SIGNAL DESCRIPTION, HEADLAMP CONTROL MODULE (HCM)

SIGNAL SPECIFICATION

All the values given below are between the respective terminal in column 1 and terminal #A6 in column 1 (power ground), if this is not the case, it is indicated within brackets.

NOTE: It is important to check ground terminals before taking readings.

U=	DC voltage in volts (V)	U_{AC} =	AC voltage in volts (V)
U_{bat} =	Battery voltage (V)	f =	Frequency in Hertz (Hz)
U_{low} =	Voltage approximately 0 V	t =	Time in seconds
PWM =	Pulse width modulated signal as a %	-	-

VEHICLE COMMUNICATION INFORMATION, HEADLAMP CONTROL MODULE (HCM) (B5254T2; 2007)

DESCRIPTION OF PARAMETERS

PARAMETERS, VALUE

POWER SUPPLY, VALUE

Measurement range 6 - 20 V.

Indicates the power supply to the headlamp control module (HCM).

The normal value when the alternator is charging: 13.0-14.5 V.

STEERING WHEEL ANGLE, VALUE

Measurement range: -780 to +780°.

Indicates current steering wheel angle.

The normal value when the steering wheel and front wheels point straight ahead is approx. 0°.

DESCRIPTION OF FROZEN VALUES, HEADLAMP CONTROL MODULE (HCM)

EXPLANATION

Frozen values are parameter values that are stored when a diagnostic trouble code is generated. Not all parameters can be read out for all diagnostic trouble codes. The parameter values can only be read if they can provide additional information on the prevailing conditions when the code was generated.

TOTAL MILEAGE, VALUE

Measurement range: 0-1,000,000 km

The value indicates the vehicle's total mileage when the Diagnostic Trouble Code (DTC) was generated.

MECU POWER SUPPLY, VALUE

Measurement range: 0 - 63 V

Normal range: 12.0 - 14.5 V

The value indicates the power supply to the central electronic module (CEM) when the diagnostic trouble code was generated.

PASSENGER COMPARTMENT TEMPERATURE, VALUE

Measurement range: -40 till +215 °C

The value indicates the passenger compartment temperature when the diagnostic trouble code was generated.

OUTSIDE TEMPERATURE, VALUE

Measurement range: -40 till +215 °C

The value indicates the outside temperature when the diagnostic trouble code was generated.

POWER SUPPLY MODE, STATUS

The value indicates the status of the power supply mode when the diagnostic trouble code was generated.

Lighting - Symptom Verification

HEADLIGHTS/MOISTURE/MIST ON INSIDE OF LENS (2006-2011)

SYMPTOM AND FUNCTION DESCRIPTION

NOTE: The symptom should always be verified together with the customer.

The following tips may be of help to decide if the symptom is due to a product feature or if continued troubleshooting is needed.

HINT: Mist on the inside of the headlight glass is normal if it has disappeared after 30 minute's driving.

FRONT FOG LIGHTS/DAYTIME RUNNING LIGHTS/MOISTURE/MIST ON INSIDE OF LENS (2006-2011)

SYMPTOM AND FUNCTION DESCRIPTION

NOTE: The symptom should always be verified together with the customer.

The following tips may be of help to decide if the symptom is due to a product feature or if continued troubleshooting is needed.

HINT: If moisture disappears after use, it is OK.

1986	Oxygen Sensor Warning Light Reset - Procedure 1

OXYGEN SENSOR WARNING LIGHT RESET - PROCEDURE 1

1. Warning light in dash will illuminate every 30,000 miles as a reminder to replace oxygen sensor. After replacing sensor, reset mileage counter.
2. To reset mileage counter on 1980-84 models, locate mileage counter in-line with speedometer cable. Press reset button. See **Fig. 1**. Ensure reminder light is out.

Fig. 1: Resetting Oxygen Sensor Light Mileage Counter (1980-84 Models)

NOTE: **The brake pedal must not be depressed when accessing ignition modes I or II .**

CAUTION: Foreign objects in the ignition slot can impair function or damage the lock.

Ignition Mode 0: Insert the remote key in the ignition slot.

Ignition Mode I: Press the remote key into the ignition slot and press **START/STOP ENGINE** .

Ignition Mode II: Press the remote key into the ignition slot and press **START/STOP ENGINE** for approx. 2 seconds.

Ignition Mode III:

- **Engine Start:** Start the engine
- **Stopping The Engine:** Press **START/STOP ENGINE** (If the engine is running and the vehicle is moving, keep the button depressed until the engine stops).

Return To Ignition Mode 0: Press **START/STOP ENGINE** to return from **I** , **II** , or **III** to ignition mode **0** .

SERVICE REMINDER LIGHT

NOTE: **Service reminder light (if equipped) will come on at 5000 or 10,000 mile intervals to indicate oil and filter change is scheduled. After changing oil and filter, reset mileage counter.**

SERVICE REMINDER LIGHT RESET - PROCEDURE 3

Remove rubber grommet to left of odometer. Using a small screwdriver, depress reset knob. See **Fig. 5**.

Fig. 5: Resetting Service Interval Light Mileage Counter (1991-92 740 & 1991-95 940 & 960; Also Applies To Some 850 Models)
Courtesy of VOLVO CARS OF NORTH AMERICA.

SERVICE REMINDER LIGHT RESET - PROCEDURE 4

The Service Reminder Indicator (SRI) is triggered at the appropriate interval is reached. On US and Canadian cars, with or without turbocharger, this will be 10,000 miles (15,000 km), 750 operating hours or 12 calendar months.

Once triggered, the SRI comes on each time the engine is started. The light goes out after about 2 minutes. After service is performed and the SRI counter reset, the SRI will not light again until shortly before the next service is due.

1. Identify type of instrument cluster used in vehicle. See **Fig. 6**.

Fig. 6: Identifying VDO Instrument Cluster (1993-97 850)
Courtesy of VOLVO CARS OF NORTH AMERICA.

2. Turn ignition on. Locate on-board diagnostic unit on right side of engine compartment. Connect diagnostic lead to terminal No. 7 on diagnostic unit. See **Fig. 7**.

Fig. 7: Locating On-Board Diagnostic Unit (1993-95 850)
Courtesy of VOLVO CARS OF NORTH AMERICA.

3. Depress button 4 times, briefly but firmly. System is now in DTM 4 mode. When LED comes on and stays on, the system is ready for entering codes.
4. Code to be entered is 1-5-1. Enter first digit (1) with LED on. Wait until it comes on and stays on again, then enter the second digit (5). Repeat procedure for the third digit (1).
5. Wait for diagnostic unit confirmation (LED flashing several times in succession). If LED emits a couple of rapid flashes and service reminder light is turned off, reset procedure is complete. If service reminder light remains on, repeat procedure.

SERVICE REMINDER LIGHT RESET - PROCEDURE 5

Vehicles with VDO Instrument Cluster

Identify type of instrument cluster used in vehicle. See **Fig. 6**.

The service reminder indicator is lit for two minutes each time the engine is started until it is reset after the next service. Reset is performed using a Volvo scan tool, or equivalent aftermarket scan tool.

Connect scan tool to Data Link Connector (DLC) in center console, in front of shift lever. See **Fig. 8**. Turn ignition on, with engine off. Follow scan tool menus as follows:

1. Select LANGUAGE, press ENTER
2. Select 800 SERIES, press ENTER
3. Select SERVICE, press ENTER
4. Select RESET SRI, press EXIT

Fig. 8: Locating Data Link Connector (1996-97 850 - VDO)

SERVICE REMINDER LIGHT RESET - PROCEDURE 6

Vehicles with Yazaki Instrument Cluster

The service reminder indicator comes on when 10,000 mile (15,000 km) service interval is reached.

1. Vehicle is equipped with Yazaki instrument cluster. See **Fig. 9**.
2. The service reminder reset knob is located on front of instrument cluster, underneath a rubber grommet. See **Fig. 5**.
3. To reset, remove rubber grommet. Use a small screwdriver to depress the knob.

G00283674

Fig. 9: Identifying Yazaki Instrument Cluster (1993-97 850 - Yazaki)
Courtesy of VOLVO CARS OF NORTH AMERICA.

SERVICE REMINDER LIGHT RESET - PROCEDURE 7

The service reminder light will illuminate at 10,000 miles, 750 hours of driving or 12 months, whichever comes first to remind driver that service interval has been exceeded. Service reminder light is reset using Volvo Scan Tool, or equivalent aftermarket scan tool. Follow scan tool manufacturer's instructions. Diagnostic connector is located in center console.

SERVICE REMINDER LIGHT RESET - PROCEDURE 8

NOTE: Depending on application, Service Reminder Indicator (SRI) may be turned off by one of two methods.

Method 1

SRI reset may depend on instrument panel installed in vehicle. See **Procedure 5 (1996-97 850 With VDO Instrument Clusters)** or **Procedure 6 (1993-97 850 With Yazaki Instrument Clusters)**.

Method 2

The service reminder light will illuminate at 10,000 miles, 750 hours of driving or 12 months, whichever comes first to remind driver that service interval has been exceeded. Service reminder light is reset using Volvo Scan Tool, or equivalent aftermarket scan tool. Follow scan tool manufacturer's instructions. Diagnostic connector is located in center console, in front of shift lever.

