volume according to the table below:

Drained oil volume	Reusing the compressor	New compressor
More than 60% of the total oil volume	Replace the drained oil volume with the equivalent volume	$180cm^3$ - (drained oil volume + $20cm^3$)
Less than 60% of the total oil volume	Fill up 60% of the total oil volume of the system	Fill up $180cm^3$ * 40% - $20cm^3$

CAUTION: When installing a completely new system:

Check that there is oil in the compressor. The other components should contain no oil.

REPLACING THE RECEIVER

Replace the receiver in the following case:

- When replacing the compressor (compressor breakdown for example).
- For coolant leaks in which nearly 100% has leaked out of the system. (System not under pressure).
- When replacing an A/C component after the warranty period.

FILLING THE A/C SYSTEM WITH OIL

NOTE: Fill with oil before vacuum pumping.

FILLING WITH PAG OIL

When replacing pipes or hoses the oil can be filled through the service valve.

When filling with PAG oil (part number 8708581-7) in the vehicle, do the following:

- Remove the needle valve in the service valve using valve tool see **9511204**

Fig. 1: Identifying Needle Valve
Courtesy of VOLVO CARS CORPORATION

Use the filler sprayer (without plastic hose) which is supplied with the station. The sprayer may need to be cleaned so that different oils are not mixed.

- Check according to the table above and measure how much oil should be filled. After filling with oil, re-install the needle valve.

NOTE: Use only your thumb and index finger when tightening the service valve using valve needle tool see 9511204 . This is to prevent damage to the seal on the valve.

REFRIGERANT, VACUUM PUMPING

VACUUM PUMPING

VACUUM PUMPING REFRIGERANT

CAUTION: Check and, if necessary, top up with new compressor oil according to REFRIGERANT, SAFETY REGULATIONS before vacuum-pumping the car's climate control system.

Fig. 2: Identifying Recycling Unit Attached To Service Valve
Courtesy of VOLVO CARS CORPORATION

- During vacuum pumping, the vacuum pump can be connected to both the high pressure (HP) and low pressure (LP) sides
- Operate the vacuum pump for at least 50 minutes.

VACUUM TEST

The vacuum must be checked after vacuum pumping.

- The vacuum gauge's value may only increase by 0.2 mbar one dash (0.1-0.3 mbar) during a period of 4 minutes.

NOTE: The vacuum test is not a substitute for leak tracing.

REPLACING CLIMATE CONTROL UNIT SWITCHES

REMOVAL

PREPARATIONS

- Ignition off
- Remove the dashboard environment panel according to **DASHBOARD ENVIRONMENT PANEL (INCLUDING CLIMATE CONTROL MODULE (CCM)), REPLACING** .

SWITCHES, LOWER ROW

Fig. 3: Dashboard Environment Panel Switches
Courtesy of VOLVO CARS CORPORATION

- Release the panel by pressing up the catches from underneath. See the illustration, upper half
- Remove any blind switches (covers where there is no switch) to make removing the switches easier
- Remove the switch by carefully pulling it straight out. See the illustration, lower half.

INSTALLATION

SWITCHES, LOWER ROW

In reverse order.

CAUTION: Carefully press the switch down when installing it. The terminal pins on the printed circuit board are fragile.

REPLACING HEAT SHIELD FOR THE TXV VALVE

REMOVAL

Fig. 4: Heat Shield For TXV Valve
Courtesy of VOLVO CARS CORPORATION

Remove

- the nuts
- the panel
- the seal.

INSTALLATION

In reverse order.

NOTE: **The heat shield is a replacement part for previous models. In these cases the firewall insulation in the engine compartment should be cut to the size of the heat shield.**

VISUAL AND PHYSICAL CHECK

Large and slow leaks will often result in air conditioning (A/C) compressor oil being drawn out with the refrigerant.

A visual inspection can localize the point where the oil gathers and identify the source of the leak.

- Check the system for corrosion which could cause refrigerant to leak
- Check that there are no loose components.

ACCESSORIES AND BODY, CAB

Miscellaneous - Design and Function

CLIMATE CONTROL MODULE (2003-2004)

DESIGN

CLIMATE CONTROL UNIT

Fig. 1: Climate Control Unit Components
Courtesy of VOLVO CARS CORPORATION

The climate control unit consists of the following components:

1. Heater element
2. Damper motor, temperature, left
3. Blower fan
4. Damper motor, fresh air / recirculation
5. Power unit for blower fan motor
6. Particle filter
7. Damper motor, ventilation and floor (also defroster for MCC/STD)

8. Damper motor, temperature, right
9. Damper motor defroster (ECC).

Engine coolant constantly flows through the heater element. There is no valve to regulate the flow. The selected temperature is achieved using dampers for the right and left-hand sides of the car installed upstream and downstream of the heater element. These control the amount of air to be warmed. There are also dampers downstream of the heater element that guide the airflow to the correct air vent.

The climate control module provides infinitely variable electronic blower fan control. When AUTO mode (only electronic climate control) is engaged the climate control module (CCM) adapts the blower fan speed to the setting of the controls and the vehicle speed. The blower fan can be set to run-on in order to reduce residual moisture in the evaporator.

A timer located in the central electronic module (CEM) controls the run-on time. 50 minutes after the engine has been switched off and the ignition has been turned to position 0 or I the central electronic module (CEM) supplies power to the climate control module (CCM) and the blower fan is activated at full speed for 7 minutes. This run-on dries the evaporator and prevents bad odors.

This function is programmed at the factory, but can be deactivated in the event of customer complaints via programming of customer parameters. Programming is carried out via VIDA (Volvo scan tool).

The function is only available to cars of structure week 199850 and later.

All damper motors are of the stepper type. Their position and speed is controlled electronically.

Manual climate control and standard climate control have four stepper motors controlling the following dampers:

- Ventilation / floor / defroster via a link system
- Recirculation and fresh air via a link system
- Temperature left
- Temperature right.

For electronic climate control (ECC) there is an extra stepper motor which controls the defroster. The wiring between the damper motors and the climate control module (CCM) consists of four cables for supply voltage and directional control and a separate cable for each motor which controls the motor to be activated. Each motor has four coils. The corresponding coils in each motor are supplied with power at the same time. The motors are only supplied with power if they are grounded at the same time. When a new position is selected for the damper motor, the climate control module (CCM) calculates how many steps are required to complete the movement. The climate control module (CCM) then activates the damper motor with the necessary number of steps. When the motor is instructed to move to an end position, the motor is activated until it stops. This end position is then used as a limit position. This means that the damper motors are self-adjusting, but only after the limit positions have been reached. When replacing the damper motors, ensure that the self-adjustment is carried out. Otherwise the customer may experience defective climate control.

There are diagnostics for the blower fan and damper motors.

AIR CONDITIONING (ECC AND MCC ONLY)

Fig. 2: Identifying A/C Compressor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) controls the A/C compressor. When the A/C switch on the dashboard environment panel is activated, a request to activate the compressor is transmitted via Control area network (CAN) to the engine control module (ECM). The engine control module (ECM) determines when the compressor must operate.

If any of the following conditions are met the compressor is disconnected:

- High engine coolant temperature (ECT)
- Wide open throttle (WOT)
- The engine has just been started
- Overpressure in the air conditioning (A/C) system.

When the engine is started the engine control module (ECM) activates the air conditioning compressor for a short period even if the climate control module (CCM) has not transmitted a request about this. This is carried out for diagnosis. This check is carried out at all temperatures exceeding -6 °C.

The advantage in allowing the engine control module (ECM) to control the air conditioning compressor is that it can delay compressor activation somewhat, if the idling speed must be compensated for the extra load for

example.

SUN SENSOR (ELECTRONIC CLIMATE CONTROL ONLY)

Fig. 3: Locating Sun Sensor
Courtesy of VOLVO CARS CORPORATION

The sun sensor transmits information about sun intensity to the climate control module (CCM).

The sun sensor consists of a photo diode which is supplied with power from the control module. The conductivity of the diode depends on the amount of light to which it is exposed. The diode is located under a diffusing lens which reduces the sensitivity of the photo diode to the angle of the light hitting it. Increased sun intensity reduces the voltage over the photo diode. The control module measures the voltage over the photo diode and compensates for high sun intensity by lowering the ventilation air temperature, changing the distribution of air and increasing the speed of the blower fan.

The climate control module (CCM) starts to compensate the blower fan speed at a sun intensity of 400 W/m^2 and reaches maximum compensation at a sun intensity of 1000 W/m^2 .

The sun sensor is located in the middle of the dashboard by the windshield.

There are diagnostics for the sun sensor.

AIR QUALITY SENSOR (ELECTRONIC CLIMATE CONTROL ONLY, OPTION)

Fig. 4: Air Quality Sensor
Courtesy of VOLVO CARS CORPORATION

The air quality sensor is available as an option for the electronic climate control from model year 2000. Its function is to transmit a signal to the climate control module (CCM) if it detects increased concentrations of pollutants in the outside air.

The air quality sensor measures the CO_x and NO_x content.

The air quality sensor compares current values with previous ones and can calculate changes in pollutant concentrations.

The signal from the air quality sensor to the climate control module (CCM) is a pulse width modulation (PWM) signal and has four stages, 0-3:

- signal 0= no increase in or reduced pollutant level
- signal 1=gradual increase in pollutant level
- signal 2=moderate increase in pollutant level
- signal 3=rapid increase in pollutant level.

The control module uses the signal to control the recirculation damper motor.

The air quality sensor is located on the right-hand side of the fresh air intake under the cowl.

There are diagnostics for the air quality sensor.

SWITCHES, DASHBOARD ENVIRONMENT PANEL, (LOWER SECTION)

Fig. 5: Identifying Climate Control Module (CCM)
Courtesy of VOLVO CARS CORPORATION

Across the lower section of the dashboard environment panel there is a 12V socket and space for a maximum of seven switches.

Each switch has its own identity. This is unique for the relevant function. The switches can therefore be positioned in any location on the dashboard environment panel, as long as they are installed in the off position. They do not have to be in any particular order. However, the identity of the installed switches must correspond with the car configuration file so that they can be activated.

There are diagnostics for the switches.

REAR A/C (ONLY XC90 WITH THREE ROWS OF SEATS)

Fig. 6: Identifying Rear A/C
Courtesy of VOLVO CARS CORPORATION

XC90 with three rows of seats is equipped with a rear A/C system. This consists of:

- power unit
- fan
- expansion valve
- blower fan switch.

The rear A/C system is controlled by a switch in the lower section of the dashboard environment panel. When the switch is activated the climate control unit (CCM) transmits a signal to the rear electronic module (REM) via the Control area network (CAN). The rear electronic module (REM) supplies the power unit and the blower fan switch with voltage via a relay. The blower fan switch sends control voltage to the power unit based on the position of the control. The power unit converts the control voltage to supply voltage for the blower fan motor.

The rear A/C is directly connected to the front air conditioning via the high and low pressure pipes and hoses. The only way to control the cooling in the third row of seats is to control the fan speed using the rear fan switch.

The rear electronic module (REM) diagnoses the relay supply, otherwise the rear A/C cannot be diagnosed.

DIAGNOSTIC FUNCTIONS

CLIMATE CONTROL MODULE (CCM)

The climate control module (CCM) has a built-in diagnostic system which continuously monitors internal functions and input and output signals.

DIAGNOSTIC TROUBLE CODES (DTCS)

Diagnostic trouble codes (DTCs) are stored in the control module if the climate control module (CCM) detects a fault. Every diagnostic trouble code (DTC) has a counter which records the number of cycles which have been "fault-free" since the diagnostic trouble code (DTC) was stored. A fault which is detected in each operating cycle is defined as permanent. A fault which is detected in one or more operating cycles (although not the present one) is defined as intermittent.

An operating cycle is the period from when the ignition was switched on, remained on for at least 10 seconds and was finally switched off for at least 10 seconds.

READING AND ERASING DIAGNOSTIC TROUBLE CODES (DTCS)

Stored diagnostic trouble codes (DTCs) can be read off and erased using this function.

READING OFF INPUT AND OUTPUT SIGNALS

Using this function, the status or value of parameters can be read off. The presentation of the status or value can be obtained graphically or digitally.

For further information about the different parameters, see **DESCRIPTION OF PARAMETERS** .

READING OFF EXTENDED FAULT-TRACING INFORMATION

This function can be used to read parameters, status identifiers and counters stored at the same time as a diagnostic trouble code (DTC). These are called frozen values.

For further information, see **FROZEN VALUES CLIMATE CONTROL MODULE, DESCRIPTION**.

DESCRIPTION OF PROGRAMMABLE PARAMETERS, CUSTOMER ADAPTATION

Certain parameters for the climate control module (CCM) can be read off and programmed using this function. The purpose of this programming is to:

- read the programmed parameters before replacing the control module. This is so the same parameters can be entered into the new control module
- to adapt the function of the control module for the equipment levels of the car (passenger compartment ventilation filter, parking heater)
- to adapt the function of the control module to the requirements of the driver.

Passenger compartment ventilation filter compensation, status

Indicates the status for the activation of passenger compartment ventilation filter compensation.

OFF = Compensation not active

ON = Compensation active (preset)

Blower fan run-on, status

Provides the status for activation of the blower fan run-on. The run-on dries the evaporator and prevents bad odors which may otherwise result from residual moisture in the system.

OFF = Run-on inactive

ON = Run-on active (preset)

Blower fan speed, value

Allows the speed to be modified for the blower fan when the climate control system is in AUTO mode. Modifying the parameters means that the climate control system either blows more or less air than the preprogrammed value, to correspond to the request of the driver.

Gives the voltage value for adaptation of the blower fan speed.

-1.0 - +1.0 V (0 V preset)

Setting for air distribution for the floor / defroster residual heat, value

Indicates the setting of the air distribution between the floor and defroster.

10/90 - 90/10% (70/30% preset)

Setting for air distribution for the floor / defroster parking heater, value

Indicates the setting of the air distribution between the floor and defroster.

10/90 - 90/10% (70/30% preset)

Passenger compartment temperature, value

The passenger compartment temperature in relation to the passenger compartment temperature switch position can be adjusted by programming a compensation value.

The passenger compartment temperature can be raised or lowered by a maximum of ±2 °C (±4 °F) from the normal value. This allows the temperature to be adjusted in accordance with the driver's wishes.

0 = -1.0 °C/-2.0 °F

1 = -0.5 °C/-1.0 °F

2 = 0.0 °C / 0.0 °F (default value)

3 = +0.5 °C/+1.0 °F

4 = +1.0 °C/+2.0 °F

DESCRIPTION OF COMPONENTS/FUNCTIONS ACTIVATION

Self-adjustment of damper motors

This function can be used to carry out self adjustment of the limit positions for all the damper motors. Self

adjustment must be carried out if, after checks, one or more of the damper motors do not reach their limit positions or the climate control module (CCM) is replaced. There are a number of possible reasons for a damper motor not reaching its end position. For example, the motor or the damper has been turned manually, the voltage supply may have been cut, or a component has been replaced.

FROZEN VALUES CLIMATE CONTROL MODULE, DESCRIPTION

EXPLANATION

Not all the parameters described need to be implemented in the control module. This varies from system to system.

Parameters can also vary depending on which type of climate control module the car is equipped with.

Frozen values are parameter values that are stored when a diagnostic trouble code (DTC) is stored.

BATTERY VOLTAGE, VALUE

Measurement range: 0-18 V

Normal value when the generator (GEN) is charging: 13.0-14.5 V

The value indicates the voltage at the climate control module. Delayed X supply means that voltage supply is retained for 1 minute after the ignition is switched off. Activation of functions such as blower fan run-on and damper motor self-adjustment must be possible during this time.

DISTANCE, VALUE

Indicates the total mileage of the vehicle. The value is given in km.

TIME, VALUE

The value displays the time that has passed since the diagnostic trouble code (DTC) was stored.

FAN CURRENT, VALUE

Measurement range: 0-10 mA

The climate control module calculates the value based on the signal from the control knob for the blower fan. With electronic climate control, the value is also affected by automatic climate control (AUTO position).

The value is used to control the power supply from the power unit to the blower fan motor.

FAN SWITCH, VALUE

Measurement range: 0-100 %

The value indicates the control signal from the climate control module to the blower fan motor.

BLOWER FAN DIAGNOSTIC SIGNAL, VALUE

Measurement range: 0-5 V

The climate control module generates an analog signal. This is converted to a current which the power unit converts back to an analog signal. The diagnostic signal is an extremely intense signal that cannot be used when checking the blower fan.

PASSENGER COMPARTMENT TEMPERATURE, VALUE

Measurement range: -40 to +85 °C

The climate control module calculates the temperature based on the signal from the passenger compartment temperature sensor.

The value is used to control the passenger compartment temperature and as the input signal to the central electronic module (CEM).

FAN LEVEL, VALUE

Measurement range: 0-7 step

The value indicates the position of the blower fan switch and is used by the climate control module to calculate the control signal to the blower fan motor.

VOLTAGE FAN, VALUE

Measurement range: 1-5 V

The value indicates the position of the blower fan switch and is used by the climate control module to calculate the control signal to the blower fan motor.

LEFT TEMPERATURE DAMPER MOTOR, STATUS

The status displays if the damper motor is activated or not.

Off = not activated

On = activated

RIGHT TEMPERATURE DAMPER MOTOR, STATUS

The status displays if the damper motor is activated or not.

Off = not activated

On = activated

RECIRCULATION DAMPER MOTOR, STATUS

The status displays if the damper motor is activated or not.

Off = not activated

On = activated

DAMPER MOTOR FLOOR / VENTILATION STATUS

The status displays if the damper motor is activated or not.

Off = not activated

On = activated

DAMPER MOTOR, DEFROSTER, STATUS

The status displays if the damper motor is activated or not.

Off = not activated

On = activated

ENGINE RUNNING, STATUS

The status displays if the engine was running when the diagnostic trouble code (DTC) was stored.

No = engine not running

Yes = engine running

PULSES FROM THE TEMPERATURE SENSOR FOR THE FAN MOTOR, VALUE

Measurement range: 0-15 pulses/65 ms

The value indicates the speed of the fan for the passenger compartment temperature sensor. The standard number of pulses is 12-13/65 ms.

TEMPERATURE, VALUE

Measurement range: -60 to +195 °C

The value indicates the engine coolant temperature (ECT). The climate control module uses the value to control the blower fan during cold start when AUTO is selected.

OUTSIDE TEMPERATURE, VALUE

Measurement range: -40 to +80 °C

The climate control module obtains the value via the control area network (CAN) from the passenger door module.

The value is used to control the passenger compartment temperature.

EVAPORATOR TEMPERATURE SENSOR, VALUE

Measurement range: 0-5 V

The climate control module uses the value from the evaporator temperature sensor to calculate the temperature.

The value is used to control the air conditioning (A/C) compressor. The compressor is switched off when there is a risk of freezing.

AIR CONDITIONING (A/C), STATUS, COMPRESSOR STATUS

The status displays if the compressor was running when the diagnostic trouble code (DTC) was stored.

Off = compressor off

On = compressor on

LINEAR PRESSURE, VALUE

Measurement range 0-3100 kPa

The value indicates the pressure in the compressor.

VOLTAGE, PASSENGER COMPARTMENT TEMPERATURE SENSOR, VALUE

Measurement range: 0-5 V

The climate control module uses the value from the passenger compartment temperature sensor to calculate the passenger compartment temperature. The value is used as a compensation parameter to control the passenger compartment temperature.

SUN SENSOR, SENSOR SIGNAL, VALUE

Measurement range: 0-5 V

The climate control module uses the value from the sun sensor to calculate the sun intensity. The value is used as a compensation parameter to control the passenger compartment temperature.

TWILIGHT SENSOR, SENSOR SIGNAL, VALUE

Measurement range: 0-5 V

The climate control module uses the value from the twilight sensor to calculate the degree of darkness. The value is used to control the strength of the lighting of the button LEDs.

TEMPERATURE DAMPER MOTOR, LEFT POSITION, VALUE

Measurement range: 0-100 %

The value indicates how much the damper is open.

The climate control module calculates the value based on the stage movement of the damper motor.

DAMPER MOTOR, TEMPERATURE RIGHT POSITION, VALUE

Measurement range: 0-100 %

The value indicates how much the damper is open.

The climate control module calculates the value based on the stage movement of the damper motor.

RECIRCULATION DAMPER MOTOR POSITION, VALUE

Measurement range: 0-100 %

The value indicates how much the damper is open.

The climate control module calculates the value based on the stage movement of the damper motor.

FLOOR / VENTILATION DAMPER MOTOR POSITION, VALUE

Measurement range: 0-100 %

The value indicates how much the damper is open.

The climate control module calculates the value based on the stage movement of the damper motor.

DAMPER MOTOR DEFROSTER POSITION, VALUE

Measurement range: 0-100%

The value indicates how much the damper is open.

The climate control module calculates the value based on the stage movement of the damper motor.

AUTOMATIC BREAKER, ACTIVATED, STATUS

The status displays if the signal from the air distribution selector to the climate control module was activated when the diagnostic trouble code (DTC) was stored.

Yes = activated

No = not activated

FLOOR, ACTIVATED, STATUS

The status displays if the signal from the air distribution selector to the climate control module was activated when the diagnostic trouble code (DTC) was stored.

Yes = activated

No = not activated

DEFROSTER, ACTIVATED, STATUS

The status displays if the signal from the air distribution selector to the climate control module was activated when the diagnostic trouble code (DTC) was stored.

Yes = activated

No = not activated

MAX DEFROSTER, ACTIVATED, STATUS

The status displays if the signal from the air distribution selector to the climate control module was activated when the diagnostic trouble code (DTC) was stored.

Yes = activated

No = not activated

AIR CONDITIONING (A/C) ON, ACTIVATED, STATUS

The status displays if the signal from the air distribution selector to the climate control module was activated when the diagnostic trouble code (DTC) was stored.

Yes = activated

No = not activated

AIR CONDITIONING (A/C) OFF, ACTIVATED, STATUS

The status displays if the signal from the air distribution selector to the climate control module was activated when the diagnostic trouble code (DTC) was stored.

Yes = activated

No = not activated

RECIRCULATION ACTIVATED, STATUS

The status displays if the signal from the air distribution selector to the climate control module was activated when the diagnostic trouble code (DTC) was stored.

Yes = activated

No = not activated

VENTILATION, ACTIVATED, STATUS

The status displays if the signal from the air distribution selector to the climate control module was activated when the diagnostic trouble code (DTC) was stored.

Yes = activated

No = not activated

SEAT HEATER LEFT FRONT ACTIVATED, STATUS

The status displays if the signal from the seat heater to the climate control module was activated when the diagnostic trouble code (DTC) was stored.

Yes = activated

No = not activated

SEAT HEATER RIGHT FRONT ACTIVATED, STATUS

The status displays if the signal from the seat heater to the climate control module was activated when the diagnostic trouble code (DTC) was stored.

Yes = activated

No = not activated

DEFROSTER / HEATED REAR WINDSHIELD, ACTIVATED, STATUS

The status displays if the signal from the defroster / heated rear windshield to the climate control module was activated when the diagnostic trouble code (DTC) was stored.

Yes = activated

No = not activated

SENSOR SIGNAL, AIR QUALITY SENSOR (AQS), STATUS

The climate control module interprets the pulse width of the air quality sensor and presents it as different levels.

Off

Level 1

Level 2

Level 3

AIR QUALITY SENSOR PULSE WIDTH, VALUE

Measurement range 0-100 %

The climate control unit calculates the air quality using the signal from the air quality sensor. The value is used to control the position of the recirculation motor.

GENERAL INFORMATION ABOUT READING OFF THE STATUS OF THE BUTTONS ON THE DASHBOARD ENVIRONMENT PANEL

The result from reading off the status for buttons on the dashboard environment panel in order from left to right.

DASHBOARD ENVIRONMENT PANEL, BUTTON IDENTITY, STATUS

The status indicates the function of the button.

The following alternatives are available:

- Empty position

  Adjustable head restraints

  Folding door mirrors

  Private locking

  STC

  DSTC

  Auxiliary lamps

  Reduced alarm

  Bi-fuel

  Child-proof lock.

DASHBOARD ENVIRONMENT PANEL, BUTTON ACTIVATED, STATUS

The status displays if the button was activated when the diagnostic trouble code (DTC) was stored.

Yes = activated

No = not activated

DASHBOARD ENVIRONMENT PANEL, BUTTON STATUS

The status displays if the function for the button corresponds to the configuration for the central electronic module (CEM).

Unknown = the status could not be determined

Not permitted = the button function does not correspond to the configuration of the central electronic module

Permitted = the button function corresponds to the configuration of the central electronic module

CARCONFIGSTATUS, ADJUSTABLE HEAD RESTRAINT, STATUS

The status displays whether the identity of a certain switch is permissible or missing compared with the permitted switch identities in the Car Configuration File.

Not defined = comparison failed

Not permitted = identity not permitted

OK = identity permitted

Button missing = button missing on the dashboard environment panel in comparison to the information in the Car Config File

CARCONFIGSTATUS, FOLDING DOOR MIRRORS, STATUS

The status displays whether the identity of a certain switch is permissible or missing compared with the permitted switch identities in the Car Configuration File.

Not defined = comparison failed

Not permitted = identity not permitted

OK = identity permitted

Button missing = button missing on the dashboard environment panel in comparison to the information in the Car Config File

CARCONFIGSTATUS, BIFUEL, STATUS

The status displays whether the identity of a certain switch is permissible or missing compared with the

permitted switch identities in the Car Configuration File.

Not defined = comparison failed

Not permitted = identity not permitted

OK = identity permitted

Button missing = button missing on the dashboard environment panel in comparison to the information in the Car Config File

CARCONFIGSTATUS, PRIVATE LOCKING, STATUS

The status displays whether the identity of a certain switch is permissible or missing compared with the permitted switch identities in the Car Configuration File.

Not defined = comparison failed

Not permitted = identity not permitted

OK = identity permitted

Button missing = button missing on the dashboard environment panel in comparison to the information in the Car Config File

CARCONFIGSTATUS, STC (STABILITY AND TRACTION CONTROL), STATUS

The status displays whether the identity of a certain switch is permissible or missing compared with the permitted switch identities in the Car Configuration File.

Not defined = comparison failed

Not permitted = identity not permitted

OK = identity permitted

Button missing = button missing on the dashboard environment panel in comparison to the information in the Car Config File

CARCONFIGSTATUS, DSTC (DYNAMIC STABILITY AND TRACTION CONTROL), STATUS

The status displays whether the identity of a certain switch is permissible or missing compared with the permitted switch identities in the Car Configuration File.

Not defined = comparison failed

Not permitted = identity not permitted

OK = identity permitted

Button missing = button missing on the dashboard environment panel in comparison to the information in the Car Config File

CARCONFIGSTATUS, AUXILIARY LAMPS, STATUS

The status displays whether the identity of a certain switch is permissible or missing compared with the permitted switch identities in the Car Configuration File.

Not defined = comparison failed

Not permitted = identity not permitted

OK = identity permitted

Button missing = button missing on the dashboard environment panel in comparison to the information in the Car Config File

CARCONFIGSTATUS, REDUCED ALARM, STATUS

The status displays whether the identity of a certain switch is permissible or missing compared with the permitted switch identities in the Car Configuration File.

Not defined = comparison failed

Not permitted = identity not permitted

OK = identity permitted

Button missing = button missing on the dashboard environment panel in comparison to the information in the Car Config File

CARCONFIGSTATUS, CHILD-PROOF LOCK, STATUS

The status displays whether the identity of a certain switch is permissible or missing compared with the permitted switch identities in the Car Configuration File.

Not defined = comparison failed

Not permitted = identity not permitted

OK = identity permitted

Button missing = button missing on the dashboard environment panel in comparison to the information in the Car Config File

DOWNLOADING SOFTWARE AND REPLACING THE CONTROL MODULE

New software can be downloaded into the climate control module. When ordering software, the hardware and the software in the car is compared to the Volvo central database. If the comparison is OK the software is downloaded to the control module.

If the comparison between the car and Volvo central database is not OK, the database is updated with the car configuration. When this is complete the software is downloaded.

The entire climate control module must be replaced as one unit. The exceptions are the fan for the passenger compartment temperature sensor and the switches on the lower section of the dashboard environment panel.

Five customer parameters can be programmed into the climate control module. These customer parameters are stored in the control module but not in the Volvo central database. This means that the customer parameters must be reprogrammed when the hardware is replaced.

FUNCTION

CONTROLLING THE CLIMATE IN THE PASSENGER COMPARTMENT

Fig. 7: Climate Control Module Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The way in which the climate in the passenger compartment is regulated depends on the type of climate control module (CCM) in the car.

Electronic climate control

Electronic climate control means that either manual settings or the AUTO function can be used. In the latter case the control module automatically regulates heat, air conditioning, recirculation and air distribution until the selected temperature is achieved.

Manual climate control

Manual climate control means that heat, air conditioning, recirculation and air distribution must be selected manually.

STD

STD means that heat, recirculation and air distribution must be selected manually.

The climate control module (CCM) (3/112) regulates the following:

- Activation of the air conditioning (A/C) compressor (8/3) with a request via the Controller area network (CAN) to the engine control module (ECM) (4/46)
- Controlling the damper motors. For electronic climate control (6/48), (6/95), (6/96), (6/102) and (6/103). For manual climate control; (6/48), (6/69), (6/95) and (6/96)
- Blower fan speed (6/28).

The climate control module (CCM) regulates the climate in the passenger compartment based on the following input signals:

- The passenger compartment temperature, signal from the internal passenger compartment temperature sensor
- The outside temperature, signal from the outside temperature sensor (7/11)
- The evaporator temperature, signal from the evaporator temperature sensor (7/41)
- Sun roof status. Signal from the sun roof control module (4/33) via the upper electronic module (UEM) (4/70) over the Controller area network (CAN)
- Side window status. Signals from the driver door module (DDM) (3/126) and passenger door module (PDM) (3/127) via the Controller area network (CAN)
- Door status. Signal from the central electronic module (CEM) (4/56) via the Controller area network (CAN)
- Sun intensity. Signal from the sun sensor (7/12)
- Speed. Signal from the brake control module (BCM) (4/16) (previously ABS), via the Controller area network (CAN)
- Windshield wiper status. Signal from the steering wheel module (SWM) (3/130) via the Controller area network (CAN).

The climate control module (CCM) (for electronic climate control) uses information about the status of the sun roof, side windows and doors to determine how it should compensate for changes in the passenger compartment temperature. If side windows, doors or the sun roof are opened, the climate control module (CCM) will not compensate for a change in passenger compartment temperature. Instead it maintains the same level of climate control for the compressor and blower fan as before.

The climate control module (CCM) (for electronic climate control) uses the signal from the steering wheel module (SWM) to establish whether the windshield wipers are switched on. This is to regulate the blower fan and the damper motor to remove any mist from the inside of the windshield when it rains.

The climate control module (CCM) (for electronic climate control) uses the signal from the sun sensor to compensate for high sun intensity by decreasing the temperature of ventilation air, changing air distribution and increasing the speed of the blower fan.

The climate control module (CCM) (for electronic climate control and manual climate control) uses the signal from the evaporator temperature sensor to control the activation of the air conditioning (A/C) compressor. If the signal from the evaporator temperature sensor indicates an evaporator temperature below 6 °C, the compressor cannot be activated because of the risk of freezing.

To maintain a constant flow of air in the passenger compartment the climate control module (CCM) (for electronic climate control) uses the speed signal from the brake control module (BCM) to regulate the speed of the blower fan. Generally, as the speed of the car increases the speed of the blower fan decreases.

At higher speeds the flow of air into the fresh air damper is adjusted.

SEAT HEATERS

Fig. 8: Seat Heaters Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The seat heaters are activated by pressing the switches on the climate control module (CCM) (3/112). The climate control module (CCM) transmits information via the Controller area network (CAN) about the status selected for each seat to the central electronic module (CEM) (4/56). The central electronic module (CEM) then transmits the information to the relevant control module for seat heating (4/201, 4/202). The control modules for the seat heaters then control the current to the heater pad for the left-hand seat (9/16, 9/18) and right-hand seat (9/17, 9/19).

The central electronic module (CEM) also transmits information to the climate control module (CCM) about whether the seat heaters are activated or not. The climate control module (CCM) uses this information to light / turn off the LEDs on the buttons.

RECIRCULATION CONTROL (ELECTRONIC CLIMATE CONTROL ONLY)

Fig. 9: Recirculation Control Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The climate control module (CCM) (3/112) controls the recirculation during the following conditions for electronic climate control:

- The recirculation switch is on (the LED lights orange)
- The system is in AUTO position and there is a large difference between the desired and current temperature
- The car is equipped with an air quality sensor, and the recirculation switch is on (the LED light green).

The air quality sensor transmits a signal to the climate control module (CCM) if it detects high concentrations of pollutants in the outside air. When this occurs the climate control module (CCM) transmits a signal to the damper motor for recirculation (6/48) to close the fresh air damper and to use recirculated air. The level of recirculation is controlled by the signal from the air quality sensor:

- signal 1 provides partial recirculation for speeds below 85 km/h, no recirculation for speeds exceeding 85 km/h
- signals 2 and 3 provide 100% recirculation.

If the high level of pollutants remains the system stays in recirculation for a certain time, maximum of 10 minutes. The time that the system is recirculating is determined by the outside temperature, if the air conditioning (A/C) is on and if the windshield wipers are activated. The system returns to fresh air for a short time before recirculation is resumed. The particle filter absorbs most of the pollutants entering the passenger compartment during this time. The maximum time prevents misting and musty air.

The air quality transmits information about the content of pollutants to the climate control module (CCM). This information is graded into four levels, and the information used for diagnosis.

Recirculation is never permitted if the defroster is selected. The climate control module (CCM) requests the compressor when the evaporator temperature exceeds 3 °C.

HEATED REAR WINDSHIELD AND DOOR MIRRORS

Fig. 10: Heated Rear Windshield And Door Mirrors Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The heated rear windshield and door mirrors are activated by pressing the switch on the climate control module (CCM) (3/112). The climate control module (CCM) transmits information to the central electronic module (CEM) (4/56) about the selected heating status. The central electronic module (CEM) transmits a signal to the driver's door module (3/126) and passenger door module (PDM) (3/127) for the heated door mirrors and to the rear electronic module (REM) (4/58) for the heated rear windshield.

The central electronic module (CEM) also transmits information to the climate control module (CCM) about whether the seat heaters are activated or not. The climate control module (CCM) uses this information to light / turn off the LED on the button.

SWITCH FUNCTIONS, DASHBOARD ENVIRONMENT PANEL, (LOWER SECTION)

The following functions can be activated using the switches on the dashboard environment panel:

- Folding head restraint, rear seat (S60/S80)
- Folding door mirrors (market dependent)
- Bi-fuel, on / off (market dependent)
- Valet lock, on/off
- Child lock, on / off (market dependent)
- STC, off / on (option)
- DSTC, off / on (option)
- Auxiliary lamps, off / on (option)

- Reduced alarm, on / off (option).

In order for certain functions to be activated the engine must be switched on and/or the master key must be in position II.

Folding head restraints, rear seat

When the switch for the folding head restraints is activated, information is transmitted by the climate control module (CCM) (3/112) to the rear electrical module (4/58) via the Controller area network (CAN).

Folding door mirrors

When the switch for the folding door mirrors is activated, information is transmitted by the climate control module (CCM) to the driver's door module (3/126) and the passenger door module (PDM) (3/127) via the Controller area network (CAN).

Bi-fuel

When the bi-fuel switch is activated, a signal is transmitted from the climate control module (CCM) to the engine control module (ECM) (4/46) on the Controller area network (CAN) via the central electronic module (CEM). The engine control module (ECM) transmits a signal to the climate control module (CCM) about the type of fuel being used. The climate control module (CCM) uses this signal to light / turn off the LED on the switch.

Valet lock / child-proof lock

When activating the valet lock switch or the child lock switch information is transmitted to the rear electronic module (REM) via the Controller area network (CAN).

STC or DSTC

When the STC or DSTC switch is activated, a signal is transmitted from the climate control module (CCM) to the brake control module (BCM) (previously ABS) (4/16) via the Controller area network (CAN). The brake control module (BCM) transmits a signal to the climate control module (CCM) about whether the STC or DSTC functions are operating. The climate control module (CCM) uses this signal to light / turn off the LED on the switch.

Auxiliary lamps

When the auxiliary lamps switch is activated, information is transmitted from the climate control module (CCM) to the central electronic module (CEM). The central electronic module (CEM) transmits a signal to the climate control module (CCM) about whether the auxiliary lamps are on or not. The climate control module (CCM) uses this information to light / turn off the LED on the switch

Reduced alarm

When activating the reduced alarm switch information is transmitted via the Controller area network (CAN) to

the upper electronic module (UEM) and rear electronic module (REM).

Rear A/C

When activating the switch for rear A/C information is transmitted via the Controller area network (CAN) to the rear electronic module (REM). From this signal and the signal from the engine control module (ECM) indicating whether the engine is running or not, the rear electronic module (REM) will activate/deactivate the relay supply to the rear A/C system. The rear electronic module (REM) transmits a signal indicating whether the rear A/C is on or not to the climate control module (CCM) via the control area network (CAN). The climate control module (CCM) uses this information to light / turn off the LED in the switch.

SYSTEM OVERVIEW

CONTROL MODULE

Fig. 11: Climate Control Module
Courtesy of VOLVO CARS CORPORATION

The climate control module controls the climate control system and the buttons in the dashboard environment panel.

The climate control module is located in the center console. There are three versions of control module (market dependent). These are:

- Electronic Climate Control. This fully automatic climate control system has air conditioning and the option of manual settings
- Manual Climate Control. A manual climate control system with air conditioning
- Standard Heater. A manual climate control system without air conditioning.

The climate control module (for the electronic climate control and manual climate control) obtains the current passenger compartment temperature from a sensor integrated into the control module.

The intensity of the dashboard lighting is regulated based on a signal from the twilight sensor. The twilight sensor is located at the front of the dashboard environment panel under the button for air distribution to the floor.

The climate control module communicates with components which are directly connected and with other control modules and also with components via serial communication and Control area network (CAN).

The control module checks input and output signals and carried out activations via an integrated diagnostic system. A diagnostic trouble code (DTC) is stored if the control module detects an error. In certain cases the control module replaces the faulty signal with a substitute value.

Diagnostic trouble codes (DTC) are stored in the control module memory. This information can be read off using the diagnostic tool via the data link connector (DLC) in the car.

A simple method for checking that the climate control module has a power supply and is grounded is to increase or decrease the blower fan speed. Another method is to activate one of the functions controlled by the buttons on the dashboard environment panel.

SIGNALS

The table below summarizes input and output signals to and from the climate control module. The signal types are divided into directly connected signals, serial communication and Controller area network (CAN) communication. The illustration below displays the same information with the Volvo component designations.

Input signals	Output signals
Directly connected:	**Directly connected:**
Sun sensor (7/12), (ECC)	Blower fan motor (6/28), control signal
Blower fan motor (6/28), diagnostic signal	Damper motors for electronic climate control (6/48, 6/95-96, 6/102-103), control signal
Evaporator temperature sensor (7/41), control signal	Damper motors for manual climate control (6/48, 6/69, 6/95-96), control signal
Air quality sensor (7/159), (ECC, option)	Sun sensor (7/12), (ECC)
Via Controller Area Network (CAN):	**Via Controller Area Network (CAN):**
The central electronic module (CEM) (4/56)	The central electronic module (CEM) (4/56)
The engine control module (ECM) (4/46)	Driver's door module (DDM) (3/126)
Rear electronic module (4/58)	Passenger door module (3/127)
Brake control module (ABS-control module) (4/16)	Brake control module (ABS-control module) (4/16)
Driver's door module (DDM) (3/126)	Rear electronic module (4/58)

CLIMATE CONTROL MODULE (CCM) (2005-2012)

DESIGN

CLIMATE CONTROL UNIT

Fig. 13: Climate Control Unit
Courtesy of VOLVO CARS CORPORATION

The climate control unit consists of the following components:

1. Heater element
2. Damper motor module (DMM), temperature left
3. Blower fan
4. Damper motor module (DMM), fresh air/recirculation
5. Power unit for blower fan motor
6. Particle filter
7. Damper motor module, ventilation and floor (also defroster for MCC)
8. Damper motor module (DMM), temperature right
9. Damper motor module (DMM), defroster (ECC).

Engine coolant constantly flows through the heater element. There is no valve to regulate the flow. The selected temperature is achieved using dampers for the right and left-hand sides of the car installed upstream and downstream of the heater element. These control the amount of air to be warmed. There are also dampers downstream of the heater element that guide the airflow to the correct air vent.

The climate control module provides infinitely variable electronic blower fan control. When AUTO mode (ECC only) is engaged the climate control module (CCM) adapts the blower fan speed to the setting of the controls and the vehicle speed. The blower fan can be set to run-on in order to reduce residual moisture in the evaporator (the function is not available for vehicle's with engine B8444S).

A timer located in the central electronic module (CEM) controls the run-on time. 50 minutes after the engine has been switched off and the ignition has been turned to position 0 or I, the central electronic module (CEM) supplies power to the climate control module (CCM) and the blower fan is activated at full speed for 7 minutes. This run-on dries the evaporator and prevents bad odors.

This function is programmed at the factory, but can be deactivated in the event of customer complaints via programming of customer parameters. Programming is carried out via VIDA (Volvo scan tool).

DAMPER MOTOR MODULE (DMM)

Fig. 14: Damper Motor Module
Courtesy of VOLVO CARS CORPORATION

The damper motor module (DMM) consists of a control unit and a stepper motor. The different versions of the climate control system have up to 5 damper motor modules (DMM). These are for the different functions such as defroster and recirculation. The climate control module (CCM) communicates with the other damper motor modules (DMM) via two LIN buses, LIN bus 1 and LIN bus 2.

When regulating the different dampers, the climate control module (CCM) transmits a request for a new damper position to the each damper motor module (DMM). The damper motor module (DMM) calculates and then regulates the required direction and number of steps required to obtain the requested position. The damper motor module (DMM) then transmits information to the climate control module (CCM) indicating the actual damper position and status.

When replacing the damper motor module (DMM), the new damper motor must be identified by the climate control module (CCM). This is carried out via VIDA (Volvo scan tool). When replacing the damper motors,

ensure that identification is carried out.

Each damper motor module (DMM) is powered via a relay in the central electronic module (CEM).

There are diagnostics for the damper motor module (DMM).

COOLING SYSTEM (NOT B8444S)

Fig. 15: Identifying A/C Compressor
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) controls the A/C compressor. When the air conditioning (A/C) compressor on the dashboard environment panel is activated, a request is transmitted via the control area network (CAN) to the engine control module (ECM) about the activation of the compressor. The engine control module (ECM) determines when the compressor must operate. If any of the following conditions are met the compressor is disconnected:

- high engine coolant temperature (ECT)
- wide open throttle (WOT)
- the engine has just been started
- overpressure in the air conditioning (A/C) system.

When the engine is started the engine control module (ECM) activates the air conditioning compressor for a

short period even if the climate control module (CCM) has not transmitted a request for this. This is carried out for diagnosis. This check is carried out at all temperatures exceeding -6 °C.

The advantage in allowing the engine control module (ECM) to control the air conditioning compressor is that it can delay compressor activation somewhat, if the idling speed must be compensated for the extra load for example.

COOLING SYSTEM (B8444S ONLY)

Fig. 16: Identifying A/C Compressor (B8444S Only)
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) controls the variable A/C compressor. When the A/C switch on the dashboard environment panel is activated, a request is transmitted via the control area network (CAN) to the engine control module (ECM) about the activation of the compressor. The engine control module (ECM) calculates the current to open the valve to control the variable A/C compressor. If any of the following conditions are met, the valve that activates the compressor is not opened:

- high engine coolant temperature (ECT)
- wide open throttle (WOT)
- the engine has just been started
- overpressure in the air conditioning (A/C) system.

When the engine is started the engine control module (ECM) activates the air conditioning compressor for a short period even if the climate control module (CCM) has not transmitted a request for this.

This is carried out for diagnosis and maintenance at all temperatures exceeding 0 °C.

SUN SENSOR (ELECTRONIC CLIMATE CONTROL ONLY)

Fig. 17: Locating Sun Sensor
Courtesy of VOLVO CARS CORPORATION

TWILIGHT SENSOR

Fig. 18: Locating Sun Sensor
Courtesy of VOLVO CARS CORPORATION

EVAPORATOR TEMPERATURE SENSOR

Fig. 19: Identifying Evaporator Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

The evaporator temperature sensor is installed on the heater. Its role is to inform the climate control module (CCM) of the temperature of the refrigerant. The climate control module (CCM) controls the request from the evaporator temperature sensor to activate the air conditioning compressor. The evaporator temperature sensor is directly connected to the climate control module (CCM).

There are diagnostics for the evaporator temperature sensor.

AIR QUALITY SENSOR (AQS) (ECC ONLY, OPTION)

Fig. 20: Air Quality Sensor
Courtesy of VOLVO CARS CORPORATION

The air quality sensor (AQS) is available as an option for ECC. The air quality sensor (AQS) is, together with a particle filter, part of a system which has the role of ensuring that the air in the passenger compartment is free of pollutants. The role of the air quality sensor (AQS) is to transmit a signal to the climate control module (CCM) if it detects increased concentrations of pollutants in the outside air.

The air quality sensor (AQS) measures concentrations of COx and NOx.

The air quality sensor (AQS) compares the present values with previous ones and can calculate changes in pollutant concentrations.

The air quality sensor (AQS) communicates with the climate control module (CCM) via a LIN bus.

The signal from the air quality sensor (AQS) to the climate control module (CCM) has four steps, 0-3:

- off = no increase or reduction in pollutant level
- signal 1 = gradual increase in pollutant level
- signal 2 = medium increase in pollutant level
- signal 3 = rapid increase in pollutant level.

The climate control module (CCM) uses the signal to control the recirculation damper motor.

There are diagnostics for the air quality sensor (AQS).

SEAT HEATERS

Fig. 21: Identifying Left Seat Heating Module (SHM)
Courtesy of VOLVO CARS CORPORATION

The system for the seat heaters consists of three different parts:

- a seat heating module (SHM) which controls the function for communicating with the climate control module (CCM)
- two heater pads
- a temperature sensor.

The seat heating module (SHM) is under the left and right-hand front seat. The heater pads are in the seat and backrest. The temperature sensor is in the seat.

The seat heating module (SHM) is directly connected to the heater pad and temperature sensor. The seat heating module (SHM) communicates with the climate control module (CCM) via a LIN bus.

There are diagnostics for the seat heating module (SHM).

SWITCHES, DASHBOARD ENVIRONMENT PANEL, (LOWER SECTION)

Fig. 22: Dashboard Environment Panel

Courtesy of VOLVO CARS CORPORATION

Across the lower section of the dashboard environment panel there is a 12V socket and space for a maximum of seven switches.

Each switch has its own identity. This is unique for the relevant function. The switches can therefore be positioned in any location on the dashboard environment panel, as long as they are installed in the off position. They do not have to be in any particular order. However, the identity of the installed switches must correspond with the car configuration file so that they can be activated.

There are diagnostics for the switches.

REAR A/C (ONLY XC90 WITH THREE ROWS OF SEATS)

Fig. 23: Identifying Rear A/C
Courtesy of VOLVO CARS CORPORATION

XC90 with three rows of seats is equipped with a rear A/C system. This consists of:

- power unit
- fan
- expansion valve
- blower fan switch.

The rear A/C system is controlled by a switch in the lower section of the dashboard environment panel. When the switch is activated, the climate control unit (CCM) transmits a signal to the rear electronic module (REM) via the controller area network (CAN). The rear electronic module (REM) supplies the power unit and the blower fan switch with voltage via a relay. The blower fan switch sends control voltage to the power unit based on the position of the control. The power unit converts the control voltage to supply voltage for the blower fan motor.

The rear A/C is directly connected to the front air conditioning via the high and low pressure pipes and hoses. The only way to control the cooling in the third row of seats is to control the fan speed using the rear fan switch.

The rear electronic module (REM) diagnoses the relay supply, otherwise the rear A/C cannot be diagnosed.

DIAGNOSTIC FUNCTIONS

CLIMATE CONTROL MODULE (CCM)

The climate control module (CCM) has a built-in diagnostic system which continuously monitors internal functions and input and output signals.

DIAGNOSTIC TROUBLE CODES (DTCS)

Diagnostic trouble codes (DTCs) are stored in the control module if the climate control module (CCM) detects a fault. Each diagnostic trouble code (DTC) has a counter which records the number of operating cycles which have been fault-free since the diagnostic trouble code (DTC) was last stored. A fault which is detected in the present operating cycle is defined as permanent. A fault which is detected in one or more operating cycles (although not the present one) is defined as intermittent.

An operating cycle is the period from when the ignition has been off, then on for at least 10 seconds and finally off for at least 10 seconds.

READING AND ERASING DIAGNOSTIC TROUBLE CODES (DTCS)

Stored diagnostic trouble codes (DTCs) can be read off and erased using this function.

READING OFF INPUT AND OUTPUT SIGNALS

Using this function, the status or value of parameters can be read off. The presentation of the status or value can be graphic or digital.

For further information about the different parameters, see: **DESCRIPTION OF PARAMETERS**

READING OFF EXTENDED FAULT-TRACING INFORMATION

This function can be used to read parameters, status identifiers and counters stored at the same time as a diagnostic trouble code (DTC). These are called frozen values.

For further information, see: **DESCRIPTION OF FROZEN VALUES**

PROGRAMMING THE CLIMATE CONTROL MODULE (CCM), CUSTOMER ADAPTATION

Certain parameters for the climate control module (CCM) can be read off and programmed using this function. The purpose of this programming is to:

- read the programmed parameters before replacing the control module. This is so the same parameters can be entered into the new control module
- adapt the function of the control module to the requirements of the driver (customer adaptation)
- adapt the function of the control module for the equipment levels of the vehicle (passenger compartment ventilation filter, parking heater).

Blower fan run-on, status

Provides the status for activation of the blower fan run-on. The run-on dries the evaporator and prevents bad odors which may otherwise result from residual moisture in the system.

OFF = Run-on inactive

ON = Run-on active (preset)

Air distribution floor/defroster when residual heater is active (NOTE Accessory)

Parameter programming controls the desired setting of air distribution between the floor and defroster when the residual heater is active.

The function means that the coolant can circulate for around 20 minutes after the engine has been switched off. In this way, the passenger compartment can be heated for up to 20 minutes without the engine having to be running. The function is started via the control stalk.

The function can be activated for a further 20 minutes, however, the temperature of the coolant will have cooled considerably and the residual heat will therefore be lower.

Possible settings (70/30% preset):

- 90/10 (90% floor, 10% defroster)
- 80/20 (80% floor, 20% defroster)
- 70/30 (70% floor, 30% defroster)
- 60/40 (60% floor, 40% defroster)
- 50/50 (50% floor, 50% defroster)
- 30/70 (30% floor, 70% defroster)
- 10/90 (10% floor, 90% defroster).

Programming the seat temperature

Enter the setting for the high and low temperature levels for heating the front seat.

IDENTIFYING THE DAMPER MOTORS

This function is used to identify the damper motor module (DMM) after a replacement. When replacing the damper motor module (DMM), the new unit will have a general identity on the LIN bus. The damper motor module (DMM) must then be run to its limit positions. The number of steps the motor can be run between the limit positions is unique for each damper. This determines the functionality of the new damper motor module (DMM) for the climate control module (CCM).

CALIBRATION OF CLIMATE CONTROL MODULE (CCM)

This function is used to check the components communicating with the climate control module (CCM) via LIN bus 1 and LIN bus 2. A diagnostic trouble code (DTC) between CCM-0070 and CCM-0072 will be stored, depending on the fault, if there is a fault in one of the LIN buses. These diagnostic trouble codes (DTCs) can

only be stored for this diagnostic function.

DOWNLOADING SOFTWARE AND REPLACING THE CONTROL MODULE

New software can be downloaded into the climate control module (CCM). When ordering software, the hardware and the software in the car is compared to the information in the Volvo central database. If the comparison is OK the software is downloaded to the control module.

If the comparison between the car and Volvo central database is not OK, the database is updated with the car configuration. When this is complete the software is downloaded.

The entire climate control module (CCM) must be replaced as one unit.

Different customer parameters can be programmed into the climate control module (CCM). These customer parameters are stored in the control module but not in the Volvo central database. This means that the customer parameters must be reprogrammed when hardware is replaced.

For further information about programmable customer parameters, see: **DIAGNOSTIC FUNCTIONS**

FUNCTION

CONTROLLING THE CLIMATE IN THE PASSENGER COMPARTMENT

Fig. 24: Identifying Climate Control System & Components
Courtesy of VOLVO CARS CORPORATION

The way in which the climate in the passenger compartment is regulated depends on the type of climate control module (CCM) in the car.

Electronic climate control (ECC)

Electronic climate control means that either manual settings or the AUTO function can be used. In the latter case the control module automatically regulates heat, air conditioning, recirculation and air distribution until the selected temperature is achieved.

Manual climate control (MCC)

Manual climate control means that heat, air conditioning, recirculation and air distribution must be selected manually.

Climate control module (CCM) (3/112) regulates the following:

- Activation of the air conditioning (A/C) compressor (8/3) using a request via the controller area network (CAN) to the engine control module (ECM) (4/46)
- Controlling the damper motors. For ECC (6/48), (6/95), (6/96), (6/102) and (6/103). For MCC (6/48), (6/69), (6/95) and (6/96)
- Blower fan speed (6/28).

The climate control module (CCM) regulates the climate in the passenger compartment based on the following input signals:

- The passenger compartment temperature, signal from the internal passenger compartment temperature sensor
- Outside temperature, signal from the outside temperature sensor (7/11) via the passenger door module (PDM) (3/127) on the controller area network (CAN)
- The evaporator temperature, signal from the evaporator temperature sensor (7/41)
- Sun roof status. Signal from the sun roof control module (4/33) via the upper electronic module (UEM) (4/70) over the controller area network (CAN)
- Status of the side window, signals from the driver door module (DDM) (3/126) and passenger door module (PDM) (3/127) via the controller area network (CAN)
- Status of the doors, signal from the central electronic module (CEM) via the controller area network (CAN)
- Sun intensity, signal from the sun sensor (7/12) via the central electronic module (CEM)
- Speed, signal from the brake control module (BCM) (4/16) via the controller area network (CAN)
- Status of the windshield wipers, signal from the steering wheel module (SWM) (3/254) via the controller area network (CAN).

The climate control module (CCM) (for ECC) uses information about the status of the sun roof, side windows and doors to determine how it should compensate for changes in the passenger compartment temperature. If any side windows, doors or the sun roof are opened, the climate control module (CCM) will not compensate for a change in the passenger compartment temperature. Instead it maintains the same level of climate control for the compressor and blower fan as before.

The climate control module (CCM) (for ECC) uses the signal from the steering wheel module (SWM) indicating that the windshield wipers are on. This is to regulate the blower fan and the damper motor to remove any mist from the inside of the windshield when it rains.

The climate control module (CCM) (for ECC) uses the signal from the sun sensor to compensate for high sun intensity. This is done by lowering the temperature of the ventilation air, altering air distribution and increasing the speed of the blower fan.

The climate control module (CCM) uses the signal from the evaporator temperature sensor to control a request for:

- activation of the A/C compressor (not B8444S)
- control of the A/C compressor (B8444S only)

If the signal from the evaporator temperature sensor displays an evaporator temperature of below 4.5 °C, the compressor is not permitted to run due to the risk of ice formation.

To maintain a constant flow of air in the passenger compartment, the climate control module (CCM) (for ECC) uses the speed signal from the brake control module (BCM) to regulate the speed of the blower fan. Generally, as the speed of the car increases the speed of the blower fan decreases.

At higher speeds the flow of air into the fresh air damper is adjusted.

REGULATING SEAT HEAT

Fig. 25: Identifying Seat Heat Regulation System & Components
Courtesy of VOLVO CARS CORPORATION

The seat heaters are activated using the switches on the climate control module (CCM) (3/112). The function is normally switched off. When activating the seat heaters, the first position is high temperature. If the button is pressed again, the temperature will be low. The status of the indication is displayed via LEDs. The climate control module (CCM) transmits information about the selected temperature to the relevant seat heating module (SHM) on the relevant LIN bus. The seat heating module (SHM) then controls the current to the heater pads.

Each seat heating module (SHM) then transmits its present status to the climate control module (CCM).

Communication between the climate control module (CCM) and each seat heating module (SHM) takes place in the following way:

- seat heating module (SHM), driver's side (9/12) on LIN bus 1
- seat heating module (SHM), passenger side (9/13) on LIN bus 2.

The climate control module (CCM) receives information from the central electronic module (CEM) (4/56) about the type of seat and upholstery via the controller area network (CAN). The levels for high and low temperature are adapted for the relevant seat and upholstery by the climate control module (CCM). To a certain extent, the levels for high and low temperature can be adapted to the wishes of the customer using VIDA (Volvo scan tool).

RECIRCULATION CONTROL (ELECTRONIC CLIMATE CONTROL ONLY)

Fig. 26: Identifying Air Recirculation Control System & Components
Courtesy of VOLVO CARS CORPORATION

For ECC, the climate control module (CCM) (3/112) controls the recirculation during the following conditions:

- the recirculation switch is on (the LED lights orange)
- the system is in AUTO mode and there is a large difference between the desired and current temperature
- the car is equipped with an air quality sensor (AQS), and the recirculation switch is on (the LED lights green).

The air quality sensor (AQS) (7/159) transmits a signal to the climate control module (CCM) if it detects raised concentrations of pollutants in the outside air. When this occurs, the climate control module (CCM) transmits a signal to the damper motor for recirculation (6/48) to close the fresh air damper and to use recirculated air.

The degree of recirculation is controlled by the signal from the air quality sensor (AQS):

- signal 1 provides partial recirculation for speeds below 85 km/h, no recirculation for speeds exceeding 85 km/h
- signals 2 and 3 provide 100% recirculation.

If the high level of pollutants remains, the system stays in recirculation for a certain time, maximum of 10 minutes. The time that the system is recirculating is determined by the outside temperature, whether the air conditioning (A/C) is on or if the windshield wipers are activated. The system returns to fresh air for a short

time before recirculation is resumed. The particle filter absorbs most of the pollutants entering the passenger compartment during this time. The maximum time prevents misting and musty air.

The air quality sensor (AQS) transmits information about the content of pollutants to the climate control module (CCM). This information is graded into four levels, and the information used for diagnosis.

Recirculation is never permitted if the defroster is selected. The climate control module (CCM) also requests compressor activation when the evaporator temperature exceeds 3 °C.

HEATED REAR WINDSHIELD AND DOOR MIRRORS

Fig. 27: Identifying Heated Rear Windshield & Door Mirror System Components
Courtesy of VOLVO CARS CORPORATION

The heated rear windshield and door mirrors are activated by pressing the switch on the climate control module (CCM) (3/112). The climate control module (CCM) transmits information via the controller area network (CAN) indicating the status of the electrical heating to the following:

- rear electronic module (REM) (4/58)
- driver door module (DDM) (3/126)
- passenger door module (PDM) (3/127).

SWITCH FUNCTIONS, DASHBOARD ENVIRONMENT PANEL, (LOWER SECTION)

The following functions can be activated using the switches on the dashboard environment panel:

- Folding head restraint, rear seat (S60/S80)
- Folding door mirrors (market dependent)
- Bi-fuel, on / off (market dependent)
- Valet lock, on/off
- Child-proof lock, on/off (market dependent)
- Rear air conditioning (A/C) (XC90, option)
- STC, off / on (option)
- DSTC, off / on (option)
- BLIS, off / on (option)
- Auxiliary lamps, off / on (option)
- Parking assistance (option)
- Reduced alarm, on / off (option)
- Four-C (Continuously Controlled Chassis Concept), (option).

In order for certain functions to be activated the engine must be switched on and/or the master key must be in position II.

Folding head restraints, rear seat

When the switch for the folding head restraints is activated, information is transmitted by the climate control module (CCM) (3/112) to the rear electrical module (4/58) via the control area network (CAN).

Folding door mirrors

When the switch for the folding door mirrors is activated, information is transmitted by the climate control module (CCM) to the driver door module (3/126) and the passenger door module (PDM) (3/127) via the control area network (CAN).

Bi-fuel

When the bi-fuel switch is activated, a signal is transmitted from the climate control module (CCM) to the engine control module (ECM) (4/46) on the control area network (CAN) via the central electronic module (CEM) (4/56). The engine control module (ECM) transmits a signal to the climate control module (CCM) about the type of fuel being used. The climate control module (CCM) uses this information to light and turn off the LED in the switch.

Valet lock / child-proof lock

When activating the valet lock switch or the child lock switch information is transmitted to the rear electronic module (REM) via the control area network (CAN).

Rear A/C

When activating the switch for rear A/C information is transmitted via the Controller area network (CAN) to the rear electronic module (REM). From this signal and the signal from the engine control module (ECM) indicating whether the engine is running or not, the rear electronic module (REM) will activate/deactivate the relay supply to the rear A/C system. The rear electronic module (REM) transmits a signal indicating whether the rear A/C is on or not to the climate control module (CCM) via the control area network (CAN). The climate control module (CCM) uses this information to light and turn off the LED in the switch.

STC or DSTC (applies to model year -2006)

When the STC or DSTC switch is activated, a signal is transmitted from the climate control module (CCM) to the brake control module (BCM) (4/16) via the controller area network (CAN). The brake control module (BCM) then transmits a signal to the climate control module (CCM) indicating that the STC or DSTC function is on or off. The climate control module (CCM) uses this information to light and turn off the LED in the switch.

BLIS (applies to model year 2007-)

When activating the switch for Blind Spot Information System, the information is transmitted via the CAN network to the Driver door module (DDM) / Passenger door module (PDM). The Driver door module (DDM) / Passenger door module (PDM) transmit the signal to the Climate control module (CCM) about whether the BLIS function is on or off.

The Climate control module (CCM) uses the signal to switch the LED on or off the switch

Auxiliary lamps

When the auxiliary lamps switch is activated, information is transmitted from the climate control module (CCM) to the central electronic module (CEM). The central electronic module (CEM) transmits a signal to the climate control module (CCM) about whether the auxiliary lamps are on or not. The climate control module (CCM) uses this information to light and turn off the LED in the switch.

Back-up warning

When activating the switch for parking assistance, information is transmitted via the Controller area network (CAN) to the rear electronic module (REM).

Reduced alarm

When activating the switch for reduced alarm, information is transmitted via the Controller area network (CAN) to the rear electronic module (REM).

Four-C (Continuously Controlled Chassis Concept)

When activating the switch for Four-C, information is transmitted via the Controller area network (CAN) to the suspension module (SUM).

SYSTEM OVERVIEW

CONTROL MODULE

Fig. 28: Identifying Climate Control Module (CCM)
Courtesy of VOLVO CARS CORPORATION

The climate control module (CCM) controls the climate control system and the buttons in the dashboard environment panel.

The climate control module (CCM) is located in the center console. There are two versions of control module (market dependent). These are:

- Electronic climate control (ECC)
- Manual climate control (MCC).

ECC is a fully automatic climate control system with air conditioning. It also allows manual settings.

MCC is a manual climate control system with air conditioning.

The climate control module (CCM) communicates with components which are directly connected and also with other control modules and components via LIN and CAN communication.

The climate control module (CCM) communicates with the damper motors, air quality sensor (AQS) and the seat heaters via two separate LIN buses. The number of components on the LIN buses varies, depending on the equipment level of the car (ECC/MCC and any accessories).

The following components communicate on LIN bus 1:

- the damper motor module (DMM) for air distribution
- the damper motor module (DMM) for temperature left
- the left-hand seat heater.

The following components communicate on LIN bus 2:

- the damper motor module (DMM) for the defroster (ECC only)

- the damper motor module (DMM) for temperature right
- the damper motor module (DMM) for recirculation
- the air quality sensor (AQS)
- the right-hand seat heater.

The control module checks input and output signals and carries out activations via an integrated diagnostic system. A diagnostic trouble code (DTC) is stored if the control module detects an error. In certain cases the control module replaces the faulty signal with a substitute value.

Any diagnostic trouble codes (DTCs) are stored in the control module memory. This information can be read off using VIDA via the data link connector (DLC) in the vehicle.

A simple method for checking that the climate control module (CCM) has a power supply and is grounded is to increase or decrease the blower fan speed. Another method is to activate one of the functions controlled by the buttons on the dashboard environment panel.

SIGNALS

The table below summarizes the input signals to and output signals from the climate control module (CCM). The signal types are divided into directly connected signals, LIN and CAN communication. The illustration below displays the same information with the Volvo component designations.

Input signals	Output signals
Directly connected: • Blower fan motor (6/28), diagnostic signal • Evaporator temperature sensor (7/41), control signal.	**Directly connected:** • Blower fan motor (6/28), control signal.
Via LIN communication: • Damper motor module (DMM) for ECC (6/48, 6/95-96, 6/102-103) • Damper motor module (DMM) for MCC (6/48, 6/69, 6/95-96) • Air quality sensor (AQS) (7/159) • Seat heating module (SHM), passenger side (9/13) • Seat heating module (SHM), driver's side (9/12).	**Via LIN communication:** • Damper motor module (DMM) for ECC (6/48, 6/95-96, 6/102-103) • Damper motor module (DMM) for MCC (6/48, 6/69, 6/95-96) • Air quality sensor (AQS) (7/159) • Seat heating module (SHM), passenger side (9/13) • Seat heating module (SHM), driver's side (9/12).

COMBUSTION PREHEATER MODULE (CPM) (2005-2012)

INFORMATION

GENERAL

Combustion preheater module (CPM) is not a CAN-node, it is a slave node for Central electronic module (CEM), that communicates via serial communication (LIN).

CONTROL MODULE FOR THE STEERING WHEEL ANGLE SENSOR (2003-2004)

DESIGN

CONTROL MODULE FOR THE STEERING WHEEL ANGLE SENSOR

Fig. 30: Control Module For Steering Wheel Angle Sensor
Courtesy of VOLVO CARS CORPORATION

After initiation, with the ignition key in position II and when the steering wheel is turned 4.5 degrees in any

direction, the control module for the steering wheel angle sensor continuously transmits information about the steering wheel angle position to the brake control unit to calculate the driving style of the driver. The brake control module was called ABS-control module up to and including model year 2001.

Communication between the Steering wheel angle sensor control module and the brake control module occurs on the high speed side of the Controller area network (CAN). The control module for the steering wheel angle sensor is positioned on a bracket inside the central electronic module.

The control module for the steering wheel angle sensor is supplied with power from the overload relay.

STEERING WHEEL ANGLE SENSOR

Fig. 31: Identifying Steering Wheel Angle Sensor
Courtesy of VOLVO CARS CORPORATION

The steering wheel angle sensor is incorporated with the SRS contact reel, which in turn is installed on the steering wheel module. The steering wheel angle sensor is equipped with a disc with two code paths. Two circuits with light diodes read off a code path each. One circuit measures the steering angle up to 360 degrees and the other records how many complete turns the steering wheel has turned. Both circuits measure within +/- 700 degrees with a precision of 4.5 degrees. This information is transmitted to the control module for the Steering wheel angle sensor as digital signals.

Due to the reliance of the DSTC (Dynamic stability and traction control) on information from the steering angle sensor it is extremely important that the contact reel has been centered correctly and that only an original Volvo

steering wheel is used.

SRS

SAS DIAGNOSTIC FUNCTIONS

Fig. 32: Control Module For Steering Wheel Angle Sensor
Courtesy of VOLVO CARS CORPORATION

General

The control unit has built-in diagnostics, Volvo Diagnostics, which continually monitor the unit and the input and output signals.

Diagnostic trouble codes

If the control unit detects a fault, it stores a diagnostic trouble code. If, for any reason, a fault disappears after the diagnostic trouble code has been permanently stored in the control unit, information about the trouble code still remains in the control unit.

Reading and erasing diagnostic trouble codes

Stored diagnostic trouble codes can be read from the control unit using this facility.

Diagnostic trouble codes may be erased but only after they have been read at least once.

Reading input and output signals

Status of control unit input and output signals can be continually read using this facility.

For more information about parameters, see **DESCRIPTION OF PARAMETERS (STEERING ANGLE SENSOR)**.

Reading the control unit identity

VIDA identifies control units by reading the number of codes from the control unit memory. The codes contain information on the control unit as follows:

- hardware component number (control units without software)
- software component number (control units without software)
- software component number
- diagnostic software component number

DESCRIPTION OF PARAMETERS (STEERING ANGLE SENSOR)

INTRODUCTION / STATUS

INTRODUCTION

The steering angle sensor is integrated with the contact roller for the SRS-system and is installed on the steering wheel lever module. The function of the sensor is to sense the driver's steering wheel movements. The steering angle sensor consists of a steel disc with two hole-patterned grooves illuminated by several installed pairs of light-emitting diodes and phototransistors. The disc is mounted so that it follows the steering column's movements and then the phototransistors can sense the disc's movement. One pair of light-emitting diodes (IY, IX) reads an index groove with a unique groove pattern. The other pair (A, B) reads a groove with a repeated pattern around the disc (dark, light, dark, light, etc. The grooves' resolution is 1.5 degrees. Since the steering wheel can be turned several revolutions an additional two groups of light-emitting diodes must be used (R1, R2, R3, R4) to read off which steering wheel revolution one is at (normal <3). During the movement the SAS control module (Steering Angle Sensor) processes all information about the steering wheel's absolute position. In connection with start of the vehicle one has to turn the steering wheel a small angle, approx. 5 degrees in any direction to enable the control module to determine the steering wheel's position. This means that the wheel's angle and direction can be determined in relation to the driving direction. The information is used in the DSTC-system (together with other information about the vehicle's driving situation) to decide if the vehicle is driven stable and safe or is in a skid situation.

STEERING WHEEL ANGLE

The value displays the steering wheel angle in degrees.

0° = Steering wheel in the straight forward position

1° to 720° = Angle of the steering wheel when turning to the left

-1° to -720° = Angle of the steering wheel when turning to the right

LED IY STATUS

The value displays the status of LED IY.

ON = LED IY active

OFF = LED IY not active

LED IX STATUS

The value displays the IX status.

ON = LED IX active

OFF = LED IX not active

LED A STATUS

The value displays the A status.

ON = LED A active

OFF = LED A not active

LED B STATUS

The value displays the B status.

ON = LED B active

OFF = LED B not active

LED R1 STATUS

The value displays the R1 status.

ON = LED R1 active

OFF = LED R1 not active

LED R2 STATUS

The value displays the R2 status.

ON = LED R2 active

OFF = LED R2 not active

LED R3 STATUS

The value displays the R3 status.

ON = LED R3 active

OFF = LED R3 not active

LED R4 STATUS

The value displays the R4 status.

ON = LED R4 active

OFF = LED R4 not active

POWER SUPPLY, STEERING WHEEL ANGLE SENSOR MODULE (SAS)

The value indicates battery voltage at the steering wheel angle sensor module (SAS).

Measurement range: 5 to 15 V

POWER SUPPLY, CENTRAL ELECTRONIC MODULE (CEM)

The value indicates battery voltage at the Central electronic module (CEM).

Measurement range: 5 to 15 V

LED CIRCUIT 1 STATUS

The value displays the status of LED circuit 1

ON = LED circuit 1 is active

OFF = LED circuit 1 is not activate

LED CIRCUIT 2 STATUS

The value displays the status of LED circuit 1

ON = LED circuit 2 is active

OFF = LED circuit 2 is not activate

SIGNAL VOLTAGE, SIGNAL A

The value indicates the signal voltage for signal A.

Measurement range: 0 to 16 V

SIGNAL VOLTAGE, SIGNAL B

The value indicates the signal voltage for signal B.

Measurement range: 0 to 16 V

LED CIRCUIT 1 CURRENT

The value displays the current through LED circuit 1.

Measurement range: 0 to 50 mA

LED CIRCUIT 2 CURRENT

The value displays the current through LED circuit 2.

Measurement range: 0 to 50 mA

SOFTWARE DOWNLOADING

New software can be downloaded into the control module for the Steering wheel angle sensor. When ordering software, the hardware and the software in the car is compared to the Volvo central database. If the comparison is OK the software is downloaded to the control module. If the comparison between the car and Volvo central database is not OK, the database is updated with the car configuration. When this is complete the software is downloaded.

SYSTEM OVERVIEW

CONTROL MODULE

Fig. 33: Control Module For Steering Wheel Angle Sensor
Courtesy of VOLVO CARS CORPORATION

1. Control module for the steering wheel angle sensor
2. Steering wheel angle sensor
3. Reference groove
4. Encoder for steering movements.

Only cars equipped with DSTC (dynamic stability and traction control) have a steering wheel angle sensor control module. The easiest way to determine if a car is equipped with DSTC (Dynamic stability and traction control) is to search for a switch, marked DSTC, positioned in the panel on the climate control module.

The Steering wheel Angle Sensor Module is positioned on the side of the central electronic module. The only function of the steering wheel angle sensor is to process the signals from the steering wheel angle sensor. The signals used by the DSTC system. The steering wheel angle sensor is mounted on the steering wheel module and is directly connected to the steering angle sensor via a connector on the steering wheel module. The Steering wheel angle sensor control module transmits signal information via the high-speed side of the Controller area network (CAN) to the brake control module, model year 2002-or the ABS control module, model year 1999-2001.

If a fault occurs the control module for the steering angle sensor detects this and a diagnostic trouble code (DTC) is stored at the same time as the DSTC function is switched off.

Diagnostic trouble codes (DTCs) stored in the control module for the steering wheel angle sensor. This information can be read off using the diagnostic tool via the data link connector (DLC) in the car.

SIGNALS FOR THE CONTROL MODULE FOR THE STEERING WHEEL ANGLE SENSOR

The table below summarizes input and output signals to and from the Steering wheel angle sensor control module. The signal types are divided into directly connected signals, serial communication and Controller area

network (CAN) communication.

Input signals	Output signals
Via Controller Area Network (CAN): -	**Via Controller Area Network (CAN):** **The brake control module (or ABS-control module)** (4/16). Transmits relevant information about the steering wheel angle from the straight ahead position, the speed of the steering wheel movements and about which direction the steering wheel is turned.
Directly connected: **The steering wheel angle sensor** (7/91). Provides the control module with relevant information about the steering wheel angle from the straight ahead position, the speed of the steering wheel movements and about which direction the steering wheel is turned.	**Directly connected:** -

DIAGNOSIS (2003-2012)

BACKGROUND

GENERAL

Factors that have improved safety, increased comfort, added functions and increased environmental friendliness, have made modern vehicles more and more complicated.

The more complicated the vehicle is, the more important is the diagnostics system in the vehicle with the diagnostics tool when it comes to ensuring fast, safe and economic test, service and repair.

To reduce emissions from the vehicle, the diagnostic systems shall also, according to legislation, detect emission-influencing problems as well as defects that may cause follow-up damage on emission-related components.

LEGAL REQUIREMENTS EMISSIONS

OBD I - On Board Diagnostic I

On Board Diagnostic I (diagnostic system in the vehicle) was 1988 a requirement from CARB (California Air Resource Board) which is an air quality board. The purpose of these regulations was to ensure that component or function defects that affected exhaust emissions are detected by the control module's diagnostic functions.

OBD I included diagnosis of control module, emission-related components connected to the control module as well as exhaust gas recirculation.

Using the diagnostic socket in the engine compartment, the information about the system was accessible to all, both brand-name workshops and independent workshops.

In case of a detected emission-related problem, a warning light is activated in the driver information module (MIL= Malfunction Indicator Light), when the problem is confirmed as a real malfunction. Thus, the light is not activated immediately upon detection, only first when the malfunction is confirmed, which may be, e. g., following a few driving cycles.

OBD II - On Board Diagnostic II

Fig. 34: Locating OBD II - On Board Diagnostic II
Courtesy of VOLVO CARS CORPORATION

On Board Diagnostic II was another requirement from CARB that applied from 1996. CARB demanded additional and refined diagnosis for emission-related component and systems in the drivetrain (engine and transmission).

Also, a standardized communication method was required for reading out of diagnosis (Standard SAE J1979 and J2190, where J2190 is voluntary and includes Enhanced Diagnostics - the vehicle manufacturer's own diagnosis in addition to legal requirements).

It should be possible to read out diagnostic trouble codes and their format, information connected to diagnostic trouble codes as well as parameters*, according to this standard. OBD II's diagnostic trouble codes are five-digit and begin with the letter P followed by four digits.

This standardized communication method means that anyone shall be able to manufacture and sell an instrument for reading out, a so-called Generic Scan Tool. Thus, the vehicle owner is not dependent on using a brand-name workshop.

The standard OBD II requires a standardized diagnostic socket in the passenger compartment near the driver's seat, where this instrument is to be plugged in. This means that the diagnostic socket (connector) is the same on all vehicles regardless of manufacturer or model.

However, there is a difference between manufacturers regarding which pins are used in the connector. This depends on the OBD II standard supports four types of communication protocols.

A protocol may be said to be the "language" that is to be used for communication with the control module.

Fig. 35: Identifying Standardized Pins On OBD II-Connector
Courtesy of VOLVO CARS CORPORATION

Standardized pins on OBD II-connector:

- Pin 2 SAE J-1850 bus +
- Pin 4 Chassis ground
- Pin 5 Signal ground
- Pin 6 SAE J-2284, CAN-bus (CAN-H)
- Pin 7 SAE J1979, ISO 9141-2 / ISO14230-4, K-line
- Pin 10 SAE J-1850 bus -
- Pin 14 SAE J.2284, CAN-bus (CAN-L)
- Pin 15 ISO 9141-2 / ISO14230-4, L-line
- Pin 16 Voltage feed

Other pins in the connector are permitted for the vehicle manufacturer's own specific use. On pin 7 (K-line), two-way communication is permitted, on pin 15 (L-line) only one-way communication is permitted to the control module. Therefore, the L-line is missing in many vehicles.

ISO14230-4 = Protocol KWP2000.

OBD II was first introduced for Volvo on engine management system Motronic 4.3, Motronic 4.4, and automatic transmission AW 50 42, AW 30 40/43 in model 850/960 for market USA/CDN.

With time, OBD II-communication with control modules via CAN is introduced.

The legal requirement also includes the function Readiness Monitoring.

* Parameter refers to, e. g., rpm, engine temperature, battery voltage, etc., with associated value 800 rpm, 87 °C as well as 14, 2 V, etc.

DIAGNOSTIC VERSIONS AND COMMUNICATION METHODS

GENERAL

Since the end of the 1980s, the control module's diagnosis has developed from detecting simple problems and storing a small amount of information to including more complicated tests and checks.

Today a large amount of information can be read out both about the detected problem as well as parameters from the control module's input and output signals.

VOLVO DIAGNOSTICS II - FIRST VERSION

Fig. 36: Locating OBD II - On Board Diagnostic II
Courtesy of VOLVO CARS CORPORATION

Volvo Diagnostics II - first version was a new Volvo standard introduced in *1996* . This meant that control modules communicated serially in the same way, and that diagnostic functions in the different systems were designed in a similar manner.

The communication cable in the vehicle used for this communication is common to all control modules in question. The control modules are connected to the same connection in the diagnostic socket (pin 7).

The diagnostic socket is located in the passenger compartment and for certain markets it is common with the diagnostics system OBD II.

Volvo Diagnostics II, first version, was introduced in 1996 on, among others:

- Engine management system Motronic 4.4
- Automatic transmission AW 50 42/AW 30 40/43
- Control module Airbag SRS6.2
- Immobilizer

- Control module Brakes ABS 850
- Combined instrument panel 850
- Power seat 850/960
- and was gradually introduced for additional systems and car models.

For certain models, the diagnostics tool for this diagnosis is still Volvo System Tester (car models from and incl. model year 1998 as well as certain systems for model year 1999).

The diagnostics tool VIDA, now replacing VADIS, is used for car models of model year 1999 and later.

VOLVO DIAGNOSTICS II - SECOND VERSION

Fig. 37: Communication Via CAN-Communication
Courtesy of VOLVO CARS CORPORATION

Volvo Diagnostics II - second version was introduced in *1999* and is a development of the first version. The major difference is that communication between the diagnostics tool and the control modules takes place via CAN-communication instead of on a communication cable.

The control modules also communicate with each other to exchange information on the CAN-net instead of via separate cables between the control modules.

This version introduced the possibility to download software to the control modules.

With the introduction of this version, the rate in the low-speed network was (LS CAN) 125 kbit/s and the rate in the low-speed network was (HS CAN) 250 kbit/s. Depending on model and model year, the speed of the network has increased with time.

The diagnostics tool VIDA, now replacing VADIS, is used for car models of model year 1999 and later.

GENERIC GLOBAL DIAGNOSTICS (GGD)

Fig. 38: Engine Block
Courtesy of VOLVO CARS CORPORATION

Generic Global Diagnostics (GGD) is a mutually developed diagnostics concept within the Ford company.

Communication and services are similar to Volvo Diagnostics II - first version. Communication between the diagnostics tool and control modules takes place via CAN-communication. The services that can be performed are similar.

Designation of trouble codes adheres to standard ISO/DIS 15031-6.4 and consist of a letter and six characters.

The control modules also communicate on the CAN-net with each other to exchange information.

It is also possible to download other software to the control modules.

Volvo Diagnostics, fifth version, was introduced in model XC90 model year *2005* with engine B8444S (only high-speed network) and then in model S80 (07-).

The diagnostics tool VIDA, now replacing VADIS, is used for car models of model year 2005 and later.

DIAGNOSTICS AND SERVICES

GENERAL

Fig. 39: Control Module And Diagnostics Tool
Courtesy of VOLVO CARS CORPORATION

The control module's diagnostics can perform and present the following using a connected diagnostics tool:

- Store malfunction indicator (diagnostic trouble codes) and in certain cases activate warning light or show text message.
  - Counter that indicates how frequent the malfunction is
  - Status indicators for the diagnostic trouble code test.
  - Frozen values that were generated when malfunction was detected for the first time.
- Store information about the nature of the malfunction:
  - Counter that indicates how frequent the malfunction is
  - Status indicators for the diagnostic trouble code test.
  - Frozen values that were generated when malfunction was detected for the first time.
- Erase information about malfunction and its information.
- Present values (parameters) for different connected input signals and output signals from, e. g., components as well as other calculated values.
- Present part number, version number, component number, etc. for both software and hardware.
- Present and change certain special customer settings and configurations.
- Trigger/control (activate) the connected output signals.
- Start special built-in check programs/tester such as, e. g., calibrations of gear position sensor, quick-test of tank system.
- Access check to limit access to certain parameters and functions. Accessible first after unlocking with, e. g., PIN-code.

Exactly what each control module's diagnostics can perform depends both on model year and system.

DIAGNOSTIC TROUBLE CODES (MALFUNCTION INDICATOR)

- see **IDENTIFYING MALFUNCTION**
- see **CONDITIONS FOR DIAGNOSIS TO FIND A MALFUNCTION**

- see **DRIVING CYCLE/OPERATION CYCLE**
- see **EMERGENCY MODE, BACK-UP MODE "LIMP-HOME"**
- see **CLASSIFICATION OF DIAGNOSTIC TROUBLE CODES**
- see **DESIGNATION OF TROUBLE CODES**
- see **STATUS IDENTIFIER**
- see **COUNTER**
- see **FROZEN VALUES**
- see **ERASING DIAGNOSTIC TROUBLE CODES**
- see **READINESS MONITOR (CERTAIN MARKETS ONLY)**

PARAMETERS

Parameters or values are data that are read out from the control module's memory positions to, e. g., check the signal from a sensor or identify the control module's software version.

In principle, parameters can be divided into two parts:

- one for **dynamic values** continuously updated in the control module
- one for **static values** not changed by the control module and always stored.

Parameters, dynamic

Fig. 40: Dynamic Parameters
Courtesy of VOLVO CARS CORPORATION

The *dynamic values* are stored in the control module's RAM-memory, which means that the values disappear when the memory's power supply is turned off (control module is turned off). As soon as the control module's power is turned on (ignition on), values are stored again.

Example of values are:

- Outside temperature
- Engine speed

- Load
- Coolant temperature
- Vehicle speed
- Battery voltage

Values are updated continuously after a pre-determined time interval. This means that certain values are updated with very short time interval, while other values are updated more seldom. Update rate is determined by how important the value is to the control module.

By reading off the value from, e. g., a sensor or switch, it can be decided if the signal is correct or not.

NOTE: **When a malfunction is detected and a diagnostic trouble code is stored, it may well be that the displayed value is a replacement value and not the real value. If the value does not change, e. g., if the sensor is disconnected, it may be the replacement value that is shown.**

Parameters, static

Fig. 41: Identifying Static Parameters
Courtesy of VOLVO CARS CORPORATION

The *static values* are stored in the control module's EEPROM, which means that these values are always stored regardless of if the control module is on or off. These values are normally not updated by the control module, instead they are only changed using, e. g., the diagnostics tool at vehicle manufacture in the factory or reprogramming during a workshop visit.

Example of values are:

- Hardware P/N (control module without software).
- Hardware serial number (control module without software).
- Software P/N.
- Diagnostic software P/N.
- Customer-programmed values, e. g., passenger compartment temperature, alarm on and off.

- The vehicle's configuration, that is, the vehicle's content and equipment that can be used to compare the vehicle's equipment physically with how the vehicle is configured. The configuration may be affected/changed, e. g., when downloading software.

ACTIVATIONS

Fig. 42: Control Module Activation Of Components
Courtesy of VOLVO CARS CORPORATION

Wit this service it is possible to trigger (activate) the components that are connected to the control module. Examples of components are:

- Relays
- Solenoids
- Lock motors
- Damper motors
- Signals to other control modules.

NOTE: If a malfunction is detected, diagnostic trouble code is stored and emergency functions or modes, etc. are activated to "protect" the system, the control module can prevent activation.

Depending on the system, the control module or diagnostics tool can perform activations in different ways, for some the component is activated according to a certain pattern, e. g., OFF, ON, OFF, ON, OF, ON, etc. in a sequence.

For other systems, the component is activated, e. g., ON, and remain on until the activation is stopped.

QUICK-TESTS, CALIBRATIONS

Quick-tests or calibrations are functions or checks that are integrated in the control module's software and are started by the control module using commands from the diagnostics tool.

Wit this service it is possible to start certain pre-defined checks or teach-ins. Examples of these are:

- Quick-test of fuel tank system
- Quick-test of camshaft control
- Resetting of adaptions and counter for oil
- Calibration of gear position sensor
- Calibration of components for Brake control module (BCM)

NOTE: To enable start and running of these services, it is often that certain start conditions must be fulfilled.

SOFTWARE DOWNLOADING

New software can be downloaded to the control modules. When ordering software the vehicle software and hardware are compared to Volvo's central database. If the comparison corresponds the new software is downloaded to the control module.

If the comparison between the car and Volvo's central database does not correspond, then the database is updated with the vehicle's configuration. When this is complete the software is downloaded.

ERASING DIAGNOSTIC TROUBLE CODES

Stored diagnostic trouble codes (DTCs) can be read off and erased using this function. Diagnostic trouble codes (DTCs) can only be erased once all the diagnostic trouble codes (DTCs) have been read off at least once.

When erasing diagnostic trouble codes, the diagnostic trouble code's counter, status identifier as well as frozen values are also erased.

For certain systems, stored adaptions may also be reset when erasing.

DRIVING CYCLE/OPERATION CYCLE

Fig. 43: Driving Cycle/Operation Cycle
Courtesy of VOLVO CARS CORPORATION

All control modules' diagnostics require that some form of driving cycle or operation cycle is run for

diagnostics to be considered as complete. The terms driving cycle or operation cycle appear, these mean the same, they are only different designations.

Example

The illustration above shows an example of a driving cycle or operation cycle. The vehicle is started and driven *(Start)* , is stopped sometime and the ignition is turned off *(Stop)* . When the ignition is turned on again *(Start)* a new driving cycle starts.

A new driving cycle or operation cycle usually starts every time the ignition is turned on, which means that you should turn on the ignition, turn off the ignition, and then turn on the ignition again.

However, the condition varies from control module to control module, there are also, e. g., speed and temperature conditions, before a driving cycle or operation cycle is considered to be complete.

When a malfunction is detected and then is confirmed as a real malfunction and is stored, various counters are also stored, indicating how frequent the malfunction is. These counters use driving cycles or operation cycles as basis for updating the counters' values.

READINESS MONITOR (CERTAIN MARKETS ONLY)

This is a function in Engine control module (ECM) that controls the control module's emission-related sub-system. With the function you can read out if the control module has run all diagnostics for the following sub-systems:

- Misfiring
- Fuel system
- Catalytic converter
- Evaporative emission (EVAP) system
- Heated oxygen sensors (HO2S)
- Other related components

Thus, Readiness refers only to if the diagnostics (tests) have been run or not, not if a malfunction was found or not. If a malfunction is found during the test, a diagnostic trouble code is stored and the malfunction light (MIL-light) is lit.

If the tests are run in the driving cycle without detecting a malfunction, then "Readiness" is immediately generated to OK.

However, if a malfunction is found in the driving cycle, then Readiness is generated to Not Ok, and another driving cycle is required where the test is run to generate Readiness to Ok.

The following alternatives are possible:

- Readiness is run (Ok), no malfunction detected, which means that the vehicle can be approved in a check.
- Readiness is run (Ok), with malfunction detected, which means that the vehicle cannot be approved in a

check.
- Readiness is not run (Not ok), which means that the vehicle cannot be approved in a check.

Readiness was originally a requirement from the American authority, United States Environmental Protection Agency (EPA), and is used there for Inspection and maintenance test (IM-test) (corresponds to annual inspection). Depending on legal requirements, the function may also be found on other markets.

EMERGENCY MODE, BACK-UP MODE "LIMP-HOME"

When a malfunction has occurred in the system that is confirmed (permanent malfunction) and is registered by the control module, modes are activated for certain systems and functions to handle the malfunction.

The purpose of these actions is to "protect" the control system and at the same time retain as much functionality or driving function as possible.

The minor malfunctions do not activate any back-up modes, there are different programs depending on type of malfunction and which control system to which it applies. All control systems do not have emergency modes or back-up modes.

Sometimes emergency modes must be activated immediately when a malfunction is detected, even if there has been no time to confirm and store any diagnostic trouble code. This is to maintain certain function, e. g., in case of malfunction of the mass air floe sensor for the engine management system, when the emergency program tries to prevent the engine from stopping.

HINT: Limp-home, emergency mode or back-up mode that may appear in case of malfunction is described in diagnostic trouble code information under replacement values.

For, e. g., automatic transmission TF-80SC AWD (XC90, B8444S) there are two back-up modes:

- Failsafe action (temporary action)
- Emergency/limp-home mode

Failsafe action is activated at the first detection of the malfunction, if the malfunction disappears the system returns to normal function.

Emergency mode is activated in case of less serious malfunctions Limp-home mode is activated for the most serious malfunctions.

The warning light in the driver information module lights up, and a text message is shown in the text window in the driver information module that emergency/limp-home mode has been activated. When the ignition is turned off and on again, no text is shown until the malfunction is detected again.

NOTE: If the malfunction disappears (intermittent malfunction) the control module returns to normal function first when the ignition is turned on the next time.

For automatic transmission's emergency mode, the following may take place, e. g.:

- Adaption function is blocked.
- Lock-up function is blocked.
- Function slipping lock-up is blocked.
- Function neutral check is blocked.
- The transmission only shifts to 3rd gear and reverse gear. All other shifting is blocked.

The above actions will be noticed by the driver since only one gear can be sued. Some may also notice that lock-up is not engaged. Then the vehicle comes to the workshop with a *symptom* for some form of lost driving function, probably also with the warning light on.

This symptom shall not be confused with the malfunction itself, instead it is a symptom of the back-up mode. The symptom that the malfunction itself causes (it it causes any) may be noticed briefly or not at all.

NOTE: If the malfunction is confirmed (permanent) it may be that the control module resumes normal function at ignition off and on again (symptom does not exist any longer). First when the malfunction is detected again (diagnostic trouble code test started and conditions fulfilled), the back-up mode is activated. The malfunction may then first be interpreted as if it was intermittent (non-existent or not active).

FROZEN VALUES

For every diagnostic trouble code, pre-defined parameters are frozen and stored in the control module. The frozen values are stored immediately after the malfunction has been detected and gives a "picture" of the conditions when the malfunction was stored.

NOTE: Status identifier, Counter and Frozen values are the most important factors to deciding the malfunction's nature, that is, to decide:

- when the malfunction was detected (frozen values, counters)
- what the driving conditions were at the time (frozen values)
- status for the test (self-diagnosis) (status identifier)
- how frequent the malfunction is (counter).

In newer car models, frozen values consist of a number of global (common) general parameters as well as a number of control model-unique parameters. Global may be:

- Road distance
- Battery voltage
- Passenger compartment temperature
- Outside temperature
- Engine running

In addition to these, the diagnostic trouble code-unique parameters are stored which are especially selected

parameters for the diagnostic trouble code.

Most parameters in the frozen values are the same for all malfunctions and indicate a general condition when a malfunction was detected, for example:

- Road distance
- Outside temperature
- Engine speed
- Load
- Coolant temperature
- Vehicle speed
- Battery voltage
- etc.

Some of them have been selected to give a better understanding of the specific malfunction.

NOTE: When erasing diagnostic trouble codes, stored frozen values are also erased.

HINT: Reading out and interpreting these frozen values make it easier to understand when in time the malfunction occurred, as well as under what driving and environment conditions the malfunction was detected, related to when and how the customer experienced the symptom.

IDENTIFYING MALFUNCTION

Fig. 44: Identifying Detected Malfunction
Courtesy of VOLVO CARS CORPORATION

A malfunction that is detected is assessed by the control module's self-diagnosis. First after, e. g., a certain time, a certain number of driving cycles, certain driving/operation or other conditions, the control module decides if it is a real malfunction or not.

When self-diagnosis has determined that a real malfunction exists, you can say that the *malfunction is confirmed* and the malfunction is stored in the control module's trouble code memory in the form of diagnostic

trouble codes.

If a malfunction disappears, the diagnostic trouble code will remain for a tome in the diagnostic trouble code memory, but the status of the diagnostic trouble code changes. How long the diagnostic trouble code is stored in the diagnostic trouble code memory is different from control module to control module, as well as between different vehicle models (generation of vehicle model).

In some systems the diagnostic trouble code will be stored until it is erased with the diagnostics tool. In other systems the diagnostic trouble code is erased automatically by the control module after, e. g., a certain number of malfunction-free driving cycles. A new driving cycle (operation cycle) is usually started every time the ignition is turned on.

Information about the nature of the malfunction is stored for every diagnostic trouble code:

- when the malfunction was detected (frozen values, counters)
- what the driving conditions were at the time (frozen values)
- status for the test (diagnosis) (status identifier)
- how frequent the malfunction is (counter).

Exactly what is stored is different from control module to control module,, as well as between different vehicle models (generation of vehicle model).

If the system is provided with warning light, it is lit when the ignition key is turned to position II. The warning light will go off after a certain number of seconds when no malfunction is detected on the control system.

The warning light will be on in case of a malfunction of the control system. The warning light will be lit first after the malfunction is confirmed as a real malfunction.

DESIGNATION OF TROUBLE CODES

The diagnostics tool VIDA shows the diagnostic trouble code in plain text according to the following example:

TCM-001F Speed sensor Signal missing Permanent malfunction

This diagnostic trouble code consists of the following parts:

- Prefix for control system in question (**TCM**) to show what system the diagnostic trouble code belongs to. *
    - If the qualifier is, e. g., "Too high signal", the control module interprets that the signal from the sensor is too high. This may mean that, e. g., the voltage is too high, current is too high, frequency is too high, or the pulse ratio (% duty) is too high, all depending on which type of signal it is. Malfunction causes may be, e. g., open circuit or short-circuiting to voltage.
    - If the qualifier is "Too low signal", the control module interprets that the signal from the sensor is too low. Malfunction causes may be, e. g., open circuit, short-circuiting to ground, contact resistance in connections.

NOTE: **Information about which type of signal that the control module detects and what conditions are required to detect that a malfunction is found again in the diagnostic trouble code information.**

- Diagnostic trouble code number (**001F**) to decide which diagnostic trouble code is stored. Number of digits in the diagnostic trouble code number may vary. *, **
  - If the qualifier is, e. g., "Too high signal", the control module interprets that the signal from the sensor is too high. This may mean that, e. g., the voltage is too high, current is too high, frequency is too high, or the pulse ratio (% duty) is too high, all depending on which type of signal it is. Malfunction causes may be, e. g., open circuit or short-circuiting to voltage.
  - If the qualifier is "Too low signal", the control module interprets that the signal from the sensor is too low. Malfunction causes may be, e. g., open circuit, short-circuiting to ground, contact resistance in connections.

NOTE: **Information about which type of signal that the control module detects and what conditions are required to detect that a malfunction is found again in the diagnostic trouble code information.**

- Title (**Speed sensor**) is a text that shows to which component/function the diagnostic trouble code refers. *
  - If the qualifier is, e. g., "Too high signal", the control module interprets that the signal from the sensor is too high. This may mean that, e. g., the voltage is too high, current is too high, frequency is too high, or the pulse ratio (% duty) is too high, all depending on which type of signal it is. Malfunction causes may be, e. g., open circuit or short-circuiting to voltage.
  - If the qualifier is "Too low signal", the control module interprets that the signal from the sensor is too low. Malfunction causes may be, e. g., open circuit, short-circuiting to ground, contact resistance in connections.

NOTE: **Information about which type of signal that the control module detects and what conditions are required to detect that a malfunction is found again in the diagnostic trouble code information.**

- Qualifier (**Signal missing**) is used to show *how the control module has perceived the signal from, e. g., the sensor, or how it detected the monitored function.* In this case, the control module has perceived that the signal is missing. There a re a number of other qualifiers for, e. g., too high signal, incorrect signal, too high flow, too low flow, etc. *, **.
  - If the qualifier is, e. g., "Too high signal", the control module interprets that the signal from the sensor is too high. This may mean that, e. g., the voltage is too high, current is too high, frequency is too high, or the pulse ratio (% duty) is too high, all depending on which type of signal it is. Malfunction causes may be, e. g., open circuit or short-circuiting to voltage.
  - If the qualifier is "Too low signal", the control module interprets that the signal from the sensor is

too low. Malfunction causes may be, e. g., open circuit, short-circuiting to ground, contact resistance in connections.

NOTE: Information about which type of signal that the control module detects and what conditions are required to detect that a malfunction is found again in the diagnostic trouble code information.

-
- Status (**Permanent malfunction**) to show the malfunction's status, that is, if the malfunction has been detected in the present driving cycle or not. There are two different status texts, permanent or intermittent. When the control module's diagnosis cannot decide the malfunction's status, the diagnostic trouble code is shown without status text. *

* When reading out diagnostic trouble codes using diagnostic socket with light-emitting diode, you get a three-digit flash code. Then this code is translated to a diagnostic trouble code text using the service information.

For example, if the control module flashes the code 1-2-3 from Engine control module (ECM), it can be translated to, e. g., diagnostic trouble code 1-2-3 Engine temperature sensor. Volvo Diagnostic Key and Volvo System Tester translate these flash codes directly to plain text (add a title). In these diagnostic systems it is not possible to show qualifier or status.

** For systems with diagnostic version called Generic Global Diagnostics (GGD) (adheres to standard ISO/DIS 15031-6.4) the diagnostic trouble code number consists of a letter and six characters. The letter alternatives are B, C, P and N, which means Body, Chassis, Powertrain and Network and indicate to which "function" in the vehicle the diagnostic trouble code belongs. The six following characters may consist of both letters (A-F) and digits (0-9) and indicate the component to which the malfunction refers as well as what type of malfunction. See following example.

BCM-C006A16 Multi-axial acceleration sensor. General electric malfunction. Too low voltage

CLASSIFICATION OF DIAGNOSTIC TROUBLE CODES

In principle, malfunctions can be classified in two categories, intermittent or permanent.

Permanent malfunctions.

The easiest malfunctions to identify and confirm as a malfunction are the permanent malfunctions. A permanent malfunction is a malfunction when something has "broken" and remains like that until it is repaired.

Intermittent malfunctions.

The intermittent malfunctions are, as opposed to the permanent malfunctions, are both difficult to identify and confirm. The malfunction exists but is neither active nor present all the time. The malfunction comes and goes briefly under very rare conditions.

For the intermittent malfunctions, the degree of intermittence can also be determined, that is, how intermittent the malfunction is (how often/seldom the malfunction appears).

HINT: For assessment of intermittence, stored counters are used together with the diagnostic trouble code.

Common permanent malfunction causes are:

- Open circuits or short-circuits on cables or in connectors caused by mechanical damage, vibrations, corrosion, oxidation, moisture, etc.

Common intermittent malfunction causes are:

- Loose connections or contact resistance caused by vibrations, corrosion, oxidation, moisture, etc.
- Brief short-circuits to both ground and voltage caused by damage to cables, moisture in connectors, etc.
- Electro-magnetic interference.

Malfunction causes may be both electrical, mechanical or related to software.

Intermittent malfunctions (or malfunctions that occur under unknown conditions) may also be malfunctions that only occur during certain operation or ambient conditions.

E. g., that the window or seat for some reason jams in its end-position when using automatic function, or that the climate control unit supplies poor heat in a certain position when it rains outside.

CONDITIONS FOR DIAGNOSIS TO FIND A MALFUNCTION

For the control module's self-diagnosis of a component or function to start and run (one or several times) special conditions must be fulfilled. Conditions for diagnosis varies depending on which component or function is to be monitored. When the diagnosis has started and is run, the signal, value or function must go above or below the limit value for the control module to detect a malfunction.

Example of conditions for the control module to start the diagnosis/test:

- Engine speed higher than 500 rpm.
- Ignition position II.
- Speed above 40 km/h.
- 4th gear selected.

Example of limit values for detecting malfunction:

- Direct voltage from outside temperature sensor lower than 0.495 V for a time longer than 1 second.
- After the engine has run for approx. 10 minutes, the control module receives an unchanged signal from the oil temperature sensor even though the signal should have changed according to a set pattern.
- Malfunction shall be active (permanent) for at least 2 driving cycles.

Example

Fig. 45: Example Of Limit Values For Detecting Malfunction (1 Of 2)
Courtesy of VOLVO CARS CORPORATION

The illustration shows an imagined scenario when a malfunction occurs in a circuit for a signal.

First the signal varies normally during driving. The diagnostic trouble code test starts after some time (5), is then run cyclically in a pre-defined pattern and monitors the signal. Limit values for monitoring to consider the signal as incorrect is a voltage lower than 0.50 V (2) or higher than 4.85 V (1). An open circuit occurs in the circuit and the signal becomes 0 V (4). Monitoring detects this, waits so that the malfunction is confirmed and then stores a diagnostic trouble code (6).

Fig. 46: Example Of Limit Values For Detecting Malfunction (2 Of 2)
Courtesy of VOLVO CARS CORPORATION

If the diagnostic trouble code test (5) starts after the malfunction (4) occurs, then monitoring will detect the malfunction fist when the test starts. Then monitoring waits so that the malfunction is confirmed and then stores a diagnostic trouble code (6). If you want the control module to detect a malfunction in the vehicle, you have to make sure that the control module's diagnostic trouble code test starts or is started.

HINT: If a malfunction occurs which has not yet been detected by the control module's monitoring, since the diagnostic trouble code test has not started, the vehicle may still exhibit a symptom.

NOTE: Conditions for diagnosis are described in the diagnostic trouble code

information for every diagnostic trouble code.

Most diagnosis (at least non-emission-related diagnosis) are repeated periodically during the driving cycle, and every time they are repeated, a test is run that either results in a malfunction being detected or no malfunction being detected.

To enable the emission-related diagnosis to be completed and the diagnostic trouble code to be confirmed (with MIL-light activated as a result), several driving cycles in a row must be completed with a detected malfunction.

To enable the non-emission-related diagnosis to be completed (at least once), in principle the start conditions must be fulfilled for a certain time (from fractions of a second to a number of seconds).

Certain diagnoses require a completed driving cycle (e. g., ignition on, ignition off, and ignition on again) for the diagnosis to be considered as complete. Other diagnoses requires several other conditions to be fulfilled, e. g., with regards to:

- vehicle speed
- engine coolant temperature (ECT)
- time since start
- different load and engine speed relationships in the same trip
- a certain event (for example, that the component operates).

HINT: To assess if a test/diagnosis for the diagnostic trouble code is started or completed, status identifiers can be used. Turning off the ignition and then turning it on again often results in start of a new driving cycle/operation cycle, which results in update of status identifiers.

When, e. g., the engine control module (ECM) has run all diagnostics, the control module has completed a "trip". An extensive driving schedule in various conditions is required to complete a trip. The engine may also need to be shut off for a certain amount of time and then switched on again to complete a trip.

Emissions related diagnostic functions

Control modules that have and control emission-related components or functions, e. g., Engine control module (ECM) and Transmission control module (TCM), check that emission-related systems work. These systems are checked by running a diagnostic function. The diagnostic function checks the included components and that the function itself works in the system.

Lighting the malfunction indicator lamp (MIL)

In the event of emissions related diagnostic trouble codes (DTCs), a counter counts down to determine when to light the malfunction indicator lamp (MIL). The conditions for lighting the malfunction indicator lamp (MIL) vary depending on which diagnostic trouble code (DTC) is stored.

NOTE: **If a malfunction becomes intermittent or the malfunction disappears, then the MIL-light turns off first after 3 driving cycles in a row are completed with malfunction detection.**

Self-erasing of emission-related diagnostic trouble codes

After 40 driving cycles without detected malfunction with start of cool engine, where the engine temperature (coolant temperature) increases more than 5 °C (approx. 9 °F) and the final temperature is above approx. +71 ° C (159.8 °F), then the diagnostic trouble code is erased. Diagnoses (diagnostic trouble code tests) for misfire and fuel adaptions require 80 driving cycles. These driving cycles are defined as a "warm-up cycle".

COUNTER

GENERAL

For every diagnostic trouble code, the control modules stores a number of counters. These counters count the number of driving cycles that have been performed in the control module with or without malfunctions, if the malfunction is detected or not. In control systems older than model year 1999, there may be control systems, depending on control system, without counters or with few counters. From model year 1999, there are systems with several counters. The following counters may appear:

- Counter 1
- Counter 2 *
- Counter 3
- Counter 4
- Counter 5**
- Counter 6
- Counter 7
- Counter 8

The text uses the term driving cycle, which may also be called Operation cycle.

* In principle, only systems with the diagnostic concept Generic Global Diagnostic (GGD).

** Only for emission-related systems.

When erasing diagnostic trouble codes, the diagnostic trouble code's counter is erased.

NOTE: Status identifier, Counter and Frozen values are the most important factors to deciding the malfunction's nature, that is, to decide:

- when the malfunction was detected (frozen values, counters)
- what the driving conditions were at the time (frozen values)
- status for the test (self-diagnosis) (status identifier)
- how frequent the malfunction is (counter).

COUNTER VOLVO DIAGNOSTICS II

Fig. 47: Counter Volvo Diagnostics II Graph
Courtesy of VOLVO CARS CORPORATION

Graph A illustrates when in time that the malfunction occurs. In the illustration, the control module has detected a malfunction in the second driving cycle (graph's x-axis) and this malfunction then appears 4 more times, a total of 5 times. Counters can be read out for every diagnostic trouble code in the control module which have this introduced. Driving cycles are marked with vertical lines. A driving cycle often begins with ignition on and ends with ignition off.

Counter 1 (C#1). Counts number of cycles performed since the malfunction was confirmed *last* . As soon as a malfunction is detected and confirmed, the value is reset.

When the malfunction is both detected and disappears in the second driving cycle (graph A), counter 1 will count up to 1 first in the following driving cycle (driving cycle 3), that is, a driving cycle has been run through since the last time the malfunction was confirmed.

In driving cycle 4, the counter is updated again, now to value 2. Just after that, the malfunction is detected (graph A), the malfunction is confirmed and the counter's value is reset. This sequence is repeated once again in driving cycle 5.

With other words, one can say that if the value is zero, the malfunction exists now or has existed earlier in the current driving cycle. If the vehicle is restarted so that a new driving cycle is initiated (often requires ignition off and on again) in this position and the counter's value still is 0, then you probably have a permanent malfunction.

Values near zero indicate that the malfunction has been detected recently. It may also be that the malfunction exists but the diagnostic trouble code test has not started in these driving cycles, which means that the counter has not been reset. A high counter value indicates that the malfunction was last detected a number of driving cycles ago.

Counter 3 (C#3) (see graph). Counts the number of driving cycles performed since the malfunction was confirmed the *first* time. When a malfunction is confirmed the first time, the counter will count up by 1 for every subsequent driving cycle, regardless of if the malfunction is detected or not. Thus, the counter tracks the number of driving cycles since the malfunction was detected the first time. See graph where the counter increases by 1 for every subsequent driving cycle and the value of the counter is finally 6.

A low value indicates that the malfunction was detected for the first time relatively recently. However, a high value indicates that a first detection was performed some time ago.

Counter 4 (C#4) (see graph). Counts the number of driving cycles in which the malfunction has been confirmed since it was confirmed the first time. The graph shows that after the malfunction was detected the first time, the malfunction has been detected in 3 driving cycles. Thus, after the malfunction was detected the first time, another 6 driving cycles (counter 3), have passed and in these the malfunction has been detected 3 times (counter 3). Simplified, one can say that in this example, the malfunction has occurred/been detected in every other driving cycle, and the malfunction can be assessed as relatively frequent.

A certain indication of a malfunction's intensity can be obtained if you compare the value for counter 4 with counter 3. The closer the value for counter 4 the value is to the value of counter 3, the more frequent the malfunction.

If counters 3 and 4 have the same value, the malfunction has been detected in every driving cycle, which means that the malfunction is frequent.

Counter 5 (C#5). The counter sums up the time in seconds that *the control module has been operating* since the malfunction first was confirmed and the diagnostic trouble code was stored. The time that the control module has been operating is only counted when it is active, not in "sleep mode". The counter is not shown in the illustration.

Counter 6 (C#6). The counter sums up the time in seconds that *the diagnostic trouble code test has been in progress* since the malfunction first was confirmed and the diagnostic trouble code was stored. The counter is not shown in the illustration.

Counter 7 (C#7). The counter sums up the time in seconds that *malfunction has been confirmed* since it first was confirmed and the diagnostic trouble code was stored. The counter is not shown in the illustration.

COUNTER GENERIC GLOBAL DIAGNOSTICS (GGD)

Fig. 48: Counter Generic Global Diagnostics (GGD) Graph
Courtesy of VOLVO CARS CORPORATION

Graph A. Diagnostic trouble code test active

Shows if the control module's diagnostic trouble code test is active or not. The blue surface indicates when the test is active. Not included as a status identifier.

Graph B. Malfunction active

Shows if the malfunction in the vehicle is active or not. The red surface indicates when the malfunction is present (active). Not included as a status identifier.

In the illustration, the control module has detected a malfunction in the second driving cycle, and this malfunction occurs a total of 4 times. Counters can be read out for every diagnostic trouble code in the control module which has this implemented. Driving cycles are indicated with vertical lines. A driving cycle often begins with ignition on and ends with ignition off.

Counter 1 (C#1). Counts number of driving cycles performed since the malfunction was confirmed *last* . As soon as a malfunction is detected and confirmed, the value is reset. When the malfunction is both detected and disappears in the second driving cycle (graph A), counter 1 will count up to 1 first in the following driving cycle (driving cycle 3), that is, a driving cycle has been run through since the last time the malfunction was confirmed.

In driving cycle 4, the counter is updated again, now to value 2. Just after that, the malfunction is detected (graph A), the malfunction is confirmed and the counter's value is reset. This sequence is repeated once again in driving cycle 5.

With other words, one can say that if the value is zero, the malfunction exists now or has existed earlier in the current driving cycle. If the vehicle is restarted (often requires ignition off and on again) in this position and the counter's value still is 0, then you probably have a permanent malfunction.

Values near zero indicate that the malfunction has been detected recently. It may also be that the malfunction exists but the diagnostic trouble code test has not started in these driving cycles, which means that the counter has not been reset. A high counter value indicates that the malfunction was last detected a number of driving cycles ago.

Counter 2 (C#2). Counts the number of driving cycles since the last confirmation of the malfunction and where the diagnostic trouble code was performed *without* detecting malfunction and confirmation of malfunction. Thus, when diagnostic trouble code is performed and no malfunction is detected, the counter will count up by 1 for every driving cycle. As soon as a malfunction is detected and confirmed, the value is reset.

When the malfunction is detected and disappears in the second driving cycle (graph A), counter 2 will count up to 1 first in the following driving cycle (run cycle 3). In driving cycle 4 the counter is updated again (diagnostic trouble code test has been run without detecting malfunction), now to value 2. Immediately after that the malfunction is detected (graph A), the malfunction is confirmed and the counter's value is reset. This sequence is repeated once again in driving cycle 5.

During driving cycle 6 and 7, the diagnostic trouble code test was run without detecting malfunction and the counter receives the value 2. In driving cycle 8, the diagnostic trouble code test is not run and thus the counter is not updated.

Counter 3 (C#3) . Counts the number of driving cycles performed since the malfunction was confirmed the *first* time. When a malfunction is confirmed the first time, the counter will count up by 1 for every subsequent driving cycle, regardless of if the malfunction is detected or not. Thus, the counter tracks the number of driving cycles since the malfunction was detected the first time. See graph where the counter increases by 1 for every subsequent driving cycle and the value of the counter is finally 6.

A low value indicates that the malfunction was detected for the first time relatively recently. However, a high value indicates that a first detection was performed some time ago.

Counter 4 (C#4). Counts the number of driving cycles in which the counter's value has been updated first when the malfunction was detected in the driving cycle. The counter has a final value of 3.

A certain indication of a malfunction's intensity can be obtained if you compare the value for counter 4 with counter 3. The closer the value for counter 4 the value is to the value of counter 3, the more frequent the malfunction.

Counter 5 warm-up (C#5). Counts the number of warm-up cycles that have been run since the malfunction light (MIL) has gone off. The counter is not shown in the illustration. Note: Only applies to emission-related systems.

Counter 6 malfunction detection (C#6). The counter counts the number of internal detections of the malfunction that have been run for the diagnostic trouble code. When this counter reaches value +127, the control modules decides that the malfunction is active right now.

When the counter is at value -128, the malfunction is not active. The value is reset for every new driving cycle.

If the value increases towards +127, the control module has detected a malfunction, and for every internal test the value is counted up. When the malfunction no longer exists, the control module counts down to minimum -128.

The value on the control module can only be changed when it has started the test for the diagnostic trouble code. How big each step is that the control module counts up or down the value by to reach the limits +127 or -128 may vary between control modules. Limits +127 and -128 are pre-defined limits in the control module.

In the graph, the counter first counts down to -128 when the diagnostic trouble code test starts. When a malfunction occurs (graph B) and the diagnostic trouble code test detects the malfunction, first the counter's value is reset to 0, then it scrolls up to +127. Only then the malfunction is considered to exist. If the malfunction disappears and the diagnostic trouble code test is active, the counter counts down to -128.

Counter 7 malfunction detection - max. current (C#7). Shows maximal value that counter 6 has in the present driving cycle.

The counter is not shown in the illustration.

Counter 8 malfunction detection - max. earlier (C#8). Shows maximal value that counter 6 has in the present and/or has had in earlier driving cycle.

The counter is not shown in the illustration.

STATUS IDENTIFIER

GENERAL

There are status indicator (status identifiers) that can be read out for every diagnostic trouble code. The control module tests every connection (signal) or function more or less periodically, depending on the self-diagnosis' conditions for start.

By reading out the diagnostic trouble code with associated status identifier, then you obtain *status for the diagnostic trouble code test that detects the malfunction, as well as if the malfunction exists now or not.*

NOTE: Status identifier, Counter and Frozen values are the most important factors to deciding the malfunction's nature, that is, to decide:

- when the malfunction was detected (frozen values, counters)
- what the driving conditions were at the time (frozen values)
- status for the test (self-diagnosis) (status identifier)
- how frequent the malfunction is (counter).

All status identifiers (or malfunction detection counters) do not have to be introduced in one control module, this varies from system too system. All status identifiers restarts the count every time a new driving cycle/operation cycle starts or when erasing diagnostic trouble codes. Status identifiers should be read off continuously as the different identifiers can be updated later on.

The following describes possible status identifiers.

NOTE: Status identifiers for systems with diagnostics Volvo Diagnoses II is slightly different from status identifiers for diagnostic version Generic Global Diagnostics (GGD).

When erasing diagnostic trouble codes, the diagnostic trouble code's status identifier is erased.

STATUS IDENTIFIER VOLVO DIAGNOSTICS II

The following identifiers are available (showed values apply until updated with a new read-out):

- SB 01 Diagnostic trouble code test run in progress.
- SB 02 Diagnostic trouble code test run at least once during current driving cycle.
- SB 03 Sporadic/single malfunctions found the last time diagnostic trouble code test was run during current driving cycle/operation cycle.
- SB 04 Sporadic/single malfunctions found at least once during current driving cycle.
- SB 05 Request light warning light/text message due to detected malfunction.
- SB 06 Diagnostic trouble code test blocked due to malfunction found by another diagnostic trouble code test.
- SB 08 Malfunction detection counter, current value.
- SB 09 Malfunction detection counter, maximum value reached some time during current operation cycle.

Abbreviation SB is from the English 'Status Bit'.

Fig. 49: Identifying Status Identifier Volvo Diagnostics II Graph
Courtesy of VOLVO CARS CORPORATION

The upper graph shows a varying signal value. If the signal value exceeds a max. value, which is considered a malfunction by the control module, then a sporadic malfunction is registered, that is, a malfunction is about to occur. Then the grey-marked surface indicates the signal considered to be incorrect.

The text below uses the term Driving cycle, which may also be called Operation cycle.

NOTE: If the diagnostic trouble codes are erased, the status identifiers are also erased

SB01 Diagnostic trouble code test run in progress (second paragraph from top).

Shows if the diagnostic trouble code test runs or not right now (in current driving cycle). It is only when the test runs that the control module can detect malfunctions and generate diagnostic trouble codes.

Grey-marked surface means that the test runs and can detect a malfunction if it occurs. The surface is "dashed", showing that when the diagnostic trouble codes runs, it runs in a cyclic, pre-determined pattern.

Status identifier 03 and 04 shows if a malfunction is detected or not. In this case, a malfunction is detected 3 times.

Status alternative when reading out is Yes (test runs now) or No (test is not run now).

SB02 Diagnostic trouble code test run at least once during current driving cycle (third graph from the top).

Shows if the diagnostic trouble code test has been run or not during the current driving cycle. If it has been possible for the control module to detect malfunctions and generate diagnostic trouble code any time during the current driving cycle.

Grey-marked surface means that the diagnostic trouble code test has been run at some time. If the diagnostic trouble code test has been run at some time in this driving cycle, status will always be Yes and remain so until the ignition is turned on off and a new driving cycle starts. When a new driving cycle starts, status identifiers are "reset" and is initially No.

Status identifier 03 and 04 shows if a malfunction is detected or not.

Status alternative when reading out is Yes (test completed) or No (test not completed).

SB03 Sporadic/single malfunctions found the last time diagnostic trouble code test was run during current driving cycle (fourth graph from the top).

A sporadic malfunction (intermittent malfunction) has been detected 3 times *the last* time the diagnostic trouble code test was run during current driving cycle. During the diagnostic trouble code test run the last time (status identifier 01) a malfunction has been detected 3 times.

Status alternative when reading out is Yes (sporadic malfunction found) or No (no sporadic malfunction found).

NOTE: **When the control module detects the malfunction for the first time(status identifier 03 and 04), a diagnostic trouble code has not yet been stored. It is first when the malfunction detection counter 08 reaches a certain value that the control module considers that a real malfunction exists (a confirmed malfunction) and the diagnostic trouble code is stored.**

SB 04 Sporadic/single malfunctions found at least once during current driving cycle (fifth graph from the top).

A sporadic malfunction (intermittent malfunction) has been detected at some time during current driving cycle. Grey. marked surface means that a malfunction has been detected at some time.

If the diagnostic trouble code test has been run at some time in this driving cycle, status will always be Yes and remain so until the ignition is turned on off and a new driving cycle starts. When a new driving cycle starts, status identifiers are "reset" and is initially No. Status identifier 03 and 04 shows if a malfunction is detected or not.

Status alternative when reading out is Yes (test has been run earlier) or No (test has not been run).

SB 05 Request light warning light/text message due to detected malfunction (sixth paragraph from the top).

Information that diagnostic trouble code activates a warning light or text message in driver information module. In this case, lighting of warning light is requested when the diagnostic trouble code has been confirmed and stored.

Status alternative when reading out is Yes (request performed) or No (no request).

SB06 Diagnostic trouble code test blocked (seventh graph from top).

Information that diagnostic trouble code test is turned off as a result of another malfunction and diagnostic trouble code is generated where the root cause is detected. If this in turn results in subsequent malfunctions, it prevents generation of subsequent diagnostic trouble codes. In this case, the diagnostic trouble code test is not blocked.

Status alternative when reading out is Yes (diagnostic trouble code test blocked) or No (diagnostic trouble code test not blocked).

SB08 Malfunction detection counter, current value (eight graph from top).

When a sporadic malfunction is detected by the control module the malfunction detection counter counts up as long as the malfunction exists.

When the malfunction no longer exists the counter counts down again. This is the basis for the control module's decision to store the diagnostic trouble code and the diagnostic trouble code is stored in the vehicle first when the counter reaches a certain max. value. This max. value varies between different diagnostic trouble codes.

Count rate of the counter is controlled as long as the malfunction exists before it causes customer symptom. The counter is used to decide if it is a real malfunction that has occurred and that has existed for some time. It is the control module's way of confirming the diagnostic trouble code, that is, confirming that a real malfunction exists.

SB09 Malfunction detection counter, max. value during current operation cycle

Shows max. value that status identifier 08 has reached during current driving cycle. When a new driving cycle starts, the counter is "reset".

STATUS IDENTIFIER GENERIC GLOBAL DIAGNOSTICS (GGD)

The following identifiers are available (showed values apply until updated with a new read-out):

- SB 00 Malfunction found the last time that the diagnostic trouble code test was run during current driving cycle
- SB 01 Malfunction found at least once during the current driving cycle
- SB 02 Malfunction found at least once during the current and previous driving cycles
- SB 03 Malfunction found recently since erasing of diagnostic trouble codes
- SB 04 Diagnostic trouble code test run at least once since erasing of diagnostic trouble codes
- SB 05 Malfunction found at least once since erasing of diagnostic trouble codes
- SB 06 Diagnostic trouble code test run at least once during current operation cycle.
- SB 07 Request light warning light/text message due to detected malfunction.

Fig. 50: Identifying Status Identifier Generic Global Diagnostics (GGD) Graph
Courtesy of VOLVO CARS CORPORATION

The upper graph shows a varying signal value. If the signal value exceeds a max. value, which is considered a malfunction by the control module, then a sporadic malfunction is registered, that is, a malfunction is about to occur. Then the grey-marked surface indicates the signal considered to be incorrect.

The text below uses the term Driving cycle, which may also be called Operation cycle. The order of status identifiers in illustration and in the list below are presented as they belong to each other, not in numerical order.

NOTE: If the diagnostic trouble codes are restored, the status identifiers are also restored

Graph A Diagnostic trouble code test active

Shows if the control module's diagnostic trouble code test is active or not. The blue surface indicates when the test is active. The surface is "dashed", which shows when the diagnostic trouble code test runs it runs in a cyclically pre-determined pattern. Not included as a status identifier.

Graph B Malfunction active

Shows if the malfunction in the vehicle is active or not. The red surface indicates when the malfunction is present (active). Not included as a status identifier.

Graph C Counter 6 malfunction detection (C#6)

The counter counts the number of internal detections of the malfunction that have been performed for the diagnostic trouble code. Not included as a status identifier. When this counter reaches value +127 the control module considers the malfunction to be active right now.

When the counter is at value -128, the malfunction is not active. The value is reset for every new driving cycle.

If the value increases towards +127, the control module has detected a malfunction and for every internal test the value is counted up. When the malfunction no longer exists, the control module counts down to minimum -128.

The value on the control module can only be changed when it has started the test for the diagnostic trouble code. How big each step is that the control module counts up or down the value by to reach the limits +127 or -128 may vary between control modules. Limits +127 and -128 are pre-defined limits in the control module.

In the graph, the counter first counts down to -128 when the diagnostic trouble code test starts (graph A). When a malfunction occurs (graph B) and the diagnostic trouble code test detects the malfunction, first the counter's value is reset to 0, then it scrolls up to +127. Only then the malfunction is considered to exist. If the malfunction disappears and the diagnostic trouble code test is active, the counter counts down to -128.

SB **06 Diagnostic trouble code test run at least once during current operation cycle**

Shows if the control module has performed diagnostic trouble code test for this diagnostic trouble code in *current* driving cycle. When the diagnostic trouble code test starts and counter 6 (malfunction detection) counts down to -128 (no malfunction found) or up to +127 (malfunction found), the control module considers that diagnostic trouble code test has been run.

Yellow-marked surface means that diagnostic trouble code test *is not yet* run.

Status alternative when reading out is Run or Not run.

SB **00 Malfunction found the last time that the diagnostic trouble code test was run during current driving cycle**

Shows if the control module detects the malfunction right now. It is only when the test runs that the control module can detect malfunctions and generate diagnostic trouble codes. A malfunction has been detected 2 times during the current driving cycle. Note that only when counter 6 (malfunction detection) reaches the value +127 is it considered to be a malfunction. When the value gas dropped from +127 to 0, it is considered that there is no longer a malfunction.

Status alternative when reading out is Yes (malfunction detected right now) or No (no malfunction detected right now).

SB **01 Malfunction found at least once during the current driving cycle**

Shows if the control module has detected the malfunction *anytime during the current driving cycle.* It is only when the test runs that the control module can detect malfunctions and generate diagnostic trouble codes. The diagnostic trouble code test has started and a malfunction has been detected at least 1 time during the current driving cycle.

Status alternative when reading out is Yes (malfunction found) or No (malfunction not found).

This status identifier is generated at the same time as status identifier SB00 and will remain in status Yes for the rest of the current driving cycle. At start of a new driving cycle, it has changed to status No until a malfunction is detected again.

SB **05 Malfunction found at least once since erasing of diagnostic trouble codes**

Shows if the control module has detected the malfunction during *earlier* driving cycle. A malfunction has been detected at least 1 time since the diagnostic trouble code was erased the last time.

Status alternative when reading out is Yes (malfunction found) or No (malfunction not found).

This status identifier is generated at the same time as status identifier SB 00 and will remain in status Yes until diagnostic trouble codes are erased once again.

SB **04 Diagnostic trouble code test run at least once since erasing of diagnostic trouble codes**

Shows if the control module has performed diagnostic trouble code test for this diagnostic trouble code in

current and/or earlier driving cycle since the diagnostic trouble code was erased the last time. This means that if diagnostic trouble code test has been run after erasing of diagnostic trouble codes, it will remain in Run until diagnostic trouble codes are erased once again.

Yellow-marked surface means that diagnostic trouble code test *has been* run.

Status alternative when reading out is Run or Not run.

This status identifier is generated at the same time as status identifier SB 06.

SB **07 Request for lit warning light/text message**

Information about the diagnostic trouble code activates a warning light or text message. In this case, lighting of the warning light is requested when a diagnostic trouble code is stored.

Status alternative when reading out is Yes (request performed) or No (no request).

SB **02 Malfunction found at least once during the current and previous driving cycles**

Pending not yet confirmed diagnostic trouble code.

Status alternative when reading out is Yes (malfunction found but not confirmed) or No (no malfunction found).

This status identifier is generated at the same time as status identifier SB 00 is generated for the first time and will remain in status Yes until certain driving cycle conditions are fulfilled and no malfunctions are detected. After a certain number of driving cycles without detected malfunction, it returns to status No. Number of driving cycles required depends on the system.

SB **03 Malfunction found recently since erasing of diagnostic trouble codes**

Confirmed diagnostic trouble code.

Status alternative when reading out is Yes (malfunction found and confirmed) or No (no malfunction found).

This status identifier is generated at the same time as status identifier SB 00 is generated for the first time and will remain in status Yes until certain driving cycle conditions are fulfilled and no malfunctions are detected. After a certain number of driving cycles without detected malfunction, it returns to status No. That is, if a malfunction becomes intermittent and no longer is detected, the status will change to No. Number of driving cycles required depends on the system.

NOTE: **For emission-related control system, this status identifier is generated to status Yes (Malfunction found and confirmed), first after status identifier SB02 has had status Yes (Malfunction found but not confirmed) for 2 driving cycles in a row with malfunction detected.**

INTRODUCTION

Volvo has developed a wide range of tools and information for easier and faster troubleshooting of the vehicle and its different systems. The range includes service and troubleshooting information, integrated self-diagnostics in control modules, measuring instrument for exhaust analysis, diagnostic tools, etc.

Troubleshooting or diagnostics are performed by the mechanic using two different concepts; Off Board Diagnostics (diagnostics outside the vehicle) or On Board Diagnostics (diagnostics system in the vehicle).

Off Board Diagnostics (diagnostics outside the vehicle) is done *without* help from the control module's self-diagnosis. Examples of these are:

- Breakout box and multimeter to measure signals.
- Mechanic's troubleshooting using hearing, touch, and vision as well as experience.
- Diagnostic tools that are connected in parallel between control module and connector.
- Cylinder leak tester.

On Board Diagnostics (diagnostic systems in the vehicle) *is done using the control module's self-diagnosis* and is read out and presented using a diagnostics tool.

	Off Board Diagnostics	On Board Diagnostics
Advantages	• A few tools to develop compared to functionality/software in all control modules. • Can probably be used for several models.	• Store information about the nature of the malfunction (malfunction frequency, test status, driving conditions), making it possible to troubleshoot intermittent malfunctions. • Require a diagnostic tool to convey information to the mechanic.
Disadvantages	• If the malfunction has disappeared (intermittent), the malfunction will probably not be found.	• Software and its functionality must be in every control module (great quantity). • If a malfunction in the software is detected, many units must be updated.

Fig. 51: Identifying Vehicle Diagnostics
Courtesy of VOLVO CARS CORPORATION

The term **Diagnostics** refers to true recognition and designation of an illness. The term comes from the Greek **dia** = through, and **gnosis** = knowledge. The purpose of a diagnosis is to give a summarized term for the different symptoms that the "sick" describes, and thus be able to give a specific treatment.

The control module in the vehicle includes software to manage intended function (e. g., control all functions of an engine), to monitor the system's components and functions. Monitoring (self-diagnosis) detects any malfunctions, stores these, activates protective actions (back-up modes) and, in some cases, warns the driver.

Monitoring (diagnosis) is always activated when the system is on but tests are started and run according to different pre-defined conditions. A malfunction that is detected is first assessed by monitoring, after, e. g., a certain time, a certain number of driving cycles, certain driving/operation cases or other conditions, the control module decides if it is a real malfunction or not. When monitoring determines that a real malfunction exists, it can be said that the malfunction is confirmed and the malfunction is stored.

The basic goal of self-diagnosis in control modules is to detect and report malfunctions in a control module or its connected components and cables. Part of the goal (found in legal requirements) is also to detect malfunctions that affect emissions as well as malfunctions that may cause subsequent damage to emission-related components.

Self-diagnosis shall also warn for malfunctions that mean a safety risk for drivers, passengers, and vehicles that otherwise would not cause a symptom and thus not be detected. This applies to, e. g., brake system and SRS-system.

Self-diagnosis shall be used by workshops as one of the tools for taking care of the symptom (property/malfunction) that the customer experiences. After the malfunction cause is found (via troubleshooting) and taken care of (via repair), self-diagnosis can also be used to verify that the malfunction cause has been fixed and that the customer's symptom does not exist any longer.

NOTE: **The control module's self-diagnosis (diagnostic trouble code tests) cannot detect all malfunctions that may occur in a vehicle. This primarily applies to mechanical malfunctions but also some electrical malfunctions, e. g., poor connection to battery, or relay spools for a relay are monitored but the**

function/circuit that the relay controls is not monitored.

Unfortunately, sometimes the control module's self-diagnosis can *miss to generate* a diagnostic trouble code for a malfunction where the customer experiences a symptom (malfunction), and sometimes it may generate a diagnostic trouble code despite the customer *not* experiencing any symptom (malfunction). This is because customers have different sensitivity to malfunctions (how easily the symptom is detected) and because it is not always to optimize self-diagnosis for all conditions that may occur during the vehicle's life. That is why you should *not entirely rely* on the vehicle's diagnostic trouble codes.

Diagnostic trouble codes should only be regarded as *indicators* of probably malfunction sources. *If the customer experiences a symptom (malfunction) but diagnostic trouble codes are not stored, this does not mean that the vehicle is trouble-free.*

Worth keeping in mind when troubleshooting:

- When there is so much electronic equipment in the vehicles, it is easy to blame the "complex" electronics and forget the normal basics for, e. g., an engine's function. But the basics are the same today as when we had carburetor engines.
- A common mistake in troubleshooting is to quickly restricting yourself to a certain area without having checked basic functions, e. g., that the ignition system and engine are in good mechanical condition, the battery is fully charged, fuses are intact.
- Troubleshooting information gives very good guidance when troubleshooting and is almost impossible to do without. By using the customer's symptom, developed troubleshooting methods with, e. g., diagnostic trouble code information, you are quickly guided to being able to pin-point the malfunction.

NOTE: The electronic components in the control systems are very reliable and seldom cause any malfunctions.

This document describes the following:

- Background to why self-diagnosis is found in the vehicle.
- Diagnostic services, what they do.
- Using the self-diagnosis.
- Diagnostic versions and its communication method.
- Tools for reading out diagnosis.
- Where I find the information.

PRACTICAL USE OF DIAGNOSTICS

GENERAL

There are several ways to decide if the malfunction is active right now or not as well as when the malfunction occurred:

- **Read off the diagnostic trouble code's counter, status identifier and frozen values.** By interpreting these you can find out when the malfunction was stored, how often the malfunction has occurred (intermittence) and what the driving conditions were when the malfunction was stored.
- **Read off a parameter** for component/system and decide if the value is correct or not. By, e. g., manually affecting the sensor or the switch, you can decide immediately if the parameter (signal) with its circuit is correct.
- **Trigger a component** (activate) and decide if the component/function is affected or not. By triggering, e. g., the relay and listening for its clicking sound or the function which is to be affected, it is possible to decide immediately if the component is correct.
- **Decide if the vehicle shows any symptom (malfunction).** If the vehicle no longer shows the symptom, one may suspect that the malfunction no longer is active.

The following accounts in detail for some of the above.

TO DECIDE THE INTENSITY OF A MALFUNCTION

NOTE: Examples 1-5 (below) are based on counters for diagnostic concept Generic Global Diagnostic (GGD).

When a malfunction is intermittent or has unknown status, the diagnostic trouble code's counter is very useful to decide:

- How many driving cycles that have passed since the malfunction was detected the first time as well as since the malfunction was detected.
- During how many driving cycles that the control module has detected the malfunction during a certain period, as well as how many driving cycles that the control module has not detected the malfunction. That the control module has not detected the malfunction may be due to the control module not having started the test for the malfunction, conditions to detect the malfunction are not fulfilled, or that the malfunction no longer exists.

The purpose of interpreting the counters is that it is possible to understand the malfunction's intensity, that is, show "how much" intermittent the malfunction is, as well as help in assessing if the chances to repeat the malfunction and customer symptom, and then succeed with troubleshooting.

If you read out the diagnostic trouble code information and it shows that the diagnostic trouble code test runs at least once every driving cycle (e. g., when driving), the counters' value may be very important when assessing the diagnostic trouble code's status and actions. However, if start of diagnostic trouble code test and its conditions are difficult to achieve, the counters' values should be considered to be of less importance.

Counters 1 and 3 show driving cycles. Counters 2 and 4 also show driving cycles, but then really a "share" of counters 1 and 3, respectively. In principle, counter 4 shows how many times that the customer should have detected symptoms.

NOTE: ***For systems with diagnostic concept Generic Global Diagnostics (GGD).*** **If many diagnostic trouble codes are stored at the same time, then certain diagnostic trouble codes (the oldest) will have these frozen values/counters erased, this to save memory in the control module. These diagnostic trouble codes will then only have counter 2 left. Note also that counter 2 will also be erased when the memory is full, but often later than when other counters are erased.**

NOTE: ***For system with diagnostic concept Volvo Diagnostics II.*** **If many diagnostic trouble codes are stored at the same time, the control module keeps at least half of the oldest and half of the newest diagnostic trouble codes in the trouble code memory.**

NOTE: **For diagnostic trouble codes where the malfunction is not detected for many driving cycles and where the malfunction is detected again, then frozen values and counter values are written over with new values, that is, the diagnostic trouble code is considered "new".**

Example 1, Intermittent malfunction

Fig. 52: Identifying Intermittent Malfunction Example 1
Courtesy of VOLVO CARS CORPORATION

1. Counter 1 = 5
2. Counter 2 = 2
3. Counter 3 = 25
4. Counter 4 = 10
5. Driving cycles

After the malfunction has been detected for the first time (driving cycle 0) the malfunction has been detected again in 9 of the first 20 driving cycles. Using this, the conclusion can be drawn that in 11 driving cycles the test has not been run or the malfunction has not been found, or a combination of these. After the last time that the malfunction was detected, 5 driving cycles have passed, where the test was run in 2 driving cycles without

detecting a malfunction.

Conclusion: Intermittent malfunction

Assessment: Good possibility to repeat the malfunction and customer symptom, and thus succeed with troubleshooting, as the malfunction has been found quite recently in several driving cycles.

Example 2, Permanent malfunction

Fig. 53: Identifying Permanent Malfunction Example 2
Courtesy of VOLVO CARS CORPORATION

1. Counter 1 = 0
2. Counter 2 = 0
3. Counter 3 = 25
4. Counter 4 = 26
5. Driving cycles

After the malfunction has been detected for the first time the malfunction has been detected again in all following driving cycles.

Conclusion: Permanent malfunction

Assessment: Very good possibility to repeat the customer symptom and thus succeed with troubleshooting, as the malfunction has been found in every driving cycle. Since the malfunction has been detected during the present driving cycle it does not really matter for troubleshooting if the malfunction has been detected in all previous driving cycles or not.

The counter show more how "sure" the malfunction is as well as that it can confirm if the customer experienced the malfunction as the counter indicates.

Example 3, Intermittent malfunction

Fig. 54: Identifying Intermittent Malfunction Example 3
Courtesy of VOLVO CARS CORPORATION

1. Counter 1 = 122
2. Counter 2 = 122
3. Counter 3 = 125
4. Counter 4 = 4
5. Driving cycles

After the malfunction has been detected for the first time the malfunction has been detected again in the 3 following driving cycles. After the last time that the malfunction was detected, 122 driving cycles have passed, where the test has been run in 122 driving cycles without detecting a malfunction.

Conclusion: Intermittent malfunction

Assessment: Not very good chance to repeat the malfunction and the customer symptom and thus succeed with troubleshooting, as the malfunction has only been detected in a few driving cycles a very long time ago.

The less driving cycles a malfunction has been detected in and the greater the number of driving cycles since the malfunction was detected the last time, the more difficult it is expected to be to repeat the malfunction and the customer symptom and thus succeed with troubleshooting.

This can be read off by the lower value is on counter 4 and the higher the value is on counter 1 and 2, as well as the lower the difference is between the value on counter 3 and counter 2, the more difficult it is expected to be to repeat the malfunction and the customer symptom and thus succeed with troubleshooting.

Example 4, Intermittent malfunction

Fig. 55: Identifying Intermittent Malfunction Example 4
Courtesy of VOLVO CARS CORPORATION

1. Counter 1 = 25
2. Counter 2 = 25
3. Counter 3 = 25
4. Counter 4 = 1
5. Driving cycles

After the malfunction has been detected for the first time, the malfunction has never been detected again. After the last time that the malfunction was detected, 25 driving cycles have passed, where the test has run in 25 driving cycles without detecting a malfunction.

Conclusion: Intermittent malfunction

Assessment: Not very good chance to repeat the malfunction and the customer symptom and thus succeed with troubleshooting, as the malfunction has only been detected in one driving cycle quite a long time ago.

Example 5 Unknown status

Fig. 56: Identifying Unknown Status Example 5
Courtesy of VOLVO CARS CORPORATION

1. Counter 1 = 25
2. Counter 2 = 0
3. Counter 3 = 25
4. Counter 4 = 1
5. Driving cycles

After the malfunction has been detected for the first time, the malfunction has never been tested and/or detected. After the last time that the malfunction was detected, 25 driving cycles have passed where the test has not been started. Since the diagnostic trouble code test has not started anymore, it cannot be decided if the malfunction exists or not.

Conclusion: Unknown status

Assessment: Read diagnostic trouble code information and try to achieve condition so that the diagnostic trouble code test is started and run, which makes it possible to detect the malfunction. If the malfunction is detected, chances are very good to repeat the customer symptom, and thus succeed with troubleshooting when the malfunction has been found in the current driving cycle.

If the malfunction was not detected even though conditions are fulfilled, then chances are less good to repeat the customer symptom, and thus succeed with troubleshooting as the malfunction has not been found in the current driving cycle.

TO DECIDE DIAGNOSTIC TROUBLE CODE TEST'S STATUS

By reading out the diagnostic trouble code with associated status identifier, then *status for the diagnostic trouble code test that detects the malfunction and generates the diagnostic trouble code, is obtained.*

Example 1, Permanent malfunction

Status identifier:

	Malfunction found the last time that the diagnostic trouble code test was run during current driving cycle	=	Yes
	Malfunction found at least once during the current driving cycle	=	Yes
	Malfunction found at least once during the current and previous driving cycles	=	Yes
	Malfunction found recently since erasing of diagnostic trouble codes	=	Yes
	Diagnostic trouble code test run at least once since erasing of diagnostic trouble codes	=	Test run
	Malfunction found at least once since erasing of diagnostic trouble codes	=	Yes
	Diagnostic trouble code test run at least once during the current driving cycle	=	Test run

	Request for lit warning light/text message	=	Yes

The diagnostic trouble code test has been run in both current driving cycle and in earlier driving cycles. Malfunction has been detected both in current driving cycle and in previous driving cycle, which indicates that the malfunction is active right now. The control module has requested lighting of the warning light.

Conclusion: Permanent malfunction.

Assessment: Very good chance to repeat the customer symptom and thus succeed with troubleshooting, as the malfunction has been found in current and in previous driving cycle. Since the malfunction has been detected during the present run cycle, it does not really matter for troubleshooting if the malfunction has been detected in all previous driving cycles or not. If this information is supplemented with the counters' values you can decide how "permanent" the malfunction is.

If the vehicle is stationary, e. g., with the ignition on, this means that the test runs directly when the ignition is turned on. This makes it easier to both fins the malfunction and to verify that the malfunction cause has been take care of.

Example 2, Unknown status

Status identifier:

	Malfunction found the last time that the diagnostic trouble code test was run during current driving cycle	=	No
	Malfunction found at least once during the current driving cycle	=	No
	Malfunction found at least once during the current and previous driving cycles	=	Yes
	Malfunction found recently since erasing of diagnostic trouble codes	=	Yes
	Diagnostic trouble code test run at least once since erasing of diagnostic trouble codes	=	Test run
	Malfunction found at least once since erasing of diagnostic trouble codes	=	Yes
	Diagnostic trouble code test run at least once during the current driving cycle	=	Test not run
	Request for lit warning light/text message	=	No

The diagnostic trouble code test has been run in previous run cycles but not in current driving cycle. Malfunction has been detected in previous run cycle, but not in current driving cycle since the test has not started. Warning light is on.

Conclusion: Unknown status

Assessment: Since the test has not started in the current driving cycle it is not possible to decide if the malfunction is "active" right now. First read the diagnostic trouble code information and try to obtain conditions

so that the test is started and run, which enables detection of the malfunction. If the malfunction is detected, chances are very good to repeat the customer symptom, and thus succeed with troubleshooting as the malfunction has been found in the current driving cycle.

If the malfunction was not detected even though conditions are fulfilled, then chances are less good to repeat the customer symptom, and thus succeed with troubleshooting as the malfunction has not been found in the current driving cycle.

TO DECIDE OPERATION CONDITIONS WHEN THE MALFUNCTION WAS DETECTED

Malfunctions in a system may be intermittent. It is important to remember this when troubleshooting a possible malfunction cause. If the malfunction is not in the vehicle when it is in the workshop you can miss a malfunction cause since the values may be correct when troubleshooting takes place. A good indication of when the malfunction first occurred for the first time are the frozen values that can be read out for every diagnostic trouble code.

The frozen values are stored immediately after a malfunction has been detected. Most parameters in the frozen values are the same for all malfunctions and indicate a general condition when a malfunction has been detected, e. g., engine rpm, load, coolant temperature, vehicle speed and battery voltage. Some of them have been selected to give a better understanding of the specific malfunction.

Diagnostic trouble code *ECM-903F Electronic throttle unit, internal malfunction* cam be used as an example of how frozen values can be used.

The first possible source indicated in VIDA is the voltage feed to the electronic throttle unit and then continues by suggesting that you check the battery and charging system. However, the battery's condition when the vehicle is in the workshop does not necessarily show the battery voltage when the malfunction was detected.

Instead, the best information is found in the frozen values, that is, voltage that the Engine control module (ECM) detects when Electronic throttle module (ETM) indicated the malfunction.

However, you should remember that this is not an indication of voltage feed to Electronic throttle module (ETM), it is voltage feed to Engine control module (ECM). If Engine control module (ECM) according to frozen values has had good voltage the battery was okay. Therefore, voltage feed to Electronic throttle module (ETM) should be checked separately.

Frozen values for ECM 903F:

- Condition, heated oxygen sensor control bank 1 = LR: Closed circuit with two sensors
- Condition, heated oxygen sensor control bank 2 = LR: Closed circuit with two sensors
- Calculated load = 4.71%
- Engine temperature = 87 °C
- Fuel adaption, quick adjustment, bank 1 = 15.63%
- Fuel adaption, slow adjustment, bank 1 = -0.78%
- Fuel adaption, quick adjustment, bank 2 = 23.44%
- Fuel adaption, slow adjustment, bank 2 = -0.78%

- Engine speed = 760 rpm
- Vehicle speed = 0 km/h
- Boost pressure = 30%
- Battery voltage = 12.50 V
- Throttle angle, desired value = 14.84%
- Air mass = 23.8 kg/h
- Outside temperature = 33 °C

In this case we assume that the vehicle had low battery voltage in the workshop. However, as can be seen in the frozen values, battery voltage was okay when the malfunction occurred, so this was probably not the cause.

This is an example of how frozen values can be used to increase efficiency of troubleshooting and avoid using too much time for incorrect troubleshooting. This prevents troubleshooting and fixing a malfunction that was not the real cause of the problem that was to be solved.

The odometer reading (km) is sometimes included in frozen values in Engine control module (ECM). This enables a quick comparison with the odometer so that you can assess if the malfunction occurred as part of the troubleshooting and can be ignored. For example, CAN-network-related diagnostic trouble codes are saved when the battery voltage drops during work on the vehicle since passenger compartment lighting and other loads drain the battery.

The frozen values indicate odometer reading in km. If you multiply this value by factor 0.62 you obtain driving distance in miles. Current driving distance in both miles and km can be read out with VIDA (Volvo scan tool).

Keep the following in mind when using frozen values for troubleshooting.

The frozen values to be used with care are those stored for the CAN-net and are related to diagnostic trouble codes for Electronic throttle module (ETM).

If Electronic throttle module (ETM) detects that communication to Engine control module (ECM) is interrupted, then malfunction flags will be generated in Electronic throttle module (ETM). These malfunction flags will be sent to Engine control module (ECM) first when communication on the CAN-net works again.

This means that Engine control module (ECM) will store the diagnostic trouble codes first when Electronic throttle module (ETM) delivers them, which in turn means that it is at this point in time that the frozen values are saved. For Electronic throttle module (ETM) this means that the frozen values will be from a point in time after the malfunction first occurred.

DIFFERENTIAL ELECTRONIC MODULE (DEM) (4T65 AWD; 2005-2006)

DESIGN

see **DESIGN**

DIAGNOSTIC FUNCTIONS

GENERAL

The control module has a built-in diagnostic system, Volvo Diagnostic, which continuously monitors internal functions as well as input and output signals.

DIAGNOSTIC TROUBLE CODES (DTCS)

A diagnostic trouble code (DTC) is stored if the control module detects a fault. Should a fault disappear for any reason after being permanently stored in the control module as a diagnostic trouble code (DTC), the information remains stored in the control module.

READING AND ERASING DIAGNOSTIC TROUBLE CODES (DTCS)

Stored diagnostic trouble codes (DTCs) can be read off and erased using this function.

Diagnostic trouble codes (DTCs) can only be erased once all the diagnostic trouble codes (DTCs) have been read off at least once.

READING OFF INPUT AND OUTPUT SIGNALS

This function can be used to continuously read off the status of the control module's input and output signals.

For further information about parameters, see **DESCRIPTION OF PARAMETERS**

READING OFF THE CONTROL MODULE IDENTIFICATION

VIDA identifies control modules by reading off a number of codes from the control module memory.

The codes contain information about the control module:

- hardware P/N (control module without software)
- hardware serial number (control module without software)
- software P/N
- diagnostic software P/N.

DIFFERENTIAL ELECTRONIC MODULE (DEM) (TF-80SC AWD; 2005-2008)

DESIGN

CONTROL MODULE

Fig. 57: Identifying Differential Electronic Module (DEM)
Courtesy of VOLVO CARS CORPORATION

Differential Electronic Module (DEM) is directly secured onto the clutch unit housing and together with the axial solenoid constitutes one unit. The axial solenoid controls the control valve.

The Differential Electronic Module (DEM) receives signals via the Controller Area Network (CAN)

from:

- Engine Control Module (ECM)
- Central Electronic Module (CEM)
- Brake Control Module (BCM)
- Driver Information Module (DIM).

Conducted by these signals, the Differential Electronic Module (DEM) determines how high the oil pressure to the clutch unit should be. The oil pressure to the clutch driven plates is decisive for how much torque can be transferred to the rear wheels.

Four-wheel drive does not function in the event of a fault in the Differential Electronic Module (DEM).

OIL PRESSURE AND TEMPERATURE SENSOR

Fig. 58: Identifying Oil Pressure And Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

The oil pressure and temperature sensor is fitted close to the axial solenoid in the Differential Electronic Module (DEM) housing. The sensor is flushed with hydraulic oil. The sensor measures the temperature and pressure (measurement range 0 - 4 MPa) of the hydraulic oil. The sensor sends a signal on temperature and pressure to the control module. The control module uses the signal to adapt the function of the system when the temperature of the oil and its subsequent viscosity is changed.

If the temperature of the oil exceeds 105 °C then the clutch is depressurized and four-wheel drive is disconnected. When the temperature falls below 101 °C the clutch is pressurized again. The pressure of the oil is limited to max. 10.3 MPa by the safety valve.

Four-wheel drive does not function in the event of any fault in the temperature sensor, and the function is significantly reduced in the event of a fault in the pressure sensor.

The oil pressure and temperature sensor can be diagnosed.

CONTROL VALVE/AXIAL SOLENOID

Fig. 59: Identifying Control Valve / Axial Solenoid
Courtesy of VOLVO CARS CORPORATION

The control valve/axial solenoid is located in the Differential Electronic Module (DEM) housing.

The control module supplies a variable pulse width modulated (PWM) signal to the axial solenoid. The solenoid changes the position of the control valve in accordance with the control signal. The pressure to the working piston of the clutch driven plates is controlled in this way.

Four-wheel drive does not function in the event of a fault in the control valve/axial solenoid.

The control valve/axial solenoid can be diagnosed.

ELECTRICAL FEED PUMP

Fig. 60: Identifying Electrical Feed Pump
Courtesy of VOLVO CARS CORPORATION

The electrical feed pump is fitted on the clutch unit and is supplied with voltage from the Differential Electronic Module (DEM). When the engine is started and reaches an engine speed of over 400 rpm the electrical feed pump is supplied with voltage from the control module.

The feed pump pumps oil to the axial pistons whose rollers are applied to the cam disc. At the same time oil flows to the working piston so that the play in the disc package is eliminated and the clutch's capacity for rapid

reaction and control is prepared.

Four-wheel drive does not function in the event of a fault in the feed pump.

The feed pump can be diagnosed.

DIAGNOSTIC FUNCTIONS

GENERAL

The control module has an integrated diagnostic system, which continuously monitors its own system as well as the input and output signals.

DIAGNOSTIC TROUBLE CODES (DTC)

If the control module detects a fault then it stores a diagnostic trouble code (DTC). If a fault disappears for any reason after a diagnostic trouble code (DTC) has been permanently stored in the control module then the information on the diagnostic trouble code (DTC) remains in the control module.

READING AND ERASING DIAGNOSTIC TROUBLE CODES (DTC)

Stored diagnostic trouble codes (DTC) can be read off and erased using this function.

NOTE: Diagnostic trouble codes (DTC) can be erased even if all diagnostic trouble codes (DTC) have not been read off at least once.

READING OFF INPUT AND OUTPUT SIGNALS

The status for the control module input and output signals can be continuously read off using this function.

For more information on parameters, see: **DESCRIPTION OF PARAMETERS**

READING OFF THE CONTROL MODULE IDENTIFICATION

The control module can be identified by means of reading off a number of codes.

The codes contain information about the control module:

- hardware P/N (control module without software)
- hardware serial number (control module without software)
- software P/N
- diagnostic software P/N

DOWNLOADING SOFTWARE AND REPLACING THE CONTROL MODULE

New software can be downloaded into the Differential Electronic Module (DEM). When software is ordered the software and hardware of the vehicle are compared with Volvo's central database. If the comparison

corresponds then the software is downloaded into the control module.

If the comparison between the car and Volvo's central database does not correspond, then the database is updated with the vehicle's configuration. When this is complete the software is downloaded.

The control module is fitted on the clutch unit and can be replaced. Control module replacement also involves replacing the control valve/axial solenoid, this is because the control module and control valve/axial solenoid are fitted and calibrated in the factory as one unit.

FUNCTION

ELECTRONIC FUNCTION

Fig. 61: Active On Demand Coupling Electronic Function
Courtesy of VOLVO CARS CORPORATION

1. Oil pressure and temperature sensor
2. Differential Electronic Module (DEM)
3. Control valve/axial solenoid
4. Electrical feed pump

The Differential Electronic Module (DEM) is directly secured onto the clutch unit and together with the axial solenoid and control valve constitutes one unit. Amongst other things the Differential Electronic Module

(DEM) communicates with the Engine Control Module (ECM) and the Brake Control Module (BCM) via the Controller Area Network (CAN). Conducted by the sensor signals, the Differential Electronic Module (DEM) controls the oil pressure to the clutch driven plates by adjusting the axial solenoid. The axial solenoid has variable control over the control valve by means of a pulse width modulated (PWM) signal. The basic pressure in the system is built up by the electrical feed pump. The oil pressure to the clutch driven plates is decisive for how much torque can be transferred to the rear wheels.

NOTE: If the car has dynamic stability and traction control (DSTC), the required stability control is applied before four wheel drive.

Active On demand Coupling (AOC) is equipped with an oil pressure and temperature sensor, which measures the prevailing temperature and pressure in the hydraulic oil. The oil pressure and temperature sensor informs the Differential Electronic Module (DEM) on the temperature and the pressure. If the temperature is too high, above 105 °C, then the four-wheel drive is disconnected to protect the clutch unit from damage. When the temperature falls below 101 °C the clutch unit is reconnected with full functionality.

To protect driveshafts and joints, the Differential Electronic Module (DEM) has functions that reduce the torque that is transferred to the rear wheels in certain situations.

"Trailer detection" is an example of one of these functions. This function is based means that if a trailer is coupled to the vehicle and the driving conditions are such that the front wheels slip on the surface, the Differential Electronic Module (DEM) will transfer less torque to the rear wheels than it would have done without a trailer.

This results in most of the torque remaining on the front wheels, which protects the rear wheel driveshafts and drive joints from extreme loads.

MECHANICAL FUNCTION, OVERVIEW

4. Axial piston
5. Working piston
6. Input shaft
7. Cam disc
8. Housing for outer clutch driven plates
9. Outer clutch driven plates
10. Inner clutch driven plates
11. Compression springs
12. Output shaft

The engine torque is transferred to the propeller shaft via the transmission. The input shaft is separated from the output shaft. The disc package must be applied to transfer torque to the rear axle. Inner and outer wet clutch plates are the power transmission points between the input and output shafts.

The cam disc, which is sine shaped, rotates at the same speed as the propeller shaft. The axial piston rollers run

on the cam disc's roller coaster and press the axial piston in and out, which creates an oil pressure which acts on the working piston, which in turn applies the disc package.

HYDRAULIC FUNCTION, OVERVIEW

12. Oil filter
13. Suction valves

14. Piston pump
15. Working piston
16. Wet disc package
17. Bearings
18. Compression springs

Active On demand Coupling (AOC) can be explained as a hydraulic pump.

The basic pressure in the system is built up by the electrical feed pump. This way the axial pistons are pressurized with oil so that they are pressed against the cam disc via the rollers. The axial piston builds up a working pressure which is conducted to the working piston via the pressure valves. This pressure creates a fixed connection between the input and output shafts. The maximum pressure is limited by the pressure limiting valve. The difference in speed between the input and output shafts is proportional in accordance with the oil pressure to the axial pistons. A large difference in speed between the input and output shafts provides high oil pressure to the axial pistons. The same speed on the input and output shafts provides lower oil pressure to the axial pistons. The oil pressure on the clutch driven plates is controlled by the control valve. The axial solenoid controls the control valve. A closed control valve provides maximum pressure to the clutch driven plates, which provides maximum power transmission. An open control valve provides minimum pressure to the clutch driven plates, which provides a limited power transmission.

The accumulator maintains the basic pressure in the system. The oil filter keeps the oil free from dirt and small particles which can damage the system.

PRETENSIONING

The function of the four-wheel drive system is based in there being a difference in speed between front and rear wheels. This difference in speed can affect traction performance in certain driving situations. The role of the pretensioning function is to improve traction performance, primarily in starting off from being stationary, without affecting other properties of the system to achieve this.

The pretensioning function is obtained by means of the feed pump building up a basic pressure. A pretensioning of the clutch unit is generated by means of this increase in pressure, and the engine torque can be transferred to both rear and front wheels. The pretensioning functionality is controlled by software so that activation only takes place when necessary.

SYSTEM OVERVIEW

ACTIVE ON DEMAND COUPLING (AOC)

Fig. 64: Active On Demand Coupling (AOC)
Courtesy of VOLVO CARS CORPORATION

The most important function of Active On demand Coupling (AOC) and its Differential Electronic Module (DEM) is to control the four-wheel drive function, i. e. power distribution between front and rear axles. The system consists of a clutch assembly with a mechanical, hydraulic and electronic section. The clutch unit is located on the rear axle, between the final drive and the propeller shaft. The mechanical section is driven by the propeller shaft. The hydraulic section is driven by the difference in speed arising between propeller shaft rotation and rear axle rotation.

Active On demand Coupling (AOC) enables the following characteristics:

- Permanent four-wheel drive with electronic control of transferred torque.
- A driving character equivalent to front-wheel drive.
- Rapid reactions.
- No opposing forces when maneuvering or parking.
- The system is not so sensitive to differences between the tires, e. g. when driving with the spare wheel.
- Not sensitive to towing with an axle lifted.
- Not sensitive to brake testing on a chassis dynamometer.

CLUTCH UNIT AND CONTROL MODULE

Fig. 65: Coupling Unit And Control Module
Courtesy of VOLVO CARS CORPORATION

The hydraulic section consists of 1-5, the mechanical consists of 6-10 and the electronic section consists of 11-13:

1. Pressure valves
2. Accumulator
3. Oil filter
4. Ring pistons
5. Control valve/axial solenoid
6. Input shaft
7. Inner and outer wet clutch plates
8. Inner clutch hub with sine shape cam disc
9. Rollers with ring pistons
10. Output shaft
11. Electrical feed pump

12. Differential Electronic Module (DEM)
13. Oil pressure and temperature sensor

The Differential Electronic Module (DEM) is fitted on the clutch unit housing.

The Differential Electronic Module (DEM) communicates with other control modules via Controller Area Network (CAN) communication:

The control module has an integrated diagnostic system.

SIGNALS

The table below summarizes input and output signals to and from the Differential Electronic Module (DEM). The illustration below displays the same information with the Volvo component designations.

Input signals	Output signals
Directly connected: • **Oil pressure and temperature sensor**	**Directly connected:** (supply voltage unless otherwise specified) • **Electrical feed pump** • **Axial solenoid** - pulse width modulated (PWM) signal
Via Controller Area Network (CAN) communication: • **Central Electronic Module (CEM)** (4/56), informs on the position of the ignition key and reverse gear status amongst other things. • **Brake Control Module (BCM)** (4/16), informs on the speed of the wheels from the wheel speed sensors and ABS modulation status amongst other things. • **Driver Information Module (DIM)** (5/1), informs on parking brake switch status. • **Engine Control Module (ECM)** (4/46), informs on engine speed, driver engine torque request, calculated engine torque, accelerator pedal position, stop lamp switch status and clutch pedal switch status, amongst other things.	**Via Controller Area Network (CAN) communication:** • **Brake Control Module (BCM)** (4/16), receives information on clutch unit status and torque transferred to the rear axle. • **Central Electronic Module (CEM)** (4/56), receives information on the diagnostic status of the Differential Electronic Module (DEM).

Fig. 66: Differential Electronic Module (DEM) Network

DIFFERENTIAL ELECTRONIC MODULE (DEM) (TF-80SC AWD; 2009-2012)

DESIGN

CONTROL MODULE

Fig. 67: Differential Electronic Module (DEM)
Courtesy of VOLVO CARS CORPORATION

The differential electronic module (DEM) is secured directly to the coupling unit's housing and makes up unit with the pressure reducing valve. The control module and the pressure reducing valve are calibrated together at the factory and can therefore only be replaced together.

Via the controller area network (CAN), the differential electronic module (DEM) receives signals from:

- engine control module (ECM).
- central electronic module (CEM)
- brake system control module (BCM)
- driver information module (DIM).

Conducted by these signals, the Differential Electronic Module (DEM) determines how high the oil pressure to the clutch unit should be. The oil pressure to the clutch driven plates is decisive for how much torque can be transferred to the rear wheels.

In case of Differential electronic module (DEM) failure, four-wheel drive may be reduced or lost completely.

PRESSURE REDUCING VALVE

Fig. 68: View of Pressure Reducing Valve
Courtesy of VOLVO CARS CORPORATION

The pressure reducing valve is located in the Differential electronic module (DEM).

The pressure reducing valve receives a constant pulse width modulated (PWM) signal from the control module. The control signal from the control module changes the position of the pressure reducing valve. This regulates the pressure to the discs' operating piston.

In case of diagnostics failure of the pressure reducing valve, four-wheel drive is lost.

The pressure reducing valve can be diagnosed.

ELECTRICAL FEED PUMP.

Fig. 69: View of Electrical Feed Pump
Courtesy of VOLVO CARS CORPORATION

The electric feed pump is located on the clutch unit and is supplied with voltage from the Differential electronic module (DEM).

The pump starts at ignition on and then works up a max. oil pressure of 35 bar. This is to always enable request for full torque. Then the pump is shut off until the pressure has dropped to 50%, then it starts again. If the pump does not reach max. pressure within 15 seconds, it is shut off and is then started again. This is calculated via a current measuring algorithm in the Differential electronic module (DEM). The pump works in intervals so that it is not damaged in case of a malfunction, e. g., leakage, in the system. The time interval that the pump works between depends on the temperature. At normal room temperature the pump runs at approx. 20-30 second intervals.

Four-wheel drive does not function in the event of a fault in the feed pump.

The feed pump can be diagnosed.

OIL FILTER WITH NON-RETURN VALVE

Fig. 70: View of Oil Filter With Non-Return Valve
Courtesy of VOLVO CARS CORPORATION

The hydraulic oil is pumped to the accumulator tank via an oil filter. The oil filter keeps the oil free from dirt

and small particles that can damage the system. There is a non-return valve installed in the oil filter.

In case of oil filter malfunction, a trouble code may be generated.

The oil filter can be diagnosed

DIAGNOSTIC FUNCTIONS

GENERAL

The control module has an integrated diagnostic system, which continuously monitors its own system as well as the input and output signals.

DIAGNOSTIC TROUBLE CODES (DTCS)

If the control module detects a fault then it stores a diagnostic trouble code. If a fault disappears for any reason after a diagnostic trouble code has been permanently stored in the control module then the information on the diagnostic trouble code remains in the control module in a number of driving cycles that can be calibrated.

READING AND ERASING DIAGNOSTIC TROUBLE CODES (DTCS)

Stored diagnostic trouble codes (DTCs) can be read off and erased using this function.

NOTE: Diagnostic trouble codes (DTCs) can be erased without having been read off.

READING OFF INPUT AND OUTPUT SIGNALS

This function can be used to continuously read off the status of the control module's input and output signals.

READING OFF THE CONTROL MODULE IDENTIFICATION

The control module can be identified by means of reading off a number of codes.

The codes contain information about the control module:

- hardware P/N (control module without software)
- hardware serial number (control module without software)
- software P/N
- diagnostic software P/N.

DOWNLOADING SOFTWARE AND REPLACING THE CONTROL MODULE

New software can be downloaded into the Differential Electronic Module (DEM). When software is ordered the software and hardware of the vehicle are compared with Volvo's central database. If the comparison corresponds then the software is downloaded into the control module.

If the comparison between the car and Volvo's central database does not correspond, then the database is

updated with the vehicle's configuration. When this is complete the software is downloaded.

The control module is fitted on the clutch unit and can be replaced. Control module replacement also involves replacing the pressure reducing valve, this is because the control module and pressure reducing valve are installed and calibrated in the factory as one unit.

FUNCTION

ELECTRONIC HYDRAULIC FUNCTION

Fig. 71: Electronic Hydraulic Schematic
Courtesy of VOLVO CARS CORPORATION

1. Differential electronic module (DEM)
2. Electrical feed pump.
3. Oil filter with non-return valve
4. Pressure reducing valve (installed on Differential electronic module (DEM))
5. Disc pack
6. Accumulator tank

Differential electronic module (DEM) is mounted directly on the clutch unit and makes up a unit together with the pressure reducing valve.

Differential electronic module (DEM) communicates with, among others, Engine control module (ECM) and Brake control module (BCM) via the CAN-net. With guidance of the sensor signals, Differential Electronic Module (DEM) controls the oil pressure to the discs through the pressure reducing valve.

The pressure reducing valve is controlled endlessly by a pulse-width modulated (PWM)-signal.

The electric feed pump starts at ignition on and immediately works up a maximal hydraulic pressure in the accumulator. When max. pressure has been reached, the feed pump shuts off until the pressure has dropped below 50% again. Then the feed pump starts again and builds up the max. pressure.

This procedure is calculated by Differential electronic module (DEM) using various parameters. In the accumulator the pressurized oil is routed to the clutch via the pressure reducing valve. Differential electronic module (DEM) controls the valve so that correct working pressure is obtained, 0-27.5 bar. The oil pressure to the discs is decisive to how much torque can be transmitted to the rear wheels.

MECHANICAL FUNCTION, OVERVIEW

Fig. 72: Cutaway View
Courtesy of VOLVO CARS CORPORATION

1. Output shaft.
2. Input shaft
3. Inner and outer wet clutch plates

4. Operating piston

The transmission and bevel gear transfers engine torque to the propeller shaft. The input shaft is joined to the clutch's output shaft via the multi-plate clutch pack. The multi-plate clutch in the coupling must be engaged to transfer torque to the rear axle. The inner and outer wet multi-plate clutch are the transfer point between the input and output shafts.

The feed pump builds up an oil pressure which then Differential electronic module (DEM) controls via the pressure reducing valve, so that correct pressure is obtained. Then the working piston is applied against the disc pack so that the clearance is eliminated and the clutch is prepared to enable quick reaction and control. At 27.5 bar deployed pressure from the pressure reducing valve max. torque is reached, 1, 500 Nm, through the clutch to the rear wheels already at start.

SYSTEM OVERVIEW

POWER TRANSMISSION

Fig. 73: Power Transmission Overview
Courtesy of VOLVO CARS CORPORATION

1. **Bevel gear:** Transmits torque from transmission to propeller shaft. Always rotates at the same rate as the front wheel pair.
2. **Propeller shaft:** Transmits torque from front axle (bevel gear) to rear axle. Always rotates at the same

rate as the front wheel pair.

3. **Active On demand Coupling (AOC):** At four-wheel drive, the AOC transmits torque from the propeller shaft to the rear wheel pair. Rotates at four-wheel drive.
4. **Differential gear:** Transmits the force to the rear wheel pairs. Rotates at the same rate as the front wheels at four-wheel drive.

ACTIVE ON DEMAND COUPLING (AOC)

Fig. 74: View of Active On Demand Coupling (AOC)
Courtesy of VOLVO CARS CORPORATION

Active On demand Coupling (AOC) and its Differential electronic module (DEM), has as its most important function to control the function for four-wheel drive, that is, power distribution between front and rear axle.

The system consists of an integrated clutch with a mechanical, a hydraulic, and an electronic part.

The clutch unit is located on the rear axle, between the final drive and the propeller shaft. The mechanical part is driven by the propeller shaft. The hydraulic part is driven by an electric pump.

Active On demand Coupling (AOC) generation 4 enables the following characteristics:

- Continuous control of four wheel drive, with electronic control of torque transfer.
- Rapid reactions
- No opposing forces when maneuvering or parking.
- Improved stability.
- Reduction of oversteering/understeering.
- Permanent capacity for four-wheel drive.

CLUTCH UNIT AND CONTROL MODULE

6. Input shaft
7. Electrical feed pump.
8. Differential electronic module (DEM)
9. Non-return valve
10. Annular piston

The Differential Electronic Module (DEM) is fitted on the clutch unit housing.

The Differential Electronic Module (DEM) communicates with other control modules via Controller Area Network (CAN) communication:

The control module has integrated diagnostics for its own components and functions.

SIGNALS

The table below summarizes input and output signals to and from the Differential Electronic Module (DEM). The illustration below displays the same information with the Volvo component designations.

Input signals	Output signals
Directly connected: -	**Directly connected:** (power supply unless otherwise stated) • **Electric feed pump** (internal in AOC) - pulse-width modulated (PWM) signal • **Pressure reducing valve** (internal in AOC) - pulse-width modulated (PWM) signal
Via Controller Area Network (CAN) communication: • **central electronic module (CEM)** (4/56), provides the status of, among other things, the ignition position and the back-up (reverse) gear. • **Brake Control Module (BCM)** (4/16), informs on the speed of the wheels from the wheel speed sensors and ABS modulation status amongst other things. • **Driver Information Module (DIM)** (5/1), informs on parking brake switch status. • **Engine Control Module (ECM)** (4/46), informs on engine speed, driver engine torque request, calculated engine torque, accelerator pedal position, stop lamp switch status and clutch pedal switch status, amongst other things. • **Trailer module (TRM)** (4/110), provides information about whether a trailer is connected to the vehicle or not.	**Via Controller Area Network (CAN) communication:** • **Brake control module (BCM)** (4/16), receives information about the status of the coupling unit and current torque capacity for the rear axle. • **Central Electronic Module (CEM)** (4/56), receives information on the diagnostic status of the Differential Electronic Module (DEM). • **Driver information module (DIM)** (5/1), via Central electronic module (CEM) receives information about malfunction messages from Differential electronic module (DEM). These are shown to the driver as text messages and warning symbols.

Fig. 76: Network Diagram

DRIVER DOOR MODULE (DDM) AND PASSENGER DOOR MODULE (PDM) (2003-2012)

DESIGN

THE DOOR LOCK

The passenger door module (PDM) and driver door module (DDM) have diagnostics for the front door locks.

THE POWER WINDOW MECHANISM

Fig. 77: Identifying Power Window Mechanism
Courtesy of VOLVO CARS CORPORATION

The window lift mechanism on the driver's side is operated via the driver door module (DDM). The window lift mechanism on the passenger side is operated either via the passenger door module (PDM) or via the driver door module (DDM).

The window lift mechanisms in both rear doors can be operated via the driver door module (DDM). The window lift mechanisms in the front and rear doors can be operated when the ignition key is in position I or II. The power windows can be operated from when the ignition is switched off until one of the front doors is opened.

The driver door module (DDM) has four spring loaded switches which operate the individual front and rear windows.

The passenger door module (PDM) has a spring loaded switch which operates the window in the front passenger door. The switches in the driver door module (DDM) which control the rear windows can only be activated up or down. The rear windows move up or down for as long as the switch is activated.

The switches for the front windows have five positions which control the position of the window:

0) Normal position where the function is passive.

1) step 1 upwards, raises the window for as long as the button is activated.

2) step 2 upwards, automatically fully closes the window (AUTO-UP).

-1) step 1 downwards, lowers the window for as long as the button is activated.

-2) step 2 downwards, fully opens the window automatically (AUTO-DOWN).

The rear windows are powered via the central electronic module (CEM). However they can be disabled using a child lock switch on the driver door module (DDM). When the child lock is activated, the rear windows cannot be operated from the rear seats. They can still be operated however from the driver door module (DDM).

The front window lift mechanisms have a Hall sensor which measures the rotation speed of each lift mechanism, allowing them to determine the position of the window. If a Hall sensor is not functioning in one of the window lift mechanisms, the AUTO-UP or AUTO-DOWN function for that window is not available. The power window lift mechanism, power window lift motor and Hall sensor form one unit and cannot be replaced separately.

The window lift mechanisms in the front doors have an inbuilt function to prevent trapping. When AUTO-UP is activated, the window lift mechanism detects whether there is any resistance, i. e. whether too much force is required to close the window. If so, the window stops and then lowers slightly. The anti-trapping system is active during AUTO-UP if the window is open more than 3 mm.

A diagnostic trouble code (DTC) is stored if for any reason the power window mechanism is unable to determine the window position. If this should happen, the power window mechanism must be re-initialized. This is carried out via a diagnostic function in VIDA (Volvo scan tool).

The passenger door module (PDM) and driver door module (DDM) have diagnostics for the window lift mechanisms and Hall sensors in the front doors.

DOOR MIRROR

Fig. 78: Door Mirror
Courtesy of VOLVO CARS CORPORATION

Motors

The motors for the door mirrors are operated via the driver door module (DDM).

The mirrors can be adjusted in the X and Y axes via the two motors for each mirror. Two buttons on the driver door module (DDM), marked L and R, are used to select either the right or left-hand mirror for adjustment. An LED lights in the button that is activated. Only one button can be activated at any one time (left or right). X and Y axis adjustment is made using a control which maneuvers the mirror in the selected direction for as long as the button is pressed (or until the mirror reaches a limit position). To deactivate the adjustment control, press the

left or right-hand button again so that the LEDs are off. The mirrors can be adjusted when the ignition key is in position I or II.

Power seats with memories for the door mirrors are optional equipment. This function requires that the position of the mirrors is saved when the car is locked. Two sensors in each mirror register the mirror position in the X and Y axes. This function has been available as an option since structure week 199950.

The door windows can be equipped as an option with a motor that allows the mirror housing to be folded in. The driver door module (DDM) and passenger door module (PDM) have diagnostics for the motor for folding in the door mirrors. However the activation signal is transmitted by the climate control module (CCM).

The motors and sensors used to set the position of the door mirrors form one unit and cannot be replaced separately.

Heating

The door mirrors contain a heating loop to defrost the glass. The heating loop is on the reverse of the mirror glass. In the event of a fault, the entire mirror glass must be replaced. The heating loops are supplied with power and ground by the driver door module (DDM) and passenger door module (PDM), which also have diagnostics for the loops. However the function is activated by the climate control module (CCM).

Lights in the door mirrors

As an option, the door mirrors can be equipped with lights. The lights are mounted on the underneath of the mirror housing. The driver door module (DDM) and passenger door module (PDM) have diagnostics for the outputs for the lights. However the function is activated by the upper electronic module (UEM) and the remote control.

Outside temperature

In the right-hand mirror there is a temperature sensor which measures the outside temperature. This temperature data is used by the combined instrument panel.

NOTE: This temperature sensor must not be confused with the temperature sensor in the left-hand mirror housing which is used by the engine control module (ECM).

The temperature sensor in the right-hand mirror housing can be replaced separately. The passenger door module (PDM) has diagnostics for the temperature sensor.

DOOR OPEN WARNING LAMP

Fig. 79: Door Open Warning Lamp
Courtesy of VOLVO CARS CORPORATION

There is a door open warning lamp in each front door which lights when the door is opened. The lamps are supplied with power via the driver door module (DDM) and passenger door module (PDM).

Since structure week 199950 door open warning lamps are no longer installed.

The driver door module (DDM) and passenger door module (PDM) have diagnostics for the door open warning lamps.

DIAGNOSTIC FUNCTIONS

DRIVER'S DOOR MODULE

See **DIAGNOSTIC FUNCTIONS, DRIVER'S DOOR MODULE (DDM)**.

PASSENGER DOOR MODULE (PDM)

See **DIAGNOSTIC FUNCTIONS, PASSENGER DOOR MODULE (PDM)**.

DIAGNOSTIC FUNCTIONS, PASSENGER DOOR MODULE (PDM)

GENERAL

The control module has a built-in diagnostic system, Volvo Diagnostic, which continuously monitors internal functions as well as input and output signals.

DIAGNOSTIC TROUBLE CODES (DTCS)

A diagnostic trouble code (DTC) is stored if the control module detects a fault. The passenger door module can store up to 10 diagnostic trouble codes (DTCs).

Should a fault disappear for any reason after being permanently stored in the control module as a diagnostic trouble code (DTC), the information remains stored in the control module.

READING AND ERASING DIAGNOSTIC TROUBLE CODES (DTCS)

Diagnostic trouble codes (DTCs) can only be erased once all the diagnostic trouble codes (DTCs) have been read off at least once.

READING OFF INPUT AND OUTPUT SIGNALS

This function can be used to continuously read off the values and status of the control module's input and output signals.

The key must not be in the ignition when reading off the status of the door mirror lamp.

Lock cable M1, status, is active while locking the central locking

Lock cable M2, status, is active while unlocking the central locking and / or deadlocks

Lock cable M3, status, is active while locking the deadlocks

The following parameters can be read off:

- The status of the front passenger window up-control
- The status of the front passenger window down-control
- The status of the front passenger window auto-control
- The status of the up-motor for the power window
- The status of the down-motor for the power window
- Lock cable M1, status
- Lock cable M2, status
- Lock cable M3, status
- The status of the door open warning lamp (does not apply to all cars)
- The status of the control for the door mirror
- Defroster, status
- Door mirror lamp, status
- Outside temperature, value

NOTE: The outside temperature can only be read off from the control module on the right-hand side of the car.

- Power supply, value
- Signal supply, value
- Door mirror position X axis, value (does not apply to all cars)
- Door mirror position Y axis, value (does not apply to all cars).

ACTIVATING COMPONENTS AND FUNCTIONS

Use this option to activate components / functions in the passenger door module.

The following components / parameters can be activated in alternative ways:

- The up / down control for the front passenger window
- Power window motor, up / down
- Lock cable M1
- Lock cable M2
- Door mirror motor
- Defroster
- Door mirror lamp
- Door open warning lamp (does not apply to all cars).

READING OFF AND PROGRAMMING DATA

With this option it is possible to read programmed data and to program in data.

NOTE: If the control module has been replaced, the position of the windows must be initiated using a diagnostic function. A window must be in its uppermost position before it can be initiated.

No customer related programming is available in the control module.

READING OFF THE CONTROL MODULE IDENTIFICATION

The diagnostic tool identifies control modules by reading off a number of codes from the control module memory.

The codes contain information about the control module:

- hardware P/N (control module without software)
- hardware serial number (control module without software)
- software P/N
- diagnostic software P/N.

DIAGNOSTIC FUNCTIONS, DRIVER'S DOOR MODULE (DDM)

GENERAL

The control module has a built-in diagnostic system, Volvo Diagnostic, which continuously monitors internal functions as well as input and output signals.

DIAGNOSTIC TROUBLE CODES (DTCS)

The control module will store a diagnostic trouble code (DTC) if it detects a fault. The driver's door module can

store up to 10 diagnostic trouble codes (DTCs).

Should a fault disappear for any reason after being permanently stored in the control module as a diagnostic trouble code (DTC), the information remains stored in the control module.

READING AND ERASING DIAGNOSTIC TROUBLE CODES (DTCS)

Diagnostic trouble codes (DTCs) can only be erased once all the diagnostic trouble codes (DTCs) have been read off at least once.

READING OFF INPUT AND OUTPUT SIGNALS

This function can be used to continuously read off the values and status of the control module's input and output signals.

The key must not be in the ignition when reading off the status of the door mirror lamp.

Lock cable M1, status, is active while locking the central locking

Lock cable M2, status, is active while unlocking the central locking and / or deadlocks

Lock cable M3, status, is active while locking the deadlocks

The following parameters can be read off:

- The status of the front left window up-control
- The status of the front left window down-control
- The status of the front left window auto-control
- The status of the front right window up-control
- The status of the front right window down-control
- The status of the front right window auto-control
- The status of the rear left window up-control
- The status of the rear left window down-control
- The status of the rear right window up-control
- The status of the rear right window down-control
- The status of the child safety button

NOTE: A diagnostic trouble code (DTC) is stored if the child safety button is activated for 10 seconds.

- The status of the selection of control for the left door mirror
- The status of the selection of control for the right door mirror
- The status of the upward control for the door mirror
- The status of the downward control for the door mirror

- The status of the control for the left door mirror
- The status of the control for the right door mirror
- The status of the up-motor for the power window
- The status of the down-motor for the power window
- Lock cable M1, status
- Lock cable M2, status
- Lock cable M3, status
- The status of the door open warning lamp (does not apply to all cars)
- Defroster, status
- Door mirror lamp, status
- Outside temperature, value

NOTE: The outside temperature can only be read off from the control module on the right-hand side of the car.

- Power supply, value
- Signal supply, value
- Door mirror position X axis, value (does not apply to all cars)
- Door mirror position Y axis, value (does not apply to all cars).

ACTIVATING COMPONENTS AND FUNCTIONS

Use this option to activate components / functions in the driver's door module.

The following components / parameters can be activated in alternative ways:

- The up / down control for the front left window
- The up / down control for the front right window
- The up / down control for the rear windows
- The selection of the left or right door mirror control
- Upwards / downwards / left / right door mirror control
- Power window motor, up / down
- Lock cable M1
- Lock cable M2
- Door mirror motor
- Defroster
- Door mirror lamp
- Door open warning lamp (does not apply to all cars).

READING OFF AND PROGRAMMING DATA

With this option it is possible to read programmed data and to program in data.

NOTE: **If the control module has been replaced, the position of the windows must be initiated using a diagnostic function. A window must be in its uppermost position before it can be initiated.**

No customer related programming is available in the control module.

READING OFF THE CONTROL MODULE IDENTIFICATION

The diagnostic tool identifies control modules by reading off a number of codes from the control module memory.

The codes contain information about the control module:

- hardware P/N (control module without software)
- hardware serial number (control module without software)
- software P/N
- diagnostic software P/N.

DOWNLOADING SOFTWARE AND REPLACING THE CONTROL MODULE

New software can be downloaded into the driver door module (DDM) and passenger door module (PDM). When ordering software, the hardware and the software in the car is compared to the data in the Volvo central database. If the comparison is OK the software is downloaded to the control module.

If the comparison between the car and Volvo central database is not OK, the database is updated with the car configuration. When this is complete the software is downloaded.

The window positions must be re-initialized after the driver door module (DDM) or passenger door module (PDM) is replaced. This is so that the new control module stores the closed position of the window. Initialization is carried out using VIDA (Volvo scan tool).

If the car has power seats with memory for the door mirrors, this function can be switched off. This means that the personal settings for the door mirrors, based on the remote control used to unlock the door, can be deactivated. Deactivation is carried out using VIDA (Volvo scan tool). This function can be switched off on cars from model year 2003. This setting will be stored in the control module after deactivation, but not in the Volvo Central Database. This means that the deactivation must be repeated when hardware is replaced.

FUNCTION

OPERATING WINDOWS

Fig. 80: Identifying Window Control Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

Window control is activated via switches on the driver door module (DDM) (3/126) and passenger door module (PDM) (3/127). The motor for the power window on the driver's side (6/58) is controlled directly from the driver door module (DDM). The motor for the power window on the passenger side (6/60) is controlled via CAN communication from the driver door module (DDM) to the passenger door module (PDM). The signals for operating the rear windows are transmitted from the driver door module (DDM) via the controller area network (CAN) to the central electronic module (CEM) (4/56), which manages the rear window functions.