SERVICE REMINDER LIGHT RESET - PROCEDURE 9

1. Turn ignition off.
2. Press in trip odometer reset button.
3. Switch ignition on, while continuing to press trip odometer reset button.

4. Continue pressing in the reset button for 10 seconds.
5. Release reset button within 4 seconds.

SERVICE REMINDER LIGHT RESET - PROCEDURE 10

Models 2001 & Earlier

The service reminder indicator (SRI) informs the driver that it is time for the car to be serviced. The lamp remains lit for 120 seconds when the ignition is switched on.

NOTE: If the lamp flashes, it may be because one of the service parameters has not been programmed.

1. Turn ignition to position I.
2. Press and hold in the reset button for the trip odometer.
3. Turn ignition to position II, while continuing to press trip odometer reset button.
4. The service reminder indicator (SRI) starts flashing when the reset button for the trip odometer has been pressed for 10 seconds.
5. Release the reset button for the trip odometer within 5 seconds. The instrument gives an audible signal when resetting has succeeded.

NOTE: If the trip meter reset button is not released within 5 seconds the indicator is not reset. However the indicator will stop flashing.

Models 2002 & Later

The service reminder indicator (SRI) informs the driver that it is time for the car to be serviced. The text message is displayed for 120 seconds each time the ignition is switched on.

1. Turn ignition to position I
2. Press and hold in the reset button for the trip odometer
3. Turn the key to position II within 2 seconds, while continuing to press trip odometer reset button.
4. For all vehicles from the 2003 model year a general yellow lamp will light when the reset button must be released.
5. Release the reset button for the trip odometer within 4 seconds. The instrument gives an audible signal when resetting has succeeded

   NOTE: If the reset button for the trip odometer is not released within 4 seconds, the service reminder indicator (SRI) is not reset.

6. If the trip meter is already reset the reset button should be held in for a minimum of 10 seconds and a maximum of 14 seconds.

SERVICE REMINDER LIGHT RESET - PROCEDURE 11

NOTE: **If equipped with a push button start/stop ignition, see PUSH BUTTON START/STOP IGNITION SWITCH POSITIONS for ignition switch positions.**

The SRI lights the first time the ignition is switched on after the service interval has been reached. The SRI will continue to illuminate, and remain illuminated, for 2 minutes every time the ignition is switched on or until it is reset. The SRI can be programmed for distance traveled, time since last service and engine hours since last service. Programming is done using the Volvo factory scan tool.

Starting from the 2002 model year, the need for service is indicated partly by the lamp and partly by a text message, TIME FOR SERVICE or TIME FOR REGULAR SERVICE. The SRI can be reset using the Volvo factory scan tool (or equivalent aftermarket scan tool), or using the following method.

NOTE: **The service indicator message can also be reset using VIDA vehicle communication.**

The service reminder indicator (SRI) informs the driver that it is time for the vehicle to be serviced. The text message is displayed for 120 seconds each time the ignition is switched on.

1. Ignition position I
2. Press and hold in the reset button for the trip odometer.
3. Turn the key to position II within 2 seconds, while continuing to press trip odometer reset button.
4. Hold the reset button for the trip meter pressed in until the original value has been reset and the general yellow lamp comes on.
5. Release the reset button for the trip odometer within 4 seconds. The instrument gives an audible signal when resetting has succeeded.

   NOTE: **The odometer reset button must be released within 4 seconds to reset the service indication message.**

6. If the trip meter is already reset, the reset button should be held in for a minimum of 10 seconds and a maximum of 14 seconds.

SERVICE REMINDER LIGHT RESET - PROCEDURE 12

NOTE: **The S40 information applies to late production 2004 cars. In mid-2004, Volvo introduced a redesigned S40. For early production cars, the 4th character of the VIN is V. For late production cars, the 4th character of the VIN is M. Early production S40 models are equipped with 1.9L 4-cylinder engines. Late production S40 models are equipped with 5-cylinder engines.**

1. Turn ignition to position I.
2. Press and hold the reset button for the trip odometer.
3. Turn key to position II within 2 seconds, while continuing to press trip odometer reset button.
4. Hold the reset button for the trip meter until the original value has been reset.

5. Release the reset button for the trip odometer within 4 seconds. The instrument cluster will give an audible signal when resetting is completed.

NOTE: If the reset button for the trip odometer will not released within 4 seconds, the light is not reset.

6. If the trip meter is already reset, the reset button should be held in for a minimum of 10 seconds and a maximum of 14 seconds.

SERVICE REMINDER LIGHT RESET - PROCEDURE 13

NOTE: If equipped with a push button start/stop ignition, see PUSH BUTTON START/STOP IGNITION SWITCH POSITIONS for ignition switch positions.

NOTE: The lamp can also be reset using VIDA vehicle communication.

The service reminder indicator (SRI) informs the driver that it is time for the vehicle to be serviced. The text message is displayed for 120 seconds each time the ignition is switched on.

1. Turn ignition to position I.
2. Press and hold in the reset button for the trip odometer.
3. Turn the key to position II within 2 seconds, while continuing to press trip odometer reset button.
4. Hold the reset button for the trip odometer pressed in until the original value has been reset.
5. The information lamp lights when the reset button must be released.
6. Release the reset button for the trip odometer within 4 seconds. The instrument gives an audible signal when resetting has succeeded.

NOTE: If the reset button for the trip odometer is not released within 4 seconds, the service reminder indicator (SRI) is not reset.

7. If the trip odometer is already reset, the reset button must be held in for a minimum of 10 seconds and a maximum of 14 seconds.

SERVICE REMINDER LIGHT RESET - PROCEDURE 14

NOTE: The S40 information applies to early production 2004 cars. In mid-2004, Volvo introduced a redesigned S40. For early production cars, the 4th character of the VIN is V. For late production cars, the 4th character of the VIN is M. Early production S40 models are equipped with 1.9L 4-cylinder engines. Late production S40 models are equipped with 5-cylinder engines.

1. Turn ignition off.
2. Press and hold in the reset button for the trip odometer.
3. Turn ignition on, while continuing to press trip odometer reset button.

4. The service reminder indicator (SRI) starts flashing when the reset button for the trip odometer has been pressed for 10 seconds.
5. Release the reset button for the trip odometer within 4 seconds. The instrument gives an audible signal when the reset has succeeded. The SRI indicator lamp goes out.

NOTE: If the reset button for the trip odometer is not released within 4 seconds, the light is not reset. However it will stop flashing.

SERVICE REMINDER LIGHT RESET - PROCEDURE 15

NOTE: The service indicator message can also be reset using VIDA vehicle communication.

1. Turn ignition switch to position I.
2. Press and hold the trip odometer reset button.
3. Turn ignition switch to position II, while continuing to press trip odometer reset button.
4. Wait for 10 seconds.
5. Release the reset button when the information lamp starts to flash.
6. The instrument panel beeps when resetting has been successful.

TIRE PRESSURE MONITOR SYSTEM (TPMS)

NOTE: To determine the appropriate reset procedure, refer to TPMS RESET INDEX. Only vehicles listed in this index have a TPMS reset.

TPMS RESET - PROCEDURE 1

CAUTION: When inflating tires with TPMS valves, press the pump's mouthpiece straight onto the valve to help avoid bending or otherwise damaging the valve.

NOTE: This system may not function properly if vehicle is equipped with a temporary spare tire or winter wheel/tire, as this tire does not have a TPM system sensor.

NOTE: Volvo vehicles do not require a formal reset procedure for any of the TPM system functions. Tire pressure sensor IDs are automatically programmed while driving.

Tire Pressure Warning

There are two warning levels that generate different warning messages, one warning for low pressure and a warning for very low pressure. A message is also displayed if a sensor stops transmitting or receives insufficient battery voltage. A warning lamp also lights in the Driver information module (DIM) at the same time as the warning message appears.

The easiest way to reset a warning is to fill the underinflated tire to specification. The warning in the Driver information module (DIM) disappears the next time the ignition is switched on. If air is filled in a tire that has warned of low pressure and the ignition is on during the entire process, the warning will go out as soon as the pressure in the tire exceeds the specified level.

Tire Sensor Learning

If a sensor must be replaced, the system must "learn" the new sensor ID. This can be carried out in 2 different ways:

NOTE: The vehicle must be parked for longer than 15 minutes to learn the new ID.

- Drive the vehicle faster than 40 km/h (25 mph) for longer than 10 minutes. The warning for low pressure remains in the Driver information module (DIM) until the Central electronic module (CEM) has identified the new sensor.
- Programming "by hand". This is carried out using the appropriate Volvo tire sensor activation tool, or Low Frequency (LF) initiator (sensor activation tool).

NOTE: The Volvo tire sensor activation tool on S80 (-06)/S60/V70/XC70/XC90 does

not work with the sensors on S40 (04-)/V50/C30/C70 (06-)

MAINTENANCE

Service And Maintenance - General Information

RAPGARD-F™ PAINTWORK PROTECTION (2003-12)

RAPGARD-F PAINTWORK PROTECTION

Fig. 1: Hood, Roof And Trunk Protected By RAPGARD
Courtesy of VOLVO CARS CORPORATION

During storage and transport the paintwork on the engine hood, roof and trunk lid of cars is protected by RAPGARD-F, a white plastic film with synthetic rubber adhesive, which is applied to the car in the factory.

RAPGARD-F must be left on the car until approximately **48 hours** prior to delivery to the customer.