The passenger door module (PDM) only operates the front window on the passenger side. The signal for operating the front passenger window is transmitted from the passenger door module (PDM) to the window lift mechanism motor on the passenger side (6/60).

If the child lock is activated from the driver door module (DDM), the rear windows cannot be operated from the rear seat. When the child lock switch is activated, a signal is transmitted from the driver door module (DDM) on the controller area network (CAN) to the central electronic module (CEM) which disables rear window operation.

FUNCTIONS IN THE DOOR MIRRORS

The functions in the door mirrors (6/62 left) (6/63 right) which are controlled from the driver door module (DDM) (3/126) or passenger door module (PDM) (3/127) are: mirror position adjustment, folding in the mirrors, mirror heating, local lighting/guide lighting, and temperature measurement.

Adjusting the mirror position

Fig. 81: Identifying Mirror Position Adjusting Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The position of the mirror is controlled using buttons on the driver door module (DDM) (3/126). The driver door module (DDM) transmits a signal directly to the mirror on the driver's side (6/62). When adjusting the mirror on the passenger side (6/63), a signal is transmitted from the driver door module (DDM) to the passenger door module (PDM) (3/127) on the Controller area network (CAN).

If the car has power seats with memory for the door mirrors, the position of the mirrors is stored by two potentiometers. The signal indicating the position in the X and Y axes is received by the driver door module (DDM) and passenger door module (PDM). When one of the buttons on the control unit for the power seat is activated, a signal is transmitted from the power seat module (PSM) (4/52) to the driver door module (DDM) and passenger door module (PDM). This adjusts the door mirrors to the stored position. The stored position can also be set according to which remote control is used to unlock the car.

Folding in the door mirrors

Fig. 82: Door Mirrors Folding Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

Mirror folding is activated via the switch for folding door mirrors (3/171), which is on the climate control module (CCM) (3/112). A signal is transmitted via the Controller area network (CAN) to the driver door module (DDM) (3/126) and passenger door module (PDM) (3/127). These in turn send the signal on to each door mirror (6/62 and 6/63), which fold each mirror in or out. There is a delay between the button being pressed and the door mirrors folding in or out.

Heating the mirrors

Fig. 83: Identifying Mirrors Input Heating And Output Signals
Courtesy of VOLVO CARS CORPORATION

Mirror heating is activated at the same time as the rear windshield defroster. When the switch for rear demist/mirror demist (3/8) is pressed, the climate control module (CCM) (3/112) transmits a signal to the central electronic module (CEM) (4/56). The central electronic module (CEM) activates the rear demist and transmits a signal to the driver door module (DDM) (3/126) and passenger door module (PDM) (3/127) to activate mirror heating. When the driver door module (DDM) and passenger door module (PDM) receive the signal, the outputs for each door mirror are powered (6/62 and 6/63). The function is switch off at the same time as the rear demist. This can happen in three different ways:

- If the switch for rear demist/mirror demist is pressed again after activation the function is switched off, using a signal from the central electronic module (CEM)
- The heating switches off automatically 12 minutes after activation. The driver door module (DDM) and passenger door module (PDM) then receive a signal from the central electronic module (CEM) requesting that the function be deactivated
- The heating is also switched off if the ignition is switched off.

Local lighting/Guide lighting

Fig. 84: Identifying Local Lighting / Guide Lighting Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The local lighting is activated using the remote control for the car. The function can only be activated when the ignition is off. When the yellow button on the remote control is pressed, the upper electronic module (UEM) (4/70) receives an activation signal which is sent onwards on the Controller area network (CAN). The driver door module (DDM) (3/126) and passenger door module (PDM) (3/127) receive the signal and switch on the lighting for the left door mirror (10/148) and the lighting for the right door mirror (10/149). The function is deactivated by pressing the button on the remote control again. A signal is then sent from the upper electronic module (UEM) to the driver door module (DDM) and passenger door module (PDM) requesting that the function is switched off. The function is also switched off when the ignition is switched on.

The guide lighting is activated using the left-hand control stalk (the key must be removed from the ignition switch). The steering wheel module (SWM) (3/130) then transmits a signal via the controller area network (CAN) to the central electronic module (CEM) (4/56). When the car is then locked, the central electronic module (CEM) sends a signal onwards via the controller area network to the driver door module (DDM) (3/126) and passenger door module (PDM) (3/127), which turn on the lights in the door mirrors (10/148 and 10/149). The lights are part of the guide lighting function and remain on for a set time (30, 60 or 90 seconds).

Measuring the outside temperature

Fig. 85: Identifying Outside Temperature Measuring Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The outside temperature is continuously measured (in ignition positions I and II) by the outside temperature sensor (7/11), which is always in the right-hand door mirror. The analog signal is received by the passenger door module. The signal is converted to a digital signal. This signal is then transmitted on the controller area network (CAN) and used by the central electronic module (CEM) (4/56), which sends the signal on to the driver information module (DIM) (5/1).

DOOR OPEN WARNING LAMP

Fig. 86: Door Open Warning Lamp Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The door open warning lamp function is on cars from between structure weeks 199820 and 199950. The function utilizes the signal transmitted by the central electronic module (CEM) (4/56) on the controller area network (CAN) when a door is opened. The signal is received by the driver door module (DDM) and passenger door module (PDM). The door open warning lamp is then lit in the left (10/60) and right-hand (10/61) front doors. When the door is closed, the central electronic module (CEM) transmits a new signal on the controller area network (CAN). The signal is received by the driver door module (DDM) and passenger door module (PDM) which turns off the relevant door open warning lamp.

SYSTEM OVERVIEW

CONTROL MODULE

Fig. 87: Driver Door Module And Passenger Door Module Control Modules
Courtesy of VOLVO CARS CORPORATION

The driver door module (DDM) and the passenger door module (PDM) are broadly similar in terms of functionality. The information in this document is common to both the driver door module (DDM) and the passenger door module (PDM) unless otherwise indicated. The main task of both control modules is to manage:

- The power window mechanism
- The door lock
- Door mirror adjustment
- Door mirror folding
- Door mirror heating
- Outside temperature measurement
- Local lighting
- Door open warning lamp.

The control modules are in their respective doors. The driver door module (DDM) is on the driver's side and the passenger door module (PDM) is on the passenger side. The switches for the power windows are mounted directly on top of the control modules. The appearance and physical versions of the two control modules is different.

The driver door module (DDM) and passenger door module (PDM) communicate with directly connected components and with other control modules and components connected via Controller area network (CAN) communication.

Both control modules check activations and input and output signals via an integrated diagnostic system. A diagnostic trouble code (DTC) is stored if either of the control module detects a fault.

Any diagnostic trouble codes (DTCs) are stored in the relevant control module memory. The data can be read off using VIDA (Volvo scan tool).

A simple way to ensure that the control modules are powered and grounded is to activate one of the functions

that are operated via the switches on the driver door module (DDM) or passenger door module (PDM). The control module is powered and grounded if any of the functions are working.

SIGNALS

The following table summarizes the input signals to and output signals from the driver door module (DDM) and the passenger door module (PDM). The signal types are divided into directly connected signals and Controller area network (CAN) communication. The following illustration displays the same information with the Volvo component designations.

Input signals	Output signals
Directly connected: • Door lock (3/74, 3/75) • Sensors used to set the position of the door mirror (2 per mirror) • Outside temperature sensor (7/11).	**Directly connected:** (power supply unless otherwise stated) • Window lift mechanisms (Front doors) (6/58, 6/60) • Door locks (Front doors) (3/74, 3/75) • Door mirror motors (3 per mirror) (6/62, 6/63) • Heating, door mirror (9/33, 9/34) • Lights in the door mirrors (10/148, 10/149) (optional equipment) • Door open warning lamps (10/60, 10/61).
Via Controller Area Network (CAN) communication: • Climate control module (CCM) (3/112) • Central electronic module (CEM) (4/56) • Driver door module (DDM) (3/126) (Applies only to the passenger door module (PDM)) • Power seat module (PSM) (4/52) • Upper electronic module (UEM) (4/70).	**Via Controller Area Network (CAN) communication:** • Climate control module (CCM) (3/112) • Central electronic module (CEM) (4/56) • Passenger door module (PDM) (3/127) (Applies only to the driver door module (DDM)) • Phone module (PHM) (16/60) (optional equipment) • Upper electronic module (UEM) (4/70) (Applies only to the driver door module (DDM)).

Fig. 88: Driver Door Module And Passenger Door Module Input And Output Signals

DRIVER INFORMATION MODULE (DIM). (2003-2012)

DESIGN

ILLUMINATION IN DRIVER INFORMATION MODULE (DIM)

Up to and including model year 2003, filament bulbs were used for illuminating the Driver Information Module (DIM). These bulbs can be changed separately.

LEDs have been used for illumination purposes as from model year 2004. If any of the LEDs blow, the entire Driver Information Module (DIM) will have to be changed.

DIAGNOSTIC FUNCTIONS

DESCRIPTION OF THE SCROLLING VALUES (LAMPS)

Warning lamp seat belts, value

Indicates whether the lamp is on or off according to the control module.

SRS warning lamp, value

Indicates whether the lamp is on or off according to the control module.

Brake system warning lamp, value

The ABS control module lights or extinguishes the lamp via the control area network. The lamp may assume the value on or off.

Lamp parking brake warning, value

Indicates whether the lamp is on or off according to the control module.

Lamp low oil pressure, value

The oil pressure signal can be read off. The signal comes from the engine control module (ECM). One can read off whether the low oil pressure lamp should be on or off.

Charge lamp, value

Indicates whether the lamp is on or off according to the control module.

Indicator lamp fog lamp rear, value

Indicates whether the lamp is on or off according to the control module.

Malfunction indicator lamp (MIL), value

Indicates whether the lamp is on or off according to the control module.

ABS warning lamp, value

Indicates whether the lamp is on or off according to the control module.

Traction control warning lamp, value

The Brake Control Module (BCM) transmits the lamp signal to the driver information module (DIM) via the Control area network (CAN). Indicates whether the lamp is on or off according to the Driver Information Module (DIM).

Trailer warning lamp, value

Indicates whether the lamp is on or off according to the control module.

General orange warning lamp, value

Indicates whether the lamp is on or off according to the control module.

General red warning lamp, value

Indicates whether the lamp is on or off according to the control module.

High beam, value

Indicates whether the lamp is on or off according to the control module.

Lamp low fuel level, value

Indicates whether the lamp is on or off according to the control module.

DESCRIPTION OF THE SCROLLING VALUES (OTHER SIGNALS)

Fuel level, value

Signal from the two fuel level sensors in the rear electronic module (REM). The value displays between 0 and 80 liters depending on the amount of fuel in the tank.

Engine coolant temperature, value

An engine coolant temperature (ECT) display. The signal comes from the engine control module (ECM) and the temperature is displayed in Celsius.

Engine speed (RPM), value

An engine speed (RPM) display. The signal is between 0 and 8000 rpm and comes from the engine control module (ECM).

Vehicle speed, value

The vehicle speed can be read off. The signal comes from the Brake Control Module (BCM) or the transmission control module (TCM) via the Control area network (CAN).

Brake fluid level, value

The sensor is directly connected to the driver information module (DIM). Indicates whether the control module interprets the signal as low or high level.

Parking brake, value

The sensor is directly connected to the driver information module (DIM). Indicates whether the control module interprets the signal as activated or not activated. With the parking brake applied the sensor is activated.

The SRS indicator lamp status, value

The Driver Information Module (DIM) informs the Supplemental Restraint System Module (SRS) if the indicator lamp is working or is defective.

Cruise control, value

Indicates whether the cruise control status is on or off.

DESCRIPTION OF THE CUSTOMER PARAMETERS IN THE DRIVER INFORMATION MODULE (DIM)

Total mileage, value

Measurement range 0-999999 km, 0-999999 miles. The parameter can only be programmed once before the read off mileage exceeds 500 km or 310 miles. Programmed by the Central Electronic Module (CEM) after the control module has been replaced.

Distance conditions for service, value

Indicates the mileage required to display the service indicator message. The available values for metric calibrated instruments are 5000, 7500, 10000, 12000, 15000 or 20000 km. The available values for imperial calibrated instruments are 2500, 5000, 6000, 7500, 10000 or 12500 miles.

Time conditions for service, value

Indicates the time required to display the service indication message. The values set are 6, 12, 18 or 24 months.

Engine run time conditions for service, value

Indicates the time the engine must have been running before the service indication message will be displayed. The value set is 500, 750 or 1000 hours.

Displaying zeroes, value

Setting the instrument panel to display or not display the zeroes.

Temperature unit, value

The temperature unit of measurement can be selected. The temperature display can be selected between Celsius or Fahrenheit.

Unit trip computer, value

Setting the trip computer (applies only to cars with trip computer). It is possible to select liters, Imperial gallons or US gallons.

Clock position, value

12- or 24- hour display.

Mileage at service, value

Reading off the mileage at service. The parameter can be programmed between 0-999999 km or miles. When resetting the service reminder indicator (SRI) the parameter is reprogrammed by copying the mileage.

CAUTION: Mileage at service should be used with total mileage to determine whether a service is due

Time at service, value

Reading off global time at service. The parameter can be between 0 -163 months (13.6 years). When resetting the service reminder message, the parameter is reprogrammed by copying the global time in the central electronic module (CEM) to the driver information module (DIM).

CAUTION: Time at service and global time should be used with time conditions to determine whether a service is due.

Engine hours since service, value

Parameter read off. Indicates how many hours the engine has run since the last service. The parameter can be between 0 -65536 hours. Resets when service reminder message is reset.

CAUTION: Engine time since service should be used with engine hours to service to determine whether a service is due

Global time, value

Reading off the clock in the central electronic module (CEM). The parameter can be between 0 -163 months (13.6 years).

CAUTION: Time at service and global time should be used with time conditions to determine whether a service is due.

Parking brake warning

Setting the sound signal for the parking brake warning. Parking brake warning can be on or off. The default position is on.

DESCRIPTION OF COMPONENT / FUNCTION ACTIVATION

Lamps and displays

The combined instrument panel lamps flash and the gauges sweep from minimum to maximum for 4 seconds.

Warning lamp seat belts, value

Activating the instrument lamp.

SRS warning lamp, value

Activating the instrument lamp.

Brake system warning lamp, value

Activating the instrument lamp.

Lamp parking brake warning, value

Activating the instrument lamp.

Lamp low oil pressure, value

Activating the instrument lamp.

Charge lamp, value

Activating the instrument lamp.

Indicator lamp fog lamp rear, value

Activating the instrument lamp.

Malfunction indicator lamp (MIL), value

Activating the instrument lamp.

ABS warning lamp, value

Activating the instrument lamp.

Traction control warning lamp, value

Activating the instrument lamp.

Trailer warning lamp, value

Activating the instrument lamp.

General orange warning lamp, value

The orange triangular warning lamp in the center of the instrument panel is activated.

General red warning lamp, value

The red triangular warning lamp in the center of the instrument panel is activated.

High beam indicator lamp, value 1

Activating the instrument lamp.

Lamp low fuel level, value

Activating the instrument lamp.

DOWNLOADING SOFTWARE AND REPLACING THE CONTROL MODULE

New software can be downloaded into the driver information module. When ordering software, the hardware and the software in the car is compared to the Volvo central database. If the comparison is OK the software is downloaded to the control module.

If the comparison between the car and Volvo central database does not correspond, the database is updated with the configuration of the car. The software download then begins.

The driver information module is integrated in the combined instrument panel. When replacing the control module the entire combined instrument panel must also be replaced.

The language in the combined instrument panel can be changed. This is done by ordering new software for the driver information module from the replacement parts catalogue. In the replacement parts catalogue there is software for reloading the driver information module (reloading driver information module) and software for changing to 15 different languages. Reloading reloads the same software that was installed before the control module was replaced.

There are other functions for the combined control module which can be ordered. However, these are not downloaded into the driver information module but into the central electronic module. There are functions such as the trip computer.

A number of customer parameters can be programmed into the driver information module.

The following data can be programmed into the driver information module. Programming:

- Conditions for the service reminder indicator (SRI) to light, mileage, time and engine hours
- If the instrument panel should display zeroes for the mileage
- Unit for temperature. Fahrenheit or Celsius
- Unit in the trip computer (only applies to cars with trip computers). Fuel consumption can be displayed in liters per 100 km, miles per GB Gallon, miles per US Gallon and kilometers per liter
- 12 or 24 hour clock display.

These customer parameters are stored in the control module but not in the Volvo central database. This means that the customer parameters must be reprogrammed when the hardware is replaced.

FUNCTION

TEXT MESSAGES

Fig. 89: Identifying Text Messages Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

In the lower left section of the combined instrument panel (driver information module) (5/1) there is a small window where text messages are displayed. This gives the driver supplementary information for the different warning symbols in order to reduce the number of different symbols in the combined instrument panel. Other types of messages are also displayed, such as the functions of the trip odometer. There is an order of priority where warning signals are displayed first.

Depending on the circumstances, a request for these messages may come from the central electronic module (4/56) or the steering wheel module (3/130). The signals are transmitted via the Control Area Network (CAN).

OUTSIDE TEMPERATURE

Fig. 90: Identifying Outside Temperature Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The outside temperature gauge is integrated in the tachometer. Its function is to display the outside temperature and to warn the driver when the conditions are icy by displaying a symbol of a snowflake. The snowflake is displayed at a range of -5 to +2 °C.

A sensor which detects the outside temperature is mounted in the right-hand door mirror. The temperature signal is then read off by either the passenger door module (3/127). The value is transmitted via the Control area network (CAN) to the central electronic module (4/56) which then forwards the message to the driver's information module (5/1). The temperature is displayed in Celsius or Fahrenheit, depending on the market, in increments of one degree. The temperature unit can be changed when reprogramming.

CLOCK

Fig. 91: Clock Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The only function of the clock is to display the time in hours and minutes.

The data is transmitted via the control area network (CAN) from the central electronic module (4/56) to the driver information module (5/1).

The customer can adjust the time using a knob on the clock display. The driver information module then transmits the new time to the central electronic module which registers the new data and updates its clock accordingly. The customer can select whether the time will be displayed using the 12 or 24 hour clock. If the 12 hour clock is selected AM or PM is automatically displayed.

SEAT BELT REMINDER

Fig. 92: Identifying Seat Belt Reminder Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The seat belt reminder reminds the driver to put on the seat belt. There are two versions of the seat belt reminder - European and American. They are slightly different, which is outlined below. The signals which indicate the variant in the car (European or American) are transmitted by the central electronic module (4/56) via the Control Area Network (CAN). Two small symbols light in the upper electronic module (4/70) and indicate when a seat belt is not fastened. The driver information module (5/1) emits an audible signal to warn the driver that no seat belt is fastened. From model year 2002 inclusive, there is also a display on the combined instrument

panel (5/1) which warns the driver if their belt is not fastened.

European version

If the seat belt is not fastened when the ignition is switched on, the symbols in the upper electronic module will light and there will be an audible signal from the driver information module. This continues for 6 seconds until either the seat belt is fastened or reverse gear is selected. If the car travels at 10 km/h or more, the audible signal reactivates if the driver has not fastened his/her seat belt.

American version

When the ignition is switched on, the symbols in the upper electronic module will light continuously for 6 seconds, or until the driver's seat belt is fastened. At the same time there will be a ringing sound from the driver information module for the same period of time. If the driver releases the belt after fastening it, the audible signal will not resume if more than 6 seconds have passed since the ignition was switched on.

TRIP ODOMETER / ODOMETER

Fig. 93: Brake Warning Lamp Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The function of the trip odometers and the odometer is to display the three available odometer modes. The two settings are the total mileage of the car and the mileage since the two trip odometers were last set to zero. These two can be reset individually. The odometer and one of the two trip odometers are always displayed. The central electronic module (4/56) receives a speed signal from the brake control module (ABS) (4/16) which is transmitted on the high speed section of the Control Area Network (CAN). The central electronic module then transmits the signal on to the driver information module (5/1) via the low speed section of the Control Area Network (CAN). The distance traveled is saved every fourth kilometre and the value is stored in the central electronic module (4/56). Press the button briefly to switch between the two trip odometers. Hold the button in longer to reset the trip odometer. There must be a power supply to the driver information module (5/1) before the odometer can be reset.

SERVICE REMINDER INDICATOR (SRI)

Fig. 94: Clock Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The service reminder indicator (SRI) lights the first time the ignition is switched on after the service interval has been reached. The service reminder indicator (SRI) will continue to light and remain lit for 2 minutes, every time the ignition is switched on until it is reset. The service indicator has changed from model year 2002. The need for a service is indicated partly by a lamp and partly by a text message - "time for service". Previously only the lamp indicated "Service". The service reminder indicator (SRI) can be programmed in three different ways: distance traveled, time since last service and engine hours since last service. The service reminder indicator (SRI) can be reset using VIDA or as follows:

Hold down the reset button for the trip odometer and turn the key to position II. Continue holding the button down until the service reminder indicator (SRI) begins to flash. Release the button.

ENGINE COOLANT TEMPERATURE (ECT) GAUGE

Fig. 95: Engine Coolant Temperature Gauge Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM), (4/46) processes the value from the coolant temperature sensor (7/16). The processed value is then transmitted to the central electronic module (4/56) on the high speed section of the Control Area Network (CAN). The central electronic module receives the signal and generates a corresponding signal on the low speed section of the Control Area Network (CAN). The driver information module (5/1) reads the signal from the low speed section of the Control Area Network (CAN). The driver receives information about the temperature from the engine coolant temperature gauge in the combined instrument panel. If the value is too high a red lamp lights and a text message is displayed outlining the fault.

HANDBRAKE

Fig. 96: Hand Brake Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

A switch is connected to the combined instrument panel (driver information module) (5/1) which detects the incoming signal indicating whether the handbrake is applied or not. The switch is activated and the lamp is lit when the handbrake is applied. This signal is directly connected.

SRS LAMP

Fig. 97: Identifying SRS Lamp Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The supplementary restraint system (SRS) (4/9) contacts the driver information module (5/1) if there is a problem in the system. A signal is transmitted via the Control area network (CAN) and the driver information module lights a lamp and displays a text message. The combined instrument panel also informs the supplementary restraint system (SRS) whether the lamp is working or not.

BRAKE WARNING LAMP

Fig. 98: Brake Warning Lamp Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The brake control module (4/16) (called ABS module on model years up to and including 2001) informs the driver information module (5/1) via the Control area network (CAN) if there is a fault in the brake system. The

driver information module indicates this to the driver by lighting the red general warning lamp and displaying a text message.

The brake fluid level sensor detects the level of the brake fluid in the reservoir. When the level is low, a switch in the sensor closes and the warning lamp lights. This function is directly connected to the driver information module.

FUEL GAUGE

Fig. 99: Fuel Gauge Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

There are two sensors in the fuel tank which transmit signals about the fuel level to the rear electronic module (REM). The rear electronic module (4/58) sends the values on to the driver information module (5/1), which receives the signals, interprets them and displays the fuel level on the fuel gauge. When the fuel level is low a yellow lamp lights to inform the driver.

The fuel gauge is not sensitive to rapid change. This is to prevent incorrect values being displayed when cornering or driving on slopes for example.

SPEEDOMETER

Fig. 100: Identifying Speedometer Input And Output Signals

Courtesy of VOLVO CARS CORPORATION

The speedometer displays the actual speed the car is traveling at.

Information about the vehicle speed comes from the speed sensor which is connected to the brake control module (BCM) (called the ABS module on cars up to and including model year 2001) and the gearbox control module (TCM) (4/28). The brake control module (BCM) (4/16) and the gearbox control module (TCM) calculate an average speed based on the signals sent from the two front wheels by the speed sensors. The calculated speed signal is then transmitted to the central electronic module (CEM) (4/56) from the brake control module and the gearbox control module on the high speed section of the Control Area Network (CAN). Depending on the quality of the signal, the central electronic module uses the signal from the brake control module or the gearbox control module (TCM). The central electronic module then transmits this data on to the driver information module (DIM) (5/1) where it is displayed.

Only cars with automatic gearbox have a gearbox control module (TCM). In cars with manual transmissions, the speed signal is transmitted to the central electronic module by only the brake control module on the high speed section of the Control Area Network (CAN).

TACHOMETER

Fig. 101: Engine Coolant Temperature Gauge Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

A flywheel sensor (7/25) is connected to the engine control module (ECM) (4/46). The engine control module (ECM) transmits the engine speed signal onwards via the high speed section of the Control Area Network (CAN). The central electronic module (CEM) (4/56) receives the signal and generates a corresponding signal on the low speed section of the Control Area Network (CAN). The driver information module (DIM) (5/1) reads the signal from the low speed section of the Control Area Network (CAN). The driver information module

receives the value and presents the actual engine speed for the driver.

LAMP FOR LOW OIL PRESSURE (ONLY APPLIES TO VERSIONS WITH OIL PRESSURE SENSOR)

Fig. 102: Identifying Lamp For Low Oil Pressure Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The oil pressure sensor (7/6) is connected to the engine control module (ECM) (4/46). The engine control module transmits the oil pressure signal onwards via the high speed section of the Control Area Network (CAN). The central electronic module (4/56) receives the signal, and generates a corresponding signal on the low speed section of the Control Area Network (CAN). If the oil pressure is low, the driver information module (DIM) (5/1) reads the signal from the low speed section of the Control Area Network (CAN). The driver information module indicates this to the driver by lighting a red warning lamp and displaying a text string with explanatory information.

HINT: In vehicles with an oil level sensor, the general warning lamp comes on and a text message appears when the oil level is too low.

GENERAL WARNING LAMP

The function is to display different "faults" in the car. When a lamp lights this is followed by a text message which presents the driver with additional information about why the lamp has lit. From model year 2002 inclusive the color of the lamp has changed from orange to yellow / red. The lamp lights red in the event of serious faults, or yellow for less serious faults.

MALFUNCTION INDICATOR LAMP (MIL)

The malfunction indicator lamp (MIL) only lights in the combined instrument panel (driver information module) (5/1), if certain emissions related diagnostic trouble codes (DTCs) are stored in the engine control module (ECM) (4/46) or gearbox control module (TCM) (4/28). The signal between the driver information module and engine control module (ECM) is directly connected.

SYSTEM OVERVIEW

CONTROL MODULE

Fig. 103: Driver Information Module
Courtesy of VOLVO CARS CORPORATION

The most important role of the Driver Information Module is to display the status of the systems in the car for the driver. This covers functions such as:

- Vehicle speed
- Engine speed
- Fuel level
- Engine coolant temperature (ECT)
- Various warning signals.

The control module is integrated in the combined instrument panel. When replacing the driver information module, the entire combined instrument panel must also be replaced.

The driver information module mostly communicates with other control modules and components via CAN communication. However some functions are connected directly.

The control module checks input and output signals through an integrated diagnostic system. A diagnostic trouble code (DTC) is stored if the control module detects an error. In certain cases the driver information module replaces the faulty signal with a substitute signal.

Diagnostic trouble codes (DTC) are stored in the control module memory. The data can be read off using the diagnostic tool.

An easy way of checking that the driver information module is both powered and grounded is to check whether the following warning lamps light when the ignition is switched on: Parking brake, Malfunction indicator lamp

and Brake fluid level.

SIGNALS

The table below summarizes input and output signals to and from the driver information module. The signal types are divided into directly connected signals, serial communication and Control area network (CAN) communication. The illustration below displays the same information with the Volvo part numbers.

Input signals	Output signals
Directly connected: Parking brake switch, 3/47 Malfunction indicator lamp (MIL) Brake fluid level sensor, 7/4	**Directly connected:**
Via Control Area Network (CAN): Brake control module (ABS), 4/16 Central electronic module, 4/56 ECM, 4/46 Phone module, 16/60 SRS, 4/9 TCM (4/28) Rear electrical module, 4/58 Steering wheel module, 3/130	**Via Control Area Network (CAN):** Brake control module (ABS), 4/16 Central electronic module, 4/56 Phone module, 16/60 SRS, 4/9 RTI, 16/45 Climate control module, 3/112

ENGINE (B6324S; 2007-2010)

DESIGN AND FUNCTION

ENGINE BLOCK

Fig. 105: Expanded View of Engine Components
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Oil separator	5	Cylinder block
2	Camshaft cover	6	Intermediate section
3	Cylinder head	7	Oil pan
4	Gear housing		

CYLINDER HEAD, CAMSHAFT BEARING HOUSING

Fig. 106: View of Cylinder Head, Camshaft Bearing Housing
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Camshaft cover	3	Induction camshaft
2	Exhaust camshaft	4	Cylinder head

The cylinder head is of the cross-flow type, (Cross-flow = in from one side and out from the other side).

The two camshafts are supported by seven bearing caps each, directly in the cylinder head and camshaft cover. The camshaft cover works like a combined valve cover and camshaft bearing cap. The camshaft cover has cast oil ducts on the underneath which ensure good oil supply to the camshafts and the valve lifters.

The maintenance-free valve lifters, valve springs and valves are in the cylinder head.

CYLINDER HEAD GASKET

Fig. 107: Identifying Cylinder Head Gasket
Courtesy of VOLVO CARS CORPORATION

The seal between the cylinder head and cylinder block is a conventional cylinder head gasket. The seal between the other gasket faces is a liquid gasket.

The cylinder head gasket is made of steel and has multiple layers.

For exact adaptation to the relevant piston height there are different thicknesses available. This is to absorb the differences between pistons, connecting rods etc and thereby obtain the correct compression.

CYLINDER BLOCK

Fig. 108: View Of Cylinder Block
Courtesy of VOLVO CARS CORPORATION

The cylinder block consists of 3 sections.

- Cylinder block
- Intermediate section
- Gear housing

All three sections are made of die cast aluminum, molded under high pressure.

The mating flange between the cylinder block and intermediate section is in the center line of the crankshaft. The gear housing for the camshaft drive is secured on top of the cylinder block.

The cylinder block houses six cast iron cylinder sleeves. These cylinder sleeves cannot be replaced. The stroke length of the cylinders is greater than the cylinder diameter. This produces good torque and competitive power.

The intermediate section's seven main bearing caps have cast iron reinforcements.

On the top of the intermediate section there are cast oil channels which distribute the oil to the main bearings and on via the crankshaft to the big ends.

OIL PAN

Fig. 109: Identifying Engine Oil Pan
Courtesy of VOLVO CARS CORPORATION

The oil pan is made of die cast aluminum with baffles. This is so that the oil does not splash excessively. Liquid gasket creates a seal between the cylinder block and the oil sump.

The oil pan is designed to reduce mechanical noise from the engine, at the same time as providing a reliable supply of oil at different angles. A composite oil scraper keeps the larger section of the oil volume away from the rotating crankshaft. It minimizes power loss, improves fuel economy and prevents the oil from foaming.

The oil suction line, which runs from the oil pan, is made of plastic. The oil pan is equipped with an oil level sensor.

The oil pan contributes to the rigid design and operates as an extra reinforcement of the cylinder block.

PISTON

Fig. 110: Identifying Piston Cooling Nozzle
Courtesy of VOLVO CARS CORPORATION

1. Piston cooling nozzle

The pistons are die cast in aluminum and the connecting rods are forged in steel.

The heat received by the pistons from combustion, is cooled, partly via the coolant jacket in the block but also by the oil from the six piston cooling nozzles.

CRANK SYSTEM

Fig. 111: Identifying Crankshaft System
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Vibration damper	4	Gear wheel
2	Crankshaft	5	Oil cooler pipe
3	Carrier plate		

The crankshaft is made from forged steel with induction hardened bearing surfaces.

The sprocket is crimped on the crankshaft's rearmost shank.

The crankshaft is supported by seven main bearings. The main bearings are replaceable main bearing shells. The sixth main bearing is a thrust bearing that holds the crankshaft in a determined position along the length of

the axle.

An internal vibration damper is on the front end of the crankshaft. Inside the enclosed vibration damper, a circular flywheel works on a silicone fluid, which dampens the crankshaft torsion oscillations. The vibration damper gives longer service life for the crankshaft and smoother engine operation.

The energy that is generated in the vibration damper, is converted to heat, therefore, the unit is cooled with oil via the oil cooler pipe.

INTERMEDIATE SHAFT

Fig. 112: Identifying Intermediate Shaft
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Camshaft transmission sprocket	5	Intermediate wheel
2	Drive wheel for the auxiliary unit	6	Crankshaft sprocket
3	Intermediate shaft	7	Oil pump
4	Freewheel clutch		

The intermediate shaft is located in the gear housing on the cylinder block. The intermediate shaft drives the

camshafts and the auxiliary unit.

There is a sprocket on the rear section of the crankshaft, which drives the intermediate shaft via an intermediate wheel. The intermediate wheel drives the intermediate shaft via the intermediate shaft's centrally mounted gear. The intermediate shaft has a further two gear wheels of different sizes.

The intermediate shaft's front gear wheel has a freewheel clutch that drives the alternator at 2.7 times the engine speed. A free wheel clutch drives in one direction and slips/freewheels in the other direction.

The rear gear wheel drives the overhead camshafts.

CAMSHAFT TRANSMISSION

Fig. 113: Identifying Camshaft Transmission
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Camshaft chain	3	Intermediate shaft
2	Auxiliary unit sprocket		

Both camshafts are driven by a camshaft chain, which in turn, is driven by the crankshaft via the intermediate shaft. The camshaft chain has inverted teeth, so called, "silent chain".

The chain drive is maintenance free.

The exhaust side's camshaft has a vibration damper, which guarantees optimum balance in the gear and chain sprockets.

Timing cover

Fig. 114: Identifying Timing Chain Cover
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Chain guide	5	Coolant pump outlet
2	Induction camshaft	6	Hydraulic chain tensioner
3	Exhaust camshaft	7	Intermediate shaft
4	Coolant pump shell		

The timing cover is cast in aluminum.

The coolant pump shell is integrated in the timing cover. This saves weight. The coolant pump is still driven by the auxiliary unit's transmission.

The chain us tensioned by a hydraulic chain tensioner, which is located in the timing cover. Oil injection pipes supply the chain with oil.

VARIABLE CAMSHAFT PROFILE (CPS), ONLY APPLIES TO B6324S

Fig. 115: Identifying Variable Camshaft
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Camshaft phase setting	3	High lift
2	Shift lobe	4	Low lift

The ideal engine should have low valve lift for low engine RPMs and loads, and high valve lift at high RPMs and loads.

To achieve this, an engine with two completely different camshaft profiles is required.

This engine has a patented system for camshaft profile switching. The system uses two completely different cam profiles designed on the same camshaft.

The inlet camshaft is provided with three cams for each valve, one centrally located with small lift height, 3.6 mm, and two equally sized outer cams with big lift height, 10.0 mm. With a small lift height at low load and at engine speeds up to approx. 3000 rpm, the primary benefit is lower fuel consumption.

In principle, during the time that the lift height is small, the air damper is completely open. Control of the incoming air volume to the cylinders takes place through control of the camshaft's opening times. Hereby the

pump losses are reduced, which in turn gives lower fuel consumption.

Low lift

At small lift height (4), only the centrally placed cam acts on the valve, which takes place through the inner valve depressor. The outer cams act on the outer valve depressors, which follow the cams' movement. Since the centrally located valve depressor and the outer depressor are not connected, the outer depressor moves without affecting the valve. Thus, lift height becomes small.

High lift

At high lift height (3), the inner valve depressor is connected with the outer valve depressor with lock pins. The outer camshaft cams' movement is transmitted through the outer valve depressor, on through the lock pins and the inner valve depressor to the valve. Thus, lift height becomes big.

The position of the lock pins is controlled hydraulically with two electro-hydraulic valves. One electro-hydraulic valve controls the valves for cylinders 1, 2 and 4, while the other controls the valve for cylinders 3, 5 and 6. Thus, the electro-hydraulic valves control 6 valves each (as the engine has 2 inlet valves and 2 exhaust valves per cylinder).

The position, on/off, of the electro-hydraulic valves is controlled by the Engine control module (ECM).

The inner valve depressor works like a hydraulic valve depressor, which compensates any wear. Thus the valve clearance is "0".

The exhaust camshaft is conventional and has a lift height of 10.0 mm. The valve depressors are mechanical, that is, they "have" valve clearance.

LUBRICATION SYSTEM

Fig. 116: Identifying Lubrication System
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Oil pan	5	Oil dipstick
2	Oil pump	6	Housing for the oil filter
3	Oil pressure line	7	Supply to the vibration damper's cooling nozzle.
4	Oil cooler	8	Oil suction line

The task of the lubrication system is to build-up a protective film of oil between the moving parts of the engine. The lubrication system must also transport dirt particles away from the moving parts and cool hot engine parts.

This is carried out by the oil pump supplying oil to the oil filter through an oil pressure line of treated steel.

Clean oil is supplied to the oil cooler from the oil filter to the oil cooler. From there the oil is further distributed, through a duct system, out to the various engine functions.

A pressure sensitive valve controls the oil flow to the vibration damper's oil cooler pipe if necessary.

Oil pump

Fig. 117: Identifying Oil Pump
Courtesy of VOLVO CARS CORPORATION

The oil pump is in the oil pan, mounted underneath the intermediate section. The oil pump has an integrated relief valve. The pump is directly driven by the sprocket on the rear end of the crankshaft.

The oil pump draws oil from a centrally located nozzle in the sump.

The pump increases the pressure of the oil for lubrication, cooling and hydraulic functions.

Oil filter module

Fig. 118: Identifying Oil Filter Module
Courtesy of VOLVO CARS CORPORATION

The oil filter module consists of an oil filter reservoir and an oil cooler. It is mounted on the intermediate section. The oil filter module is element based and can be taken apart.

The oil cooler is connected to the coolant system. Coolant is led through the oil cooler.

COOLING SYSTEM

Fig. 119: Identifying Cooling System
Courtesy of VOLVO CARS CORPORATION

The coolant pump shell is integrated in the timing cover. The pump wheel is still driven by the auxiliary unit's transmission.

The coolant pump pumps coolant through the cylinder block, and also cools the cylinder head, cylinder sleeves, spark plug wells, intake ducts and fuel injection nozzles.

The coolant flows in at the coolant pump and passes through a number of channels before it collects and then flows out to the thermostat housing. If the thermostat housing is closed, the coolant passes via the by-pass channel directly to the coolant pump to then circulate through the cylinder block again.

For the turbocharged engine, the task of the cooling system is to supply the turbocharger with coolant.

CRANKCASE VENTILATION

Fig. 120: Identifying Crankcase Ventilation System
Courtesy of VOLVO CARS CORPORATION

The crankcase ventilation is maintained internally in the engine.

An oil separator is on top of the engine's camshaft cover. It separates the oil drops from the air in the crankcase. The drops are collected in a separator and flow back inside the engine to the oil pan. This prevents extra weight and space for external pipes.

AUXILIARY UNIT TRANSMISSION

Fig. 121: Auxiliary Unit Drive
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Servo pump	4	Intermediate shaft
2	Guide pulley	5	Belt tensioner
3	Air conditioning (A/C) compressor	6	Coolant pump

The auxiliary units are located at the upper edge of the cylinder block, above the transmission. They are driven by two systems, a Poly-V-belt driven system and a clutch system. These two systems are driven by the intermediate shaft transmission.

The belt system consists of a 6-ribbed Poly-V belt, an automatic belt tensioner and a guide pulley. This system drives the servo pump and AC compressor. The coolant pump is driven by the servo pump via the clutch system.

TURBOCHARGER (TC)

NOTE: Only applies to turbocharged engines.

Fig. 122: View of Turbocharger System
Courtesy of VOLVO CARS CORPORATION

The exhaust gases enter via the manifold (1) down to the turbine housing (8) and out to the exhaust system via a downpipe and catalytic converter.

The turbine expels the exhaust gases and rotates the compressor wheel (3). The compressor wheel creates a certain amount of suction using the intake air. This intake air enters the compressor via the air filter and uses a rotational movement to speed up the air, creating the boost pressure. The air then continues into the intake system via the charge air pipe and charge air cooler.

The electronically controlled By-pass valve (4) then controls the boost pressure in the turbocharger by determining the amount of exhaust gases which must pass the turbine. The turbine transfers drive to the compressor. The wastegate valve (2) is a membrane which equalizes the pressure of the intake and exhaust air to eliminate noise.

The turbocharger is lubricated by the engine's oil system (7). The oil system also acts as a supplement to the coolant system (5 and 6).

OVERVIEW

Fig. 123: ENGINE (B6324S; 2007-2010)
Courtesy of VOLVO CARS CORPORATION

The engine has been developed by Volvo.

It is a 6 cylinder transverse in-line engine with a cylinder capacity of 3.2 L for naturally aspirated engines and 3.0 L for turbocharged engines.

The engine is extremely compact. When it was introduced it was the shortest 6-cylinder engine of 3.2 L on the market. Conventional straight 6-cylinder engines are too long to fit between the collision members in the engine compartment. The special design of this engine solves the problem.

The engine has an extremely short drive train, its length is only 625 mm from the front edge of the engine block to the rear edge of the carrier plate.

Great attention has been paid to creating a very rigid engine. Middle part, cylinder block and cylinder head have been structurally optimized to combine low weight with high rigidity.

Even the camshaft cover is structurally optimized.

The engine has double overhead camshafts and 24 valves.

Camshafts, servo pump, AC-compressor, coolant pump and alternator are driven by an auxiliary unit drive, mounted on the back of the engine.

This placement of the auxiliary unit drive gives completely new possibilities of creating a good collision-protective structure around the straight 6-cylinder drive unit.

The entire engine block and the cylinder head is made from aluminum.

The engine has a compact "pent-roof" designed combustion chamber and V-arranged valves. This gives optimal and fast filling and direct flushing via the inlet manifold followed by the combustion chamber (cross-flow) and the exhaust channel.

The squish surfaces together with the centrally positioned spark plug provide optimal combustion of the air/fuel mixture, low knock sensitivity and low, stable exhaust emissions.

The engine's firing order is 1 - 5 - 3 - 6 - 2 - 4. The firings occur every 120 degrees that the crankshaft rotates.

ENGINE (B6324S5; 2011-2012)

DESIGN AND FUNCTION

ENGINE BLOCK

Fig. 124: Expanded View of Engine Components
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Oil separator	5	Cylinder block
2	Camshaft cover	6	Intermediate section
3	Cylinder head	7	Oil pan
4	Gear housing		

CYLINDER HEAD, CAMSHAFT BEARING HOUSING

Fig. 125: View of Cylinder Head, Camshaft Bearing Housing
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Camshaft cover	3	Induction camshaft
2	Exhaust camshaft	4	Cylinder head

The cylinder head is of the cross-flow type, (Cross-flow = in from one side and out from the other side).

The two camshafts are supported by seven bearing caps each, directly in the cylinder head and camshaft cover. The camshaft cover works like a combined valve cover and camshaft bearing cap. The camshaft cover has cast oil ducts on the underneath which ensure good oil supply to the camshafts and the valve lifters.

The maintenance-free valve lifters, valve springs and valves are in the cylinder head.

CYLINDER HEAD GASKET

Fig. 126: Identifying Cylinder Head Gasket
Courtesy of VOLVO CARS CORPORATION

The seal between the cylinder head and cylinder block is a conventional cylinder head gasket. The seal between the other gasket faces is a liquid gasket.

The cylinder head gasket is made of steel and has multiple layers.

CYLINDER BLOCK

Fig. 127: View Of Cylinder Block
Courtesy of VOLVO CARS CORPORATION

The cylinder block consists of 3 sections.

- Cylinder block
- Intermediate section
- Gear housing

All three sections are made of die cast aluminum, molded under high pressure.

The mating flange between the cylinder block and intermediate section is in the center line of the crankshaft. The gear housing for the camshaft drive is secured on top of the cylinder block.

The cylinder block houses six cast iron cylinder sleeves. These cylinder sleeves cannot be replaced. The stroke length of the cylinders is greater than the cylinder diameter. This produces good torque and competitive power.

The intermediate section's seven main bearing caps have cast iron reinforcements.

On the top of the intermediate section there are cast oil channels which distribute the oil to the main bearings and on via the crankshaft to the big ends.

OIL SUMP AND OIL VOLUME

Fig. 128: View of Oil Sump and Dipstick
Courtesy of VOLVO CARS CORPORATION

The oil sump is made of die-cast aluminum with baffles (splash walls). This is so that the oil stays in the sump during active driving (heavy braking/acceleration, sharp turns, etc). Liquid gasket ensures the seal between the cylinder block and the oil sump.

The oil pan is designed to reduce mechanical noise from the engine, at the same time as providing a reliable supply of oil at different angles. A composite oil scraper keeps the larger section of the oil volume away from the rotating crankshaft. It minimizes power loss, improves fuel economy and prevents the oil from foaming.

The oil suction line, which runs from the oil pan, is made of plastic. The oil pan is equipped with an oil level sensor.

The oil pan contributes to the rigid design and operates as an extra reinforcement of the cylinder block.

The oil volume for engines B6324S4/S5 and B6304T4 have been reduced by 0.6 litres. Reasons for reducing the oil volume are, among others, lower service costs (cost of ownership), lower friction, and increased power. Lower friction and higher power are attained by facilitating the engine's internal 'breathing' with a lower oil surface, that is, easier evacuation of gases under the pistons.

The change of the oil volume is partly connected to a changed oil scraper plate, which means that the oil system also works with a reduced oil volume, as well as cooling for **IVD** (**I** nternal **V** iscous **D** amper), which is removed since 09w11. Since the volume reduction is partly connected to IVD-cooling it is not possible to

reduce the oil volume on an older engine with IVD-cooling, even if the new oil scraper plate is retrofitted. Due to the volume reduction, a new oil dipstick is introduced with adapted markings.

OIL SCRAPER PLATE

Fig. 129: Identifying Oil Scraper Plate
Courtesy of VOLVO CARS CORPORATION

Under the crankshaft there is an oil scraper plate that is to prevent the oil from following along with the crankshaft in the crank movement. The plate is updated and is now located closer to the crankshaft and has integrated drain pipes. With these changes it has been possible to reduce the oil volume.

PISTON

Fig. 130: Identifying Piston Cooling Nozzle
Courtesy of VOLVO CARS CORPORATION

1. Piston cooling nozzle

The pistons are die cast in aluminum and the connecting rods are forged in steel.

The heat received by the pistons from combustion, is cooled, partly via the coolant jacket in the block but also by the oil from the six piston cooling nozzles.

SPARKPLUGS

Fig. 131: View of SIP-spark plug
Courtesy of VOLVO CARS CORPORATION

To further improve the engine's features, a new type of spark plug is used, from Denso. The designation is "**SIP** " which means **S** uper **I** gnition spark **P** lug.

An SIP-spark plug has a special design which improves a number of features with a more stable spark. By using a special alloy for both the centre and side electrode, these can have a smaller diameter than normally. The smaller diameter of the electrodes minimizes heat losses during the flame build process, concentrates the electric field, and gives a stronger spark. The stronger spark gives higher engine power, improved fuel economy, better cold-cranking performance, and longer service life. It is the same spark plug for all versions of engine B63x4x, and can also be used for older versions. Electrode gap is 1.0 mm.

CRANK SYSTEM

Fig. 132: Identifying Crankshaft System
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Vibration damper	4	Gear wheel
2	Crankshaft	5	Oil cooler pipe
3	Carrier plate		

The crankshaft is made from forged steel with induction hardened bearing surfaces.

The sprocket is crimped on the crankshaft's rearmost shank.

The crankshaft is supported by seven main bearings. The main bearings are replaceable main bearing shells. The sixth main bearing is a thrust bearing that holds the crankshaft in a determined position along the length of the axle.

An internal vibration damper is on the front end of the crankshaft. Inside the enclosed vibration damper, a circular flywheel works on a silicone fluid, which dampens the crankshaft torsion oscillations. The vibration damper gives longer service life for the crankshaft and smoother engine operation.

Engine versions without turbo were changed 10w20 with a modified crankshaft. The goal is to reduce the crankshaft's torsion vibrations at high engine speeds (4, 500 rpm and up) and to save weight. The reduced torsion vibration means reduced noise level at high RPMs at the same time as it reduces the load (torque) on the

geartrain that drives the camshafts and auxiliary unit drive. It is the crankshaft's forged blank that is changed, reworking is unchanged.

To reduce vibrations material has been added between crank pin and main pin for the rear cylinders, which gives increased stiffness. At the crankshaft's front end, material has been removed instead, to reduce the crankshaft's oscillating mass. A new strategy has been used to design the crankshaft's balance weights to reduce weight. This can be seen by some balance weights having become small while others have become bigger. The changes have reduced the crankshaft's weight by a total of 1 kg. The change does not apply to turbo engines, but can be used on earlier versions of aspiration engines.

Main bearing

Fig. 133: Identifying Main Bearings
Courtesy of VOLVO CARS CORPORATION

To improve the cold-cranking capacity, all main bearings have a changed appearance. In the middle of the bearing the thickness is unchanged but toward the end of the bearing the thickness is approx. 10µm thinner. The new type of bearing is possible to use on all versions of engine B63x4x, also those built earlier than 10w20.

INTERMEDIATE SHAFT

Fig. 134: Identifying Intermediate Shaft
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Camshaft transmission sprocket	5	Intermediate wheel
2	Drive wheel for the auxiliary unit	6	Crankshaft sprocket
3	Intermediate shaft	7	Oil pump
4	Freewheel clutch		

The intermediate shaft is located in the gear housing on the cylinder block. The intermediate shaft drives the camshafts and the auxiliary unit.

There is a sprocket on the rear section of the crankshaft, which drives the intermediate shaft via an intermediate wheel. The intermediate wheel drives the intermediate shaft via the intermediate shaft's centrally mounted gear. The intermediate shaft has a further two gear wheels of different sizes.

The intermediate shaft's front gear wheel has a freewheel clutch that drives the alternator at 2.7 times the engine speed. A free wheel clutch drives in one direction and slips/freewheels in the other direction.

The rear gear wheel drives the overhead camshafts.

CAMSHAFT TRANSMISSION

Fig. 135: Identifying Camshaft Transmission

4	Coolant pump shell		

The timing cover is cast in aluminum.

The coolant pump shell is integrated in the timing cover. This saves weight. The coolant pump is still driven by the auxiliary unit's transmission.

The chain us tensioned by a hydraulic chain tensioner, which is located in the timing cover. Oil injection pipes supply the chain with oil.

VARIABLE CAMSHAFT PROFILE (CPS), ONLY APPLIES TO B6324S5

Fig. 137: Identifying Variable Camshaft
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Camshaft phase setting	3	High lift
2	Shift lobe	4	Low lift

The ideal engine should have low valve lift for low engine RPMs and loads, and high valve lift at high RPMs and loads.

To achieve this, an engine with two completely different camshaft profiles is required.

This engine has a patented system for camshaft profile switching. The system uses two completely different cam profiles designed on the same camshaft.

The inlet camshaft is provided with three cams for each valve, one centrally located with small lift height, 3.6 mm, and two equally sized outer cams with big lift height, 10.0 mm. With a small lift height at low load and at engine speeds up to approx. 3000 rpm, the primary benefit is lower fuel consumption.

In principle, during the time that the lift height is small, the air damper is completely open. Control of the incoming air volume to the cylinders takes place through control of the camshaft's opening times. Hereby the pump losses are reduced, which in turn gives lower fuel consumption.

Low lift

At small lift height (4), only the centrally placed cam acts on the valve, which takes place trough the inner valve depressor. The outer cams act on the outer valve depressors, which follow the cams' movement. Since the centrally located valve depressor and the outer depressor are not connected, the outer depressor moves without affecting the valve. Thus, lift height becomes small.

High lift

At high lift height (3), the inner valve depressor is connected with the outer valve depressor with lock pins. The outer camshaft cams' movement is transmitted through the outer valve depressor, on through the lock pins and the inner valve depressor to the valve. Thus, lift height becomes big.

The position of the lock pins is controlled hydraulically with two electro-hydraulic valves. One electro-hydraulic valve controls the valves for cylinders 1, 2 and 4, while the other controls the valve for cylinders 3, 5 and 6. Thus, the electro-hydraulic valves control 6 valves each (as the engine has 2 inlet valves and 2 exhaust valves per cylinder).

The position, on/off, of the electro-hydraulic valves is controlled by the Engine control module (ECM).

The inner valve depressor works like a hydraulic valve depressor, which compensates any wear. Thus, the valve clearance is "0".

The exhaust camshaft is conventional and has a lift height of 10.0 mm. The valve depressors are mechanical, that is, they "have" valve clearance.

VALVE DEPRESSOR

Fig. 138: Identifying Valve Depressors
Courtesy of VOLVO CARS CORPORATION

Valve depressors without **CPS** -functionality (**C** amshaft **P** rofile **S** hifting) have a coating of **DLC** (**D** iamond **L** ike **C** arbon).

It is the tops of the valve depressors that are coated with DLC. The layer with diamond-like carbon structure has a depth of 2µm, is very hard and has self-lubricating properties. The surface reduces the friction against the camshaft lobes and thus gives lower fuel consumption and longer service life.

Thanks to very good adhesion and toughness the DLC-coating can handle very high loads. The change applies to valve depressors without CPS-functionality.

This means that it concerns depressors in position:

- Engine B6304T4 (Ulev2) Exhaust, inlet
- Engine B6324S4 (Pzev) Exhaust, inlet
- Engine B6324S5 (Ulev) Exhaust

If needed the DLC-coated depressors can also be used on older engines.

LUBRICATION SYSTEM

Fig. 139: View Of Lubrication System
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Oil pan	5	Oil dipstick
2	Oil pump	6	Housing for the oil filter
3	Oil pressure line	7	Oil suction line
4	Oil cooler		

The task of the lubrication system is to build-up a protective film of oil between the moving parts of the engine. The lubrication system must also transport dirt particles away from the moving parts and cool hot engine parts.

This is carried out by the oil pump supplying oil to the oil filter through an oil pressure line of treated steel.

Clean oil is supplied from the oil filter to the oil cooler. From there the oil is further distributed, through a duct system, out to the various engine functions.

A pressure sensitive valve controls the oil flow to the vibration damper's oil cooler pipe if necessary.

Oil pump

Fig. 140: Identifying Oil Pump
Courtesy of VOLVO CARS CORPORATION

The oil pump is in the oil pan, mounted underneath the intermediate section. The oil pump has an integrated relief valve. The pump is directly driven by the sprocket on the rear end of the crankshaft.

The oil pump draws oil from a centrally located nozzle in the sump.

The pump increases the pressure of the oil for lubrication, cooling and hydraulic functions.

Oil filter module

Fig. 141: Identifying Oil Filter Module
Courtesy of VOLVO CARS CORPORATION

The oil filter module consists of an oil filter reservoir and an oil cooler. It is mounted on the intermediate section. The oil filter module is element based and can be taken apart.

The oil cooler is connected to the coolant system. Coolant is led through the oil cooler.

COOLING SYSTEM

Fig. 142: Identifying Cooling System
Courtesy of VOLVO CARS CORPORATION

The coolant pump shell is integrated in the timing cover. The pump wheel is still driven by the auxiliary unit's transmission.

The coolant pump pumps coolant through the cylinder block, and also cools the cylinder head, cylinder sleeves, spark plug wells, intake ducts and fuel injection nozzles.

The coolant flows in at the coolant pump and passes through a number of channels before it collects and then flows out to the thermostat housing. If the thermostat housing is closed, the coolant passes via the by-pass channel directly to the coolant pump to then circulate through the cylinder block again.

For the turbocharged engine, the task of the cooling system is to supply the turbocharger with coolant.

Coolant pump and drive gear

Fig. 143: Identifying Coolant Pump And Pulley
Courtesy of VOLVO CARS CORPORATION

Alternator/clutch

Fig. 144: View of Alternator and Freewheel
Courtesy of VOLVO CARS CORPORATION

The belt pulleys on alternator and intermediate shaft have improved surface treatment.

On the alternator shaft between alternator and intermediate shaft there is a clutch with a freewheel (one-way clutch) at each end. The function is to filter the engine's different irregular shape and thus avoid gear rattle/noise in the geartrain.

In connection with introduction of **EHPAS** (electric servo pump), the belt-driven servo pump with its heavy steel belt pulley is discontinued as well as the clutch for the coolant pump. The reduced rotating moment of inertia means more freewheeling, primarily when idling.

To reduce/avoid wear, the drive gears' outer ring (against the one-way clutch's friction band), are treated with nitride.

AC bracket

Fig. 145: Identifying A/C Compressor Bracket
Courtesy of VOLVO CARS CORPORATION

The AC compressor's fastening bracket is simplified. Earlier solution with a main bracket and three separate stays, is replaced by a modified bracket which has the front reinforcement stay integrated and a new fastening point in the transmission. The change means, except that the fastener assembly has 9 fewer bolts, that the installation method becomes easier and there is no longer a need for any special tools when assembling.

CRANKCASE VENTILATION

Fig. 146: Identifying Crankcase Ventilation System
Courtesy of VOLVO CARS CORPORATION

The crankcase ventilation is maintained internally in the engine.

An oil separator is on top of the engine's camshaft cover. It separates the oil drops from the air in the crankcase. The drops are collected in a separator and flow back inside the engine to the oil pan. This prevents extra weight and space for external pipes.

AUXILIARY UNIT TRANSMISSION

Fig. 147: Auxiliary Unit Drive
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Servo pump (only XC90)	4	Intermediate shaft
2	Guide pulley	5	Belt tensioner
3	Air conditioning (A/C) compressor	6	Coolant Pump

The auxiliary units are located at the upper edge of the cylinder block, above the transmission. They are driven by two systems, a Poly-V-belt driven system and a clutch system. These two systems are driven by the intermediate shaft transmission.

The belt system consists of a 6-ribbed Poly-V belt, an automatic belt tensioner and a guide pulley. This system drives the servo pump and AC compressor. The coolant pump is driven by the servo pump via the clutch system.

TURBOCHARGER (TC)

NOTE: Only applies to turbocharged engines.

Fig. 148: View of Turbocharger System
Courtesy of VOLVO CARS CORPORATION

The exhaust gases enter via the manifold (1) down to the turbine housing (8) and out to the exhaust system via a downpipe and catalytic converter.

The turbine expels the exhaust gases and rotates the compressor wheel (3). The compressor wheel creates a certain amount of suction using the intake air. This intake air enters the compressor via the air filter and uses a rotational movement to speed up the air, creating the boost pressure. The air then continues into the intake system via the charge air pipe and charge air cooler.

The electronically controlled By-pass valve (4) then controls the boost pressure in the turbocharger by determining the amount of exhaust gases which must pass the turbine. The turbine transfers drive to the compressor. The wastegate valve (2) is a membrane which equalizes the pressure of the intake and exhaust air to eliminate noise.

The turbocharger is lubricated by the engine's oil system (7). The oil system also acts as a supplement to the coolant system (5 and 6).

EXHAUST MANIFOLD / CATALYTIC CONVERTER

Fig. 149: Identifying Manifold With Catalytic Converter
Courtesy of VOLVO CARS CORPORATION

Exhaust manifold/**CCC** (**C** lose **C** oupled **C** atalyst) and front exhaust pipe/catalytic converter for engine are improved with regards to weight and efficiency. Heat shield plates are modified.

Manifold with catalytic converter

The catalytic converter's cross-section is changed from oval to round, which means better contact pattern of the exhaust flow against the catalytic converter's substrate. This means that the amount of precious metals in the coating on the catalytic converter can be reduced at the same time as the emission standards are fulfilled. In addition to a great cost-saving, reducing the need for precious metals also results in less environmental impact.

The outlet flange is changed from a thickness of 8 mm with threaded holes (x4) to a 4 mm thick plate with press bolts (x4). This gives weight and cost-savings. Gaskets are changed to 1.2 mm flat gaskets.

Downpipe/Catalytic converter

The catalytic converter's inlet flange is also changed from 8 mm to 4 mm thick, which gives a weight and cost-saving. The bellows is more flexible which gives less noise from resonance and vibrations as well as longer service life. Also, the rear catalytic converters have a reduced amount of precious metals in the substrate's coating at the same time as the emission standards still are fulfilled, which gives another big cost-saving.

OVERVIEW

Fig. 150: ENGINE (B6324S5; 2011-2012)
Courtesy of VOLVO CARS CORPORATION

The engine has been developed by Volvo.

It is a 6 cylinder transverse in-line engine with a cylinder capacity of 3.2 L for naturally aspirated engines and 3.0 L for turbocharged engines.

After having been relatively unchanged since the introduction 0620, this engine family has been updated on several points. Most modifications have their basis in an effort to achieve lower fuel consumption and thus less environmental impact.

Engine power has increased, at the same time as fuel consumption has decreased.

- B6304T4: (ULEV2 Ultra Low Emission Vehicle): 300(US)/ 304 hp / 440 Nm
- B6324S4 (PZEV - Partial Zero Emission Vehicle): 230(US) 233 hp (torque unchanged 300 Nm)
- B6324S5 (ULEV - Ultra Low Emission Vehicle): 240(US) /243 hp (torque unchanged 320 Nm)

All of these engines meet the emission standards for Euro5.

The engines' idle speed 650 rpm.

The engine is extremely compact. When it was introduced it was the shortest 6-cylinder engine of 3.2 L on the

market. Conventional straight 6-cylinder engines are too long to fit between the collision members in the engine compartment. The special design of this engine solves the problem.

The engine has an extremely short drive train, its length is only 625 mm from the front edge of the engine block to the rear edge of the carrier plate.

Great attention has been paid to creating a very rigid engine. Middle part, cylinder block and cylinder head have been structurally optimized to combine low weight with high rigidity.

Even the camshaft cover is structurally optimized.

The engine has double overhead camshafts and 24 valves.

Camshafts, AC-compressor, coolant pump and alternator are driven by an auxiliary unit drive, mounted on the back of the engine.

This placement of the auxiliary unit drive enables new possibilities for creating a good collision-protecting structure around the straight 6-cylinder drive unit. In the latest update of the engine family the servo pump has been replaced by an electrically driven pump (EHPAS).

The entire engine block and the cylinder head is made from aluminum.

The engine has a compact "pent-roof" designed combustion chamber and V-arranged valves. This gives optimal and fast filling and direct flushing via the inlet manifold followed by the combustion chamber (cross-flow) and the exhaust channel.

The squish surfaces together with the centrally positioned spark plug provide optimal combustion of the air/fuel mixture, low knock sensitivity and low, stable exhaust emissions.

The engine's firing order is 1 - 5 - 3 - 6 - 2 - 4. The firings occur every 120 degrees that the crankshaft rotates.

ENGINE (B8444S; 2005-2011)

DESIGN

ENGINE BLOCK

Fig. 151: Engine (B8444S; 2005-2011)
Courtesy of VOLVO CARS CORPORATION

The cylinder heads and valve covers are made of aluminum.

The seal between the cylinder head and cylinder block occurs using two cylinder head gaskets, one for each cylinder head. The cylinder head gasket is made up of three layers of stainless steel. Two outer and a center which act as a seal around the cylinders. The outer surfaces of the gasket are covered by a rubber layer which functions as a seal. The seal between the other planes is made using liquid gasket.

Fig. 152: Identifying Cylinder Bank Offset
Courtesy of VOLVO CARS CORPORATION

The engine has two cylinder banks. The left cylinder bank is slightly offset compared to the right. This allows the use of the vehicle's existing member system and crumple zones.

The engine has double pairs of overhead camshafts - one intake camshaft and one exhaust camshaft in each cylinder head. The camshafts are chain-driven.

Fig. 153: Identifying Cylinder Number
Courtesy of VOLVO CARS CORPORATION

The cylinders are numbered in the order in which they are installed on the crankshaft when seen from the front (from the camshaft's timing gear).

Fig. 154: View of Four Valves Per Cylinder
Courtesy of VOLVO CARS CORPORATION

The engine has four valves per cylinder. The valves are angled at 19 degrees. The valve diameter of the intake valves is 35 mm and the exhaust valve's is 30 mm. The valves are stellite coated. The valve stem diameter for both inlet and exhaust is 5.5 mm.

The combustion chamber is the "Pent roof" type. Together with the V arranged valves this gives optimal and fast filling and direct flushing via the intake channel followed by the combustion chamber (cross-flow) and exhaust channel.

The squish surfaces together with the centrally positioned spark plug provide optimal combustion of the air/fuel mixture, low knock sensitivity and low, stable exhaust emissions.

CYLINDER HEAD

Fig. 155: Identifying Cylinder Head
Courtesy of VOLVO CARS CORPORATION

The engine's two cylinder heads are in principle mirror images of each other. The cast oil galleries in the cylinder head ensures good oil supply to the camshafts and the mechanical valve lifters.

CYLINDER BLOCK

Fig. 156: Identifying Cylinder Block
Courtesy of VOLVO CARS CORPORATION

The cylinder block is made of cast aluminum. It has a stiff rib structure for better rigidity and thereby better sound and vibration properties.

The cylinder block has eight cast-iron cylinder liners molded into the cylinder block. They cannot be replaced.

The coolant jacket goes halfway down the cylinders to ensure quicker heating and thereby reduce hydrocarbon emissions. Certain sections of the coolant jacket are deeper to reduce the risk of the cylinder deformation.

INTERMEDIATE SECTION

Fig. 157: Identifying Intermediate Section
Courtesy of VOLVO CARS CORPORATION

The intermediate section is made of aluminum. The crankshaft bearing caps are integrated in the intermediate section. The bearing caps are made of cast iron. The caps are fixed with four screws per cap.

OIL SUMP

Fig. 158: Identifying Oil Pan
Courtesy of VOLVO CARS CORPORATION

The oil pan is made of pressed aluminum. It has baffles to prevent the oil moving too much. Because of the exterior dimensions of the engine, the oil pan has a unique shape in order to hold the necessary oil volume. The oil pan is made in two parts for manufacturing reasons.

An electric oil level sensor is located in the pan. There is also a normal oil dipstick for manual checks of the oil volume.

PISTONS AND CONNECTING RODS

Fig. 159: Identifying Piston And Connecting Rod
Courtesy of VOLVO CARS CORPORATION

The pistons are cast and are made of a light metal alloy. The piston mantle is coated with graphite. The first groove is hard anodized to minimize wear.

The piston is equipped with two compression rings and a three piece oil ring.

The connecting rods are forged. The contact surface between the bearing cap and the connecting rod is treated. Guide pins contribute to good alignment. The connecting rod bearings are aluminum bearings. The bearings are lead free.

The piston transfers the compressive force of the ignited fuel/air mixture to the crankshaft via the connecting rod. The piston rings form a seal so that the fuel/air mixture does not force its way down past the piston. The top ring ensures a seal between the piston and the cylinder. The second ring also seals and scrapes away any oil during the downward movement of the piston. The third ring makes sure the oil drains via the drain hole.

The pistons are oil-cooled. This is necessitated by the short distance between the piston head and the top piston ring.

CRANKSHAFT AND BALANCER SHAFT

Fig. 160: Identifying Crank and Balancer Shafts
Courtesy of VOLVO CARS CORPORATION

1. Balancer shaft
2. Crankshaft

The crankshaft is made of carbon steel with a nitride hardened surface. The crankshaft bearings have separate caps, the intermediate section of the cylinder block makes up the lower half of the bearing. The crankshaft has five main bearings where the third also acts as an axial bearing. The main bearings are aluminum bearings.

The crankshaft has offset pins. Two connecting rods are mounted on each crankshaft pin with an internal offset of 30°.

Big-end bearings and axial bearings are lead-free.

Two splined joints are located at the front end of the crankshaft, the inner one drives the oil pump. The timing chain gear is located on the outer joint.

The crankshaft has a three part vibration damper consisting of a hub and two active masses. The hub is located between the inner and outer masses. The crankshaft vibration damper drives the auxiliary belt.

The 60 degree angle between the two cylinder banks means that the engine is equipped with a balancer shaft.

This is to give the vibration characteristic which corresponds to a 90 degree V8. The balancer shaft is located in the center of the engine, above the crankshaft. The balancer shaft rotates in the opposite direction to the crankshaft. It is driven by the crankshaft using the same chain that drives the intake camshafts. The balancer shaft rotates at the same speed as the crankshaft.

The balancer shaft is made of spherolitic cast iron (nodular iron).

CAMSHAFTS AND VALVE SYSTEM

Fig. 161: Identifying Camshafts
Courtesy of VOLVO CARS CORPORATION

The engine has double pairs of overhead camshafts, one intake camshaft and one exhaust camshaft in each cylinder bank. The intake camshafts are located in the middle of the engine while the exhaust camshafts are placed on the outside.

The camshafts are made of cast iron. They are hollow to keep the weight down. Each camshaft pair is mounted in its respective cylinder head with five loose bearing caps per camshaft.

The camshafts work directly on the valve stem via the valve lifters. There is a certain amount of play (valve play) between the valve depressors and the cam lobes. Valve play is adjusted to make up for the longitudinal differences between the valve and cylinder head that occur upon warm-up. The valve depressors are solid and made of steel.

Each camshaft has a CVVT unit. The reset angle is 40.5 crankshaft degrees for the intake camshafts and 42.5 crankshaft degrees for exhaust camshafts.

- Intake camshafts open -8° to 32, 5° before top dead center (BTDC) and close 60° to 19.5° after the bottom dead center.
- Exhaust camshafts open 62° to 19.5° before bottom dead center and close -10° to 32.5° after the top dead center (TDC).

CAMSHAFT CHAIN DRIVE

Fig. 162: Identifying Camshaft Chain Drive
Courtesy of VOLVO CARS CORPORATION

The crankshaft drives the intake camshafts and the balancer shaft using a camshaft chain (1). The camshaft is tensioned by a hydraulic chain tensioner. The tensioner is supplied with oil from the normal lubrication system. The camshaft chain is lubricated with oil via a separate nozzle (2).

The intake camshafts in turn drive the respective exhaust camshafts via their chain (3). This intermediate drive means that the outer exhaust camshafts can have smaller pulley wheels which reduces the size of the engine. The intermediate drive chains each have their own hydraulic tensioner. The tensioner is supplied with oil from the normal lubrication system.

A cover seals the area for the camshaft chain drive.

The system requires no maintenance during the entire life of the engine. Both the chain guide and the chain tensioner have plastic inserts on the treads for quiet operation.

LUBRICATION SYSTEM

Fig. 163: View of Lubrication System
Courtesy of VOLVO CARS CORPORATION

The lubrication system has a large supply line with a strainer which prevents large contaminants from reaching the oil pump.

The oil pump (1) is driven by the crankshaft. The oil pump is a rotor pump with integrated pressure control valve. The valve opens at approximately 5.0 bar and prevents excessively high pressure which could damage the oil cooler.

The oil cooler is a flat oil cooler. The space for oil and coolant is divided alternately between the plates.

The oil filter (2) is a loose filter element placed in a housing. The overflow valve for a blocked filter is in the cover.

FUEL SYSTEM

Fig. 164: Identifying Fuel Injection System
Courtesy of VOLVO CARS CORPORATION

A specially designed fuel system is used to reduce the height of the engine.

The fuel system is made of stainless steel to ensure reliability. The fuel hose is made of nylon to reduce the weight of the engine.

INTAKE SYSTEM

Fig. 165: View of Two Mode Induction System
Courtesy of VOLVO CARS CORPORATION

An induction system with two modes is used to increase torque at low engine speed. Both the intake manifold and the equalizer tank are made of aluminum.

A moveable damper is located in the common area of the intake pipe. The damper separates the area lengthways into two chambers. The damper is controlled from completely closed to completely open, with no intermediate position. Up to an engine speed of 3200 rpm the damper is closed and the damper is open at higher engine speeds.

By dividing the area into two separate chambers, the area functions as two secondary intake pipes. The primary pipes are the cast pipes which lead to the inlet valves of the respective cylinder's intake valves from the collection volume. A closed damper provides secondary pipes while an open damper gives short secondary pipes.

Engine speeds up to 3200 rpm

The combined length and volume of the pipes is tuned to the piston movement and the valve opening times. The result is that the air pulses in time with the valve opening times. this means that the air is pumped into the cylinders when the inlet valves are open. The system gives a high a volumetric efficiency, that is, fills the cylinders and therefore produces a high torque.

In order not to disturb the pulse frequency the left chamber supplies 1, 4, 6 and 7 while the right chamber

supplies cylinders 8, 3, 5 and 2, this is to interact with the firing order 1-8-4-3-6-5-7-2.

Engine speed (RPM) greater than 3200 rpm

At engine speeds greater than 3200 rpm the throttle opens. At these speeds the character of the pulses change character at the same time as a greater volume is required to supply the cylinders with air. The whole area/volume now supplies all cylinders. The common volume and the shape of the pipes is designed to exploit the pulses which occur in this engine speed (rpm) range.

If the damper does not open at 3200 rpm there is marked deterioration in performance from 3200 rpm up to 5000 rpm.

THROTTLE BODY

Fig. 166: Identifying Throttle Body
Courtesy of VOLVO CARS CORPORATION

The throttle body is made of cast aluminum. The position sensor, which is located under the plastic cover, reads the position of the throttle disc and two engine connections that turn the throttle disc. The throttle disc position is determined by how much the driver depresses the accelerator pedal. The throttle body is warmed via engine coolant.

COOLING SYSTEM

Fig. 167: Schematic of Cooling System
Courtesy of VOLVO CARS CORPORATION

1. Cylinder block
2. Right cylinder head
3. Electric coolant pump
4. Heat exchanger (passenger compartment)
5. Preheating crankcase ventilation
6. Throttle body
7. Upper cooling hose
8. Bypass pipe
9. To cylinder head
10. Radiator
11. Oil cooler
12. Lower cooling hose
13. Thermostat housing
14. Coolant pump
15. Left cylinder head
16. Expansion tank with level sensor
17. Air bleed circuit

The engine is cooled used reversed cooling, that is, the cylinder head is cooled first. The system gives fast heating and contributes to reducing emissions.

The radiator is made of aluminum to withstand thermal fatigue as the radiator is alternately cooled with cold air and heated with hot coolant. The cooling system is regulated by a mechanical thermostat, which is located in the thermostat housing. The thermostat housing, in turn, is located on the inlet side of the coolant pump, between the radiator and the coolant pump.

The heart of the thermostat is a wax body which expands when energy, in the form of heat, is applied. A jiggle pin is located in the thermostat. Any air in the cooling system can be evacuated from the system using the jiggle pin.

Cold air is sucked through the cooler using an electric engine cooling fan installed on the fan shroud behind the radiator. The engine cooling fan is brushless and has six fixed stages. It is controlled by the engine control module (ECM).

Oil cooler

The oil cooler is round and has an inlet and outlet for oil as well as for coolant. The oil cooler is structured in layers, with alternating layers of coolant and oil flow. Because the oil cooler has very small slits, there is a large pressure drop here.

AUXILIARIES BELT

Fig. 168: Auxiliaries Belt Routing
Courtesy of VOLVO CARS CORPORATION

1. Generator (GEN)
2. Belt tensioner
3. Servo pump
4. Water pump
5. air conditioning (A/C) compressor.

All auxiliary units, the alternator, servo pump and A/C compressor are directly mounted in the engine block. They are driven by the vibration damper via an auxiliaries belt. This solution gives a compact design.

The coolant pump is also driven by the auxiliaries belt.

The auxiliaries belt has a mechanical belt tensioner.

EXHAUST SYSTEM

Fig. 169: Identifying Exhaust System
Courtesy of VOLVO CARS CORPORATION

HINT: The illustration displays the exhaust system for the XC90.

The exhaust system is made of double-layer sheeting to keep the temperature down. The inner sheet is 1.0 mm thick while the outer is 1.5 mm thick. There is 4-8 mm of space between the sheets.

An exhaust system extends from each cylinder bank. Each side consists of a manifold with close-coupled catalytic converter, pipes, bellows and a rear catalytic converter. Both sides join to form a common pipe after the rear catalytic converter.

The pipes are designed in such a way that the gas flow from the cylinders is not disruptive and there is good flow distribution to the catalytic converters. Bellows in front of the two rear catalytic converters absorb engine movements and compensate for manufacturing and assembly tolerances.

A catalytic converter consists of perforated stones of ceramic or metal (known as substrate). These are coated with a surface enlarger (washcoat) on which the precious metals platinum, palladium and rhodium, the catalysts, are applied.

The catalytic converter has an extra heat shield toward the radiator fan to reduce the temperature.

Four oxygen sensors are used to regulate the engine and monitor the catalytic converter. There is an oxygen sensor upstream and downstream of each close-coupled catalytic converter.

The two banks are almost exactly the same length to ensure good sound. The exhaust system provides the engine's characteristic V8 sound.

FUNCTION

CRANKSHAFT MOVEMENT

Fig. 170: View Of Crankshaft Relationships
Courtesy of VOLVO CARS CORPORATION

To achieve an even running and characteristic V8 sound, the ignition impulse interval is 90 crankshaft degrees. To reach this in an engine with a 60 degree angle between the cylinder banks, the crankshaft pins for the opposing cylinder pairs are offset by 30 degrees.

Fig. 171: Identifying Crankshaft Pins Offset By 30 Degrees.
Courtesy of VOLVO CARS CORPORATION

When the left hand piston is at the top, the right hand piston is halfway between the upper and lower turn points. This is because the crankshaft pins are internally offset by 30 degrees.

Fig. 172: Crankshaft Rotated 90 Degrees
Courtesy of VOLVO CARS CORPORATION

When the crankshaft has rotated 90 degrees the right hand piston is at the top and the left hand piston is halfway between the upper and lower turning points.

Fig. 173: Ignition Impulses Occur Every 90° Crankshaft Rotation
Courtesy of VOLVO CARS CORPORATION

When the crankshaft has rotated a further 270 degrees the left hand piston is at the top and the right hand piston is halfway between the upper and lower turning points.

By offsetting the crankshaft pins by 30 degrees in this way the ignition impulses will occur every 90th crankshaft degree.

Fig. 174: Identifying Ignition Impulses
Courtesy of VOLVO CARS CORPORATION

The Example shows the principle for cylinder 1 and 2. With the firing order 1-8-4-3-6-5-7-2 the following occurs:

- Cylinder 1 fires.
- The crankshaft then rotates 360°+270°=630° until cylinder 2 fires.
- The next ignition impulse, now again for cylinder 1, occurs when the crankshaft has rotated a further 90 degrees.

LUBRICATION SYSTEM

Fig. 175: Identifying Lubrication System
Courtesy of VOLVO CARS CORPORATION

1. Cylinder head
2. Cylinder block
3. Intermediate section
4. Oil sump
5. Crankshaft
6. Oil filter
7. Camshafts

Oil is led from the oil sump via a suction nozzle to the oil pump, which is located on the crankshaft. The oil pump suction function is facilitated by a purge valve that eliminates any air from the system.

The oil is pumped on to the oil cooler system and then on to the oil filter. The oil is led from the filter through a cast oil duct in the intermediate section to the main bearings. The oil is distributed to the big-end bearings via drilled channels in the crankshaft.

The camshafts receive their oil supply via drilled channels in the cylinder block. The channels continue up through the cylinder heads where they open out on the underside of the lower half of the cylinder head. There is a cross channel in the channels to the cylinder heads which leads oil to the pistons. From here the oil is moved further via the oil channels to the intake camshaft bearings and valve lifters.

The exhaust camshaft bearings are supplied via two cast cross channels at the front of the upper halves. The oil is led via drains in the block from the cylinder heads and from the crankshaft bearings back to the oil pan.

CRANKCASE VENTILATION

Fig. 176: Identifying Crankcase Ventilation
Courtesy of VOLVO CARS CORPORATION

The system is pressure controlled and completely enclosed.

Crankcase gases flow up to both the valve covers. There is a hose connecting the valve covers. A labyrinth system of plates is installed in the valve covers. The oil in the gases condenses on the plates and drains back to the oil pan.

The ventilation is pressure controlled to retain stable pressure in the crankcase. A pressure regulator is installed on the rear edge of the right valve cover. The gases which are evacuated are led from the regulator through a hose to a connection on the inlet pipe. Coolant is circulated around the connection to prevent freezing.

The pressure in the crankcase is approximately - 0.03 bar.

COOLING SYSTEM

Fig. 177: Diagram Of Cooling System
Courtesy of VOLVO CARS CORPORATION

The combustion of fuel in the vehicle engine produces both mechanical motion and excess energy. The excess energy takes the form of heat that is led away from the engine via:

- exhaust gases
- convection to the air in the engine compartment
- transfer to the coolant in the cooling system
- the engine oil.

The thermostat (1) regulates the amount of coolant to the engine. The wax body in the thermostat expands when subjected to heat.

The coolant is pumped by the coolant pump (2) to the inlets (6) for the cylinder heads (3). The coolant flows forward through the relevant cylinder head and on through the cylinder banks back to the common outlet (4). After passing the engine the coolant flows by:

- Closed thermostat through the bypass pipe (5) back to the coolant pump without cooling off.
- Open thermostat through the radiator (7) to the coolant pump. The coolant also flows through the bypass pipe back to the coolant pump.

EXHAUST SYSTEM

Fig. 178: Identifying Exhaust System
Courtesy of VOLVO CARS CORPORATION

HINT: The illustration displays the exhaust system for the XC90.

The three-way catalytic converters clean by oxidizing carbon monoxide (CO) and hydrocarbons (HC) to water and carbon dioxide (CO_2). Nitrous oxides (NO_x) are reduced to nitrogen and water. The catalytic converter transforms over 98 percent of these substances during normal operation. Lead contaminates in the fuel can damage the catalytic converter, quickly rendering it inoperable.

OVERVIEW

Fig. 179: ENGINE (B8444S; 2005-2011)
Courtesy of VOLVO CARS CORPORATION

The engine is an 8 cylinder V-engine with 60 degrees angle between the two cylinder banks. A specially adapted exhaust system together with the offset crankshaft pins gives the characteristic V8 sound. The engine is transverse and is only available in combination with AWD.

The engine is mounted vertically on the subframe.

Displacement is 4.4 dm^3 . Each cylinder has four valves.

The engine has a variable intake system which gives high torque at low engine speeds (rpm) and high performance at high engine speeds (rpm).

The ignition system has directly installed ignition coils.

The engine has mechanical valve lifters and electronic throttle. The throttle body is heated by coolant which means that pre-heating of intake air is not required.

The engine has double pairs of overhead camshafts, driven by three maintenance-free chains.

The engine has a counter rotating balancer shaft which gives vibration free running.

The cylinder block is made of a light metal alloy.

The direction of cooling system flow allows the coolant to first cool the cylinder heads and then the engine block.

All auxiliary units, the alternator, servo pump and A/C compressor are directly mounted on the engine block.

95 RON fuel can be used for normal operation. 98 RON is recommend for maximum performance and lowest possible fuel consumption. When driving in climates hotter than +38 °C, fuel with the highest possible octane rating is recommended to ensure the best possible performance and fuel consumption.

The engine is regulated by the Engine Control Module (ECM).

ENGINE CONTROL MODULE (ECM) (B6324S; 2007-2010)

DESIGN

IGNITION SWITCH

Fig. 180: Identifying Ignition Switch
Courtesy of VOLVO CARS CORPORATION

The Engine Control Module (ECM) uses the signal from the ignition switch to detect when the ignition key has been turned to position II or III. When the key is in the ignition position (position II) or starting position (position III) a high signal (U_{bat}) is transmitted from the ignition switch to the engine control module (ECM).
The engine management system prepares for start-up (for example, temporarily activates the fuel pump (FP) relay). When the flywheel in the engine rotates, the engine speed (RPM) sensor signal is used to keep the fuel pump (FP) relay activated.

The fuse in the fusebox in the passenger compartment supplies current to the ignition switch.

The central electronic module (CEM) has diagnostics for the ignition switch.

TRANSMISSION CONTROL MODULE (TCM)

The engine control module (ECM) uses a directly connected signal from the transmission control module (TCM) in the start function (activating the starter motor).

ENGINE SPEED (RPM) SENSOR

Fig. 181: Identifying Engine Speed (RPM) Sensor
Courtesy of VOLVO CARS CORPORATION

The engine speed (RPM) sensor provides the engine control module (ECM) with information about the speed and position of the crankshaft. The engine control module (ECM) is able to use the signal from the engine speed (RPM) sensor to determine when a piston is approaching top dead center (TDC).

The signal from the engine speed (RPM) sensor is also used to check the engine for misfires. For further information, see: **MISFIRE DIAGNOSTIC**

The impulse sensor is located on the engine's flywheel side, pointing forward. The sensor is inductive with permanent magnet. When the flywheel/drive flange plate passes the impulse sensor, an alternating voltage is induced in the sensor. The generated voltage and frequency increase when the engine speed increases.

The signal varies between 0.1-100 V depending on the engine speed (RPM).

The Engine Control Module (ECM) is able to determine the engine speed (RPM) by counting the number of holes per time unit. When the reference position passes the engine speed (RPM) sensor, the voltage and frequency drop momentarily to zero, even though the engine is still running. This allows the engine control module (ECM) to determine the position of the crankshaft.

If the signal from the engine speed (RPM) sensor is incorrect or missing, the control module will use signals from the camshaft position (CMP) sensor.

The engine speed sensor can be diagnosed by the engine control module (ECM) and the sensor signal (engine speed) can be read out.

CAMSHAFT POSITION (CMP) SENSOR

Fig. 182: Identifying Camshaft Position (CMP) Sensor
Courtesy of VOLVO CARS CORPORATION

The function of the camshaft position (CMP) sensor is to detect the flanks of the camshaft rotor. The signal from the sensor is used by the engine control module (ECM) to determine the angle of the camshaft.

Each camshaft is divided into a number of flanks (segments) per camshaft revolution. A pulse wheel on the camshaft consisting of teeth (the teeth are positioned by each flank) is used by the camshaft position sensor (CMP) to detect the flanks and the position of the camshaft.

In the event of misfire or engine knock, the control module is able to determine which cylinder is misfiring or knocking using the camshaft position (CMP) sensor's signal.

Data about the camshaft position is used during camshaft control (CVVT). See: **CAMSHAFT CONTROL (CVVT)**

The sensor, which is a magnetic resistor with a permanent magnet, is grounded in the control module and supplied with 5 V from the control module. When one of the teeth on the camshaft pulse wheel passes the camshaft position (CMP) sensor, a signal is transmitted to the control module from the camshaft position (CMP) sensor. The signal varies between 0 and 5 V and is high when a tooth is in contact with the camshaft position (CMP) sensor and low when the tooth leaves the camshaft position (CMP) sensor.

There is camshaft position (CMP) sensor for each camshaft.

The camshaft sensors are located by the camshafts on the engine's left side, closest to the flywheel.

The engine control module (ECM) can diagnose the camshaft position (CMP) sensors.

KNOCK SENSOR (KS)

Fig. 183: Identifying Knock Sensor (Ks)
Courtesy of VOLVO CARS CORPORATION

The function of the knock sensor (KS) is to monitor combustion knocking from the engine. Knocking may damage the engine and reduces the efficiency of engine combustion.

If the engine control module (ECM) registers knocking from any of the cylinders, the ignition will be retarded for that cylinder at the next combustion stage. If repeated ignition retardation does not prevent knocking, the injection period will be increased. This has a cooling effect.

The sensor is made up of a piezo electrical crystal. If there is engine knock, vibrations (sound waves) spread through the cylinder block to the knock sensor (KS). The resultant mechanical stress in the piezo electrical material in the knock sensors generates a voltage. This signal is transmitted to the Engine Control Module (ECM). The signal corresponds to the frequency and amplitude of the sound waves. This allows the Engine Control Module (ECM) to determine if the engine is knocking. The camshaft position (CMP) sensor and engine speed (RPM) sensor are used to determine the operating cycle of the engine (which cylinder is igniting) and thereby which cylinder is knocking.

The knock sensors (KS) are located on the cylinder block under the intake manifold.

The engine control module (ECM) can diagnose the knock sensors (KS).

ENGINE COOLANT TEMPERATURE (ECT) SENSOR

Fig. 184: Identifying Engine Coolant Temperature (ECT) Sensor
Courtesy of VOLVO CARS CORPORATION

The engine coolant temperature (ECT) sensor checks the temperature of the engine coolant. The temperature of the engine coolant is required so that the engine control module (ECM) can regulate:

- the injection period
- the idle speed
- the engine cooling fan (FC)
- the ignition advance
- engagement and disengagement of the A/C compressor
- diagnostic functions.

The sensor is a negative temperature coefficient (NTC) type which is supplied with power from the control module (signal) and is grounded in the control module.

The resistance in the sensor changes depending on the temperature of the coolant. Depending on the resistance in the sensor, voltage (signal) is transmitted to the engine control module (ECM). The lower the temperature the higher the voltage (high resistance). A high temperature results in low voltage (low resistance).

The engine temperature sensor is located by the thermostat under the intake manifold.

The engine temperature sensor can be diagnosed by the engine control module (ECM) and the sensor value can be read out.

MASS AIR FLOW (MAF) SENSOR/INTAKE AIR TEMPERATURE (IAT) SENSOR

Fig. 185: Identifying Mass Air Flow (MAF) Sensor/Intake Air Temperature (IAT) Sensor
Courtesy of VOLVO CARS CORPORATION

Overview

The mass air flow (MAF) sensor is a combined sensor and contains two sensors in the same component:

- Mass air flow (MAF) sensor
- intake air temperature (IAT) sensor.

The mass air flow sensor is located by the air filter housing.

Mass air flow (MAF) sensor

The mass air flow (MAF) sensor gauges the air mass sucked into the engine. It continuously transmits signals to the engine control module (ECM) about the mass of the intake air. This data is used by the engine control module (ECM) to calculate:

- the injection period
- the fuel pressure
- the ignition timing
- the engine load.

The gearbox control module (TCM) also uses this data for its gear shift calculations. This data is transmitted to the gearbox control module (TCM) from the engine control module (ECM) via the high speed side of the Controller area network (CAN).

The mass air flow (MAF) sensor is a hot wire type. Unlike other hot wire types, the mass air flow sensor in the Denso system uses a hot wire which has a ceramic casing. This eliminates the need for a clean burn function.

The mass air flow (MAF) sensor is supplied with battery voltage by the system relay and is grounded in the engine control module (ECM). The signal from the sensor is analog and varies between approximately between 0.5 - 4.5 V. Low air flow (low mass) results in low voltage, high air flow (high mass) gives high voltage.

The mass air flow (MAF) sensor can be diagnosed by the engine control module (ECM) and the sensor signal can be read off.

Intake air temperature (IAT) sensor

The temperature sensor checks the temperature of the intake air in the intake manifold. This data is used by the engine control module (ECM) to calculate injection period. The control module also controls certain diagnostic functions using the signal from the temperature sensor.

The sensor, which is an NTC resistor, is grounded in the control module and supplied with power (signal) from the control module.

The resistance in the sensor changes according to the intake air temperature. This provides the control module with a signal of between 0.5 - 5 V. The lower the temperature the higher the voltage (high resistance). A high temperature results in low voltage (low resistance).

The temperature sensor can be diagnosed by the engine control module (ECM) and the sensor signal can be read off.

HEATED OXYGEN SENSORS (HO2S)

Front heated oxygen sensor (HO2S)

Fig. 186: Identifying Heated Oxygen Sensors (HO2S)
Courtesy of VOLVO CARS CORPORATION

CAUTION: The air lines for the heated oxygen sensors (HO2S) must not be trapped or damaged in any way. The connectors for the heated oxygen sensors (HO2S) must not be greased under any circumstances. The oil in the grease would disrupt the reference air and the function of the heated oxygen sensors (HO2S).

Front heated oxygen sensor (HO2S) is used to provide the engine control module (ECM) with information about the remaining oxygen content of the exhaust gases before the three-way catalytic converter (TWC). This is so that the engine control module (ECM) can continually check the combustion so that lambda=1 is achieved. lambda=1 is the ideal fuel-air ratio, with 14.7 kg air per 1 kg fuel.

The heated oxygen sensor uses current regulation and its signal characteristic is linear. With a linear signal characteristic, the amplitude of the signal curve is low when changing the oxygen content in the exhaust gases. The probe consists of a preheating element and the actual lambda sensor. The lambda sensor is an oxygen sensitive ceramic body consisting of zirconium oxide. The control module supplies power to the ceramic body, which reacts to the oxygen content of the exhaust gases. This in turn affects the signal to the engine control module (ECM). In order to determine the oxygen content in the exhaust pipe, the heated oxygen sensor needs reference air from the surrounding air. This reference air reaches the heated oxygen sensor via the air lines.

There are two front heated oxygen sensors; one for bank 1 and one for bank 2.

The heated oxygen sensors (HO2S) are diagnosed by the engine control module (ECM) and the signals from them can be read off. For further information, see: **HEATED OXYGEN SENSOR (HO2S) DIAGNOSTIC**

The control module can be used to read off the calculated lambda value from the heated oxygen sensor (HO2S) signal.