The maximum storage time for RAPGARD-F is 6 months from the date of manufacture.

The date of manufacture can be obtained by the dealer using the chassis number register.

If the plastic film becomes detached at any point, the loose section must be removed as soon as possible.

The white areas in the graphic show where RAPGARD-F is applied .

REMOVAL OF RAPGARD-F

TEMPERATURE:

A temperature of **20°C** is ideal for removing RAPGARD-F. The temperatures permitted are as follows:

- Minimum temperature **0°C**
- Maximum temperature **35°C** .

CAUTION: If the body and ambient temperature is higher than 35°C, the car should be parked in the shade and the body cooled with cold water. The adhesive RAPGARD-F may otherwise stick to the paint.

METHOD OF REMOVAL

Fig. 2: Identifying RAPGARD Film Pulled Off By Hand
Courtesy of VOLVO CARS CORPORATION

Pull off the RAPGARD film by hand only. No tools may be used.

Begin by loosening the film at the corners.

Fig. 3: Identifying RAPGARD Correct And Incorrect Removal
Courtesy of VOLVO CARS CORPORATION

Place the hands as close as possible to the body so that the film is lifted off parallel to the body.

This will minimize the quantity of adhesive remaining on the body.

The method shown in the crossed-out graphic is incorrect.

Fig. 4: Identifying RAPGARD Alternately Pulled From Two Corners
Courtesy of VOLVO CARS CORPORATION

On large surfaces, such as the hood and roof, pull alternately from two corners until the film is loose.

PLASTIC RESIDUE

Fig. 5: Identifying Flat-Nosed Pliers
Courtesy of VOLVO CARS CORPORATION

After RAPGARD-F is removed, there may still be plastic residue caught under the washer jets. The jets must be lifted slightly when RAPGARD-F is removed to avoid this.

Use flat-nosed pliers to press in the locking clips on the jet and then lift it in order to remove the RAPGARD-F.

After removing RAPGARD-F, press the washer jet firmly into place on the hood.

ADHESIVE RESIDUE

Wash the car with water when the film has been removed. Dry the car and inspect for adhesive residue on the paintwork.

Any adhesive residue must be removed using auto-cleaner, P/N 1161300 or 1161450.

BUBBLING

Inspect paintwork for bubbling after any adhesive residue has been removed. Bubbling is usually temporary and will disappear within **24 hours** . If there is still bubbling after **48 hours** , heat carefully using a hot-air gun. Hold the air pistol approximately **30 cm** from the paint.

NOTE: The temperature of paintwork must not exceed 100°C

If the bubbling persists, the paintwork must be sanded down and touched up.

- Switch off the ignition. Wait 10 seconds
- Ensure that the passenger seat is completely empty
- Switch on the ignition. Wait 10 seconds.

CAUTION: The passenger seat must be completely empty during calibration. If the passenger seat is not completely empty, the calibration will be incorrect, which will result in incorrect function of the SRS system.

Activate calibration of the occupant weight sensor (OWS) using the VCT2000 (or appropriate scan tool).

When disassembling the connector it is extremely important that the catch on the connector is released first. The connector must be pulled straight off in relation to the mounting to prevent damage.

CAUTION: Do not use a tool of any type when disassembling due to the increased risk of damage to the connector.

SUPPLEMENTARY RESTRAINT SYSTEM (SRS) SAFETY

WARNING: **The components in the SRS and SIPS systems must be treated very carefully during repair. This is to help prevent:**

1. **Personal injury when carrying out repairs**
2. **Damage to or malfunction of the SRS/SIPS systems.**

Work on the SRS/SIPS system or components related to the SRS/SIPS system must be carried out by an authorized Volvo workshop.

NOTE: **See the relevant section for further information about safety and repair of the SRS system.**

The car has pyrotechnical airbags and seat belt tensioners

The car has the letters SRS stamped into the center of the steering wheel and on the dashboard above the glove compartment. This shows that the car is equipped with driver and passenger side airbags.

There are side airbags in both the front seats. There is a SIPS bag decal on the windscreen and seat compartments to indicate that side airbags are installed.

The letters IC are stamped onto the CD panel. This indicates that an inflatable curtain is installed. The car is equipped with an inflatable curtain as standard but can be delivered with it deactivated.

The car has pyrotechnical airbags and seat belt tensioners.

All SRS components are activated by signals from various electrical sensors.

Cable harness

Take care not to trap, fray, pierce or damage SRS wiring in any way:

- the soundproofing panel
- the glove compartment
- the dashboard
- steering shaft covers
- the ignition switch
- sill trim panels
- all posts
- the roof
- the parcel shelf.

SRS control module

The SRS control module is located between the handbrake and the gear selector lever in the center console.

Never install car accessories on or beside the control module.

Sensors

The collision sensors for the SRS/SIPS system (5) are located in the B-posts, C/D-posts and in the SRS control module. These control all the components in the SRS/SIPS system (4 airbags, 2 inflatable curtains, 5 seat belt tensioners).

Never install car accessories on or beside the sensors.

Signal communication

The sensor modules for the pyrotechnical components are located in the bodywork.

They can be triggered by a blow to, or pressure on, the bodywork. If the acceleration on the sensor is sufficiently high the sensor(s) will transmit a signal to the control module. The control module transmits an activation signal if the signal from the sensors has been sufficiently high or long-lasting.

Work on the SRS steering wheel module

When carrying out repairs to the steering wheel, steering column or steering gear always follow the repair procedures in the appropriate SRS Service Information.

Read the relevant sections. The contact reel in the steering shaft is damaged if the steering wheel is turned more than three turns in one direction.

Test output

Data link connector (DLC) in passenger compartment.

- Remove the 3 control module screws (Torx 30).
- Lift the control module.

INSTALLATION

CAUTION: Take care that nothing comes between the control module and the bodywork. This can cause over-sensitivity or poor SRS system function.

SUPPLEMENTAL RESTRAINT SYSTEM MODULE (SRS)

Fig. 7: 3 Control Module Screws
Courtesy of VOLVO CARS CORPORATION

Install 3 screws (Torx 30). Tighten to **10 Nm** .

CAUTION: It is important that the control module is securely mounted onto the bodywork if the sensor module is to operate properly.

Other components are reinstalled in reverse order.

ORDERING SOFTWARE

Order software. See: 9438415

PROGRAMMING CONTROL MODULE

Applies to MY 2005-

After downloading and configuring the control module the control module receives the vehicle configuration data from the central electronic module (CEM). This can take up to 15 seconds and during this time the SRS lamp flashes in the Driver information module (DIM). Downloading and configuration is complete when the SRS lamp stops flashing.

FINAL CHECK

Fig. 8: Connecting Battery Negative Lead
Courtesy of VOLVO CARS CORPORATION

WARNING: **The ignition must not be switched on when the SRS ignition cable connector is being removed or installed.**

When all components have been installed:

- switch ignition to position II
- reconnect the battery negative lead.

NOTE: **Check that the SRS indicator lamp is not defective by turning the key to position II. The SRS indicator lamp should light and go out after approximately seven seconds.**

Fig. 9: Identifying SRS Indicator Lamp
Courtesy of VOLVO CARS CORPORATION

- Check that the SRS indicator lamp is not lit constantly. If the lamp is lit constantly use the data link connector (DLC) or VCT2000 to trace the fault.

STEERING WHEEL MODULE

PREPARATIONS

NOTE: Disconnect the battery lead.

NOTE: Wait three minutes before starting work.

Ignition on to turn the steering wheel to the correct position.

REMOVING THE STEERING WHEEL MODULE

Courtesy of VOLVO CARS CORPORATION

Turn the steering wheel a 1/4 turn so that the two holes on the rear of the steering wheel are accessible.

Fig. 2: Identifying Using Screwdriver To Release Catch
Courtesy of VOLVO CARS CORPORATION

Insert a screwdriver in the hole on the rear at right angles to the reverse of the steering wheel.

Put the screwdriver point against the top of the spring clip as shown in the illustration.

Pry the screwdriver up against the upper edge of the hole (2) so that the point of the screwdriver presses down the catch (1) until the catch releases.

Turn the steering wheel a 1/2 turn in the opposite direction. Repeat the process on the other side.

Turn the steering wheel to the neutral position.

Fold out the steering wheel module.

Fig. 3: Connectors For Airbag

NOTE: The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

CAUTION: As the SRS system is a safety system, it is extremely important that these instructions are carefully followed when carrying out repairs in the cable harness.

CAUTION: Ensure that the new pin has the same type of surface treatment as the old.

WARNING: Do not carry out any work on the cable for the SRS system until the connector has been disconnected from the relevant airbag or seat belt tensioner. There is otherwise a risk of static electricity deploying the component.

PREPARATORY WORK

SELECTION OF REPAIR KIT, SRS SYSTEM

Materials: SRS system repair kit for the selected car.

NOTE: Only special tools and materials from the SRS system repair kit for the selected car must be used. Choose a repair location where there is plenty of room to guarantee that work is of the highest quality.

The cables should always be connected color to color. In the cases where the repair terminals have a completely orange cable then this is always fitted to terminal No. 1. In the cases where the repair terminals have a blue and a brown cable, then blue is No. 1 and brown is No. 2.

REMOVING THE BATTERY LEAD AND THE IGNITION CABLE

Disconnect the negative battery cable. See: **BATTERY - DISCONNECTING AND CONNECTING**

Disconnect the relevant ignition cable. See: **IGNITER WIRE CONNECTOR**

ASSEMBLY

CUTTING AND STRIPPING PAIRS OF CABLES

Fig. 1: Cables Cut With Approximately 40 MM Between Splices
Courtesy of VOLVO CARS CORPORATION

Release the cable from the cable harness so that you have plenty of room in which to work.

NOTE: The maximum permitted twinned length after splicing is 100 mm. This is to prevent interference problems.

Cut the cables so that there is approximately 40 mm between the splices (center to center) (A).

Fig. 2: Identifying Cable Strip Length
Courtesy of VOLVO CARS CORPORATION

Strip off 5.0 mm of the insulation on the 4 cable ends. Use: see **9512620** .

Twin the cable cores on the stripped ends of the cables.

CAUTION: Ensure that all the cores are twinned.

CRIMPING THE SLEEVE

Fig. 3: Crimping Examples
Courtesy of VOLVO CARS CORPORATION

Install a crimp sleeve from the repair kit in the press tool: see **9512785**

Squeeze the crimping tool a little to secure the crimping sleeve in the tool.

Insert the cable as far into the crimp sleeve as it will go.

Ensure that the cable insulation does not get into the crimping area or that stripped cable does not extend outside the sleeve.

Press the pliers' handles as far as they will go to ensure a proper joint. The pliers release automatically.

Check by hand that the crimping sleeve is secure.

Prepare the remaining cable ends in the same way.

Hold a putty knife or other suitable protection behind the heat-shrink tubing to shield the surrounding components from heat.

Heat the sleeve with hot air gun: see **9512777** and a suitable nozzle. It is important that the heat-shrink tubing is shrunk around the cable. It should be possible to, see some adhesive that has squeezed out around the cable.

FINISHING

SECURING THE CABLE FOR THE SRS SYSTEM

Secure the new cable for the SRS system next to the old cable using a tie strap or similar. Reinstall the connectors.

INSTALLING THE BATTERY CABLE

Install the battery negative lead. See **BATTERY - DISCONNECTING AND CONNECTING**

CHECKING AND ADJUSTING THE SRS SYSTEM

Turn the ignition to position 2.

Check the SRS system to ensure that the warning lamp comes on and stays on while the SRS system performs a self-test. The lamp must go out after a few seconds. If not, perform fault-tracing.

If everything is working, reinstall other components.

Test drive the vehicle.

STEERING

Steering - Cleaning, Inspection And Adjustment

STEERING WHEEL (2003-2012)

STEERING WHEEL POSITION, ADJUSTING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATION

Test drive the car and make a note of the steering wheel position.

Remove the battery lead. See **BATTERY, DISCONNECTING** .

Remove the driver's airbag module. See **AIRBAG DRIVER'S SIDE (SRS), REPLACING** .

STEERING WHEEL POSITION, ADJUSTING

Fig. 1: Identifying Steering Wheel Screw

Courtesy of VOLVO CARS CORPORATION

Remove the steering wheel mounting screw.

Turn the steering wheel to the position noted during the test drive. Remove the steering wheel.

Zero the contact reel. See **CONTACT REEL DRIVER AIRBAG MODULE, RESETTING** .

Set the steering wheel to the "straight ahead" position.

NOTE: **Do not turn the steering wheel when it is on the steering shaft. Since the contact reel is locked, it will be damaged beyond repair if the wheel is turned in this situation.**

Tighten the steering wheel mounting screw. Tighten to **35 Nm** .

Remove the locking screw for the contact reel. Secure the locking screw in the "parking hole" in the steering wheel.

FINISHING

Install:

- the driver's airbag module. See **AIRBAG DRIVER'S SIDE (SRS), REPLACING**
- the battery lead.

Test drive and repeat the adjustment if necessary.

PREPARATORY WORK

REMOVING

NOTE: The vehicle most be lowered when carrying out work.

Remove the airbag, see **AIRBAG DRIVER'S SIDE (SRS), REPLACING** .

INSTALLING THE TEST DEVICE

Fig. 2: Identifying Special Tools 9511506
Courtesy of VOLVO CARS CORPORATION

Install the test devices to the connectors for the cables instead of the airbags. The test devices are used so that no diagnostic trouble codes (DTCs) are registered when the engine is started.

On model years 2003 and 2004, see **9511506** alternatively 951 1506 version B are used depending on the version the connectors have.

On model year 2005 or later, see **9511506** and 951 1506 version B is used for the green and violet connector. Use 951 1506 version B for the gray connector that is found on certain vehicles.

Install the battery negative lead, see **BATTERY, DISCONNECTING**

REMOVING THE PRESSURE LINE, APPLIES ONLY TO 5 AND 6 CYLINDER ENGINES

Fig. 3: Identifying Lock Grip Pliers On Oil Pump Return Hose

NOTE: **The illustration displays previous versions, up to and including 2004. From and including 2005 the pressure pipe is secured by a screw and washer.**

WARNING: **Avoid skin contact with the oil.**

Protect the generator (GEN).

Place paper over the generator (GEN) as protection against oil.

Remove the control module coolant pipe.

Install lock grip pliers on the power steering pump return hose.

Remove the pressure line from the power steering pump.

REMOVING THE PRESSURE LINE, APPLIES ONLY TO 8 CYLINDER ENGINES

Fig. 5: Identifying Cover Over Engine Front Row Cylinders And Protective Cover Over Power Steering Pump

Remove:

- the cover over the engine's front row of cylinders (bank 1) and slightly detach the cover for the rear row of cylinders (bank 2)
- the protective cover over the power steering pump.

Fig. 6: Identifying Screw And Nut

NOTE: Note the position of the delivery pipe.

Place paper around the pressure line on the power steering pump.

Remove:

- the screw (1)
- the nut (2)
- the pressure line from the power steering pump.

CONNECTING THE MANOMETER, APPLIES TO MODEL YEARS UP TO AND INCLUDING 2004

Fig. 7: Identifying Special Tools 9995055, 9995175 And 9995319

Connect see **9995055** version C between the pump and the steering gear pressure hose.

Use: see **9995175** and see **9995319** .

Connect see **9995175** with the pipe screws and the washers from see **9995319** .

NOTE: Connect the hose from the pressure gauge's valve to the steering gear's pressure hose. The valve should be in a position along the hose.

Remove:

- lock grip pliers
- paper over the generator (GEN).

CONNECTING THE MANOMETER, APPLIES TO MODEL YEARS FROM AND INCLUDING 2005

Fig. 8: Connecting Manometer Between Pump And Steering Gear Pressure Hose

Connect see **9995055** version C between the pump and the steering gear pressure hose.

Use: see **9997179** and see **9997180** .

MANOMETER LOCATION

Fig. 9: Identifying Manometer
Courtesy of VOLVO CARS CORPORATION

Position the manometer in the engine compartment so that it can be read off from the driver's seat.

CHECKS

CONDITIONS

For control to be as exact as possible the following conditions must be met:

- The vehicle must be equipped with summer tires on the front wheels, with pressures according to the decal on the fuel tank filler cover.
- That the surface beneath the front wheels resembles a dry asphalt metalled road.

LEAK CHECKING

NOTE: Check for leakage in the connections on the power steering pump or on the steering gear before carrying out the measurements below.

CHECKING THE PUMP CAPACITY

Fig. 10: Checking Pump Capacity With Manometer
Courtesy of VOLVO CARS CORPORATION

Shut the cock for a maximum of 5 seconds. If the pump is fault-free, the manometer pressure should rise to the correct value: **11.0-12.0 MPa** .

The pump must be replaced if the pressure is outside the above values

Switch off the engine.

CHECKING PUMP PRESSURE

Fig. 11: Checking Pump Pressure Using Manometer
Courtesy of VOLVO CARS CORPORATION

Left limit position:

- Start the engine.
- Turn the steering wheel to the left. Press the steering wheel to the limit position for a maximum of 5 seconds while reading off the manometer.
- Correct pressure: **11.0-12.0 MPa** .

Right limit position:

- Turn the steering wheel to the right limit position and read the manometer according to the previous operation.

If the correct value is not reached there is an internal leak in the steering gear. The steering gear must then be replaced by a new one.

CHECKING THE POWER STEERING BALANCE WHEN TURNING THE STEERING WHEEL

Fig. 12: Checking Power Steering Balance When Turning Steering Wheel Using Manometer
Courtesy of VOLVO CARS CORPORATION

Start the engine.

Turn the steering wheel to the right limit position and release.

Connect torque wrench see **9998081** to the steering shaft screw and turn to the right with the torque wrench at the limit position to pressure level 1 on the manometer. Release the torque on the steering wheel.

Turn again at the limit position to pressure level 2 on the manometer. Read off the torque.

Repeat the procedure turning the steering wheel to the left.

NOTE: Do not hold the steering wheel at the limit position for each pressure level for more than 5 seconds.

Pressure level and torque

Standard steering gear:

Level 1 pressure 4 Mpa torque interval 2.5-5.5 Nm

Level 2 pressure 8 Mpa torque interval 3.0-6.0 Nm

Speed dependent steering gear:

Level 1 pressure 4 Mpa torque interval 1.5-4.5 Nm

Level 2 pressure 8 Mpa torque interval 2.0-5.0 Nm

NOTE: If the torque deviation is greater than 0.7 Nm to reach the same pressure the

steering gear must be replaced. This applies to both with and without speed dependant steering gear.