Rear heated oxygen sensor (HO2S)

Fig. 187: Identifying Heated Oxygen Sensors (HO2S)
Courtesy of VOLVO CARS CORPORATION

CAUTION: The air lines for the heated oxygen sensors (HO2S) must not be trapped or damaged in any way. The connectors for the heated oxygen sensors (HO2S) must not be greased under any circumstances. The oil in the grease would disrupt the reference air and the function of the heated oxygen sensors (HO2S).

The rear heated oxygen sensor (HO2S) is used to provide the Engine Control Module (ECM) with information about the remaining oxygen content of the exhaust gases behind the three-way catalytic converter (TWC). This information is used by the Engine Control Module (ECM) to check the function of the three-way catalytic converter (TWC). This check is carried out when the conditions for the Rear heated oxygen sensors (HO2S) are used to provide the Engine Control Module (ECM) with information about the remaining oxygen content of the exhaust gases behind the three-way catalytic converter (TWC). This information is used by the Engine Control Module (ECM) to check the function of the three-way catalytic converter (TWC). This check is carried out when the conditions for the catalytic converter diagnostics have been met. Rear heated oxygen sensors (HO2S) have no direct effect on regulation of the fuel/air mixture. However the Engine Control Module (ECM) uses the signal to optimize the signal from front heated oxygen sensors (HO2S). For further information, see: **THREE-WAY CATALYTIC CONVERTER (TWC) DIAGNOSTICS**

The heated oxygen sensor (HO2S) uses voltage control. The signal characteristic is binary. With a binary signal characteristic, the amplitude of the signal curve changes considerably when changing the oxygen content in the exhaust gases. Otherwise its components and function are the same as the front heated oxygen sensor (HO2S).

There are two rear heated oxygen sensors; one for bank 1 and one for bank 2.

The heated oxygen sensors (HO2S) can be diagnosed by the engine control module (ECM), and signals from them can be read off

Preheating of the heated oxygen sensors (HO2S)

The heated oxygen sensor (HO2S) only functions above a certain temperature, approximately 300 °C. The normal operating temperature is between 300-900 °C. The heated oxygen sensors (HO2S) are electrically pre-heated so that operating temperature is rapidly reached. They are also pre-heated to ensure that the heated

oxygen sensors (HO2S) maintain a normal operating temperature and to prevent condensation which could damage the heated oxygen sensor (HO2S).

The sensor's heating coil consists of a PTC-resistor. The heating coil is supplied with voltage from the system relay and is grounded internally in the Engine control module (ECM).

When the control module grounds the connection, a current will pass through the PTC-resistor. When the heated oxygen sensor is cold, the resistance in the PTC-resistor is low and a high current will pass through the circuit. To avoid condensation damage to the heated oxygen sensor the current is pulsed from the Engine control module (ECM) in the beginning. Depending on the temperature, consideration is given to dew point and, as the temperature increases in the PTC-resistor, the resistance increases in the resistor, the current is reduced and transfers gradually to non-pulsing current.

The heating period for the front heated oxygen sensor is short, approx. 20 seconds.

The heater element heats the heated oxygen sensors (HO2S) to approximately 350 °C. The probes maintain this as a minimum temperature.

The engine control module (ECM) can diagnose the heater element.

BRAKE LIGHT SWITCH

Fig. 188: Identifying Brake Light Switch
Courtesy of VOLVO CARS CORPORATION

The purpose of the brake light switch is to provide the engine control module (ECM) with information indicating whether the brake pedal is depressed.

When the brake pedal is pressed down, a signal is sent to the Engine control module (ECM), which turns off the cruise control (if it is activated). The brake pedal position sensor also handles the function for switching off cruise control.

The brake light switch is supplied with power from the ignition switch (terminal 30). When the brake pedal is depressed the switch closes and a high signal (12 V) is transmitted to the engine control module (ECM).

The stop lamp switch can be diagnosed by the engine control module (ECM) and its status (depressed or not)

can be read off.

The brake light switch is on the pedal box by the brake pedal.

A/C PRESSURE SENSOR

Fig. 189: Identifying A/C Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

The air conditioning (A/C) pressure sensor detects the pressure in the high-pressure side of the air conditioning (A/C) system. See: **REGULATING THE AIR CONDITIONING (A/C) COMPRESSOR**

The sensor is linear. It is grounded in the control module and supplied with a 5 Volt current from the control module. A linear signal (between 0-5 V depending on the pressure in the air conditioning (A/C)) is transmitted to the control module. Low pressure produces low voltage, high pressure produces high voltage. The air conditioning (A/C) pressure sensor is affected by the pressure in the high-pressure pipe of the air conditioning (A/C) system (narrow pipe).

The engine control module (ECM) can diagnose the air conditioning (A/C) pressure sensor. The sensor value can be read off using the diagnostic tool.

ACCELERATOR PEDAL (AP) POSITION SENSOR

Fig. 190: Identifying Accelerator Pedal (AP) Position Sensor

Courtesy of VOLVO CARS CORPORATION

The function of the accelerator pedal position sensor is to provide the engine control module (ECM) and central electronic module (CEM) information on the position of the accelerator pedal. The engine control module (ECM) uses this data to deploy the shutter in the throttle unit to the correct angle.

The accelerator pedal position sensor consists of a plastic housing with two potentiometers, and an Analog/Digital converter. The potentiometers are connected to a common shaft which is affected by the position of the accelerator pedal.

The accelerator pedal (AP) position sensor transmits an analog and a pulse width modulated (PWM-signal to the engine control module (ECM). These signals indicate the position of the accelerator pedal (AP). The digital signal is generated by the sensors Analog/Digital converter.

The analog and digital signals are used at the same time by the engine control module (ECM) to regulate the throttle shutter angle.

The power supply to the two potentiometers is different. The analog potentiometer is supplied with 5 V via the engine control module (ECM). The digital potentiometer is supplied with 12 V via the system relay and is grounded in the car body.

The digital signal is used together with the analog signal for diagnostics of the accelerator pedal position sensor.

Accelerator pedal (AP) position sensor's signals can be read off.

A diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects a difference between the analog and digital signals. The engine control module (ECM) then uses a minimal value to ensure the function (limp home).

The accelerator pedal (AP) position sensor is located on the accelerator pedal bracket.

OUTSIDE TEMPERATURE SENSOR

Fig. 191: Locating Outside Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

The outside temperature sensor detects the temperature in the surrounding air. The signal is used by the engine control module (ECM) as a substitute value in the event of a fault in certain components or functions and to control certain diagnostic functions.

The sensor is a negative temperature coefficient (NTC) type which is supplied with power from the control module (signal). The resistance in the sensor changes with the outside temperature. This alters the signal to the engine control module (ECM). The lower the temperature the higher the voltage (high resistance). A high temperature results in low voltage (low resistance).

The outside temperature sensor is positioned in the left door mirror.

The outside temperature sensor can be diagnosed by the engine control module (ECM) and the sensor value can be read off.

ENGINE COOLANT LEVEL SENSOR

Fig. 192: Identifying Engine Coolant Level Sensor
Courtesy of VOLVO CARS CORPORATION

The function of the engine coolant level sensor is to alert the driver if the engine coolant level in the expansion tank is too low.

The sensor is a magnetic reed switch, which is enclosed in a pipe on the bottom of the expansion tank. Around the pipe, on the inside of the expansion tank is a float. This float contains a magnet. When the engine coolant level is above minimum, the float is too high in the tank to affect the switch. However if the engine coolant level falls below the minimum level, the magnetic field acts on the switch.

The sensor is supplied with voltage (signal) from the engine control module (ECM) and grounded in the body. When the engine coolant level in the expansion tank is over a certain level the circuit closes, which produces a low signal. When the engine coolant level is below a certain level the circuit is opened by the engine coolant level sensor, which produces a high signal. When the engine control module (ECM) detects a high signal the information about low engine coolant level is transmitted via the Controller area network (CAN) to the driver information module (DIM), which warns the driver.

NOTE: There are no functions controlled by the engine which are directly connected to

the low coolant level warning lamp. The Engine Control Module (ECM) only transfers the signal which is used by the Driver Information Module (DIM).

The engine control module (ECM) cannot diagnose the engine coolant level sensor.

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR, INTAKE

Fig. 193: Identifying Manifold Absolute Pressure (Map) Sensor
Courtesy of VOLVO CARS CORPORATION

The manifold absolute pressure (MAP) sensor detects quick pressure changes in the intake manifold after the throttle. The signal from the sensor is used by the engine control module (ECM) to supplement the mass air flow (MAF) sensor when calculating injection period.

Manifold absolute pressure (MAP) sensor, intake is located on the lower part of the intake manifold at the electronic throttle module.

The semi-conductor sensor is grounded in the control module and is supplied with power from the control module.

The resistance in the intake manifold moves the silicone membrane in the sensor, giving a signal of 0.5 - 4.5 V to the control module. Low pressure results in low voltage, high pressure gives high voltage.

The pressure sensor can be diagnosed by the engine control module (ECM) and the sensor signal can be read off.

FUEL PRESSURE SENSOR / FUEL TEMPERATURE SENSOR

Fig. 194: Identifying Fuel Pressure Sensor / Fuel Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

Overview

The fuel pressure, fuel temperature sensor is combined and consists of both the fuel pressure sensor and the fuel temperature sensor. The sensor detects the fuel pressure (the absolute pressure) and the temperature of the fuel in the fuel rail.

The fuel pressure sensor is located on the fuel rail's end.

The fuel pressure-/fuel temperature sensor can be diagnosed by the engine control module (ECM) and its signals (pressure and temperature) can be read off.

Fuel pressure sensor

The pressure sensor is a Piezo resistive type resistor, the resistance of which changes with the pressure. Depending on the pressure in the fuel rail, an analog signal of 0 - 5 V is transmitted to the engine control module (ECM). Low pressure results in low voltage, high pressure gives high voltage.

The engine control module (ECM) then uses this signal to adjust the pressure in the fuel rail using the fuel pump control module. See also: **FUEL PRESSURE REGULATION**

The pressure sensor is supplied with 5 V and grounded in the engine control module (ECM). The pressure sensor transmits a signal indicating the fuel pressure to the engine control module (ECM) on a separate cable.

NOTE: The absolute pressure is displayed when using parameter read outs to read off the fuel pressure. If there is no pressure at the fuel rail, the atmospheric pressure will be displayed.

HINT: The relative pressure (absolute pressure minus atmospheric pressure) is displayed when reading off the fuel pressure via a manometer connected to the fuel rail.

Fuel temperature sensor

The temperature sensor is an NTC sensor. The sensor is supplied with voltage (signal) from and grounded in the engine control module (ECM).

The resistance in the sensor changes according to the temperature of the fuel. This provides the engine control module (ECM) with a signal of between 0 - 5 V. Low temperature results in high voltage (high resistance). High temperature results in low voltage (low resistance).

The engine control module (ECM) uses the signal to calculate the volume of the fuel.

OIL LEVEL SENSOR

Fig. 195: Identifying Oil Level Sensor
Courtesy of VOLVO CARS CORPORATION

The function of the oil level sensor is to provide the engine control module (ECM) with information regarding the level of engine oil in the oil sump.

The sensor consists of:

- a terminal with three pins
- integrated electronics
- 2 capacitive gauge elements
- a PTC resistor.

The oil level sensor is supplied with 5 V by the engine control module (ECM). The oil level sensor generates a pulse width modulated (PWM) signal for the engine control module (ECM).

The oil level sensor can be diagnosed by the engine control module (ECM).

The pulse-width modulated (PWM) signal from the oil level sensor can be read using parameter readout.

MAIN RELAY (SYSTEM RELAY)

Fig. 196: Identifying Main Relay
Courtesy of VOLVO CARS CORPORATION

The function of the main relay (system relay) is to supply certain components with voltage.

The relay is mechanical and has a closing and opening function. In the rest position the circuit in the relay is open.

The main relay terminals (#30 and #86) are supplied with voltage by the battery. When the ignition key has been turned and the engine control module (ECM) is powered, the terminal (#85) on the main relay is grounded by the engine control module (ECM).

When the terminal (#85) is grounded, the relay is activated and a number of components are powered via the relay terminal (#87).

The main relay is in the integrated relay/fuse box in the engine compartment and is diagnosed by the engine control module (ECM).

INJECTORS

Fig. 197: Identifying Fuel Injector
Courtesy of VOLVO CARS CORPORATION

The function of the injectors is to spray fuel into the cylinders in the correct spray patterns. This happens

sequentially.

The injectors are located along the intake pipe.

The engine control module (ECM) controls the injectors by grounding the valves in pulses.

The injectors can be diagnosed by the engine control module (ECM) and can be activated.

IGNITION COILS

Fig. 198: Identifying Ignition Coil
Courtesy of VOLVO CARS CORPORATION

The ignition coils supply the spark plugs with high voltage to produce sparks. The engine control module (ECM) controls the ignition coils so that sparks are generated at the correct time. The signal reconnects to the engine control module (ECM) so that diagnostics can be carried out.

Each ignition coil has an integrated power stage.

The ignition coils are in the sparkplug wells above each spark plug.

The control module checks the ignition coils' function using one separate diagnostic lead.

CAMSHAFT RESET VALVE (CVVT)

Fig. 199: Identifying Camshaft Reset Valve
Courtesy of VOLVO CARS CORPORATION

The camshaft reset valve controls the oil flow to the CVVT unit (camshaft pulley).

The valve consists of an electro-magnetic valve with a spring-loaded piston. There are slits in the piston which channel the engine lubricating oil to the CVVT unit by moving the piston in the reset valve. The continuous variable valve timing (CVVT) unit turns the camshaft (the camshaft timing changes). The direction in which the camshaft turns depends on the chamber in the CVVT unit which is supplied with oil (pressure). See also: **CAMSHAFT CONTROL (CVVT)**

An oil filter is mounted at the intake channel for the valves to prevent oil contaminants from affecting the function of the reset valves.

The system relay supplies the reset valve with voltage via a fuse. The valve is grounded (control stage) internally in the engine control module (ECM). When the valve is grounded using a pulse width modulation (PWM) signal, the oil flow in the valve can be regulated to the different chambers in the continuous variable valve timing (CVVT) unit at variable rates. This allows the angle position to be changed precisely and steplessly.

The engine control module (ECM) can diagnose the camshaft reset valve.

The valve is located on the cylinder head above the camshaft. There is a valve for intake camshaft.

There is no valve for the exhaust camshaft.

EVAPORATIVE EMISSION SYSTEM (EVAP) VALVE

Fig. 200: Identifying Evaporative Emission System (EVAP) Valve
Courtesy of VOLVO CARS CORPORATION

The evaporative emission system (EVAP) valve is used to open and close the connection between the EVAP canister and the intake manifold. The valve controls the flow of hydro-carbons (fuel vapor) from the EVAP canister to the engine intake manifold using the vacuum in the intake manifold. This ensures that hydro-carbons stored in the EVAP canister are used in the engine combustion process.

The valve is an electromagnetic valve and is powered from the system relay. When the valve needs to be opened, it is grounded internally in the engine control module (ECM). The evaporative emission system (EVAP) valve is closed when in the standby position (open-circuit).

When the control module requests that the EVAP canister should be drained (the hydrocarbons stored in the canister should be released into the engine), the control module deploys the evaporative emission system (EVAP) valve by grounding it. A pulse width modulation (PWM) signal is used to ground the valve and to control the degree to which the valve will open. In this way, the drainage of the EVAP canister is matched to the volumetric efficiency of the EVAP canister, the engine speed (RPM) and the engine load.

The evaporative emission system (EVAP) valve can be diagnosed by the engine control module (ECM) and can be activated.

The EVAP-valve is located by the intake manifold (by the electronic throttle module) on the front of the engine.

LEAK DIAGNOSTIC UNIT

Fig. 201: View of Leak Diagnostic Unit
Courtesy of VOLVO CARS CORPORATION

The function of the leak diagnostic unit is to pressurize the fuel tank system during leak diagnostics and to open the fuel tank system to the surrounding air during evaporative emissions control.

The leak diagnostic unit consists of a plastic housing with:

1. electrical air pump
2. a valve / solenoid which governs the air flow in the unit
3. a heater element (PTC resistor) which warms up the pump.

The electrical pump, valve and heater element in the unit are supplied with voltage by the system relay. The pump, valve and heater element are grounded (control) in the engine control module (ECM).

During leak diagnostics the pump in the leak diagnostic unit starts. The valve in the unit is operated by the engine control module (ECM) by grounding the different circuits internally in the engine control module (ECM). Operation depends on whether the diagnostic phase is checking for leakage or checking the function of the diagnostic system. The engine control module (ECM) gauges the power consumption of the pump during pressurization. The power consumption corresponds to a certain pressure in the fuel tank system. See also:**LEAK DIAGNOSTIC UNIT**

The engine control module (ECM) can diagnose the leak diagnostic unit.

The valve in the leak diagnostic unit can be activated and the power consumption of the pump can be read off.

The leak diagnostic unit is at the upper front edge of the fuel tank.

AIR CONDITIONING (A/C) COMPRESSOR.

Fig. 202: Identifying (A/C) Compressor
Courtesy of VOLVO CARS CORPORATION

The air conditioning (A/C) compressor transports refrigerant, which is necessary for air conditioning (A/C) operation. It is an axial piston compressor with variable displacement. I. E. The compressor has adjustable cylinder displacement which is controlled by a check valve (solenoid). The valve, which is underneath the compressor, can be replaced.

The A/C compressor is mounted on the cylinder block and is driven by the engine's crankshaft via the auxiliaries belt.

AIR CONDITIONING (A/C) RELAY

Fig. 203: Identifying (A/C) relay
Courtesy of VOLVO CARS CORPORATION

The air conditioning (A/C) relay supplies the A/C compressor with voltage. The relay is controlled by the engine control module (ECM) based on information from different signals:

- the climate control module (CCM) (via the control area network (CAN))
- the engine coolant temperature
- the position of the accelerator pedal (AP)
- the pressure in the system.

The engine control module (ECM) can temporarily disengage the A/C compressor during wide open throttle (WOT) acceleration.

The relay is mechanical. It has a closing / opening function and is supplied with power from the system relay.

In the rest position the circuit in the relay is open.

The system relay supplies the coil and the relay with power. The relay activates when the coil is grounded in the engine control module (ECM), the circuit closes and the A/C compressor is supplied with power via the relay voltage output.

The relay coil is grounded (signal) when the engine control module (ECM) receives a signal via the CAN network from the climate control module (CCM) to activate the relay and start the compressor.

STARTER MOTOR RELAY

Fig. 204: Identifying Main Relay
Courtesy of VOLVO CARS CORPORATION

The function of the starter motor relay is to supply power to the starter motor. See also: **START**

The starter motor relay is in the relay/fusebox in the engine compartment.

ENGINE COOLING FAN (FC) / ENGINE COOLING FAN (FC) CONTROL MODULE

Fig. 205: Identifying Engine Cooling Fans (FC) and Control Modules
Courtesy of VOLVO CARS CORPORATION

NOTE: The engine cooling fan may have a post-run of up to approx. 6 minutes after the engine has been turned off. The time for the fan's post-run depends on engine temperature, temperature in the engine compartment and pressure level in the AC-system.

WARNING: Be careful since the engine cooling fan may have a post-run after the engine has been turned off.

The engine cooling fan (FC) consists of two fans and two control modules. The control modules are controlled by the same signal from the engine control module (ECM).

HINT: For different reasons, there are variants where the engine cooling fan consists of two fans and one control module.

The engine cooling fan (FC) has two functions. One is to cool the engine compartment, the other is to cool the condenser when the air conditioning (A/C) compressor is working.

The engine control module (ECM) transmits a pulse width modulated (PWM) signal to the engine cooling fan (FC) control modules. The control modules then activate the fans at different speeds. The speed is determined by the engine control module (ECM), depending on the coolant temperature and the vehicle speed.

The temperature conditions for engagement of the different engine cooling fan (FC) stages may vary slightly, depending on the engine variant and the equipment level. The temperature conditions apply when:

- the A/C is off
- no faults are detected by the engine control module (ECM).

The engine cooling fan (FC) is located behind the radiator and its control module is grounded and powered with battery voltage via a fuse.

There are diagnostics for the engine cooling fan (FC). The engine cooling fan (FC) transmits a diagnostic signal

to the engine control module (ECM).

FUEL PUMP (ONLY US)

Fig. 206: Identifying Fuel Pump Module
Courtesy of VOLVO CARS CORPORATION

The function of the fuel pump is to ensure that the pressure is correct at the delivery lines for the injectors when requested by the fuel pump control module.

The fuel pump consists of:

1. An electrical pump with an integrated safety valve
2. A pressure equalization valve. This valve equalizes rapid pressure peaks which occur, for example, when the injectors close during engine braking. It also contains a non-return valve which ensures that the pressure in the system does not drop when the engine is switched off
3. Fuel level sensor
4. Fuel filter, cannot be replaced separately
5. Relief valve, releases fuel into the pump housing
6. Ejector pump, continuously fills the pump housing with fuel. The fuel always flows from the fuel pump through the ejector and back to the pump housing.

The fuel pump is supplied with battery voltage by the fuel pump control module and is grounded in the car body via the fuel pump control module.

The engine control module (ECM) has diagnostics for the fuel pump function to ensure that the pressure is correct. See also: **FUEL PRESSURE REGULATION, DIAGNOSTICS**

The fuel pump can be activated and its status can be read off.

The pressure in the fuel rail can be measured by connecting a manometer to a nipple. This nipple is on the right-hand end of the fuel rail.

FUEL PUMP CONTROL MODULE

Fig. 207: Identifying Fuel Pump
Courtesy of VOLVO CARS CORPORATION

The fuel pump control module is called PEM (Pump Electronic Module). It powers the fuel pump and regulates the output of the pump. The fuel pressure changes with the output of the pump.

The fuel pump control module is supplied with battery voltage by the fuel pump (FP) relay and is grounded in the car body. The fuel pump (FP) relay is controlled by the central electronic module (CEM) when requested by the engine control module (ECM).

The engine cannot be started if the power supply to the fuel pump control module is faulty because the fuel pump will not then be powered.

The fuel pump control module is controlled by the engine control module (ECM) via serial communication. The fuel pump control module then controls the fuel pump by transmitting pulse width modulated (PWM) voltage on the ground lead for the fuel pump. This means that the voltage drop across the pump changes, and with it the output of the fuel pump. See also: **FUEL PRESSURE REGULATION**

There are no diagnostics for the fuel pump control module. The engine control module (ECM) has diagnostics for fuel pressure regulation and the associated components. See also: **FUEL PRESSURE REGULATION, DIAGNOSTICS**

The pulse width modulated (PWM) signal from the engine control module (ECM) to the fuel pump control module can be read off using the diagnostic tool.

The fuel pump control module is on the outside on the right-hand side of the fuel tank.

ACTUATOR VARIABLE INTAKE MANIFOLD

Fig. 208: Identifying Actuators, Variable, Intake Manifold
Courtesy of VOLVO CARS CORPORATION

1. Primary actuator with throttle (upper)
2. Secondary actuator with throttle (lower)

The function of the actuators is to vary the length of the intake manifold, via throttles installed in the intake manifold.

The actuators are supplied with voltage from the system relay via fuse and ground (control) internally in the engine control module (ECM).

see **VARIABLE INTAKE SYSTEM**

The actuators for variable intake can be diagnosed by the engine control module (ECM).

The actuators are bolted directly to the intake manifold.

CAM PROFILE SOLENOID (CPS)

Fig. 209: Identifying Cam Profile Solenoid (CPS)
Courtesy of VOLVO CARS CORPORATION

The function of the solenoid is to control (trigger) oil pressure to the hydraulic valve depressors.

The solenoid is supplied with voltage from the system relay via fuse and ground (control) internally in the engine control module (ECM).

The system has two solenoids that each supplies a number of cylinders.

The solenoids are located on each side of the engine between the camshafts.

The solenoids can be diagnosed by the Engine control module (ECM).

see **VARIABLE CAMSHAFT PROFILE (CPS)**

EMISSIONS WARNING LAMP

Fig. 210: Identifying Malfunction Indicator Lamp
Courtesy of VOLVO CARS CORPORATION

The emissions warning lamp in the Driver Information Module (DIM) has a warning symbol. This warning symbol varies depending on the market. The warning symbols are:

- "Engine symbol" (not USA)
- "CHECK ENGINE" (MIL - Malfunction Indicator Lamp, USA only).

The warning lamp lights when the ignition key is turned to position II. The warning lamp will go out after approximately 15 seconds or if the engine is started when no fault is found in the engine management system.

If Readiness is not complete (certain diagnostic functions not completed), the warning lamp will flash instead of going out when the ignition key is in position II.

The warning lamp will light if there is a fault in one of the parameters in the engine management system. The warning lamp will also light in response to a request transmitted via the control area network (CAN) if there is a fault in the transmission control module (TCM) which affects emissions.

ELECTRONIC THROTTLE UNIT

Fig. 211: Identifying Electronic Throttle Unit
Courtesy of VOLVO CARS CORPORATION

The electronic throttle unit, using the PWM control signal from the engine control module (ECM), regulates the amount of air for engine combustion. This is done using an electronically controlled shutter.

The aluminum electronic throttle unit consists of a round throttle disc on a spindle. The spindle is driven by a DC motor (damper motor), gear wheel and two springs; one for opening and one for return.

By changing the polarity of the power supply, the DC motor can be run in both directions. At one of the limit positions the throttle disc is closed so that minimal air can pass the throttle unit. In the other limit position, the throttle disc is parallel to the air flow. This provides maximum airflow through the electronic throttle unit.

Two permanent magnets in the gear sector on the throttle spindle are used to check the position of the throttle disc. The permanent magnets affect two throttle position (TP) Hall sensors in the cover. The analog signals from the two sensors are transmitted to the engine control module (ECM). The signals are offset. The engine control module (ECM) compares these signals with the stored desired values to check if they are plausible.

The electronic throttle unit is located on the engine intake manifold. In the event of a fault, the throttle unit must be replaced as a single unit.

The engine control module (ECM) can diagnose the electronic throttle unit.

THROTTLE POSITION (TP) SENSOR

Electronic throttle unit.

LEAK DIAGNOSTICS (CERTAIN MARKETS ONLY)

Fig. 212: Fuel Tank System Leak Overview
Courtesy of VOLVO CARS CORPORATION

All gases that evaporate from fuel in the fuel tank must be led to and stored in the evaporative emission system (EVAP) canister so that they can be directed into the engine for combustion. In order to detect leakages which cause evaporation of gases into the air, the fuel tank system is diagnosed for leakage. The fuel tank system consists of:

- fuel tank
- Canister purge (CP) valve (1)
- EVAP canister (2)
- leak diagnostic unit (3)
- air cleaner (ACL) (4)
- Roll-over valve (5)
- Float Limit Vent Valve (6)
- fuel filler pipe (7)
- all lines between the above components.

The fuel tank system has a leak diagnostic unit to diagnose any leakage. The leak diagnostic unit pressurizes the fuel tank system when the ignition is off, if the conditions for diagnosis have been met. The control module can detect faults in the function of the leak diagnostic unit and leakage that is 0.5 mm or greater. Minor leak; leakage greater than 0.5 mm but less than 1.0 mm. Major leak; leakage greater than 1.0 mm.

The leak diagnostic unit consists of a pump and a valve that controls the air flow in the unit. The fuel tank system tests for leaks by measuring the power consumption of the pump. The power consumption of the pump corresponds to a certain pressure in the fuel tank system. During diagnosis, the rate at which the pressure can build up is checked, taking into account the quantity of fuel in the tank. The quicker the pressurization the better the fuel tank system is sealed.

Conditions for diagnosis

The diagnosis begins when all the following conditions are met:

- There must be no diagnostic trouble code (DTC) stored for the following components or functions:
  - the power stage for the pump in the leak diagnostic unit
  - the power stage for the valve in the leak diagnostic unit
  - the power stage for the EVAP canister purge valve
  - the EVAP canister purge valve.
  - the engine coolant temperature (ECT) sensor
  - atmospheric pressure sensor
  - outside temperature sensor.
- The engine is switched off until the engine coolant temperature (ECT) has fallen to a few degrees above the outside temperature, then engine running for at least 10 minutes.
- Ignition off
- Vehicle speed 0 km/h
- Engine coolant temperature (ECT) -5 °C or higher.
- Maximum altitude of 2500 meters above sea level
- Outside temperature between -5 and +35 °C.
- Fuel volume in the tank less than 85%. The engine control module (ECM) ignores these parameters if a diagnostic trouble code (DTC) is stored for the fuel level sensor and the fuel volume cannot be determined.
- Battery voltage between 11.0-15.0 V. The voltage must be stable.
- EVAP canister purge valve closed
- Low volume in the canister.
- Fuel tank filler cap locked. Tip. Locking occurs when the vehicle speed exceeds approximately 20 km/h.

Diagnostic phases

The diagnostic is divided into the following phases and is carried out in sequence when all conditions for the diagnostic have been met.

- reference phase
- function test
- Leak diagnostic

Fig. 213: Identifying Fault Free Fuel Tank System Diagram Phase 1
Courtesy of VOLVO CARS CORPORATION

Reference phase (1-2)

The illustration is a diagram of a fault free fuel tank system.

Before the leak diagnostic begins, the control module runs reference phase for leakage. Reference phase (1-2) for leakage that is 0.5 mm is carried out by the pump in the leak diagnostic unit pumping ambient air through a 0.5 mm hole and back out to the ambient air. At the same time, the power consumption (A) of the pump is measured and stored in the control module. The stored value (A) for the power consumption of the pump corresponds to a leakage of 0.5 mm. This value is then compared by the engine control module (ECM) to determine the leak status of the fuel tank system.

Function test (1-3)

If the value for the power consumption of the pump is too high or low during reference phase (1-2), or if the value for pump power consumption varies too much during reference phase (1-2), the diagnostic is cancelled and starts again the next time the conditions for the diagnostic are met. A diagnostic trouble code (DTC) is stored if the diagnostic is cancelled because the power consumption of the pump is varying excessively.

After reference phase the valve (2) in the leak diagnostic unit is activated and controls the air flow to the fuel tank to pressurize the fuel tank system. This change of air flow will cause the power consumption of the pump to fall briefly before the pressure builds up in the fuel tank system (3). A diagnostic trouble code is stored if the value for the power consumption of the pump drops too quickly, slowly or not at all.

Fig. 214: Identifying Leak Diagnostic, Major Leak Diagram
Courtesy of VOLVO CARS CORPORATION

Leak diagnostic, major leak (leakage greater than 1.0 mm)

The diagnostic for "major leaks" is carried out each time when the conditions for the diagnostic are met. The leak diagnostic unit pressurizes the fuel tank system, measures the power consumption of the pump (4) and compares this with a calculated desired value (B). A diagnostic trouble code (DTC) for a major leak is stored if the measured value does not reach the calculated desired value within a certain time (the time is determined by the fuel level in the tank).

Leak diagnostic, minor leak (leakage greater than 0.5 mm but less than 1.0 mm)

The diagnostic for minor leaks is run every other time that the conditions for the diagnostic are met. The diagnostic for major leaks is always run before the diagnostic for minor leaks. The leak diagnostic unit continues to pressurize the fuel tank system (5-6). After a certain amount of time (the time varies depending on the fuel level in the tank), the engine control module (ECM) checks the fuel tank system for leaks. This is determined from calculations based on:

- time
- the measured reference current consumption of the pump (A)
- the measured power consumption of the pump when the assessment is made
- the shape and character of the current curve during pressurization.

A diagnostic trouble code (DTC) is stored if a minor leak is detected.

DIAGNOSTIC FUNCTIONS

LEAK DIAGNOSTICS, ORIGINAL VERSION (CERTAIN MARKETS ONLY)

LEAK DIAGNOSTICS, ORIGINAL VERSION

Fig. 215: Fuel Tank System Leak Overview
Courtesy of VOLVO CARS CORPORATION

To minimize false detection of leakage, new software has been released for the Engine control module (ECM). The software has been released afterwards, in order of priority, started at the end of 2006.

The improved software version makes diagnostics more robust and durable against aging and wear of the leak diagnostic unit. It affects strategies, behavior and to a degree also read off parameters.

All gases that evaporate from fuel in the fuel tank must be led to and stored in the evaporative emission system (EVAP) canister so that they can be directed into the engine for combustion. In order to detect leakages which cause evaporation of gases into the air, the fuel tank system is diagnosed for leakage. The fuel tank system consists of:

- fuel tank
- Canister purge (CP) valve (1)
- EVAP canister (2)
- leak diagnostic unit (3)
- air cleaner (ACL) (4)
- Roll-over valve (5)
- Float Limit Vent Valve (6)
- fuel filler pipe (7)

- all lines between the above components.

The fuel tank system has a leak diagnostic unit to diagnose any leakage. The leak diagnostic unit pressurizes the fuel tank system when the ignition is off, if the conditions for diagnosis have been met. The control module can detect faults in the function of the leak diagnostic unit and leakage that is 0.5 mm or greater. Minor leak; leakage greater than 0.5 mm but less than 1.0 mm. Major leak; leakage greater than 1.0 mm.

The leak diagnostic unit consists of a pump and a valve that controls the air flow in the unit. The fuel tank system tests for leaks by measuring the power consumption of the pump. The power consumption of the pump corresponds to a certain pressure in the fuel tank system. During diagnosis, the rate at which the pressure can build up is checked, taking into account the quantity of fuel in the tank. The quicker the pressurization the better the fuel tank system is sealed.

Conditions for diagnosis

The diagnosis begins when all the following conditions are met:

- There must be no diagnostic trouble code (DTC) stored for the following components or functions:
  - the power stage for the pump in the leak diagnostic unit
  - the power stage for the valve in the leak diagnostic unit
  - the power stage for the EVAP canister purge valve
  - the EVAP canister purge valve.
  - the engine coolant temperature (ECT) sensor
  - atmospheric pressure sensor
  - outside temperature sensor.
- The engine is switched off until the engine coolant temperature (ECT) has fallen to a few degrees above the outside temperature, then engine running for at least 10 minutes.
- Ignition off
- Vehicle speed 0 km/h
- Engine coolant temperature (ECT) -5°C or higher.
- Maximum altitude of 2500 meters above sea level.
- Outside temperature between -5 and +35°C.
- Fuel volume in the tank less than 85%. The engine control module (ECM) ignores these parameters if a diagnostic trouble code (DTC) is stored for the fuel level sensor and the fuel volume cannot be determined.
- Battery voltage between 11.0-15.0 V. The voltage must be stable.
- EVAP canister purge valve closed
- Low volume in the canister.
- Fuel tank filler cap locked. Tip. Locking occurs when the vehicle speed exceeds approximately 20 km/h.

Diagnostic phases

The diagnostic is divided into the following phases and is carried out in sequence when all conditions for the

diagnostic have been met.

- reference phase
- function test
- leak diagnostic

Fig. 216: Identifying Fault Free Fuel Tank System Diagram Phase 1
Courtesy of VOLVO CARS CORPORATION

Reference phase (1-2)

The illustration is a diagram of a fault free fuel tank system.

Before the leak diagnostic begins, the control module runs a reference phase for leakage. During the reference phase (1-2) for leakage that is 0.5 mm, the pump in the leak diagnostic unit pumps ambient air through a 0.5 mm hole and back out to the ambient air. At the same time, the power consumption (A) of the pump is measured and stored in the control module. The stored value (A) for the power consumption of the pump corresponds to a leakage of 0.5 mm. This value is then used by the engine control module (ECM) to determine the leak status of the fuel tank system.

Function test (1-3)

If the value for the power consumption of the pump is too high or low during reference phase (1-2), or if the value for pump power consumption varies too much during reference phase (1-2), the diagnostic is cancelled and starts again the next time the conditions for the diagnostic are met. A diagnostic trouble code (DTC) is stored if the diagnostic is cancelled because the power consumption of the pump is varying excessively.

After the reference phase, the valve (2) in the leak diagnostic unit is activated and controls the air flow to the fuel tank to pressurize the fuel tank system. This change of air flow will cause the power consumption of the pump to fall briefly before the pressure builds up in the fuel tank system (3). A diagnostic trouble code is stored if the value for the power consumption of the pump drops too quickly, slowly or not at all.

Fig. 217: Identifying Leak Diagnostic, Major Leak Diagram
Courtesy of VOLVO CARS CORPORATION

Leak diagnostic, major leak (leakage greater than 1.0 mm)

The diagnostic for "major leaks" is carried out each time when the conditions for the diagnostic are met. The leak diagnostic unit pressurizes the fuel tank system, measures the power consumption of the pump (4) and compares this with a calculated desired value (B). A diagnostic trouble code (DTC) for a major leak is stored if the measured value does not reach the calculated desired value within a certain time (the time is determined by atmospheric pressure and the fuel level in the tank).

Leak diagnostic, minor leak (leakage greater than 0.5 mm but less than 1.0 mm)

The diagnostic for minor leaks is run every other time that the conditions for the diagnostic are met. The diagnostic for major leaks is always run before the diagnostic for minor leaks. The leak diagnostic unit continues to pressurize the fuel tank system (5-6). After a certain amount of time (the time varies depending on the fuel level in the tank), the engine control module (ECM) checks that the fuel tank system for leaks. This is determined based on:

- time
- the measured reference current consumption of the pump (A)
- the measured power consumption of the pump when the assessment is made
- the shape and character of the current curve during pressurization.

A diagnostic trouble code (DTC) is stored if a minor leak is detected.

OVERVIEW

OVERVIEW

General

The engine control module (ECM) diagnoses both internal signals and functions as well as signals and functions

from connected components.

Conditions for diagnosis

For the diagnosis of a component or function to start, certain specific conditions must be met. The conditions for diagnostics vary depending on the component or function being diagnosed.

Conditions must be met during the diagnostic in order for the diagnostic to be completed. The time and conditions for the diagnostic vary depending on the component or function being diagnosed. Certain diagnostics only require the ignition to be switched on and off for a diagnostic to be run. Other diagnostics require that several different conditions are met. For example:

- vehicle speed
- engine coolant temperature (ECT)
- time since start
- different load and engine speed relationships in the same trip
- a certain event (for example the evaporative emission system (EVAP) valve is operating).

When the engine control module (ECM) has run all the implemented diagnostics, the control module has completed a "trip". An extensive driving schedule in various conditions is required to complete a trip. The engine may also need to be shut off for a certain amount of time and then switched on again to complete a trip.

Emissions related diagnostic functions

The engine control module (ECM) checks that the emissions related systems are working. These systems are checked by running a diagnostic function. The diagnostic function checks the components and that the system is functioning.

Diagnostic trouble code (DTC) memory

When the engine control module (ECM) detects a fault, the diagnostic trouble code and status are stored in the diagnostic trouble code memory and are visible during normal diagnostic trouble code readout. If the diagnostic trouble code (DTC) lights the malfunction indicator lamp (MIL), this occurs at the same time. If an existing fault disappears and does not recur, the engine control module changes the status of the diagnostic trouble code after a certain number of fault-free operating cycles (depending on the nature of the diagnostic trouble code). This means that it can no longer be read during normal diagnostic trouble code readout. In this status, the diagnostic trouble code remains until the engine control module (ECM) erases diagnostic trouble codes or is disconnected from power.

Substitute value

For certain types of diagnostic trouble codes (DTCs), the missing signal is replaced with a substitute value so that the system can continue functioning.

LEAK DIAGNOSIS, IMPROVED VERSION (CERTAIN MARKETS ONLY)

LEAK DIAGNOSTICS, IMPROVED VERSION

Fig. 218: Fuel Tank System Leak Overview
Courtesy of VOLVO CARS CORPORATION

All gases that evaporate from fuel in the fuel tank must be led to and stored in the evaporative emission system (EVAP) canister so that they can be directed into the engine for combustion. In order to detect leakages which cause evaporation of gases into the air, the fuel tank system is diagnosed for leakage. The fuel tank system consists of:

- fuel tank
- Canister purge (CP) valve (1)
- EVAP canister (2)
- leak diagnostic unit (3)
- air cleaner (ACL) (4)
- Roll-over valve (5)
- Float Limit Vent Valve (6)
- fuel filler pipe (7)
- all lines between the above components.

The fuel tank system has a leak diagnostic unit to diagnose any leakage. The leak diagnostic unit pressurizes the fuel tank system when the conditions for diagnosis have been met. The control module can detect faults in the function of the leak diagnostic unit and leakage that is 0.5 mm or greater. Minor leak; leakage greater than 0.5 mm but less than 1.0 mm. Major leak; leakage greater than 1.0 mm.

The leakage diagnostic consists of a pump and a valve that control the flow in the unit. Engine control module (ECM) checks sealing in the tank system by measuring the relationship between obtained pressure and flow from the leakage diagnostic pump when pressurized.

If a certain pressure is not obtained with a pre-determined (with known mass) the Engine control module (ECM) interprets it as a leakage from the fuel tank system.

Leakage diagnostics start in normal operation when specific conditions have been fulfilled, see below. Diagnostics can also be started by command using VIDA when you disregard some of these conditions.

Conditions for diagnosis

The diagnosis begins when all the following conditions are met:

NOTE: Slightly different conditions apply when diagnostics are started by command using VIDA (Volvo scan tool).

- No diagnostic trouble codes for EVAP-valve or atmospheric pressure sensor may be stored.
- The engine is switched off until the engine coolant temperature (ECT) has fallen to a few degrees above the outside temperature, then engine running for at least 10 minutes.
- Ignition off
- Vehicle speed 0 km/h
- Engine temperature 4-35 °C.
- Maximum altitude of 2500 meters above sea level.
- Outdoor temperature between 4-35 °C.
- Fuel volume in the tank between 0-85%. The engine control module (ECM) ignores these parameters if a diagnostic trouble code (DTC) is stored for the fuel level sensor and the fuel volume cannot be determined.
- Battery voltage between 11-15 V. The voltage must be stable.
- EVAP canister purge valve closed
- Low volume in the canister.
- Tank hatch locked.

NOTE: Locking occurs when the vehicle speed exceeds 20 km/h.

Diagnostic phases

The diagnostic is divided into the following phases and is carried out in sequence when all conditions for the diagnostic have been met.

- reference phase
- function test
- checking tank system.

Reference phase

Before leakage diagnosis itself can be started, the control module performs a reference phase for leakage. Reference phase for leakage which is 0.5 mm is performed by the leakage diagnostic unit's pump pumping ambient air through a hole which is 0.5 mm and back out to the ambient air. During that time, the pump is monitored n the leakage diagnostic unit and reference values are stored away for later use in assessing the tank system's sealing.

If any reference value for the pump is unreasonably high or low, or varies too much, then diagnosis is interrupted and a diagnostic trouble code is generated.

Function test

After the reference phase, the leakage diagnostic unit's valve is activated and the air flow is controlled to the tank system to pressurize the tank system. This shift in air flow means that the pump load drops briefly before the pressure builds up in the tank system. If the load does not change within reasonable limits within reasonable time, then diagnosis is interrupted and a diagnostic trouble code is generated.

Checking tank system, major leakage (leakage bigger than 1.0 mm)

Diagnosis are performed every time conditions for diagnosis are fulfilled.

The leakage diagnostic unit pressurizes the tank system and checks sealing by monitoring the pressure in the tank system. The pressure is a calculated pressure, calculated using measured power consumption on the pump. If the pressure stabilizes and/or does not go above 1500 Pa within 450 seconds, this is interpreted as a leakage from the fuel tank system. Diagnosis is interrupted and a diagnostic trouble code for major leakage is generated.

Checking tank system, minor leakage (leakage bigger than 0.5 mm but smaller than 1.0 mm)

Diagnosis for minor leakage is performed every other time conditions for diagnosis are fulfilled. Otherwise, diagnosis finishes after checking for major leakage.

The leakage diagnosis unit continues pressurizing the tank system. Engine control module (ECM) checks sealing in the tank system by measuring the relationship between reached pressure and flow from the leakage diagnosis pump when pressurizing. In a sealed system the relationship between these shall be linear. Any deviations from the linear relationship is calculated and used to assess the tank system's sealing.

If the assessment, performed within 15 minutes, is that a minor leakage has been detected in the tank system, a diagnostic trouble code for minor leakage is generated.

DOWNLOADING SOFTWARE AND REPLACING THE CONTROL MODULE

New software can be downloaded into the engine control module (ECM). When ordering software, the hardware and the software in the car is compared to the information in the Volvo central database. If the comparison is OK the software is downloaded to the control module. If the comparison between the car and Volvo central database is not OK, the database is updated with the car configuration. When this is complete the software is downloaded.

The Engine control module (ECM) is located on the air filter box, under a plastic cover.

The engine control module (ECM) contains a unique code for each car for the immobilizer. The central electronic module (CEM) checks this code at engine start up. The engine will not start if the central electronic module (CEM) detects an incorrect code for the immobilizer. This means that the engine control module (ECM) cannot be switched from vehicle to vehicle.

The engine control module (ECM) must first be "unlocked" using a unique PIN for each car before it can be programmed with a code for the immobilizer. When the PIN has been approved by the engine control module (ECM), the code for the immobilizer can be programmed.

The PIN and the code for the immobilizer are obtained from the Volvo central database and sent out with the software package when software for downloading has been ordered.

All new engine control modules (ECM) have the same PIN which is preprogrammed by the control module supplier. When the engine control module (ECM) has been programmed successfully the original PIN for the car will be programmed in the engine control module (ECM) memory and will replace the preprogrammed PIN code.

FUNCTION

START

Fig. 219: Identifying Starting System

Courtesy of VOLVO CARS CORPORATION

The starter motor (6/25) is supplied with power via the starter motor relay (2/35), the starter motor relay is controlled by the engine control module (ECM) (4/46).

The start process is as follows:

1. The ignition key is turned to start position (position III)
2. A high signal (U_{bat}) from the ignition switch (3/1) is transmitted to the engine control module (ECM) via the central electronic module (CEM) (4/56). The engine control module (ECM) interprets this high signal as a request to activate the starter motor.
3. The engine control module (ECM) activates the starter motor solenoid by grounding and powering the coil for the starter motor relay.
4. The relay closes the circuit between the starter motor solenoid and the fuse in the relay/fuse box in the engine compartment, activating the starter motor.
5. The engine control module (ECM) activates the starter motor until the engine starts (the engine speed (rpm) exceeds a certain value)

Auto start

If the ignition key returns to ignition position (position II) before the engine is started, the starter motor continues to run. The starter motor runs until the engine is started or until a certain time has elapsed. The engine temperature dictates the running time of the starter motor:

- 0 °C or higher, approximately 3 seconds
- less than 0 °C, up to approximately 5 seconds.

If the engine does not turn or if the engine speed is extremely low when the start relay is activated, the engine control module (ECM) interrupts start relay activation.

Activation of the starter motor is not permitted or is interrupted if:

- the engine is running (the engine speed (RPM) above a certain value)
- the immobilizer function does not allow a start.
- the gear selector is not in position "P" or "N" (automatic transmissions). The engine control module (ECM) receives a signal indicating the position of the gear selector from the transmission control module (TCM) (4/28) via both the controller area network (CAN) and from a directly connected cable between the engine control module (ECM) and transmission control module (TCM).

CAMSHAFT CONTROL (CVVT)

Fig. 220: Identifying Camshaft Control (CVVT) System
Courtesy of VOLVO CARS CORPORATION

Only the intake camshaft can be controlled by the Engine control module (ECM) via a reset valve.

The intake camshaft is located in the engine's leading edge (in the travel direction) and the exhaust camshaft in the trailing edge (towards the passenger compartment).

The camshafts are driven by the crankshaft via a gear housing located on the engine's top side.

When each camshaft is adjusted in the factory, its position is aligned with the crankshaft's position. The camshaft's position at alignment against the crankshaft is called the **camshaft's 0-position** (basic setting).

At camshaft control (CVVT), the camshaft's 0-position is displaced so that the camshaft's angle position is changed. Thus, opening and closing of the exhaust and inlet valves changes relative to the crankshaft.

By controlling the camshaft's angle position, the engine's performance can be increased, idle quality can be improved, and emissions can be reduced.

The engine control module (ECM) detects the position of the camshafts by comparing the signals from the engine speed (RPM) sensor (1) (crankshaft position) and the camshaft position (CMP) sensors (2) (camshaft positions). The engine control module (ECM) then controls the angle of the camshaft by controlling the oil flow to the CVVT unit using the reset valve camshaft (3).

There are diagnostics for this function. See also: **CAMSHAFT DIAGNOSTICS (CVVT)**

Controlling, reset valve camshaft

1. Oil filter reset valve camshaft.
2. Oil channel (pressure, inlet).
3. Channel connected with CVVT-unit's chamber (triggering).
4. Channel connected with CVVT-unit's chamber (re-triggering).

The camshaft reset valve controls the oil flow to the continuous variable valve timing (CVVT) unit. The engine control module (ECM) uses a pulse width modulation (PWM) signal to control the valve. See also: **CAMSHAFT RESET VALVE (CVVT)**

The continuous variable valve timing (CVVT) unit allows the position of the camshaft to be adjusted relative to the crankshaft.

The camshaft is secured to the CVVT-unit's rotor. The rotor (and thus, the camshaft) can rotate in relation to the timing belt pulley by the oil pressure building up on one or the other side of the rotor's vanes in the CVVT-unit.

Control occurs according to the following during deployment/return of the camshaft.

Fig. 222: Action of Camshaft Reset Valve
Courtesy of VOLVO CARS CORPORATION

A: Inlet camshaft

- Oil pressure from the lubrication system (1) of the engine.
- The oil passes the filter for the camshaft reset valve (2) and then on to the reset valve (3).
- The engine control module (ECM) controls the oil flow to one of the CVVT unit chambers (4) depending on whether it is to be deployed/returned by the camshaft.

The reset valve is controlled by the engine control module (ECM) by high frequency, switching for deployment and return. This results in rapid and precise control. The inlet camshaft can be triggered up to approx. 40 crankshaft degrees.

CONTROLLING THE GENERATOR

Fig. 223: Controlling The Generator
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) (4/46) regulates the charge voltage of the alternator (GEN) (6/26) (via LIN communication) when requested by the central electronic module (CEM) (4/56) (via CAN communication).

The engine control module (ECM) can change the requested charging voltage from the central electronic module (CEM) in order to adapt it to certain operating conditions such as starting, idling or high engine loads.

The value of requested charge voltage from the engine control module (ECM) and the charge current of the generator can be read off.

The alternator control module (ACM) (6/26) transmits information to the engine control module (ECM) regarding any faults). The diagnostic trouble codes (DTCs) are stored in the engine control module (ECM) in the event of a fault. In the event of certain faults, information about these faults is also transmitted to the central electronic module (CEM).

VARIABLE INTAKE SYSTEM

Fig. 224: Controlling The Variable Intake System
Courtesy of VOLVO CARS CORPORATION

General

Today's modern car engines often utilize systems with variable length of the intake manifolds.

In older engines with fixed lengths, the length had to be adapted to a certain specific engine speed range.

Today's system gives greater flexibility as well as additional torque without any costs in the form of, e. g., fuel consumption or emissions.

In the variable intake system, there are two actuators with associated throttles to change the length of the intake manifolds. These are:

- Actuator variable intake manifold, upper (6/139)
- Actuator variable intake manifold, lower (6/140)

The primary throttle is activated at engine speed over approx. 4800 rpm and the secondary throttle is activated between approx. 3800 rpm and 4800 rpm (applies at + 20 °C).

Different throttle combinations:

- **Position 1:** Both throttles are closed at engine speeds lower than approx. 3800 rpm.
- **Position 2:** The secondary throttle opens at approx. 3800 rpm and this shortens the length some more.
- **Position 3:** Both throttles are fully open to minimize the length at higher engine speeds (over 4800 rpm).

The valve for variable intake is controlled by the engine control module (ECM) (4/46).

The actuators for variable intake function can be activated and the function for variable intake can be diagnosed by the engine control module (ECM).

VARIABLE CAMSHAFT PROFILE (CPS)

Fig. 225: Viewing Variable Camshaft Profile (CPS)
Courtesy of VOLVO CARS CORPORATION

1. High lift
2. Low lift

To maintain low fuel consumption at different loads and engine speeds, there is a system for variable camshaft profile (CPS, Cam Profile Shifting) that can vary the duration and lift height of the valves on the intake camshaft.

Duration = part of the rotating camshaft's revolution that the camshaft acts on the valve.

The system is made up of hydraulic valve depressors where the Engine control module (ECM), via oil channels, can set the valve depressors in two positions, one low position and one high position.

At start and at low temperatures (oil temperature below +40 °C, the system is pressureless and thus in its low position (spring loaded).

To minimize stresses the Engine control module (ECM) pressurizes the depressors that are not loaded at the moment. For this, two cam profile solenoids are needed.

Cam profile solenoid 1 (CPS1) supplies cylinder 1, 2, and 4, and cam profile solenoid 2 (CPS2) supplies cylinder 3, 5, and 6 with pressurized oil.

OIL MONITORING

Fig. 226: Monitoring Oil Level
Courtesy of VOLVO CARS CORPORATION

General

The following components are used for oil monitoring:

- oil level sensor (7/35)
- engine control module (ECM) (4/46)
- driver information module (DIM) (5/1).

The oil level sensor, via the driver information module (DIM), is used to inform the driver if oil filling is required.

Detecting the oil level

The integrated electronics of the sensor calculates the oil level using the measured value for the oil temperature.

For the correct oil level to be calculated, temporary oil level changes in the oil trough must also be included in the calculation, which can occur when driving on hills, around bends or similar for example. The engine control module (ECM) makes these calculations using the oil level sensor signal and a number of other parameters, for example, vehicle speed signal and load signal.

CONTROLLING THE CRUISE CONTROL

Fig. 227: Identifying Cruise Control Components
Courtesy of VOLVO CARS CORPORATION

The following components are used when controlling the cruise control:

- engine control module (ECM) (4/46)
- steering wheel module (SWM) (3/254)
- control unit cruise control (3/4)
- central electronic module (CEM) (4/56)
- brake control module (BCM) (4/16) (brake pedal position, speed signal)
- driver information module (DIM) (5/1) (cruise control light)
- transmission control module (TCM) (4/28)
- electronic throttle unit (6/120)

- brake light switch (3/9).

To activate cruise control, the function must be switched on using the "CRUISE" button. Then a light is activated in the driver information module (DIM).

The driver activates the function by pressing the SET+ or SET- button. A message is then transmitted via the low speed side of the CAN network to the central electronic module (CEM) which then transmits the message on via the high speed side of the CAN network to the engine control module (ECM).

The engine control module (ECM) controls the throttle angle so that a constant speed is maintained using the vehicle speed signal from the Brake Control Module (BCM). The transmission control module (TCM) also receives a message indicating that cruise control is active via the Controller area network (CAN), so that the transmission follows certain shifting patterns when the cruise control is active.

If the accelerator pedal (AP) is depressed the vehicle speed increases as normal and then resumes the stored value when the driver releases the accelerator pedal (AP) again.

The engine control module (ECM) continually stores the speed. If the cruise control is disengaged, for example, if the driver depresses the brake pedal, the previous speed can be resumed by pressing the "RESUME" button.

The cruise control cannot be activated below a certain speed.

Cruise control is switched off:

- when the driver depresses the brake pedal
- when the driver presses the "CRUISE" button on the steering wheel
- when the driver depresses the "0" button on the steering wheel
- if "P" or "N" position is transmitted on the controller area network (CAN)
- if the speed deviates too much from the set value
- when the control system detects a fault that prevents activation.

FUEL TRIM

Fig. 228: Graphic of Exhaust Emissions
Courtesy of VOLVO CARS CORPORATION

Overview

Fuel trim reduces exhaust emissions. Fuel trim reduces nitrous oxides (NO_x), carbon monoxide (CO) and hydrocarbon (HC) emissions.

Theoretically, if the correct amount of oxygen is added during combustion, fuel can be converted to water (H_2O) and carbon dioxide (CO_2). Emissions would then be completely safe.

In practice considerable amounts of hydro-carbons (HC) and varying amounts of carbon monoxide (CO) and carbon dioxide (CO_2) remain.

Fig. 229: Identifying Nitrous Oxides
Courtesy of VOLVO CARS CORPORATION

Due to the high temperature and pressure, nitrous oxides such as NO and NO_2 are also formed. The common designation for these gases is nitrous oxides NO_x .

Fig. 230: Graphic of Exhaust Emissions
Courtesy of VOLVO CARS CORPORATION

By speeding up the reaction between the remaining reactive components using a catalytic converter, these can be converted to water (H_2 O), carbon dioxide (CO_2) and nitrogen (N_2).

However this can only happen if the balance of hydro-carbons (HC), carbon monoxide (CO), oxygen (O_2) and nitrous oxides (NO_x) is exactly right in the exhaust. This happens when the fuel air mixture before combustion is 14.7 kg of air per kg of fuel. The Lambda value is then said to be one, (lambda=1).

Fig. 231: Diagram of Engine Control Components
Courtesy of VOLVO CARS CORPORATION

A base program in the engine control module (ECM) calculates the injection period based on data about load, i.

e. the measured air mass and engine speed (rpm). The calculated injection time (from the base program) is then modified by a circuit (short-term fuel trim). The signal from the heated oxygen sensor (HO2S) is used to finely adjust the injection period so that lambda=1 is reached. The short-term fuel trim is a circuit that finely adjusts the injection period so that the fuel/air mixture is optimized (lambda=1). The control module also used the signals from the front and rear heated oxygen sensors (HO2S) to correct the front heated oxygen sensor (HO2S) (offset adjustment) and thereby the injection period. This gives a higher degree of accuracy during fuel trim. Fuel trim is a rapid process which may take place several times a second. Adjustment of the injection period calculated in the base program is limited.

The short-term fuel trim can be read off.

Adaptive functions

Fig. 232: Graphed View Of Adaptive Function
Courtesy of VOLVO CARS CORPORATION

Certain factors, for example, tolerance deviations on certain components such as mass air flow (MAF) sensor and injectors, air leakage on the intake side, fuel pressure etc. affect the fuel / air mix. In order to compensate for this, the engine control module (ECM) has adaptive (self learning) functions. When the engine is new the short term fuel trim varies cyclically around a nominal central line (A) 1.00, with, for example, a ±5% change of injection time when fuel trim is in operation.

If there is air leakage for example, the short-term fuel trim will quickly be offset to a new position (B) and will then work for example between 1.10 (+10%) and 1.20 (+20%), although still at an amplitude of 5%, but with an

offset in relation to the original center line (A). The injection period has then been increased to compensate the increase in the amount of air.

The adaptive functions will correct the change, so that the short-term fuel trim will work around the new center line (B) where it will again have its full range of control available.

Put simply, fuel trim is a measurement of the difference (C) between the original short-term fuel trim center line (A) and the new center line (B).

The adaptive functions are split into various operational ranges based on the load and speed of the engine.

The different adaption ranges can be read off.

The adaptive adjustments of injection time are continuously stored in the engine control module (ECM). This means that, at different operating ratios, the correct mixture ratio is achieved before the heated oxygen sensor (HO2S) reaches operating temperature.

The diagnostic trouble code (DTC) is stored in the engine control module (ECM) if any adaption value is too high or too low.

INDIVIDUAL CYLINDER FUEL TRIM (-2009)

General

The Engine control module (ECM) controls the fuel according to the description in Fuel trim above, but has another refined system for improving exhaust values, namely individual cylinder fuel trim.

In short, this means that the Engine control module (ECM) can detect the fuel/air mixture composition for each individual (6 cylinders).

To achieve this requires, among others, refined heated oxygen sensors that are very sensitive to the oxygen content in the exhausts.

Should problems occur, which would mean that the sensors, "lose" their extra sensitivity, the Engine control module (ECM) will return to traditional fuel trim.

This will not force the vehicle outside any limit values for exhausts, since this is more than enough to give "clean" exhausts.

FUEL PRESSURE REGULATION

Fig. 233: Identifying Fuel Pressure Control Components
Courtesy of VOLVO CARS CORPORATION

General

Fuel pressure regulation for demand controlled fuel pumps (DECOS - DEmand COntrolled fuel Supply) means that the fuel pressure is controlled steplessly by varying the output of the fuel pump. The design of the system allows a greater maximum pressure (approximately 650kPa) in the fuel pump. This pressure is used in extreme situations, such as heavy engine load for example

The following components are used for fuel pressure regulation:

- engine control module (ECM) (4/46) with integrated atmospheric pressure sensor
- fuel pump control module (4/83)
- fuel pressure sensor with fuel temperature sensor (7/156)
- fuel pump with by-pass valve (6/33).

The time taken for the engine start procedure can be reduced by rapidly increasing the pressure in the fuel rail when the engine control module (ECM) receives a signal about the position of the ignition switch from the central electronic module (CEM).

The engine control module (ECM) is better able to calculate the injection period using the signal from the atmospheric pressure sensor and fuel pressure sensor. This particularly improves the cold starting characteristics of the engine.

The advantages of varying the output of the fuel pump so that it is not always at full power are:

- the total power consumption of the fuel pump (FP) is reduced, reducing the load on the power supply system
- the service life of the fuel pump (FP) is increased

- fuel pump noise is reduced.

Control

The engine control module (ECM) calculates the desired fuel pressure. A signal is then transmitted to the fuel pump control module indicating the desired fuel pressure. Serial communication between the engine control module (ECM) and the fuel pump control module is used to carry the signal. The fuel pump control module then operates the fuel pump unit to obtain the desired pressure using a pulse width modulation voltage on the ground lead. The fuel pump (FP) can be controlled steplessly by changing the pulse width modulation (PWM) signal. Only that pressure which is required at that specific time will then be released to the fuel rail/injectors. The value of the pulse width modulation (PWM) signal is a measurement of the operational load of the fuel pump (FP) (% duty, 100% = maximum pressure).

The engine control module (ECM) continuously monitors the fuel pressure using the signal from the fuel pressure sensor. This allows the desired fuel pressure to be reached, and if necessary a signal is transmitted to the fuel pump control module requesting that the fuel pressure is adjusted.

The engine control module (ECM) attempts too obtain a constant fuel pressure (approximately 380kPa relative to atmospheric pressure with the engine running).

By-pass valve

When the injectors close when the pressure is too great (during engine braking for example) there is a pressure peak. The by-pass valve in the fuel pump (FP) is used to even out the pressure peak. The opening pressure of the valve is approximately 650 kPa.

The by-pass valve also functions as a non-return valve, ensuring that the fuel pressure in the system is maintained when the engine is switched off.

There is high pressure before the engine is started. This high pressure means that the valve in the by-pass valve opens and the system is "flushed".

Passive safety

For safety reasons, the engine control module (ECM) shuts off the fuel pump (FP) if the supplemental restraint system module (SRS) detects a collision.

KNOCK CONTROL

Fig. 234: Identifying Knock Sensors
Courtesy of VOLVO CARS CORPORATION

Knock occurs in the combustion chamber when the fuel and air mixture self ignites. This can occur either before or after the spark plug has produced an ignition spark. In both cases the gas in two or more places ignites in the combustion chamber.

This results in an extremely fast combustion process with flames from several directions. When these flames collide, the pressure in the cylinder increases rapidly and there is a mechanical knocking sound.

If any cylinder knocks, then certain types of vibrations in the engine block. These vibrations are transmitted to the knock sensors (7/23-24), which are bolted in the engine block.

One knock sensor detects knock on cylinders 1, 2, 3. The other knock sensor detects knock on cylinders 4, 5, and 6.

The mechanical stress generated in the knock sensors' piezo-electric materials result in generation of a voltage. The Engine control module (ECM) (4/46) can then, using the camshaft sensors (7/172-173) and the impulse sensor (7/25), decide which cylinder is knocking.

The knock sensors (KS) also interpret a proportion of normal engine sound. The control module is able to recognize the vibrations which correspond to knocking by filtering, amplifying and using software to evaluate the signal.

If the knock sensors (KS) detect knocking in the engine above a certain threshold value, the ignition timing is first retarded and then the fuel/air mixture is enriched to eliminate knocking.

IGNITION CONTROL

Fig. 235: Identifying Ignition Control Components
Courtesy of VOLVO CARS CORPORATION

The following components are used for ignition control:

- engine speed (RPM) sensor (7/25)
- Camshaft sensor (7/172-173)
- mass air flow (MAF) sensor (7/17)
- engine coolant temperature (ECT) sensor (7/16)
- throttle position (TP) sensor on the electronic throttle unit (6/120)
- knock sensor (KS) (7/23-24)
- transmission control module (TCM) (4/28)
- spark plugs with ignition coils (20/3-8).

The engine control module (ECM) calculates the optimum ignition advance based on the software and information from the sensors. The engine control module (ECM) cuts the current to the ignition coil mounted on the cylinder to be ignited and produces a spark.

During the starting phase the engine control module (ECM) produces a fixed ignition setting. When the engine has started and the vehicle is being driven, the engine control module (ECM) calculates the optimum ignition setting, taking factors such as the following into account:

- engine speed (RPM)
- load
- temperature.

The engine control module (ECM) analyses the signal from the knock sensors (KS) when the engine reaches operating temperature. If any of the cylinders knock, the ignition is retarded for that specific cylinder until the knocking ceases.

The ignition then advanced to the normal position or until the knock recurs.

Before the Transmission control module (TCM) is going to shift, sometimes it sends a request for torque limitation to the Engine control module (ECM). Which then lowers the ignition momentarily to reduce the torque and thus give smoother shifting and reduced load on the transmission.

Lowering of ignition can be done in several levels, where the levels depend on the signals from the Transmission control module (TCM). The return signal from the Engine control module (ECM) to the Transmission control module (TCM) confirms that the signal reached the Engine control module (ECM).

For further information, also see: **MISFIRE DIAGNOSTIC**

The engine misfires if the fuel does not ignite correctly. For further information, also see: **MISFIRE DIAGNOSTIC**

REGULATING THE AIR CONDITIONING (A/C) COMPRESSOR

Fig. 236: (A/C) Compressor Regulating System
Courtesy of VOLVO CARS CORPORATION

The air conditioning (A/C) compressor is controlled by the engine control module (ECM) (4/46) on request from the climate control module (CCM) (4/6) via the controller area network (CAN). When the engine control module (ECM) receives a signal from the climate control module (CCM) to activate the air conditioning (A/C) compressor, the engine control module (ECM) grounds the circuit for the relay coil for the A/C compressor. See also: **AIR CONDITIONING (A/C) RELAY**

The relay (2/22) closes the circuit between the integrated relay/fusebox in the engine compartment and the clutch for the air conditioning (A/C) compressor (8/3). The air conditioning (A/C) compressor which has a variable cylinder displacement is always running during normal driving. Displacement in the compressor is regulated by a solenoid which is controlled by the engine control module (ECM).

The engine control module (ECM) controls the solenoid (displacement) from the driver's and vehicle's various driving characteristics. On Startup of the engine, pulling off and at acceleration etc, displacement is controlled so that the A/C compressor has the least possible effect on the engine torque. The climate control module (CCM) controls all functions in the climate control system that are related to the vehicle's interface for driver and passenger. I. E. the climate control system buttons on the dashboard environment panel.

The climate control module (CCM) transmits information to the engine control module (ECM), which determines what must be prioritized. For example, the air conditioning (A/C) compressor in certain extreme cases is switched off completely, regardless of the climate control module (CCM) request. This is to prevent negative engine performance and to protect the air conditioning (A/C) system. As well as the information from

the climate control module (CCM), the engine control module (ECM) controls the air conditioning (A/C) compressor based on the information from:

- Air conditioning (A/C) pressure sensor (high pressure side) (7/8)
- the throttle position (TP) sensor (6/120)
- the engine coolant temperature (ECT) sensor (7/16).

THROTTLE CONTROL

Fig. 237: Identifying Throttle Control
Courtesy of VOLVO CARS CORPORATION

To ensure that the correct throttle angle is reached, the engine control module (ECM) (4/46) controls the throttle shutter in the throttle unit (6/120), mainly using the signal from:

- Accelerator pedal (AP) position sensor (7/51)
- the throttle position (TP) sensor on the electronic throttle unit.

Additional signals and parameters are used to ensure optimum throttle control. By example by compensating for:

- the load from the air conditioning (A/C) compressor
- the load from the transmission depending on the selected gear mode

- engine coolant temperature (ECT)
- mass air flow through the intake manifold
- manifold absolute pressure (MAP) in the intake manifold.

The position of the throttle is measured by two potentiometers, in the throttle position (TP) sensor, which are on the throttle unit. These are connected, so that potentiometer 1 produces a higher voltage as the throttle angle increases, while potentiometer 2 does the opposite.

In a combustion engine, the difference between the minimum and maximum airflow is considerable. The smaller air flows need more thorough regulation, so the potentiometer signal from potentiometer 1 is amplified approximately 4 times in the engine control module (ECM) before it reaches the AC/DC converter in the engine control module (ECM). This means that there are three, two real and one fictitious, input signals available to the engine control module (ECM). These signals are used to determine the position of the throttle and to deploy the damper motor to the correct position. In general the amplified signal is primarily used for small throttle angles (small air flows), which are desirable when a high degree of accuracy is required, for idle air trim for example.

Because the signal is amplified, it reaches its maximum value as early as approximately a quarter of maximum deployment.

The engine control module (ECM) primarily uses the signal from potentiometer 1 as a measurement of throttle opening. The signal from potentiometer 2 is mainly to check that potentiometer 1 is working. The engine control module (ECM) then uses the signal to calculate a throttle angle (actual value). This is the actual throttle angle. The value for the actual throttle angle is used by those functions in the engine control module (ECM) which depend on this information so that the throttle can be correctly regulated.

There is an adaptation (learning) in the engine control module (ECM) so that the control module can calculate how the damper motor needs to be controlled. See "Adaptation of the throttle unit" below.

The throttle angle is regulated so that the actual angle (actual value) is the same as the angle calculated by the engine control module (ECM) (desired value). The engine control module (ECM) also uses the values that were stored during adaptation of the throttle angle, and the actual signals from the potentiometers.

The damper motor is deployed by the integrated power stage in the engine control module (ECM) using a pulse width modulation (PWM) signal. The torsion from the opening and return springs in the electronic throttle unit is also used. If there is a fault in the engine control module (ECM) so that the throttle unit cannot be operated or powered, the springs in the throttle unit will turn the throttle disc to the limp home position (return position). This return position gives a throttle angle large enough to allow the car to be driven to a workshop, although with considerably reduced driveability.

Throttle angle

The throttle angle is usually gauged by potentiometer 1. For small angles the amplified signal is used to obtain a clearer signal. The engine control module (ECM) also monitors the throttle unit signals from the potentiometers to check that they are plausible, that they are within the minimum and maximum limits and that the signals correspond to the same throttle angle. If there is a difference in the signals, a fictitious throttle signal is calculated from the load signal, the engine speed (rpm) and the prevailing conditions, particularly pressure and temperature.

The potentiometer whose signal is closest to the calculated throttle angle will then be assumed to be correct. The other potentiometer is then classified as not functioning and a diagnostic trouble code (DTC) is generated. The system then constantly monitors the throttle angle of the remaining potentiometer in comparison to the calculated throttle angle. If there is a difference between these values, the engine control module (ECM) will not rely on any of the throttle unit potentiometers. The power stage in the throttle unit is then disengaged, and the throttle switches to limp home mode.

Adaptation of the throttle unit

In ignition position II, the engine control module (ECM) carries out adaptation of the electronic throttle unit. Adaptation is carried out by the throttle disc being mechanically controlled to the closed position and the current throttle position being read off. If previous adaptation values are missing in the engine control module (ECM), for example, if the control module has not been powered, the current throttle angle is stored as the adaptation value. If, in addition, there is a previously stored value, the average value of the previous one and the current throttle angle is stored as the new adaptation value.

HINT: When replacing the electronic throttle unit, the engine control module (ECM) must therefore always be switched off.

SYSTEM OVERVIEW

CONTROL MODULE

Fig. 238: Identifying Engine Control Module (ECM)
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) controls, amongst others, the following functions:

- injectors
- ignition
- camshafts (CVVT)
- Evaporative emission system (EVAP) valve
- throttle angle
- engine cooling fan (FC)

- air conditioning (A/C) compressor.
- fuel pump
- Variable intake system
- variable camshaft profile.

The engine control module (ECM) is supplied with battery voltage (U_{bat}) via fuses in the central electronic module (CEM) and in the integrated relay/fusebox in the engine compartment.

To prevent certain stored date from being erased from the engine control module (ECM) when the ignition is switched off, the control module also has a 30-supply. This supply is from the integrated relay/fusebox in the engine compartment.

The control module is grounded via the wiring which is connected at the right-hand suspension turret.

The engine control module (ECM) contains a voltage regulator which maintains a low voltage (5 V) in internal components in the control module such as:

- Analog/Digital converter
- Digital/Analog converter
- Micro-processor.

Functions which require battery power (U_{bat}) and high output are controlled by external or internal power stages. For example ignition coils have external power stages (integrated into the ignition coils) while the power stages for the injectors are integrated in the engine control module (ECM).

The micro-processor in the engine control module (ECM) receives signals from the different sensors and control modules in the vehicle. The micro-processor uses a program which interprets the signals from the different sensors and how the components and functions should be controlled.

The engine control module (ECM) has several self-learning (adaptive) functions. It continually adapts ongoing calculations to changing circumstances (such as wear, air leaks, differences between different fuels).

Emissions are kept low through efficient management of the injection period, ignition, evaporative emission system (EVAP) valve and camshafts etc. Faults which affect emissions can be detected by running diagnostics for functions and components.

The Engine control module (ECM) is located on the air filter box, under a plastic cover.

The engine control module (ECM) communicates with other control modules using controller area network (CAN) communication or LIN communication.

The engine control module (ECM) checks activations, input and output signals and functions using an integrated diagnostic system. A diagnostic trouble code (DTC) is stored if, after validation, the control module detects a fault. In certain cases the faulty signal is also replaced with a substitute value or certain functions are limited.

For example, substitute values can be set for:

- engine coolant temperature (ECT) sensor
- Mass air flow (MAF) sensor
- throttle position (TP) sensor
- air pressure
- fuel pressure.

Mathematical calculations and signals from certain components are used to calculate the substitute values. Other substitute values are fixed, predefined values in the engine control module (ECM).

The substitute value allows the vehicle to be driven and for the emissions to be kept at a reasonable level even though vital functions or components are malfunctioning.

Functions which may be limited are for example:

- camshaft control (CVVT)
- fuel trim
- throttle angle
- fuel pressure regulation.

The substitute values are used and functions restricted so that the system is still able to work while protecting components that are required for safety reasons (for example the throttle angle).

Any diagnostic trouble codes (DTCs) are stored in the internal memory of the engine control module (ECM). The information can be read off via the data link connector (DLC) in the vehicle.

SIGNALS

The table below summarizes the input signals to and output signals from the Engine Control Module (ECM). The signal types are divided into directly connected signals, LIN and CAN communication. The illustration below gives the same information as the Volvo component designations.

Input signals	Output signals
Directly connected: • Ignition switch (3/1) • Air conditioning (A/C) pressure sensor (7/8) • Brake light switch (from the central electronic module (CEM)) (3/9) • Accelerator pedal (AP) position sensor (7/51) • Electronic throttle unit (6/120)	**Directly connected:** • Air conditioning (A/C) relay (2/22) • Air conditioning (A/C) compressor (8/3) • Electronic throttle unit (6/120) • Engine cooling fan (FC) control module (4/71) • Evaporative emission system (EVAP) valve (8/18) • Injectors (8/6-11)

• Camshaft position sensor, intake (7/172) • Camshaft position sensor, exhaust (7/173) • Engine coolant temperature (ECT) sensor (7/16) • Engine speed (RPM) sensor (7/25) • Fuel pressure sensor / fuel temperature sensor (7/156) • Knock sensor (KS) (7/23-24) • Mass air flow (MAF) sensor/air temperature sensor (7/17) • Manifold absolute pressure (MAP) sensor (7/81) • Front oxygen sensor, bank 1 (7/15) • Front oxygen sensor, bank 2 (7/82) • Rear oxygen sensor, bank 1 (7/103) • Rear oxygen sensor, bank 2 (7/104) • Oil level sensor (7/35) • Outside temperature sensor (6/62) • Ignition coils (20/3-8) • Engine cooling fan (FC) control module (4/71) • Leak diagnostic unit (6/67), (certain markets only). • Gear position status (P/N engaged/disengaged) (from the transmission control module (TCM) (4/28)) • Engine coolant level sensor (7/73)	• Fuel pump (FP) control module (4/83) • Ignition coils (20/3-8) • Leak diagnostic unit (6/67), (certain markets only). • Front oxygen sensor, bank 1 preheating (7/15) • Front oxygen sensor, bank 2 preheating (7/82) • Rear oxygen sensor, bank 1 preheating (7/103) • Rear oxygen sensor, bank 2 preheating (7/104) • Main relay (system relay) (2/32) • Starter motor relay (2/35) • Camshaft reset valve (CVVT), intake (8/19) • Emissions warning lamp (5/1) • Actuator variable intake manifold, upper (6/139) • Actuator variable intake manifold, lower (6/140) • Cam profile solenoid 1 (CPS1) (8/125) • Cam profile solenoid 2 (CPS2) (8/126)

ENGINE CONTROL MODULE (ECM) (B8444S; 2005-2011)

DESIGN

IGNITION SWITCH

Fig. 241: Identifying Ignition Switch And Connector Terminals
Courtesy of VOLVO CARS CORPORATION

The Engine Control Module (ECM) uses the signal from the ignition switch to detect when the ignition key has been turned to position II or III. When the key is in the ignition position (position II) or starting position (position III) a high signal (U_{bat}) is transmitted from the ignition switch to the engine control module (ECM).

The engine management system prepares for start-up (for example, temporarily activates the fuel pump (FP) relay). When the flywheel in the engine rotates, the engine speed (RPM) sensor signal is used to keep the fuel pump (FP) relay activated.

The fuse in the fuse box in the passenger compartment supplies current to the ignition switch.

The central electronic module (CEM) has diagnostics for the ignition switch.

ENGINE SPEED (RPM) SENSOR

Fig. 242: Identifying Engine Speed (RPM) Sensor
Courtesy of VOLVO CARS CORPORATION

The engine speed (RPM) sensor provides the engine control module (ECM) with information about the speed and position of the crankshaft. The engine control module (ECM) is able to use the signal from the engine speed (RPM) sensor to determine when a piston is approaching top dead center (TDC).

The signal from the engine speed (RPM) sensor is also used to check the engine for misfires. For further information, see: **MISFIRE DIAGNOSTIC**

The engine speed (RPM) sensor is at the rear of the engine above the flywheel.

The sensor is inductive with a permanent magnet. An alternating current is induced in the sensor when the flywheel/carrier plate passes the engine speed (RPM) sensor. The generated voltage and frequency increases with the engine speed (rpm).

The signal varies between 0.1-100 V depending on the engine speed (RPM).

The Engine Control Module (ECM) is able to determine the engine speed (RPM) by counting the number of holes per time unit. When the reference position passes the engine speed (RPM) sensor, the voltage and frequency drop momentarily to zero, even though the engine is still running. This allows the engine control module (ECM) to determine the position of the crankshaft.

If the signal from the engine speed (RPM) sensor is incorrect or missing, the control module will use signals from the camshaft position (CMP) sensor.

The engine speed (RPM) sensor can be diagnosed by the engine control module (ECM) and the sensor signal (engine speed (RPM)) can be read off.

CAMSHAFT POSITION (CMP) SENSOR

Fig. 243: Camshaft Position Sensor
Courtesy of VOLVO CARS CORPORATION

The function of the camshaft position (CMP) sensor is to detect the flanks of the camshaft rotor. The signal from the sensor is used by the engine control module (ECM) to determine the angle of the camshaft.

Each camshaft is divided into a number of flanks (segments) per camshaft revolution. A pulse wheel on the camshaft consisting of teeth (the teeth are positioned by each flank) is used by the camshaft position sensor (CMP) to detect the flanks and the position of the camshaft.

In the event of misfire or engine knock, the control module is able to determine which cylinder is misfiring or knocking using the camshaft position (CMP) sensor signal. Also, see **KNOCK SENSOR (KS)** and **ENGINE SPEED (RPM) SENSOR**.

Data about the camshaft position is used during camshaft control (CVVT). See: **CAMSHAFT CONTROL (CVVT)**

The sensor, which is a magnetic resistor with a permanent magnet, is grounded in the control module and supplied with 5 V from the control module. When one of the teeth on the camshaft pulse wheel passes the camshaft position (CMP) sensor, a signal is transmitted to the control module from the camshaft position (CMP) sensor. The signal varies between 0 - 5 V and is high when a tooth is close to the camshaft position (CMP) sensor and low when the tooth leaves the camshaft position (CMP) sensor.

There is camshaft position (CMP) sensor for each camshaft.

The camshaft position (CMP) sensors are located by the camshafts on the rear edge of the engine (left-hand side of the vehicle, closest to the flywheel).

The engine control module (ECM) can diagnose the camshaft position (CMP) sensors.

KNOCK SENSOR (KS)

Fig. 244: Identifying Knock Sensor
Courtesy of VOLVO CARS CORPORATION

The function of the knock sensor (KS) is to monitor combustion knocking from the engine. Knocking may damage the engine and reduces the efficiency of engine combustion.

If the engine control module (ECM) registers knocking from any of the cylinders, the ignition will be retarded for that cylinder at the next combustion stage. If repeated ignition retardation does not prevent knocking, the injection period will be increased. This has a cooling effect.

The sensor is made up of Piezo electrical crystals. If there is engine knock, vibrations (sound waves) spread through the cylinder block to the knock sensor (KS). The resultant mechanical stress in the Piezo electrical material in the knock sensors generates a voltage. This signal is transmitted to the engine control module (ECM). The signal corresponds to the frequency and amplitude of the sound waves. This allows the Engine Control Module (ECM) to determine if the engine is knocking. The camshaft position (CMP) sensor and engine speed (RPM) sensor are used to determine the operating cycle of the engine (which cylinder is igniting) and therefore which cylinder is knocking.

The knock sensors are located on the engine block between the cylinder rows.

Knock sensor 1 detects knock on cylinders 5, 6, 7 and 8. Knock sensor 2 detects knock on cylinders 1, 2, 3 and 4.

The engine control module (ECM) can diagnose the knock sensors (KS).

ENGINE COOLANT TEMPERATURE (ECT) SENSOR

Fig. 245: View of Engine Coolant Temperature (ECT) Sensor
Courtesy of VOLVO CARS CORPORATION

The engine coolant temperature (ECT) sensor checks the temperature of the engine coolant. The temperature of the engine coolant is required so that the engine control module (ECM) can regulate:

- the injection period
- the idle speed
- the engine cooling fan (FC)
- the ignition advance
- engagement and disengagement of the A/C compressor
- diagnostic functions.

The sensor is a negative temperature coefficient (NTC) type which is supplied with power from the control module (signal) and is grounded in the control module.

The resistance in the sensor changes depending on the temperature of the coolant. Depending on the resistance in the sensor, voltage (signal) is transmitted to the engine control module (ECM). The lower the temperature the higher the voltage (high resistance). A high temperature results in low voltage (low resistance).

The engine coolant temperature (ECT) sensor is located beside the thermostat.

The engine coolant temperature (ECT) can be diagnosed by the engine control module (ECM) and the value of the sensor can be read off.

MASS AIR FLOW (MAF) SENSOR/INTAKE AIR TEMPERATURE (IAT) SENSOR

Fig. 246: Identifying Mass Air Flow Sensor
Courtesy of VOLVO CARS CORPORATION

Overview

The mass air flow (MAF) sensor is a combined sensor and contains two sensors in the same component:

- mass air flow (MAF) sensor
- intake air temperature (IAT) sensor.

The mass air flow (MAF) sensor is positioned between the air cleaner (ACL) housing and the intake manifold.

Mass air flow (MAF) sensor

The mass air flow (MAF) sensor gauges the air mass sucked into the engine. It continuously transmits signals to the engine control module (ECM) about the mass of the intake air. This data is used by the engine control module (ECM) to calculate:

- the injection period
- the fuel pressure
- the ignition timing
- the engine load.

The transmission control module (TCM) also uses this data for its gear shift calculations. This data is transmitted to the transmission control module (TCM) from the engine control module (ECM) via the high speed side of the Controller area network (CAN).

The mass air flow (MAF) sensor is a hot wire type. Unlike other hot wire types, the mass air flow sensor in the Denso system uses a hot wire which has a ceramic casing. This eliminates the need for a clean burn function.

The mass air flow (MAF) sensor is supplied with battery voltage by the system relay and is grounded in the engine control module (ECM). The signal from the sensor is analog and varies between approximately between 0.5 - 4.5 V. Low air flow (low mass) results in low voltage, high air flow (high mass) gives high voltage.

The mass air flow (MAF) sensor can be diagnosed by the engine control module (ECM) and the sensor signal can be read off.

Intake air temperature (IAT) sensor

The temperature sensor checks the temperature of the intake air in the intake manifold. This data is used by the engine control module (ECM) to calculate injection period. The control module also controls certain diagnostic functions using the signal from the temperature sensor.

The sensor, which is an NTC resistor, is grounded in the control module and supplied with power (signal) from the control module.

The resistance in the sensor changes according to the intake air temperature. This provides the control module with a signal of between 0.5 - 5 V. The lower the temperature the higher the voltage (high resistance). A high temperature results in low voltage (low resistance).

The temperature sensor can be diagnosed by the engine control module (ECM) and the sensor signal can be read off.

HEATED OXYGEN SENSORS (HO2S)

Front heated oxygen sensor (HO2S)

Fig. 247: View of Heated Oxygen Sensor (HO2S)
Courtesy of VOLVO CARS CORPORATION

CAUTION: The air lines for the heated oxygen sensors (HO2S) must not be trapped or damaged in any way. The connectors for the heated oxygen sensors (HO2S) must not be greased under any circumstances. The oil in the grease would disrupt the reference air and the function of the heated oxygen sensors (HO2S).

Front heated oxygen sensor (HO2S) is used to provide the engine control module (ECM) with information about the remaining oxygen content of the exhaust gases before the three-way catalytic converter (TWC). This is so that the engine control module (ECM) can continually check the combustion so that lambda=1 is achieved.

lambda=1 is the ideal fuel-air ratio, with 14.7 kg air per 1 kg fuel.

The heated oxygen sensor (HO2S) uses current control and its signal characteristic is linear. With a linear signal characteristic, the amplitude of the signal curve is low when changing the oxygen content in the exhaust gases. The probe consists of a preheating element and the actual lambda sensor. The lambda sensor is an oxygen sensitive ceramic body consisting of zirconium oxide. The control module supplies power to the ceramic body, which reacts to the oxygen content of the exhaust gases. This in turn affects the signal to the engine control module (ECM). In order to determine the oxygen content in the exhaust pipe, the heated oxygen sensor (HO2S) needs reference air from the surrounding air. This reference air reaches the heated oxygen sensor (HO2S) via the air lines.

CAUTION: The air lines for the heated oxygen sensors (HO2S) must not be trapped or damaged in any way. The connectors for the heated oxygen sensors (HO2S) must not be greased under any circumstances. The oil in the grease would disrupt the reference air and the function of the heated oxygen sensors (HO2S).

There are two front heated oxygen sensors; one for bank 1 and one for bank 2.

Bank 1 (front cylinder row); cylinders 1, 3, 5 and 7.

Bank 2 (rear cylinder row, closest to the passenger compartment); cylinders 2, 4, 6 and 8.

The heated oxygen sensors (HO2S) can be diagnosed by the engine control module (ECM), and signals from them can be read off. For further information: **HEATED OXYGEN SENSOR (HO2S) DIAGNOSTIC**

The control module can be used to read off the calculated lambda value from the heated oxygen sensor (HO2S) signal.

Rear heated oxygen sensor (HO2S)

Fig. 248: View of Heated Oxygen Sensor (HO2S)
Courtesy of VOLVO CARS CORPORATION

CAUTION: The air lines for the heated oxygen sensors (HO2S) must not be trapped or

damaged in any way. The connectors for the heated oxygen sensors (HO2S) must not be greased under any circumstances. The oil in the grease would disrupt the reference air and the function of the heated oxygen sensors (HO2S).

The rear heated oxygen sensor (HO2S) is used to provide the engine control module (ECM) with information about the remaining oxygen content of the exhaust gases beyond the three-way catalytic converter (TWC). This information is used by the Engine Control Module (ECM) to check the function of the three-way catalytic converter (TWC). This check is carried out when the conditions for the catalytic converter diagnostics have been met. The rear heated oxygen sensor (HO2S) has no direct effect on regulation of the fuel/air mixture. However the engine control module (ECM) uses the signal to optimize the signal from the front heated oxygen sensor (HO2S). For further information, see: **THREE-WAY CATALYTIC CONVERTER (TWC) DIAGNOSTICS**

The heated oxygen sensor (HO2S) uses voltage control. The signal characteristic is binary. With a binary signal characteristic, the amplitude of the signal curve changes considerably when changing the oxygen content in the exhaust gases. Otherwise its components and function are the same as the front heated oxygen sensor (HO2S).

CAUTION: The air lines for the heated oxygen sensors (HO2S) must not be trapped or damaged in any way. The connectors for the heated oxygen sensors (HO2S) must not be greased under any circumstances. The oil in the grease would disrupt the reference air and the function of the heated oxygen sensors (HO2S).

There are two rear heated oxygen sensors; one for bank 1 and one for bank 2.

Bank 1 (front cylinder row); cylinders 1, 3, 5 and 7.

Bank 2 (rear cylinder row, closest to the passenger compartment); cylinders 2, 4, 6 and 8.

The heated oxygen sensors (HO2S) can be diagnosed by the engine control module (ECM), and signals from them can be read off

Preheating of the heated oxygen sensors (HO2S)

The heated oxygen sensor (HO2S) only functions above a certain temperature, approximately 300 °C. The normal operating temperature is between 300-900 °C. The heated oxygen sensors (HO2S) are electrically pre-heated so that operating temperature is rapidly reached. They are also pre-heated to ensure that the heated oxygen sensors (HO2S) maintain a normal operating temperature and to prevent condensation which could damage the heated oxygen sensor (HO2S).

The heater element in the probe consists of a positive temperature coefficient (PTC) resistor. The system relay supplies the heater element with voltage. The element is grounded in the engine control module (ECM). When the control module grounds the connection a current flows through the PTC resistor. When the heated oxygen sensor (HO2S) is cold, the resistance in the PTC resistor is low and a large current will flow through the circuit. The current from the engine control module (ECM) is pulsed at first to prevent condensation damage to the heated oxygen sensor (HO2S). Depending on the temperature, allowances are made for factors such as the dew

point. As the temperature in the PTC resistor rises, the resistance rises, the current falls and switches in stages to a constant current. The pre-heating time for front heated oxygen sensor (HO2S) is short, approximately 20 seconds.

The heater element heats the heated oxygen sensors (HO2S) to approximately 350 °C. The probes maintain this as a minimum temperature.

The engine control module (ECM) can diagnose the heater element.

STOP LAMP SWITCH

Fig. 249: Brake Light Switch
Courtesy of VOLVO CARS CORPORATION

The purpose of the stop lamp switch is to provide the engine control module (ECM) with information indicating whether the brake pedal is depressed or not.

A signal is transmitted to the engine control module (ECM) when the brake pedal is pressed. The engine control module (ECM) disengages the cruise control (if activated). The brake pedal sensor also disengages cruise control.

The stop lamp switch is supplied with power from the ignition switch (terminal 30). When the brake pedal is depressed the switch closes and a high signal (12 V) is transmitted to the engine control module (ECM).

The stop lamp switch can be diagnosed by the engine control module (ECM) and its status (depressed or not) can be read off.

The stop lamp switch is on the pedal box by the brake pedal.

A/C PRESSURE SENSOR

Fig. 250: A/C Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

The air conditioning (A/C) pressure sensor detects the pressure in the high-pressure side of the air conditioning (A/C) system.

The sensor is linear. It is grounded in the control module and supplied with 5 V from the control module. A linear signal (which depends on the pressure in the air conditioning (A/C) system) is transmitted to the engine control module (ECM). Low pressure produces low voltage, high pressure produces high voltage.

The air conditioning (A/C) pressure sensor can be diagnosed by the engine control module (ECM) and the sensor value can be read off.

The air conditioning (A/C) pressure sensor is directly mounted on the air conditioning receiver drier.

TRANSMISSION CONTROL MODULE (TCM)

The engine control module (ECM) uses a directly connected signal from the transmission control module (TCM) in the start function (activating the starter motor).

ACCELERATOR PEDAL (AP) POSITION SENSOR

Fig. 251: Identifying Accelerator Pedal (AP) Position Sensor
Courtesy of VOLVO CARS CORPORATION

The function of the accelerator pedal (AP) position sensor is to provide the engine control module (ECM) and central electronic module (CEM) with information about the position of the accelerator pedal. This data is used by the engine control module (ECM) to deploy the shutter in the throttle unit to the correct angle.

The accelerator pedal (AP) position sensor consists of a plastic housing with two potentiometers, and an Analog/Digital converter. The potentiometers are connected to a common shaft which is affected by the position of the accelerator pedal (AP).

The accelerator pedal (AP) position sensor transmits an analog and a pulse width modulated (PWM signal to the engine control module (ECM). These signals indicate the position of the accelerator pedal (AP). The digital signal is generated by the sensors Analog/Digital converter.

The analog and digital signals are used at the same time by the engine control module (ECM) to regulate the throttle shutter angle.

The power supply to the two potentiometers is different. The analog potentiometer is supplied with 5 V via the engine control module (ECM). The digital potentiometer is supplied with 12 V via the system relay and is grounded in the car body.

The digital signal is also used in conjunction with the analog signal for accelerator pedal (AP) position sensor diagnostics.

Accelerator pedal (AP) position sensor signals can be read off.

A diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects a difference between the analog and digital signals. The engine control module (ECM) then uses a minimal value to ensure the function (limp home).

The accelerator pedal (AP) position sensor is located on the accelerator pedal bracket.

OUTSIDE TEMPERATURE SENSOR

Fig. 252: Identifying Outside Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

The outside temperature sensor detects the temperature in the surrounding air. The signal is used by the engine

control module (ECM) as a substitute value in the event of a fault in certain components or functions and to control certain diagnostic functions.

The sensor is a negative temperature coefficient (NTC) type which is supplied with power from the control module (signal). The resistance in the sensor changes with the outside temperature. This alters the signal to the engine control module (ECM). The lower the temperature the higher the voltage (high resistance). A high temperature results in low voltage (low resistance).

The outside temperature sensor is positioned in the left door mirror.

The outside temperature sensor can be diagnosed by the engine control module (ECM) and the sensor value can be read off.

ENGINE COOLANT LEVEL SENSOR

Fig. 253: Engine Coolant Level Sensor
Courtesy of VOLVO CARS CORPORATION

The function of the engine coolant level sensor is to alert the driver if the engine coolant level in the expansion tank is too low.

The sensor is a magnetic reed switch, which is enclosed in a pipe on the bottom of the expansion tank. Around the pipe, on the inside of the expansion tank is a float. This float contains a magnet. When the engine coolant level is above minimum, the float is too high in the tank to affect the switch. However if the engine coolant level falls below the minimum level, the magnetic field acts on the switch.

The sensor is supplied with voltage (signal) from the engine control module (ECM) and grounded in the body. When the engine coolant level in the expansion tank is over a certain level the circuit closes, which produces a low signal. When the engine coolant level is below a certain level the circuit is opened by the engine coolant level sensor, which produces a high signal. When the engine control module (ECM) detects a high signal the information about low engine coolant level is transmitted via the Controller area network (CAN) to the driver information module (DIM), which warns the driver.

NOTE: There are no functions controlled by the engine which are directly connected to the low coolant level warning lamp. The Engine Control Module (ECM) only

transfers the signal which is used by the Driver Information Module (DIM).

The engine control module (ECM) cannot diagnose the engine coolant level sensor.

OIL PRESSURE SWITCH

Fig. 254: Identifying Oil Pressure Sensor
Courtesy of VOLVO CARS CORPORATION

The function of the oil pressure switch is to warn the driver about low oil pressure via the driver information module (DIM).

The oil pressure switch has a pressure sensing switch which is powered (signal) by the engine control module (ECM) and grounded in the cylinder block. The oil pressure switch is affected by the oil pressure of the engine.

When the oil pressure exceeds a certain value, the switch in the oil pressure switch will open. A high signal is then sent to the engine control module (ECM).

If the oil pressure is below a certain value, the switch in the oil pressure switch will close and a low signal will be sent to the engine control module (ECM). The engine control module (ECM) then transmits a CAN signal to the driver information module (DIM) to light the indicator lamp for low oil pressure.

The oil pressure sensor is on the cylinder block.

The engine control module (ECM) cannot diagnose the oil pressure switch.

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR, INTAKE

Fig. 255: Identifying Manifold Absolute Pressure (MAP) Sensor
Courtesy of VOLVO CARS CORPORATION

The manifold absolute pressure (MAP) sensor detects quick pressure changes in the intake manifold after the throttle. The signal from the sensor is used by the engine control module (ECM) to supplement the mass air flow (MAF) sensor when calculating injection period.

The manifold absolute pressure (MAP) sensor intake is located on the upper rear edge of the engine (passenger compartment side).

The semi-conductor sensor is grounded in the control module and is supplied with power from the control module.

The resistance in the intake manifold moves the silicone membrane in the sensor, giving a signal of 0.5 - 4.5 V to the control module. Low pressure results in low voltage, high pressure gives high voltage.

The pressure sensor can be diagnosed by the engine control module (ECM) and the sensor signal can be read off.

FUEL PRESSURE SENSOR / FUEL TEMPERATURE SENSOR

Fig. 256: Fuel Pressure Sensor And Fuel Temperature Sensor
Courtesy of VOLVO CARS CORPORATION

Overview

The fuel pressure and fuel temperature sensors are combined.

The sensor detects the fuel pressure (absolute pressure) and the temperature of the fuel in the fuel rail.

The fuel pressure sensor is on the right-hand end of the fuel rail.

The fuel pressure-/fuel temperature sensor can be diagnosed by the engine control module (ECM) and its signals (pressure and temperature) can be read off.

Fuel pressure sensor

The pressure sensor is a Piezo resistive type resistor, the resistance of which changes with the pressure. Depending on the pressure in the fuel rail, an analog signal of 0 - 5 V is transmitted to the engine control module (ECM). Low pressure results in low voltage, high pressure gives high voltage.

The engine control module (ECM) then uses this signal to adjust the pressure in the fuel rail using the fuel pump control module. See also: **FUEL PRESSURE REGULATION**

The pressure sensor is supplied with 5 V and grounded in the engine control module (ECM). The pressure sensor transmits a signal indicating the fuel pressure to the engine control module (ECM) on a separate cable.

NOTE: The absolute pressure is displayed when using parameter read outs to read off the fuel pressure. If there is no pressure at the fuel rail, the atmospheric pressure will be displayed.

HINT: The relative pressure (absolute pressure minus atmospheric pressure) is displayed when reading off the fuel pressure via a manometer connected to the fuel rail.

Fuel temperature sensor

The temperature sensor is an NTC sensor. The sensor is supplied with voltage (signal) from and grounded in the engine control module (ECM).

The resistance in the sensor changes according to the temperature of the fuel. This provides the engine control module (ECM) with a signal of between 0 - 5 V. Low temperature results in high voltage (high resistance). High temperature results in low voltage (low resistance).

The engine control module (ECM) uses the signal to calculate the volume of the fuel.

OIL LEVEL SENSOR

Fig. 257: Identifying Oil Level Sensor
Courtesy of VOLVO CARS CORPORATION

The function of the oil level sensor is to provide the engine control module (ECM) with information regarding the level of engine oil in the oil sump.

The sensor consists of:

- a terminal with three pins
- integrated electronics
- 2 capacitive gauge elements
- a PTC resistor.

The oil level sensor is supplied with 5 V by the engine control module (ECM). The oil level sensor generates a pulse width modulated (PWM) signal for the engine control module (ECM).

The oil level sensor can be diagnosed by the engine control module (ECM).

The pulse-width modulated (PWM) signal from the oil level sensor can be read using parameter readout.

MAIN RELAY (SYSTEM RELAY)

Fig. 258: Identifying Main Relay

Courtesy of VOLVO CARS CORPORATION

The function of the main relay (system relay) is to supply certain components with voltage.

The relay is mechanical and has a closing and opening function. In the rest position the circuit in the relay is open.

The main relay terminals (#30 and #86) are supplied with voltage by the battery. When the ignition key has been turned and the engine control module (ECM) is powered, the terminal (#85) on the main relay is grounded by the engine control module (ECM).

When the terminal (#85) is grounded, the relay is activated and a number of components are powered via the relay terminal (#87).

The main relay is in the integrated relay/fuse box in the engine compartment and is diagnosed by the engine control module (ECM).

INJECTORS

Fig. 259: Identifying Fuel Injector
Courtesy of VOLVO CARS CORPORATION

The function of the injectors is to spray fuel into the cylinders in the correct spray patterns. This happens sequentially.

The injectors are located under the intake manifold.

The engine control module (ECM) controls the injectors by grounding the valves in pulses.

The injectors can be diagnosed by the engine control module (ECM) and can be activated.

IGNITION COILS

Fig. 260: Identifying Ignition Coil
Courtesy of VOLVO CARS CORPORATION

The ignition coils supply the spark plugs with high voltage to produce sparks. The engine control module (ECM) controls the ignition coils so that sparks are generated at the correct time. The signal reconnects to the engine control module (ECM) so that diagnostics can be carried out.

Each ignition coil has an integrated power stage.

The ignition coils are in the sparkplug wells above each spark plug.

The engine control module (ECM) can diagnose the ignition coils.

CAMSHAFT RESET VALVE (CONTINUOUS VARIABLE VALVE TIMING (CVVT))

Fig. 261: Identifying Camshaft Reset Valve
Courtesy of VOLVO CARS CORPORATION

The camshaft reset valve controls the oil flow to the CVVT unit (camshaft pulley).

The valve consists of an electro-magnetic valve with a spring-loaded piston. There are slits in the piston which channel the engine lubricating oil to the CVVT unit by moving the piston in the reset valve. The continuous variable valve timing (CVVT) unit turns the camshaft (the camshaft timing changes). The direction in which the camshaft turns depends on the chamber in the CVVT unit which is supplied with oil (pressure). See also:

CAMSHAFT CONTROL (CVVT)

An oil filter is mounted at the intake channel for the valves to prevent oil contaminants from affecting the function of the reset valves.

The system relay supplies the reset valve with voltage via a fuse. The valve is grounded (control) in the engine control module (ECM). When the valve is grounded using a pulse width modulation (PWM) signal, the oil flow in the valve can be regulated to the different chambers in the continuous variable valve timing (CVVT) unit at variable rates. This allows the cam timing to be changed precisely and steplessly.

It is important not to mix up the pipes for the valves when removing/installing the reset valve camshaft.

The engine control module (ECM) can diagnose the camshaft reset valve.

The valves are on the cylinder head above the camshafts. There are four reset valves, two for the inlet camshaft and two for the exhaust camshaft.

EVAPORATIVE EMISSION SYSTEM (EVAP) VALVE

Fig. 262: Evaporative Emission System Valve
Courtesy of VOLVO CARS CORPORATION

The evaporative emission system (EVAP) valve is used to open and close the connection between the EVAP canister and the intake manifold. The valve controls the flow of hydro-carbons (fuel vapor) from the EVAP canister to the engine intake manifold using the vacuum in the intake manifold. This ensures that hydro-carbons stored in the EVAP canister are used in the engine combustion process.

The valve is an electromagnetic valve and is powered from the system relay. When the valve needs to be opened, it is grounded internally in the engine control module (ECM). The evaporative emission system (EVAP) valve is closed when in the standby position (open-circuit).

When the control module requests that the EVAP canister should be drained (the hydrocarbons stored in the canister should be released into the engine), the control module deploys the evaporative emission system (EVAP) valve by grounding it. A pulse width modulation (PWM) signal is used to ground the valve and to control the degree to which the valve will open. In this way, the drainage of the EVAP canister is matched to the volumetric efficiency of the EVAP canister, the engine speed (RPM) and the engine load.

The evaporative emission system (EVAP) valve can be diagnosed by the engine control module (ECM) and can be activated.

The evaporative emission system (EVAP) valve is on the rear edge of the engine (passenger compartment side).

LEAK DIAGNOSTIC UNIT (CERTAIN MARKETS ONLY)

Fig. 263: Identifying Leak Diagnostic Unit
Courtesy of VOLVO CARS CORPORATION

The function of the leak diagnostic unit is to pressurize the fuel tank system during leak diagnostics.

The leak diagnostic unit consists of a plastic housing with:

1. electrical air pump
2. a valve / solenoid which governs the air flow in the unit
3. a heater element (PTC resistor) which warms up the pump.

The electrical pump, valve and heater element in the unit are supplied with voltage by the system relay. The pump, valve and heater element are grounded (control) in the engine control module (ECM).

When leak diagnostics are not active, the valve is held open to ambient air for EVAP control to be carried out.

During leak diagnostics the pump in the leak diagnostic unit starts. The valve in the unit is operated by the engine control module (ECM) by grounding the different circuits internally in the engine control module (ECM).

The Engine control module (ECM) checks the fuel tanks system for leaks by pressurizing the system and at the same time monitoring a number of relevant parameters. Also see: **LEAK DIAGNOSTICS (CERTAIN MARKETS ONLY)**

The engine control module (ECM) can diagnose the leak diagnostic unit.

The valve in the leak diagnostic unit can be activated.

The leak diagnostic unit is at the upper front edge of the fuel tank.

AIR CONDITIONING (A/C) COMPRESSOR (CHECK VALVE AIR CONDITIONING (A/C) COMPRESSOR)

Fig. 264: Identifying A/C Compressor (B8444S Only)
Courtesy of VOLVO CARS CORPORATION

The air conditioning (A/C) compressor transports refrigerant, which is necessary for air conditioning (A/C) operation. It is an axial piston compressor with variable displacement. I. E. The compressor has adjustable cylinder displacement which is controlled by a check valve (solenoid). The valve, which is underneath the compressor, can be replaced.

The air conditioning (A/C) compressor is directly mounted on the engine block and is powered by the engine crankshaft via the auxiliaries belt.

AIR CONDITIONING (A/C) RELAY

Fig. 265: Air Conditioning Relay
Courtesy of VOLVO CARS CORPORATION

The air conditioning (A/C) relay supplies the A/C compressor with voltage. The relay is controlled by the engine control module (ECM) based on information from different signals:

- the climate control module (CCM) (via the control area network (CAN))

- the engine coolant temperature
- the position of the accelerator pedal (AP)
- the pressure in the system.

The engine control module (ECM) can temporarily disengage the A/C compressor during wide open throttle (WOT) acceleration.

The relay is mechanical. It has a closing / opening function and is supplied with power from the system relay.

In the rest position the circuit in the relay is open.

The system relay supplies the coil and the relay with power. The relay activates when the coil is grounded in the engine control module (ECM), the circuit closes and the A/C compressor is supplied with power via the relay voltage output.

The relay coil is grounded (signal) when the engine control module (ECM) receives a signal via the Controller area network (CAN) from the climate control module (CCM) to activate the relay and start the compressor.

STARTER MOTOR RELAY

Fig. 266: Identifying Main Relay
Courtesy of VOLVO CARS CORPORATION

The function of the starter motor relay is to supply power to the starter motor. See also: **START**

The starter motor relay is in the relay/fuse box in the engine compartment.

ENGINE COOLING FAN (FC) / ENGINE COOLING FAN (FC) CONTROL MODULE

Fig. 267: Identifying Engine Cooling Fans (FC) and Control Modules
Courtesy of VOLVO CARS CORPORATION

NOTE: The engine cooling fan may have a post-run of up to approx. 6 minutes after the engine has been turned off. The time for the fan's post-run depends on engine temperature, temperature in the engine compartment and pressure level in the AC-system.

WARNING: Be careful since the engine cooling fan may have a post-run after the engine has been turned off.

The engine cooling fan (FC) cools the coolant, engine compartment and the condenser when the air conditioning (A/C) compressor is running.

The engine control module (ECM) transmits a pulse width modulated (PWM) signal to the engine cooling fan (FC) control module. The control module then activates the fan at different speeds. The speed of the engine cooling fan (FC) is determined by the engine control module (ECM), depending on the coolant temperature (based on the signal from the engine coolant temperature (ECT) sensor) and the vehicle speed.

The temperature conditions for engagement of the different engine cooling fan (FC) stages may vary slightly, depending on the engine variant and the equipment level. The temperature conditions apply when:

- the A/C is off
- no faults are detected by the Engine Control Module (ECM).

There is an internal diagnostic function in the engine cooling fan (FC). This function transmits a signal to the engine control module (ECM) if the fan is partially or fully blocked. To do this, the engine cooling fan (FC) control module grounds the pulse width modulation (PWM) signal based on a predetermined pattern.

The engine cooling fan (FC) and its control module are behind the radiator.

The engine cooling fan (FC) can be diagnosed by the engine control module (ECM) and can be activated.

FUEL PUMP

Fig. 268: Fuel Pump
Courtesy of VOLVO CARS CORPORATION

The function of the fuel pump is to ensure that the pressure is correct at the delivery lines for the injectors when requested by the fuel pump control module.

The fuel pump consists of:

1. An electrical pump with an integrated safety valve
2. A pressure equalization valve. This valve equalizes rapid pressure peaks which occur, for example, when the injectors close during engine braking. It also contains a non-return valve which ensures that the pressure in the system does not drop when the engine is switched off
3. Fuel level sensor
4. Fuel filter, cannot be replaced separately
5. Relief valve, releases fuel into the pump housing
6. Ejector pump, continuously fills the pump housing with fuel. The fuel always flows from the fuel pump through the ejector and back to the pump housing.

The fuel pump is supplied with battery voltage by the fuel pump control module and is grounded in the car body via the fuel pump control module.

The engine control module (ECM) has diagnostics for the fuel pump function to ensure that the pressure is correct. See also: **FUEL PRESSURE REGULATION, DIAGNOSTICS**

The fuel pump can be activated and its status can be read off.

The pressure in the fuel rail can be measured by connecting a manometer to a nipple. This nipple is on the right-hand end of the fuel rail.

FUEL PUMP (FP) CONTROL MODULE

Fig. 269: Fuel Pump Control Module
Courtesy of VOLVO CARS CORPORATION

The fuel pump control module powers the fuel pump and regulates the output of the pump. The fuel pressure changes with the output of the pump.

The fuel pump (FP) control module is supplied with battery voltage by the fuel pump relay and grounded in the car body. The fuel pump relay is controlled by the central electronic module (CEM) at the request of the engine control module (ECM).

The engine cannot be started if the power supply to the fuel pump control module is faulty because the fuel pump will not then be powered.

The fuel pump control module is controlled by the engine control module (ECM) via serial communication. The fuel pump control module then controls the fuel pump by transmitting pulse width modulated (PWM) voltage on the ground lead for the fuel pump. This means that the voltage drop across the pump changes, and with it the output of the fuel pump. See also: **FUEL PRESSURE REGULATION**

There are no diagnostics for the fuel pump control module. The engine control module (ECM) has diagnostics for fuel pressure regulation and the associated components. See also: **FUEL PRESSURE REGULATION, DIAGNOSTICS**

The pulse width modulated (PWM) signal from the engine control module (ECM) to the fuel pump control module can be read off.

The fuel pump control module is on the outside on the right-hand side of the fuel tank.

VALVE VARIABLE INTAKE

Fig. 270: Identifying Variable Intake Control Valve
Courtesy of VOLVO CARS CORPORATION

The valve for variable intake controls the vacuum motor for the damper in the variable intake manifold.

The valve consists of an electro-magnetic valve which controls the air flow between the vacuum tank and the vacuum valve for the damper in the variable intake manifold.

The valve is supplied with voltage from the system relay via fuse and ground (control) internally in the engine control module (ECM). Also see: **VARIABLE INTAKE SYSTEM**

The valve for variable intake can be diagnosed by the engine control module (ECM).

The valve for variable intake is on the right-hand side of the engine beside the intake manifold.

EMISSIONS WARNING LAMP

Fig. 271: Emissions Warning Lamp
Courtesy of VOLVO CARS CORPORATION

The emissions warning lamp in the Driver Information Module (DIM) has a warning symbol. This warning symbol varies depending on the market. The warning symbols are:

- "Engine symbol" (not USA)

- "CHECK ENGINE" (MIL - Malfunction Indicator Lamp, USA only).

The warning lamp lights when the ignition key is turned to position II. The warning lamp will go out after approximately 15 seconds or if the engine is started when no fault is found in the engine management system.

If Readiness is not complete (certain diagnostic functions not completed), the warning lamp will flash instead of going out when the ignition key is in position II.

The warning lamp will light if there is a fault in one of the parameters in the engine management system. The warning lamp will also light in response to a request transmitted via the control area network (CAN) if there is a fault in the transmission control module (TCM) which affects emissions.

ELECTRONIC THROTTLE UNIT

Fig. 272: Electronic Throttle Unit
Courtesy of VOLVO CARS CORPORATION

The electronic throttle unit, using the PWM control signal from the engine control module (ECM), regulates the amount of air for engine combustion. This is done using an electronically controlled shutter.

The aluminum electronic throttle unit consists of a round throttle disc on a spindle. The spindle is driven by a DC motor (damper motor), gear wheel and two springs; one for opening and one for return.

By changing the polarity of the power supply, the DC motor can be run in both directions. At one of the limit positions the throttle disc is closed so that minimal air can pass the throttle unit. In the other limit position, the throttle disc is parallel to the air flow. This provides maximum airflow through the electronic throttle unit.

Two permanent magnets in the gear sector on the throttle spindle are used to check the position of the throttle disc. The permanent magnets affect two throttle position (TP) Hall sensors in the cover. The analog signals from the two sensors are transmitted to the engine control module (ECM). The signals are offset. The engine control module (ECM) compares these signals with the stored desired values to check if they are plausible.

The electronic throttle unit is located on the engine intake manifold. In the event of a fault, the throttle unit must be replaced as a single unit.

The engine control module (ECM) can diagnose the electronic throttle unit.

THROTTLE POSITION (TP) SENSOR

Electronic throttle unit.

FUEL PRESSURE REGULATION, DIAGNOSTICS

See: **FUEL PRESSURE REGULATION, DIAGNOSTICS**

OVERVIEW

GENERAL

The engine control module (ECM) diagnoses both internal signals and functions as well as signals and functions from connected components.

CONDITIONS FOR DIAGNOSIS

For the diagnosis of a component or function to start, certain specific conditions must be met. The conditions for diagnostics vary depending on the component or function being diagnosed.

Conditions must be met during the diagnostic in order for the diagnostic to be completed. The time and conditions for the diagnostic vary depending on the component or function being diagnosed. Certain diagnostics only require the ignition to be switched on and off for a diagnostic to be run. Other diagnostics require that several different conditions are met. For example:

- vehicle speed
- engine coolant temperature (ECT)
- time since start
- different load and engine speed relationships in the same trip
- a certain event (for example the evaporative emission system (EVAP) valve is operating).

When the engine control module (ECM) has run all the implemented diagnostics, the control module has completed a "trip". An extensive driving schedule in various conditions is required to complete a trip. The engine may also need to be shut off for a certain amount of time and then switched on again to complete a trip.

EMISSION-RELATED DIAGNOSTIC FUNCTIONS

The engine control module (ECM) checks that the emission-related systems are working. These systems are checked by running a diagnostic function. The diagnostic function checks the components and that the system is functioning.

DIAGNOSTIC TROUBLE CODE MEMORY

When the engine control module (ECM) detects a fault, the diagnostic trouble code (DTC) and status are stored in the diagnostic trouble code (DTC) memory and are now visible at normal diagnostic trouble code (DTC) read out. If the diagnostic trouble code (DTC) lights the malfunction indicator lamp (MIL) this occurs at the same time. If an existing fault disappears and does not recur, the engine control module, after a certain number of fault-free operating cycles and depending on the DTC, changes the status of the diagnostic trouble code (DTC). This means that it can no longer be read off at normal DTC read out. In this status, the diagnostic trouble code (DTC) remains until the engine control module (ECM) erases diagnostic trouble code (DTC) or is disconnected from power.

SUBSTITUTE VALUE

For certain types of diagnostic trouble codes (DTCs), the missing signal is replaced with a substitute value so that the system can continue functioning.

DOWNLOADING SOFTWARE AND REPLACING THE CONTROL MODULE

New software can be downloaded into the engine control module (ECM). When ordering software, the hardware and the software in the car is compared to the information in the Volvo central database. If the comparison is OK the software is downloaded to the control module. If the comparison between the car and Volvo central database is not OK, the database is updated with the car configuration. When this is complete the software is downloaded.

The engine control module (ECM) is located on the air cleaner (ACL) box in the engine compartment.

The engine control module (ECM) contains a unique code for each car for the immobilizer. The central electronic module (CEM) checks this code at engine start up. The engine will not start if the central electronic module (CEM) detects an incorrect code for the immobilizer. This means that the engine control module (ECM) cannot be switched from vehicle to vehicle.

The engine control module (ECM) must first be "unlocked" using a unique PIN for each car before it can be programmed with a code for the immobilizer. When the PIN has been approved by the engine control module (ECM), the code for the immobilizer can be programmed.

The PIN and the code for the immobilizer are obtained from the Volvo central database and sent out with the software package when software for downloading has been ordered.

All new engine control modules (ECM) have the same PIN which is preprogrammed by the control module supplier. When the engine control module (ECM) has been programmed successfully the original PIN for the car will be programmed in the engine control module (ECM) memory and will replace the preprogrammed PIN code.

FUNCTION

STARTING MOTOR

Fig. 273: Identifying Starter Motor System
Courtesy of VOLVO CARS CORPORATION

The starter motor (6/25) is supplied with power via the starter motor relay (2/35), the starter motor relay is controlled by the engine control module (ECM) (4/46).

The start process is as follows:

1. The ignition key is turned to start position (position III)
2. A high signal (U_{bat}) from the ignition switch (3/1) is transmitted to the engine control module (ECM) via the central electronic module (CEM). The engine control module (ECM) interprets this high signal as a request to activate the starter motor.
3. The engine control module (ECM) activates the starter motor solenoid by grounding and powering the coil for the starter motor relay.
4. The relay closes the circuit between the starter motor solenoid and the fuse in the relay/fuse box in the engine compartment, activating the starter motor.
5. The engine control module (ECM) activates the starter motor until the engine starts (the engine speed (rpm) exceeds a certain value)

Auto start

If the ignition key returns to ignition position (position II) before the engine is started, the starter motor continues to run. The starter motor runs until the engine is started or until a certain time has elapsed. The engine temperature dictates the running time of the starter motor:

- 0 °C or higher, approximately 3 seconds
- less than 0 °C, up to approximately 5 seconds.

If the engine does not turn or if the engine speed is extremely low when the start relay is activated, the engine control module (ECM) interrupts start relay activation.

Activation of the starter motor is not permitted or is interrupted if:

- the engine is running (the engine speed (RPM) above a certain value)
- the immobilizer function does not allow a start.
- the gear selector is not in position "P" or "N" (automatic transmissions). The engine control module (ECM) receives a signal indicating the position of the gear selector from the transmission control module (TCM) (4/28) via both the controller area network (CAN) and from a directly connected cable between the engine control module (ECM) and transmission control module (TCM).

CAMSHAFT CONTROL (CVVT)

Fig. 274: Identifying Camshaft Control (CVVT System)
Courtesy of VOLVO CARS CORPORATION

Both intake camshafts and exhaust camshafts are regulated by the Engine Control Module (ECM). The intake camshafts are located in the middle of the engine, while the exhaust camshafts are located furthest out. The camshafts are divided into two banks.

Bank 1 (front cylinder row); cylinders 1, 3, 5 and 7.

Bank 2 (rear cylinder row, closest to the passenger compartment); cylinders 2, 4, 6 and 8.

The inlet camshafts are driven primarily by the crankshaft and chain, while the exhaust camshafts are driven by a chain from the inlet camshafts.

When each camshaft is set at the factory, it is aligned with the position of the crankshaft. The position of the camshaft in relation to the crankshaft is designated **the camshaft 0 position** (default setting). During camshaft control (CVVT) the camshaft 0-position is offset so that the cam timing changes. The opening and closing of the intake and exhaust valves can be changed to match the camshaft. Engine performance can be increased, idle quality increased and emissions reduced by regulating the camshaft timing changes.

The engine control module (ECM) detects the position of the camshafts by comparing the signals from the engine speed (RPM) sensor (1) (crankshaft position) and the camshaft position (CMP) sensors (2) (camshaft positions). The engine control module (ECM) then controls the angle of the camshaft by controlling the oil flow to the CVVT unit using the reset valve camshaft (3).

There are diagnostics for this function. See also: **CAMSHAFT DIAGNOSTICS (CVVT)**

Controlling, reset valve camshaft

Fig. 275: Diagram of Camshaft Reset Valve
Courtesy of VOLVO CARS CORPORATION

1: Oil filter reset valve camshaft.

2: Oil duct (pressure, inlet).

3: Duct leading to CVVT unit chamber (deployment).

4: Duct leading to CVVT unit chamber (deployment).

The camshaft reset valve controls the oil flow to the continuous variable valve timing (CVVT) unit. The engine control module (ECM) uses a pulse width modulation (PWM) signal to control the valve. See also: **CAMSHAFT RESET VALVE (CONTINUOUS VARIABLE VALVE TIMING (CVVT))**

Controlling, CVVT units

Fig. 276: Diagram Of The Continuous Variable Valve Timing CVVT Units
Courtesy of VOLVO CARS CORPORATION

The CVVT units are the "Vane" type which means that the CVVT unit rotors are turned by oil pressure on one, or the other, side of the rotor wings.

A: CVVT unit exhaust

B: CVVT unit inlet

1: Timing belt pulley inlet camshaft (primary, inlet camshaft driven by the crankshaft).

2: Timing belt pulley inlet -/exhaust camshaft (secondary, exhaust camshaft driven by inlet camshaft).

3: Oil duct reset valve camshaft (pressure).

4: Oil duct for controlling CVVT unit.

5: Oil duct for return CVVT unit.

6: Spring (CVVT unit exhaust camshaft only).

The continuous variable valve timing (CVVT) unit allows the position of the camshaft to be adjusted relative to the crankshaft.

The camshaft is secured to the CVVT unit rotor. The rotor (and with it the camshaft) rotates in relation to the timing belt pulley (1) by the oil pressure building up on one or both sides of the rotor vanes in the CVVT unit.

The difference in function between the exhaust camshaft (A) and inlet camshaft (B) CVVT unit is that the exhaust camshaft CVVT unit is equipped with a spring. The force of the spring makes the CVVT unit deploy the camshaft. The function causes faster deployment of the exhaust camshaft at engine start-up, before the oil pressure build in the engine.

Control occurs according to the following during deployment/return of the camshaft.

Fig. 277: Diagram Of The Continuous Variable Valve Timing CVVT System
Courtesy of VOLVO CARS CORPORATION

A: Exhaust camshaft

B: Inlet camshaft

- Oil pressure from the lubrication system (1) of the engine.
- The oil passes the filter for the camshaft reset valve (2) and then on to the reset valve (3).
- The engine control module (ECM) controls the oil flow to one of the CVVT unit chambers (4) depending on whether it is to be deployed/returned by the camshaft.

The reset valve is controlled by the engine control module (ECM) by high frequency, switching for deployment and return. This results in rapid and precise control. Both camshafts can be controlled up to 40 crankshaft degrees.

CONTROLLING THE GENERATOR

Fig. 278: Identifying ACM, ECM & CEM Communication Link
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) (4/46) regulates the charge voltage of the generator (GEN) (6/26) (via LIN communication) when requested by the central electronic module (CEM) (4/46) (via CAN communication).

The engine control module (ECM) can change the charge voltage requested by the central electronic module (CEM). to suit certain operating conditions such as engine start, idle speed or high engine load.

The value of requested charge voltage from the engine control module (ECM) and the charge current of the generator can be read off.

The alternator control module (ACM) (6/26) transmits information to the engine control module (ECM) regarding any faults). The diagnostic trouble codes (DTCs) are stored in the engine control module (ECM) in the event of a fault. In the event of certain faults, information about these faults is also transmitted to the central electronic module (CEM).

VARIABLE INTAKE SYSTEM

Fig. 279: View of Variable Intake System Components

Courtesy of VOLVO CARS CORPORATION

The variable intake system components consist mainly of:

1. Vacuum tank
2. Valve for variable intake
3. Vacuum motor
4. Throttle discs

In order to maintain a high volume of intake air at different engine speeds (RPM) and engine loads, B8444S is equipped with the Variable Intake System. The Variable Intake System divides drawn in air into two volumes. The engine control module (ECM) then regulates the air flow between these volumes using dampers in order to achieve the optimum air flow at specific operating temperatures.

The vacuum from the engine is stored in a vacuum tank (1). The vacuum is then guided to the vacuum motor (3) using the variable intake valves (2). The vacuum motor affects the damper in the intake system.

The variable intake valve is controlled by the engine control module (ECM) (4/46).

The variable intake valve can be activated and the variable intake function can be diagnosed by the engine control module (ECM).

OIL MONITORING

Fig. 280: Identifying oil monitoring components
Courtesy of VOLVO CARS CORPORATION

General

The following components are used for oil monitoring:

- oil level sensor (7/35)
- engine control module (ECM) (4/46)
- driver information module (DIM) (5/1).

The oil level sensor, via the driver information module (DIM), is used to inform the driver if oil filling is required.

Detecting the oil level

The integrated electronics of the sensor calculates the oil level using the measured value for the oil temperature.

In order for the correct oil level to be calculated, temporary oil level changes in the oil sump must be added to the calculation, for example when driving on an incline, during cornering and the like. These calculations are performed by the engine control module (ECM) using the oil level sensor signal and a number of other parameters such as the vehicle speed signal and load signal.

REGULATING THE CRUISE CONTROL

Fig. 281: Components Regulating Cruise Control
Courtesy of VOLVO CARS CORPORATION

The cruise control function is an example of distributed functionality.

The following components are used when regulating the cruise control:

- engine control module (ECM) (4/46)
- steering wheel module (SWM) (3/254)
- cruise control, control unit (3/4)
- central electronic module (CEM) (4/56)
- brake control module (BCM) (4/16) (brake pedal position, speed signal)

- driver information module (DIM) (5/1) (cruise control lamp)
- transmission control module (TCM) (4/28)
- electronic throttle unit (6/120)
- stop lamp switch (3/9).

To activate cruise control the function must be switched on using the "CRUISE" button. A lamp lights up in the driver information module (DIM).

The driver activates the function by pressing the SET+ or SET- button. A message is then transmitted via the low speed side of the Controller area network (CAN) to the central electronic module (CEM) which then transmits the message on via the high speed side of the Controller area network (CAN) to the engine control module (ECM).

The engine control module (ECM) controls the throttle angle so that a constant speed is maintained using the vehicle speed signal from the Brake Control Module (BCM). The transmission control module (TCM) also receives a message indicating that cruise control is active via the Controller area network (CAN), so that the transmission follows certain shifting patterns when the cruise control is active.

If the accelerator pedal (AP) is depressed the speed increases as normal and then resumes to the stored value when the driver releases the accelerator pedal (AP) again.

The engine control module (ECM) continually stores the speed. If the cruise control is disengaged, if for example the driver depresses the brake pedal, the previous speed can be resumed by pressing the "RESUME" button.

The cruise control cannot be activated below a certain speed.

Cruise control is disengaged:

- when the driver depresses the brake pedal
- when the driver presses the "CRUISE" button on the steering wheel
- when the driver depresses the "0" button on the steering wheel
- if "P" or "N" position is transmitted on the controller area network (CAN)
- if the speed deviates too much from the set value
- when the control system detects a fault that prevents activation.

FUEL TRIM

Fig. 282: Fuel Trim
Courtesy of VOLVO CARS CORPORATION

Overview

Fuel trim reduces exhaust emissions. Fuel trim reduces nitrous oxides (NO_x), carbon monoxide (CO) and hydrocarbon (HC) emissions.

Theoretically, if the correct amount of oxygen is added during combustion, fuel can be converted to water (H_2O) and carbon dioxide (CO_2). Emissions would then be completely safe.

In practice considerable amounts of hydro-carbons (HC) and varying amounts of carbon monoxide (CO) and carbon dioxide (CO_2) remain.

Fig. 283: Fuel Trim
Courtesy of VOLVO CARS CORPORATION

Due to the high temperature and pressure, nitrous oxides such as NO and NO_2 are also formed. The common designation for these gases is nitrous oxides NO_x .

Fig. 284: Converting Exhaust To H2O And CO2
Courtesy of VOLVO CARS CORPORATION

By speeding up the reaction between the remaining reactive components using a catalytic converter, these can be converted to water (H_2 O), carbon dioxide (CO_2) and nitrogen (N_2).

However this can only happen if the balance of hydro-carbons (HC), carbon monoxide (CO), oxygen (O_2) and nitrous oxides (NO_x) is exactly right in the exhaust. This happens when the fuel air mixture before combustion is 14.7 kg of air per kg of fuel. The Lambda value is then said to be one, (lambda=1).

Fig. 285: Fuel Control Components
Courtesy of VOLVO CARS CORPORATION

A base program in the engine control module (ECM) calculates the injection period based on data about load, i. e. the measured air mass and engine speed (rpm). The calculated injection time (from the base program) is then modified by a circuit (short-term fuel trim). The signal from the heated oxygen sensor (HO2S) is used to finely adjust the injection period so that lambda=1 is reached. The short-term fuel trim is a circuit that finely adjusts the injection period so that the fuel/air mixture is optimized (lambda=1). The control module also used the signals from the front and rear heated oxygen sensors (HO2S) to correct the front heated oxygen sensor (HO2S) (offset adjustment) and thereby the injection period. This gives a higher degree of accuracy during fuel trim. Fuel trim is a rapid process which may take place several times a second. Adjustment of the injection period calculated in the base program is limited.

The short-term fuel trim can be read off.

Adaptive functions

Fig. 286: Adaptive Function Charts
Courtesy of VOLVO CARS CORPORATION

Certain factors, for example, tolerance deviations on certain components such as mass air flow (MAF) sensor and injectors, air leakage on the intake side, fuel pressure etc. affect the fuel / air mix. In order to compensate for this, the engine control module (ECM) has adaptive (self learning) functions. When the engine is new the short term fuel trim varies cyclically around a nominal central line (A) 1.00, with, for example, a 5% change of injection time when fuel trim is in operation.

If there is air leakage for example, the short-term fuel trim will quickly be offset to a new position (B) and will

then work for example between 1.10 (+10%) and 1.20 (+20%), although still at an amplitude of 5%, but with an offset in relation to the original center line (A). The injection period has then been increased to compensate the increase in the amount of air.

The adaptive functions will correct the change, so that the short-term fuel trim will work around the new center line (B) where it will again have its full range of control available.

Put simply, fuel trim is a measurement of the difference (C) between the original short-term fuel trim center line (A) and the new center line (B).

The adaptive functions are split into various operational ranges based on the load and speed of the engine.

The different adaption ranges can be read off.

The adaptive adjustments of injection time are continuously stored in the engine control module (ECM). This means that, at different operating ratios, the correct mixture ratio is achieved before the heated oxygen sensor (HO2S) reaches operating temperature.

The diagnostic trouble code (DTC) is stored in the engine control module (ECM) if any adaption value is too high or too low.

FUEL PRESSURE REGULATION

Fig. 287: Identifying Fuel Pressure Control Components
Courtesy of VOLVO CARS CORPORATION

General

Fuel pressure regulation for demand controlled fuel pumps (DECOS - DEmand COntrolled fuel Supply) means that the fuel pressure is controlled steplessly by varying the output of the fuel pump. The design of the system allows a greater maximum pressure (approximately 650kPa) in the fuel pump. This pressure is used in extreme situations, such as heavy engine load for example

The following components are used for fuel pressure regulation:

- engine control module (ECM) (4/46) with integrated atmospheric pressure sensor
- fuel pump control module (4/83)
- fuel pressure sensor with fuel temperature sensor (7/156)
- fuel pump with by-pass valve (6/33).

The time taken for the engine start procedure can be reduced by rapidly increasing the pressure in the fuel rail when the engine control module (ECM) receives a signal about the position of the ignition switch from the central electronic module (CEM).

The engine control module (ECM) is better able to calculate the injection period using the signal from the atmospheric pressure sensor and fuel pressure sensor. This particularly improves the cold starting characteristics of the engine.

The advantages of varying the output of the fuel pump so that it is not always at full power are:

- the total power consumption of the fuel pump (FP) is reduced, reducing the load on the power supply system
- the service life of the fuel pump (FP) is increased
- fuel pump noise is reduced.

Control

The engine control module (ECM) calculates the desired fuel pressure. A signal is then transmitted to the fuel pump control module indicating the desired fuel pressure. Serial communication between the engine control module (ECM) and the fuel pump control module is used to carry the signal. The fuel pump control module then operates the fuel pump unit to obtain the desired pressure using a pulse width modulation voltage on the ground lead. The fuel pump (FP) can be controlled steplessly by changing the pulse width modulation (PWM) signal. Only that pressure which is required at that specific time will then be released to the fuel rail/injectors. The value of the pulse width modulation (PWM) signal is a measurement of the operational load of the fuel pump (FP) (% duty, 100% = maximum pressure).

The engine control module (ECM) continuously monitors the fuel pressure using the signal from the fuel pressure sensor. This allows the desired fuel pressure to be reached, and if necessary a signal is transmitted to the fuel pump control module requesting that the fuel pressure is adjusted.

The engine control module (ECM) attempts too obtain a constant fuel pressure (approximately 380kPa relative to atmospheric pressure with the engine running).

By-pass valve

When the injectors close when the pressure is too great (during engine braking for example) there is a pressure peak. The by-pass valve in the fuel pump (FP) is used to even out the pressure peak. The opening pressure of the valve is approximately 650 kPa.

The by-pass valve also functions as a non-return valve, ensuring that the fuel pressure in the system is maintained when the engine is switched off.

There is high pressure before the engine is started. This high pressure means that the valve in the by-pass valve opens and the system is "flushed".

Passive safety

For safety reasons, the engine control module (ECM) shuts off the fuel pump (FP) if the supplemental restraint system module (SRS) detects a collision.

KNOCK CONTROL

Fig. 288: Locating Knock Sensors
Courtesy of VOLVO CARS CORPORATION

Knock occurs in the combustion chamber when the fuel and air mixture self ignites. This can occur either before or after the spark plug has produced an ignition spark. In both cases the gas in two or more places ignites in the combustion chamber.

This results in an extremely fast combustion process with flames from several directions. When these flames collide, the pressure in the cylinder increases rapidly and there is a mechanical knocking sound.

If one of the cylinders starts knocking there will be a certain type of vibration in the engine block. This vibration is transferred to the knock sensor, which are screwed to the engine block. One knock sensor detects knocking on cylinders 1, 2, 3 and 4. The other one detects knocking on cylinders 5, 6, 7 and 8. The mechanical stress that arises in the piezoelectric material of the knock sensors makes them generate a voltage. With the help of the camshaft position sensor and the impulse sensor, the Engine Control Module (ECM) can then determine which cylinder is knocking.

The knock sensors (KS) also interpret a proportion of normal engine sound. The control module is able to recognize the vibrations which correspond to knocking by filtering, amplifying and using software to evaluate

the signal.

If the knock sensors (KS) detect knocking in the engine above a certain threshold value, the ignition timing is first retarded and then the fuel/air mixture is enriched to eliminate knocking.

IGNITION CONTROL

Fig. 289: Components Used For Ignition Control
Courtesy of VOLVO CARS CORPORATION

The following components are used for ignition control:

- engine speed (RPM) sensor (7/25)
- camshaft position (CMP) sensor (7/172-173, 7/188-189)
- mass air flow (MAF) sensor (7/17)
- engine coolant temperature (ECT) sensor (7/16)
- throttle position (TP) sensor on the electronic throttle unit (6/120)
- knock sensor (KS) (7/23-24)
- transmission control module (TCM) (4/28)
- spark plugs with ignition coils (20/46-53).

The engine control module (ECM) calculates the optimum ignition advance based on the software and

information from the sensors. The engine control module (ECM) cuts the current to the ignition coil mounted on the cylinder to be ignited and produces a spark.

During the starting phase the engine control module (ECM) produces a fixed ignition setting. When the engine has started and the vehicle is being driven, the engine control module (ECM) calculates the optimum ignition setting, taking factors such as the following into account:

- engine speed (RPM)
- load
- temperature.

The engine control module (ECM) analyses the signal from the knock sensors (KS) when the engine reaches operating temperature. If any of the cylinders knock, the ignition is retarded for that specific cylinder until the knocking ceases.

The ignition then advanced to the normal position or until the knock recurs.

Before the transmission control module (TCM) changes gear, it sometimes transmits a torque limiting request to the engine control module (ECM). The engine control module (ECM) then retards the ignition momentarily to reduce the torque, resulting in smoother gear changes and reducing the load on the transmission. There are different ignition retardation levels depending on the signals from the transmission control module (TCM). The return signal from the engine control module (ECM) to the transmission control module (TCM) confirms that the signal reached the engine control module (ECM).

For further information, also see: **MISFIRE DIAGNOSTIC**

The engine misfires if the fuel does not ignite correctly. For further information, also see: **MISFIRE DIAGNOSTIC**

REGULATING THE AIR CONDITIONING (A/C) COMPRESSOR

Fig. 290: (A/C) Compressor Regulating Components
Courtesy of VOLVO CARS CORPORATION

The air conditioning (A/C) compressor is controlled by the engine control module (ECM) (4/46) on request from the climate control module (CCM) (3/112) via the controller area network (CAN). When the engine control module (ECM) receives a signal from the climate control module (CCM) to activate the air conditioning (A/C) compressor, the engine control module (ECM) grounds the circuit for the relay coil for the A/C compressor. See also: **AIR CONDITIONING (A/C) RELAY**

The relay (2/22) closes the circuit between the integrated relay/fusebox in the engine compartment and the clutch for the air conditioning (A/C) compressor (8/3). The air conditioning (A/C) compressor which has a variable cylinder displacement is always running during normal driving. Displacement in the compressor is regulated by a solenoid which is controlled by the engine control module (ECM).

The engine control module (ECM) regulates the solenoid (displacement) in relation to the driver's and vehicles' different driving styles. Starting the engine, moving off and acceleration means more regulated displacement so that the A/C compressor has less possible effect on engine torque. The climate control module (CCM) controls all functions in the climate control module which are related to the vehicle interface with the driver and passenger. I. E. the climate control buttons on the dashboard environment panel.

The climate control module (CCM) transmits information to the engine control module (ECM), which determines what must be prioritized. For example, the air conditioning (A/C) compressor in certain extreme cases is switched off completely, regardless of the climate control module (CCM) request. This is to prevent negative engine performance and to protect the air conditioning (A/C) system. As well as the information from

the climate control module (CCM), the engine control module (ECM) controls the air conditioning (A/C) compressor based on the information from:

- Air conditioning (A/C) pressure sensor (high pressure side) (7/8)
- the throttle position (TP) sensor (6/120)
- the engine coolant temperature (ECT) sensor (7/16).

SYSTEM OVERVIEW

CONTROL MODULE

Fig. 291: Identifying Engine Control Module (ECM)
Courtesy of VOLVO CARS CORPORATION

The engine control module (ECM) controls, amongst others, the following functions:

- injectors
- ignition
- camshafts (CVVT)
- Evaporative emission system (EVAP) valve
- throttle angle
- engine cooling fan (FC)
- Air conditioning (A/C) compressor
- fuel pump.

The engine control module (ECM) is supplied with battery power (U_{bat}) via fuses in the central electronic module (CEM) and in the relay/fuse box, engine compartment.

To prevent certain stored data from being erased from the engine control module (ECM) when the ignition is switched off, the control module also has a 30-supply. This supply is from the integrated relay/fusebox, engine compartment.

The control module is grounded via the wiring which is connected at the right-hand suspension turret.

The engine control module (ECM) contains a voltage regulator which maintains a low voltage (5 V) in internal components in the control module such as:

- AC/DC converter
- DC/AC converter
- Micro-processor.

The functions which require battery power (U_{bat}) and high output are controlled by external or internal power stages. For example, ignition coils have external power stages (integrated into the ignition coils) while the power stages for the injectors are integrated in the engine control module (ECM).

The micro-processor in the engine control module (ECM) receives signals from the different sensors and control modules in the vehicle. The micro-processor uses a program which interprets the signals from the different sensors and how the components and functions should be controlled.

The engine control module (ECM) has several self-learning (adaptive) functions. It continually adapts ongoing calculations to changing circumstances (such as wear, air leaks, differences in fuel).

Emissions are kept low through efficient management of the injection period, ignition, evaporative emission system (EVAP) valve, camshafts etc. Faults which affect emissions for example can be detected by running diagnostics for functions and components.

The engine control module (ECM) is located on the air cleaner (ACL) box in the engine compartment. A temperature sensor and atmospheric pressure sensor are integrated in the engine control module (ECM).

The engine control module (ECM) communicates with other control modules using controller area network (CAN) communication or LIN communication.

The engine control module (ECM) checks activations, input and output signals and functions using an integrated diagnostic system. A diagnostic trouble code (DTC) is stored if, after validation, the control module detects a fault. In certain cases the faulty signal is also replaced with a substitute value or certain functions are limited.

For example, substitute values can be set for:

- engine temperature sensor
- mass air flow (MAF) sensor
- throttle position (TP) sensor
- air pressure
- fuel pressure.

Mathematical calculations and signals from certain components are used to calculate the substitute values. Other substitute values are fixed, predefined values in the engine control module (ECM).

The substitute value allows the vehicle to be driven and the emissions to be kept at a reasonable level, even though vital functions or components are malfunctioning.

Functions which may be limited are for example:

- camshaft control (CVVT)
- fuel trim
- throttle angle
- fuel pressure regulation.

The substitute values are used and functions restricted so that the system is still able to work while protecting components that are required for safety reasons (for example the throttle angle).

Any diagnostic trouble codes (DTCs) are stored in the internal memory of the engine control module (ECM). The information can be read off via the data link connector (DLC) in the vehicle.

SIGNALS

The table below summarizes the input signals to and output signals from the Engine Control Module (ECM). The signal types are divided into directly connected signals, LIN and controller area network (CAN) communication. The illustration below displays the same information with the Volvo component designations.

Input signals	Output signals
Directly connected: • Ignition switch (3/1) • Air conditioning (A/C) pressure sensor (7/8) • Stop lamp switch (3/9) • Accelerator pedal (AP) position sensor (7/51) • Electronic throttle unit (6/120) • Camshaft position (CMP) sensor, intake bank 2 (7/172) • Camshaft position (CMP) sensor, intake bank 1 (7/188) • Camshaft position (CMP) sensor, exhaust bank 2 (7/173) • Camshaft position (CMP) sensor, exhaust bank 1 (7/189) • Engine coolant temperature (ECT) sensor (7/16) • Engine speed (RPM) sensor (7/25) • Fuel pressure sensor / fuel temperature sensor (7/156) • Knock sensor (KS) (7/23-24) • Mass air flow (MAF) sensor/air temperature sensor (7/17)	**Directly connected:** • Air conditioning (A/C) relay (2/22) • Air conditioning (A/C) compressor (8/3) • Electronic throttle unit (6/120) • Engine cooling fan (FC) control module (4/71) • Evaporative emission system (EVAP) valve (8/18) • Injectors (8/146-153) • Fuel pump (FP) control module (4/83) • Ignition coils (20/46-53) • Leak diagnostic unit (6/67) (certain markets only) • Front oxygen sensor, bank 2 preheating (7/15) • Front oxygen sensor, bank 1 preheating (7/82) • Rear oxygen sensor, bank 2 preheating (7/103) • Rear oxygen sensor, bank 1 preheating (7/104) • Main relay (system relay) (2/32) • Starter motor relay (2/35) • Camshaft reset valve (Continuous variable

• Manifold absolute pressure (MAP) sensor (7/81) • Oil pressure switch (7/6) • Front oxygen sensor, bank 2 (7/15) • Front oxygen sensor, bank 1 (7/82) • Rear oxygen sensor, bank 2 (7/103) • Rear oxygen sensor, bank 1 (7/104) • Oil level sensor (7/35) • Outside temperature sensor (7/105) • Engine coolant level sensor (7/73) • Ignition coils (20/46-53) • Engine cooling fan (FC) control module (4/71) • Leak diagnostic unit (6/67) (certain markets only)	valve timing (CVVT)), intake bank 2 (8/19) • Camshaft reset valve (Continuous variable valve timing (CVVT)), intake bank 1 (8/117) • Camshaft reset valve (Continuous variable valve timing (CVVT)), exhaust bank 2 (8/81) • Camshaft reset valve (Continuous variable valve timing (CVVT)), exhaust bank 1 (8/118) • Emissions warning lamp (5/1) • Valve variable intake (8/107)

GDL BULBS (2003-2004)

DESIGN

HEADLAMP SYSTEM, BI-XENON

Fig. 294: Bi-Xenon Headlamp System
Courtesy of VOLVO CARS CORPORATION

1.	Ballast	5.	Internal headlamp surround
2.	Motor, headlamp range adjustment	6.	Motor, high and low beam
3.	Bulb connector, high tension	7.	Moving reflector
4.	Bulb		

Bi-Xenon uses gas discharge technology and is a headlamp system with moving reflectors. The system combines high and low beams in the same bulb.

It is a statutory requirement (for low beam) for vehicles with this type of bulb to be equipped with headlamps with automatic level control.

Xenon versus Halogen

Xenon:

- has higher color temperature which gives a whiter light
- reflects from road signs and markings better
- has lower power consumption. (approximately 2/3).

Worth knowing:

- Daylight has a color temperature of approximately 5000°K. The nearer to natural light, the easier the light is on the eye. Normal H4 bulb: approximately 3200 °K. Volvos gas discharge lamp : approximately 4200 °K
- The Bi-Xenon system also has the advantage of the high and low beam having the same color light. The human eye finds it easier to react between changes.

BULB

The light source consists of a discharge pipe surrounded by glass which filters out damaging UV radiation.

- The discharge tube is filled with a number of chemical compounds including the noble gas Xenon
- A light arc is created by an electrical discharge between two tungsten electrodes
- Because the bulb does not have a filament it is less susceptible to bumps and vibration
- Bulb designation: (special for reflector system).
- Power consumption: 35 W.

CAUTION: The bulb contains mercury (less than 0.5 mg) and when discarded must be treated as hazardous waste. Hazardous waste must be handled according to the relevant statutory regulations.

BALLAST

An electronic ballast is connected to each headlamp. The ballast functions as a voltage regulator and generates alternating current (AC).

Main tasks:

1. Light the bulb
2. Control the light during operation.

To light the bulb an initial voltage of approximately 24, 000 V is required for a very short time (less than 1ms).

The ballast transforms the vehicles 12 V (DC) to 1000 V (AC).

The high tension switch amplifies the voltage a further 25 times.

When the lamp is lit the voltage is reduced to the 100 V required to keep the lamp lit.

Power consumption: 10 W.

FUNCTION

HEADLAMPS, BI-XENON

Fig. 295: Bi-Xenon Headlamps
Courtesy of VOLVO CARS CORPORATION

1.	Moving reflector	3.	Motor, high and low beam
2.	Controls for reflector	4.	Position sensor, reflector

LIGHTING THE HEADLAMP

It normally takes 3 seconds from activation at the light switch with the ignition on to the lamp lighting.

- Like conventional headlamps the headlamps are out while the engine is cranking and do not light until the engine is running

- On each occasion that voltage is supplied to the ballast 3 attempts, within 1 second, are made to light the lamp.

COMBINED HIGH AND LOW BEAM

Reflector, left-hand headlamp

Fig. 296: Identifying Left-Hand Headlamp Reflector
Courtesy of VOLVO CARS CORPORATION

The illustration is a principle sketch showing the different segments of the moving reflector.

The reflector has a complex design where different segments are used depending on whether in high or low beam position.

The reflector is adjustable and can be moved between two fixed points.

- The reflector is moved 2 mm axially in relation to the bulb
- The direction of the movement means that position of reflector is also moved slightly vertically.

The bulb is fixed.

The headlamp lens is clear.

AUTOMATIC LEVEL CONTROL

Sensor

The following applies to vehicles without Four-C (Continuously Controlled Chassis Concept)

An inductive position sensor reads off the angle between the bodywork and the left rear control arm. The angle is a measurement of how much the vehicle is leaning (chassis height) and is dependent on weight distribution.

- The sensor is mounted differently in FWD to AWD
- The rear electronic module (REM) reads an analog signal (0.5-4.5 V) from the position sensor and

converts it to an angle value (±35°), which is transmitted to the central electronic module (CEM)
- Fully laden vehicles give a signal of 0.5 V which corresponds to minus 35°.
- The central electronic module (CEM) controls the motors for the headlamp range adjustment (PWM signal) and sets the headlamps vertically.

The following applies to vehicles with Four-C

Two sensors read off the angle between the bodywork and the left and right rear control arms. The angle is a measurement of how much the vehicle is leaning (chassis height) and is dependent on weight distribution.

The sensors are mounted differently in FWD to AWD.

The suspension module (SUM) reads the signals from the sensors and converts them to an angle value. The value is transmitted via the control area network (CAN) to the central electronic module (CEM). The central electronic module (CEM) uses this information to control the motors for headlamp range adjustment.

Level control

Controlled at speeds *below 4 km/h*

When the ignition is switched on, the position sensor is read off and the headlamp range adjustment motors set the headlamps.

Controlled at speeds *above 4 km/h*

At greater angle changes during driving the headlamps are controlled. Control is dependent on the time for the system not to react to short term changes such as uneven road surfaces etc.

Calibration

The position sensor must be calibrated after work on the rear suspension. Carry out calibration according to tab DIAGNOSTICS/VEHICLE COMMUNICATION, rear electronic module (REM).

CAUTION: Calibration must be carried out after work such as removing/installing the sensors and replacing the sensors, rear axle, bushings, shock absorbers or springs.

In vehicles with Four C, calibration is carried out via the suspension module (SUM).

Beam adjustment is carried out conventionally (via adjustment screws by the headlamp).

The light switch must be in the "on" position while calibrating.

SAFETY

- In the event of a short-circuit on the high tension side the power supply cuts in less than 10 ms
- If the high tension circuit is broken (for example by a broken cable, blown bulb or no bulb in the bulb connector) the system attempts to activate the lamp for a time of 700 ms. During this time the high voltage is outside the ballast
- Approximate temperatures on the components during operation are; Ballast = 130 °C, Bulb holder = 170 ° C, Bulb = 400 °C
- The glass body of the Bi-Xenon-lamp is filled with different gases and metal vapors which are under pressure. The lamp can explode as it is under gas pressure.

WARNING: **Follow the safety instructions and recommendations in VIDA carefully when working with high voltage.**

Use safety goggles when handling the bulb. Risk of explosion

The electrical system must be switched off before starting work.

Risk of burn injury. The components operate at very high temperatures.

HIGH VOLTAGE UNIT

Fig. 297: High Voltage Unit
Courtesy of VOLVO CARS CORPORATION

- High voltage is required to light the Xenon lamp
- A high voltage unit is attached to each Xenon lamp. It transforms 12 V voltage to approximately 24 000 V, which is necessary to light the lamp. When the lamp is lit the voltage is reduced to the 100 V required to keep the lamp lit
- On each occasion that voltage is supplied to the high voltage unit an attempt is made to light the Xenon lamp. If this voltage does not exceed 9.5 V within a time span of 200 ms the lamp does not light. If the voltage is too low, after a power consuming start for cold start, the lamp does not light until the engine is running and the generator starts to charge. A new start attempt of the lamp must be made by turning the knob of the light switch till "0" position or parking lamp position and then back to low beam again.

WARNING: Because of the high voltage it is important to follow the instructions for working with the Xenon lamps and high voltage unit

SYSTEM OVERVIEW

HEADLAMPS, BI-XENON

Fig. 298: Bi-Xenon Headlamps Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

		Power supply via relay.

1.	Motor, high / low beam	Reconnected PWM signal provides information about the position of the reflector to the central electronic module (CEM).
2.	Motor, headlamp range adjustment	Controlled by the central electronic module (CEM) using a PWM signal.
3.	Position sensor	Inductive sensor which sends an analog signal (voltage) to the rear electronic module (REM) (Does not apply to vehicles with Four-C (Continuously Controlled Chassis Concept)). In vehicles with Four C the signal travels via the suspension module.
4.	Ballast	High voltage regulator for switch and lamp.
5.	Gas discharge lamp	Socket

CONTROL

Fig. 299: Bi-Xenon Headlamps Control Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

1.	Central electronic module (CEM)	4.	Motor, headlamp range adjustment
2.	Rear electronic module (REM)	5.	Suspension module (SUM) (vehicles with Four-C (Continuously Controlled Chassis Concept) only)
3.	Position sensor		

An electric motor is controlled by the central electronic module (CEM) via a relay (ordinary high beam relay).

The motor drives a gear wheel which moves the reflector along its guides.

A sensor which detects the position of the reflector is connected to the motor.

- The electronics in the motor interprets the sensor information and generates a signal
- The signal is reconnected to the central electronic module (CEM).

If the reflectors are in the wrong position during high beam the reflectors are forced into a safety position;

- the warning lamp (orange) lights in the driver information module (DIM)
- an error message is also shown in the display in the driver information module (DIM).

If the high beam is activated with the light switch in 0 position, the high beam is only activated as long as the high beam lever is activated for a high beam flash. The headlamp switch must be in the "on" position in order for the high beam lamps to remain active.

GDL BULBS (2005-2012)

DESIGN

BI-XENON HEADLIGHT SYSTEM

Fig. 300: Identifying Bi-Xenon Headlight System Assembly

Courtesy of VOLVO CARS CORPORATION

1.	Ballast	5.	Internal headlight edge
2.	Motor, headlight levelling	6.	Motor, high and low beam
3.	Lamp contact, high voltage	7.	Movable reflector
4.	Lamp		

Bi-Xenon, a headlight system with moveable reflector, is based on gas discharge technology. The system combines high and low beam into the same lamp.

Due to legal requirements (regarding low beam) for this type of lamp, the vehicle must be equipped with automatic headlight levelling.

Xenon vs. Halogen

Xenon:

- higher color temperature, which produces a whiter light
- better reflection of road signs and road markings
- has lower power consumption.

Good to know:

- Daylight has a color temperature of about 5000 °K. The closer to natural light, the less strain on the eyes. Standard H4 bulb: 3200 °K. Volvo's gas discharge bulb: about 4200 °K.
- With the Bi-Xenon system, high and low beam generates the same light color. The human eye thus has an easier time adjusting to switches between high and low beam.

LAMP

The light source consists of a discharge tube surrounded by a glass that filters out harmful UV radiation.

- The discharge tube is filled with a blend of chemical compounds, including the inert gas Xenon.
- An electric arch is created through an electrical discharge between two tungsten electrodes.
- Because the lamp does not have a filament, it is less sensitive to bumps and vibrations.
- Bulb designation: (special for reflector system).
- Power consumption: 35 W.

CAUTION: The bulb contains mercury (less than 0.5 mg) and when discarded must be treated as hazardous waste. Hazardous waste must be handled according to the relevant statutory regulations.

BALLAST

An electronic ballast is connected to each headlight. The ballast serves as a voltage regulator and generates

alternating current (AC).

Primary tasks:

1. Light the bulb.
2. Regulate light during operation.

A initial voltage of about 24, 000 V for a very brief period (less than 1 ms) is required to light the bulb.

The ballast transforms the vehicle's 12 V (DC) to 1000 V (AC).

The high voltage contact amplifies the voltage an addition 25 times.

Once the bulb has been lit, voltage is regulated down to about 100 V, which is required to keep the bulb lit.

Power consumption: 10 W.

FUNCTION

BI-XENON HEADLIGHTS

Fig. 301: Identifying Bi-Xenon Headlight Assembly
Courtesy of VOLVO CARS CORPORATION

1.	Movable reflector	3.	Motor, high and low beam
2.	Reflector control	4.	Reflector position sensor

LIGHTING THE LAMP

There is normally a 3 second delay between activation with the light switch or ignition on and the lamp coming on.

- As with normal headlights, the lamps remain off while the starter motor is cranking and come on once the engine is running.
- Each time voltage is supplied to the ballast, 3 one-second attempts are made to light the lamp.

COMBINED HIGH AND LOW BEAM

Reflector, left headlight

Fig. 302: Identifying Segments Of Moveable Reflector
Courtesy of VOLVO CARS CORPORATION

The illustration is an outline diagram showing the various segments of the moveable reflector.

The reflector has a complex shape in which different segments are used depending on whether high beam or low beam is in use.

The reflector is moveable suspended and is moved between two fixed positions.

- The reflector is moved 2 mm (0.08 in) axially in relationship to the lamp.
- The direction of the movements also causes the reflector to shift slightly vertically.

The lamp remains in a fixed position.

The headlight lens is clear.

AUTOMATIC LEVEL CONTROL

Sensor

The following applies to cars without Four-C (Continuously Controlled Chassis Concept)

An inductive position sensor reads the angle between the body and the left rear control arm. The angle is a indication of how much the vehicle is leaning (chassis height) and depends on weight distribution.

- The sensor is mounted slightly differently for FWD and AWD.
- The rear electronic module (REM) reads off an analog signal (0.5 - 4.5 V) from the position sensor and converts it to an angle value (±35°), which is sent to the central electronic module (CEM).
- A fully loaded vehicle generates a signal of 0.5 V, which corresponds to negative 35°.
- The central electronic module (CEM) regulates the headlight levelling motors (PWM signal) to adjust the headlights vertically.

The following applies to vehicles with Four-C

Two sensors read the angle between the body and the left and right rear control arm. The angle is a indication of how much the vehicle is leaning (chassis height) and depends on weight distribution.

The sensors are mounted slightly differently for FWD and AWD.

The suspension module (SUM) reads off the signals from the sensors and converts them to an angle value. The value is sent to the central electronic module (CEM) via the CAN network. The central electronic module (CEM) uses the information to regulate the headlight levelling motors.

Level control

Regulation at speeds *below 4 km/h (2.5 mph)*

When the ignition is switched on, the position sensor is read and the headlight levelling motors adjust the headlights.

Regulation at speeds *above 4 km/h (2.5 mph)*

The headlights are regulated if there are great angle changes while driving. Regulation is time-dependant so that the system does not react to short changes, such as unevenness in the road surface.

Calibration

The position sensor must be calibrated after work on the rear suspension. Perform calibration as described in the tab DIAGNOSTICS/VEHICLE COMMUNICATION, Rear electronic module (REM).

CAUTION: Calibration must be carried out after work such as removing/installing the sensors and replacing the sensors, rear axle, bushings, shock absorbers or springs.

In vehicles with Four C, calibration is carried out via the suspension module (SUM).

Beam adjustment is carried out conventionally (via adjustment screws by the headlight).

The light switch must be in the "on" position while calibrating.

SAFETY

- In the event of a short-circuit on the high voltage side, the power supply is cut off for less than 10 ms.
- If the high voltage circuit is broken (such as due to an open circuit, defective bulb or no bulb in the lamp socket), during each activation the system attempts to light the lamp for a period of 700 ms. During the period, there is high voltage across the ballast.
- Approximate component temperatures during operation: Ballast = 130 °C (266 °F), Bulb holder = 170 °C (338 °F), Bulb = 400 °C (752 °F).
- The glass body of the Bi-Xenon lamp is filled with various gases and metal vapors and is under pressure. Because the lamp is subjected to gas pressure, it could explode.

WARNING: **Follow the safety instructions and recommendations in VIDA carefully when working with high voltage.**

Use safety goggles when handling the bulb. Risk of explosion

The electrical system must be switched off before starting work.

Risk of burn injury. The components operate at very high temperatures.

HIGH VOLTAGE UNIT

Fig. 303: Identifying High Voltage Unit & Graph
Courtesy of VOLVO CARS CORPORATION

- High voltage is required to light the Xenon lamp.
- A high voltage unit is connected to each Xenon lamp. This transforms 12-V voltage to the approximately 24, 000 V required to light the lamp. Once the lamp is on, voltage is lowered to the approximately 100 V required to keep the lamp lit.
- Each time voltage is supplied to the high voltage unit, an attempt is made to light the Xenon lamp. If this voltage does not exceed 9.5 V during a time period of 200 ms, the lamp does not light. If voltage is too low, such as after a voltage-consuming cold start, the lamp does not light just because the engine is running and the alternator begins charging. A new attempt must be made to start the lamp by turning the light switch to the "0" or parking light position and then back to the low beam position.

WARNING: **Because of the high voltage it is important to follow the instructions for working with the Xenon lamps and high voltage unit**

SYSTEM OVERVIEW

BI-XENON HEADLIGHTS

Fig. 304: Identifying Bi-Xenon Headlight Communication System & Components
Courtesy of VOLVO CARS CORPORATION

1.	Motor, high/low beam	Power supply via relay. Feedback PWM signal gives central electronic module (CEM) information on reflector position.
2.	Motor, headlight levelling	Regulated by central electronic module (CEM) via PWM signal.
3.	Position sensors	Inductive sensor that transmits an analogue signal (voltage) to the rear electronic module (REM) (not vehicles equipped with Four-C (Continuously Controlled Chassis Concept)). On vehicles with Four-C, the signal travels via the suspension module.
4.	Ballast	High voltage regulator for contact and lamp.
5.	Gas discharge lamp	Socket

CONTROL

Fig. 305: Identifying Bi-Xenon Headlight Control System Diagram
Courtesy of VOLVO CARS CORPORATION

1.	Central electronic module (CEM)	4.	Motor, headlight levelling
2.	Rear electronic module (REM)	5.	Suspension module (SUM) (only vehicles with Four-C (Continuously Controlled Chassis Concept))
3.	Position sensors		

An electric motor is controlled by the central electronic module (CEM) via a relay (standard high beam relay).

The motor drives a gear that moves the reflector along its guides.

A sensor connected to the motor detects the position of the reflector.

- The motor electronics interpret the sensor information and generate a signal.
- The signal is fed back to the central electronic module (CEM).

If the reflectors are in the wrong position for high beam, the are forced down into a so-called safety position;

- the warning lamp (orange) in the driver information module (DIM) illuminates
- an error message appears in the driver information module (DIM) display.

If high beam is activated with the light switch in position 0, high beam is only activated while the stalk is in the high beam position, so-called high beam flash. In order for high beam to remain on, the light switch must be in the "On" position.

GENERATOR (GEN) (2003-2004)

DESIGN

GENERATOR (GEN) DESIGN

Fig. 306: Cutaway View of Generator
Courtesy of VOLVO CARS CORPORATION

The main components of the generator (GEN) consist of:

1. Stator
2. Rotor with slip rings
3. Integrated cooling fans
4. DC bridge
5. Charge regulator
6. Pulley.

Generator (GEN) terminals:

Fig. 307: Generator Terminals
Courtesy of VOLVO CARS CORPORATION

- #A:1 (B+)
- #B:1 (L)

Ground terminal via the cylinder block.

STATOR

Fig. 308: Identifying Stator
Courtesy of VOLVO CARS CORPORATION

The stator is secured and consists of grooved plates which are insulated and pressed onto a secured plate unit. The stator winding coils are positioned in the grooves. They are delta connected at 120° and provide a three phase alternating current to the DC bridge.

ROTOR WITH SLIP RINGS

Fig. 309: Identifying Rotor With Slip Rings
Courtesy of VOLVO CARS CORPORATION

The rotor consists of two halves (claw-poles) which engage each other. The halves are pressed onto the rotor shaft. There are twelve claws on the rotor, i. e twelve poles. One half consists of six north poles and the other half six south poles. The excitation winding is secured on the rotor shaft between the claw-pole halves. The excitation winding (also known as rotor winding) consists of a circular coil winding which is connected to the slip rings and surrounded by the claw-poles. The charge regulator supplies a current to the rotor winding through the brushes which lie against the slip rings. The greater the current in the rotor the stronger the magnetic field in the rotor becomes, and thus a greater current is generated in the stator windings.

COOLING FANS

Fig. 310: Cooling Fans
Courtesy of VOLVO CARS CORPORATION

The heat distributed in the generator (GEN) is, in principle, proportional to the current generated and must be

directed away so that the insulation and diodes are not damaged. The generator (GEN) is therefore air cooled and equipped with two integrated cooling fans on the rotor shaft.

RECTIFIER

Fig. 311: Identifying Rectifier
Courtesy of VOLVO CARS CORPORATION

The current created in the generator (GEN) stator winding is AC and must be converted to DC before it can be used in the electrical system of the car. The conversion (rectifying) occurs using a DC bridge consisting of six diodes, two diodes per phase windings.

The stator windings generate three phases and are delta connected An exciter diode is connected to each of the three stator windings. The six rectifier diodes are bridge connected. The diodes are pressed into a diode holder.

CHARGE REGULATOR

General

Fig. 312: Charge Regulator
Courtesy of VOLVO CARS CORPORATION

The charge regulator is mounted at the rear edge of the generator (GEN). The role of the charge regulator is to constantly maintain the generator current at engine speeds, depending on the load and speed of the generator.

If the voltage produced exceeds the preset desired value depending on the load, the charge regulator reduces or cuts the magnetic current to the rotor. This, in turn, lowers the magnetic field. The voltage from the stator windings decreases. When the voltage is below the desired value, the current increases through the rotor so that magnetization increases as does the generator voltage until the desired value is exceeded again. This process is repeated continuously.

Charge voltage

Fig. 313: Charge Regulator Graph
Courtesy of VOLVO CARS CORPORATION

At room temperature a fully charged battery cell produces 2.12 V. A 12 V battery has 6 cells and therefore produces 12.72 V when the battery is fully charged. The battery has an internal resistance which must be overcome for charging to occur. At room temperature 0.2 V per cell or 1.2 V for the entire battery is required. 13.92 V (12.72 V+1.2 V) is required to charge a battery at room temperature. In cold weather conditions the chemical reactions are slower and the inner resistance becomes higher. This requires a greater voltage when charging to overcome the internal resistance.

The charge regulator controls the output voltage, depending on the engine compartment temperature, following a predetermined curve, see the illustration.

The charge regulator calculates the engine compartment temperature using integrated semi-conductor electronics. In cold conditions the charge regulator allows a higher voltage. At higher temperatures the voltage is lowered. This ensures full battery charging regardless of the temperature. A battery must have a greater charge voltage at lower temperature for charging to occur.

L-signal for the central electronic module (CEM)

Fig. 314: Generator And CEM Input And Output Signals
Courtesy of VOLVO CARS CORPORATION

The charge regulator is connected to the central electronic module via an L-signal.

The L-signal is used to pre-magnetize the generator rotor and to transmit signals to the central electronic module telling the central electronic module that the generator is charging or not when the engine is running.

When the engine is starting, the generator (GEN) does not charge. When the engine speed (RPM) passes approximately 550 rpm a delay of approximately 3 seconds occurs. After the delay a successive increase of charging begins. When the generator (GEN) is at full load the increase ranges from 0-100% for a period of 6 seconds.

If the engine speed (RPM) passes approximately 1300 rpm during the delay or the successive increase breaks the increase, full charging is obtained immediately. This is to successively increase the load on the engine during the start-up phase and to ensure the engine starts.

If the L-signal is missing the generator will not start charging on start-up. Charge regulator can self magnetize the rotor and start charging in this way. This only happens at speeds in excess of approximately 2300 rpm. There is no successive charge engagement with self magnetization, the generator operates at full charge immediately.

DF-signal to the engine control module (ECM)

FREEWHEEL

Fig. 315: Freewheel Generator
Courtesy of VOLVO CARS CORPORATION

Certain generators are equipped with a freewheel between the rotor shaft and the pulley. The cover over the pulley nut in the center of the pulley indicates whether a freewheel is installed. Using the freewheel, the generator rotor shaft can only rotate freely in one direction. This means that any jerking in the belt transmission is minimized.

FUNCTION

CHARGING

When the ignition key is turned to position II (and III) current goes from the central electronic module to connection L on the charge regulator. The regulator directs current to the excitation winding rotor and is then grounded via the regulator. When the current travels through the rotor a magnetic field is formed around the rotor. When the engine is started and the rotor begins to rotate, the magnetic field also rotates and then produces alternating current in the stator windings.

Alternating current is rectified when it passes the diodes and is then fed to the electrical system of the car. The voltage obtained from the stator winding also passes to the regulator via the rectifier and affects the control functions.

When the voltage exceeds the permitted value, the charge regulator reduces the current through the excitation winding. The strength of the magnetic field decreases as does the stator winding supplied alternating current.

The charge indicator lamp in the combined instrument panel is controlled by the driver information module via signals from the Controller area network (CAN).

SYSTEM OVERVIEW

GENERAL

Fig. 316: Freewheel Generator
Courtesy of VOLVO CARS CORPORATION

The purpose of the generator (GEN) is to supply the power consumers with power and to ensure that the battery remains charged. The generator (GEN) is mounted on the front edge of the engine.

The power handling capacity of the generator (GEN) depends on the engine speed (RPM). When the engine is idling the generator (GEN) only supplies approximately half the maximum power handling capacity. When the engine is idling with many power consumers connected battery recharge is negatively affected i. e, the battery does not charge. Battery charging is less efficient in cold conditions than at room temperature. This means that when the engine is idling for a long time, with large power consumers connected the battery can drain.

If the generator fails to charge the power consuming components will take their supply exclusively from the battery. In the end this will drain the battery completely.

The generator (GEN) first generates AC current which is converted to DC current in the DC bridge. the generator (GEN) has a built-in charge regulator.

The auxiliaries belt transfers power from the crankshaft pulley to the auxiliaries such as the power steering pump, air conditioning (A/C) compressor and generator (GEN). The belt tension is tensioned using an automatic belt tensioner. The belt is a Poly-v-belt.

The generator (GEN) with charge regulator can be diagnosed through the central electronic module.

HVAC

Power transmission

HVAC

REFRIGERANT, DRAINING

WARNING: Follow the safety instructions for work on the air conditioning system. See CLIMATE UNITS - GENERAL SAFETY INFORMATION .

NOTE: First read the instructions covering slow and fast leaks. See AC-SYSTEM, OIL, REFILLING

NOTE: Always plug the pipes and connections when working on the climate control system.

NOTE: The recycling unit must have an oil separator. The oil separator must be of a type that allows the amount of run out oil to be measured.

NOTE: The ambient temperature must be above 20°C when draining the system.

NOTE: Always disconnect the battery ground cable when working with the climate control system. See BATTERY - DISCONNECTING AND CONNECTING

NOTE: Always use new O-rings lubricated with compressor oil.

When draining refrigerant, the recycling unit can be attached to the service valve for both the high pressure side (HP) (1) and the low pressure side (LP) (2) at the same time. This is the quickest method.

Fig. 1: Identifying Oil Check Points When Draining Refrigerant

Courtesy of VOLVO CARS CORPORATION

Check the amount of oil (if any) that has run out when draining the refrigerant.

BACK-UP LAMP SWITCH

Electrical system

BACK-UP LAMP SWITCH

BACK-UP LAMP SWITCH, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATORY WORK

REMOVING THE GEAR SELECTOR CABLES

Ignition off.

Remove the air cleaner (ACL) housing and the gear selector cables from the levers and the bracket on the gearbox. See **GEARBOX CABLES, REPLACING** .

NOTE: **Ensure that the mechanical cables do not crack or break.**

REMOVAL

REMOVING THE BRACKET FOR THE GEAR SELECTOR CABLES

Fig. 1: Identifying Bracket And Bolt Locations
Courtesy of VOLVO CARS CORPORATION

Remove the bracket from the gearbox.

Fig. 2: Back-Up Lamp Switch
Courtesy of VOLVO CARS CORPORATION

Clean thoroughly around the connectors.

Remove the connector and the back-up lamp switch from the gearbox.

INSTALLATION

NOTE: For tightening torques, see TIGHTENING TORQUE .

INSTALLING BACK-UP LAMP SWITCH

Install the back-up lamp switch. Tighten. See **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS** .

INSTALLING THE LEADS

Fig. 3: Back-Up Lamp Switch Leads
Courtesy of VOLVO CARS CORPORATION

Install the cables in the connector with the opening for the primary lock facing up as shown in the illustration. Press in the secondary lock.

JOINING CABLES

Splice the new connector with cables to the existing wiring. See: **JOINING THE CABLES**

INSTALLING CONNECTORS

Fig. 4: Identifying Tie-Strap Installed
Courtesy of VOLVO CARS CORPORATION

Install the connector with cables on the back-up lamp switch.

Install a tie-strap as shown in the illustration so that the cable harness is not in contact with the gear selector cable.

Fig. 5: Identifying Bracket And Bolt Locations
Courtesy of VOLVO CARS CORPORATION

Install the bracket on the gearbox using the 3 M8 screws. Tighten.

FINISHING

INSTALLING THE GEAR SELECTOR CABLES

Install the air cleaner (ACL) housing and the gear selector cables. See **GEARBOX CABLES, REPLACING** .

BRAKE LAMP SWITCH

Power transmission

BRAKE LAMP SWITCH

REMOVING THE BRAKE LAMP SWITCH

Fig. 1: Identifying Brake Lamp Switch Removal
Courtesy of VOLVO CARS CORPORATION

Remove the connector.

Press the brake lamp switch housing (1) forward towards the pedal box bracket. This is to release the white locking sleeve (2).

Pull the white locking sleeve towards the tip of the brake lamp switch as far as it will go.

Press in the brake lamp switch lock catch (3) from below with a small screwdriver. Bend the switch up, pull out.

Cables And Fuses - Symptom Related Diagnostic Procedures

CHECK THE START SYSTEM (2005-12)

CHECK THE START SYSTEM

If the vehicle does not always start first time, at the same time that a message appears in the Driver information module (DIM), the problem can be rectified with new software in the Central electronic module (CEM).

Action

- Upgrade the software in the central electronic module (CEM).

CHECKING ACCESSORY USB UNIT (AUU) (2007-12)

CHECKING ACCESSORY USB UNIT (AUU)

INFORMATION

The fault may be caused by:

- Malfunction in external sound source.
- Faulty software.
- Loose connections in leads.
- Internal fault in the Accessory USB unit (AUU).

Remedy in the following order.

Check function of the external sound source.

Load the Accessory USB Unit (AUU) with new software.

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

Corrective actions

- Ignition switch position II.
- Check that the external sound source is connected correctly to the control module.
- Check function of the Accessory USB Unit (AUU).

Is the function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

Remedy in the following order.

- Check the connectors and cables. Check especially the USB-connection for loose connection.

Other information:

- see **SIGNAL SPECIFICATION**
- see **LOCATION OF COMPONENTS**
- For left-hand drive vehicles, see **UNIVERSAL BUS MODULE (USB)**

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

Corrective actions

- Ignition switch position II.
- Check that the external sound source is connected correctly to the control module.
- Check function of the Accessory USB Unit (AUU).

Is the function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

Replace Accessory USB Unit (AUU).

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CHECKING AIR LEAKAGE, COMBUSTION PREHEATER MODULE (CPM) (2003-12)

CHECKING AIR LEAKAGE, COMBUSTION PREHEATER MODULE (CPM)

FAULT-TRACING INFORMATION

NOTE: This symptom troubleshooting only applies to vehicles with Combustion

preheater module (CPM).

If a customer has problems with the fuel heater not working optimally, it may be due to air leakage.

Probable symptoms in case of air leakage:

- Failed start attempt of fuel heater.
- Smoke development from the fuel heater at standstill or after driving a short distance.

Use mechanical troubleshooting to search for air leakage, see link below.

Other

- see **FUEL-POWERED PREHEATER, CHECKING**

CHECKING ALARM CAUSE (2003-04)

READING OFF THE ALARM CAUSE

Fig. 1: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Read off the cause of the alarm by clicking on the VCT2000 symbol.

  The alarm can be triggered by up to 12 different components in the vehicle, depending on the equipment level. Each time the alarm is triggered, information is saved which makes it easier to determine the reason it was triggered. Click on the VCT2000 symbol to find out which components triggered the alarm. Other information retained is the time, temperature and power supply when the alarm was triggered.

  NOTE: **The alarm occurrences are not presented in chronological order. Read off the Actual time and Time parameters to determine the last time the alarm deployed. The parameter in Actual time gives a reference value which displays how long the internal clock in the central electronic module**

(CEM) has calculated at the time of the read off. The value of Actual time minus the value in Time gives the number of days since the last alarm. The alarm cause is erased when the diagnostic trouble codes (DTCs) are erased in the central electronic module (CEM).

Other information

- For XC90 with mass movement sensor (MMS) and sunroof, see **INFORMATION**
- see **DESCRIPTION OF READING OFF ALARM CAUSES**

Fig. 2: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

OKAY: Troubleshooting has been completed.

NOT OKAY:

- Refer to **COMMUNICATION FAULT**

COMMUNICATION FAULT

Communication has been interrupted for one of the following reasons:

- The ignition is switched off
- VCT2000 disconnected from the data link connector (DLC)
- VCT2000 disconnected from the VIDA cart
- Communication problems in VIDA application or in car.
- No voltage in the data link connector (DLC).

Check therefore:

- That the control module power supply and ground terminal are fault-free.
- That the fuse for the data link connector (DLC) is intact.
- that the ignition is on
- that the battery voltage (system voltage) is normal (approximately 12 V).

  If necessary a battery charger can be connected during the test.

  For information about charge currents and the battery, see **BATTERY, CHARGING**

- that VCT2000 is correctly connected to the VIDA cart and the data link connector (DLC)
- that VCT2000 and the wiring is fault-free.

Other information

Try to establish communication again or exit reading off diagnostic trouble codes (DTCs). Depending on the communication fault, select one of the following options.

1. Try again. Refer to **READING OFF THE ALARM CAUSE**.
2. Fault-trace more comprehensively for the communication problem that has occurred. Refer to **CHECKING COMMUNICATION ERRORS**.
3. Exit fault-tracing/Read off from the next system. Troubleshooting has been completed.

Fig. 3: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

CHECKING COMMUNICATION ERRORS

Refer to **CHECKING COMMUNICATION ERRORS**.

CHECKING COMMUNICATION ERRORS

HINT: Test the communication with another corresponding vehicle to decide if the malfunction is in the vehicle or in VIDA/VCT/cable harness. If the communication works on another vehicle, the malfunction is in the vehicle.

Different speed on the CAN-communication can lead to problems

Volvo's vehicles have different speed of communication on the high-speed part of the CAN-network (HS-CAN), depending on model year.

- Model year -2004 communicates with 250 kbit/s.
- Model year 2005- communicates with 500 kbit/s.

Due to this, it is very important to specify correct vehicle profile before any communication is started with the vehicle's HS-CAN. This is normally done by pressing on "Retrieve VIN" or by manually specifying vehicle parameters under "Vehicle profile".

If the wrong model year has been selected, it may lead to blocking of the CAN-net, diagnostic trouble codes being stored in several control modules or missing response from control modules at continued communication. The following control modules may be affected by this problem:

- Brake control module (BCM)/(ABS)
- Engine control module (ECM)
- Electronic Throttle Module (ETM)
- Suspension Module (SUM)
- Central electronic module (CEM)
- Transmission control module (TCM)
- Steering wheel angle sensor module (SAS)
- Steering Wheel Module (SWM)
- Electrical Power Steering Module (EPS)

If this happens, take the following action:

- Turn off the ignition and remove the ignition key. Insert the key again in position II.
- If the above does not work, remove the battery cable and connect it again after a minute to reset the control modules.
- Select the correct vehicle profile in VIDA and erase the diagnostic trouble codes. Check that the symptoms have disappeared.

Diagnostic outlet

- Check the voltage feed to diagnostic outlet #16. The voltage shall match battery voltage.
- Check the cable for power ground and signal ground to diagnostic outlet #4 and #5.

HINT: When VCT2000 is connected to the diagnostic outlet (is supplied with voltage), the indicator diode shall be activated with a green light. Then the indicator diode flashes quickly when communication takes place with a control module. In case of certain internal malfunctions on VCT2000 the indicator diode is activated with a red light.

Communication cables

- Check the communication cable (k-line) between diagnostic outlet #7 and central electronic module (CEM) #D6 and other connected control modules for open circuit, short-circuit to ground and short-circuit to voltage.

CAUTION: In case of malfunction on this communication cable, communication cannot be established on either the low or high-speed network. First when communication takes place on this cable, the low and high-speed cables between the diagnostic outlet and central electronic module (CEM) are connected to the rest of the network in the vehicle. This is controlled via a relay in the central electronic module (CEM).

This relay is only found on vehicles of model year -2004.

- For communication problems with control units on **the high-speed network** , check communication cables between diagnostic outlet #6/ #14 and central electronic module (CEM) #B7/#B8 for open circuit, short-circuit to ground and short-circuit to voltage according to references above.
- For communication problems with control units on **the low-speed network** , check communication cables between diagnostic outlet #3/#11 and central electronic module (CEM) #B19/#B20 for open circuit, short-circuit to ground and short-circuit to voltage according to references above.
- Also check the communication cables for the low and high-speed net between the central electronic module (CEM) and the other connected control modules according to troubleshooting above.

Control modules

- Check that the control module's voltage feed and ground connection are trouble-free.

CAUTION: If none of the above checks help, try reading out diagnostic trouble codes in the central electronic module (CEM). Done via VIDA vehicle communication. A prerequisite for being able to communicate with the control modules in the car is that the central electronic module (CEM) is active and can be communicated with. If communication is not possible with the central electronic module (CEM), check the voltage feed and ground for the central electronic module (CEM).

VCT2000 and cable harness

- Connect VCT2000 to the vehicle so that it is supplied with voltage. Test VCT2000 by selecting the system's self-test and VCT Test in the VIDA main menu. If any malfunction is found according to the test, first replace the cable harness then the VCT2000, if the test still indicates a malfunction.
- If no malfunctions were found after troubleshooting according to above, try with a new cable harness and/or new VCT2000.

VIDA

- If no malfunctions were found after troubleshooting according to above, try performing a complete system reset of VIDA (Volvo scan tool).

Other information

INFORMATION

INFORMATION ABOUT FALSE ALARM, XC90 WITH MASS MOVEMENT SENSOR (MMS) AND SUN ROOF

Fig. 5: Locating Mass Movement Sensor
Courtesy of VOLVO CARS CORPORATION

On certain vehicles the alarm can be triggered by the mass movement sensor (MMS 2) in the event of heavy rain. This is due to the position of the senor in relation to the sun roof. To remedy this problem a repair method and repair kit have been introduced. If mass movement sensor (MMS 2) has triggered the alarm on several occasions and no other fault has been found, the position of the mass movement sensor (MMS 2) should be altered. See the Service bulletin for reducing false alarms.

DESCRIPTION OF READING OFF ALARM CAUSES

THE DATA IS READ OUT AS FOLLOWS:

ACTUAL TIME

Indicates how long the internal clock in the central electronic module (CEM) has counted, displayed in days. The actual time gives a reference value which can be used to calculate the number of days since the last alarm. Subtract the value in Time from the value of Actual time to calculate the number of days since the last alarm.

TIME

Indicates how long the internal clock in the central electronic module (CEM) had counted until the time the alarm deployed. The highest number is the latest alarm.

OUTSIDE TEMPERATURE

Indicates the temperature when the alarm deployed.

30 SUPPLY

Indicates the power supply when the alarm deployed.

ALARM CAUSE

Indicates the component in the car that caused the alarm.

- Front door right
- Front door left
- Rear door right
- Rear door left
- Hood
- Tailgate/Glass breakage loop
- Ignition switch
- Tilt sensor
- Siren
- Glass breakage loop
- MMS 1, standard mass movement sensor module (MMS) for the S60, S80, V70 and XC70. Rear mass movement sensor module (MMS) for the XC90
- MMS 2, front mass movement sensor module (MMS) for the XC90.

CHECKING BATTERY CHARGING FOR EXTERNAL IPOD-UNITS (2007-08)

CHECKING BATTERY CHARGING FOR EXTERNAL IPOD-UNITS

FAULT-TRACING INFORMATION

Accessory USB unit (AUU) has the function of acting as interface between the vehicle's infotainment system and external USB- and iPod-units. Since later generations of iPod and iPhone use 5 V-charging, instead of 12 V-charging, it is not possible to charge the iPod-battery using the original cable intended for iPod devices. The iPOD-battery can be charged using the USB-outlet, but then Accessory USB unit (AUU) does not handle playback of media stored on the external iPOD-unit.

Check:

- What charging applies to the external iPOD-unit.
- If there is a need for an adapter cable that supports 5 V charging.

Fault-tracing

To replace the adapter cable, see installation instructions for the installation of iPod cable in the Accessory USB unit (AUU) on the Accessory Business Unit's homepage, http://vccs. volvocars. se/accessories/ii/

Fault symptom

- Audio other/Other audio problems

CHECKING CAN-NET REST STATUS (2003-12)

CHECKING CAN-NET REST STATUS

PREPARATIONS FOR POWER SUPPLY, CAN NETWORK

When the vehicle sets the communication buses and the control modules in "sleep mode", power consumption drops. Factors such as whether the vehicle is locked, the alarm is on or off or whether any doors are open affect the rate at which the vehicle will reach standby power consumption. The lowest power consumption is achieved the quickest when the vehicle is locked, the alarm is on and the vehicle's doors are closed.