FINISHING

Disconnect the battery negative lead, see **BATTERY, DISCONNECTING** .

Fig. 13: Identifying Lock Grip Pliers On Oil Pump Return Hose
Courtesy of VOLVO CARS CORPORATION

Remove the test devices see **9511506** and 951 1506 version B. Install the airbag, see **AIRBAG DRIVER'S SIDE (SRS), REPLACING** .

Disconnect the test instrument.

Install lock grip pliers on the oil pump return hose.

NOTE: Place paper over the alternator as protection against any oil spill.

Disconnect the test instrument and the nipples.

Connect the pressure line to the pump. Tighten the nut or screw to the pressure line. Tighten to **25 Nm** . Use new O-ring.

Remove:

- lock grip pliers
- the paper over the generator (GEN).

Only applies to 5 and 6 cylinder engines

Install the coolant hose for the control module.

Applies to all engine variants

Check the oil level in the reservoir. Use Volvo power steering fluid, P/N **1161529-1** to ensure the correct oil quality.

Start the engine. Check for leakage.

Applies to 8 cylinder engines only

Install:

- the cover over the power steering pump 2 x M6. Tighten
- the covers on the engine's row of cylinders, front (bank 1) and rear (bank 2).

BLEEDING/FILLING

WARNING: Avoid skin contact with the oil.

NOTE: Use the correct quality.

Fill the reservoir with oil. **Use:** Volvo's servo oil, 116 1529-1

Hang the fluid reservoir from the hood catch using welding rod or similar. Ensure that the hose is stretched.

Turn the steering wheel between both end positions repeatedly 10 times. Fill with fluid if necessary.

Apply the parking brake. Start the engine.

A : Turn the steering wheel slowly to the right. Hold it in the limit position for a maximum of 2 seconds.

B : Turn the steering wheel slowly to the left. Hold it in the limit position for a maximum of 2 seconds.

Switch off the engine, wait 5 minutes and repeat steps **A** and **B** 10 times. Repeat the operation.

Switch off the engine, wait 5 minutes and repeat steps **A** and **B** 10 times.

Reinstall the oil reservoir. Check the oil level.

Steering - Diagnostic Trouble Codes and Associated Procedures

SAS-0016: CONTROL MODULE. COMMUNICATION FAULT (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION SAS-0016

Condition

Fig. 1: Identifying Steering Wheel Control Module
Courtesy of VOLVO CARS CORPORATION

The control modules transmit and receive information via a standardized serial communication method, CAN (Control Area Network). Diagnostic trouble codes (DTCs) are stored if the steering wheel angle sensor module (SAS) registers that information from the central electronic module (CEM) is missing.

Steering wheel angle sensor module (SAS) is located inside, and is supplied with power by, the steering wheel module (SWM). Only the steering wheel angle sensor module (SAS) communicates on the controller area network (CAN).

Substitute Value

- The stability function is blocked.

Possible Source

- Incorrect information from the central electronic module (CEM).

Fault symptom[s]

- Anti-spin warning lamp lit.
- General warning lamp lit.
- The stability control system does not function.

COMMUNICATION FAULT

INFORMATION

The steering wheel angle sensor module (SAS) has registered that information about the car configuration from the central electronic module (CEM) is missing.

Exit fault-tracing and fault-trace the central electronic module (CEM) system.

SAS-0019: CONTROL MODULE. INTERNAL FAULT (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION SAS-0019

Condition

Fig. 40: Identifying Steering Wheel Control Module
Courtesy of VOLVO CARS CORPORATION

The Steering wheel angle sensor module (SAS) is located in the lever module together with the steering wheel module (SWM) and is supplied with power by it.

Steering wheel angle sensor module (SAS) contains two processors which work together. The processors receive information about steering wheel angle, steering direction and steering angle speed from the steering wheel sensor and compare the information with each other. The diagnostic trouble code (DTC) is stored if one processor registers that other processor requests information more often than expected.

Substitute Value

- The stability function is blocked.

Possible Source

- Internal fault.

Fault symptom[s]

- Anti-spin warning lamp lit.

- General warning lamp lit.
- The stability control system does not function.

SAS-0019: CONTROL UNIT. INTERNAL FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

The control units communicate with each other via a standardized serial method of communication - CAN (Controller Area Network) - to exchange information. Control units send and receive information. If the steering wheel angle sensor (SAS) control unit registers an internal fault, diagnostic trouble code SAS-0019 is set.

If the steering wheel angle sensor (SAS) control unit registers that the signal from the steering wheel angle sensor is missing, diagnostic trouble code SAS-0024 is set.

Substitute Value

- Stabilizing function disconnected.
- Anti-spin function blocked.

Possible Source

- The steering wheel angle sensor connector is not connected.
- Open circuit in the power supply to the steering wheel angle sensor.
- Open circuit in the signal wires.
- Internal fault in the steering wheel angle sensor control unit.

Fault symptom[s]

- Anti-spin warning lamp is on.
- Stabilizing function not working.
- Anti-spin does not work.

SAS-0042: STEERING WHEEL ANGLE SENSOR. INTERNAL FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

Fig. 125: Identifying Steering Wheel Angle Sensor
Courtesy of VOLVO CARS CORPORATION

If the steering wheel angle sensor (SAS) control unit registers that the steering speed (the speed at which the steering wheel is turned) from the SAS element exceeds 2000°/s, diagnostic trouble code SAS-0042 is set.

Substitute Value

- Stabilizing function disconnected.
- Anti-spin function blocked.

Possible Source

- The front wheels hit a curb or stone.

Fault symptom[s]

- Anti-spin warning lamp is on.
- Stabilizing function not working.

- Anti-spin does not work.

INTERNAL FAULT

INFORMATION

The diagnostic trouble code shows that the steering wheel has turned at a speed of more than 2050°/s. The probable cause of the diagnostic trouble code is that the driver has hit a curb or stone, for example, causing the angle speed of the wheels and steering wheel to change severely.

Check that the fore carriage adjustment has not changed and that the wheels have not been damaged.

SAS-0046: STEERING WHEEL ANGLE SIGNAL B. NO SIGNAL. INTERMITTENT FAULT (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

Fig. 149: Identifying Steering Wheel Angle Sensor
Courtesy of VOLVO CARS CORPORATION

The steering wheel angle sensor has two circuits each with 4 LEDs and 4 receptors which read off the position of their individual code wheel. One circuit measures the steering wheel angle and the other measures steering wheel revolutions. If the steering wheel angle sensor (SAS) control unit registers that steering wheel angle signal B is missing, diagnostic trouble code SAS-0046 will be stored.

Substitute Value

- Stabilizing function disconnected.
- Anti-spin function blocked.

Possible Source

- Contact resistance or oxidation in the connector of the steering wheel angle sensor control unit or the steering wheel control unit (SWM).
- Open circuit in the signal wires.
- Internal fault in control unit.

Fault symptom[s]

- Anti-spin warning lamp is on.
- Stabilizing function not working.
- Anti-spin does not work.

NO SIGNAL. INTERMITTENT FAULT

CHECKING THE WIRING AND CONNECTIONS

Diagnostic trouble code (DTC) SAS-004B is stored if the control module for the steering wheel angle sensor registers that the signal from the steering wheel angle sensor is faulty.

Substitute Value

- None.

Possible Source

- Contact resistance or oxidation in the control module for the steering wheel angle sensor or in the steering wheel module connector.
- Fault in the signal cables between the steering wheel angle sensor and the control module for the steering wheel angle sensor.
- Internal fault in the steering wheel angle sensor.
- Internal fault in the control module.

Fault symptom[s]

- Anti-spin warning lamp lit.
- No stability function.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION SAS-C008B64

Condition

Fig. 196: Identifying Steering Wheel Control Module
Courtesy of VOLVO CARS CORPORATION

The Steering Angle Sensor (SAS) is located in the Steering Wheel Module (SWM) from which it is supplied with power. It is however only the Steering Angle Sensor which communicates on the Control Area Network (CAN).

If the Steering Angle Sensor (SAS) registers that the steering angle exceeds 720°, in either direction, the trouble code is set.

The trouble code may be diagnosed when the ignition is on and the angle sensor is initiated. The sensor is initiated by the steering wheel being turned by more than 4.5° in either direction.

Substitute Value

- The stability function is blocked.

Possible Source

- The Steering Angle Sensor (SAS) is incorrectly fitted.

Fault symptom[s]

- The anti-spin warning lamp is illuminated.
- General warning lamp lit
- The stability function is not working.

FAULT TRACING SAS-C008B64

CHECKING THE FITTING OF THE STEERING ANGLE SENSOR (SAS)

NOTE: **The trouble code indicates that the Steering Angle Sensor (SAS) is incorrectly fitted. It is very important that the switch roller/Steering Angle Sensor (SAS) is correctly fitted. If the unit is fitted with the rotating centre section displaced by one complete revolution, internal components can be damaged when the steering wheel is turned to full lock. If it is possible that the unit is incorrectly assembled, the switch roller must be replaced.**

Fig. 197: Identifying Ignition OFF
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Align the wheels in the straight ahead position.
- Remove the steering wheel.
- Ignition on
- Turn the steering wheel by more than 5° in either direction to initiate the Steering Angle Sensor (SAS).
- Read the value of steering angle by clicking on the VCT2000 (Volvo Scan Tool) symbol.