Preparations

Ensure that all lighting is switched off.

Ensure that the diagnostic tool is not connected in the vehicle.

Open the tailgate or trunk lid and bonnet and set the locks to the deadlocked position using a screwdriver for example.

Open the driver's and passenger doors and set the locks to the deadlocked position using a screwdriver for example.

Close the rear doors, remove the key and lock and alarm the vehicle. Never use reduced alarm as it then takes longer for the CAN network to continue in "sleep mode".

Wait approximately 3 minutes so that the vehicle's standby current consumption drops.

NOTE: Do not open any doors or the test will have to be restarted from the beginning.

- **Continue**

  Refer to **MEASURING THE VOLTAGE LEVEL ON THE CAN NETWORK.**

MEASURING THE VOLTAGE LEVEL ON THE CAN NETWORK.

When measuring the voltage level on the CAN network, it will soon become evident if there are modules in the vehicle that do not continue in "sleep mode".

The method for measuring the voltage on the CAN network is described below.

The voltage level on the CAN network is carried out using a multimeter.

Measuring

The CAN network must have continued in "sleep mode" after approximately 3 minutes. The voltage on the network must be 0 V with the CAN network in "sleep mode".

The voltage is 0.5 to 4 V for a vehicle that communicates over the CAN network.

Voltage measure the CAN network as follows:

Prepare the multimeter for power supply 10 V.

NOTE: Do not carry out work inside a vehicle equipped with mass movement sensors as the alarm may be triggered.

Measure the voltage on the low speed CAN network by connecting the hand terminal, component number 30656638, in diagnostic tool socket terminals #3 and #11. Connect the multimeter to the hand terminal and read off the voltage.

Measure the voltage on the high speed CAN network by connecting the hand terminal, component number 30656638, in diagnostic tool socket terminals #6 and #14. Connect the multimeter to the hand terminal and read off the voltage.

CHECKING CLOCK IN THE INFORMATION MODULE (2003-04)

CHECKING CLOCK IN THE INFORMATION MODULE

CHECKING THE REAL TIME CLOCK IN CENTRAL ELECTRONIC MODULE (CEM)

Fig. 6: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Try to set the correct time for the clock in the information module. Wait a few minutes and check whether the clock is still showing the correct time.

Does the clock show correct time?

- **YES**

  Refer to **VERIFICATION**

- **NO**

Refer to **REPLACEMENT OF CONTROL UNIT**

REPLACEMENT OF CONTROL UNIT

A diagnostic trouble code indicates a fault in the central electronic module (CEM), which means that the control unit should be replaced.

Read the programmed customer parameters. Note the values.

Other information

- see **CENTRAL ELECTRONIC MODULE (CEM), REPLACING**

Fig. 7: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 8: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 9: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect connectors, install components etc.
- Ignition on.

  Check that the clock is working by setting the correct time and waiting a few minutes.

Is the clock working?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CHECKING COMPASS (2007-10)

CHECKING COMPASS

FAULT-TRACING INFORMATION

In the event of a problem with the compass in the Upper electronic module (UEM), for example, if the compass shows incorrect direction or the direction freezes, a software download can solve the problem.

Fault-tracing

NOTE: Replacing components does not solve the problem.

- Download the latest software to the Upper electronic module (UEM).
- Perform a compass calibration.

Other information

see **COMPASS, CALIBRATION**

Fault symptom

- Compass/Does not work

Fig. 10: Identifying TMC Receiver
Courtesy of VOLVO CARS CORPORATION

CHECKING COURTESY LIGHTING (2003-04)

CHECKING COURTESY LIGHTING

CHECKING THE BULBS

Fig. 11: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check that the courtesy lighting light bulbs are undamaged.

  There are two lamps; left front and right front.

  Remedy as necessary.

  Other information:

  - To access or replace the front courtesy lighting, see **COURTESY LIGHTING, FRONT, REPLACING** .

Does the courtesy lighting function?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING CABLE TO GROUND**

CHECKING CABLE TO GROUND

Fig. 12: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

Check that there is a ground for each lamp. Measure the resistance between the relevant lamp terminal #4 and ground.

The resistance must be approximately 0 ohms.

There are two lamps; left front and right front.

Remedy as necessary.

Other information:

- To access or replace the front courtesy lighting, see **COURTESY LIGHTING, FRONT, REPLACING** .

Fig. 13: Electronic Throttle Module (ETM) Connector Terminal Identification

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 18: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 19: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect connectors, install components etc.
- Ignition on.

  Check that the courtesy lights operate by opening each door.

Does the courtesy light work?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CHECKING DIPPED BEAM ADJUSTMENT (2003-04)

CHECKING DIPPED BEAM ADJUSTMENT

PROGRAMMING CONTROL MODULE

PROGRAMMING PROCEDURES

The following can be programmed in the Central electronic module (CEM) according to customer's wishes.

Programming

1. Seat temperature. Refer to **PROGRAMMING THE SEAT TEMPERATURE (CENTRAL ELECTRONIC MODULE)**.
2. Approach lights. Refer to **PROGRAMMING THE HOME SAFE LIGHTS**.
3. Daytime running lights. Refer to **PROGRAMMING DAYTIME RUNNING LAMPS**.
4. Tailgate window wiper (5 DRS). Refer to **PROGRAMMING THE WIPER FUNCTION FOR THE REAR WINDSHIELD (5 DOOR MODELS)**

Do you want to program any more parameters?

- **YES**

  Refer to **PROGRAMMING PROCEDURES**

- **NO**

  OKAY: Troubleshooting has been completed.

Do you want to program any more parameters?

- **YES**

  Refer to **PROGRAMMING PROCEDURES**

- **NO**

  OKAY: Troubleshooting has been completed.

Do you want to program any more parameters?

- **YES**

  Refer to **PROGRAMMING PROCEDURES**

- **NO**

  OKAY: Troubleshooting has been completed.

Do you want to program any more parameters?

- **YES**

  Refer to **PROGRAMMING PROCEDURES**

- **NO**

  OKAY: Troubleshooting has been completed.

PROGRAMMING THE SEAT TEMPERATURE (CENTRAL ELECTRONIC MODULE)

The heated seat temperature can be adjusted.

This can be carried out for both the left and right seats.

There are two values that can be programmed: low temperature and high temperature.

Programming must be carried out so that the high temperature setting is higher than the low temperature setting.

Do you want to program in Celsius or Fahrenheit?

1. Celsius. Refer to **CELSIUS**.
2. Fahrenheit. Refer to **FAHRENHEIT**

CELSIUS

The seat temperature can be set between 0°C and 43°C.

Which seat do you want to reprogram:

1. Left seat. Refer to **CHECKING THE LEFT SEAT**
2. Right seat. Refer to **CHECKING THE RIGHT SEAT**

FAHRENHEIT

The seat temperature can be set between 32°F and 109.4°F.

Which seat do you want to reprogram:

1. Left seat. Refer to **CHECKING THE LEFT SEAT**
2. Right seat. Refer to **CHECKING THE RIGHT SEAT**.

CHECKING THE LEFT SEAT

Read off the programming by clicking on the VCT2000 symbol.

To change the seat temperature, mark the desired value in the scrolling list and start programming.

Programming must be carried out so that the high temperature setting is higher than the low temperature setting.

Fig. 20: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **SAVE THE PROGRAMMED VALUE**

CHECKING THE RIGHT SEAT

Read off the programming by clicking on the VCT2000 symbol.

To change the seat temperature, mark the desired value in the scrolling list and start programming.

Programming must be carried out so that the high temperature setting is higher than the low temperature setting.

Fig. 21: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **SAVE THE PROGRAMMED VALUE**

CHECKING THE LEFT SEAT

Read off the programming by clicking on the VCT2000 symbol.

To change the seat temperature, mark the desired value in the scrolling list and start programming.

Programming must be carried out so that the high temperature setting is higher than the low temperature setting.

Fig. 22: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **SAVE THE PROGRAMMED VALUE**

CHECKING THE RIGHT SEAT

Read off the programming by clicking on the VCT2000 symbol.

To change the seat temperature, mark the desired value in the scrolling list and start programming.

Programming must be carried out so that the high temperature setting is higher than the low temperature setting.

Fig. 23: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **SAVE THE PROGRAMMED VALUE**

SAVE THE PROGRAMMED VALUE

To ensure that the programmed information is stored, click on the VCT2000 symbol to force the entry.

Fig. 24: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **PROGRAMMING THE HOME SAFE LIGHTS**

PROGRAMMING THE HOME SAFE LIGHTS

The home safe lights can be programmed to stay on for a longer or shorter time according to the wishes of the customer.

The factory setting is 30 seconds. The time can be set to 0, 30, 60 or 90 seconds.

Read off the programming by clicking on the VCT2000 symbol.

To change the time set, mark the desired value in the scrolling list and start programming.

Fig. 25: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **SAVE THE PROGRAMMED VALUE**

SAVE THE PROGRAMMED VALUE

To ensure that the programmed information is stored, click on the VCT2000 symbol to force the entry.

Fig. 26: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **PROGRAMMING DAYTIME RUNNING LAMPS**

PROGRAMMING DAYTIME RUNNING LAMPS

Three different daytime running light functions can be programmed:

1. Low beam in all switch positions except the parking light position (Flex zero)

Position light switch:

OFF: Parking and daytime running lamps or Xenon lamps are activated depending on the signal from the twilight sensor.

Parking lamps: Only parking lamps activated.

On: Parking and Xenon lamps are activated.

2. The light switch functioning on the basis of: off, parking light and low beam (Flex standard)

Position light switch:

OFF: Daytime running lamps are activated. If the twilight sensor registers insufficient light, all lighting is switched off (Xenon lamps are not activated).

Parking lamps: Only parking lamps activated.

On: Parking and Xenon lamps are activated.

3. Low beam always on regardless of the position of the light switch (Flex low)

Position light switch:

OFF: Parking and daytime running lamps or Xenon lamps are activated depending on the signal from the twilight sensor.

Parking lamps: Parking and Xenon lamps are activated.

On: Parking and Xenon lamps are activated.

It is essential that the legal requirements of each country are followed.

NOTE: It is not permitted to change this programming in the Canadian market.

Read off the programming by clicking on the VCT2000 symbol.

To change the setting, mark the desired value in the scrolling list and start programming.

Fig. 27: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **SAVE THE PROGRAMMED VALUE**

SAVE THE PROGRAMMED VALUE

CHECKING DIPPED HEADLAMP (2003-04)

CHECKING LOW BEAM

CHECKING THE WIRING AND THE RELAY

Check the signal cables to the low beam. Check for an open-circuit. Check for contact resistance and oxidation.

Check the relay (2/62).

HINT: The voltage over the relay must be 12 V on pins #1 and #3 when the low beam is switched on.

Check the cable between terminal #3 and fuse 2, fusebox in the engine compartment (11B/2).

Check that fuse is intact.

Check the connector.

Check the cable between relay #1 (2/62) and shunt low beam #3 (20/27).

Check shunt (20/27).

HINT: The voltage must be 12 V at the shunt terminals, i. e. #3 and #2.

Check the cable between shunt low beam #2 (20/27) and fuses low beam.

Check that the fuses are intact.

HINT: Passenger compartment fuse no. 1 for left low beam and no. 2 for right low beam.

Remedy as necessary.

Other information

- see **CHECKING WIRING AND TERMINALS** .

Fig. 31: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 32: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE WIRING FOR THE LAMP HOUSING**

CHECKING THE WIRING FOR THE LAMP HOUSING

Check the signal cables to the low beam. Check for an open-circuit. Check for contact resistance and oxidation.

Check the cable between the passenger compartment fuse and terminal #3 of the lamp housing for each headlamp.

For the left low beam, check lamp housing 10/1.

For the right low beam, check 10/2.

Check the ground supply between lamp housing #1 and the ground terminal.

Also check the connectors: 54/3L, 54/4.

Remedy as necessary.

If no fault was found, replace the lamp housing.

Other information

- To replace the lamp housing, see **HEADLIGHT/BULB, REPLACING** (2005-2012) or **HEADLIGHT/BULB, REPLACING** (2003-2004).
- see **CHECKING WIRING AND TERMINALS** .

Fig. 33: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 34: Fuse Holder (Passenger Compartment)
Courtesy of VOLVO CARS CORPORATION

FAULT-TRACING INFORMATION

Condition

No diagnostic trouble codes (DTCs) are stored.

Substitute Value

None.

Possible Source

- Defective relay.
- Defective shunt low beam.
- Open-circuit or short-circuit to ground in the cable.

Fault symptom[s]

- The front lighting does not function.

CHECKING ELECTRONIC CHILD LOCKS (2003-04)

CHECKING ELECTRONIC CHILD LOCKS

CHECKING THE SWITCH

Check the switch for the child-proof lock by clicking on the VCT2000 symbol.

- Note the number of the switch that corresponds to the location of each switch for the child-proof lock in the car. Start the read off
- Press the switch for electronic child-proof locking several times
- Check on the display that there is a signal from the switch.

Remedy as necessary.

Other information:

- To access or replace the climate control module (CCM), see **CLIMATE CONTROL MODULE (CCM), REPLACING** .

Fig. 35: Identifying VCT2000 Diagnostic Tool Symbol In VIDA

Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING FUSES**

CHECKING FUSES

Check fuses 11C/37 and 11D/8.

Remedy as necessary.

Other information:

- To access and replace the fuses, 11D, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- Fuse 11C is in the passenger compartment.

- **Continue**

  Refer to **CHECKING THE RELAY**

CHECKING THE RELAY

Fig. 36: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 37: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

  Close the rear doors. Activate the child-proof lock using the switch.

Can the doors be opened from the inside?

- **YES**

  Refer to **CHECKING THE SIGNAL CABLE**

- **NO**

  Refer to **CHECKING THE SIGNAL CABLE**

CHECKING THE SIGNAL CABLE

Fig. 38: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check the signal cables below for both the rear doors. Check for a short-circuit to supply voltage. Check for an open-circuit. Check for a short-circuit to ground.

  - Between lock unit connector terminal #3 and the relay holder in the door, terminal #4

- Between the relay holder in the door, terminal #3 and rear electronic module (REM) relay position 2/115 terminal #3.

Remedy as necessary.

Other information:

- To access the lock unit in the rear door, see **LOCK MECHANISM REAR SIDE DOOR, REPLACING**
- To access the integrated relay/fusebox in the cargo compartment:
  - For -2004, see: **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
  - For 2005-, see: **REAR ELECTRONIC MODULE (REM), REPLACING** .
- see **CHECKING WIRING AND TERMINALS** .

Fig. 39: Identifying Terminals
Courtesy of VOLVO CARS CORPORATION

- **Continue**

Refer to **VERIFICATION**

CHECKING THE SIGNAL CABLE

Fig. 40: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check the signal cables below for both the rear doors. Check for a short-circuit to supply voltage. Check for an open-circuit. Check for a short-circuit to ground.

  - Between the relay holder in the door, terminal #2 and ground
  - Between the relay holder in the door, terminal #1 and central electronic module (CEM) relay position 2/120 terminal #3.

  Remedy as necessary.

  Other information:

- To access the central electronic module (CEM), see **CENTRAL ELECTRONIC MODULE (CEM), REPLACING**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 41: Identifying Terminals
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 42: Belt Routing/Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

Fig. 43: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect connectors, install components, etc.
- Disconnect the starter motor connector.
- Try to start the engine with the gear lever in any position other than P or N.
- Connect the starter motor connector.

Check that diagnostic trouble code status changes from permanent to intermittent.

Fig. 44: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the diagnostic trouble code status intermittent?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

FAULT-TRACING INFORMATION

Condition

No DTCs stored.

Possible Source

- Open-circuit, short-circuit to ground or short-circuit to supply voltage in the cable.
- Defective relay.

Fault symptom[s]

- The child-proof lock does not function.

CHECKING EXTRA LAMP (2003-04)

CHECKING EXTRA LAMP

CHECKING RELAY AND WIRES

NOTE: Trouble-shooting is only relevant to vehicles equipped with an extra lamp. The relay to the extra lamp is part of the cable to the extra lamp. The extra lamp is connected to connector 54/8.

Check relay (2/64).

HINT: The voltage on coil supply 2 should be 12 V.

HINT: The voltage on the relay contacts should be 12 V on pin 4. With the extra lamp switched on the voltage should also be 12 V on 3.

Check the wire between relay contact 4 and fuse 10 in the engine compartment fuse box (11B/10).

Check that the fuse is intact.

Check the wire between relay contact 3 (2/64) and front extra lamp 1 (10/69 front left extra lamp and 10/65 front right extra lamp respectively).

HINT: Ground connection to extra lamp at 2.

Check the connector.

Additional information

Fig. 45: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 46: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are stored.

The vehicle is fitted with an extra lamp.

Substitute Value

None.

Possible Source

- Faulty relay.
- Open circuit or short-circuit to ground in the wire.
- Faulty extra lamp.

Fault symptom[s]

- Front lamp is not working.

CHECKING FOR SHORT CIRCUIT ON CAN BUS SYSTEM, LOW SPEED NETWORK (2003-04)

CHECKING FOR A SHORT-CIRCUIT IN THE CAN BUS SYSTEM, LOW SPEED NETWORK

CHECKING FOR A SHORT-CIRCUIT

Disconnect the upper electronic module from the bus cable (disconnect the connector from the control module).

Measure the resistance at the connector between terminals #3 and #5. The resistance must be 120 ohms.

NOTE: Take care that you measure directly at the connector so that it is not damaged.

If the resistance is 0 ohms between the terminals, there short-circuit somewhere in the bus system.

Other information:

- To connect the breakout box to the upper electronic module, see **CONNECTING THE BREAKOUT BOX**

Fig. 47: Breakout Box
Courtesy of VOLVO CARS CORPORATION

Fig. 48: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Is the resistance 0 ohms?

- **YES**

  Refer to **CHECKING THE CONNECTORS AND BUS CABLE, PERMANENT**

- **NO**

  Refer to **FAULT-TRACING INFORMATION**

CHECKING THE CONNECTORS AND BUS CABLE, PERMANENT

Locate the bus cable. Check the wiring in different stages to localize where in the bus the fault is (the fault may

be anywhere in the bus cable).

HINT: It is possible to get an approximate location of the fault by checking which functions are not working in the car and then relating the functions to the relevant control module.

HINT: Remember that the CAN bus is a communication network. There are no fuses, switches or sensors.

Short-circuit between the bus cables: Use an ohmmeter between the cables to find short-circuits between them. If the reading is 0 ohms between the CAN bus cables there is a short-circuit between them. In particular check the pins and terminals in this way. See **CONTACT RESISTANCE AND OXIDATION** .

Other information:

- To connect the breakout box to the upper electronic module, see **CONNECTING THE BREAKOUT BOX**

Fig. 49: Breakout Box
Courtesy of VOLVO CARS CORPORATION

Fig. 50: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

FAULT-TRACING INFORMATION

No fault detected in this fault-tracing.

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Possible Source

- Short circuit between bus wires

- Contact resistance and oxidation.

Fault symptom[s]

- No indicators are working
- Central locking does not work
- Interior lighting does not work.

CHECKING FRONT FOG LAMP (2003-04)

CHECKING FRONT FOG LAMP

CHECKING RELAY AND WIRES

Check wires to fog lamp for, see **OPEN-CIRCUIT, PERMANENT FAULTS** , **SHORT-CIRCUIT TO GROUND, PERMANENT FAULTS** and **CONTACT RESISTANCE AND OXIDATION** .

Check relay (2/34).

HINT: The voltage across the relay should be 12 V at pins 1 and 3 when the fog lamp is on.

Check the wire between 3 and fuse number 3 in the interior compartment fuse box (11 C/3).

Check that the fuse is intact.

Check the wire between relay 1 (2/34) and front fog lamp 1 (10/5 left front fog lamp and 10/6 right front fog lamp).

HINT: Ground connection to fog lamp at 2.

Check the connector.

Additional information

Fig. 51: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 52: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are stored.

Substitute Value

None.

Possible Source

- Faulty relay
- Open circuit or short-circuit to ground in the wire.

Fault symptom[s]

- Front fog lamp is not working.

CHECKING FUSES (2005-12)

CHECKING FUSES

FAULT-TRACING INFORMATION

Missing function may be due to a blown fuse.

Check that the fuse for the function in question is intact.

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 53: Identifying Connector(s) Reinstallation
Courtesy of VOLVO CARS CORPORATION

Fig. 54: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Reinstall the connectors, components etc.
- Ignition on.

  Check that the function in question is OK.

Is the function OK?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CHECKING FUSES (2005-12)

CHECKING FUSES

FAULT-TRACING INFORMATION

Loss of power steering function may be due to a blown fuse.

Check that fuse is intact.

If the fuse has blown, check the circuit after the fuse before replacing the fuse. Check for a short-circuit to ground.

It is important that all cables and components are checked.

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 55: Identifying Connector(s) Reinstallation
Courtesy of VOLVO CARS CORPORATION

Fig. 56: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Reinstall the connectors, components etc.
- Ignition on.

  Check that the function in question is OK.

Is the function OK?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CHECKING HEADLAMP (2003-04)

CHECKING HEADLAMP

CHECKING RELAY AND WIRES

Check relay (2/63).

HINT: The voltage should be 12 V at pins 1 and 3 when main beam is on.

Check the wire between 3 and fuse number 1 in the engine compartment fuse box (11B/1).

Also check the connector and fuse.

Check the wire between 1 (2/63) and interior compartment fuse number 10 (left main beam) and number 11 (right main beam) and the fuses.

Fig. 57: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Is there a fault?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE WIRES**

CHECKING THE WIRES

HINT: Depending on which headlamp is not working, check for faults on the left or right headlamp.

Check interior compartment fuse number 10 (left main beam) and number 11 (right main beam).

Check the wire between the interior compartment fuse and front lamp housing 4 (10/1 for left main beam and 10/2 for right main beam).

Also check the connectors

Fig. 58: Fuse Holder (Passenger Compartment)
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are stored.

Substitute Value

None.

Possible Source

- Faulty relay
- Open circuit or short-circuit to ground in the wire.

Fault symptom[s]

- Front lamp is not working.

CHECKING IMPACT STATUS (2005-12)

CHECKING IMPACT STATUS

Fig. 59: Checking Traffic Load On CAN Cables
Courtesy of VOLVO CARS CORPORATION

It may occur that the Central electronic module (CEM) incorrectly perceives that the vehicle's impact protection has been activated, without that being the case. This means that Central electronic module (CEM) does not allow operation of the fuel pump in ignition position II, and does not allow start of parking-/auxiliary heater.

Correct function is returned by resetting impact status in Central electronic module (CEM).

Fig. 60: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- Click the VCT2000 symbol to read off the value. If the value is "Airbag deployed", reset shall be performed.
- Click on Restore if the value is to be changed.
- Read and then delete all diagnostic trouble codes for Engine control module (ECM) (when other troubleshooting is done).

NOTE: It is important to reset impact status for Engine control module (ECM).

- Then turn off the ignition and wait for at least 2 minutes. Turn on the ignition again and check the function.

CHECKING LEAKS FROM THE SUN ROOF (2003-12)

CHECKING LEAKS FROM THE SUN ROOF

CHECKING WATER LEAKS

If water stops in the drainage frame, check that the drain hoses are not clogged.

Check that the glass panel is properly adjusted and the sun roof is properly calibrated.

If the glass panel or its seal is damaged, replace the glass panel.

Check the connection to the front drain channel for leaks. Remedy any leaks with sealant.

Check drain hoses and their connections.

Remedy as necessary:

Other information

- see **SUN ROOF, ADJUSTING**
- see **SUN ROOF, LEAK TEST**
- see **GLASS SUN ROOF, REPLACEMENT**

Fig. 61: Identifying Sun Roof Glass Panel
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **FUNCTIONALITY CHECK**

FUNCTIONALITY CHECK

Check that the sun roof does not leak.

Is the sun roof function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should be diagnosed and remedied. Since this is not the case the fault-tracing process has failed.

Complete the fault-tracing for those fault or try again.

SUN ROOF, LEAK TEST

- See **SUN ROOF, LEAK TEST** .

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Substitute Value

None.

Possible Source

- Improperly adjusted sun roof.
- Cracks in the sun roof.
- Poorly fastened sealing strip.

Fault symptom[s]

- Water leaks from the sun roof.

CHECKING LOCKING TO DEADLOCK (2003-04)

CHECKING LOCKING TO DEADLOCK

SELECTING A DOOR

NOTE: The fault-tracing assumes that unlocking / locking with the central locking system functions normally.

Which door does it apply to?

1. Front door. Refer to **CHECKING THE FRONT DOOR**
2. Rear door. Refer to **CHECKING REAR DOORS**.

CHECKING THE FRONT DOOR

Check the control module connector terminal #B1 and the lock unit connector terminal #6. Check for contact resistance and oxidation. Check the intermediate cable. Check for an open-circuit.

Other information

- see **CHECKING WIRING AND TERMINALS** .

Fig. 62: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 63: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE COMPONENT**

CHECKING REAR DOORS

Which door does it apply to?

1. A rear door. Refer to **CIRCUIT TEST**.
2. Both the rear doors. Refer to **CIRCUIT TEST**

CIRCUIT TEST

The fault is caused by an open-circuit in the cable to (or in) the lock unit. To determine in which circuit the fault is:

Remove the deadlock relay (2/115).

Remove the lock unit connector. Check the connector for contact resistance and oxidation.

Other information

- To expose the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**

- To expose the lock unit, see **LOCK MECHANISM, TAILGATE, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 64: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 65: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CIRCUIT TEST (CONT.)**

CIRCUIT TEST (CONT.)

Check the cable between terminal #8 the cable and connector and terminal #3 on the relay base. Check for an

open-circuit. If a fault is detected, check in particular the 2 intermediate connectors in the cable harness. Check for contact resistance and oxidation.

Other information

- To expose the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- To expose the lock unit, see **LOCK MECHANISM, TAILGATE, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 66: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 67: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE COMPONENT**

CIRCUIT TEST

The fault indicates an open-circuit in the common relay circuit (relay 2/115 or the power supply to the relay).

Begin by replacing the relay for deadlocking (2/115) in the integrated relay/fusebox in the cargo compartment. Check the relay base switches. Check for contact resistance and oxidation.

Other information

- To expose the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 68: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 69: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING RELAY POWER SUPPLY**

CHECKING THE COMPONENT

Measure the resistance between pins terminals #8 and #6 on the chassis switch lock unit.

The ohmmeter should read approximately 5 ohm

Other information

- To remove the lock unit, see **LOCK MECHANISM, TAILGATE, REPLACING**
- For information about signals, see **SIGNAL SPECIFICATION** .

Fig. 70: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 71: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Is the value correct?

- **YES**

  Refer to **FUNCTION TEST**

- **NO**

  Refer to **REPLACING THE COMPONENT**

FUNCTION TEST

Check that the mechanical/electrical function of the lock unit is OK before the lock unit is reinstalled.

Is the function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

Replace the lock unit. See **LOCK MECHANISM, TAILGATE, REPLACING** .

CHECKING THE COMPONENT

Measure the resistance between pins terminals #7 and #6 on the chassis switch lock unit.

The ohmmeter should read approximately 5 ohm

Other information

- To remove the lock unit, see **LOCK MECHANISM, TAILGATE, REPLACING**
- For information about signals, see **SIGNAL SPECIFICATION** .

Fig. 72: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 73: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Is the value correct?

- **YES**

  Refer to **FUNCTION TEST**

- **NO**

  Refer to **REPLACING THE COMPONENT**

FUNCTION TEST

Check that the mechanical/electrical function of the lock unit is OK before the lock unit is reinstalled.

Is the function OK?

- **YES**

  Refer to **REPLACING THE COMPONENT**

- **NO**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

Replace the rear electronic module (REM). See **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .

REPLACING THE COMPONENT

Replace the lock unit. See **LOCK MECHANISM, TAILGATE, REPLACING** .

CHECKING RELAY POWER SUPPLY

- Remove the deadlock relay (2/115)
- Measure the voltage between terminal #5 in the relay base and ground.

  The voltmeter should read battery voltage

  HINT: If the value is OK but the fault remains, bridge between terminals #3 and #5 in the relay base to force a supply to the locking motor when continuing to take measurements

  Other information

  - To expose the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .

Fig. 74: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

Fig. 75: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Is the value correct?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING FUSES**

CHECKING FUSES

Remove fuse 11D/8 from the cargo compartment fusebox

Check that fuse 11D/8 is intact. Check for contact resistance and oxidation.

Other information

- To expose the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 76: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 77: Locating Integrated Relay/Fusebox In Cargo Compartment
Courtesy of VOLVO CARS CORPORATION

Is the fuse intact?

- **YES**

  Refer to **CHECKING FOR OPEN-CIRCUITS**

- **NO**

  Refer to **CHECKING FOR SHORT-CIRCUITS**

CHECKING FOR OPEN-CIRCUITS

Remove the relay 2/115 from the integrated relay/fusebox in the cargo compartment.

Check the cable between the fuse holder secondary side (left) and terminal #5 in the relay base. Check for an open-circuit.

Other information

- To expose the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**

- see **CHECKING WIRING AND TERMINALS** .

Fig. 78: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Fig. 79: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 80: Locating Integrated Relay/Fusebox In Cargo Compartment
Courtesy of VOLVO CARS CORPORATION

CHECKING FOR SHORT-CIRCUITS

Measure the resistance between the fuse holder secondary side (left) and ground.

The ohmmeter should indicate an open-circuit.

If the value is correct, replace the fuse.

NOTE: The fault could be intermittent

If the ohmmeter displays a fault (short-circuit), fault-trace all affected relay circuits for a short-circuit to ground.

HINT: The relay circuits affected are from relays 2/111, 2/112, 2/113, 2/114, 2/115, 2/56, 2/59 and 2/67.

Remove one relay at a time and measure resistance to ground from terminal #5 and #3 on the relay base to determine which loop the fault is in.

Other information

- To expose the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO**

COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING

- see **CHECKING WIRING AND TERMINALS** .

Fig. 81: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Fig. 82: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 83: Locating Integrated Relay/Fusebox In Cargo Compartment
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Possible Source

- Faulty lock unit
- Faulty relay
- Fault in relay supply
- Contact resistance and oxidation in the connectors
- Fault in locking to lock unit
- Fault in control unit.

Fault symptom[s]

- Does not lock to the deadlock position BLL.

CHECKING NOISE FROM THE SUN ROOF (2003-12)

CHECKING NOISE FROM THE SUN ROOF

NOISE FROM THE SUN ROOF

Noise occurs:

1. When the sun roof is operated. Refer to **CHECKING THE SUN ROOF**
2. When the car is driven. Refer to **CHECKING THE SUN ROOF**

CHECKING THE SUN ROOF

If the noise is sporadic (clicking), check the mechanism, rails and drive for unevenness.

HINT: Adjusting the glass panel may remedy the problem.

If there are squeaks coming from the front of the sun roof, check the motor and drive.

Clean and lubricate the rails and mechanism.

Remedy as necessary:

Other information

- For glass panel adjustment: see **SUN ROOF, ADJUSTING**
- see **MECHANISM/MECHANICAL CABLE SUN ROOF, REPLACEMENT**

- **Continue**

  Refer to **FUNCTIONALITY CHECK**

CHECKING THE SUN ROOF

If there is rattling from the sun roof, check that all components are properly mounted and check that all bolts and screws are securely tightened.

Replace any damaged components. Use new bolts when mounting.

If there is rattling, but no loose or damaged components are found, try replacing the mechanism.

An improperly adjusted sun roof can cause wind noise. If this is the case, adjust the sun roof vertically as well as the front and rear position.

Check that the sun roof seal is undamaged. If the seal is damaged, replace the sun roof.

Laterally adjust the entire sun roof cassette in the body.

Remedy as necessary:

Other information

- see **SUN ROOF, ADJUSTING**
- see **MECHANISM/MECHANICAL CABLE SUN ROOF, REPLACEMENT**
- see **GLASS SUN ROOF, REPLACEMENT**

- **Continue**

  Refer to **FUNCTIONALITY CHECK**

FUNCTIONALITY CHECK

Check that there is no noise from the sun roof during operation.

Is the sun roof function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

FUNCTIONALITY CHECK

Test drive the car and check that there is no noise from the sun roof.

Is there noise from the sun roof?

- **YES**

  Refer to **INFORMATION**

- **NO**

  OKAY: Troubleshooting has been completed.

INFORMATION

FAULT-TRACING INFORMATION

The fault should be diagnosed and remedied. Since this is not the case the fault-tracing process has failed.

Complete the fault-tracing for those fault or try again.

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Substitute Value

None.

Possible Source

- Improperly adjusted sun roof.
- Improperly mounted sun roof.
- Coating or dirt on the guide rail.
- Uneven guide rail.

Fault symptom[s]

- Noise from the sun roof.

CHECKING REAR WINDOW LIFT (2003-04)

CHECKING REAR WINDOW LIFT

CHECKING FUSE 11C/37 (30A)

Fig. 84: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check that fuse 11C/37 (30A) is intact.

Fig. 85: Fuse Holder (Passenger Compartment)
Courtesy of VOLVO CARS CORPORATION

Is the fuse OK?

- **YES**

  Refer to **CHECKING POWER SUPPLY WIRE**

- **NO**

  Refer to **CHECKING THE POWER SUPPLY WIRES**

CHECKING POWER SUPPLY WIRE

Fig. 86: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Remove window lift relay from relay holder.

  - Relay 2/116 for LH rear door, up.
  - Relay 2/118 for LH rear door, down.
  - Relay 2/117 for RH rear door, up.
  - Relay 2/119 for RH rear door, down.
  - Relay 2/120 for child catch.

  Remove fuse 11C/37.

Check wire between fuse 11C/37 #2 and relay holder #3 (for each function) for an open circuit as described in, see **OPEN-CIRCUIT, PERMANENT FAULTS** .

Install relay and fuse.

Activate relay with switch unit on rear door, up/down.

Additional information:

- To connect the test box, see **CONNECTING THE BREAKOUT BOX** .
- For information on signals, see **SIGNAL SPECIFICATION** .

Fig. 87: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 88: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Is function OK?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING CONTACT RESISTANCE, OXIDATION**

CHECKING CONTACT RESISTANCE, OXIDATION

Remove relay and check relay socket contacts for contact resistance and oxidation as described in, see **CONTACT RESISTANCE AND OXIDATION** .

Also check switch 54/20 or 54/21 (LH/RH) for contact resistance and oxidation as described in, see **CONTACT RESISTANCE AND OXIDATION** .

Reassemble relay and switch.

Activate relay with switch unit on rear door, up/down.

If the function is now OK, this means that the fault was probably caused by a faulty contact in the relay socket.

Additional information:

- To access the window lift relay, see **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** .

Fig. 89: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 90: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Does it work?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING FOR OPEN CIRCUITS FROM RELAY TO MOTOR**

CHECKING FOR OPEN CIRCUITS FROM RELAY TO MOTOR

Fig. 91: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  For window lift control rear LH door up, remove window lift relay 2/116 from relay holder. Check wire for open circuit between relay holder #1, switch 54/20 #8, and switch 3/85 #5, as described in, see **OPEN-CIRCUIT, PERMANENT FAULTS** . Also check wire from 3/85 #4 and #6, and motor 6/92 #1 and #2 for open circuit.

  For window lift control rear LH door down, remove window lift relay 2/118 from relay holder. Check wire for open circuit between relay holder #1 switch 54/20 #6, and switch 3/85 #3, as described in, see **OPEN-CIRCUIT, PERMANENT FAULTS** . Also check wire from 3/85 #4 and #6, and motor 6/92 #1 and #2.

  For window lift control rear RH door up, remove window lift relay 2/117 from relay holder. Check wire

for open circuit between relay holder #1, switch 54/21 #8 and switch 3/86 #5, as described in, see **OPEN-CIRCUIT, PERMANENT FAULTS** . Also check wire from 3/86 #4 and #6, and motor 6/93 #1 and #2.

For window lift control rear RH door down, remove window lift relay 2/119 from relay holder. Check wire for open circuit between relay holder #, switch 54/21 #6, and switch 3/86 #3, as described in, see **OPEN-CIRCUIT, PERMANENT FAULTS** . Also check wire from 3/86 #4 and #6, and motor 6/93 #1 and #2.

For child lock, remove window lift relay 2/120 from relay holder. Check wire for open circuit between relay holder #1 switch 54/20, switch 54/21 #5, switch 3/85 and 3/86 #1, as described in, see **OPEN-CIRCUIT, PERMANENT FAULTS** . Also check wire from 3/85 #4 and #6, motor 6/92 #1 and #2. Also check wire from 3/86 #4 and #6, motor 6/93 #1 and #2.

Do the necessary corrective action.

If no fault is found, replace control panel, (switch unit).

Additional information:

- To access the window lift relay, see **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** .

Fig. 92: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 93: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

CHECKING THE POWER SUPPLY WIRES

Fig. 94: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Remove relay from relay holder.

  Check wire between 11C/37 #2 and relay holder #3 for short circuit to ground, as described in, see **SHORT-CIRCUIT TO GROUND, PERMANENT FAULTS** . Also check the wire circuit between relay #3 and motor #2 for short circuit to ground, see **SHORT-CIRCUIT TO GROUND, PERMANENT FAULTS** .

  Additional information:

  - To access the window lift relay, see **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** .

Fig. 95: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 96: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Is there a fault?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING INTERMITTENT SHORT CIRCUIT TO GROUND**

CHECKING INTERMITTENT SHORT CIRCUIT TO GROUND

Fig. 97: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Activate window by clicking on the VCT 2000 symbol.

  Bring up the relay so that it is still connected.

  Check power supply to relay by measuring voltage between #3 in the relay socket and ground.

  HINT: The voltage between #3 and ground should be battery voltage.

  If value deviates from this, check wire for intermittent open circuit, as described in, see **OPEN-CIRCUIT, INTERMITTENT FAULTS** .

Additional information:

- To access the window lift relay, see **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** .
- Do the necessary corrective action.

Fig. 98: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 99: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **INFORMATION**

VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 100: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 101: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect connectors, install components etc.
- Ignition on.

  Activate relay on control switch unit, window up/down.

Does it work?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CHECKING REMOTE CONTROL, POOR CONTACT WITH BATTERY (2005-06)

CHECKING REMOTE CONTROL, POOR CONTACT WITH BATTERY

This symptom troubleshooting only applies to vehicles that show any or some of the following symptoms:

- Alarm/Arming does not work/No visible indication
- Locking/unlocking/Other central locking problems
- Locking/unlocking/Central locking does not work

Problems with the remote control's function may be due to poor contact between the battery and the connecting pins in the remote control.

To solve problems with poor contact:

- Open the remote control's battery cover and remove the battery.
- Carefully bend the connecting pin upward (approx. 0.5 - 1 mm) for the battery's plus terminal.
- Carefully bend the connecting pins upward (approx. 1 - 2 mm) for the battery's minus terminal.
- Reinstall the battery in the remote control.
- Hold the remote control upside-down and shake it carefully.
- If the battery works loose, bend the connecting pins upward a little more for the battery's plus terminal.
- If the battery is still in the remote control, reinstall the battery cover.
- Verify the remote control's function.

Fig. 102: Checking Contact Of Remote Control Battery
Courtesy of VOLVO CARS CORPORATION

CHECKING REMOTE CONTROLLED IMMOBILIZING (2011-12)

CHECKING REMOTE CONTROLLED IMMOBILIZING

NOTE: **This fault tracing only applies to vehicles with the function for remote controlled immobilizing. Is DTC CEM-6C57 stored? Fault trace this diagnostic DTC first.**

HINT: Function for remote controlled immobilizing is only available on certain markets and only in combination with Volvo On Call.

If the vehicle cannot be started, the cause may be that the vehicle has been remote-immobilized via Volvo On Call Service Center. The vehicle may also have been remotely immobilized if the Central electronic module (CEM) identified problems with the components used for the function.

To read out the status for remote controlled immobilizing, see

The following options are available:

- Vehicle immobilised by remote control.
- Vehicle mobilised by remote control.
- Vehicle mobilised by remote control but remote controlled immobilising continues.

If the vehicle is remotely immobilised, the cause can be read out, see

The following options are available:

- Vehicle remotely immobilised by Volvo On Call Service Center.

- No or incorrect communication between the Phone module (PHM) and Central electronic module (CEM).
- Vehicle remotely immobilised by VIDA (Volvo scan tool).

To cancel a remote-controlled immobilization, Volvo On Call Service Center has to remobilize the vehicle.

Remedy as necessary.

CHECKING REMOTE CONTROLS (2003-12)

CHECKING THE REMOTE CONTROL

Check with the customer if the remote control's function ceases in certain places or if the problem can occur at any place.

Does the remote control's function cease to work in certain places?

- **YES**

  Refer to **INFORMATION ABOUT "DEAD ZONES" FOR WIRELESS COMMUNICATION**

- **NO**

  Refer to **CHECKING THE FUNCTION**

CHECKING THE WIRES AND COMPONENTS

Check that all the remote controls work by pressing any button on the remote control and activating the Smart-tool.

Options

1. None of the remote controls work. Refer to **REPLACING THE COMPONENT**.
2. One or more of the remote controls work, but not all. Refer to **CHECKING THE REMOTE CONTROL**.
3. All the remote controls work. Troubleshooting has been completed.

Fig. 103: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

REPLACING THE COMPONENT

Replace control unit.

Before replacing the control unit all the program data should be read from the control unit, make a note of it. This is done from VIDA vehicle communication.

Additional information

- see **INTERIOR LIGHTING AND UPPER ELECTRONIC MODULE (UEM), REPLACING**

CHECKING THE REMOTE CONTROL

Check that the battery in the remote control has not discharged.

Do the necessary corrective action.

If no fault is found, replace the remote control.

If a faulty remote control is replaced by a new one, the old one has to be erased first.

Additional information

- see **IGNITION KEY/REMOTE CONTROL, ADDITION/REPLACING/ERASING**

CHECKING THE FUNCTION

Check if the vehicle can be unlocked but not locked with the remote control.

HINT: Lower a side window, turn off the ignition and pull out the ignition key slowly. That the vehicle cannot be locked with the remote control may depend on a switch at the ignition jamming.

Can the vehicle be locked with the remote control?

- **YES**

  Refer to **CHECKING THE WIRES AND COMPONENTS**

- **NO**

  Refer to **CHECKING S-VOLTAGE FEED**

CHECKING S-VOLTAGE FEED

HINT: If the switch for S-feed in the ignition jams in active position, the vehicle assumes that the ignition key is in the ignition and will then not lock the central lock on command from the remote control.

- Ignition off.
- Activate reading off the status. Click the VCT2000 symbol.

- Insert and remove the ignition key a number of times.

  Check that the status changes.

  NOTE: S voltage supply to the central electronic module (CEM) must be approximately battery voltage when the ignition key is in the ignition switch.

  Remedy as necessary.

  Other information

  - see **STEERING WHEEL LOCK, REPLACING**

Fig. 104: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

INTERIOR LIGHTING AND UPPER ELECTRONIC MODULE (UEM), REPLACING

REPLACING THE LENS AND THE BULB

Fig. 105: Identifying Courtesy Light And Catches
Courtesy of VOLVO CARS CORPORATION

Removal

- Fold down the cover as shown.
- Press the catches outwards. Remove the lens.
- Remove the bulb. Use a weatherstrip tool or similar.

Installation

- Install the bulb.
- Press the lens into place.
- Press the cover into place.

REPLACING THE BULB HOLDER IN THE REAR VIEW MIRROR UNIT

The upper electronic module (UEM) is integrated in the rear view mirror. For more information about removing the rear view mirror, see **REPLACING THE UPPER ELECTRONIC MODULE (UEM), OR THE REAR VIEW MIRROR**.

Fig. 106: Identifying Bulb Holder
Courtesy of VOLVO CARS CORPORATION

Removal

- Remove the lens.
- Remove the 2 screws at the front edge.
- Press the 2 rear catches forward.
- Press two of the catches on one side inwards. Remove the bulb holder.
- Disconnect the 2 connectors.
- Disconnect the ground lead.

HINT: Only certain versions of the upper electronic module (UEM) have a ground lead.

Fig. 107: Identifying Removal Of Rear View Mirror/Control Module
Courtesy of VOLVO CARS CORPORATION

- Remove the cover over the connector for the rear view mirror and control module.

Fig. 108: Identifying Removal Of Rear View Mirror Connector
Courtesy of VOLVO CARS CORPORATION

- Flip the anti-dazzle button toward the lens. Disconnect the connector in the rear view mirror and control module by pressing the catch through the opening. Use a screwdriver.
- Remove the bulb holder together with the rear view mirror and control module.

Installation

- Connect the connector for the rear view mirror and control module.
- Reinstall the cover for the rear view mirror and control module connector.
- Connect the 2 connectors.
- Install the ground lead.
- Press the bulb holder into place.
- Install the 2 screws at the front edge.

CAUTION: Check that the microphone cable is not trapped (if applicable).

- Install the lens.

HINT: Only certain versions of the upper electronic module (UEM) have a ground lead.

REPLACING THE SWITCH FOR THE INTERIOR LIGHTING

Removal

- Remove the lens. See **REPLACING THE LENS AND THE BULB**.
- Remove the bulb holder. See **REPLACING THE BULB HOLDER IN THE REAR VIEW MIRROR UNIT**.
- Remove the bulbs.
- Remove the screws.
- Remove the back piece from the switch.
- Detach and remove the printed circuit board and switch.

To replace the switch for the sun roof, see **SWITCH, SUN ROOF, REPLACING** .

Installation

- In reverse order.

REAR VIEW MIRROR, REPLACING

NOTE: A rear view mirror with manual function cannot be replaced with automatic anti-dazzle or vice versa. The car will store diagnostic trouble codes (DTCs).

The upper electronic module (UEM) is integrated in the rear view mirror. To remove the rear view mirror, see **REPLACING THE UPPER ELECTRONIC MODULE (UEM), OR THE REAR VIEW MIRROR**.

REPLACING THE UPPER ELECTRONIC MODULE (UEM), OR THE REAR VIEW MIRROR

PREPARATIONS

NOTE: Read off data from the control module before replacing the control module. Program this data back into the new control module.

Programmed data is read off via VIDA vehicle communication.

CAUTION: New software can only be ordered when the control module is installed in the car. VIDA reads off the new control module identity which is required to order the correct software.

Always check the control module and connector on the control module box for bent or damaged pins or sockets. This may have caused the fault.

REMOVING THE CONTROL MODULE

Fig. 109: Identifying Bulb Holder
Courtesy of VOLVO CARS CORPORATION

- Remove the lens.
- Remove the 2 screws at the front edge.
- Press the 2 rear catches forward.
- Press two of the catches on one side inwards. Remove the bulb holder.
- Disconnect the 2 connectors.
- Disconnect the ground lead.

HINT: Only certain versions of the upper electronic module (UEM) have a ground lead.

Fig. 110: Identifying Removal Of Rear View Mirror/Control Module
Courtesy of VOLVO CARS CORPORATION

- Remove the control module connector cover.

Fig. 111: Identifying Removal Of Rear View Mirror Connector
Courtesy of VOLVO CARS CORPORATION

- Flip the anti-dazzle button toward the lens. Disconnect the connector in the control module by pressing the catch through the opening. Use a screwdriver.
- Remove the screw from the control module.
- Remove the control module.

CHECK

Check that the control module connectors are intact.

INSTALLING THE CONTROL MODULE

- Screw the control module screw into place.
- Connect the connector for the control module.
- Reinstall the cover for the control module connector.
- Connect the 2 connectors.
- Press the bulb holder into place.
- Install the ground lead.
- Install the 2 screws at the front edge.
- Install the lens.

ORDERING SOFTWARE

Order software. See 8637414

FINISHING

Program in the data read off from the old control module.

INFORMATION ABOUT "DEAD ZONES" FOR WIRELESS COMMUNICATION

Due to increased radiation in the surroundings from various forms of transmitters, in rare instance, the signal from the remote control can be interrupted. In such cases it is often in locations where the external signals mean that the transmission and reception conditions become unfavorable. The effect can be so severe that total loss can occur in some places, which means that no wireless communication can occur. This can affect all types of wireless communication, not only signals from the remote control and depends on many different units sending information within the open frequency band. If these signals negatively affect each other, wireless communication in certain places is impossible.

Examples of interfering radiation sources are:

- Mobile telephones
- Radio/TV masts
- Wireless readable electric meters
- Wireless headsets
- Microwave ovens
- Remote controls for garage door opening
- Wireless supervision cameras
- Remote controls for other vehicles
- Wireless weather stations

Inform the customer about these conditions. If the customer is regularly in the vicinity of such locations, the cause of the fault has been found. See if the vehicle can be unlocked by moving the remote control closer to the receiver (in the upper electronic module (UEM)). Alternatively the vehicle can be unlocked using the keyblade.

NOTE: If the vehicle is unlocked using the key blade, the alarm functions are deployed if the vehicle is equipped with an alarm. The alarm can be reset in such cases by inserting the ignition key in the ignition switch and turning to position II.

Applies to vehicles of model year 2005 and 2006.

Check that the upper electronic module (UEM) is up to date. If it is not, some of the above problems can be solved by downloading new software to the upper electronic module (UEM). The software increases the range for the remote control and increases the tolerances against these types of interference.

NOTE: Downloading new software can solve some problems experienced by the

customer. It will not solve all problems.

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Substitute Value

Nothing.

Possible Source

- Communication between upper electronic module (UEM) and remote control is interfered with by external frequency sources.
- Internal fault in control unit.
- Low battery in remote control.
- Internal fault in remote control.

Fault symptom[s]

- Cannot be operated using remote control.
- Central locking does not work.

CHECKING REVERSE LIGHT CONTACT (2003-04)

CHECKING REVERSE LIGHT CONTACT

CHECKING WIRE AND REPLACEMENT OF COMPONENT

Check the wire between the control unit 1A and reverse light contact 2 (3/10) for a short-circuit to voltage supply as described in, see **SHORT-CIRCUIT TO SUPPLY VOLTAGE. PERMANENT FAULTS** , and for an open circuit as described in **OPEN-CIRCUIT, PERMANENT FAULTS** .

Also check the connectors for a short circuit to voltage supply, as described in, see **SHORT-CIRCUIT TO SUPPLY VOLTAGE. PERMANENT FAULTS** , and for an open circuit as described in **OPEN-CIRCUIT, PERMANENT FAULTS** .

If no fault is found on the wire, check the function of the reversing lamp switch.

HINT: If reverse light contact is closed, the voltage between 1 and 2 on the contact is 0 V.

Do the necessary corrective action.

Additional information

- To access/replace the central electronic module (CEM), see **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** .
- For information on signals and additional values, see **SIGNAL SPECIFICATION** .
- To connect the test box, see **CONNECTING THE BREAKOUT BOX** .

Fig. 112: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Possible Source

- Faulty switch
- Short circuit to voltage supply
- Open circuit.

Fault symptom[s]

- Reverse light remains on.

CHECKING REVERSE LIGHT CONTACT (2003-04)

CHECKING REVERSE LIGHT CONTACT

CHECKING WIRE AND REPLACEMENT OF COMPONENT

Check the wire between the central electronic module (CEM) 1A and reverse light contact 2 (3/10) for a short circuit to ground as described in, see **SHORT-CIRCUIT TO GROUND, PERMANENT FAULTS** .

Also check the connector for a short circuit to ground as described in, see **SHORT-CIRCUIT TO GROUND, PERMANENT FAULTS** .

If no fault is found on the wire, check the function of the reversing lamp switch.

HINT: If brake light contact is closed, the voltage between 1 and 2 on the contact is 0 V.

Do the necessary corrective action.

Additional information

- To access/replace the CEM connector, see **CENTRAL ELECTRONIC MODULE (CEM), REPLACING**
- For information on signals and additional values, see **SIGNAL SPECIFICATION**
- To connect a test box, see **CONNECTING THE BREAKOUT BOX** .

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Possible Source

- Short circuit to ground.

Fault symptom[s]

- Reverse light does not work when reverse is selected.

CHECKING SPEED RELATED POWER STEERING (2003-12)

CHECKING SPEED RELATED POWER STEERING (2003-04)

CHECKING SPEED RELATED POWER STEERING

A fault in the speed related power steering can result in the steering becoming abnormally stiff at low speed or abnormally light at high speed.

Fault causes could be:

- No power supply to the speed related power steering control module
- Open-circuit or loose connection in the wiring between the control module and the central electronic module (CEM)
- Open-circuit or loose connection in the wiring between the control module and the solenoid on the steering gear
- Contact resistance and oxidation in the control module or solenoid connectors
- Defective control module for speed related power steering.

- **Continue**

  Refer to **CHECKING THE POWER SUPPLY**

CHECKING THE POWER SUPPLY

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CHECKING STANDBY CURRENT (2005-12)

CHECKING STANDBY CURRENT

PREPARATIONS FOR STANDBY CURRENT MEASUREMENT

When the vehicle sets the communication buses and the control modules in "sleep mode", power consumption drops. Factors such as whether the vehicle is locked, the alarm is on or off or whether any doors are open affect the rate at which the vehicle will reach standby power consumption. The lowest power consumption is achieved the quickest when the vehicle is locked, the alarm is on and the vehicle's doors are closed.

Preparations

Ensure that all lighting is switched off.

Ensure that the diagnostic tool is not connected in the vehicle.

Open the tailgate or trunk lid and bonnet and set the locks to the deadlocked position using a screwdriver for example.

Open the driver's and passenger doors and set the locks to the deadlocked position using a screwdriver for example.

Close the rear doors, remove the key and lock and alarm the vehicle. Never use reduced alarm as it then takes longer for the CAN network to continue in "sleep mode".

Wait until the vehicle has come down in standby current consumption, which can take up to 10 minutes.

NOTE: Do not open any doors or the test will have to be restarted from the beginning.

- **Continue**

  Refer to **CONNECTING THE MEASURING INSTRUMENT**

CONNECTING THE MEASURING INSTRUMENT

When measuring the power consumption, it will soon become evident if there is a power consuming component in the car drawing an excessive amount of the battery capacity. If it is clear that the power consumption is greater than the specified limit values, fault trace by successive elimination.

The method for measuring the total standby current consumption is described below.

The vehicle's standby current is measured using a multimeter.

NOTE: If the vehicle has been run to operating temperature, check that the system relay has been activated. An activated system relay causes increased standby current consumption. This is normal under certain circumstances.

- **Continue**

  Refer to **MEASUREMENT METHOD**

MEASUREMENT METHOD

When measuring the vehicle's total power consumption, connect the measuring instrument in series with the battery at the battery's negative pole.

Connecting the multimeter at the battery negative pole

NOTE: To avoid current surges that could damage the measuring instrument when the battery cable is connected, carry out the following. Never connect the measuring instrument if the engine cooling fan is in operation as this can damage the instrument.

Ensure that the multimeter is equipped with a clamp and a probe.

Check that the multimeter is set for current measurement.

Disconnect the nut on the battery cable's negative pole.

NOTE: Do not lift the battery cable so that the circuit is broken.

Secure the clamp on the negative pole's battery cable terminal.

NOTE: Check that the connections are installed correctly. If the circuit is broken, the standby current must be re-checked from the beginning

Place the end of the probe on the battery's negative pole.

Slowly lift the battery negative cable without removing the probe.

Stop when the battery negative cable hangs freely without touching the battery or the probe.

Measuring and reading off the total standby current.

Read off the standby current consumption. The total standby current should be less 25 mA.

NOTE: If the car is equipped with "Volvo on call" and the standby current is too high, wait 5 minutes and measure again. The "Volvo on call" system is active for short periods and then increases the short-term standby current above the normal value.

Reinstall the battery's negative cable.

Look and listen for unusual vehicle behavior. Check, for example, if a relay is hot, if it is this can indicate that current is flowing through it.

NOTE: Do not carry out work inside a vehicle equipped with mass movement sensors

as the alarm may be triggered.

Check that the CAN network has continued in "sleep mode", see instructions. See **CHECKING CAN-NET'S REST STATUS**

If the standby current is OK and the CAN network is still in "sleep mode", reset the vehicle.

NOTE: Do not forget to unlock the trunk lid or tailgate and doors.

If a fault is detected, fault-trace the relevant system. Otherwise continue fault tracing by successive elimination.

Fig. 144: Identifying Multimeter (1 Of 2)
Courtesy of VOLVO CARS CORPORATION

Fig. 145: Identifying Multimeter (2 Of 2)
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **FAULT TRACING BY SUCCESSIVE ELIMINATION**

FAULT TRACING BY SUCCESSIVE ELIMINATION

During fault tracing by successive elimination, try to localise the problem by measuring the power consumption at the same time as removing one fuse at a time in the vehicle.

Procedure

Expose the integrated relay/fusebox in the engine compartment and the fuses in the Central electronic module (CEM).

Use the multimeter and check that the relays and fuses have the correct voltage. Measure between fuses and suitable ground terminals. If any problem is detected, troubleshoot the system in question.

Remove a fuse and read off the standby consumption according to the instructions above. If the power consumption has dropped to less than 25 mA, fault trace the system that the fuse corresponds to. if power consumption has not reduced, repeat the procedure with another fuse.

NOTE: **Remove one fuse at a time and measure. Do not reinstall the fuses until the fault has been found, because it could awaken the car from "sleep mode" and restore the problem. If the vehicle was going to woken from "sleep mode" anyway, repeat the preparations for standby power consumption before continuing successive elimination.**

If the fault has not occurred, continue with successive elimination on relays and the connectors for the vehicle's control modules.

CHECKING STARTING CONDITIONS (2003-04)

CHECKING THE START REQUIREMENTS

CHECKING THE FUEL PUMP (FP)

Fig. 146: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Activate the fuel pump (FP): Click on the VCT 2000 symbol.

  WARNING: **Great care must be taken when activating the fuel pump (FP). If fuel is filled for an excessive amount of time, smoke may be generated or the heater may be damaged.**

  Check that the fuel pump (FP) is working. The heater cannot be started if the pump is not working. The basic problem is then in the fuel system / fuel pump (FP).

Fig. 147: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the fuel pump (FP) working?

- **YES**

  Refer to **CHECKING THE START PARAMETERS**

- **NO**

  Perform additional troubleshooting.

CHECKING THE START PARAMETERS

Fig. 148: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

NOTE: The heater must be switched off when reading off

Read out the values for quantity of fuel, battery voltage and number of failed start attempts.

The fuel level should be sufficient and the voltage to the heater must not be too low in order for the heater to be started. If the number of failed start attempts is excessive the heater prevents starting.

Remedy as necessary.

Other information:

- For a description of parameters, see **DESCRIPTION OF PARAMETERS** .

Fig. 149: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are stored.

Substitute Value

None.

Possible Source

- Fault in fuel system
- Voltage too low in control unit (CPM)
- Fuel level too low
- Airbag deployed (blocks fuel pump)

Fault symptom[s]

- Poor interior heating.
- Parking heater does not work.

CHECKING SUN ROOF OPERATION (2003-12)

CHECKING SUN ROOF OPERATION

CALIBRATING THE SUN ROOF MODULE (SRM)

To ensure that the sun roof is correctly calibrated, try recalibrating it.

Then test sun roof operation.

Other information

- see **SUN ROOF MODULE (SRM), CALIBRATING**

Fig. 150: Identifying Sun Roof Module (SRM)
Courtesy of VOLVO CARS CORPORATION

Can the sun roof be operated?

- **YES**

Refer to **CHECKING OPERATION**

- **NO**

  Refer to **CHECKING THE MECHANISM**

CHECKING OPERATION

Check that the sun roof makes smooth movements during operation.

Is the sun roof function OK?

- **YES**

  Refer to **CHECKING SUN ROOF CLOSURE**

- **NO**

  Refer to **CHECKING CABLES**

CHECKING SUN ROOF CLOSURE

Check that the sun roof closes properly and tightly.

Is the sun roof function OK?

- **YES**

  FAULT NOT FOUND: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING CLOSURE**

CHECKING THE MECHANISM

Check whether the mechanism moves during sun roof operation.

Fig. 151: Identifying Sun Roof Mechanism
Courtesy of VOLVO CARS CORPORATION

Does the mechanism move?

- **YES**

  Refer to **CHECKING SUN ROOF INSTALLATION**

- **NO**

  Refer to **CHECKING VOLTAGE**

CHECKING SUN ROOF INSTALLATION

Check that the sun roof is properly mounted.

Remedy as necessary.

Other information

- For checking sun roof installation: **SUN ROOF, REPLACING**
- **Continue**

Refer to **FUNCTIONALITY CHECK**

CHECKING VOLTAGE

Fig. 152: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check the voltage to the motor. It should be 9-16 V.

Fig. 153: Identifying Sunroof Motor
Courtesy of VOLVO CARS CORPORATION

Is the voltage OK?

- **YES**

  Refer to **CHECKING SUN ROOF INSTALLATION**

- **NO**

  Refer to **CHECKING VOLTAGE**

CHECKING SUN ROOF INSTALLATION

Check that the motor is properly installed. If no fault is found, replace the motor.

Remedy as necessary.

Is the voltage OK?

- **YES**

Refer to **CHECKING CABLES**

- **NO**

  Refer to **CHECKING CABLES AND BATTERY VOLTAGE**

CHECKING CABLES

Fig. 157: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off

  Check cables and connectors to the motor. If no fault is found, replace the sun roof module (SRM).

  Remedy as necessary.

Other information

- see **CONTROL MODULE, SUN ROOF, REPLACING**
- see **CHECKING WIRING AND TERMINALS**

- **Continue**

  Refer to **FUNCTIONALITY CHECK**

CHECKING VOLTAGE

Fig. 158: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

Check the voltage to the sun roof switch. It should be 9-16 V.

Other information

- see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)**

Is the voltage OK?

- **YES**

  Refer to **CHECKING CABLES AND BATTERY VOLTAGE**

- **NO**

  Refer to **CHECKING CABLES**

CHECKING CABLES AND BATTERY VOLTAGE

Fig. 159: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check the battery voltage to the sun roof module (SRM).

  Check the fuse:

  - 11C/26 (XC90).

  Check cables and connectors for contact resistance and open-circuit.

  Remedy as necessary.

  Other information

- see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)**
- see **CHECKING WIRING AND TERMINALS**

Fig. 160: Identifying Sun Roof Module (SRM)
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **FUNCTIONALITY CHECK**

CHECKING CABLES

Fig. 161: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off

  Check the cables and connectors of the sun roof module (SRM) for contact resistance and open-circuit.

  Remedy as necessary.

  Other information

  - see **SWITCH SUN ROOF, REPLACING**
  - see **CHECKING WIRING AND TERMINALS**

Fig. 162: Identifying Sun Roof Module (SRM)
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **FUNCTIONALITY CHECK**

CHECKING CABLES

Fig. 163: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check that the motor runs smoothly. Replace the motor as necessary.

  Check that the sun roof opens properly. It should take approx. 6 seconds for the sun roof to completely open from the closed position. Check the mechanism as necessary. Clean and lubricate the rail.

  Check the mechanism, rails and drive for unevenness. Replace the drive and/or mechanism as necessary.

  Remedy as necessary.

  Other information

- see **ELECTRIC MOTOR, SUN ROOF, REPLACING**
- see **MECHANISM/MECHANICAL CABLE SUN ROOF, REPLACEMENT**

- **Continue**

  Refer to **FUNCTIONALITY CHECK**

CHECKING CLOSURE

Fig. 164: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  When closing, check if the sun roof stops or returns to the open position.

Does the sun roof stop at the wrong position?

- **YES**

  Refer to **CHECKING THE SUN ROOF**

- **NO**

  Refer to **CHECKING THE MECHANISM**

CHECKING THE SUN ROOF

Try recalibrating the sun roof module (SRM).

Check the function of the sun roof motor. Replace the motor as necessary. If the motor works properly, check the sun roof mechanism for friction-free travel and blockage.

HINT: If there is a problem with ATS (pinch protection function), the cause of the fault is usually mechanical. It is therefore important to perform a comprehensive check of the sun roof mechanics. If the cause of the fault is not found, replace the control module.

Remedy as necessary.

Other information

- see **SUN ROOF MODULE (SRM), CALIBRATING**
- see **ELECTRIC MOTOR, SUN ROOF, REPLACING**
- see **CONTROL MODULE, SUN ROOF, REPLACING**

- **Continue**

  Refer to **FUNCTIONALITY CHECK**

CHECKING THE MECHANISM

Fig. 165: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off

  Check the sun roof mechanism.

  Remedy as necessary.

  Other information

  - see **MECHANISM/MECHANICAL CABLE SUN ROOF, REPLACEMENT**

Fig. 166: Identifying Sun Roof Mechanism
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **FUNCTIONALITY CHECK**

FUNCTIONALITY CHECK

Fig. 167: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check that sun roof function is OK. Check that the sun roof operates and closes properly.

Is the sun roof function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should be diagnosed and remedied. Since this is not the case the fault-tracing process has failed.

Complete the fault-tracing for those fault or try again.

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Substitute Value

None.

Possible Source

- Improperly mounted sun roof.
- No battery voltage - sun roof module (SRM) to or from electric motor.
- Wrong electric motor for sun roof.
- Sun roof improperly calibrated.

Fault symptom[s]

- Power sun roof does not work.

CHECKING SUPPLIES (B5254T2; B6294T; 2003-04)

CHECKING THE FEEDS

CHECKING SUPPLY

Fig. 168: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Check the supply to Combustion Preheater Module (CPM) #9 for contact resistance and oxidation as described in, see **CONTACT RESISTANCE AND OXIDATION** , or a loose connection as described in **LOOSE CONNECTIONS (TERMINALS)** . Also check fuse 9 in the engine compartment.

  Check the cable between #1 on the Ext-X relay (2/29) and #15 on the Combustion Preheater Module (CPM) for contact resistance and oxidation as described in, see **CONTACT RESISTANCE AND OXIDATION** , or for a loose connection as described in **LOOSE CONNECTIONS (TERMINALS)** . Also check the relay (2/29), the supply to the relay and passenger compartment fuse 24.

  Check that the ground lead is undamaged by checking the cable between additional heater #3 and the ground terminal.

Also check the intermediate connectors.

Other information:

- To replace the relay, see **CENTRAL ELECTRONIC MODULE (CEM), REPLACING** .
- For other values, see **SIGNAL SPECIFICATION** .

Remedy as necessary.

Fig. 169: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 170: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 171: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 172: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 173: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect connector, install components etc.
- Ignition on.

NOTE: It is important that only the ignition is on for the heater to start up.

- Activate the heater.

  A buzzing sound should be heard from the heater.

  Check the function of the heater as described in, see **ENGINE COOLANT HEATER, TEST RUNNING** .

Additional information:

- For a description of the parameters, see **DESCRIPTION OF PARAMETERS** .
- For a description of activations, see **ACTIVATING COMPONENTS/FUNCTIONS** .

Fig. 174: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Does the heater work?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble code has been stored.

Substitute Value

None.

Possible Source

- Weak battery
- Low voltage
- Contact resistance in the control unit connectors

Fault symptom[s]

- Parking heater does not work.

CHECKING THE 30 AND 15-SUPPLY (2003-04)

CHECKING THE 30 AND 15-SUPPLY

CHECKING THE 30-SUPPLY

Check fuses 11A/4 and 11C/25.

Check the power cable between fuse 11A/4 and fuse 11C/25 for an open-circuit or a short-circuit to ground.

HINT: If the VCT2000 is connected and the green LED lights then fuse 11A/4 is OK.

Remedy as necessary.

Other information:

- see **CHECKING WIRING AND TERMINALS** .

Fig. 175: Identifying Main Fuse
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING THE 30-SUPPLY CONTINUED**

CHECKING THE 30-SUPPLY CONTINUED

Check the power cable between fuse 11C/25 and the start switch terminal #30 for an open-circuit or a short-circuit to ground.

Remedy as necessary.

Other information:

- see **CHECKING WIRING AND TERMINALS** .

Fig. 176: Identifying Power Cable Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 177: Identifying Fuses In Engine Compartment Integrated Relay/Fusebox
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING THE 15-SUPPLY**

CHECKING THE 15-SUPPLY

- Ignition switch position II.

Check that there is contact between start switch terminals #30 and #15.

- Ignition switch position III.

Check that there is contact between start switch terminals #30 and #15.

Check that there is 15-supply from the start switch during the vehicle start attempt. Check the power supply from start switch terminal #15.

If a fault is found during the above fault tracing, replace the start switch.

If no fault is found, check the signal cable between start switch connector #15A and:

- engine control module (ECM) #B37
- central electronic module (CEM) #3B
- relay 2/31, central electronic module (CEM) #2
- Immobilizer antenna unit #1
- supplemental restraint system module (SRS) #28B for open-circuit or short-circuit to ground.

Remedy as necessary.

Other information:

- For connection of breakout box to engine control module (ECM): see **CONNECTING THE BREAKOUT BOX** .
- For connection of breakout box to central electronic module (CEM): see **CONNECTING THE BREAKOUT BOX** .
- For connection of breakout box to supplemental restraint system module (SRS): see **CONNECTING THE BREAKOUT BOX** .
- To replace the start switch, see **STARTER SWITCH, REPLACING** .
- see **CHECKING WIRING AND TERMINALS** .

Fig. 178: Identifying Power Cable Terminals

Position	Terminal						
	30	15	15	X	15I	S	50
KeyOut	X						
0	X					X	
I	X			X		X	
II	X	X	X	X	X	X	
III	X	X	X			X	X

Fig. 179: Identifying Reference Chart For Checking Power Terminals
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 180: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 181: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Reinstall the connectors, components etc.
- Start the engine.

Does the engine start?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

STARTER SWITCH, REPLACING

XC90

- See **STARTER SWITCH, REPLACING** .

CHECKING THE ALARM (2003-12)

CHECKING THE ALARM

CHECKING THE CONNECTORS

Fig. 182: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 183: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Check the connectors for the siren, upper electronic control module and cable harness. Check for contact resistance and oxidation.

  In particular, check for any damage

- Reinstall the components, reconnect the connectors etc.
- Ignition on.

  Open the driver's door window. Lock the car using the remote control.

  Wait 25 seconds until the vehicle has been alarmed. Trigger the alarm by extending your hand into the

passenger compartment and opening the bonnet.

Other information:

- See **SIREN, REPLACING** (for cars with structure week -201127)
- To access the connector for the upper electronic module (UEM), see **UPPER ELECTRONIC MODULE (UEM)/REARVIEW MIRROR, REPLACING** (for vehicles with structure week -201127)
- See **ANTI-THEFT PROTECTION SIREN** (for cars with structure week 201128-)
- To access the connector, see **REAR ELECTRONIC MODULE (REM), REPLACING** (for vehicles with structure week 201128-)
- see **CHECKING WIRING AND TERMINALS** .

Fig. 184: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Is the siren functioning?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Check that the fuses in the fusebox in the passenger compartment are intact.

Check the cable between the control module's and siren's connector for open-circuits and short circuits to ground.

Check the wiring from the fuse in the passenger compartment to siren connector terminal #1. Check for an open-circuit. Check for a short-circuit to ground.

Remedy as necessary.

Other information:

- See **SIREN, REPLACING** (for cars with structure week -201127)
- See **ANTI-THEFT PROTECTION SIREN** (for cars with structure week 201128-)
- see **CHECKING WIRING AND TERMINALS** .

Fig. 185: Fuse Holder (Passenger Compartment)
Courtesy of VOLVO CARS CORPORATION

Fig. 186: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

The alarm is fitted.

Possible Source

- Open circuit or short circuit to ground on the wire.

  Faulty siren.

Fault symptom[s]

- Alarm does not work.

CHECKING THE ALARM CAUSE (2005-12)

READING OFF THE ALARM CAUSE

Fig. 187: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

  Read off the cause of the alarm by clicking on the VCT2000 symbol.

  The alarm can be deployed by up to 12 different components in the car, depending on the equipment

level. Each time the alarm is deployed, information is saved which makes it easier to determine the reason for deployment. Click on the VCT2000 symbol to find out which components deployed the alarm. Other information obtained is the time when the alarm deployed.

NOTE: **The alarm occurrences are not presented in chronological order. Read off the Actual time and Time parameters to determine the last time the alarm deployed. The parameter in Actual time gives a reference value which displays how long the internal clock in the central electronic module (CEM) has calculated at the time of the read off. The value of Actual time minus the value in Time gives the number of days since the last alarm.**

For more information: **DESCRIPTION OF READING OFF ALARM CAUSES**

Fig. 188: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

OKAY: Troubleshooting has been completed.

NOT OKAY: Refer to **COMMUNICATION FAULT**

COMMUNICATION FAULT

Communication has been interrupted for one of the following reasons:

- The ignition is switched off
- VCT2000 disconnected from the data link connector (DLC)
- VCT2000 disconnected from the VIDA cart
- Communication problems in VIDA application or in car.
- No voltage in the data link connector (DLC).

Check therefore:

- That the control module power supply and ground terminal are fault-free.
- That the fuse for the data link connector (DLC) is intact.
- that the ignition is on
- that the battery voltage (system voltage) is normal (approximately 12 V).

  If necessary a battery charger can be connected during the test.

  For information about charge currents and the battery, see **BATTERY, CHARGING**

- that VCT2000 is correctly connected to the VIDA cart and the data link connector (DLC)
- that VCT2000 and the wiring is fault-free.

Other information

Try to establish communication again or exit reading off diagnostic trouble codes (DTCs). Depending on the communication fault, select one of the following options.

1. Try again. Refer to **READING OFF THE ALARM CAUSE**.
2. Fault-trace more comprehensively for the communication problem that has occurred. Refer to **CHECKING COMMUNICATION ERRORS**.
3. Exit fault-tracing/Read off from the next system. Troubleshooting has been completed.

Fig. 189: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

CHECKING COMMUNICATION ERRORS

CHECKING COMMUNICATION ERRORS

HINT: Test the communication with another corresponding vehicle to decide if the malfunction is in the vehicle or in VIDA/VCT/cable harness. If the communication works on another vehicle, the malfunction is in the vehicle.

HINT: For current information about each circuit and signals, see signal description for each system.

Different speed on the CAN-communication can lead to problems

Volvo's vehicles have different speed of communication on the high-speed part of the CAN-network (HS-CAN), depending on model year.

- Model year -2004 communicates with 250 kbit/s.
- Model year 2005- communicates with 500 kbit/s.

Due to this, it is very important to specify correct vehicle profile before any communication is started with the vehicle's HS-CAN. This is normally done by pressing on "Retrieve VIN" or by manually specifying vehicle parameters under "Vehicle profile".

If the wrong model year has been selected, it may lead to blocking of the CAN-net, diagnostic trouble codes being stored in several control modules or missing response from control modules at continued communication. The following control modules may be affected by this problem:

- Brake control module (BCM)/(ABS)
- Engine control module (ECM)
- Electronic Throttle Module (ETM)
- Suspension Module (SUM)
- Central electronic module (CEM)
- Transmission control module (TCM)
- Steering wheel angle sensor module (SAS)
- Steering Wheel Module (SWM)
- Electrical Power Steering Module (EPS)

If this happens, take the following action:

- Turn off the ignition and remove the ignition key. Insert the key again in position II.
- If the above does not work, remove the battery cable and connect it again after a minute to reset the control modules.
- Select the correct vehicle profile in VIDA and erase the diagnostic trouble codes. Check that the symptoms have disappeared.

Diagnostic outlet

- Check the voltage feed to diagnostic outlet #16. The voltage shall match battery voltage.
- Check the cable for power ground and signal ground to diagnostic outlet #4 and #5.

HINT: When VCT2000 is connected to the diagnostic outlet (is supplied with voltage), the indicator diode shall be activated with a green light. Then the indicator diode flashes quickly when communication takes place with a control module. In case of certain internal malfunctions on VCT2000 the indicator diode is activated with a red light.

Communication cables

- Check the communication cable (k-line) between diagnostic outlet #7 and central electronic module (CEM) #D6 and other connected control modules for open circuit, short-circuit to ground and short-circuit to voltage.

CAUTION: In case of malfunction on this communication cable, communication cannot be established on either the low or high-speed network. First when communication takes place on this cable, the low and high-speed cables between the diagnostic outlet and central electronic module (CEM) are connected to the rest of the network in the vehicle. This is controlled via a relay in the central electronic module (CEM).

This relay is only found on vehicles of model year -2004.

- For communication problems with control units on **the high-speed network** , check communication cables between diagnostic outlet #6/ #14 and central electronic module (CEM) #B7/ #B8 for open circuit, short-circuit to ground and short-circuit to voltage according to references above.
- For communication problems with control units on **the low-speed network** , check communication cables between diagnostic outlet #3/#11 and central electronic module (CEM) #B19/#B20 for open circuit, short-circuit to ground and short-circuit to voltage according to references above.
- Also check the communication cables for the low and high-speed net between the central electronic module (CEM) and the other connected control modules according to troubleshooting above.

Control modules

- Check that the control module's voltage feed and ground connection are trouble-free.

CAUTION: If none of the above checks help, try reading out diagnostic trouble codes in the central electronic module (CEM). Done via VIDA vehicle communication. A prerequisite for being able to communicate with the control modules in the car is that the central electronic module (CEM) is active and can be communicated with. If communication is not possible with the central electronic module (CEM), check the voltage feed and ground for the central electronic module (CEM).

VCT2000 and cable harness

- Connect VCT2000 to the vehicle so that it is supplied with voltage. Test VCT2000 by selecting the system's self-test and VCT Test in the VIDA main menu. If any malfunction is found according to the test, first replace the cable harness then the VCT2000, if the test still indicates a malfunction.
- If no malfunctions were found after troubleshooting according to above, try with a new cable harness and/or new VCT2000.

VIDA

- If no malfunctions were found after troubleshooting according to above, try performing a complete system reset of VIDA (Volvo scan tool).

Other information

- see **CONTENTS**

Fig. 190: Identifying Data Link Connector
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **FAULT-TRACING INFORMATION**

FAULT-TRACING INFORMATION

Fault-tracing communication problems is now finished.

Do you want to try establishing communication again?

- **YES**

  see **DESCRIPTION OF READING OFF ALARM CAUSES**

- **NO**

  Troubleshooting has been completed.

DESCRIPTION OF READING OFF ALARM CAUSES

THE DATA IS READ OUT AS FOLLOWS

ACTUAL TIME

Indicates how long the internal clock in the central electronic module (CEM) has counted, displayed in days. The actual time gives a reference value which can be used to calculate the number of days since the last alarm. Subtract the value in Time from the value of Actual time to calculate the number of days since the last alarm.

TIME

Indicates how long the internal clock in the central electronic module (CEM) had counted until the time the alarm deployed. The highest number is the latest alarm.

ALARM CAUSE

Indicates the component in the car that caused the alarm.

- Front door right
- Front door left
- Rear door right
- Rear door left
- Hood
- Luggage Compartment Lid
- Ignition switch
- Vehicle tilt sensor
- Voltage drop siren
- Glass breakage sensor activated
- Rear MMS for XC90, or movement sensor (IMS) (IMS replaces MMS for XC90 from and incl. model year 2012).
- Mass movement sensor front, front MMS for XC90 (IMS replaces MMS for XC90 from and incl. model year 2012).

ELECTRICAL

Cables And Fuses - Symptom Related Diagnostic Procedures

CHECKING THE BACK-UP (REVERSING) LAMP (1) (2003-04)

CHECKING THE BACK-UP (REVERSING) LAMP (1)

CHECKING THE RELAY

Check the function of relay 2/80: Activate and deactivate the relay a number of times. The relay is functioning if there is a clicking sound when the relay is activated and deactivated.

Replace with a new relay if the relay does not function.

Other information:

- To access and replace the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .

Fig. 1: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 2: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Check that fuse 11D/4 is intact.

Check that the back-up (reversing) lamp bulbs are intact.

Check the cable between fuse 11D/4 terminal #2 and relay 2/80 terminal #5. Check the cable between relay 2/80 terminal #3 and the left and right upper lamp housing switches terminal #3. Check these cables for an open-circuit according to **OPEN-CIRCUIT, PERMANENT FAULTS** . Check these cables for a short-circuit to ground according to **SHORT-CIRCUIT TO GROUND, PERMANENT FAULTS** .

Check the cable between the left and right upper lamp housing switch terminal #1 and the ground terminal for an open-circuit according to **OPEN-CIRCUIT, PERMANENT FAULTS** .

Remedy as necessary.

Other information:

- For further information about signals and other values, see **SIGNAL SPECIFICATION**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX** .
- To access the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Possible Source

- Open circuit/short circuit to ground in power supply
- Open circuit in ground wire
- Faulty relay
- Defective lamp.

Fault symptom[s]

- Reversing light not working.

CHECKING THE BACK-UP (REVERSING) LAMP (2) (2003-04)

CHECKING THE BACK-UP (REVERSING) LAMP (2)

CHECKING THE RELAY

Check the function of relay 2/80: Activate and deactivate the relay a number of times. The relay is functioning if there is a clicking sound when the relay is activated and deactivated.

Replace with a new relay if the relay does not function.

Other information:

- To access the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .

Fig. 6: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 7: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE WIRING**

CHECKING THE WIRING

Check the cable between fuse 11D/4 terminal #2 and relay 2/80 terminal #5. Check the cable between relay 2/80 terminal #3 and the left and right upper lamp housing switches terminal #3. Check these cables for a short-circuit to supply voltage according to **SHORT-CIRCUIT TO SUPPLY VOLTAGE. PERMANENT FAULTS** .

Remedy as necessary.

Other information:

- For further information about signals and other values, see **SIGNAL SPECIFICATION**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX** .
- To access the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .

Fig. 8: Identifying Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 9: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Possible Source

- Wire between relay and lamp body short circuited to voltage supply
- Faulty relay.

Fault symptom[s]

- Reversing light remains on.

CHECKING THE BEAM SETTING ADJUSTMENT (2003-04)

CHECKING HEADLAMP BEAM HEIGHT CONTROL

Check the cable between the central electronic module (CEM) terminal #9A and the beam adjustment unit #2. Check for a short-circuit to supply voltage. Check for a short-circuit to ground. Check for an open-circuit. 6/38 for left motor and 6/39 for right motor.

HINT: Headlamp beam height control receives power and terminal #3 and is grounded at terminal #1.

If no faults are found, try replacing the switch and the beam adjustment unit.

Other information

- To replace light switches, see **SWITCHES LIGHTS, REPLACING**
- To replace beam adjustment unit, see **MOTOR HEIGHT CONTROL HEADLAMP, REPLACING**.

Fig. 10: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

MOTOR HEIGHT CONTROL HEADLAMP, REPLACING

- See **MOTOR HEIGHT CONTROL HEADLAMP, REPLACING** .

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are stored.

Possible Source

- Short circuit to voltage supply, ground or open circuit.

Fault symptom[s]

Beam setting adjustment does not work.

CHECKING THE BOOT LID AUTOMATIC CLOSING (2003-12)

CHECKING AUTOMATIC CLOSING OF THE SUN ROOF

CHECKING COMPONENTS AND WIRING

Check the wiring between sun roof switch and roof lamp module (RCM). Check for an open-circuit. Check for a short-circuit to ground.

Check the cable between the sun roof module (SRM) terminal #7 and the roof lamp module (RCM) terminal #1B. Check for an open-circuit. Check for a short-circuit to ground.

Check the cable between the sun roof module (SRM) terminal #9 and the roof lamp module (RCM) terminal #9A. Check for an open-circuit. Check for a short-circuit to ground.

Remedy as necessary.

If no fault was found, try replacing the sun roof switch.

Other information

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For further information about signals and other values, see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)**
- To access or replace the sun roof module (SRM), see **INTERIOR LIGHTING, REPLACING**
- To access or replace the sun roof switch, see **SWITCH SUN ROOF, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 11: Identifying Connector (D) Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 12: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 13: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Boot lid OK.

Substitute Value

-

Possible Source

- Open circuit or short circuit to ground on the wire
- Defective diodes.

Fault symptom[s]

- Automatic sunroof closing does not work.

CHECKING THE BRAKE LIGHT (2003-04)

CHECKING THE STOP LAMP

CHECKING THE WIRING AND THE RELAY

If the brake light does not light up, check the cable between the central electronic module (CEM) terminal #6B and the rear electronic module (REM) terminal #4A. Check for an open-circuit. Check for a short-circuit to

supply voltage.

If the brake light is constantly lit, check the cable between the central electronic module (CEM) terminal #6B and the rear electronic module (REM) terminal #4A. Check for a short-circuit to ground.

HINT: When the brake pedal is depressed, there should be 0 V in the connections, otherwise 12 V in the connections.

Check the relay (2/79).

HINT: There should be a 12 V supply to the relay switch to terminal #5 and in the supply to coil #2. When the brake pedal is depressed, there should be 12 V in the relay switch #3.

Check the cable between terminal #5 and fuse 3 in the cargo compartment fusebox (11D/3).

Check that fuse is intact.

Check the cable between relay #3 (2/79) and shunt brake light #3 (20/31).

Check shunt (20/31).

HINT: The voltage must be 12 V at the shunt terminals, i. e. at terminals #3 and #2 when the brake light is active.

Check the cable between shunt brake light #2 (20/31) and brake light #2B (10/54 for left brake light and 10/48 for right brake light).

Check the ground supply between the brake light terminal #1B and the ground terminal.

If no fault was found, replace the brake light.

Other information:

- For information about signals, see **SIGNAL SPECIFICATION**
- To replace the brake light, see **BULB TAIL LAMP/STOP LAMP/BACK-UP LAMP/FOG LAMP, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 14: Identifying Ohmmeter

BULB TAIL LAMP/STOP LAMP/BACK-UP LAMP/FOG LAMP, REPLACING

- See **BULB TAIL LAMP/STOP LAMP/BACK-UP LAMP/FOG LAMP, REPLACING** .

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are stored.

Possible Source

- Faulty relay

- Faulty brake light shunt
- Open circuit
- Short circuit to ground on the wire
- Short circuit to voltage supply on wire.

Fault symptom[s]

Brake light does not come on when brake pedal is pressed.

Brake light remains on.

CHECKING THE BUTTON DIODES (2003-12)

CHECKING BUTTON LEDS

CHECKING COMPONENTS AND WIRING

Check the cable between the control module terminal #8 and roof lamp module terminal #2A. Check for an open-circuit. Check for a short-circuit to ground.

Check the cable between the roof lamp module terminal #10A and the ground terminal 31/83 (A-post, left). Check for an open-circuit.

Remedy as necessary.

Replace the printed circuit board if no fault was found

Other information

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For further information about signals and other values, see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)**
- To access or replace the printed circuit board, see **INTERIOR LIGHTING, REPLACING**
- To access the sun roof control module, see **CONTROL MODULE, SUN ROOF, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 16: Identifying Connector (D) Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 17: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Substitute Value

-

Possible Source

- Open circuit in wire

- Defective diodes.

Fault symptom[s]

- Button diodes do not light.

CHECKING THE COURTESY LIGHT (2003-04)

CHECKING THE COURTESY LIGHT

PROGRAMMING THE HOME SAFE LIGHTS

The home safe lights can be programmed to stay on for a longer or shorter time according to the wishes of the customer.

The factory setting is 30 seconds. The time can be set to 0, 30, 60 or 90 seconds.

Read off the programming by clicking on the VCT2000 symbol.

To change the time set, mark the desired value in the scrolling list and start programming.

Fig. 18: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **SAVE THE PROGRAMMED VALUE**

SAVE THE PROGRAMMED VALUE

To ensure that the programmed information is stored, click on the VCT2000 symbol to force the entry.

Fig. 19: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

CHECKING THE DIRECTION INDICATOR DISPLAY (2003-04)

CHECKING THE DIRECTION INDICATOR DISPLAY

CHECKING THE SHUNT AND WIRES

Check the fuse 11C/21.

Check the connection between the fuse 11C/21 and the central electronic module (CEM) B23 (E3).

Check that the shunt 2 has a flasher signal, 20/32 for left direction indicator and 20/34 for right direction indicator.

Check the wire between the shunt 2 and each direction indicator as shown in the table below.

Front left flasher	10/9 2
Front left side flasher	10/15 2
Rear left flasher	10/54 4B
Front right flasher	10/10 2
Front right side flasher	10/16 2
Rear right flasher	10/47 4B

Check relevant ground connection.

HINT: Ground connection is 3 for front flasher, 1 for side flasher and 1B for rear flasher.

Fig. 20: Identifying Ohmmeter

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are stored.

Possible Source

- Faulty shunt
- Open circuit in wire
- Short circuit to voltage supply or ground on the wire.

Fault symptom[s]

Indicator does not work.

CHECKING THE DOOR LOCKING FUNCTION (2003-04)

CHECKING THE DOOR LOCKING FUNCTION

QUERY

Which door does the problem affect?

1. Driver's door. Refer to **CHECKING THE DRIVER'S DOOR**
2. Passenger door. Refer to **CHECKING THE PASSENGER DOOR**
3. Left rear door. Refer to **CHECKING THE LEFT REAR DOOR**
4. Right rear door. Refer to **CHECKING THE RIGHT REAR DOOR**

CHECKING THE DRIVER'S DOOR

CHECK

Is the lock for the passenger door also not functioning?

- **YES**

  Refer to **CHECKING FUSES**

- **NO**

  Refer to **CHECK**

CHECKING FUSES

Remove fuse 11C/27 from the cargo compartment fusebox.

Check that the fuse is intact. Check for contact resistance and oxidation.

Other information

- To access the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 21: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

Fig. 22: Locating Integrated Relay/Fusebox In Cargo Compartment
Courtesy of VOLVO CARS CORPORATION

Is the fuse intact?

- **YES**

  Refer to **CHECKING FOR AN OPEN-CIRCUIT**

- **NO**

  Refer to **CHECKING FOR A SHORT-CIRCUIT**

CHECK

1. The window lift mechanism functions in the relevant door. Refer to **CHECKING THE CABLES FOR THE LOCK MOTOR**
2. The window lift mechanism does not function in the relevant door. Refer to **CHECK**.

CHECK

1. The car is left-hand drive. Refer to **CHECKING FUSES**

CHECKING FUSES

Remove fuse 11C/35 from the cargo compartment fusebox.

Check that the fuse is intact. Check for contact resistance and oxidation.

Other information

- To access the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 23: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

Fig. 24: Locating Integrated Relay/Fusebox In Cargo Compartment
Courtesy of VOLVO CARS CORPORATION

Is the fuse intact?

- **YES**

  Refer to **CHECKING THE VOLTAGE**

- **NO**

  Refer to **CHECKING FOR A SHORT-CIRCUIT**

CHECKING FUSES

Remove fuse 11C/36 from the cargo compartment fusebox.

Check that the fuse is intact. Check for contact resistance and oxidation.

Other information

- To access the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 25: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

Fig. 26: Locating Integrated Relay/Fusebox In Cargo Compartment
Courtesy of VOLVO CARS CORPORATION

Is the fuse intact?

- **YES**

  Refer to **CHECKING THE VOLTAGE**

- **NO**

  Refer to **CHECKING FOR A SHORT-CIRCUIT**

CHECKING FOR AN OPEN-CIRCUIT

Check terminal #B7 in the connectors for the door control modules. Check for contact resistance and oxidation.

Check the cable between the secondary side of the fuse holder (left) and terminal #B7 in the connectors for the door control modules. Check for an open-circuit.

If a fault is detected, check in particular the intermediate connector in the cable harness (1 connector per control module). Check for contact resistance and oxidation.

If there is an open-circuit, the fault is probably between the fuse and the common junction point 53/427.

Other information

- see **CHECKING WIRING AND TERMINALS** .

Fig. 27: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

CHECKING FOR A SHORT-CIRCUIT

Measure the resistance between the fuse holder secondary side (left) and ground.

The ohmmeter should read infinite resistance.

NOTE: If the value is correct the fault may be intermittent.

Now fault-trace for an intermittent short-circuit to ground.

If the ohmmeter displays a fault (short-circuit), fault-trace the cables between the fuse and terminal #B7 on the connectors for the driver/passenger door module (DDM/PDM). Check for a short-circuit to ground.

The fault is probably between the fuse and the common junction point 53/427.

Replace fuse.

Other information

- see **CHECKING WIRING AND TERMINALS** .

Fig. 28: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

CHECKING THE VOLTAGE

Check the voltage in door control module connector terminal #B12.

Fig. 29: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

Does the voltmeter read battery voltage?

- **YES**

  Refer to **CHECKING THE CABLES FOR THE LOCK MOTOR**

- **NO**

  Refer to **CHECKING FOR AN OPEN-CIRCUIT**

CHECKING FOR AN OPEN-CIRCUIT

Check door control module connector terminal #B12. Check for contact resistance and oxidation.

Check the cable between the secondary side of the fuse holder (left) and terminal #B12 in the connectors for the door control modules. Check for an open-circuit.

If a fault is detected, check in particular the intermediate connector in the cable harness. Check for contact resistance and oxidation.

Other information

- see **CHECKING WIRING AND TERMINALS** .

Fig. 30: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

CHECKING FOR A SHORT-CIRCUIT

Measure the resistance between the fuse holder secondary side (left) and ground.

The ohmmeter should read infinite resistance.

NOTE: If the value is correct the fault may be intermittent.

Now fault-trace for an intermittent short-circuit to ground.

If the ohmmeter displays a fault (short-circuit), fault-trace the cables between the fuse and terminal #B12 on the connectors for the door control modules. Check for a short-circuit to ground.

Replace fuse.

Other information

- To access the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 31: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 32: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

CHECKING THE CABLES FOR THE LOCK MOTOR

Check the connectors for the door control module and lock unit. Check for contact resistance and oxidation.

Check the cable between door control module connector terminal #B2 and lock unit connector terminal #8. Check for an open-circuit.

Check the cable between door control module connector terminal #B6 and lock unit connector terminal #7. Check for an open-circuit.

Other information

- To access and replace the rear electronic module (REM), see **RELAY/FUSE BOX CARGO**

COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING

- see **CHECKING WIRING AND TERMINALS** .

Fig. 33: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

Replace the lock unit. See **LOCK MECHANISM FRONT SIDE DOOR, REPLACING** .

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

Replace the rear electronic module (REM). See **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .

CHECKING THE PASSENGER DOOR

CHECK

Is the lock for the driver's door also not functioning?

- **YES**

  Refer to **CHECKING FUSES**

- **NO**

  Refer to **CHECK**

CHECKING FUSES

Remove fuse 11C/27 from the cargo compartment fusebox.

Check that the fuse is intact. Check for contact resistance and oxidation.

Other information

- To access the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 34: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

Fig. 35: Locating Integrated Relay/Fusebox In Cargo Compartment
Courtesy of VOLVO CARS CORPORATION

Is the fuse intact?

- **YES**

  Refer to **CHECKING FOR AN OPEN-CIRCUIT**

- **NO**

  Refer to **CHECKING FOR A SHORT-CIRCUIT**

CHECK

1. The window lift mechanism functions in the relevant door. Refer to **CHECKING THE CABLES FOR THE LOCK MOTOR**.
2. The window lift mechanism does not function in the relevant door. Refer to **CHECK**.

CHECK

1. The car is left-hand drive. Refer to **CHECKING FUSES**.

CHECKING FUSES

Remove fuse 11C/35 from the cargo compartment fusebox.

Check that the fuse is intact. Check for contact resistance and oxidation.

Other information

- To access the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 36: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

Fig. 37: Locating Integrated Relay/Fusebox In Cargo Compartment
Courtesy of VOLVO CARS CORPORATION

Is the fuse intact?

- **YES**

  Refer to **CHECKING THE VOLTAGE**

- **NO**

  Refer to **CHECKING FOR A SHORT-CIRCUIT**

CHECKING FUSES

Remove fuse 11C/36 from the cargo compartment fusebox.

Check that the fuse is intact. Check for contact resistance and oxidation.

Other information

- To access the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 38: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

Fig. 39: Locating Integrated Relay/Fusebox In Cargo Compartment
Courtesy of VOLVO CARS CORPORATION

Is the fuse intact?

- **YES**

  Refer to **CHECKING THE VOLTAGE**

- **NO**

  Refer to **CHECKING FOR A SHORT-CIRCUIT**

CHECKING FOR AN OPEN-CIRCUIT

Check terminal #B7 in the connectors for the door control modules. Check for contact resistance and oxidation.

Check the cable between the secondary side of the fuse holder (left) and terminal #B7 in the connectors for the door control modules. Check for an open-circuit.

If a fault is detected, check in particular the intermediate connector in the cable harness (1 connector per control module). Check for contact resistance and oxidation.

If there is an open-circuit, the fault is probably between the fuse and the common junction point 53/427.

Other information

- see **CHECKING WIRING AND TERMINALS** .

Fig. 40: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

CHECKING FOR A SHORT-CIRCUIT

Measure the resistance between the fuse holder secondary side (left) and ground.

The ohmmeter should read infinite resistance.

NOTE: If the value is correct the fault may be intermittent.

Now fault-trace for an intermittent short-circuit to ground.

If the ohmmeter displays a fault (short-circuit), fault-trace the cables between the fuse and terminal #B7 on the connectors for the door control modules. Check for a short-circuit to ground.

The fault is probably between the fuse and the common junction point 53/427.

Replace fuse.

Other information

- see **CHECKING WIRING AND TERMINALS** .

Fig. 41: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

CHECKING THE VOLTAGE

Check the voltage in door control module connector terminal #B12.

Fig. 42: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

Does the voltmeter read battery voltage?

- **YES**

  Refer to **CHECKING THE CABLES FOR THE LOCK MOTOR**

- **NO**

  Refer to **CHECKING FOR AN OPEN-CIRCUIT**

CHECKING FOR AN OPEN-CIRCUIT

Check door control module connector terminal #B12. Check for contact resistance and oxidation.

Check the cable between the secondary side of the fuse holder (left) and terminal #B12 in the connectors for the door control modules. Check for an open-circuit.

If a fault is detected, check in particular the intermediate connector in the cable harness. Check for contact resistance and oxidation.

Other information

- see **CHECKING WIRING AND TERMINALS** .

Fig. 43: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

CHECKING FOR A SHORT-CIRCUIT

Measure the resistance between the fuse holder secondary side (left) and ground.

The ohmmeter should read infinite resistance.

NOTE: If the value is correct the fault may be intermittent.

Now fault-trace for an intermittent short-circuit to ground.

If the ohmmeter displays a fault (short-circuit), fault-trace the cables between the fuse and terminal #B12 on the connectors for the door control modules. Check for a short-circuit to ground.

Replace fuse.

Other information

- To access the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 44: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 45: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

CHECKING THE CABLES FOR THE LOCK MOTOR

Check the connectors for the door control module and lock unit. Check for contact resistance and oxidation.

Check the cable between door control module connector terminal #B2 and lock unit connector terminal #8. Check for an open-circuit.

Check the cable between door control module connector terminal #B6 and lock unit connector terminal #7. Check for an open-circuit.

Other information

- To access and replace the rear electronic module (REM), see **RELAY/FUSE BOX CARGO**

COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING

- see **CHECKING WIRING AND TERMINALS** .

Fig. 46: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

Replace the lock unit. See **LOCK MECHANISM FRONT SIDE DOOR, REPLACING** .

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

Replace the rear electronic module (REM). See **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .

CHECKING THE LEFT REAR DOOR

CHECK

Is the lock for the right rear door also not functioning?

- **YES**

  Refer to **REPLACING THE COMPONENT**

- **NO**

  Refer to **CIRCUIT TEST**

REPLACING THE COMPONENT

Replace the relays for locking and unlocking in the integrated relay/fusebox in the cargo compartment. Check the relay base switches. Check for contact resistance and oxidation.

Other information

- To access the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 47: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 48: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING FUSES**

CIRCUIT TEST

The fault indicates an open-circuit in the lock unit circuit.

Disconnect the connector at the lock unit.

Check the connectors for contact resistance and oxidation.

Measure the resistance between terminals terminal #4 and #6 on the cable connector.

Other information

- To access and replace the lock unit, see **LOCK MECHANISM REAR SIDE DOOR, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 49: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 50: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

The ohmmeter should read 0 ohms.

- **OK**

  Refer to **CHECKING THE COMPONENT**

- **NOT OK**

  Refer to **CIRCUIT TEST CONTINUED**

CIRCUIT TEST CONTINUED

Measure the resistance between terminal #4 and ground and between terminal #6 and ground on the cable

connector.

The ohmmeter should read 0 ohms.

1. The ohmmeter displays a fault between terminal #4 and ground. Refer to **CHECKING THE LOCKING RELAY CIRCUIT**.
2. The ohmmeter displays a fault between terminal #4 and ground. Refer to **CHECKING THE UNLOCKING RELAY CIRCUIT**.

Fig. 51: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 52: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

CHECKING THE UNLOCKING RELAY CIRCUIT

Remove the relay for unlocking the left rear door.

Check the cable between terminal #4 the cable and connector and terminal #3 on the relay base. Check for an open-circuit.

If a fault is detected, check in particular the 2 intermediate connectors in the cable harness. Check for contact resistance and oxidation.

Remedy as necessary.

If no fault is detected, measure the resistance between terminal #4 in the relay base and ground.

The ohmmeter should read 0 ohms.

If the resistance is incorrect, replace the rear electronic module (REM).

Other information

- To access and replace the rear electronic module (REM), see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 53: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 54: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 55: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

CHECKING THE LOCKING RELAY CIRCUIT

Remove the central locking relay.

Check the cable between terminal #6 the cable and connector and terminal #3 on the relay base. Check for an open-circuit.

If a fault is detected, check in particular the 2 intermediate connectors in the cable harness. Check for contact resistance and oxidation.

Remedy as necessary.

If no fault is detected, measure the resistance between terminal #4 in the relay base and ground.

The ohmmeter should read 0 ohms.

If the resistance is incorrect, replace the rear electronic module (REM).

Other information

- To access and replace the rear electronic module (REM), see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 56: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 57: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 58: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

CHECKING THE COMPONENT

Measure the resistance between pins terminals #4 and #6 on the chassis switch lock unit.

The ohmmeter should read 5 ohms.

If the resistance is incorrect, replace the lock unit.

Remedy as necessary.

Other information

- To access the rear electronic module (REM), see **RELAY/FUSE BOX CARGO**

COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING

- To access and replace the lock unit, see **LOCK MECHANISM REAR SIDE DOOR, REPLACING**
- For further information about signals and other values, see **SIGNAL SPECIFICATION** .

Fig. 59: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 60: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING FOR A SHORT-CIRCUIT**

CHECKING FUSES

Remove fuse 11D/8 from the cargo compartment fusebox.

Check that fuse 11D/8 is intact. Check for contact resistance and oxidation.

Other information

- To access the rear electronic module (REM), see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 61: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

Fig. 62: Fuse Holder (Cargo Compartment)
Courtesy of VOLVO CARS CORPORATION

Is the fuse intact?

- **YES**

  Refer to **CHECKING FOR AN OPEN-CIRCUIT**

- **NO**

  Refer to **CHECKING FOR A SHORT-CIRCUIT**

CHECKING FOR AN OPEN-CIRCUIT

Remove the central locking relay in the rear electronic module (REM) and fault-trace the cable between the fuse holder secondary side (left) and terminal #5 in the relay base. Check for an open-circuit.

Other information

- To access the rear electronic module (REM), see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 63: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 64: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

CHECKING FOR A SHORT-CIRCUIT

Measure the resistance between the fuse holder secondary side (left) and ground.

The ohmmeter should read infinite resistance.

If the value is correct, replace the fuse.

Fault-trace all affected relay circuits for a short-circuit to ground if the value is incorrect.

HINT: Replace fuse.

HINT: If the fuse blows immediately the short-circuit is in the relay power cable.

HINT: If the fuse blows when the relevant relay is activated, the short-circuit is in the component power supply cable

HINT: The relay circuits that are affected belong to the central locking relay, unlocking rear left door relay and unlocking rear right door relay.

Other information

- To access the rear electronic module (REM), see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 65: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 66: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

CHECKING THE RIGHT REAR DOOR

CHECK

Is the lock for the left rear door also not functioning?

- **YES**

  Refer to **REPLACING THE COMPONENT**

- **NO**

  Refer to **CIRCUIT TEST**

REPLACING THE COMPONENT

Replace the relays for locking and unlocking in the integrated relay/fusebox in the cargo compartment. Check the relay base switches. Check for contact resistance and oxidation.

Other information

- To access the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 67: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 68: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING FUSES**

CIRCUIT TEST

The fault indicates an open-circuit in the lock unit circuit.

Disconnect the connector at the lock unit.

Check the connectors for contact resistance and oxidation.

Measure the resistance between terminals terminal #4 and #6 on the cable connector.

Other information

- To access and replace the lock unit, see **LOCK MECHANISM REAR SIDE DOOR, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 69: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 70: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

The ohmmeter should read 0 ohms.

- **OK**

  Refer to **CHECKING THE COMPONENT**

- **NOT OK**

  Refer to **CIRCUIT TEST CONTINUED**

CIRCUIT TEST CONTINUED

Measure the resistance between terminal #4 and ground and between terminal #6 and ground on the cable

connector.

The ohmmeter should read 0 ohms.

1. The ohmmeter displays a fault between terminal #4 and ground. Refer to **CHECKING THE LOCKING RELAY CIRCUIT**
2. The ohmmeter displays a fault between terminal #6 and ground. Refer to **CHECKING THE UNLOCKING RELAY CIRCUIT**

Fig. 71: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 72: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

CHECKING THE UNLOCKING RELAY CIRCUIT

Remove the relay for unlocking the right rear door.

Check the cable between terminal #4 the cable and connector and terminal #3 on the relay base. Check for an open-circuit.

If a fault is detected, check in particular the 2 intermediate connectors in the cable harness. Check for contact resistance and oxidation.

Remedy as necessary.

If no fault is detected, measure the resistance between terminal #4 in the relay base and ground.

The ohmmeter should read 0 ohms.

If the resistance is incorrect, replace the rear electronic module (REM).

Other information

- To access and replace the rear electronic module (REM), see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 73: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 74: Identifying Ohmmeter

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Possible Source

Rear doors:

- Faulty relay
- Fault in locking relay circuit

- Fault in unlocking relay circuit
- Faulty lock unit
- Fault in relay supply
- Defective fuse.

Fault symptom[s]

- A door does not lock/open.

CHECKING THE FAN DELAY IN THE INTERIOR COMPARTMENT (2003-04)

CHECKING THE FAN DELAY IN THE INTERIOR COMPARTMENT

PROGRAMMING FAN DELAY RUNNING IN COMPARTMENT

- With a smarttool it is possible to program if fan dealy function is switched on or off.

  The vehicle is delivered from factory with fan delay switched off.

  Read current programming.

  If the current setting is to be changed, select desired value in list and start programming sequence.

Fig. 87: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **STORING PROGRAMMED VALUE**

STORING PROGRAMMED VALUE

Press button in smarttool to ensure that programmed information is stored.

Fig. 88: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

CHECKING THE FLAME SENSOR (B5254T2; B6294T; 2003-04)

CHECKING THE FLAME SENSOR

CHECKING THE OPERATING STATUS

Fig. 89: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.
- Start the heater.

  Read off the operating status and temperature of the heater.

  HINT: The flame sensor should register the flame. If the temperature increases, even though status 3 is not obtained, the fault may be due to an open-circuit in the cable or the flame sensor may be blocked.

  Check the cable between terminal #8 on the control module and the flame sensor for an open-circuit according to **OPEN-CIRCUIT, PERMANENT FAULTS** .

  - For other values, see **SIGNAL SPECIFICATION** .

Fig. 90: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 91: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 92: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

Erase diagnostic trouble codes (DTCs).

NOTE: **Diagnostic trouble codes (DTCs) must be erased to start the heater. Before erasing diagnostic trouble codes (DTCs) all indicated faults must be corrected.**

Fig. 93: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- Refer to **VERIFICATION, CONTINUED**

VERIFICATION, CONTINUED

Fig. 94: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 95: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

NOTE: **It is important that only the ignition is on in order for the heater to start.**

- Activate the heater.

  A buzzing sound should be heard from the heater.

  HINT: After repair, the voltage of the flame sensor can be checked. The voltage should be a maximum of 1.0 V.

Check the function of the heater. See **ENGINE COOLANT HEATER, TEST RUNNING** .

Other information:

- For a description of parameters, see **DESCRIPTION OF PARAMETERS**
- For a description of activations, see **ACTIVATING COMPONENTS/FUNCTIONS** .

Fig. 96: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Does the heater operate?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

FAULT-TRACING INFORMATION

Condition

No diagnostic trouble codes (DTCs) are stored.

Substitute Value

None.

Possible Source

- Open-circuit in the cable for the flame sensor (terminal #8).
- The flame sensor is blocked.

Fault symptom[s]

- Poor heating in the passenger compartment.
- The parking heater does not operate.

CHECKING THE FRONT POSITION LAMPS (2003-04)

CHECKING THE FRONT POSITION LAMPS

CHECKING THE WIRING AND THE RELAY

Check the signal cables to the parking lamps. Check for an open-circuit. Check for contact resistance and oxidation.

Check the relay (2/61).

HINT: The voltage over the relay must be 12 V on pins #1 and #3 when the parking lamp is switched on.

Check the cable between terminal #3 and fuse 2, main fuses in the engine compartment (11A/2).

Also check the main fuse.

Check the connector between (54/3R).

Check the cable between the relay #1 (2/61) and passenger compartment fuses for the left respectively right parking lamps. (Fuse 11C/30 for the left side and 11C/31 for the right side).

Check the cable between the passenger compartment fuse and terminal #2 of the lamp housing for the relevant lamp circuit.

For the left parking lamp, check lamp 10/11.

For the right parking lamp, check lamp 10/12.

Check the ground supply between the lamp housing terminal #1 and the ground terminal.

Also check the connector between (54/3L).

Remedy as necessary.

Other information

- To access or replace the headlamp, see **HEADLIGHT/BULB, REPLACING** and **HEADLIGHT/BULB, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 97: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 98: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are stored.

Substitute Value

None.

Possible Source

- Faulty relay
- Open circuit or short-circuit to ground in the wire.

Fault symptom[s]

- Position lamps are not working.

CHECKING THE FUEL LEVEL SENSOR (2003-04)

CHECKING THE FUEL LEVEL SENSOR

CHECKING WIRING AND CONNECTORS

Check the wiring between:

connector terminal #5 for the fuel level sensors and rear electronic module (REM) terminal #A02 (#A2)

connector terminal #6 for the fuel level sensors and rear electronic module (REM) terminal #A10 (#A10)

connector terminal #7 for the fuel level sensors and rear electronic module (REM) terminal #A8 (#A8)

check for an open-circuit. Check for a short-circuit to supply voltage.

Check the relevant connectors. Check for contact resistance and oxidation.

Remedy as necessary.

Other information:

- For further information about signals and other values, see **SIGNAL SPECIFICATION**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- To access the fuel level sensor connector (left-hand side), see **LEVEL SENSOR, FUEL TANK, RIGHT-HAND/FUEL TANK, REPLACING**
- To access the fuel level sensor connector (right-hand side), see **LEVEL SENSOR, FUEL TANK, RIGHT-HAND/FUEL TANK, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 99: Fuel Level Sensor Terminals

Courtesy of VOLVO CARS CORPORATION

Fig. 100: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

CHECKING THE RESISTANCE OF THE SENSOR

Check the resistance of both the fuel level sensors. The resistance across each sensor may vary between 12 ohms (full fuel tank) and 383 ohms (empty fuel tank).

HINT: The resistance of the left fuel level sensor can be measured between terminals #5 and #6 on the connector for the fuel level sensors. The resistance of the right fuel level sensor can be measured between terminals #6 and #7 on the connector for the fuel level sensors.

Remedy as necessary.

Other information:

- For further information about signals and other values, see **SIGNAL SPECIFICATION**
- To access the connector/replace the fuel level sensor connector (left-hand side), see **LEVEL SENSOR, FUEL TANK, RIGHT-HAND/FUEL TANK, REPLACING**
- To access the connector/replace the fuel level sensor connector (right-hand side), see **LEVEL SENSOR, FUEL TANK, RIGHT-HAND/FUEL TANK, REPLACING** .

Fig. 101: Fuel Level Sensor Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 102: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING FLOATS AND WIRING**

CHECKING FLOATS AND WIRING

Check that the floats for the fuel levels sensors have not stuck.

Check the cable inside the fuel tank between the two sensors. Check for a short-circuit to supply voltage. Check for a short-circuit to ground. Check for an open-circuit.

Remedy as necessary.

Other information:

- For further information about signals and other values, see **SIGNAL SPECIFICATION**
- To access or replace the fuel level sensor (left-hand side), see **LEVEL SENSOR, FUEL TANK, RIGHT-HAND/FUEL TANK, REPLACING**
- To access or replace the fuel level sensor (right-hand side), see **LEVEL SENSOR, FUEL TANK, RIGHT-HAND/FUEL TANK, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 103: Identifying Ohmmeter

Courtesy of VOLVO CARS CORPORATION

Fig. 104: Identifying Floats, Fuel Level Sensors, And Wiring
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Possible Source

- Faulty sensor
- Open circuit/short circuit to ground in power supply
- Open circuit in ground wire.

Fault symptom[s]

- Trip computer indicates too soon that fuel tank is empty
- Fuel gauge not working.

CHECKING THE HIGH LEVEL STOP (BRAKE) LAMPS (2003-04)

CHECKING THE HIGH LEVEL STOP (BRAKE) LAMPS

CHECKING THE WIRING AND THE RELAY

If the stop (brake) lamp does not light, check the cable between rear electronic module terminal #4D and high level stop (brake) lamps terminal #1. Check for an open-circuit according to **OPEN-CIRCUIT, PERMANENT FAULTS** . Check for a short-circuit to ground according to **SHORT-CIRCUIT TO GROUND, PERMANENT FAULTS** .

Check the cable between high level stop (brake) lamps terminal #5 and ground. Check for an open-circuit according to **OPEN-CIRCUIT, PERMANENT FAULTS** . Check for a short-circuit to supply voltage according to **SHORT-CIRCUIT TO SUPPLY VOLTAGE. PERMANENT FAULTS** .

If the high level stop (brake) lamps are constantly lit, check the cable between rear electronic module terminal #4D and high level stop (brake) lamps terminal #1 for a short-circuit to supply voltage according to **SHORT-CIRCUIT TO SUPPLY VOLTAGE. PERMANENT FAULTS** .

Other information:

- For information about signals, see **SIGNAL SPECIFICATION** .

Fig. 105: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

FAULT-TRACING INFORMATION

Condition

No diagnostic trouble codes (DTCs) are stored.

Possible Source

- Defective high level stop (brake) lamp.
- Open-circuit.
- Short-circuit to ground in the cable.
- Short-circuit to supply voltage in the cable.

Fault symptom[s]

The stop (brake) lamp does not light when the brake pedal is depressed.

The stop (brake) lamp lights constantly.

CHECKING THE HIGH/LOW WIPER SPEED (2003-04)

CHECKING WINDSHIELD WIPERS, HIGH AND LOW SPEED

CHECKING THE WIRING

In the event of a fault at high speed, check the cable between the windshield wiper relay for high and low speed (2/90) terminal #5 and windshield wiper motor (6/1) terminal #2. Check for an open-circuit.

HINT: Check that relay (2/90) is functioning. When high speed is selected there must be 12 V at terminal #5.

In the event of a fault at low speed, check the cable between the windshield wiper relay for high and low speed (2/90) terminal #4 and windshield wiper motor (6/1) terminal #1. Check for an open-circuit.

HINT: Check that relay (2/90) is functioning. When low speed is selected there must be 12 V at terminal #4.

Check the ground supply (6/1) for windshield wiper motor terminal #4 at the ground terminal. Check for an open-circuit.

Check the cable between the relay for windshield wiper low speed and high speed (2/90) terminal #1 and the relay for windshield wiper on/off/interval (2/91) terminal #1. Check for an open-circuit.

HINT: The fault may have been caused by an open-circuit in the supply to the relay. The voltage must be 12 V at (2/90) terminal #1, (2/91) terminal #1 and at (2/91) terminal #5. Check in particular fuse 4 in the integrated relay/fusebox in the engine compartment.

Try replacing the windshield wiper motor according to **MOTOR WINDSHIELD WIPER, REPLACING** .

Remedy as necessary.

Other information:

- see **CHECKING WIRING AND TERMINALS** .

Fig. 106: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Possible Source

- Faulty relay
- Open circuit in signal wire.

Fault symptom[s]

- Windscreen wiper motor does not work.

CHECKING THE HORN (2003-04)

CHECKING THE HORN

CHECKING THE INPUT SIGNAL

Press the horn. Check that the signal from the horn reaches the control module.

Read off the value.

The value must display ON when the horn is pressed. Otherwise the signal should read OFF.

HINT: The value is constantly OFF in the event of an open-circuit or a short-circuit to supply voltage. The horn value is constantly ON (horn activated) in the event of a short-circuit to ground.

Fig. 107: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the function OK?

- **YES**

Refer to **CHECKING THE OUTPUT SIGNAL**

- **NO**

  Refer to **CHECKING THE CABLE FOR THE INPUT SIGNAL**

CHECKING THE CABLE FOR THE INPUT SIGNAL

Check the cable between central electronic module (CEM) terminal #12D and steering wheel module (SWM) (3/130) terminal #15.

Also check the ground lead for the steering wheel module (SWM) (3/130) terminal #16 for an open-circuit.

If no faults are found, the fault may be in the steering wheel module (SWM).

Remedy as necessary.

Other information

- For further information about signals and other values, see **SIGNAL SPECIFICATION**
- To connect the breakout box to the central electronic module (CEM), see **CONNECTING THE BREAKOUT BOX**
- To connect the breakout box to the steering wheel module (SWM), see **CONNECTING THE BREAKOUT BOX**
- To replace the steering wheel module (SWM), see **STEERING WHEEL MODULE (SWM), REPLACING** .

CHECKING THE OUTPUT SIGNAL

Activate the horn.

HINT: Listen for a click from the relay to determine whether the fault is in the relay circuit or in the wiring for the horn itself.

1. The horn is functioning. Troubleshooting has been completed.
2. The relay clicks. Refer to **CHECKING THE WIRING FOR THE HORN**.
3. The relay does not click. Refer to **CHECKING THE CABLE FOR THE RELAY**.

Fig. 108: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

CHECKING THE WIRING FOR THE HORN

Check the relay (2/17).

HINT: The voltage must be 12 V at terminal #3. The signal to the horn is at terminal #5.

Check the cable between relay terminal #5 and horn 1 (16/10) terminal #1 and horn 2 (16/11) terminal #1.

Also check that both the horns are grounded at terminal #2.

Check the connector.

Remedy as necessary.

Fig. 109: Brake Pedal Position Sensor Connector Terminal Identification
Courtesy of VOLVO CARS CORPORATION

Fig. 110: Identifying Connectors
Courtesy of VOLVO CARS CORPORATION

CHECKING THE CABLE FOR THE RELAY

Check the cable between central electronic module (CEM) terminal #19A and horn relay 2/17 terminal #2.

Check for an open-circuit.

Also check the connector. Check for an open-circuit.

HINT: The fault may have been caused by an open-circuit in the supply to the relay.

HINT: The voltage must be 12 V at both terminals #1 and #2 for relay 2/17.

HINT: In particular, check that fuse 9 in the integrated relay/fusebox in the engine compartment is intact.

Try a new horn relay (2/17).

Remedy as necessary.

Other information

- For further information about signals and other values, see **SIGNAL SPECIFICATION**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 111: Identifying Connectors
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Possible Source

- Short circuit to voltage supply in the signal line
- Short circuit to ground in the signal line
- Open circuit.

Fault symptom[s]

- Horn does not work.

CHECKING THE IGNITION SWITCH KEY SENSOR (2003-04)

CHECK THE KEY SENSOR IN THE IGNITION SWITCH

CHECKING THE KEY SENSOR SIGNAL

Fig. 112: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check the voltage in the central electronic module (CEM) connector, terminal #B1 (#A21). The voltage must be battery voltage.

  Remove the key from the ignition switch. The voltage must now be approximately 0 V.

  Other information

  - To access or replace the central electronic module (CEM) connector, see **CENTRAL ELECTRONIC MODULE (CEM), REPLACING**
  - To connect the breakout box to the control module, see **CONNECTING THE BREAKOUT BOX**

- For further information about signals and other values, see **SIGNAL SPECIFICATION**

Fig. 113: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

Fig. 114: Identifying Central Electronic Module (CEM) Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Is the voltage OK?

- **YES**

  FAULT NOT FOUND: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE IGNITION SWITCH**

CHECKING THE IGNITION SWITCH

Fig. 115: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Key out
- Disconnect the connector for the ignition switch.

Check the voltage in the central electronic module (CEM) connector, terminal #B1 (#A21).

Other information

- To access the ignition switch, see **STEERING WHEEL LOCK, REPLACING**

Fig. 116: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

Fig. 117: Identifying Central Electronic Module (CEM) Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Does the voltage drop to approximately 0 V?

- **YES**

  Refer to **REPLACING THE IGNITION SWITCH**

- **NO**

  Refer to **CHECKING THE WIRING**

CHECKING THE WIRING

Fig. 118: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Key out.

Check the cable between central electronic module (CEM) connector terminal #B1 (#A21) and ignition switch connector terminal #3 (#S). Check for a short-circuit to battery voltage.

Other information

- To access the ignition switch, see **STEERING WHEEL LOCK, REPLACING**

Fig. 119: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

Fig. 120: Identifying Central Electronic Module (CEM) Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  FAULT NOT FOUND: Troubleshooting has been completed.

REPLACING THE IGNITION SWITCH

Fig. 121: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Key out.

Replace the ignition switch. See **STEERING WHEEL LOCK, REPLACING** .

Fig. 122: Identifying Central Electronic Module (CEM) Connector Terminals
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 123: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 124: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reinstall the connectors, components etc.

  Open the driver's door.

  Check to, see if the key warning signal functions normally and silences when the key is removed from the ignition switch

Was the function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

FAULT-TRACING INFORMATION

Condition

No DTCs stored.

Possible Source

- The key sensor (pin in the ignition switch) has jammed in the key position.
- Short-circuit to battery voltage in the cable from the key sensor.

Fault symptom[s]

- Cannot be activated/deactivated
- Alarm does not operate
- Central locking does not operate

CHECKING THE INNER REAR-VIEW MIRROR DIMMER (2003-12)

CHECKING THE ANTI-DAZZLE FUNCTION IN THE REAR VIEW MIRROR

CHECKING THE ANTI-DAZZLE FUNCTION

NOTE: If the upper electronic module (UEM) has been replaced software, specially developed for downloading after replacing the control module, must be downloaded to the control module before the anti-dazzle function is changed. See UPPER ELECTRONIC MODULE (UEM)/REARVIEW MIRROR, REPLACING .

The rear view mirror anti-dazzle function can be adjusted:

- If the rear view mirror anti-dazzle function is too powerful or too weak, it can be adjusted.

Specific software for setting the anti-dazzle function must be installed in the car to do this.

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Electrochromatic mirror.

Substitute Value

?

Possible Source

- Internal fault in control unit.

Fault symptom[s]

- Dimmer does not work.

CHECKING THE INTERIOR LIGHTING (1) (2003-12)

CHECKING THE INTERIOR LIGHTING (1)

CHECKING COMPONENTS AND WIRING

Control module and rear reading lamp module

Check the cable between control module terminal #15 and rear reading lamp module terminal #2. Check for an open-circuit.

Check the cable between control module terminal #14 and rear reading lamp module terminal #6. Check for an open-circuit.

Control module and roof lamp module

Check the cable between the control module terminal #8 and roof lamp module terminal #2A. Check for an open-circuit. Check for a short-circuit to ground.

Control module and right/left vanity mirror lighting

Check the cable between control module terminal #8 and right/left vanity mirror lighting terminal #1. Check for an open-circuit. Check for a short-circuit to ground.

Check the cable between control module #20 and right/left vanity mirror lighting #3. Check for an open-circuit.

Remedy as necessary.

If no fault is found, try replacing the module that is malfunctioning.

This could be:

- Rear reading lamp module
- Roof lamp module
- Right/left vanity mirror lighting.

Other information

- For further information about signals and other values, see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To access the vanity mirror lighting, see **BULB VANITY MIRROR, REPLACING**
- To access or replace the roof lamp module, see **INTERIOR LIGHTING, REPLACING**
- To access or replace the rear reading lamp module, see **BULB, READING LAMP, REAR, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 125: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 126: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

BULB VANITY MIRROR, REPLACING

- See **BULB VANITY MIRROR, REPLACING** .

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Substitute Value

Nothing.

Possible Source

- Open circuit or short circuit to ground on the wire.

  Faulty lamp unit.

Fault symptom[s]

- Interior lighting does not work.

CHECKING THE INTERIOR LIGHTING (2) (2003-12)

CHECKING THE INTERIOR LIGHTING

Two times can be programmed for the interior lighting:

1. **Short**

   The period from when the door is unlocked, or the engine stops, to when the interior lighting goes out can be changed if it is too long or too short.

2. **Long**

   The period from when the door is opened, or a lamp is lit with a switch, to when the lamp goes out can be changed if it is too long or too short.

To program a long interior lighting period you must step ("click") through the short interior lighting period programming.

- **Continue**

  Refer to **PROGRAMMING A SHORT INTERIOR LIGHTING PERIOD**

PROGRAMMING A SHORT INTERIOR LIGHTING PERIOD

The general lighting and rear reading lamps light and remain lit for 30 seconds when:

- The door has been unlocked from outside with a key or the remote control.
- The engine has been stopped and the ignition key turned to 0.

The default period is 30 seconds. This can be changed to between 5 and 255 seconds.

Read off the programmed values.

To change the time, mark the desired value in the scrolling list and start programming.

Fig. 127: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Do you want to program any more parameters?

- **YES**

  Refer to **PROGRAMMING A LONG INTERIOR LIGHTING PERIOD**

- **NO**

  OKAY: Troubleshooting has been completed.

PROGRAMMING A LONG INTERIOR LIGHTING PERIOD

The general lighting and rear reading lamps light and remain lit for 10 minutes when:

- A door is opened after being unlocked.
- The lamp is lit with a switch.

The default period is 10 minutes. This can be changed to between 0 and 255 minutes at 10 minute intervals.

Read off the programmed values.

To change the time, mark the desired value in the scrolling list and start programming.

Fig. 128: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

CHECKING THE LIGHT SWITCH (2003-04)

CHECKING LIGHT SWITCH

FAULT IDENTIFICATION

Select the alternative corresponding to the fault.

1. The switch for the front fog lamps does not work. Refer to **CHECKING THE SWITCH FOR THE FRONT FOG LAMPS**.
2. The switch for the fog tail lamps does not work. Refer to **CHECKING THE SWITCH FOR THE FOG TAIL LAMPS**.
3. It is not possible to change between parking lights and low beam. Refer to **CHECKING THE SWITCH FOR THE LOW BEAM AND PARKING LAMPS**

CHECKING THE SWITCH FOR THE FRONT FOG LAMPS

Read off the front fog lamps.

Operate the switch for the front fog lamps.

Other information

- With the front fog lamp on the value should be "on".

  With the front fog lamp switched off the value should be "off".

Fig. 129: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **REPLACING COMPONENT**

CHECKING THE SWITCH FOR THE FOG TAIL LAMPS

Read off the fog tail lamps.

Operate the switch for the fog tail lamps.

Other information

- With the fog tail lamps on the value should be "on".

  With the fog tail lamps switched off the value should be "off".

Fig. 130: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Is the function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **REPLACING COMPONENT**

CHECKING THE SWITCH FOR THE LOW BEAM AND PARKING LAMPS

Read off the switch signal.

Turn the switch to all positions.

The light switch sends the status of switches to the central electronic module (CEM). In event of a non permissible combination on the light switch "Non permissible" is displayed at the read out.

Fig. 131: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Does the switch function?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **REPLACING COMPONENT**

REPLACING COMPONENT

The diagnostic trouble code (DTC) indicates that the light switch is defective.

Replace the light switch.

Other information

- To replace the light switch, see **SWITCHES LIGHTS, REPLACING** .

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are stored.

Possible Source

- Faulty light switch.

Fault symptom[s]

Dipped headlamp remains on.

CHECKING THE LOCK FUNCTION OF THE FUEL TANK FILLER COVER (2003-04)

CHECKING THE LOCK FUNCTION OF THE FUEL TANK FILLER COVER

CHECK

Check that the lock is not sticking or jammed. Check that the lock unit is correctly installed.

Check that the locks for the rear doors are not disabled.

1. The fuel tank filler cover plate lock was sticking or had jammed. The lock unit was not correctly installed. Troubleshooting has been completed.
2. The locks for the rear doors are disabled. Refer to **CHECKING FUSES**.
3. No fault detected. Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

Replace the relays for locking (2/58) and unlocking (2/59) in the integrated relay/fusebox in the cargo compartment. Check the relay base switches. Check for contact resistance and oxidation.

Other information

- To access the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 132: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 133: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CIRCUIT TEST**

CIRCUIT TEST

The fault is caused by an open-circuit in one of the relay circuits in the lock unit. To determine in which circuit

the fault is:

Disconnect the connector at the lock unit.

Check the connectors for contact resistance and oxidation.

Measure the resistance between terminals terminal #1 and #2 on the cable connector.

Other information

- To access and replace the lock unit, see **LOCK UNIT FUEL TANK FILLER COVER, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 134: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 135: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

The ohmmeter should read 0 ohm.

- **OK**

  Refer to **CHECKING THE COMPONENT**

- **NOT OK**

  Refer to **CIRCUIT TEST CONTINUED**

CIRCUIT TEST CONTINUED

Measure the resistance between terminal #1 and ground and between terminal #2 and ground on the cable

connector.

The ohmmeter should read 0 ohm.

1. The ohmmeter displays a fault between terminal #1 and ground. Refer to **CHECKING THE UNLOCKING RELAY CIRCUIT**.
2. The ohmmeter displays a fault between terminal #2 and ground. Refer to **CHECKING THE LOCKING RELAY CIRCUIT**

Fig. 136: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 137: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

CHECKING THE LOCKING RELAY CIRCUIT

Remove the locking relay (2/58 (RMI 20)).

Check the cable between terminal #2 the cable and connector and terminal #3 on the relay base. Check for an open-circuit.

Remedy as necessary.

If no fault is detected, measure the resistance between terminal #4 in the relay base and ground.

The ohmmeter should read 0 ohm.

If the resistance is incorrect, replace the rear electronic module (REM).

Other information

- To access and replace the rear electronic module (REM), see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- To access the lock unit, see **ELECTRIC MOTOR, SUN ROOF, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 138: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 139: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 140: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

CHECKING THE UNLOCKING RELAY CIRCUIT

Remove the unlocking relay (2/59 (RMI 21)).

Check the cable between terminal #2 the cable and connector and terminal #3 on the relay base. Check for an open-circuit.

Remedy as necessary.

If no fault is detected, measure the resistance between terminal #4 in the relay base and ground.

The ohmmeter should read 0 ohm.

If the resistance is incorrect, replace the rear electronic module (REM).

Other information

- To access and replace the rear electronic module (REM), see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- To access the lock unit, see **ELECTRIC MOTOR, SUN ROOF, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 141: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 142: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 143: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

CHECKING THE COMPONENT

Measure the resistance between pins terminals #1 and #2 on the chassis switch lock unit.

The ohmmeter should read 5 ohm.

If the resistance is incorrect, replace the lock unit.

Other information

- To access the rear electronic module (REM), see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- To access and replace the lock unit, see **ELECTRIC MOTOR, SUN ROOF, REPLACING**

- For further information about signals and other values, see **SIGNAL SPECIFICATION** .

Fig. 144: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 145: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING RELAY POWER SUPPLY**

CHECKING RELAY POWER SUPPLY

Remove the locking relay (2/58 (RMI 20)).

Measure the voltage between terminal #5 in the relay base and ground.

The voltmeter should read battery voltage.

HINT: If the value is OK but the fault remains, connect the connector to the lock module between terminals #3 and #5 in the relay base to force a supply to the locking motor when continuing to take measurements.

Other information

- To access the rear electronic module (REM), see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .

Fig. 146: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

Fig. 147: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Does the voltmeter read battery voltage?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING FUSES**

CHECKING FUSES

Remove fuse 11D/8 from the cargo compartment fusebox.

Check that fuse 11D/8 is intact. Check for contact resistance and oxidation.

Other information

- To access the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 148: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

Fig. 149: Locating Integrated Relay/Fusebox In Cargo Compartment
Courtesy of VOLVO CARS CORPORATION

Is the fuse intact?

- **YES**

  Refer to **CHECKING FOR AN OPEN-CIRCUIT**

- **NO**

  Refer to **CHECKING FOR A SHORT-CIRCUIT**

CHECKING FOR AN OPEN-CIRCUIT

Remove relay 2/59 from the integrated relay/fusebox in the cargo compartment. Fault-trace the cable between the secondary side of the fuse holder (left) and terminal #5 in the relay base. Check for an open-circuit.

Other information

- To access the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 150: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 151: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

CHECKING FOR A SHORT-CIRCUIT

Measure the resistance between the fuse holder secondary side (left) and ground.

The ohmmeter should read infinite resistance.

If the value is correct, replace the fuse.

NOTE: The fault could be intermittent.

Fault-trace all affected relay circuits for a short-circuit to ground if the value is incorrect.

HINT: Replace fuse.

HINT: If the fuse blows immediately the short-circuit is in the relay power cable.

HINT: If the fuse blows when the relevant relay is activated, the short-circuit is in the component power supply cable

HINT: The relay circuits affected are from relays 2/111, 2/112, 2/113, 2/114, 2/115, 2/56, 2/59 and 2/67.

Other information

- To access the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 152: Identifying Ohmmeter

LOCK UNIT FUEL TANK FILLER COVER, REPLACING

- See **LOCK UNIT FUEL TANK FILLER COVER, REPLACING** .

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Possible Source

Rear doors:

- Faulty relay
- Fault in locking relay circuit
- Fault in unlocking relay circuit
- Faulty lock unit
- Fault in relay supply
- Defective fuse.

Fault symptom[s]

- Tank hatch will not open/lock.

CHECKING THE LOCK FUNCTION OF THE TRUNK LID (2003-04)

CHECKING THE LOCK FUNCTION OF THE TRUNK LID

CHECKING THE LOCK UNIT

Check that the lock is not sticking or jammed. Check that the lock unit is correctly installed.

Check that the lock position sensor functions: Open the trunk lid and close the lock manually with the trunk lid open. This can be carried out by pressing a pen against the striker plate. The cargo compartment lighting should go out when locking is complete.

Then unlock using the trunk lid handle button. The lock motor should automatically and audibly return to the starting point when unlocking is complete.

Remedy as necessary.

1. The trunk lid can be unlocked with the handle button and locked mechanically. Troubleshooting has been completed.
2. The trunk lid can only be unlocked with the remote control. Refer to **BUTTON TEST**.
3. The trunk lid cannot be unlocked with either the remote control or the handle button. Refer to **CHECKING FUSES**.

Fig. 154: Identifying Upper/Lower Tailgate Panel, Screws, Disconnecting Connector And Link, And Pulling Out Lock
Courtesy of VOLVO CARS CORPORATION

BUTTON TEST

Press the button in and check if the text displays ON.

Check that the trunk lid opens when the button is pressed in.

Is the function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NOT OK**

  Refer to **CHECKING THE LICENSE PLATE LIGHTING**

CHECKING THE LICENSE PLATE LIGHTING

Fig. 155: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition on.

Does the license plate lighting function?

- **YES**

  Refer to **CHECKING THE SIGNAL CABLE FOR THE LOCK BUTTON**

- **NOT OK**

  Refer to **CHECKING THE GROUND LEAD FOR THE LOCK BUTTON**

CHECKING THE SIGNAL CABLE FOR THE LOCK BUTTON

Disconnect the connector at the license plate lighting. Check for contact resistance and oxidation.

Check the cable between rear electronic module (REM) connector terminal #D7 and the license plate lighting terminal #1. Check for an open-circuit. In particular check the intermediate connector in the cable harness and the connector in the rear electronic module (REM). Check for oxidation.

Remedy as necessary.

If no fault is detected, ground terminal #1 in the connector for the license plate lighting lamp housing. Then check that the ON is displayed.

If the text ON is not displayed, break the power supply to the rear electronic module (REM).

If the text ON is displayed, replace the lock button.

Other information

- To access and replace the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To expose the lamp housing for the license plate lighting, see **BULB, NUMBER PLATE LIGHTING, REPLACING**
- To access and replace the lock button, see **LOCK MECHANISM, TAILGATE, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 156: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 157: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 158: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

CHECKING THE GROUND LEAD FOR THE LOCK BUTTON

Check the switch at license plate lighting lamp housing terminal #3 and at lock unit terminal #4. Check the intermediate cable for an open-circuit.

Remedy as necessary.

Other information

- To expose the lamp housing for the license plate lighting, see **BULB, NUMBER PLATE LIGHTING, REPLACING**
- To access and replace the lock button, see **LOCK MECHANISM, TAILGATE, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 159: Identifying Connector Terminals

Courtesy of VOLVO CARS CORPORATION

Fig. 160: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 161: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

CHECKING FUSES

Remove fuse 11D/6 from the cargo compartment fusebox.

Check the fuse. Check for contact resistance and oxidation.

Other information

- To access the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 162: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 163: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Is the fuse intact?

- **OK**

  Refer to **REPLACING THE RELAY**

- **NOT OK**

  Refer to **CHECKING FOR A SHORT-CIRCUIT**

REPLACING THE RELAY

Replace the relay for unlocking 2/67 (RMI 20) in the integrated relay / fusebox in the cargo compartment.

At the same time, check the relay base switches. Check for contact resistance and oxidation.

Remedy as necessary.

Other information

- To access the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 164: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 165: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CIRCUIT TEST**

CIRCUIT TEST

The fault is caused by an open-circuit in one of the relay circuits in the lock unit. To determine in which circuit

the fault is:

Disconnect the connector at the lock unit.

Check the connectors for contact resistance and oxidation.

Measure the resistance between terminals terminal #2 and #4 on the cable connector.

Other information

- To access and replace the lock unit, see **LOCK MECHANISM, TAILGATE, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 166: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 167: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

The ohmmeter should read 0 ohm.

- **OK**

  Refer to **CHECKING GROUND LEAD**

- **NOT OK**

  Refer to **CIRCUIT TEST CONTINUED**

CIRCUIT TEST CONTINUED

Measure the resistance between terminal #2 and ground and between terminal #4 and ground on the cable

connector.

1. The ohmmeter displays an incorrect value between terminal #4 and ground. Refer to **CHECKING GROUND LEAD**.
2. The ohmmeter displays an incorrect value between terminal #2 and ground. Refer to **CHECKING THE POWER SUPPLY**
3. The ohmmeter displays the correct value. Troubleshooting has been completed.

Fig. 168: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 169: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

CHECKING GROUND LEAD

Check the cable between terminal #2 in the cable connector and ground terminal. Check for an open-circuit.

Check in particular the intermediate connector in the cable harness. Check for contact resistance and oxidation.

Remedy as necessary.

Other information

- see **CHECKING WIRING AND TERMINALS** .

Fig. 170: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 171: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

CHECKING THE POWER SUPPLY

Remove the relay for unlocking 2/67 (RMI 20) from the integrated relay/fusebox in the cargo compartment.

Check the cable between terminal #2 the cable and connector and terminal #3 on the relay base. Check for an open-circuit.

If a fault is detected, check in particular the intermediate connector in the cable harness. Check for contact resistance and oxidation.

If no fault is detected, measure the resistance between terminal #4 in the relay base and ground.

In both cases the ohmmeter should read 0 ohms.

If the value is incorrect, replace the rear electronic module (REM).

Other information

- To access and replace the rear electronic module (REM), see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .

Fig. 172: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 173: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 174: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

CHECKING THE COMPONENT

Measure the resistance between pins terminals #2 and #4 on the chassis switch lock unit.

The ohmmeter should read approximately 5 ohm.

If the value is incorrect, replace the lock unit.

Other information

- To access and replace the lock unit, see **LOCK MECHANISM, TAILGATE, REPLACING** .

Fig. 175: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 176: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING RELAY POWER SUPPLY**

CHECKING RELAY POWER SUPPLY

Remove the relay for locking 2/67 (RMI 20) from the integrated relay/fusebox in the cargo compartment.

Measure the voltage between terminal #5 in the relay base and ground.

The voltmeter should read battery voltage.

HINT: If the value is OK but the fault remains, connect the connector to the lock module between terminals #3 and #5 in the relay base to force a supply to the locking motor when continuing to take measurements.

Other information

- To access the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .

Fig. 177: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

Fig. 178: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Does the voltmeter read battery voltage?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING FOR AN OPEN-CIRCUIT**

CHECKING FOR AN OPEN-CIRCUIT

Check the cable between the fuse holder secondary side (left) and terminal #5 in the relay base. Check for an

open-circuit.

Other information

- To access the rear electronic module (REM), see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 179: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 180: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

CHECKING FOR A SHORT-CIRCUIT

Measure the resistance between the fuse holder secondary side (left) and ground.

The ohmmeter should read infinite resistance.

If the value is correct, replace the fuse.

NOTE: The fault could be intermittent.

If the value is incorrect, fault-trace all affected relay circuits and component wiring for a short-circuit to ground.

HINT: Replace fuse.

HINT: If the fuse blows immediately the short-circuit is in the relay power cable.

HINT: If the fuse blows when the tailgate is opened the short-circuit is in the power supply cable for the component

HINT: Relay supply cable: fuse 11D/6 terminal #5 relay base 2/67.

HINT: Component supply cable: terminal #4 relay base 2/67 terminal #2 lock unit.

Other information

- To access the rear electronic module (REM), see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 181: Identifying Ohmmeter

Courtesy of VOLVO CARS CORPORATION

Fig. 182: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Possible Source

Rear doors:

- Faulty relay

- Short circuit to ground/open circuit on lock unit ground/supply wire
- Faulty lock unit
- Fault in relay supply
- Defective fuse
- Defective switch (in boot lid handle)
- Open circuit on switch (in boot lid handle) signal/ground wire
- Fault in control unit
- Defective lock cylinder (mechanical fault).

Fault symptom[s]

- The boot lid will not lock/open.

CHECKING THE POWER SUPPLY (2003-12)

CHECKING THE POWER SUPPLY

SYMPTOM VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 183: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 184: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Connect the connectors, install the components, etc.
- Ignition on.

  Move the sunroof to its end position and activate the reading lamps.

Is the function delayed?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  VERIFICATION FAILED: The fault should have been detected and remedied. As this is not the case fault-tracing has failed. Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CHECKING THE POWER SUPPLY (2003-12)

CHECKING THE POWER SUPPLY

CHECKING THE CONNECTORS

Check connectors 54/13, 54/3L and control unit connector for contact resistance and oxidation as described in, see **CONTACT RESISTANCE AND OXIDATION** .

Do the necessary corrective action.

Fig. 185: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Is there a fault?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE WIRES AND COMPONENTS**

CHECKING THE WIRES AND COMPONENTS

Check that fuse 11C/28 in the interior fuse box is correctly installed and is intact.

Check the wire between the battery positive pole and control unit 1 and 11 for an intermittent open circuit as described in, see **OPEN-CIRCUIT, INTERMITTENT FAULTS** , and for an intermittent short circuit to ground as described in **SHORT-CIRCUIT TO GROUND, INTERMITTENT FAULTS** .

Additional information

- For information on signals and additional values, see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)**
- To connect the test box, see **CONNECTING THE BREAKOUT BOX** .

Fig. 186: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Substitute Value

Nothing.

Possible Source

- Intermittent open circuit or intermittent short circuit to ground on the wire.

Contact resistance or oxidation on the connector.

Fault symptom[s]

- Poor response to command.

CHECKING THE POWER SUPPLY (LSM) (2003-04)

CHECKING THE POWER SUPPLY (LSM)

Check the power supply to the switch, i. e. the wire between the light switch module 1 (3/111) and fuse 23 in the interior compartment fuse box (11C/23), for an open circuit as described in, see **OPEN-CIRCUIT, PERMANENT FAULTS** .

Check fuse 23 in the interior compartment fuse box (11C/23).

Check the ground wire to the light switch module 5 (3/111) at the ground point.

Do the necessary corrective action.

Fig. 187: 10-CD Changer Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 188: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are stored.

Substitute Value

None.

Possible Source

- There is no power supply to the light switch module.

Fault symptom[s]

- Dipped headlamp remains on.

CHECKING THE RAIN SENSOR (2003-12)

CHECKING THE RAIN SENSOR

HINT: If the car has been in programming mode, or if the voltage has been switched off, the car must be locked and then unlocked again. This is to ensure that the rain sensor functions correctly.

Check the cable between terminal #4 on the control module and the park position switch. Check for an open-circuit and a short-circuit.

When the wiper is activated the park position switch should be grounded, 0 V. Otherwise it should be 12 V.

Remedy as necessary.

Other information

- see **CHECKING WIRING AND TERMINALS. PERMANENT FAULT**
- see **CHECKING WIRING AND TERMINALS. INTERMITTENT FAULTS**

Fig. 189: 10-CD Changer Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 190: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 191: Identifying Connector (F) Terminals

CHECKING THE REAR FOG LAMP (2003-04)

CHECKING THE REAR FOG LAMP

CHECKING THE RELAY

Check the function of relay 2/49: Activate and deactivate the relay a number of times. The relay is functioning if there is a clicking sound when the relay is activated and deactivated.

Replace with a new relay if the relay does not function.

Other information:

- To access the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .

Fig. 192: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 193: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Check that fuse 11D/2 is intact.

Check that shunt 20/29 is not damaged. The resistance between the terminal pins is 0 ohm to 5 ohms depending on which pin the reading is taken at.

Check the cables between:

fuse 11D/2 terminal #2 and rear electronic module terminal #4E

shunt 20/29 terminal #2 and relay 2/49 terminal #5

relay 2/49 terminal #3 and the left or right lower lamp housing terminal #3

for an open-circuit according to **OPEN-CIRCUIT, PERMANENT FAULTS** and a short-circuit to ground according to **SHORT-CIRCUIT TO GROUND, PERMANENT FAULTS** .

Check the cable between the left or right lower lamp housing terminal #4 and the ground terminal for an open-circuit according to **OPEN-CIRCUIT, PERMANENT FAULTS** .

Check that the bulbs are intact.

Remedy as necessary.

Other information:

- For further information about signals and other values, see **SIGNAL SPECIFICATION**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX** .
- To access the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .
- Shunt 20/29 is marked SH2 on the integrated relay/fusebox in the cargo compartment. Terminal #2 on the shunt can be identified on the reverse of the integrated relay/fusebox.

Fig. 194: Identifying Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 195: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 196: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Possible Source

- Wire between relay and lamp body short circuited to voltage supply
- Faulty relay
- Defective lamp
- Open circuit/short circuit to ground in power supply

- Open circuit in ground wire.

Fault symptom[s]

- Rear fog lamp does not work.

CHECKING THE REAR FOG LAMP (GERMANY) (2003-04)

CHECKING THE REAR FOG LAMP (GERMANY)

CHECKING THE MARKET

The following fault-tracing only applies to cars intended for the German market.

Is the test applicable?

- **YES**

  Refer to **CHECKING THE RELAY**

- **NO**

  FAULT NOT FOUND: Troubleshooting has been completed.

CHECKING THE RELAY

Check the function of relay 2/83: Activate and deactivate the relay a number of times. The relay is functioning if there is a clicking sound when the relay is activated and deactivated.

Replace with a new relay if the relay does not function.

Other information:

- To access and replace the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .

Fig. 197: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 198: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Check that shunt 20/29 is not damaged. The resistance between the terminal pins is 0 ohm to 5 ohms depending on which pin the reading is taken at.

Check the cable between relay 2/83 terminal #3 and the left and right lower lamp housing connector terminal #3A. Check for an open-circuit according to **OPEN-CIRCUIT, PERMANENT FAULTS** . Check for a short-circuit to ground according to **SHORT-CIRCUIT TO GROUND, PERMANENT FAULTS** .

Check the cable between the left and right upper lamp housing connector terminal #4A and the ground terminal for an open-circuit according to **OPEN-CIRCUIT, PERMANENT FAULTS** .

Check that fuse 11D/2 is intact.

Remedy as necessary.

Other information:

- For further information about signals and other values, see **SIGNAL SPECIFICATION**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX** .
- To access the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .

TROUBLE-SHOOTING INFORMATION

see **TROUBLE-SHOOTING INFORMATION**

CHECKING THE REAR FOG LAMP (TRAILERS) (2003-04)

CHECKING THE REAR FOG LAMP (TRAILERS)

CHECKING THE MARKET

The following fault-tracing applies ONLY to cars with trailer connectors.

Is the test applicable?

- **YES**

  Refer to **CHECKING THE RELAY**

- **NO**

  FAULT NOT FOUND: Troubleshooting has been completed.

CHECKING THE RELAY

Check the function of relay 2/83: Activate and deactivate the relay a number of times. The relay is functioning if there is a clicking sound when the relay is activated and deactivated.

Replace with a new relay if the relay does not function.

Other information:

- To access and replace the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .

TROUBLE-SHOOTING INFORMATION

see **TROUBLE-SHOOTING INFORMATION**

CHECKING THE REAR PARKING LAMPS (2003-04)

CHECKING THE REAR PARKING LAMPS

CHECKING THE FUSES AND THE CABLES

Check that fuses 11C/30 (group 1) and 11C/31 (group 2) in the passenger compartment are intact.

For group 1, check the cables between:

- fuse 11C/30 and shunt 20/28
- shunt 20/28 and terminal #1 the left and right lower lamp housings (in the cargo compartment).

check for an open-circuit or short-circuit to ground.

For group 2, check the cables between:

- fuse 11C/31 and shunt 20/33
- shunt 20/33 and terminal #2 the left and right lower lamp housings (in the cargo compartment).

check for an open-circuit or short-circuit to ground.

For all groups, check the ground leads between terminal #4 in the left and right lower lamp housings (in the cargo compartment) and the ground terminal. Check for an open-circuit.

Check the control module connector terminal #B1 and the lock unit connector terminal #6. Check for contact resistance and oxidation. Check the intermediate cable. Check for an open-circuit.

Remedy as necessary.

Additional information

- To access the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Courtesy of VOLVO CARS CORPORATION

Fig. 208: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 209: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Possible Source

- Faulty shunt.
- Open circuit or short circuit to ground in voltage supply.
- Open circuit in grounding.
- Faulty lamps.

CHECKING THE SEAT HEATER (2003-04)

CHECKING SEAT HEATER

CHECKING FUSES

Fig. 210: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check that fuse 11C/8 (25A) is intact.

  Replace the fuse if it is damaged.

Is the fuse intact?

- **YES**

  Refer to **CHECKING THE GROUND LEAD**

- **NO**

  Refer to **CHECKING THE WIRING**

CHECKING THE GROUND LEAD

Fig. 211: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect connector from the seat heater module.

Check the cable between seat heater (9/12) for left seat and (9/13) for right seat connector terminal #5 and ground terminal 31/66 or 31/67. Check for an open-circuit.

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For information about signals, see **SIGNAL SPECIFICATION**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 212: Breakout Box
Courtesy of VOLVO CARS CORPORATION

Fig. 213: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Is the cable OK?

- **YES**

  Refer to **CHECKING THE POWER SUPPLY**

- **NO**

  OKAY: Troubleshooting has been completed.

CHECKING THE WIRING

Fig. 214: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect connector from the seat heater module.

  Check the cable between fuse 11C/8 terminal #2 (25A) and seat heater (9/12) for left seat and (9/13) for right seat connector terminal #1. Check for a short-circuit to ground.

  Remedy as necessary.

  Other information:

  - To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
  - For information about signals, see **SIGNAL SPECIFICATION**

- see **CHECKING WIRING AND TERMINALS** .

Is the cable OK?

- **YES**

  Refer to **CHECKING THE CABLE**

- **NO**

  OKAY: Troubleshooting has been completed.

CHECKING THE POWER SUPPLY

Fig. 217: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect connector from the seat heater module
- Ignition on.

  Check the voltage between seat heater (9/12) for left seat and (9/13) for right seat connector terminal #1 and ground.

  Other information:

  - To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
  - For information about signals, see **SIGNAL SPECIFICATION** .

Fig. 218: Breakout Box
Courtesy of VOLVO CARS CORPORATION

Fig. 219: Identifying Voltage Display
Courtesy of VOLVO CARS CORPORATION

Is the voltage OK?

- **YES**

  Refer to **CHECKING THE WIRING**

- **NO**

  Refer to **REPAIR CABLE**

REPAIR CABLE

Fig. 220: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Repair the cable between fuse 11C/8 terminal #2 (25A) and seat heater (9/12) for left seat and (9/13) for right seat connector terminal #1. Check for a open-circuit.

  Other information:

  - To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
  - For information about signals, see **SIGNAL SPECIFICATION**
  - see **CHECKING WIRING AND TERMINALS** .

Fig. 221: Breakout Box
Courtesy of VOLVO CARS CORPORATION

Fig. 222: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

CHECKING THE CABLE

Check the cable between fuse 11C8 terminal #2 (25A) and seat heater (9/12) for left seat and (9/13) for right seat connector terminal #1. Check for an intermittent short-circuit to ground.

Remedy as necessary.

Replace fuse.

Other information:

- see **CHECKING WIRING AND TERMINALS** .

CHECKING THE WIRING

Check the cable between fuse 11C8 terminal #2 (25A) and seat heater (9/12) for left seat and (9/13) for right seat connector terminal #1. Check for contact resistance and oxidation. Check for an intermittent open-circuit.

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For information about signals, see **SIGNAL SPECIFICATION**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 223: Breakout Box

Fig. 224: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Possible Source

- Defective fuse
- Open circuit or short circuit to ground in power supply or signal wire
- Contact resistance or oxidation.

Fault symptom[s]

- Front seat heating does not work.

CHECKING THE SEAT TEMPERATURE (2003-04)

CHECKING THE SEAT TEMPERATURE

PROGRAMMING THE SEAT TEMPERATURE (CENTRAL ELECTRONIC MODULE)

The heated seat temperature can be adjusted.

This can be carried out for both the left and right seats.

There are two values that can be programmed: low temperature and high temperature.

Programming must be carried out so that the high temperature setting is higher than the low temperature setting.

Do you want to program in Celsius or Fahrenheit?

1. Celsius. Refer to **CELSIUS**
2. Fahrenheit. Refer to **FAHRENHEIT**

CELSIUS

The seat temperature can be set between 0°C and 43°C.

Which seat do you want to reprogram:

1. Left seat. Refer to **CHECKING THE LEFT SEAT**
2. Right seat. Refer to **CHECKING THE RIGHT SEAT**

FAHRENHEIT

The seat temperature can be set between 32°F and 109.4°F.

Which seat do you want to reprogram:

1. Left seat. Refer to **CHECKING THE LEFT SEAT**.
2. Right seat. Refer to **CHECKING THE RIGHT SEAT**

CHECKING THE LEFT SEAT

Read off the programming by clicking on the VCT2000 symbol.

To change the seat temperature, mark the desired value in the scrolling list and start programming.

Programming must be carried out so that the high temperature setting is higher than the low temperature setting.

Fig. 225: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **SAVE THE PROGRAMMED VALUE**

CHECKING THE RIGHT SEAT

Read off the programming by clicking on the VCT2000 symbol.

To change the seat temperature, mark the desired value in the scrolling list and start programming.

Programming must be carried out so that the high temperature setting is higher than the low temperature setting.

Fig. 226: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **SAVE THE PROGRAMMED VALUE**

CHECKING THE LEFT SEAT

Read off the programming by clicking on the VCT2000 symbol.

To change the seat temperature, mark the desired value in the scrolling list and start programming.

Programming must be carried out so that the high temperature setting is higher than the low temperature setting.

Fig. 227: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **SAVE THE PROGRAMMED VALUE**

CHECKING THE RIGHT SEAT

Read off the programming by clicking on the VCT2000 symbol.

To change the seat temperature, mark the desired value in the scrolling list and start programming.

Programming must be carried out so that the high temperature setting is higher than the low temperature setting.

Fig. 228: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **SAVE THE PROGRAMMED VALUE**

SAVE THE PROGRAMMED VALUE

To ensure that the programmed information is stored, click on the VCT2000 symbol to force the entry.

CHECKING THE SHIFT LOCK (2003-04)

CHECKING THE SHIFT LOCK

CHECKING FUSES

Fig. 230: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check that fuse 11C/24 (10A) is intact.

  Replace the fuse if it is damaged.

Is the fuse intact?

- **YES**

  Refer to **CHECKING THE GROUND LEAD**

- **NO**

Refer to **CHECKING THE CABLE**

CHECKING THE GROUND LEAD

Fig. 231: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Remove connector from Shift Lock module 3/156.

  Check the cable between Shift Lock connector terminal #6 and ground terminal 31/6. Check for an open-circuit.

  Remedy as necessary.

  Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 232: Breakout Box
Courtesy of VOLVO CARS CORPORATION

Fig. 233: Identifying Ohmmeter

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Possible Source

- Defective fuse
- Open circuit in signal wire or power supply
- Faulty relay.

Fault symptom[s]

- Engine does not start.

CHECKING THE STARTER MOTOR CIRCUIT (2003-04)

CHECKING THE STARTER MOTOR CIRCUIT

SYMPTOM VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 261: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

Fig. 262: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Ignition off.
- Install connectors, components, etc.

  Start the engine.

Does the starter motor work

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

VERIFICATION FAILED: The fault should have been detected and remedied. As this is not the case fault-tracing has failed. Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

CHECKING THE SUN ROOF SUNSHADE (2003-12)

CHECKING THE SUN ROOF SUNSHADE

CHECKING THE SUNSHADE

Check that the sunshade rail is clean. Clean the rail as necessary.

Check that the sunshade guide runs in the rail. If necessary, reinsert the guide in the rail.

Replace the sunshade guide as necessary.

Remedy as necessary:

Other information

- For sunshade guide replacement: **SUN VISOR/INNER COVER SUN ROOF, REPLACING**

Fig. 263: Identifying Sunshade
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **FUNCTIONALITY CHECK**

FUNCTIONALITY CHECK

Check that the sun roof sunshade can be operated.

Is the sunshade function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should be diagnosed and remedied. Since this is not the case the fault-tracing process has failed.

Complete the fault-tracing for those fault or try again.

SUN VISOR/INNER COVER SUN ROOF, REPLACING

- See **SUN VISOR/INNER COVER SUN ROOF, REPLACEMENT** .

TROUBLE-SHOOTING INFORMATION

Condition

Fig. 264: Identifying Sunshade
Courtesy of VOLVO CARS CORPORATION

No diagnostic trouble codes are displayed.

Substitute Value

None.

Possible Source

- Dirt or coating on the guide rail.
- Faulty guide rail.

Fault symptom[s]

- The sun roof sunshade cannot be operated.

CHECKING THE SUNROOF (2003-12)

CHECKING SUN ROOF

CHECKING THE CONNECTORS

Fig. 265: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

  Check the upper electronic module (UEM), sun roof module (SRM) and wiring connectors (54/3R and 54/13). Check for contact resistance and oxidation. Check for loose connections.

  Check for damage carefully.

  Reinstall the components, reconnect the connectors etc.

  Ignition on.

  Operate the sun roof.

Other information

- To access the upper electronic module (UEM), see **UPPER ELECTRONIC MODULE (UEM)/REARVIEW MIRROR, REPLACING**
- To access the sun roof connector, see **CONTROL MODULE, SUN ROOF, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 266: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Do the sun roof controls operate?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING COMPONENTS AND WIRING**

CHECKING COMPONENTS AND WIRING

Check that main fuse (11A/2) in the relay/fusebox in the engine compartment is intact.

Check that fuse (11C/34) in the integrated relay/fusebox in the passenger compartment is intact.

Check the cable between sun roof module (SRM) terminal #1 and the battery. Check for a short-circuit to ground. Check for an open-circuit.

Check the cable between sun roof control module terminal #10 and ground: Check the left A-post. Check for a short-circuit to ground. Check for an open-circuit.

The upper electronic module (UEM) and sun roof module (SRM)

Check the cable between upper electronic module (UEM) terminal #8 and sun roof module (SRM) terminal #6. Check for a short-circuit to ground.

Sun roof control module and roof lamp module

Check the cable between the sun roof module (SRM) terminal #2 and the roof lamp module terminal #4B. Check for a short-circuit to supply voltage.

Check the cable between the sun roof module (SRM) terminal #8 and the roof lamp module terminal #3B. Check for a short-circuit to supply voltage.

Check the cable between sun roof module (SRM) terminal #8 and roof lamp module terminal #3B. Check for an open-circuit.

Check the cable between sun roof module (SRM) terminal #2 and roof lamp module terminal #4B. Check for an open-circuit.

Check the cable between sun roof module (SRM) terminal #3 and roof lamp module terminal #2B. Check for an open-circuit.

Check the cable between sun roof module (SRM) terminal #7 and roof lamp module terminal #1B. Check for an open-circuit.

Check the cable between the sun roof module (SRM) terminal #9 and the roof lamp module terminal #9A. Check for an open-circuit. Check for a short-circuit to ground.

Sun roof switch and roof lamp module

Check the wiring between sun roof switch and roof lamp module (RCM). Check for an open-circuit. Check for

a short-circuit to supply voltage.

Remedy as necessary.

Other information

- For further information about signals and other values, see **SIGNAL DESCRIPTION, UPPER ELECTRONIC MODULE (UEM)**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- To replace the switch for the sun roof, see **SWITCH SUN ROOF, REPLACING**
- To access the roof lamp module connector, see **INTERIOR LIGHTING, REPLACING**
- To access the sun roof control module, see **CONTROL MODULE, SUN ROOF, REPLACING**
- With the ignition off, the voltage between control module terminal #1 and ground should be battery voltage
- see **CHECKING WIRING AND TERMINALS** .

Fig. 267: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Fig. 268: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 269: Identifying Sunroof Module Connector A Terminals
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **CHECKING COMPONENTS**

CHECKING COMPONENTS

Visually check for damage to the roof lamp module and its switches.

Remedy as necessary.

If no fault is found replace the sun roof switch.

Other information

- To replace the switch for the sun roof, see **SWITCH SUN ROOF, REPLACING** .

Fig. 270: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 271: Identifying Sunroof Module Connector A Terminals
Courtesy of VOLVO CARS CORPORATION

FAULT-TRACING INFORMATION

Condition

No DTCs stored. Sun roof installed.

Substitute Value

None.

Possible Source

- Blown fuse.
- Fault in the power supply to the sun roof control module.
- Fault in the ground terminal for the sun roof control module.
- Fault in the wiring between the upper electronic module and the sun roof control module.
- Fault in the wiring between the sun roof control module and the roof lamp module.
- Fault in the wiring between the sun roof switch and the roof lamp module.

Fault symptom[s]

- The power sun roof does not operate.

CHECKING THE TAILGATE WIPER (2003-04)

CHECKING THE TAILGATE WIPER

CHECKING THE CABLE

- **HINT: The fault could also have been caused by the tailgate wiper sticking.**

  Check fuse 11D/12.

  Check the cable between fuse 11D/12 #2 and rear electronic module relay base 2/16 #3. Check the cable between fuse 11D/12 #2 and rear electronic module relay base 2/72 #3. Check for a short-circuit to supply voltage according to **SHORT-CIRCUIT TO SUPPLY VOLTAGE. PERMANENT FAULTS** . Check for an open-circuit according to **OPEN-CIRCUIT, PERMANENT FAULTS** .

  Check the cable between rear electronic module relay base 2/16 #1 and wiper motor 6/32 #2. Check the cable between rear electronic module relay base 2/72 #1 and wiper motor 6/32 #1. Check for a short-circuit to supply voltage according to **SHORT-CIRCUIT TO SUPPLY VOLTAGE. PERMANENT FAULTS** . Check for an open-circuit according to **OPEN-CIRCUIT, PERMANENT FAULTS** .

  Check the cable between wiper motor 6/32 #3 and ground terminal 31/72. Check for a short-circuit to supply voltage according to **SHORT-CIRCUIT TO SUPPLY VOLTAGE. PERMANENT FAULTS** . Check for an open-circuit according to **OPEN-CIRCUIT, PERMANENT FAULTS** .

  If no other faults are found try a new tailgate wiper motor (6/32).

  Remedy as necessary.

  Other information:

  - To access the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .
  - For information about signals, see **SIGNAL SPECIFICATION** .

Fig. 272: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After carrying out the repair, check that the fault has been remedied.

Fig. 273: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 274: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Reinstall the connectors, components etc.
- Ignition on.

  Activate the tailgate wiper.

  Activate intermittent mode.

Is the function OK?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Possible Source

- Wiper has stuck on windscreen
- Defective windscreen wiper
- Open circuit in wire
- Short circuit to voltage supply on wire.

Fault symptom[s]

- Windscreen wiper motor does not work.

CHECKING THE TANK GAUGE (2005-09)

CHECKING THE TANK GAUGE

see **CHECKING THE TANK GAUGE**

CHECKING THE WARNING LIGHT (2003-04)

CHECKING THE WARNING LIGHT

PROGRAMMING DAYTIME RUNNING LAMPS

Three different daytime running light functions can be programmed:

Low beam in all switch positions except the parking light position (Flex zero)

Position light switch:

OFF: Parking and daytime running lamps or Xenon lamps are activated depending on the signal from the twilight sensor.

Parking lamps: Only parking lamps activated.

On: Parking and Xenon lamps are activated.

The light switch functioning on the basis of: off, parking light and low beam (Flex standard)

Position light switch:

OFF: Daytime running lamps are activated. If the twilight sensor registers insufficient light, all lighting is switched off (Xenon lamps are not activated).

Parking lamps: Only parking lamps activated.

On: Parking and Xenon lamps are activated.

Low beam always on regardless of the position of the light switch (Flex low)

Position light switch:

OFF: Parking and daytime running lamps or Xenon lamps are activated depending on the signal from the twilight sensor.

Parking lamps: Parking and Xenon lamps are activated.

On: Parking and Xenon lamps are activated.

It is essential that the legal requirements of each country are followed.

NOTE: It is not permitted to change this programming in the Canadian market.

Read off the programming by clicking on the VCT2000 symbol.

To change the setting, mark the desired value in the scrolling list and start programming.

Fig. 275: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **SAVE THE PROGRAMMED VALUE**

SAVE THE PROGRAMMED VALUE

To ensure that the programmed information is stored, click on the VCT2000 symbol to force the entry.

Fig. 276: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

CHECKING THE WIPERS (2003-04)

CHECKING WINDSHIELD WIPER

CHECKING THE CABLE

HINT: The fault could also have been caused by the windshield wipers sticking.

Check the cable between central electronic module (CEM) terminal #16B and motor (6/1) terminal #3. Check for a short-circuit to supply voltage. See **SHORT-CIRCUIT TO SUPPLY VOLTAGE. PERMANENT FAULTS** . Check for an open-circuit. See **OPEN-CIRCUIT, PERMANENT FAULTS** .

Check the connector.

If no other faults are found try a new windshield wiper motor (6/1).

Remedy as necessary.

Other information:

- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For information about signals, see **SIGNAL SPECIFICATION**
- To replace the wiper motor, see **MOTOR WINDSHIELD WIPER, REPLACING** .

Fig. 277: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

HINT: After the repair it is necessary to check that the fault has been rectified.

Fig. 278: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Fig. 279: Connecting Connector
Courtesy of VOLVO CARS CORPORATION

- Connect the connectors, install the components, etc.
- Ignition on.

  Activate windscreen wipers, intermittent position.

  Read the value.

  The value should alternate between the two positions "rest position" and "operating position".

Fig. 280: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Does it work?

- **YES**

  VERIFIED: Troubleshooting has been completed.

- **NO**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

TROUBLE-SHOOTING INFORMATION

see **TROUBLE-SHOOTING INFORMATION**

CHECKING TIRE PRESSURE SENSORS (2005-12)

QUICK TEST OF THE TIRE PRESSURE SENSOR

CHECKING THE RECEIVER

NOTE: **This method only applies to vehicles with the tire pressure warning system. A diagnostic trouble code (DTC) is stored in the upper electronic module (UEM) in the event of a fault in the tire pressure sensors.**

HINT: Check that no diagnostic trouble code for missing sensor has been stored in the Upper electronic module (UEM) before checking the system - if so, troubleshoot according to this diagnostic trouble code.

The receiver is in the rear view mirror. It receives signals from both the remote control and tire pressure sensors. The remote control can be used to check that the receiver is working.

Check the function of the receiver by pressing the locking and unlocking button on the remote control. The vehicle must lock and unlock.

NOTE: **Fault-trace the symptoms if the remote control and receiver are not working.**

Fig. 281: Identifying Ignition Key
Courtesy of VOLVO CARS CORPORATION

Fig. 282: Identifying Rear View Mirror
Courtesy of VOLVO CARS CORPORATION

Are the remote control and receiver working?

- **YES**

  Refer to **QUICK TEST OF THE TIRE PRESSURE SENSOR**

- **NO**

  OKAY: Troubleshooting has been completed.

QUICK TEST OF THE TIRE PRESSURE SENSOR

HINT: The base of the air valve is aluminum colored if the rims are intended for tire pressure sensors.

Fig. 283: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

Each tire pressure sensor has its own ID number which is transmitted to and stored in the upper electronic module (UEM). Read off the last stored ID number by clicking on the VCT2000 symbol. The last stored ID number is displayed until a new ID number is received and stored.

Use the following special tools to activate the sensor. Use the following special tools to activate the sensor.

see **9512963**

NOTE: **Ensure that the special tool is positioned under the edge of the rim against the tire where the sensor is installed. The sensor will not be activated if the tool is against the rim. The sensor must then be held in place for approximately 5 seconds for the signals to be correctly received. Use only one special tool at a time in the vicinity of the car.**

NOTE: **Carry out the above in an area away from where other cars are being driven. The receiver can pick up signals from sensors on other cars. An incorrect ID number would then be displayed.**

Repeat this procedure for each wheel. Different ID numbers must be displayed.

HINT: If a sensor does not respond during the test this indicates that the rim does not have a sensor installed, the sensor may be damaged or may be a sensor intended for another make or model.

Fig. 284: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

Fig. 285: Identifying Special Tool
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  OKAY: Troubleshooting has been completed.

- Refer to **COMMUNICATION FAULT**

COMMUNICATION FAULT

Communication has been interrupted for one of the following reasons:

- The ignition is switched off
- VCT2000 disconnected from the data link connector (DLC)
- VCT2000 disconnected from the VIDA cart
- Communication problems in VIDA application or in car.
- No voltage in the data link connector (DLC).

Check therefore:

- That the control module power supply and ground terminal are fault-free.
- That the fuse for the data link connector (DLC) is intact.
- that the ignition is on
- that the battery voltage (system voltage) is normal (approximately 12 V).

  If necessary a battery charger can be connected during the test.

  For information about charge currents and the battery, see **BATTERY, CHARGING**

- that VCT2000 is correctly connected to the VIDA cart and the data link connector (DLC)
- that VCT2000 and the wiring is fault-free.

Other information

Try to establish communication again or exit reading off diagnostic trouble codes (DTCs). Depending on the communication fault, select one of the following options.

1. Try again. Refer to **CHECKING THE RECEIVER**.
2. Fault-trace more comprehensively for the communication problem that has occurred. Refer to **CHECKING COMMUNICATION ERRORS**.
3. Exit fault-tracing/Read off from the next system. Troubleshooting has been completed.

Fig. 286: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

CHECKING COMMUNICATION ERRORS

SELECTING CAR MODEL

Select car model to obtain relevant troubleshooting information.

Select one of the following model alternatives

1. XC90. Refer to **CHECKING COMMUNICATION ERRORS, CAR MODEL XC90**

CHECKING COMMUNICATION ERRORS, CAR MODEL XC90

HINT: Test the communication with another corresponding vehicle to decide if the malfunction is in the vehicle or in VIDA/VCT/cable harness. If the communication works on another vehicle, the malfunction is in the vehicle.

Different speed on the CAN-communication can lead to problems

Volvo's vehicles have different speed of communication on the high-speed part of the CAN-network (HS-CAN), depending on model year.

- Model year -2004 communicates with 250 kbit/s.
- Model year 2005- communicates with 500 kbit/s.

Due to this, it is very important to specify correct vehicle profile before any communication is started with the vehicle's HS-CAN. This is normally done by pressing on "Retrieve VIN" or by manually specifying vehicle parameters under "Vehicle profile".

If the wrong model year has been selected, it may lead to blocking of the CAN-net, diagnostic trouble codes being stored in several control modules or missing response from control modules at continued communication. The following control modules may be affected by this problem:

- Brake control module (BCM)/(ABS)
- Engine control module (ECM)
- Electronic Throttle Module (ETM)
- Suspension Module (SUM)
- Central electronic module (CEM)
- Transmission control module (TCM)
- Steering wheel angle sensor module (SAS)
- Steering Wheel Module (SWM)
- Electrical Power Steering Module (EPS)

If this happens, take the following action:

- Turn off the ignition and remove the ignition key. Insert the key again in position II.
- If the above does not work, remove the battery cable and connect it again after a minute to reset the control modules.
- Select the correct vehicle profile in VIDA and erase the diagnostic trouble codes. Check that the symptoms have disappeared.

Diagnostic outlet

- Check the voltage feed to diagnostic outlet #16. The voltage shall match battery voltage.
- Check the cable for power ground and signal ground to diagnostic outlet #4 and #5.

HINT: When VCT2000 is connected to the diagnostic outlet (is supplied with voltage), the indicator diode shall be activated with a green light. Then the indicator diode flashes quickly when communication takes place with a control module. In case of certain internal malfunctions on VCT2000 the indicator diode is activated with a red light.

Communication cables

- Check the communication cable (k-line) between diagnostic outlet #7 and central electronic module (CEM) #D6 and other connected control modules for open circuit, short-circuit to ground and short-circuit to voltage.

CAUTION: In case of malfunction on this communication cable, communication cannot be established on either the low or high-speed network. First when communication takes place on this cable, the low and high-speed cables between the diagnostic outlet and central electronic module (CEM) are connected to the rest of the network in the vehicle. This is controlled via a relay in the central electronic module (CEM). This relay is only found on vehicles of model year -2004.

- For communication problems with control units on **the high-speed network** , check communication cables between diagnostic outlet #6/#14 and central electronic module (CEM) #B7/#B8 for open circuit, short-circuit to ground and short-circuit to voltage according to references above.
- For communication problems with control units on **the low-speed network** , check communication cables between diagnostic outlet #3/#11 and central electronic module (CEM) #B19/#B20 for open circuit, short-circuit to ground and short-circuit to voltage according to references above.
- Also check the communication cables for the low and high-speed net between the central electronic module (CEM) and the other connected control modules according to troubleshooting above.

Control modules

- Check that the control module's voltage feed and ground connection are trouble-free.

CAUTION: If none of the above checks help, try reading out diagnostic trouble codes in the central electronic module (CEM). Done via VIDA vehicle communication. A prerequisite for being able to communicate with the control modules in the car is that the central electronic module (CEM) is active and can be communicated with. If communication is not possible with the central electronic module (CEM), check the voltage feed and ground for the central electronic module (CEM).

VCT2000 and cable harness

- Connect VCT2000 to the vehicle so that it is supplied with voltage. Test VCT2000 by selecting the system's self-test and VCT Test in the VIDA main menu. If any malfunction is found according to the test, first replace the cable harness then the VCT2000, if the test still indicates a malfunction.
- If no malfunctions were found after troubleshooting according to above, try with a new cable harness and/or new VCT2000.

VIDA

- If no malfunctions were found after troubleshooting according to above, try performing a complete system reset of VIDA (Volvo scan tool).

Other information

- see **CONTENTS**

Fig. 287: Identifying Data Link Connector
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **FAULT-TRACING INFORMATION**

FAULT-TRACING INFORMATION

FAULT-TRACING INFORMATION

Fault-tracing communication problems is now finished.

Do you want to try establishing communication again?

- **YES**

  Refer to **CHECKING THE RECEIVER**

- **NO**

  Troubleshooting has been completed.

CHECKING UNLOCKING FROM DEADLOCK (2003-04)

CHECKING UNLOCKING FROM DEADLOCK

SELECTING A DOOR

NOTE: **The fault-tracing assumes that unlocking / locking with the central locking system functions normally.**

Which door does it apply to?

1. Front door. Refer to **CHECKING THE FRONT DOOR**.
2. Rear door. Refer to **CHECKING REAR DOORS**.

CHECKING THE FRONT DOOR

Check the control module connector terminal #B1 and the lock unit connector terminal #6. Check for contact resistance and oxidation. Check the intermediate cable. Check for an open-circuit.

Other information

- see **CHECKING WIRING AND TERMINALS** .

Fig. 288: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 289: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE COMPONENT**

CHECKING REAR DOORS

Which door does it apply to?

1. A rear door. Refer to **CIRCUIT TEST**
2. Both the rear doors. Refer to **CIRCUIT TEST**

CIRCUIT TEST

The fault indicates an open-circuit in the cable from (or in) the lock unit. To determine in which circuit the fault is:

Remove the deadlock relay (2/115).

Remove the lock unit connector. Check the connector for contact resistance and oxidation.

Other information

- To expose the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**

- To expose the lock unit, see **LOCK MECHANISM, TAILGATE, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 290: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 291: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CIRCUIT TEST (CONT.)**

CIRCUIT TEST (CONT.)

Check the cable between terminal #8 the cable and connector and terminal #3 on the relay base. Check for an

open-circuit. If a fault is detected, check in particular the 2 intermediate connectors in the cable harness. Check for contact resistance and oxidation.

Other information

- To expose the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING**
- To expose the lock unit, see **LOCK MECHANISM, TAILGATE, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 292: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 293: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CHECKING THE COMPONENT**

CIRCUIT TEST

Begin by replacing the relay for deadlocking (2/115) in the integrated relay/fusebox in the cargo compartment.

Check the relay base switches. Check for contact resistance and oxidation.

Other information

- To expose the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .

Fig. 294: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 295: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Was a fault detected?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **CIRCUIT TEST (CONT.)**

CIRCUIT TEST (CONT.)

- Remove relay 2/115.

Take resistance readings between terminal #4 of the relay base and ground. The ohmmeter should display a short-circuit.

Other information

- To expose the integrated relay/fusebox in the cargo compartment, see **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .

Fig. 296: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 297: Identifying Relays
Courtesy of VOLVO CARS CORPORATION

Does the ohmmeter display a short-circuit?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

Replace the rear electronic module (REM). See **RELAY/FUSE BOX CARGO COMPARTMENT/REAR**

ELECTRONIC MODULE (REM), REPLACING .

CHECKING THE COMPONENT

Measure the resistance between pins terminals #8 and #6 on the chassis switch lock unit.

The ohmmeter should read approximately 5 ohm.

Other information

- To remove the lock unit, see **LOCK MECHANISM, TAILGATE, REPLACING**
- For information about signals, see **SIGNAL SPECIFICATION** .

Fig. 298: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 299: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Is the value correct?

- **YES**

  Refer to **FUNCTION TEST**

- **NO**

  Refer to **REPLACING THE COMPONENT**

FUNCTION TEST

Check that the mechanical/electrical function of the lock unit is OK before the lock unit is reinstalled.

Is the function OK?

- **YES**

  OKAY: Troubleshooting has been completed.

- **NO**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

Replace the lock unit. See **LOCK MECHANISM, TAILGATE, REPLACING** .

CHECKING THE COMPONENT

Measure the resistance between pins terminals #7 and #6 on the chassis switch lock unit.

The ohmmeter should read approximately 5 ohm.

Other information

- To remove the lock unit, see **LOCK MECHANISM, TAILGATE, REPLACING**
- For information about signals, see **SIGNAL SPECIFICATION** .

Fig. 300: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 301: Identifying Connector Terminals
Courtesy of VOLVO CARS CORPORATION

Is the value correct?

- **YES**

  Refer to **FUNCTION TEST**

- **NO**

  OKAY: Troubleshooting has been completed.

FUNCTION TEST

Check that the mechanical/electrical function of the lock unit is OK before the lock unit is reinstalled.

Is the function OK?

- **YES**

  Refer to **REPLACING THE COMPONENT**

- **NO**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

Replace the rear electronic module (REM). See **RELAY/FUSE BOX CARGO COMPARTMENT/REAR ELECTRONIC MODULE (REM), REPLACING** .

REPLACING THE COMPONENT

Replace the lock unit. See **LOCK MECHANISM, TAILGATE, REPLACING** .

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are displayed.

Possible Source

- Faulty lock unit.
- Faulty relay.
- Contact resistance and oxidation in the connectors.
- Fault in wire to lock unit.
- Fault in control unit.

Fault symptom[s]

- Does not open from the deadlock position BLL.

CHECKING WARNING FLASHERS (2003-04)

CHECKING HAZARD WARNING SIGNAL FLASHER

CHECKING THE CABLE AND THE SWITCH

Check the cable between the central electronic module (CEM) terminal #16D and the hazard warning signal flasher switch terminal #3 (3/6). Check for a short-circuit to ground. Check for a short-circuit to supply voltage. Check for an open-circuit.

Check the function of the switch.

When the switch is depressed, the voltage should be 0 V, otherwise 12 V at terminal #3 on the hazard warning signal flasher switch (3/6).

If the switch does not work, replace the switch.

Remedy as necessary.

Other information:

- To replace the switch for the hazard warning signal flasher, see **SWITCH HAZARD WARNING SIGNAL FLASHER, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 302: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are stored.

Possible Source

- Defective warning flasher switch
- Open circuit in wire
- Short circuit to voltage supply or ground on the wire.

Fault symptom[s]

Warning flasher does not work.

CHECKING WARNING FLASHERS AND GLOVE COMPARTMENT LIGHTING (2003-04)

CHECK HAZARD WARNING SIGNAL FLASHER AND GLOVE COMPARTMENT LIGHTING

CHECKING THE CABLE

Fig. 303: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off.

Check the cable between the central electronic module (CEM) terminal #17D and the hazard warning signal flasher switch terminal #1 (3/6). Check for a short-circuit to supply voltage. Check for an open-circuit.

Remedy as necessary.

If no faults were found, replace the switch.

Other information:

- For information about the central electronic module (CEM) connector, see **CENTRAL ELECTRONIC MODULE (CEM), REPLACING**
- To connect the breakout box, see **CONNECTING THE BREAKOUT BOX**
- For information about signals, see **SIGNAL SPECIFICATION**
- To replace the switch for the hazard warning signal flasher, see **SWITCH HAZARD WARNING SIGNAL FLASHER, REPLACING**
- see **CHECKING WIRING AND TERMINALS** .

Fig. 304: Breakout Box
Courtesy of VOLVO CARS CORPORATION

Fig. 305: Identifying Ohmmeter
Courtesy of VOLVO CARS CORPORATION

Fig. 306: 10-CD Changer Connector Terminals
Courtesy of VOLVO CARS CORPORATION

TROUBLE-SHOOTING INFORMATION

Condition

No diagnostic trouble codes are stored.

Possible Source

- Warning flasher or glove compartment light is short circuited to voltage supply or has an open circuit.

Fault symptom[s]

Interior lighting does not work.

MISSING INDICATION AT LOCKING OR UNLOCKING (2005-06)

FAULT-TRACING INFORMATION

In certain cases, indication may be missing when locking or unlocking the vehicle with installed alarm system.

The phenomena is rare but may occur if a door is open when the vehicle is locked with the remote control and then the open door is closed approx. one second after locking.

The problem can be solved by downloading new software to Rear electronic module (REM).

If the problem remains after new software has been downloaded, see special mechanical instruction.

Fig. 307: Identifying Rear Electronic Module (REM)
Courtesy of VOLVO CARS CORPORATION

QUICK TEST OF ALTERNATOR FUNCTION (2005-12)

QUICK TEST OF ALTERNATOR FUNCTION

QUICK TEST INFORMATION

The central electronic module (CEM) has built-in functions for regulating the alternator (alternator control module (ACM)).

To charge the battery optimally, output voltage from the alternator is calculated based on the calculated battery temperature. The central electronic module (CEM) calculates battery temperature from outside temperature, which is obtained from the outside temperature sensor.

Depending on the vehicle's ambient temperature and/or if the vehicle has been without power, the calculated battery temperature (read temperature) may differ slightly from the battery's actual temperature for up to 24 hours afterwards.

In the following tests, battery temperature in the central electronic module (CEM) is changed, thereby changing voltage from the alternator.

The test is divided into two parts - an automatic test and a manual test.

Select one of the alternatives below:

1. Automatic test of alternator function. Refer to **AUTOMATIC TEST OF ALTERNATOR FUNCTION**.
2. Manual test of alternator function. Refer to **MANUAL TEST OF ALTERNATOR FUNCTION**

Fig. 308: Freewheel Generator
Courtesy of VOLVO CARS CORPORATION

AUTOMATIC TEST OF ALTERNATOR FUNCTION

Fig. 309: Belt Routing/Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start the engine and allow it to idle for approx. 1 minute.
- Make sure that no extra electrical consumers are connected. Turn off functions that consume a great deal of power, such as the ventilation fan, heated rear window/door mirrors, heated seats, lighting, radio system, etc.