  Check that the steering angle is 0° when the wheels are in the straight ahead position. If the steering angle is incorrect, position the wheels straight ahead and loosen the steering wheel. Then adjust the contact roller so that the yellow mark can be seen in the contact roller window when the contact roller locking screw is in the correct position.

NOTE: **If the ignition key is turned to position II when the steering wheel is removed, trouble codes for the steering wheel switches are stored in the Central Electronic Module (CEM).**

FAULT TRACING SAS-C008C64

INFORMATION

The trouble code indicates that the steering wheel has been turned at a speed exceeding 1433°/second. The likely cause of the trouble code is that the driver has driven into an obstacle such as a curbstone which has caused a rapid movement of the steering wheel.

Check that the front suspension settings have not been affected or the wheels damaged.

Remedy as necessary.

CHECKING THE STATUS

Fig. 206: Identifying Belt Routing
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Wait approximately 10 seconds.
- Engine running.
- First turn the steering wheel max. to the right, then max. to the left. Then set the steering wheel to the straight-ahead position.
- Read the trouble code counter by clicking the VCT2000 (Volvo Scan Tool) symbol.

  The counters are used to determine the problem's status. For general information about the counters, see:**DESCRIPTION OF COUNTER**

  Counter 1 indicates the number of drive cycles without fault since the fault was last validated.

  If **counter 1** is the same as 0, this means that the fault has been detected in this operating cycle (permanent fault). Replace the Steering wheel module (SWM).

  If **counter 1** is over 0, this indicates that the problem has not been detected in this driving cycle (intermittent problem). The problem has existed earlier but is not active right now. Then check **counter 4** .**Counter 4** indicates number of driving cycles **with problem** since the problem was validated for the first time.

  - If the number of incorrect driving cycles is high, this indicates an intermittent recurring problem. Replace the Steering wheel module (SWM).
  - If the number of incorrect driving cycles is low, this indicates an intermittent temporary problem. No action.

  HINT: Counter 3 indicates number of driving cycles since first time that the problem occurred. If the value for counter 3 is divided by the value for counter 4, the intensity of the problem is obtained. The higher the value, the higher the problem intensity. A high problem intensity indicates that the malfunction recurs often.

NOTE: If the trouble code returns replace the Steering Wheel Module (SWM).

Remedy as necessary.

DESCRIPTION OF COUNTER

Counter
There are eight different counters that are stored individually for each diagnostic trouble code (DTC). For an intermittent malfunction, the values of the different counters can be studied to determine how intermittent the malfunction is. All counters do not need to be implemented in one control module, this varies from system to system. The possible counters are described below.

Counter	**Function**
C#1	Counts the number of operating cycles since the malfunction was *last* validated. This information can be used to determine whether the malfunction is active during the current operating cycle or not. The malfunction is present now if the value is zero.
C#2	Counts the number of operating cycles since the malfunction was *last* validated, where test for the diagnostic trouble code was performed without the malfunction being detected and validated. When a test is performed, no malfunction is detected, the counter will count up by 1 for each operating cycle.
C#3	Counts the number of operating cycles since the malfunction was validated *the*

	first time . For each completed operating cycle the counter will count up by 1.
C#4	Counts the number of operating cycles in which the malfunction was validated since it was first validated. Counts the number of times the malfunction has occurred since the first time.
C#5	Counts the number of warm-up cycles since the MIL-light has gone off.
C#6	The counter counts the number of internal detections of the malfunction that have been performed for the diagnostic trouble code. When this counter reaches + 127, the control module considers that the malfunction is active right now. When counter is at value -127 the malfunction is not active. The value is reset to zero at each new operating cycle. If the value increases toward +127 the control module has detected a malfunction and, for each internal test, the value counts up. When the malfunction is not active, the control module counts down to minimum -127. Value can only be changed when the control module has started the test for the diagnostic trouble code. The increments with which the control module counts up or down the value may vary between control modules.
C#7	Shows maximum value for current operating cycle.
C#8	Shows maximum value for current and/or earlier operating cycle.

The Steering Angle Sensor (SAS) is located in the Steering Wheel Module (SWM) from which it is supplied with power. It is however only the Steering Angle Sensor which communicates on the Control Area Network (CAN).

Fitted into the Steering Angle Sensor (SAS) is a code wheel which follows the steering wheel rotation. Nine optical digital sensors and two analogue photo diodes read the code from the wheel. The code signals which are generated shall form a specific pattern. If the Steering Angle Sensor (SAS) registers that the current through any of the digital or analogue sensors is too high or too low the trouble code is set.

The Steering Angle Sensor (SAS) is located in the Steering Wheel Module (SWM) from which it is supplied with power. It is however only the Steering Angle Sensor which communicates on the Control Area Network (CAN).

If the Steering Angle Sensor (SAS) registers an internal fault, the trouble code is set.

The trouble code may be diagnosed when the ignition is on and the angle sensor is initiated. The sensor is initiated by the steering wheel being turned by more than 4.5° in either direction.

Substitute Value

- The stability function is blocked.

Possible Source

- Internal fault in the Steering Angle Sensor (SAS).

Fault symptom[s]

- The anti-spin warning lamp is illuminated.

- General warning lamp lit
- The stability function is not working.

The Steering Angle Sensor (SAS) is located in the Steering Wheel Module (SWM) from which it is supplied with power. It is however only the Steering Angle Sensor which communicates on the Control Area Network (CAN).

If the voltage supply (5 V) to the Steering Angle Sensor (SAS) is missing, the trouble code is set.

The trouble code may be diagnosed when the ignition is on and the angle sensor is initiated. The sensor is initiated by the steering wheel being turned by more than 4.5° in either direction.

Substitute Value

- The stability function is blocked.

Possible Source

- Open circuit in the voltage supply circuit for the Steering Angle Sensor (SAS).

Fault symptom[s]

- The anti-spin warning lamp is illuminated.

- General warning lamp lit
- The stability function is not working.

The control modules transmit and receive information via a standardized serial communication method - CAN (Control Area Network). The diagnostic trouble code (DTC) is stored if the control module registers serious interference (CAN communication blocked).

NOTE: **In the event of system communication problems, it is not possible to communicate with the control module. Therefore it will only be possible to read off the fault if it is intermittent.**

Substitute Value

- The control module shuts itself off ("bus-off").

  HINT: The control module will remain shut off until the power supply is broken (15, 30, X). When the power supply is connected the control module will make a new attempt to communicate.

Possible Source

- Short-circuit between the control area network (CAN) wiring

Condition

Fig. 243: Identifying Steering Wheel Control Module
Courtesy of VOLVO CARS CORPORATION

The Steering wheel angle sensor module (SAS) is located in the lever module together with the steering wheel module (SWM) and is supplied with power by it.

The steering wheel angle sensor module (SAS) compares the voltage with the central electronic module (CEM).

Diagnostic trouble code (DTC) is stored if the steering wheel angle sensor module (SAS) registers that the voltage when compared to the voltage signal from the central electronic module (CEM) is lower than 2 V for 10 seconds.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on and the steering wheel angle sensor is initiated. Initiation is carried out when the steering wheel is turned more than 4.5° in any direction.

Substitute Value

- The stability function is blocked.

Possible Source

- Contact resistance or oxidation in the connectors of the steering wheel module (SWM)

- Internal fault in the steering wheel angle sensor module (SAS).

Fault symptom[s]

- Anti-spin warning lamp lit.
- General warning lamp lit.
- The stability control system does not function.

- Ignition on
- Read off the power supply for the steering wheel angle sensor module (SAS) and the central electronic module (CEM).

  The voltage for the steering wheel angle sensor module (SAS) and the central electronic module (CEM) must be approximately the same.

  The fault is permanent if the voltage for the steering wheel angle sensor module (SAS) deviates by more than 2.0 V from the central electronic module (CEM).

  If the voltage is approximately the same, this indicates an intermittent fault, i. e. the fault was present previously but is not active at the moment.

If microprocessor/control unit registers that serial interface between SWM and SWS (steering wheel switches) short circuits and signal is low for more than 300ms, diagnostic trouble code SWM-0008 is displayed.

Substitute Value

Cruise-control function does not work when engine is running.

Possible Source

- Serial interface between SWM and SWS (steering wheel switches) short circuited.

Fault symptom[s]

- Cruise control not working at all
- Radio steering wheel buttons do not work
- RTI steering wheel buttons do not work
- Telephone steering wheel buttons do not work.

SIGNAL TOO LOW. INTERMITTENT FAULT

TROUBLE-SHOOTING INFORMATION

The diagnostic trouble code is displayed if there is a fault in internal communication. If the diagnostic trouble code is not displayed, no further action is necessary.

SIGNAL TOO LOW. PERMANENT FAULT

CHECKING THE CONTACT REEL

Check that the upper connector on the switch for the cruise control is correctly connected.

Disconnect the upper switch on the switch for the cruise control. Take voltage readings between terminals #B1 (26) and #B3 (28) (on the cable connector). The fault is probably in the contact reel if the voltage is 0 V. The fault is probably in the switch for the cruise control if the voltage is approximately 12 V.

Remedy as necessary.

Other information:

- To access or replace the cruise control switch, see **KEYPAD STEERING WHEEL, REPLACING**

Diagnostic trouble code (DTC) SWM-0009 is stored if the micro-processor / control module registers that the serial interface between the steering wheel module and the steering wheel switches is short circuited to 12 V and the signal is high for more than 300 ms.

Substitute Value

The cruise control is deactivated for the rest of the journey.

Possible Source

- The serial interface between the steering wheel module and the steering wheel switches is short circuited to voltage.

Fault symptom[s]

- Cruise control does not function at all.
- The steering wheel radio controls do not function.
- The steering wheel RTI controls do not function.
- The steering wheel carphone controls do not function.

CHECKING THE CABLE AND COMPONENT

If the car is equipped with a Road Traffic Information (RTI) system, disconnect the RTI switch from the electrical radio and audio switch. This is so that the fault can be located.

Read off the status of the buttons in the audio and carphone switch.

If any of the buttons are activated without having been depressed, the fault is in the RTI switch.

Disconnect the lower switch from the audio and radio switch. This is so that the fault can be located.

Read off the status of the buttons in the audio and carphone switch.

If any of the buttons are activated without having been manually depressed, the fault is in the audio and carphone switch.

Disconnect the lower switch from the cruise control switch. This is so that the fault can be located.

Read off the status of the buttons in the audio and carphone switch.

If any of the buttons are activated without having been manually activated, the fault is in the cruise control switch, or in the cable between the cruise control switch and the radio and carphone switch.

Remedy as necessary.

SWM-E001: CONTROL MODULE COMMUNICATION. FAULTY COMMUNICATION (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION SWM-E001

Condition

Fig. 78: Identifying Steering Wheel Module
Courtesy of VOLVO CARS CORPORATION

The control modules transmit and receive information via a standardized serial communication method - CAN (Controller Area Network). The diagnostic trouble code (DTC) is stored if the control module registers serious interference (CAN communication blocked).

NOTE: **In the event of system communication problems, it is not possible to communicate with the control module. Therefore it will only be possible to read off the fault if it is intermittent.**

Substitute Value

- The control module shuts itself off ("bus-off").

  HINT: The control module will remain shut off until the power supply is broken (15, 30, X). When the power supply is connected the control module will make a new attempt to communicate.

Possible Source

- Short-circuit between the control area network (CAN) wiring
- Open-circuit in the control area network (CAN) wiring
- Internal fault in the control module

- Internal fault in another control module in the same part of the control area network (CAN).

Fault symptom[s]

- Windshield wipers only operate at lowest speed
- Front windshield washing does not work
- Rear windshield washing does not work
- The turn signal lamp switch does not work
- Cruise control does not work at all
- The turn signal lamps do not work.

FAULTY COMMUNICATION

SWM-E003: CONFIGURATION FAULT. FAULTY CONFIGURATION (2003-2004)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION SWM-E003

Condition

Fig. 79: Identifying Steering Wheel Module
Courtesy of VOLVO CARS CORPORATION

The control module compares its configuration ID with the signal configuration transmitted on the Control area network (CAN) by the central electronic module (CEM). If the configuration IDs do not correspond the fault code is stored. The diagnostic trouble code (DTC) is also stored if the communication between the control module and the central electronic module (CEM) is interrupted.

NOTE: **In the event of open-circuit in both the control area network (CAN) cables, it is not possible to communicate with the control module. Therefore it will only be possible to read off the diagnostic trouble code (DTC) if this type of fault is intermittent. When the diagnostic trouble code (DTC) is stored, the control module responds to the diagnostic command, however normal control area network (CAN) communication does not work. ("Expulsion mode")**

Substitute Value

- None.

Possible Source

- Faulty Control area network (CAN) configuration ID. (The node is not intended for this car, for example a used control module with different software/hardware)
- Open-circuit in the control area network (CAN) wiring between the control module and the central electrical module (CEM).

Fault symptom[s]

- Windshield wipers only operate at lowest speed
- Front windshield washing does not work
- Rear windshield washing does not work
- The turn signal lamp switch does not work
- Cruise control does not work at all
- The turn signal lamps do not work.

Substitute Value

- None.

Possible Source

- Temporary voltage drop in the electrical system.
- Internal fault in the control module.

Fault symptom[s]

- Anti-spin warning lamp lit.

SAS-0001: CONTROL MODULE. FAULTY VOLTAGE (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION SAS-0001

Condition

Fig. 83: Identifying Steering Wheel Control Module
Courtesy of VOLVO CARS CORPORATION

Steering wheel angle sensor module (SAS) is located inside, and is supplied with power by, the steering wheel module (SWM). Only the steering wheel angle sensor module (SAS) communicates on the controller area network (CAN).

The steering wheel angle sensor module (SAS) compares the voltage with a known value from the central electronic module (CEM).

The diagnostic trouble code (DTC) is stored if the steering wheel angle sensor module (SAS) registers that the voltage differs from the known value.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on and the steering wheel angle sensor is initiated. Initiation is carried out when the steering wheel is turned more than 4.5° in any direction.

Substitute Value

- The stability function is blocked.

Possible Source

- Internal fault in the steering wheel angle sensor module (SAS).

Fault symptom[s]

- Anti-spin warning lamp lit.
- General warning lamp lit.
- The stability control system does not function.

SAS-0001: LED GROUP 1 CIRCUIT. SIGNAL TOO LOW (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

Fig. 85: Control Module For Steering Wheel Angle Sensor
Courtesy of VOLVO CARS CORPORATION

The steering wheel angle sensor has two circuits each with 4 LEDs and 4 receptors which read off their individual code wheel. One circuit measures the steering wheel angle and the other measures steering wheel revolutions. If the control unit registers that the current passing through the LED group circuit is too low, diagnostic trouble code SAS-0001 or SAS-0025 is set, depending on the group.

Substitute Value

- The AYC function is blocked.
- Anti-spin function blocked.

Possible Source

- Contact resistance or oxidation in connections or connectors.
- Short circuit to ground in LED circuit.
- LED 1-4 defective (diagnostic trouble code SAS-0001).
- LED 5-8 defective (diagnostic trouble code SAS-0025).
- Defective control unit.

Fault symptom[s]

- Anti-spin warning lamp is on.
- Stabilizing function not working.
- Anti-spin does not work.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

SAS-0002: CONTROL MODULE. INTERNAL FAULT (B5254T2; 2005-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION SAS-0002

Condition

Fig. 96: Identifying Steering Wheel Control Module
Courtesy of VOLVO CARS CORPORATION

Steering wheel angle sensor module (SAS) is located inside, and is supplied with power by, the steering wheel module (SWM). Only the steering wheel angle sensor module (SAS) communicates on the controller area network (CAN).

Steering wheel angle sensor module (SAS) contains two processors which work together. The processors continuously check the communication between them. The diagnostic trouble code (DTC) is stored if the main processor in the steering wheel angle sensor module (SAS) registers that the information is incorrect in any way.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on and the steering wheel angle sensor is initiated. Initiation is carried out when the steering wheel is turned more than 4.5° in any direction.

Substitute Value

- The stability function is blocked.

Possible Source

- Internal fault in the control module.

Fault symptom[s]

- Anti-spin warning lamp lit.
- General warning lamp lit.
- The stability control system does not function.

INTERNAL FAULT

CHECKING THE STATUS

Fig. 97: Identifying Ignition ON
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Wait approximately 10 seconds
- Engine running.
- First turn the steering wheel max. to the right, then max. to the left. Then set the steering wheel to the straight-ahead position.
- Click on the VCT2000 symbol to read off the diagnostic trouble code (DTC) counter.

The counters are used to determine the problem's status. For general information about the counters, see: **COUNTERS, DESCRIPTION**. Counters 5, 6 and 7 are not used during this check.

Counter 1 counts the number of operating cycles without a fault since the fault was last validated.

If **counter 1** is the same as 0, this means that the fault has been detected in this operating cycle (permanent fault). Replace the Steering wheel module (SWM).

If **counter 1** is over 0, this indicates that the problem has not been detected in this driving cycle (intermittent problem). The problem has existed earlier but is not active right now. The digit indicates number of driving cycles since the diagnostic trouble code was generated. Then check **counter 4** .**Counter 4** indicates number of driving cycles **with problem** since the problem was validated for the first time.

- If the number of incorrect driving cycles is high, this indicates an intermittent recurring problem. Replace the Steering wheel module (SWM).
- If the number of incorrect driving cycles is low, this indicates an intermittent temporary problem. No action.

NOTE: **Counter 3 indicates number of driving cycles since first time that the problem occurred. If the value for counter 3 is divided by the value for counter 4 , the intensity of the problem is obtained. The higher the value, the higher the problem intensity. A high problem intensity indicates that the malfunction recurs often.**

NOTE: **Replace the steering wheel module (SWM) if the fault recurs.**

Remedy as necessary.

SAS-0002: LED GROUP 1 CIRCUIT. SIGNAL TOO HIGH (2003-2004)

DIAGNOSTIC TROUBLE CODE INFORMATION

Condition

Fig. 99: Control Module For Steering Wheel Angle Sensor
Courtesy of VOLVO CARS CORPORATION

The steering wheel angle sensor has two circuits each with 4 LEDs and 4 receptors which read off their individual code wheel. One circuit measures the steering wheel angle and the other measures steering wheel revolutions. If the control unit registers that the current passing through the LED group circuit is too high, diagnostic trouble code SAS-0002 or SAS-0026 is set, depending on the group.