  Start the automatic test by clicking the Start button.

  Values for battery temperature and voltage are read and displayed continually during the test. A number of tests are performed in which various battery temperatures are used from -30°C to +90°C. Between each battery temperature, there is a delay of approx. 5 seconds before the voltage is read. This allows the alternator to have time to set the right voltage in relation to the set battery temperature.

  The entire test takes approx. 1 minute. A message is displayed when the test is complete. Compare the

values from the readout of battery temperature (T) and voltage (U) with the values in the table.

Battery temperature (T) (°C)	Voltage (U), lower limit (V)	Voltage (U), upper limit (V)
+60°C, +70°C, +80°C, +90°C	12.80 V	13.60 V
+50°C	12.95 V	13.75 V
+40°C	13.27 V	14.07 V
+30°C	13.58 V	14.38 V
+20°C	13.89 V	14.69 V
-30°C, -20°C, -10°C, 0°C, +10°C	14.20 V	15.00 V

If the voltage values generally lie below the lower limit (low voltage), redo the test at an engine speed of 2500 rpm.

If the voltage is within the tolerances this time, alternator function is OK, but the test indicates that the battery is not fully charged. If voltage still deviates, there is a fault in the charging system.

NOTE: **The read-out voltage is read internally from the central electronic module (CEM) and deviates slightly from the actual alternator output voltage due to a drop in voltage in the wiring harness.**

Fig. 310: Identifying VCT2000 Diagnostic Tool Symbol In VIDA
Courtesy of VOLVO CARS CORPORATION

MANUAL TEST OF ALTERNATOR FUNCTION

Fig. 311: Belt Routing/Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Start the engine and allow it to idle for approx. 1 minute.
- Make sure that no extra electrical consumers are connected. Turn off functions that consume a great deal of power, such as the ventilation fan, heated rear window/door mirrors, heated seats, lighting, radio system, etc.

  Values for battery temperature and voltage are read and displayed continually during the test. Select values that are available in the list window. Wait approx. 5 seconds between each battery temperature change to allow the alternator to have time to set the right voltage in relation to the set battery temperature. Then read battery temperature and voltage between each temperature selection.

  Compare the values from the readout of battery temperature and voltage with the values in the table.

Battery temperature (T) (°C)	Voltage (U), lower limit (V)	Voltage (U), upper limit (V)
+60°C, +70°C, +80°C, +90°C	12.80 V	13.60 V
+50°C	12.95 V	13.75 V
+40°C	13.27 V	14.07 V
+30°C	13.58 V	14.38 V
+20°C	13.89 V	14.69 V
-30°C, -20°C, -10°C, 0° C, +10°C	14.20 V	15.00 V

If the voltage values generally lie below the lower limit (low voltage), redo the test at an engine speed of 2500 rpm.

If the voltage is within the tolerances this time, alternator function is OK, but the test indicates that the battery is not fully charged. If voltage still deviates, there is a fault in the charging system.

NOTE: The read-out voltage is read internally from the central electronic module (CEM) and deviates slightly from the actual alternator output voltage due to a drop in voltage in the wiring harness.

DOOR LOCKS & ANTI-THEFT SYSTEMS

Electrical system

DOOR LOCKS & ANTI-THEFT SYSTEMS

REPLACING THE SWITCH FOR THE LOCK UNIT / CARGO COMPARTMENT LIGHTING

REMOVAL

LOCK UNIT

The switch for the cargo compartment lighting is positioned in the lock unit.

Fig. 1: Identifying Screws & Switch For Lock Unit/Cargo Compartment Lighting
Courtesy of VOLVO CARS CORPORATION

- Remove the upholstery on the tailgate. This is to gain access to the entire lock unit mechanism
- Unhook the lever from the lock cylinder mechanism
- Remove the screws (3 x) from the lock unit. Remove the lock unit
- Disconnect the connector.

INSTALLATION

LOCK UNIT

Install:

1. the connector,
2. the three screws for the lock unit. Tighten the screws to **10 Nm** ,
3. the lever for the lock mechanism,
4. the upholstery.

EXTERIOR LIGHTS

Electrical system

EXTERIOR LIGHTS

REPLACING POSITION SENSORS FOR BI-XENON LAMPS

REMOVING THE POSITION SENSOR

Fig. 1: Identifying Lever Arm And Nut
Courtesy of VOLVO CARS CORPORATION

Raise the car.

Remove:

- the connector
- the nut for the lever arm
- the bracket with the sensor. Press the bracket (it is sprung) and pull it backwards from the rear axle.

Transfer the bracket to the new position sensor.

INSTALLING THE POSITION SENSOR

Fig. 2: Identifying Lever Arm And Bracket
Courtesy of VOLVO CARS CORPORATION

Install:

- the bracket with the sensor on the rear axle
- the nut for the lever arm
- the connector.

NOTE: The initial setting for the lever arm should be pointing straight upwards at the rear axle.

Lower the car.

ELECTRICAL

General - Specifications, Mechanical

TIGHTENING TORQUE

GENERAL TIGHTENING TORQUE

NOTE: **Screws coated with a locking fluid or self locking nuts must be replaced with new when reinstalled.**

See the table below to find the tightening torques for components not included in the summary.

Nuts and screws which are not self locking can be reused provided that they are in good condition.

TIGHTENING TORQUE

Applies to screwed joint with strength class 8.8.	
Thread	Tightening torque (Nm)
M5	5
M6	10
M7	17
M8	24
M10	50
M12	80
M14	130

SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS

NOTE: **Screws coated with locking fluid or sealant must always be replaced with new screws during reinstallation.**

Always use **new screws and nuts** when angle tightening. Any exceptions to this rule will be indicated in the method.

Angle-tightening in tight spaces. See **SCREWED JOINT, TORQUE/ANGLE TIGHTENING** .

Battery connector	2.5 Nm
Generator B+ terminal	15 Nm
Generator, fixed belt pulley	65 Nm
Generator, freewheel pulley	80 Nm
Starter motor	40 Nm
Starter motor B+ terminal	15 Nm
Windshield wiper arm	20 Nm

Rear window wiper arm	14 Nm
Upper screw of tail light, XC90	6 Nm
Lower screw of tail light, XC90	8 Nm
Tail light, other	10 Nm
Screw, speed sensor	10 Nm
Screw, left level sensor	60 Nm
Screw, washer fluid reservoir	17 Nm
Nut, generator cover	16 Nm

Lighting - Cleaning, Inspection and Adjustment

HEADLAMPS, ALIGNING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

CAUTION: Cars equipped with Bi-Xenon lamps or halogen lamps are adjusted in the same way. Ensure that the position sensor for the Bi-Xenon lamps is correctly calibrated.

PREPARATORY WORK

CAUTION: Always adjust the headlamp beam according to the legal requirements of the market.

Fig. 1: Identifying Headlamp Switch And Lighting Level Switch
Courtesy of VOLVO CARS CORPORATION

- Ensure that there is sufficient battery voltage.

- Check the button that controls the lighting level. Set the button to the 0 position.
- Ignition and low beam on.

NOTE: Always adjust the beam with low beam switched on.

HEADLAMP ALIGNMENT

Fig. 2: Identifying Headlamp Alignment Screws
Courtesy of VOLVO CARS CORPORATION

- Adjust the beam vertically (Y) by turning the Allen screw. See the illustration
- Adjust the beam horizontally (X) by turning the Allen screw. See the illustration.

HINT: Use a 6 mm Allen screw.

NOTE: Adjust according to the illustration for the applicable market.

Lighting - Diagnostic Trouble Codes and Associated Procedures

HCM-0141: CONTROL MODULE. INTERNAL FAULT (B5254T2; 2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION HCM-0141

Condition

The Headlamp Control Module (HCM) checks internal components and functions.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Internal components do not work.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 1: Identifying Headlight Control Module (HCM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Damaged Headlamp Control Module (HCM).

Fault symptom[s]

- Active Bi-Xenon light; No Functionality
- Message in information display
- Indicator lamp Active Bi-Xenon light; Flashing

FAULT-TRACING

REPLACING A COMPONENT

The headlamp control module (HCM) has registered an internal fault.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference upon start of the headlamp control module (HCM) or may be a different type of fault that occurs on different occasions. The fault is evaluated depending on how it occurs. If the problem recurs, replace the headlamp control module (HCM).

In the event of a permanent fault, replace the headlamp control module (HCM).

Remedy as necessary.

Fig. 2: Identifying Headlight Control Module (HCM)
Courtesy of VOLVO CARS CORPORATION

- **Continue**

  Refer to **INFORMATION**

INFORMATION

FAULT-TRACING INFORMATION

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

HCM-0317: BATTERY VOLTAGE. VOLTAGE TOO HIGH (B5254T2; 2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION HCM-0317

Condition

The Headlamp Control Module (HCM) checks its own system voltage by comparing the DC voltage to the system voltage in the Central electronic module (CEM). Information about the system voltage in the Central electronic module (CEM) is transmitted via CAN to the Headlamp Control Module (HCM).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Direct voltage to control module is higher than 16.0 V.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 3: Identifying Headlight Control Module (HCM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- The charging system is overcharging.
- Damaged generator (GEN).
- Damaged battery.

Fault symptom[s]

- Active Bi-Xenon light; No Functionality
- Message in information display
- Indicator lamp Active Bi-Xenon light; Flashing

FAULT-TRACING

FAULT-TRACING INFORMATION

Use the following information and general checks during fault-tracing.

NOTE: Check that the fuses are intact. For locations, see the instruction manual, cover for fuse box, fuse ratings or similar.

1. Check, if possible, relevant functions in the vehicle using buttons/controls/test drives to determine the status of the fault.

   NOTE: If the vehicle does not show any of the given symptoms in the diagnostic trouble code information (DTC), this may mean that the fault is intermittent or that the control module is not detecting the fault at this moment.

2. Use the diagnostic trouble code's **frozen values** , **status identifiers** and **counter** to determine the operating conditions when the fault was detected, the fault's current status and any degree of intermittence of the fault.
3. Check and fault-trace according to **the fault causes** that are specified in the **diagnostic trouble code (DTC) information** .
4. Use **VIDA Vehicle communication** . Read off the parameters, activate components and functions, carry out quick tests and checking routines for the diagnostic trouble codes to identify the fault.
5. Check relevant components according to **Component specifications** .
6. Check relevant signals using **wiring diagram** , **signal specification** and **breakout box** .

NOTE: More information is available in Design and function .

Remedy as necessary.

  Refer to **INFORMATION**

DESCRIPTION OF FROZEN VALUES, HEADLAMP CONTROL MODULE (HCM)

EXPLANATION

Frozen values are parameter values that are stored when a diagnostic trouble code is generated. Not all parameters can be read out for all diagnostic trouble codes. The parameter values can only be read if they can provide additional information on the prevailing conditions when the code was generated.

TOTAL MILEAGE, VALUE

Measurement range: 0-1,000,000 km

The value indicates the vehicle's total mileage when the Diagnostic Trouble Code (DTC) was generated.

MECU POWER SUPPLY, VALUE

Measurement range: 0 - 63 V

Normal range: 12.0 - 14.5 V

The value indicates the power supply to the central electronic module (CEM) when the diagnostic trouble code was generated.

PASSENGER COMPARTMENT TEMPERATURE, VALUE

Measurement range: -40 till +215 °C

The value indicates the passenger compartment temperature when the diagnostic trouble code was generated.

OUTSIDE TEMPERATURE, VALUE

Measurement range: -40 till +215 °C

The value indicates the outside temperature when the diagnostic trouble code was generated.

POWER SUPPLY MODE, STATUS

The value indicates the status of the power supply mode when the diagnostic trouble code was generated.

Key removed

Key recently removed

Key approved

Ignition off after Accessory position

Accessory position

Accessory position after Ignition on

Ignition on

Running

Start attempt

Signal missing

SPEED, VALUE

Measurement range: 0 to 255 km/h (158 mph).

Indicates speed when the diagnostic trouble code was generated.

STEERING WHEEL ANGLE, VALUE

Measurement range: -780 to +780 °.

Indicates current steering wheel angle.

The normal value when the steering wheel and front wheels point straight ahead is approx. 0°.

INFORMATION

FAULT-TRACING INFORMATION

In case of this defect, troubleshooting is not followed by verification.

The information can be displayed again or the fault-tracing for this fault can be interrupted.

HCM-2281: COMMUNICATION, CENTRAL ELECTRONIC MODULE (CEM). SIGNAL MISSING (B5254T2; 2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION HCM-2281

Condition

The control module continually supplies necessary information from the Central electronic module (CEM) via CAN communication. The control module checks the communication with the Central electronic module (CEM).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Communication with the Central electronic module (CEM) is interrupted or missing.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 7: Identifying Headlight Control Module (HCM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Fault-trace in transmitting control module.

Fault symptom[s]

- Active Bi-Xenon light; No Functionality
- Message in information display
- Indicator lamp Active Bi-Xenon light; Flashing

FAULT-TRACING

see **FAULT-TRACING**

HCM-2687: COMMUNICATION WITH SAS CONTROL MODULE. SIGNAL MISSING (B5254T2; 2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION HCM-2687

Condition

The control module is continually supplied with necessary information from the Steering wheel angle sensor module (SAS) via CAN communication. The control module checks the communication with the Steering wheel angle sensor module (SAS).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- No communication with the Steering wheel angle sensor module (SAS).

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 8: Identifying Headlight Control Module (HCM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Fault-trace in transmitting control module.

Fault symptom[s]

- Active Bi-Xenon light; No Functionality
- Message in information display
- Indicator lamp Active Bi-Xenon light; Flashing

FAULT-TRACING

see **FAULT-TRACING**

HCM-2987: COMMUNICATION WITH BCM CONTROL MODULE. SIGNAL MISSING (B5254T2; 2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION HCM-2987

Condition

The control module is continually supplied with necessary information from the Brake control module (BCM) via CAN communication. The control module checks the communication with the Brake control module (BCM).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- No communication with the Brake control module (BCM).

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 9: Identifying Headlight Control Module (HCM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Fault-trace in transmitting control module.

Fault symptom[s]

- Active Bi-Xenon light; No Functionality
- Message in information display
- Indicator lamp Active Bi-Xenon light; Flashing

FAULT-TRACING

see **FAULT-TRACING**

HCM-4076: LAMP UNIT WRONG MOUNTING POSITION (B5254T2; 2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION HCM-4076

Condition

The Headlamp Control Module (HCM) checks the location of the Left headlamp control unit (LHCU) and the Right headlamp control unit (RHCU).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The left headlamp control unit (LHCU) is installed on the right-hand side or vice versa.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 10: Identifying Headlamp Units
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Cable harness for the Right headlamp control unit (RHCU) is connected to the Left headlamp control unit (LHCU).
- Cable harness for the Left headlamp control unit (LHCU) is connected to the Right headlamp control unit

(RHCU).
- The Right headlamp control unit (RHCU) is programmed with incorrect software.
- The Left headlamp control unit (LHCU) is programmed with incorrect software.

Fault symptom[s]

- Active Bi-Xenon light; No Functionality
- Message in information display
- Indicator lamp Active Bi-Xenon light; Flashing

FAULT-TRACING

see **FAULT-TRACING**

HCM-6401: LEFT HEADLAMP SWIVELLING MOTOR CIRCUIT FAULTY SIGNAL (B5254T2; 2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION HCM-6401

Condition

The Headlamp Control Module (HCM) communicates with the Left headlamp control unit (LHCU).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The Left headlamp control unit (LHCU) registers the vertical motor circuit has incorrect voltage or too high temperature.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 11: Identifying Headlamp Units
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Faulty power supply.
- Damaged Left headlamp control unit (LHCU).
- Temperature too high.
- Short-circuit to supply voltage in the signal cable.
- The signal cable is short-circuited to ground.
- Open circuit on signal cable.

Fault symptom[s]

- Active Bi-Xenon light; No Functionality
- Message in information display
- Indicator lamp Active Bi-Xenon light; Flashing

FAULT-TRACING

see **FAULT-TRACING**

HCM-6411: LEFT-HAND LAMP MODULE (LHCU) VOLTAGE TOO LOW (B5254T2; 2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION HCM-6411

Condition

The Headlamp Control Module (HCM) communicates with the Left headlamp control unit (LHCU).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The Left headlamp control unit (LHCU) registers incorrect system voltage.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 12: Identifying Headlight Control Module (HCM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

Signal too high:

- The charging system is overcharging.

Signal too low:

- Short-circuit to ground in the power supply cable.
- Open-circuit in the ground lead.

Fault symptom[s]

- Active Bi-Xenon light; No Functionality
- Message in information display
- Indicator lamp Active Bi-Xenon light; Flashing

FAULT-TRACING

see **FAULT-TRACING**

HCM-6477: LEFT HEADLAMP SWIVELLING MOTOR CIRCUIT COMMANDED POSITION NOT REACHABLE (B5254T2; 2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION HCM-6477

Condition

The Headlamp Control Module (HCM) communicates with the Left headlamp control unit (LHCU).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The Left headlamp control unit (LHCU) registers that the requested position of the horizontal motor circuit cannot be achieved.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 13: Identifying Headlight Control Module (HCM)

Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Blocked engine (the engine does not turn over)
- Damaged horizontal motor.

Fault symptom[s]

- Active Bi-Xenon light; No Functionality
- Message in information display
- Indicator lamp Active Bi-Xenon light; Flashing

FAULT-TRACING

see **FAULT-TRACING**

HCM-6501: RIGHT HEADLAMP SWIVELLING MOTOR CIRCUIT FAULTY SIGNAL (B5254T2; 2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION HCM-6501

Condition

The Headlamp Control Module (HCM) communicates with the Right headlamp control unit (RHCU).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The Right headlamp control unit (RHCU) registers an internal fault or too high temperature in the horizontal motor circuit.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 14: Identifying Headlight Control Module (HCM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Damaged Right headlamp control unit (RHCU).
- Temperature too high.
- Short-circuit to supply voltage in the signal cable.
- The signal cable is short-circuited to ground.
- Open circuit on signal cable.

Fault symptom[s]

- Active Bi-Xenon light; No Functionality
- Message in information display
- Indicator lamp Active Bi-Xenon light; Flashing

FAULT-TRACING

see **FAULT-TRACING**

HCM-6511: RIGHT HAND LAMP MODULE (RHCU) VOLTAGE TOO LOW (B5254T2; 2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION HCM-6511

Condition

The Headlamp Control Module (HCM) communicates with the Left headlamp control unit (LHCU).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The Left headlamp control unit (LHCU) registers incorrect system voltage.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 15: Identifying Headlight Control Module (HCM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

Signal too high:

- The charging system is overcharging.

Signal too low:

- Short-circuit to ground in the power supply cable.
- Open-circuit in the ground lead.

Fault symptom[s]

- Active Bi-Xenon light; No Functionality
- Message in information display
- Indicator lamp Active Bi-Xenon light; Flashing

FAULT-TRACING

see **FAULT-TRACING**

HCM-6577: RIGHT HEADLAMP SWIVELLING MOTOR CIRCUIT COMMANDED POSITION NOT REACHABLE (B5254T2; 2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION HCM-6577

Condition

The Headlamp Control Module (HCM) communicates with the Right headlamp control unit (RHCU).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The Right headlamp control unit (RHCU) registers that the requested position of the horizontal motor circuit cannot be achieved.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 16: Identifying Headlight Control Module (HCM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Blocked engine (the engine does not turn over)
- Damaged horizontal motor.

Fault symptom[s]

- Active Bi-Xenon light; No Functionality
- Message in information display
- Indicator lamp Active Bi-Xenon light; Flashing

FAULT-TRACING

see **FAULT-TRACING**

HCM-B104076: LAMP UNIT. MECHANICAL FAILURES. WRONG MOUNTING POSITION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION HCM-B104076

Condition

The Headlamp Control Module (HCM) checks the location of the Left headlamp control unit (LHCU) and the Right headlamp control unit (RHCU).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The left headlamp control unit (LHCU) is installed on the right-hand side or vice versa.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: **The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.**

Fig. 17: Identifying Headlamp Units
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Cable harness for the Right headlamp control unit (RHCU) is connected to the Left headlamp control unit (LHCU).
- Cable harness for the Left headlamp control unit (LHCU) is connected to the Right headlamp control unit (RHCU).
- The Right headlamp control unit (RHCU) is programmed with incorrect software.
- The Left headlamp control unit (LHCU) is programmed with incorrect software.

Fault symptom[s]

- Active Bi-Xenon light; No Functionality
- Message in information display
- Indicator lamp Active Bi-Xenon light; Flashing

FAULT-TRACING

FAULT-TRACING INFORMATION

Use the following information and general checks during fault-tracing.

NOTE: Check that the fuses are intact. For locations, see the instruction manual, cover for fuse box, fuse ratings or similar.

1. Check, if possible, relevant functions in the vehicle using buttons/controls/test drives to determine the

status of the fault.

NOTE: **If the vehicle does not show any of the given symptoms in the diagnostic trouble code information (DTC), this may mean that the fault is intermittent or that the control module is not detecting the fault at this moment.**

2. Use the diagnostic trouble code's **frozen values** , **status identifiers** and **counter** to determine the operating conditions when the fault was detected, the fault's current status and any degree of intermittence of the fault.
3. Check and fault-trace according to **the fault causes** that are specified in the **diagnostic trouble code (DTC) information** .
4. Use **VIDA Vehicle communication** . Read off the parameters, activate components and functions, carry out quick tests and checking routines for the diagnostic trouble codes to identify the fault.
5. Check relevant components according to **Component specifications** .
6. Check relevant signals using **wiring diagram** , **signal specification** and **breakout box** .

NOTE: **More information is available in Design and function .**

Remedy as necessary.

HCM-DD00: COMMUNICATION WITH LEFT-HAND LAMP MODULE (LHCU) FAULTY SIGNAL (B5254T2; 2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION HCM-DD00

Condition

The Headlamp Control Module (HCM) both transmits and receives information via a standardized serial communication method - LIN (Local Interconnect Network). The control module checks the communication with the Left headlamp control unit (LHCU).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Received message does not correspond with expected message.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: **The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.**

HCM-E000: CONTROL MODULE COMMUNICATION. FAULTY COMMUNICATION (B5254T2; 2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION HCM-E000

Condition

The control modules transmit and receive information via a standardized serial communication method - CAN (Control Area Network).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Communication on the CAN network is interrupted by another control module on the CAN network or by the control module's own message causing interference on the CAN network.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Starting the control module's CAN communication.

NOTE: **The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met. In the event of system communication problems, it is not possible to communicate with the control module. Therefore it will only be possible to read off the fault if it is intermittent.**

Fig. 35: Identifying Headlight Control Module (HCM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- Control module shuts itself off ("bus-off").

HINT: The control module is off until the power supply has been broken. When the power supply is connected the control module will make a new attempt to communicate.

Possible Source

- Short-circuit between the control area network (CAN) wiring.
- Open-circuit in the control area network (CAN) wiring.
- Internal fault in another control module in the same part of the control area network (CAN).
- Internal fault in the control module.

Fault symptom[s]

- Active Bi-Xenon light; No Functionality
- Message in information display
- Indicator lamp Active Bi-Xenon light; Flashing

HCM-E003: CONFIGURATION FAULT. FAULTY CONFIGURATION (B5254T2; 2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION HCM-E003

Condition

The control modules communicate with each other for exchange of information in a network via a standardized serial communication procedure - CAN (Controller Area Network). The Central electronic module (CEM) regularly transmits messages on the CAN network. These messages contain information about which signal configuration ID applies to the vehicle. The control modules on the CAN network have the same signal configuration ID so that they can communicate with each other.

The control module compares its configuration ID with the signal configuration transmitted on the control area network (CAN) by the central electronic module (CEM).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The control module's configuration ID differ from the ID that the Central electronic module (CEM) transmits.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Starting the control module's CAN communication.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 36: Identifying Headlight Control Module (HCM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- Control module shuts itself off ("bus-off").

NOTE: **When the diagnostic trouble code (DTC) is stored, the control module responds to the diagnostic commands.**

Possible Source

- Incorrect configuration ID (the control module is not intended for this vehicle, for example it is a used control module with different software/hardware).
- Open-circuit in the CAN cables between the control module and the Central Electronic Module (CEM).

Fault symptom[s]

- Active Bi-Xenon light; No Functionality
- Message in information display
- Indicator lamp Active Bi-Xenon light; Flashing

HCM-E010: CONTROL MODULE. VOLTAGE TOO LOW (B5254T2; 2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION HCM-E010

Condition

The Headlamp Control Module (HCM) checks its own system voltage by comparing the DC voltage to the system voltage in the Central electronic module (CEM). Information about the system voltage in the Central electronic module (CEM) is transmitted via CAN to the Headlamp Control Module (HCM).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Direct voltage to control module is lower than 9.0 V.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 37: Identifying Headlight Control Module (HCM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Contact resistance, oxidation or open-circuit in the terminals.
- Low battery
- Short-circuit to ground in the power supply.
- Damaged fuse.

Fault symptom[s]

- Active Bi-Xenon light; No Functionality
- Message in information display
- Indicator lamp Active Bi-Xenon light; Flashing

FAULT-TRACING

see **FAULT-TRACING**

HCM-P060141: INTERNAL CONTROL MODULE MEMORY CHECK SUM ERROR. SYSTEM INTERNAL FAILURES. GENERAL CHECKSUM FAILURE (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION HCM-P060141

Condition

The Headlamp Control Module (HCM) checks internal components and functions.

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Internal components do not work.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 38: Identifying Headlight Control Module (HCM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- None.

Possible Source

- Damaged Headlamp Control Module (HCM).

Fault symptom[s]

- Active Bi-Xenon light; No Functionality
- Message in information display
- Indicator lamp Active Bi-Xenon light; Flashing

FAULT-TRACING

REPLACING A COMPONENT

The headlamp control module (HCM) has registered an internal fault.

If the fault is intermittent, it has been registered previously but is no longer present. Intermittent faults can be caused by interference upon start of the headlamp control module (HCM) or may be a different type of fault that occurs on different occasions. The fault is evaluated depending on how it occurs. If the problem recurs, replace the headlamp control module (HCM).

In the event of a permanent fault, replace the headlamp control module (HCM).

Remedy as necessary.

Fig. 39: Identifying Headlight Control Module (HCM)
Courtesy of VOLVO CARS CORPORATION

HCM-U000100: HIGH SPEED CAN COMMUNICATION BUS. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION HCM-U000100

Condition

The control modules transmit and receive information via a standardized serial communication method - CAN (Control Area Network).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Communication on the CAN network is interrupted by another control module on the CAN network or by the control module's own message causing interference on the CAN network.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Starting the control module's CAN communication.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met. In the event of system communication problems, it is not possible to communicate with the control module. Therefore it will only be possible to read off the fault if it is intermittent.

Fig. 40: Identifying Headlight Control Module (HCM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- Control module shuts itself off ("bus-off").

HINT: The control module is off until the power supply has been broken. When the power supply is connected the control module will make a new attempt to communicate.

Possible Source

- Short-circuit between the control area network (CAN) wiring.
- Open-circuit in the control area network (CAN) wiring.
- Internal fault in another control module in the same part of the control area network (CAN).
- Internal fault in the control module.

Fault symptom[s]

- Active Bi-Xenon light; No Functionality
- Message in information display

- Indicator lamp Active Bi-Xenon light; Flashing

TROUBLESHOOTING

GENERAL INFORMATION

HINT: For general information about troubleshooting in the Control Area Network (CAN), see the linked document below.

NOTE: When selecting the vehicle profile, the correct vehicle must be identified. Use the "Retrieve VIN" button. Troubleshooting may fail if this is not done.

In order to check the CAN cables, the resistance of the network must be measured. The resistance between the two high-speed CAN cables, with the network connected, must be 60 ohms. The acceptable range of this reading is approx. 55-65 ohms.

If the communication diagnostic trouble code can be read from the control module, the malfunction is probably intermittent.

An intermittent malfunction in the power supply to a control module is indicated by individual diagnostic trouble codes in the Central Electronic Module (CEM) (CEM-1A5X or CEM-1A6X, as appropriate). There is probably no diagnostic trouble code in the control module that the central electronic module (CEM) has generated, since the module cannot generate a diagnostic trouble code when it is not supplied with voltage.

CAUTION: During this troubleshooting use the appropriate wiring diagram as help when measuring.

Other information

- see **GENERAL INFORMATION ABOUT FAULT-TRACING IN THE CAN NETWORK**
- **Continue**

  Refer to **MEASURING CABLES IN CAN-NETWORK (HS-CAN)**

MEASURING CABLES IN CAN-NETWORK (HS-CAN)

Fig. 41: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Disconnect the minus terminal on the battery.
- Connect a breakout box to the Engine Control Module (ECM).

NOTE: Also connect the engine control module (ECM) to the adapter cable harness, otherwise the measured values will be incorrect.

HINT: Use the Service Manual, Wiring Diagrams as help when measuring.

Measure the resistance between the connections below. Due to the network design, different measurement values will be obtained. For each measurement, twist the cable harness and wiggle the connections, where accessible, to detect any intermittent short-circuits or open circuits.

NOTE: The following resistance measurements only measure the main paths in the high-speed network, not the junctions that exist for some control modules. An open circuit in one path cannot be detected by this measurement. However, a short-circuit in a branch can be detected.

Measure the resistance between #B58 (#C58) and #B45 (#C45). The resistance shall be approx. 60 ohms. Permitted values approx. 55-65 ohms.

Also measure the resistance between each connection and the voltage as well as ground. The resistance must be infinite or very large (more than 1 Mohms).

HINT: If a malfunction is detected, then try to separate the junction with the measured malfunction at an appropriate point further along the cable. Unplug any connector/control module nearest to the previous measurement point and measure again. In this manner, try to find the malfunction.

Remedy the cables as necessary.

Other information

- see **BATTERY, DISCONNECTING**
- see **CONNECTING THE BREAKOUT BOX**
- see **SIGNAL SPECIFICATION**
- see **CONTENTS**

Was a malfunction detected?

- **YES**

  Refer to **VERIFICATION**

- **NO**

  Refer to **CHECKING THE TRAFFIC LOAD ON THE CAN CABLES**

CHECKING THE TRAFFIC LOAD ON THE CAN CABLES

Fig. 42: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Connect the battery
- Ignition on

  Malfunctions in the Control Area Network (CAN) may be due to a control module sending incorrect messages that disrupt normal communication. When messages are sent incorrectly, this results in a considerable increase in the amount of traffic on the Control Area Network (CAN). Check the load by measuring the average voltage value on the network cables in relation to ground.

  Check in the following manner:

  - Measure the voltage between #B45 (#C45) (HS-CAN-L) and ground. The voltage shall be approx. 2.3 V.

- Measure the voltage between #B58 (#C58) (HS-CAN-H) and ground. The voltage shall be approx. 2.8 V.

Other information

- see **BATTERY, DISCONNECTING**

Is the value OK?

- **YES**

  Refer to **INFORMATION**

- **NO**

  Refer to **IDENTIFYING A CONTROL MODULE IN THE CAN-NETWORK**

IDENTIFYING A CONTROL MODULE IN THE CAN-NETWORK

If the load on the CAN network is too high, this may be due to a control module sending incorrect messages on the CAN network (known as a disruptive control module). The malfunction may also be due to an intermittent short-circuit to voltage or ground in one of the CAN-cables. This results in the control modules on the CAN-network starting to send incorrect messages. The malfunctions can occur without a diagnostic trouble code (DTC) being stored by the control modules. The voltage can be measured between the CAN-cables in order to check the load on the CAN-network.

NOTE: It is not necessarily the control module(s) that stored the diagnostic trouble code (DTC) that is communicating incorrectly. Incorrect messages can come from any control module in the same section of the CAN-network. However, incorrect communication in one network cannot affect the communication on the other network. In other words, incorrect communication on the LS-CAN cannot disrupt communication on the HS-CAN, and vice versa.

Check the communication/load on the CAN-network by measuring the voltage between #B45 (#C45) and #B58 (#C58). The average value of the voltage shall be approx. 0.5 V (0.4-0.6 V). In case of malfunctioning communication, the voltage is at approx. 0.7 V and above.

To identify which control module is responsible for the incorrect communication, one can disconnect the voltage feed to each control module in turn and re-check the voltage on the CAN-cables. The voltage feed is most easily disconnected by removing the fuse/fuses for the particular control module. Continue until the voltage between the CAN-cables drops to about 0.5 V.

NOTE: When connecting and disconnecting individual control modules, other diagnostic trouble codes (DTCs) may be stored in certain control modules.

HINT: When a suspected control module is identified, connect and disconnect the voltage feed several times to verify that the malfunction appears and disappears. Turn off the ignition between each check.

NOTE: **Do not cut the voltage to the central electronic module (CEM) unless it is the last control module left to check.**

A control module which communicates incorrectly must be replaced. See Repair and installation/Removal, replacement and installation.

NOTE: **Following a malfunction involving control modules that disrupt communication, other control modules may remain in Limp-Home mode (that is, they work but with limited functionality) even after the ignition has been turned off and on a number of times. To remedy this, disconnect and reconnect the battery's minus terminal to restore the control modules to normal function.**

- **Continue**

  Refer to **VERIFICATION**

VERIFICATION

Fig. 43: Belt Routing / Engine Idling - Volvo
Courtesy of VOLVO CARS CORPORATION

- Erase diagnostic trouble codes via Vehicle communication service under function group 0.
- Start the engine and let it run for 10 minutes.
- Read out diagnostic trouble codes via Vehicle communication service under function group 3.

  Check to, see if the communication diagnostic trouble code has been stored again.

Did the trouble code(s) return?

- **YES**

  Refer to **INFORMATION**

- **NO**

  OKAY: Troubleshooting has been completed.

INFORMATION

FAULT-TRACING INFORMATION

Verification shows that the fault is no longer present. The diagnostic trouble code (DTC) was probably caused by an intermittent fault.

Fault-tracing for this diagnostic trouble code (DTC) is not followed by a verification.

You can view the information again or exit fault-tracing for this diagnostic trouble code (DTC).

INFORMATION

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

HCM-U012687: LOST COMMUNICATION WITH STEERING ANGLE SENSOR MODULE. BUS SIGNAL / MESSAGE FAILURES. MISSING MESSAGE (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION HCM-U012687

Condition

The control module is continually supplied with necessary information from the Steering wheel angle sensor module (SAS) via CAN communication. The control module checks the communication with the Steering wheel angle sensor module (SAS).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- No communication with the Steering wheel angle sensor module (SAS).

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

HCM-U030000: INTERNAL CONTROL MODULE SOFTWARE INCOMPATIBILITY. GENERAL FAILURE INFORMATION. NO SUB TYPE INFORMATION (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION HCM-U030000

Condition

The control modules communicate with each other for exchange of information in a network via a standardized serial communication procedure - CAN (Controller Area Network). The Central electronic module (CEM) regularly transmits messages on the CAN network. These messages contain information about which signal configuration ID applies to the vehicle. The control modules on the CAN network have the same signal configuration ID so that they can communicate with each other.

The control module compares its configuration ID with the signal configuration transmitted on the control area network (CAN) by the central electronic module (CEM).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- The control module's configuration ID differ from the ID that the Central electronic module (CEM) transmits.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Starting the control module's CAN communication.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 46: Identifying Headlight Control Module (HCM)
Courtesy of VOLVO CARS CORPORATION

Substitute Value

- Control module shuts itself off ("bus-off").

NOTE: When the diagnostic trouble code (DTC) is stored, the control module responds to the diagnostic commands.

Possible Source

- Incorrect configuration ID (the control module is not intended for this vehicle, for example it is a used control module with different software/hardware).
- Open-circuit in the CAN cables between the control module and the Central Electronic Module (CEM).

Fault symptom[s]

- Active Bi-Xenon light; No Functionality
- Message in information display
- Indicator lamp Active Bi-Xenon light; Flashing

HCM-U042281: INVALID DATA RECEIVED FROM CENTRAL ELECTRONIC MODULE. BUS SIGNAL / MESSAGE FAILURES. INVALID SERIAL DATA RECEIVED (B6324S; 2007-2010)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION HCM-U042281

Condition

The control module continually supplies necessary information from the Central electronic module (CEM) via CAN communication. The control module checks the quality of the information from the Central electronic module (CEM).

The diagnostic trouble code (DTC) is stored if the control module detects that:

- Transmitting control module indicates a lower quality level of information than the Headlamp Control Module (HCM) accepts.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition switch position II.

NOTE: The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Fig. 47: Identifying Headlight Control Module (HCM)

ACCESSORIES AND BODY, CAB

Lighting - General Diagnostics and Tests

CHECK OF VOLTAGE/GROUND CONNECTION, HEADLAMP CONTROL MODULE (HCM)

CHECKING THE POWER SUPPLY AND GROUND TERMINAL

POWER SUPPLY HEADLAMP CONTROL MODULE (HCM)

Headlamp Control Module (HCM) is supplied with voltage via a voltage input on the control module.

When the ignition is on, the power input is powered and the control module is in active mode.

- Power input 1 (#A1) is supplied power via a fuse from the system relay. This power input governs the supply of power to the Headlamp Control Module (HCM). It will not be possible to activate the control module if there is an open-circuit.

Checking the power supply

Check the power supply cable from the system relay to headlamp control module (HCM) terminal #A1 for an open-circuit, loose connections, contact resistance and oxidation. Check the fuse. The voltage must be approximately battery voltage.

Ground terminal Headlamp Control Module (HCM)

Headlamp Control Module (HCM) has a ground input. The ground input from the control module is connected to a ground terminal in the body via a ground lead. See the relevant wiring diagram for further information about the ground terminal.

- Ground input 1 #A6 is power ground and connected to the ground connection in the body.

Checking the ground terminal

Check the ground cable between headlamp control module (HCM) terminal #A6 and ground terminal. Check for an open-circuit, loose connections, contact resistance and oxidation. At ignition on, the voltage-drop between Headlamp Control Module (HCM) ground connection and chassis connection may not be greater than 0.5 V.

Remedy as necessary.

Other information

- see **CHECKING WIRING AND TERMINALS**
- see **SIGNAL SPECIFICATION**

- See the relevant wiring diagram for information about circuits and ground terminals in the bodywork.

ACCESSORIES AND EQUIPMENT

Lighting - Installation Instructions, Accessories

AUXILIARY LIGHTS, INSTALLATION KIT XC90 (2005-10)

AUXILIARY LIGHTS, INSTALLATION KIT

PREPARATIONS

Fig. 1: Disconnect Battery Negative Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position 0.
- Disconnect the battery negative lead.

NOTE: **Wait at least five minutes before disassembling the connectors or removing other electrical equipment.**

Fig. 2: Identifying ACL Screws, Hose Clamp And Connector
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws (1) from the induction pipe of the air filter.
- Detach the hose clamp (2).
- Remove the connector (3) from the intake manifold to the turbocharger.
- Pull the air cleaner (ACL) from its mounting in the left-hand front member.
- Remove the intake manifold from the air cleaner (ACL) and place it to one side.

Fig. 3: Identifying ACL And Housing
Courtesy of VOLVO CARS CORPORATION

- Pull up the air cleaner (ACL), rotate it in the short hose and position it as shown. Depending on the design, more hoses or connectors may need detaching around the air cleaner (ACL).

Fig. 4: Detach Left-Hand Headlamp By Pulling Up Two Locking Pins
Courtesy of VOLVO CARS CORPORATION

- Detach the left-hand headlamp by pulling up the two locking pins and then carefully pulling away the headlamp forwards.

Fig. 5: Carefully Prize Up Catch On Connector For Headlamp With A Screwdriver
Courtesy of VOLVO CARS CORPORATION

- Carefully pry up the catch on the connector for the headlamp using a screwdriver.
- Pull the catch up completely, detach the connector and place the headlamp to one side.

INSTALLING THE CABLE HARNESS

Fig. 6: Identifying Cable Harness Routing
Courtesy of VOLVO CARS CORPORATION

- Take the cable harness from the kit and position it with relay and relay holder where the air cleaner (ACL) was located.
- Now route the ends of the cable harness without cable terminals, along the left-hand side of the panel flange on the left-hand side member.

Fig. 7: Identifying Routing Cable Harness Through The Bumper
Courtesy of VOLVO CARS CORPORATION

- Route the cable harness to the right of the top of the bumper rail and out through the third lower space in the air intake above the number plate holder.

INSTALLATION, AUXILIARY LIGHTS BRACKET

Fig. 8: License Plate And Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the number plate.
- the screws (1) to the number plate holder.
- the number plate holder.

Fig. 9: Auxiliary Lamp Bracket And Mountings
Courtesy of VOLVO CARS CORPORATION

- Take the auxiliary lights bracket (1) from the kit and secure it in the holes for the number plate holder. Use the upper holes (2) in the auxiliary lights bracket.
- Drill with a **7 mm (9/32")** diameter drill bit in the centre of the holes (3), through the bumper cover and the bumper rail that is **39 mm (1 1/2")** inside.

NOTE: Keep the drill horizontal.

- Remove the screws and auxiliary lights bracket.

Fig. 10: Identifying Drilling Through Bumper Rail
Courtesy of VOLVO CARS CORPORATION

- Drill the holes (1) with the drill bit (P/N 8633152). Drill through the plastic with the thicker section of the drill bit, and through the bumper rail (2) with the thinner section of the drill bit, which has the dimension **7.3 mm (19/64")** .

NOTE: **It is important that the tip of the drill bit meets the hole that was previously drilled into the bumper rail. The flat surface on the drill bit must drill out all plastic up to the bumper rail.**

NOTE: **Hold the drill horizontally. Use a torch to check that there is no plastic shavings in the holes.**

Fig. 11: Identifying Checking For Plastic
Courtesy of VOLVO CARS CORPORATION

- Check that the surface (1), which the socket shall support against, is free from plastic.
- Install two spacer sleeves **L = 44 mm (1 3/4")** into the holes.

NOTE: The spacer sleeves must protrude approx. 5.5 mm (7/32") from the bumper cover.

Fig. 12: Identifying Tie Straps In Holes And Bracket Screws
Courtesy of VOLVO CARS CORPORATION

- Affix tie straps (1) in the holes in the auxiliary lights bracket, but do not tighten.
- Install the auxiliary lights bracket on the bumper using the screws (2) from the kit. Tighten loosely. The screws create their own threads in the drilled holes, which means that they may screw in stiffly.

Fig. 13: Guiding Cable Ends In Tie Straps
Courtesy of VOLVO CARS CORPORATION

- Guide in the two cable ends (1) in the three tie straps (2). Route the cables as shown.
- Adapt the length of the cable to the lamps. Press back any excess length of the cable outside of the front

grille back in through the front grille.
- Tighten the tie straps.
- Tighten the two screws for the auxiliary lights bracket.
- Install a spacer washer (3) between the auxiliary lights bracket (4) and the expander nut (5) on both sides.
- Install the number plate and tighten it with the two screws.

INSTALLATION, AUXILIARY LIGHTS

Fig. 14: Identifying Prying Lamp Housing
Courtesy of VOLVO CARS CORPORATION

Use auxiliary lights which are recommended by Volvo dealers.

- Remove the screw (1) and the cover.
- Press lightly on the lens (2).
- Fit a screwdriver (3) between the insert and the lamp housing, and pry carefully.

Fig. 15: Installing Lamp Housing On Auxiliary Mounting
Courtesy of VOLVO CARS CORPORATION

- Install the lamp housing on the auxiliary lights mounting with screw and nut. Tighten manually.

Fig. 16: Routing Cable Harness With Rubber Grommet Into Holes In Lamp Housing
Courtesy of VOLVO CARS CORPORATION

- Route the cable harness with the rubber grommet (1) into the holes in the lamp housing.
- Press the rubber grommet into the hole.
- Install the cable terminals from the kit on the two cable ends.

Fig. 17: Connecting Blue Cable To Lamps Cable And Black Cable To Ground
Courtesy of VOLVO CARS CORPORATION

- Connect the blue (BL) cable to the lamp's cable, with a connector socket housing in between.
- Connect the black (SB) cable to ground on the light insert.

Fig. 18: Assembling Auxiliary Light
Courtesy of VOLVO CARS CORPORATION

- Assemble the auxiliary light, as shown.

INSTALLING THE CABLE HARNESS (CONTD.)

Fig. 19: Identifying Cable Harness Routing
Courtesy of VOLVO CARS CORPORATION

- Take the previously routed cable harness (1) and route it as shown.

Fig. 20: Identifying Connecting Connectors
Courtesy of VOLVO CARS CORPORATION

- Plug the connector (2) into the pre-routed connector (3).

Fig. 21: Identifying Pressing In Relay
Courtesy of VOLVO CARS CORPORATION

- Press in the relay (4) at the vertical panel, under the panel that the main headlamp rests on. Rotate the relay up so that the connector with the cable does not make contact with panel underneath. See also **6** for the location of the relay.

Fig. 22: Identifying Connecting The Ground Lead
Courtesy of VOLVO CARS CORPORATION

- Detach the existing screw (5) in the air cleaner (ACL) bracket and connect the ground cable. Turn the ground cable terminal down and position the cable so that it is not trapped by the air cleaner (ACL) when this is reinstalled. Pull any excess length of the cable through the front grille and clamp it with the existing cables behind the headlamp using tie straps.
- Reinstall the air cleaner (ACL) and the intake manifold.
- Plug in the connector to the headlamp and reinstall the headlamp.

NOTE: The longer of the locking pins must be located on the outside of the headlamp.

CAUTION: Ensure that the cables do not rub and chafe against sharp edges. If the this is the case, rectify this by re-securing the cables. Also check that the cables do not block the air cleaner (ACL) draining hatch.

Fig. 23: Fuse Box In Engine Compartment

Courtesy of VOLVO CARS CORPORATION

Applies to cars up to and including model year 2004

- Remove the cover from the fuse box in the engine compartment. Install a 20A fuse in position 2 (1).
- Reinstall the cover.

Fig. 24: Identifying Fuse Box Cover
Courtesy of VOLVO CARS CORPORATION

Applies to cars of model year from 2005-

- Remove the cover from the fuse box in the engine compartment. Install a 20A fuse in position 5.
- Reinstall the cover.

INSTALLING THE SWITCH

Fig. 25: Identifying Removing The Blind Cover Plug With A Scribe

Courtesy of VOLVO CARS CORPORATION

- Remove the cover plug to the 12 V socket.
- Insert a scriber with an angled tip into the joint on the underside, at one side of the keypad surround.

Fig. 26: Pulling Out The Surround Using The Scribe
Courtesy of VOLVO CARS CORPORATION

- Carefully pull out the surround using the scriber, pull along the underside of the surround. It is secured with three mounting lugs in the top and bottom edges.

  NOTE: Do not damage the surround.

- Place the surround to one side.

  HINT: The surround with three button places must be replaced with a surround with seven button places if necessary. This can be purchased separately.

Fig. 27: Identifying Installation Of New Switch
Courtesy of VOLVO CARS CORPORATION

- The switch can be located in any available position. Remove the dummy button and install the new switch (1).
- Reinstall the surround and cover plug to the 12 V socket.

- Align the auxiliary lights for optimum beam pattern.
- Tighten the two screws.
- Install the protective caps on the screw heads.

INSTALLING THE TOP STRUT

Fig. 28: Locating Mark For Drilling
Courtesy of VOLVO CARS CORPORATION

NOTE: **If the auxiliary lights vibrate and this is distracting then a top strut can be installed.**

- Take the top strut and insert one end in the space between the two bumper sections. Position it in line with the center of the auxiliary light.
- Mark out for drilling the hole through the top strut and in the bumper, in the center of the black edge (A).
- Drill out the hole using a **3 mm (1/8")** diameter drill bit.
- Remove any shavings.

Fig. 29: Identifying Drilling Holes For Stay
Courtesy of VOLVO CARS CORPORATION

- Mark out for drilling the hole through the top strut and in the center top/rear edge of the auxiliary light.
- Drill out the hole using a **4.5 mm (3/16")** diameter drill bit.
- Remove any shavings.
- Take the top strut and locate it between both of the drilled holes for cutting the strut (1).
- Shorten the strut (1) to a suitable length.
- Tighten the top strut to the bumper and auxiliary light with screws, nuts and toothed washers.

NOTE: **The toothed washer must not be fitted on the screw to the bumper, as there is otherwise a risk that the screw may chafe against the bonnet's paintwork.**

Fig. 30: Identifying Bending Top Stay Down
Courtesy of VOLVO CARS CORPORATION

- Bend the top strut down to the bumper using a screwdriver. This is so that the lower edge of the bonnet does not catch when it is closed.

Fig. 31: Identifying Cleaning Painted Surfaces
Courtesy of VOLVO CARS CORPORATION

- Clean the painted surfaces in the front and lower edges of the bonnet opposite where the top struts are mounted in the bumper. Use a mixture of 30% washer fluid and 70% water.
- Wipe dry.

Fig. 32: Pressing Masking Tape Firmly Into Place At Front And Lower Edges Of Bonnet
Courtesy of VOLVO CARS CORPORATION

- Firmly press the protective tape into place in the front and lower edges of the bonnet, opposite where the top struts are mounted in the bumper.

Fig. 33: Connecting Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position II.
- Reconnect the battery negative lead.

AUXILIARY SPOTLAMPS (2003-04)

AUXILIARY SPOTLAMPS

Fig. 34: Identifying Prying Light Insert From Lamp Housing
Courtesy of VOLVO CARS CORPORATION

- Pry the light insert from the lamp housing using the tool supplied.

Fig. 35: Identifying Installing Rubber Grommet And Metal Ring On Lamp Housing
Courtesy of VOLVO CARS CORPORATION

- Install the rubber grommet and the metal ring on the lamp housing.

Fig. 36: Identifying Various Spot Lamp Positions
Courtesy of VOLVO CARS CORPORATION

The spot lamp can be installed in several different ways.

Fig. 37: Identifying Spot Lamp Housing Screws
Courtesy of VOLVO CARS CORPORATION

- Install the mounting in the required way on the lamp housing. Use two screws and two washers.

Fig. 38: Connecting Cables Inserted Through Lamp Housing
Courtesy of VOLVO CARS CORPORATION

- Insert the cables through the lamp housing
- Install the flat pin contactors on both the cables
- Supply the blue cable (BL) with a socket housing to prevent short-circuits
- Connect the blue cable (BL) to the cable for the lamp
- Connect the black cable (SB) to ground on the light insert.

Fig. 39: Assembling Light Insert And Lamp Housing
Courtesy of VOLVO CARS CORPORATION

- Assemble the light insert and the lamp housing. Carefully stretch the cables
- Install the spot lamp on the bracket.

INSTALLATION KIT FOR AUXILIARY LAMPS (2003-08)

INSTALLATION KIT FOR AUXILIARY LAMPS

PREPARATIONS

Fig. 40: Disconnect Battery Negative Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition switch to position 0.
- Disconnect the battery negative lead.

NOTE: Wait at least five minutes before disassembling the connectors or removing other electrical equipment.

Fig. 41: Identifying ACL Screws, Hose Clamp And Connector
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws (1) from the intake manifold for the air cleaner (ACL)
- Disconnect the hose clamp (2)
- Remove the connector (3) from the intake manifold for the turbocharger (TC)
- Pull off the air cleaner (ACL) from its mounting in the left-hand front member
- Remove the intake manifold from the air cleaner (ACL). Put it to one side.

Fig. 42: Identifying ACL And Housing
Courtesy of VOLVO CARS CORPORATION

- Pull up the air cleaner (ACL). Turn the air cleaner (ACL) around in the short hose. Position as shown. Depending on the version more than one hose or connector may need to be detached from around the air cleaner (ACL).

Fig. 43: Detach Left-Hand Headlamp By Pulling Up Two Locking Pins
Courtesy of VOLVO CARS CORPORATION

- Remove the left-hand headlamp by pulling up the two cotter pins and then carefully pulling the headlamp forwards.

Fig. 44: Carefully Pry Up Catch On Connector For Headlamp With A Screwdriver
Courtesy of VOLVO CARS CORPORATION

- Carefully pry up the catch on the headlamp connector using a screwdriver
- Pull up the lock completely. Disconnect the connector. Place the headlamp to one side.

INSTALLING THE CABLE HARNESS

Fig. 45: Identifying Cable Harness Routing
Courtesy of VOLVO CARS CORPORATION

- Take the cable harness from the kit. Position the cable harness with the relay and relay holder where the air cleaner (ACL) was positioned
- Now route the ends of the cable harness without the cable terminals along the left-hand side of the panel edge on the left-hand side member.

Fig. 46: Identifying Routing Cable Harness Through The Bumper
Courtesy of VOLVO CARS CORPORATION

- Route the cable harness to the right of the upper side of the bumper rail and out through the third lower gap in the air intake above the number plate holder.

INSTALLING THE BRACKET FOR THE AUXILIARY LAMPS

Fig. 47: License Plate And Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the number plate
- the screws (1) for the number plate holder
- the number plate holder.

Fig. 48: Auxiliary Lamp Bracket And Mountings
Courtesy of VOLVO CARS CORPORATION

- Secure the auxiliary lamp bracket (1) (from the kit) in the holes for the number plate holder. Use the upper holes (2) in the auxiliary lamp bracket
- Using a **7 mm (9/32")** diameter drill bit, drill the centre of the holes (3). Drill through the bumper cover and the bumper rail which is positioned **39 mm (1 1/2")** inside.

NOTE: Hold the drill horizontally.

- Remove the screws and the auxiliary lamp bracket.

Fig. 49: Identifying Drilling Through Bumper Rail
Courtesy of VOLVO CARS CORPORATION

- Drill the holes (1) using a drill bit (P/N 8633152). Drill through the plastic using the thicker section of the drill bit. Drill through the bumper rail (2) using the smaller section of the drill bit, the dimension of which is **7.3 mm (19/64")** diameter.

NOTE: It is important that the tip of the drill bit meets the hole that was previously drilled into the bumper rail.

The flat surface of the drill bit must drill out all the plastic up to the bumper rail.

NOTE: Hold the drill horizontally. Using a torch, check that there is no plastic shavings in the holes.

Fig. 50: Identifying Checking for Plastic

Courtesy of VOLVO CARS CORPORATION

- Check that there is no plastic on the area (1) on which the spacers will rest
- Install two spacer sleeves **L = 44 mm (1 3/4")** in the holes.

NOTE: The spacer sleeves must protrude approximately 5.5 mm (7/32") from the bumper cover.

Fig. 51: Identifying Tie Straps In Holes And Bracket Screws
Courtesy of VOLVO CARS CORPORATION

- Secure the tie straps (1) in the holes in the auxiliary lamp bracket. Do not tighten
- Install the auxiliary lamp bracket on the bumper using the screws (2) from the kit. Finger tighten. The screws are self-tapping so it may be hard to screw them in.

Fig. 52: Guiding Cable Ends In Tie Straps
Courtesy of VOLVO CARS CORPORATION

- Insert the two cable ends (1) in the three tie straps (2). Route the wiring as shown.
- Adjust the cable lengths for the lamps. Press any excess cable outside the grille back into the grille
- Tighten the tie straps
- Tighten the two screws for the auxiliary lamp bracket
- Install a spacer washer (3) between the auxiliary lamp bracket (4) and the expander nut (5) on both sides
- Install the number plate. Tighten the number plate with the two screws.

INSTALLING THE AUXILIARY LAMPS

Fig. 53: Identifying Prying Lamp Housing
Courtesy of VOLVO CARS CORPORATION

Use auxiliary lamps recommended by your Volvo dealer.

- Remove the screw (1) and cover
- Press lightly on the lens (2)
- Position a screwdriver (3) between the insert and lamp housing and pry gently.

Fig. 54: Installing Lamp Housing On Auxiliary Mounting
Courtesy of VOLVO CARS CORPORATION

- Install the lamp housing on the auxiliary lamp mounting. Use a screw and nut. Finger tighten.

Fig. 55: Routing Cable Harness With Rubber Grommet Into Holes In Lamp Housing
Courtesy of VOLVO CARS CORPORATION

- Route the cable harness with the rubber grommet (1) into the holes in the lamp housing
- Press the rubber grommet into place in the hole
- Install the cable terminals from the kit on the two cable ends.

Fig. 56: Connecting Blue Cable To Lamps Cable And Black Cable To Ground
Courtesy of VOLVO CARS CORPORATION

- Connect the blue (BL) cable to the lamp cable via a socket housing
- Connect the black (SB) cable to ground on the lamp insert.

Fig. 57: Assembling Auxiliary Light
Courtesy of VOLVO CARS CORPORATION

- Assemble the auxiliary lamp as shown.

INSTALLING THE CABLE HARNESS (CONTINUED)

Fig. 58: Identifying Cable Harness Routing
Courtesy of VOLVO CARS CORPORATION

- Route the previously routed cable harness (1) as shown.

Fig. 59: Identifying Connecting Connectors
Courtesy of VOLVO CARS CORPORATION

- Connect the connector (2) to the pre-routed connector (3).

Fig. 60: Identifying Pressing In Relay
Courtesy of VOLVO CARS CORPORATION

- Press the relay (4) into place at the vertical panel, under the panel on which the headlamp rests. Twist up the relay so that the connector with the cable does not catch the panel underneath. Also, see **INSTALLING THE CABLE HARNESS** for the location of the relay.

Fig. 61: Identifying Connecting The Ground Lead
Courtesy of VOLVO CARS CORPORATION

- Remove the existing screw (5) in the air cleaner bracket. Connect the ground lead. Twist the ground lead cable terminal downwards. Position the cable so that it does not catch the air cleaner (ACL) when it is reinstalled. Route any excess cable through the front grille. Secure the cable at existing wiring behind the headlamp using tie straps
- Reinstall the air cleaner (ACL) and intake manifold
- Connect the connector to the headlamp and reinstall it.

NOTE: The longer of the cotter pins must be positioned on the outside of the

headlamp.

CAUTION: Ensure that the wiring does not rub against sharp edges. If it does, secure the wiring better. Also check that the wiring does not block the drainage hatch for the air cleaner (ACL).

Fig. 62: Fuse Box In Engine Compartment
Courtesy of VOLVO CARS CORPORATION

- Remove the cover from the fuse holder in the engine compartment. Install a 20A fuse in position 2 (1)
- Reinstall the cover.

INSTALLING THE SWITCH

Fig. 63: Identifying Removing The Blind Cover Plug With A Scribe
Courtesy of VOLVO CARS CORPORATION

- Remove the blind cover plug from the 12 V socket

- Take a scriber with an angled point. Insert the angled end of the scriber in the joint underneath, on one side of the surround for the switch unit.

Fig. 64: Pulling Out The Surround Using The Scribe
Courtesy of VOLVO CARS CORPORATION

- Carefully pull out the surround using the scriber. Pull along the underneath of the surround. It is securely positioned with three mounting lugs at the top and lower edges.

NOTE: Do not damage the surround.

- Place the surround to one side.

HINT: The surround with three button spaces can be replaced with a surround with seven button spaces if necessary. This can be purchased separately.

Fig. 65: Identifying Installation Of New Switch
Courtesy of VOLVO CARS CORPORATION

- The switch can be installed in any location. Remove the switch blank. Install the new switch (1)
- Reinstall the surround and the blind cover plug for the 12 V socket.

- Set the auxiliary lamps for optimal light distribution
- Tighten the two screws.
- Install protective caps on the screw heads.

INSTALLING TOP STAYS

Fig. 66: Locating Mark For Drilling
Courtesy of VOLVO CARS CORPORATION

NOTE: **If the lamps vibrate excessively, a top stay can be installed according to points 23-27.**

- Take the top stay and slide one end in the gap between the two bumper sections. Position in line with the centre of the auxiliary lamp
- Make a mark for drilling a hole through the top stay and in the bumper, in the center of the black edge (A)
- Drill out the hole. Use a **3 mm (1/8")** diameter drill bit
- Remove any shavings.

Fig. 67: Identifying Drilling Holes For Stay
Courtesy of VOLVO CARS CORPORATION

- Make a mark for drilling out the hole through the top stay and in the center of the top edge/rear edge of the auxiliary lamp
- Drill the hole. Use a **4.5 mm (3/16")** diameter drill bit
- Remove any shavings
- Position the top stay between both drilled holes so that the stay (1) can be cut to the correct length
- Shorten the stay (1) to a suitable length
- Tighten the top stay to the bumper and auxiliary lamps using screws, nuts and toothed plate connectors.

NOTE: **Do not install a toothed plate connector on the screw for the bumper. There is a risk that the screw would rub against the paint on the bonnet.**

Fig. 68: Identifying Bending Top Stay Down
Courtesy of VOLVO CARS CORPORATION

- Bend the top stay down to the bumper using a screwdriver. This is to prevent the lower edge of the bonnet catching when closing.

Fig. 69: Identifying Cleaning Painted Surfaces
Courtesy of VOLVO CARS CORPORATION

- Clean the painted surfaces at the front and lower edges of the bonnet, opposite the points where the top stays are secured in the bumper. Use a mixture of 30% windscreen washer fluid and 70% water
- Wipe dry.

Fig. 70: Pressing Masking Tape Firmly Into Place At Front And Lower Edges Of Bonnet
Courtesy of VOLVO CARS CORPORATION

- Press the masking tape firmly into place at the front and lower edges of the bonnet, opposite the points where the top stays are mounted in the bumper.

Fig. 71: Connecting Negative Battery Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position II
- Reconnect the battery negative lead.

MOUNTING KIT FOR THE FRONT READING LAMP, FRONT SEAT (2003-08)

MOUNTING KIT FOR THE FRONT READING LAMP, FRONT SEAT

NOTE: The reading lamp is not included in the kit. The reading lamp must be purchased separately.

PREPARATIONS

Applies to all models

Fig. 72: Applying Tape Around Seat Frame

Courtesy of VOLVO CARS CORPORATION

- Wipe the seat frame clean on the marked surface at the centre console as shown
- Remove the backing from the piece of tape. Apply the tape around the seat frame so that the tape joins at the reverse of the seat frame.

INSTALLING THE LAMP MOUNTING

Fig. 73: Installing Lamp Mounting
Courtesy of VOLVO CARS CORPORATION

- Install the lamp mounting on the piece of tape around the seat frame as close to the centre console as possible. Tighten the mounting using the screw (1)
- Adjust the lamp mounting to the desired position. Tighten using the screw (2)
- Install the reading lamp in the mounting. Connect the cable to the cigarette lighter socket.

DISASSEMBLING THE READING LAMP WHEN REPLACING THE BULB

Fig. 74: Identifying Removing Lamp Glass
Courtesy of VOLVO CARS CORPORATION

- Remove the lamp glass. First carefully pry off the top edge of the lamp using a small screwdriver.

AUXILIARY LIGHTS, INSTALLATION KIT (2007-12)

INSTALLATION KIT, AUXILIARY LIGHTS

PREPARATIONS

Fig. 75: Disconnect Battery Negative Lead
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position 0.
- Disconnect the battery negative lead.

NOTE: **Wait at least five minutes before disassembling the connectors or removing other electrical equipment.**

Fig. 76: Identifying Air Filter Cover
Courtesy of VOLVO CARS CORPORATION

- Remove the cover from the air filter.

Fig. 77: Identifying Catches On Control Module Connectors
Courtesy of VOLVO CARS CORPORATION

- Press in the catches on the control module connectors, twist up the lock arms and pull out the connectors.

Fig. 78: Identifying Screws And Hose Clamp
Courtesy of VOLVO CARS CORPORATION

- Remove the two screws (1) from the induction pipe of the air filter.
- Detach the hose clamp (2).
- Remove the intake manifold from the air cleaner (ACL) and place it to one side.

Fig. 79: Identifying Air Filter
Courtesy of VOLVO CARS CORPORATION

- Lift up the air filter, which sits with a clip on the left side. Position the air filter in the engine compartment so that the grounding point underneath is accessible.

Fig. 80: Detach Left-Hand Headlamp By Pulling Up Two Locking Pins
Courtesy of VOLVO CARS CORPORATION

- Detach the left-hand headlamp by pulling up the two locking pins and then carefully pulling away the headlamp forwards.

Fig. 81: Carefully Pry Up Catch On Connector For Headlamp With A Screwdriver
Courtesy of VOLVO CARS CORPORATION

- Carefully pry up the catch on the connector for the headlamp using a screwdriver.
- Pull the catch up completely, detach the connector and place the headlamp to one side.

INSTALLING THE AUXILIARY LIGHTS BRACKET

Fig. 82: Identifying Cable Harness Routing
Courtesy of VOLVO CARS CORPORATION

- Take the cable harness from the kit and position it with relay and relay holder where the air cleaner (ACL) was located.
- Route the cable ends without calbe terminal along the left side of the plate flange on the left side member.

Fig. 83: Routing Cable Harness To Right Of Top Of Bumper Rail And Out Through Third Lower Space In Air Intake
Courtesy of VOLVO CARS CORPORATION

- Route the cable harness to the right of the top of the bumper rail and out through the third lower space in the air intake above the number plate holder.

Fig. 84: Identifying Number Plate Holder Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the number plate
- the screws (1) to the number plate holder.
- the number plate holder.

Fig. 85: Identifying Auxiliary Lights Bracket And Upper Hole
Courtesy of VOLVO CARS CORPORATION

- Take the auxiliary lights bracket (1) from the kit and secure it in the holes for the number plate holder. Use the upper holes (2) in the auxiliary lights bracket.
- Drill with a **7 mm (9/32")** diameter drill bit in the centre of the holes (3), through the bumper cover and the bumper rail that is **39 mm (1 1/2")** inside.

NOTE: Keep the drill horizontal.

- Remove the screws and auxiliary lights bracket.

Fig. 86: Drilling Holes With Drill Bit
Courtesy of VOLVO CARS CORPORATION

- Drill the holes (1) with a drill bit (part no. 8633152), through the plastic with the thicker section of the drill bit, and through the bumper rail (2) with the thinner section of the drill bit, which has the dimension **7.3 mm (19/64")** .

NOTE: **It is important that the tip of the drill bit meets the hole that was previously drilled into the bumper rail. The flat surface on the drill bit must drill out all plastic up to the bumper rail.**

NOTE: **Hold the drill horizontally. Use a torch to check that there is no plastic shavings in the holes.**

Fig. 87: Identifying Checking for Plastic
Courtesy of VOLVO CARS CORPORATION

- Check that the surface (1), which the socket shall support against, is free from plastic.
- Install two spacer sleeves **L= 50 mm (2")** into the holes.

NOTE: The spacer sleeves must protrude approx. 5.5 mm (7/32") from the bumper cover.

Fig. 88: Identifying Tie Straps In Holes And Bracket Screws
Courtesy of VOLVO CARS CORPORATION

- Affix tie straps (1) in the holes in the auxiliary lights bracket, but do not tighten.
- Install the auxiliary lights bracket on the bumper using the screws (2) from the kit. Tighten loosely. The screws create their own threads in the drilled holes, which means that they may screw in stiffly.

Fig. 89: Identifying Cable Ends, Tie Straps, Spacer Washer, Auxiliary Lights Bracket And Bumper Shell
Courtesy of VOLVO CARS CORPORATION

- Guide in the two cable ends (1) in the three tie straps (2). Route the cables as shown.
- Adapt the length of the cable to the lamps. Press back any excess length of the cable outside of the front

grille in through the front grille.

- Tighten the tie straps.
- Tighten the two screws for the auxiliary lights bracket.
- Install a spacer washer (3) between the auxiliary lights bracket (4) and the bumper shell (5) on both sides.
- Reinstall the number plate holder and fasten it with the two screws.
- Reinstall the number plate.

INSTALLING AUXILIARY LIGHTS

Fig. 90: Identifying Prying Lamp Housing
Courtesy of VOLVO CARS CORPORATION

NOTE: Use auxiliary lights which are recommended by Volvo dealers.

- Remove the screw (1) and the cover.
- Press lightly on the lens (2).
- Fit a screwdriver (3) between the insert and the lamp housing, and pry carefully.

Fig. 91: Installing Lamp Housing On Auxiliary Mounting
Courtesy of VOLVO CARS CORPORATION

- Install the lamp housing on the auxiliary lights mounting with screw and nut. Tighten manually.

Fig. 92: Routing Cable Harness With Rubber Grommet Into Holes In Lamp Housing
Courtesy of VOLVO CARS CORPORATION

- Route the cable harness with rubber grommet (1) through the holes in the lamp housing.
- Press the rubber grommet into the hole.
- Install the cable terminals from the kit on the two cable ends.

Fig. 93: Connecting Blue Cable To Lamps Cable And Black Cable To Ground
Courtesy of VOLVO CARS CORPORATION

- Connect the blue (BL) cable to the lamp's cable, with a connector socket housing in between.
- Connect the black (SB) cable to ground on the light insert.

Fig. 94: Assembling Auxiliary Light
Courtesy of VOLVO CARS CORPORATION

- Assemble the auxiliary light, as shown.

CABLE ROUTING AND CONNECTION

Fig. 95: Identifying Cable Harness Routing
Courtesy of VOLVO CARS CORPORATION

- Take the previously routed cable harness (1) and route it as shown.

Fig. 96: Identifying Connecting Connectors
Courtesy of VOLVO CARS CORPORATION

- Plug the connector (2) into the pre-routed connector (3).

Fig. 97: Identifying Pressing In Relay
Courtesy of VOLVO CARS CORPORATION

- Press in the relay (4) at the vertical panel, under the panel that the main headlamp rests on. Rotate the relay up so that the connector with the cable does not make contact with panel underneath.

Fig. 98: Identifying Ground Cable
Courtesy of VOLVO CARS CORPORATION

Applies to cars with 5-cylinder and 8-cylinder engines

- Slacken the existing screw in the air filter bracket and connect the ground cable - tightening torque: **24 Nm (18 lbf. ft.)** .

Fig. 99: Identifying Ground Cable Fastened To Center Welding Nut
Courtesy of VOLVO CARS CORPORATION

Applies to cars with 6-cylinder engine

- Remove the ground screw from the kit and fasten the ground cable to the center welding nut - tightening torque: **24 Nm (18 lbf. ft.)** .

Applies to all models

- Twist down the ground cable terminal and position the cable so that it is not pinched by the air filter when it is reinstalled. Route any excess cable through the front grille and clamp at existing cables behind the headlamps with tie straps.
- Reinstall the air filter.
- Connect and reinstall the control module.
- Refit the cover over the air filter.
- Reinstall the intake manifold. Tighten the two screws to **10 Nm (7.5 lbf. ft.)** .
- Plug in the connector to the headlamp and reinstall the headlamp.

NOTE: The longer of the locking pins must be located on the outside of the headlamp.

CAUTION: Ensure that the cables do not rub and chafe against sharp edges. If the this is the case, rectify this by re-securing the cables. Also check that the cables do not block the air cleaner (ACL) draining hatch.

Fig. 100: Identifying 20A Fuse
Courtesy of VOLVO CARS CORPORATION

- Remove the cover from the fuse box in the engine compartment. Install a 20A fuse in position 5.
- Reinstall the cover.

INSTALLING THE SWITCH

Fig. 101: Identifying Removing The Blind Cover Plug With A Scribe
Courtesy of VOLVO CARS CORPORATION

- Remove the cover plug to the 12 V socket.
- Insert a scriber with an angled tip into the joint on the underside, at one side of the keypad surround.

Fig. 102: Pulling Out The Surround Using The Scribe
Courtesy of VOLVO CARS CORPORATION

- Carefully pull out the surround using the scriber, pull along the underside of the surround. It is secured with three mounting lugs in the top and bottom edges.

NOTE: Do not damage the surround.

- Place the surround to one side.

HINT: The surround with three button places must be replaced with a surround with seven button places if necessary. This can be purchased separately.

Fig. 103: Identifying Installation Of New Switch
Courtesy of VOLVO CARS CORPORATION

- The switch can be located in any available position. Remove the dummy button and install the new switch (1).

- Reinstall the surround and cover plug to the 12 V socket.

FINISHING WORK

Fig. 104: Identifying Auxiliary Lights, Screws And Protective Caps
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position II.
- Reconnect the battery negative lead
- Align the auxiliary lights for optimum beam pattern.
- Tighten the two screws.
- Install the protective caps on the screw heads.

INSTALLING THE TOP STRUTS

NOTE: If the auxiliary lights vibrate and this is distracting then a top strut can be installed.

Fig. 105: Locating Mark For Drilling
Courtesy of VOLVO CARS CORPORATION

- Take the top strut and insert one end in the space between the two bumper sections. Position it in line with the centre of the auxiliary light.
- Mark out for drilling the hole through the top strut and in the bumper, in the center of the black edge (A).
- Drill out the hole using a **3 mm (1/8")** diameter drill bit.
- Remove any shavings.

Fig. 106: Identifying Drilling Holes For Stay
Courtesy of VOLVO CARS CORPORATION

- Mark out for drilling the hole through the top strut and in the centre top/rear edge of the auxiliary light.
- Drill out the hole using a **4.5 mm (3/16")** diameter drill bit.
- Remove any shavings.
- Take the top strut and locate it between both of the drilled holes for cutting the strut (1).
- Shorten the strut (1) to a suitable length.
- Tighten the top strut to the bumper and auxiliary light with screws, nuts and toothed washers.

NOTE: **The toothed washer must not be fitted on the screw to the bumper, as there is otherwise a risk that the screw may chafe against the bonnet's paintwork.**

Fig. 107: Identifying Bending Top Stay Down
Courtesy of VOLVO CARS CORPORATION

- Bend the top strut down to the bumper using a screwdriver. This is so that the lower edge of the bonnet does not catch when it is closed.

Fig. 108: Identifying Cleaning Painted Surfaces
Courtesy of VOLVO CARS CORPORATION

- Clean the painted surfaces in the front and lower edges of the bonnet opposite where the top struts are mounted in the bumper. Use a mixture of 30% washer fluid and 70% water.
- Wipe dry.

Fig. 109: Pressing Masking Tape Firmly Into Place At Front And Lower Edges Of Bonnet
Courtesy of VOLVO CARS CORPORATION

- Firmly press the protective tape into place in the front and lower edges of the bonnet, opposite where the top struts are mounted in the bumper.

ACCESSORIES AND BODY, CAB

Lighting - Removal, Replacement And Installation

BULBS (2003-2004)

BULB BI-XENON, REPLACING

REMOVAL

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

SAFETY PRECAUTIONS

WARNING: **Always disconnect the headlamp connector and remove the headlamp from the car before carrying out work on bi-xenon headlamps. There is high voltage and a risk of explosion. Allow the lamp to cool. Use protective goggles and gloves when replacing the lamp.**

The glass body of the Bi-Xenon-lamp is filled with different gases and metal vapors which are under pressure. Never touch the glass body of the lamp. Only touch the lamp at the socket. Remove any finger prints from the glass using a clean cloth and alcohol. The lamp must only be used in enclosed headlamps. The replaced Bi-Xenon lamp must be treated as hazardous waste and must be sent for recycling.

LOCATION OF COMPONENTS

Fig. 1: Identifying Headlamp Bulbs
Courtesy of VOLVO CARS CORPORATION

1. Bi-xenon bulb
2. Halogen high beam
3. Parking lamps
4. Turn signal lamps
5. Side marker lamps.

PREPARATORY WORK

WARNING: Disconnect the headlamp connector. Work with the headlamp removed from the car.

WARNING: Handle the lamp with extreme care. The lamp is gas pressured and can explode.

Remove the headlamp. See **HEADLIGHT/BULB, REPLACINGHEADLIGHT/BULB, REPLACING**.

REMOVING BULBS

WARNING: Wear protective goggles and protective gloves.

- Remove the cover
- Remove the spring clamp above the bulb
- Remove the bulb holder by pressing and twisting it. Carefully pull the bulb straight out from the lamp housing
- Detach the Bi-Xenon bulb by pressing and twisting it.

INSTALLATION

INSTALLING BULB

Fig. 2: Identifying Lamp Installed
Courtesy of VOLVO CARS CORPORATION

WARNING: Wear protective goggles and protective gloves.

Install:

- The Bi-Xenon bulb in the bulb holder as illustrated

- the bulb holder carefully in the lamp housing. The connector must be downwards
- the spring clamp over the bulb
- the cover.

FINISHING WORK

Install the headlamp. See **HEADLIGHT/BULB, REPLACING**.

Test the function.

BULB DASHBOARD ENVIRONMENT PANEL, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

NOTE: **The bulbs for the switches in the lower row on the dashboard environment panel cannot be replaced. The entire switch assembly must be replaced. See SWITCHES CLIMATE CONTROL UNIT, REPLACING .**

PREPARATORY WORK

Fig. 3: Identifying Ignition In OFF Position
Courtesy of VOLVO CARS CORPORATION

Ignition off.

Remove the dashboard environment panel. See **CLIMATE CONTROL MODULE (CCM), REPLACING** .

REMOVING BULBS

Fig. 4: Locating Dashboard Environment Panel Bulb
Courtesy of VOLVO CARS CORPORATION

Remove the bulb and holder by turning the holder clockwise.

INSTALLING

Install the bulb and holder.

FINISHING WORK

Install the dashboard environment panel. See **CLIMATE CONTROL MODULE (CCM), REPLACING** .

Test the function.

BULB INTERIOR LIGHTING, REPLACING

REMOVAL AND INSTALLATION

REMOVING BULBS

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

Fig. 5: Bulb Interior Lighting Lens & Cover
Courtesy of VOLVO CARS CORPORATION

- Fold down the cover (1)
- Press the catches outwards. Remove the lens (2)
- Remove the bulb. Use a weatherstrip tool or similar.

INSTALLING BULB

- Install the bulb
- Press the lens into place
- Press the cover into place.

BULB TAIL LAMP/STOP LAMP/BACK-UP LAMP/FOG LAMP, REPLACING

LOCATION

Fig. 6: Identifying Tail Lamp/Stop Lamp/Back-Up Lamp Bulbs
Courtesy of VOLVO CARS CORPORATION

1. Turn signal lamps
2. Stop (brake) lamps
3. The upper tail lamp
4. Tail lamps
5. Back-up (reversing) lamps.

NOTE: **In the left tail lamp, there is only a fog tail lamp bulb (5/21W) in one of the tail lamps.**

REMOVAL

PREPARATIONS

Fig. 7: View Of Cargo Compartment
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Fold up the floor hatch in the cargo compartment
- Unhook the floor cargo strap
- Push the floor storage compartment and hatch to one side
- Remove the corner section of the floor.

Fig. 8: View Of Rear Side Panel Hatch
Courtesy of VOLVO CARS CORPORATION

Remove the hatch on the rear side panel.

REMOVING THE LOWER TAIL LAMP

Fig. 9: Identifying Lower Tail Lamp Nuts
Courtesy of VOLVO CARS CORPORATION

Remove:

- 2 nuts.

Fig. 10: View Of Tail Lamp Assembly
Courtesy of VOLVO CARS CORPORATION

Remove:

- the tail lamp by pulling it straight back
- the bulb holder by twisting it and pulling it outwards
- the bulb.

REMOVING THE UPPER TAIL LAMP

Fig. 11: Removing The Upper Tail Lamp
Courtesy of VOLVO CARS CORPORATION

Remove the lower tail lamp. See **REMOVING THE LOWER TAIL LAMP**.

- Slacken off the 2 screws
- Remove the tail lamp.

INSTALLATION

INSTALLING THE UPPER TAIL LAMP

Align the tail lamp.

Install the 2 screws.

NOTE: **For tightening torques, see SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS .**

INSTALLING THE LOWER TAIL LAMP

Install:

- the bulb

- the bulb holder. Press the tail lamp into place
- the 2 nuts. Tighten.

FINISHING WORK

Test the function.

Install:

- the hatch in the rear side panel
- the corner section in the floor
- the floor hatch in the cargo compartment.

BULB VANITY MIRROR, REPLACING

REMOVAL AND INSTALLATION

REMOVING THE MIRROR

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

Fig. 12: View Of Removing Mirror And Cover
Courtesy of VOLVO CARS CORPORATION

Remove the mirror and cover using a small screwdriver.

Remove the bulb.

INSTALLING THE MIRROR

Install the bulb.

Press the mirror and cover into place.

Test the function.

BULB, GROUND LIGHTING, DOOR MIRROR, REPLACING

REMOVAL

LAMP AND BULB ASSEMBLY

Fig. 13: Locating Door Mirror Ground Lighting Bulb
Courtesy of VOLVO CARS CORPORATION

- Angle the mirror glass upwards / outwards
- Insert a screwdriver in the opening and press in the catch to release the lighting
- Twist the bulb holder free. Disconnect the bulb.

INSTALLATION

LAMP AND BULB ASSEMBLY

- Install the bulb
- Insert the bulb holder and press into place.

BULB, IGNITION SWITCH, REPLACING

REMOVAL

THE HOLDER FOR THE LIGHTING AND THE ANTENNA UNIT FOR THE IMMOBILIZER

Fig. 14: Identifying Ignition Switch Bulb
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Reset the lighting switch
- Remove the steering column covers
- Remove the mounting. Remove the holder
- Disconnect the connector
- Remove the antenna unit.

BULB

- Remove the holder
- Remove the bulb holder and the bulb.

INSTALLATION

THE HOLDER FOR THE LIGHTING AND THE ANTENNA UNIT FOR THE IMMOBILIZER

In reverse order.

Check the function.

BULB, NUMBER PLATE LIGHTING, REPLACING

Fig. 15: Replacing License Plate Lighting Bulb
Courtesy of VOLVO CARS CORPORATION

BULB, READING LAMP, REAR, REPLACING

REMOVAL

READING LAMP AND BULB

Fig. 16: Removing Reading Lamp And Bulb
Courtesy of VOLVO CARS CORPORATION

- Carefully remove the lens using a small screwdriver
- Release the front edge of the lamp by pressing the catches backward and inward
- Disconnect the connector
- Remove the reflector
- Remove the bulb.

INSTALLATION

READING LAMP AND BULB

In reverse order.

HEADLIGHT/BULB, REPLACING

REMOVAL

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATORY WORK

Fig. 17: Identifying Ignition In OFF Position
Courtesy of VOLVO CARS CORPORATION

Ignition off.

Switch off the lighting switch.

CAUTION: The plastic lens on the headlight scratches easily. Do not place the headlight on a hard surface with the lens downwards.

Fig. 18: Identifying Headlamp Bulbs
Courtesy of VOLVO CARS CORPORATION

1. Low beam
2. High beam
3. Parking lights
4. Direction indicators.
5. Side marker lights.

REMOVING HEADLIGHT

Fig. 19: Pulling Locking Plate Straight Up
Courtesy of VOLVO CARS CORPORATION

CAUTION: For vehicles with Bi-Xenon lamps, see BULB BI-XENON, REPLACING.

Pull the locking plate straight up.

Disconnect the connector.

BULBS REMOVING / INSTALLING

REMOVING BULBS HIGH/LOW BEAM

Fig. 20: Removing Of Bulb Cover
Courtesy of VOLVO CARS CORPORATION

Remove the cover.

Release the spring catch.

Remove the bulb.

INSTALLING BULBS HIGH/LOW BEAM

Fig. 21: Installing Of Bulb Cover
Courtesy of VOLVO CARS CORPORATION

Align the brake light.

Lock using the spring.

Install the cover.

REMOVING THE BULB FOR PARKING LIGHTS / SIDE MARKER LIGHTS / DIRECTION INDICATORS

Fig. 22: Removing Parking Lights / Side Marker Lights / Direction Indicators Bulb
Courtesy of VOLVO CARS CORPORATION

Remove the bulb holder by pressing and twisting it.

Remove the bulb.

INSTALLING THE BULB FOR PARKING LIGHTS / SIDE MARKER LIGHTS / DIRECTION INDICATORS

Fig. 23: Installing Parking Lights / Side Marker Lights / Direction Indicators Bulb
Courtesy of VOLVO CARS CORPORATION

Install the bulb.

Install the bulb holder by pressing and twisting it.

INSTALLATION

INSTALLING THE HEADLIGHT

Connect the connector.

Align the headlight.

Install the locking plate.

FINISHING WORK

Test the function.

When replacing headlights or carrying out work which may have affected the headlight alignment, check and align the beam. See **HEADLAMPS, ALIGNING** .

4. Direction indicators.
5. Side marker lights.

REMOVING HEADLIGHT

Fig. 35: Pulling Locking Plate Straight Up
Courtesy of VOLVO CARS CORPORATION

CAUTION: For vehicles with Bi-Xenon lamps, see HEADLIGHT BULB (XENON).

Pull the locking plate straight up.

Disconnect the connector.

BULBS REMOVING / INSTALLING

REMOVING BULBS HIGH/LOW BEAM

Fig. 36: Removing Of Bulb Cover
Courtesy of VOLVO CARS CORPORATION

Remove the cover.

Release the spring catch.

Remove the bulb.

INSTALLING BULBS HIGH/LOW BEAM

Fig. 37: Installing Of Bulb Cover
Courtesy of VOLVO CARS CORPORATION

Align the brake light.

Lock using the spring.

Install the cover.

REMOVING THE BULB FOR PARKING LIGHTS / SIDE MARKER LIGHTS / DIRECTION INDICATORS

Fig. 38: Removing Parking Lights / Side Marker Lights / Direction Indicators Bulb
Courtesy of VOLVO CARS CORPORATION

Remove the bulb holder by pressing and twisting it.

Remove the bulb.

INSTALLING THE BULB FOR PARKING LIGHTS / SIDE MARKER LIGHTS / DIRECTION INDICATORS

Fig. 39: Installing Parking Lights / Side Marker Lights / Direction Indicators Bulb
Courtesy of VOLVO CARS CORPORATION

Install the bulb.

Install the bulb holder by pressing and twisting it.

INSTALLATION

INSTALLING THE HEADLIGHT

Connect the connector.

Align the headlight.

Install the locking plate.

FINISHING WORK

Test the function.

When replacing headlights or carrying out work which may have affected the headlight alignment, check and align the beam. See **HEADLAMPS, ALIGNING** .

EXTRA LAMPS AND ACCESSORIES

FOG LAMPS FRONT, REPLACING

REMOVAL

NOTE: Some variation may occur. However, the essential information in the illustrations is always correct.

LIGHTING, FRONT (2003-2006)

BALLAST BI-XENON LAMPS, REPLACING

REMOVAL

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

SAFETY PRECAUTIONS

CAUTION: Always disconnect the headlamp connector and remove the headlamp

from the car before carrying out work on bi-xenon headlamps. There is high voltage and a risk of explosion.

Allow the lamp to cool. Use protective goggles and gloves when replacing the lamp. The glass body of the Bi-Xenon-lamp is filled with different gases and metal vapors which are under pressure. Never touch the glass body of the lamp. Only touch the lamp at the socket. Remove any finger prints from the glass using a clean cloth and alcohol. The lamp must only be used in enclosed headlamps.

The replaced Bi-Xenon lamp must be treated as hazardous waste and must be sent for recycling.

PREPARATORY WORK

Remove the headlamp. See **HEADLIGHT/BULB, REPLACINGHEADLIGHT/BULB, REPLACING**.

NOTE: **Disconnect the headlamp connector. Work with the headlamp removed from the car.**

REMOVING THE BALLAST

Fig. 46: View Of Ballast

Courtesy of VOLVO CARS CORPORATION

Slacken off the screws. Use Torx 20 with holes.

Disconnect the connectors.

INSTALLATION

INSTALLING THE BALLAST

Reconnect connectors.

Install the screws. Tighten.

FINISHING WORK

Install the headlamp. See **HEADLIGHT/BULB, REPLACINGHEADLIGHT/BULB, REPLACING**.

Test the function. Check high and low beam.

HEADLIGHT/BULB, REPLACING

see **HEADLIGHT/BULB, REPLACING**

MOTOR HEIGHT CONTROL HEADLAMP, REPLACING

MOTOR HEIGHT CONTROL HEADLAMP, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVAL

PREPARATORY WORK

- Remove the headlamp. See **HEADLIGHT/BULB, REPLACINGHEADLIGHT/BULB, REPLACING**.

REMOVING THE MOTOR

Fig. 49: Pulling Lamp Back Towards Opening And Angling Motor Down While Pulling
Courtesy of VOLVO CARS CORPORATION

- Disconnect the connector
- Remove the motor by turning a 1/4 turn clockwise

- Twist the motor downwards along the shaft so that the ball releases from the channel in the reflector. See the illustration.

INSTALLATION

INSTALLING THE MOTOR

Fig. 50: Pulling Reflector Back Towards Mounting In Headlamp Housing
Courtesy of VOLVO CARS CORPORATION

- Twist the adjusting screw on the motor so that the shaft is extended, in order to facilitate installation
- Remove the cover from one of the bulbs
- Pull the reflector backwards
- Apply grease to the ball and place it in the groove as illustrated
- Twist the motor into place
- Connect the connector
- Install the cover.

FINISHING WORK

- Install the headlamp. See **HEADLIGHT/BULB, REPLACINGHEADLIGHT/BULB, REPLACING**
- Adjust the headlamp alignment. See **HEADLAMPS, ALIGNING** .

LIGHTING, INNER

COURTESY LIGHTING, FRONT, REPLACING

REMOVAL

COURTESY LAMP AND BULB

Fig. 51: Locating Front Courtesy Lighting
Courtesy of VOLVO CARS CORPORATION

- Carefully turn the inner edge of the lamp lens until the lamp releases. Use a weatherstrip tool
- Disconnect the connector
- Remove the bulb.

INSTALLATION

COURTESY LAMP AND BULB

In reverse order.

INTERIOR LIGHTING, REPLACING

REMOVAL

PREPARATORY WORK

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

Fig. 52: Identifying Rear View Mirror Console
Courtesy of VOLVO CARS CORPORATION

Remove the lens from the interior lighting. See **BULB INTERIOR LIGHTING, REPLACING**.

Fig. 53: Identifying Interior Lighting Cover And Clips
Courtesy of VOLVO CARS CORPORATION

Open the clips (2, 3) and remove the cover (1).

REMOVING THE INTERIOR LIGHTING

Fig. 54: Identifying Interior Lighting Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the screws from the front edge
- Press in the catches on one side and detach the interior lighting from the headlining
- Disconnect the connector
- Disconnect the ground lead.

Fig. 55: Removing Interior Lighting
Courtesy of VOLVO CARS CORPORATION

Remove the screw from the rear view mirror.

Remove the interior lighting.

INSTALLATION

NOTE: For tightening torques, see TIGHTENING TORQUE .

INSTALLING THE INTERIOR LIGHTING

Fig. 56: Aligning Interior Lighting On Gear Selector Module Antenna Locating Pins
Courtesy of VOLVO CARS CORPORATION

Install:

- the screw for the rear view mirror. Tighten

CAUTION: Check that the microphone cable is not trapped (if applicable).

- the ground lead. Connect the connector. Align the interior lighting on the gear selector module (GSM) antenna locating pins (1) and press into place
- the screws. Tighten.

FINISHING WORK

Install the cover.

Install the lens for the interior lighting. See **BULB INTERIOR LIGHTING, REPLACING**.

Test the function.

UPPER ELECTRONIC MODULE (UEM)/REARVIEW MIRROR, REPLACING

REMOVAL

PREPARATORY INFORMATION

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

NOTE: **A rear view mirror with manual function cannot be replaced with automatic anti-dazzle or vice versa. The system will store diagnostic trouble codes (DTCs). The upper electronic module (UEM) is integrated in the rear view mirror.**

NOTE: **Read off data from the control module before replacing the control module. Program this data back into the new control module. Programmed data is read off via VIDA vehicle communication.**

CAUTION: **New software can only be ordered when the control module is installed in the car. VIDA reads off the new control module identity which is required to order the correct software.**

NOTE: **Always check that the control module and control module box connectors do not have bent or damaged terminals or socket / sleeves. This may have been the cause of a fault.**

PREPARATORY WORK

Remove the interior lighting. See **INTERIOR LIGHTING, REPLACING**.

REMOVING THE REAR VIEW MIRROR/CONTROL MODULE

Fig. 57: Identifying Removal Of Rear View Mirror/Control Module
Courtesy of VOLVO CARS CORPORATION

- Remove the cover over the connector for the rear view mirror and control module
- Remove the cable spring using a screwdriver
- For rear view mirrors with manual anti-dazzle: Flip the anti-dazzle button toward the lens.

Fig. 58: Identifying Removal Of Rear View Mirror Connector
Courtesy of VOLVO CARS CORPORATION

Disconnect the connector by pressing the catch using a small screwdriver.

INSTALLATION

INSTALLING THE REAR VIEW MIRROR AND CONTROL MODULE

Connect the connector.

- The cable spring
- The connector cover
- The interior lighting. See **INSTALLATION**.

ORDERING SOFTWARE