Substitute Value

- Stabilizing function disconnected.
- Anti-spin function blocked.

Possible Source

- Contact resistance or oxidation in connections or connectors.
- Short circuit to voltage supply in LED circuit.
- LED 1-4 defective (diagnostic trouble code SAS-0002).
- LED 5-8 defective (diagnostic trouble code SAS-0026).
- Defective control unit.

SIGNAL OUTSIDE ITS PERMITTED RANGE

INFORMATION

The diagnostic trouble code (DTC) indicates that the steering wheel has been turned at a speed in excess of 1400°/s. The probable cause of the diagnostic trouble code (DTC) is that the driver has driven into the edge of a sidewalk or hit a stone, causing the angle speed of the steering wheel and the wheels to change drastically.

Check that front suspension alignment has not changed and that the wheels are not damaged.

Remedy as necessary.

The Steering wheel angle sensor module (SAS) is located in the lever module together with the steering wheel module (SWM) and is supplied with power by it.

The steering wheel angle sensor is installed on the underside of the contact reel and together they create a replaceable unit. A code wheel is mounted inside the steering wheel angle sensor which follows the movements of the steering wheel.9 x optical digital sensors and 2 x analog photo diodes read off the code wheel. These signals are compared and must create a specific pattern. The diagnostic trouble code (DTC) is stored if the signal pattern created does not correspond.

Diagnostic trouble code (DTC) SAS-0005 or SAS-0006 is stored (depending on the fault) if the steering wheel angle sensor module (SAS) registers an internal fault in the software.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on and the steering wheel angle sensor is initiated. Initiation is carried out when the steering wheel is turned more than 4.5° in any direction.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION SAS-0007

Condition

Fig. 163: Identifying Steering Wheel Control Module

Steering wheel angle sensor module (SAS) is located inside, and is supplied with power by, the steering wheel module (SWM). Only the steering wheel angle sensor module (SAS) communicates on the controller area network (CAN).

The Steering wheel angle sensor module (SAS) contains 2 x processors that operate together. The processors receive information about steering wheel angle, steering direction and steering angle speed from the steering wheel angle sensor module (SAS) and compare the information with each other. The diagnostic trouble code (DTC) is stored if the steering wheel angle sensor module (SAS) registers that the information is incorrect in any way.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on and the steering wheel angle sensor is initiated. Initiation is carried out when the steering wheel is turned more than 4.5° in any direction.

  2. Drive the car at over 10 km/h and steer completely to right and left full lock.
  3. Repeat steps 1-2 again, but instead begin with steering to full lock left and then do the same to full lock right.

  NOTE: Note that no anti-skid light turns on and that no message about anti-skid service is required is seen in Driver information module (DIM). If this happens, replace the contact reel.

  Refer to **CHECKING THE STATUS**

CHECKING THE STATUS

Fig. 165: Identifying Belt Routing
Courtesy of VOLVO CARS CORPORATION

- Ignition off
- Wait approximately 10 seconds
- Engine running.
- First turn the steering wheel max. to the right, then max. to the left.
- Click on the VCT2000 symbol to read off the diagnostic trouble code (DTC) counter.

The counters are used to determine the problem's status. For general information about the counters, see:**COUNTERS, DESCRIPTION**

Counter 1 counts the number of operating cycles without a fault since the fault was last validated.

If **counter 1** is the same as 0, this means that the fault has been detected in this operating cycle (permanent fault). Replace contact reel/steering wheel angle sensor.

If **counter 1** is over 0, this indicates that the problem has not been detected in this driving cycle (intermittent problem). The problem has existed earlier but is not active right now. Then check **counter 4** .**Counter 4** indicates number of driving cycles **with problem** since the problem was validated for the first time.

- If the number of incorrect driving cycles is high, this indicates an intermittent recurring problem. Replace contact reel/steering wheel angle sensor.
- If the number of incorrect driving cycles is low, this indicates an intermittent temporary problem. No action.

HINT: Counter 3 indicates number of driving cycles since first time that the problem occurred. If the value for counter 3 is divided by the value for counter 4, the intensity of the problem is obtained. The higher the value, the higher the problem intensity. A high problem intensity indicates that the malfunction recurs often.

NOTE: Replace the steering wheel module (SWM) if the fault recurs after replacing the contact reel/steering wheel angle sensor.

Remedy as necessary.

COUNTERS, DESCRIPTION

Counter
A useful fault-tracing tool is the Diagnostic Trouble Code (DTC) counter. The control module stores 6 different counters for each Diagnostic Trouble Code (DTC), which describes the occurrence. The counters can be used to determine when and how often a fault has been detected. Using the counters for the Diagnostic Trouble Code (DTC) it is possible to, see if the fault has only been registered during the current operating cycle or whether it has been detected previously. If a fault is intermittent it is possible to determine how intermittent the fault is by studying the values of the different counters. Example: • Counter 1 = 15 Counts the number of operating cycles since the fault was last validated. • Counter 3 = 69 Counts the number of operating cycles since the fault was first validated. • Counter 4 = 1 Counts how many times the fault has occurred since the first time the fault was first

validated.

- Counter 5 = 91764 The counter adds the time in seconds for which the control module has been operating since the fault was first validated and the diagnostic trouble code (DTC) was stored.
- Counter 6 = 0 The counter adds the time in seconds for which the test, the diagnostic, has run since the fault was first validated and the diagnostic trouble code (DTC) was stored.
- Counter 7 = 0 The counter adds the time in seconds for which the fault has been validated since the fault was first validated and the diagnostic trouble code (DTC) was stored.

In the examples given above, counter 1 gives the number of operating cycles where the diagnostic was run without a fault being detected. Counting takes place from when the fault was last detected. Counter 3 is the total number of operating cycles regardless of whether the diagnostic was run or not. Counter 4 shows the number of operating cycles where the diagnostic detected a fault. Counters 3 and 4 start to count from the first operating cycle after the operating cycle when the fault was first detected.
In the example, counter 4 = 1, which means that the fault was detected twice. One can, see that no fault was detected during the relevant operating cycle. Depending on the number of operating cycles and the customer's driving pattern, it can assist in ruling out this control module from the customer's current problems. The counters can help us understand how intermittent the fault can be. If the counters 1 = 0, 3 = 0 and 4 = 0 it indicates that there have not been any operating cycles since the fault was detected and that the fault was probably generated in the workshop.
For an operating cycle to be recognized certain requirements may be necessary, for example, increasing the engine coolant temperature. In certain cases ignition on, ignition off and ignition on again are counted as an operating cycle.
Counter 5 can be useful if the fault was detected in this operating cycle. The time can be used to determine more exactly when the fault occurred.

NOTE:
Not all counters need be implemented in a control module, this varies from system to system. The possible counters are described below.

Counter	Function
A (see the graph) Counter 1	The graph illustrates the time at which a fault occurs. In the illustration the control module has detected a fault in the second cycle. This fault has then occurred a total of 5 times. The counter can be read off for each diagnostic trouble code (DTC) in the control module in which this is implemented. Operating cycles are marked with vertical lines. An operating cycle usually begins at ignition on and finishes when the ignition is switched off.
C#1 (see the graph) Counter 2	Counts the number of operating cycles since the fault was *last* validated. This information can be used to determine whether the fault is active during the current operating cycle or not. The fault is present now if the value is zero. This counter is also used for most systems to give "Permanent fault" and " Intermittent fault" text messages in VIDA (Volvo

	Scan Tool) when reading off a diagnostic trouble code (DTC).
C#3 (see the graph) Counter 3	Counts the number of operating cycles since the fault was *first* validated. When a fault has been validated, the counter will count up by 1 for each subsequent operating cycle. The same as counter C#1 but monitors the number of cycles since the first fault occurred.
C#4 (see the graph) Counter 4	Counts the number of operating cycles in which the fault was validated since it was first validated. Counts the number of times the fault has occurred since the first time.
C#5 Counter 5	The counter assesses the number of seconds the control module has been operating since the fault was first validated and the diagnostic trouble code (DTC) was stored. The time the control module has been operating is only counted when it is active, not in "sleep mode".
C#6 Counter 6	The counter assesses the number of seconds the test (the diagnosis) has been operating since the fault was first validated and the diagnostic trouble code (DTC) was stored.
C#7 Counter 7	The counter assesses the number of seconds the fault has been valid since it was first validated and the diagnostic trouble code (DTC) was stored.

The Steering wheel angle sensor module (SAS) is located in the lever module together with the steering wheel module (SWM) and is supplied with power by it.

The diagnostic trouble code (DTC) is stored if the steering wheel angle sensor module (SAS) registers an internal fault.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on and the steering wheel angle sensor is initiated. Initiation is carried out when the steering wheel is turned more than 4.5° in any direction.

Substitute Value

- The stability function is blocked.

Possible Source

- Internal fault in the steering wheel angle sensor module (SAS).

The Steering wheel angle sensor module (SAS) is located in the lever module together with the steering wheel module (SWM) and is supplied with power by it.

The diagnostic trouble code (DTC) is stored if there is no voltage supply (12 V) or ground to the steering wheel angle sensor.

The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on and the steering wheel angle sensor is initiated. Initiation is carried out when the steering wheel is turned more than 4.5° in any direction.

Substitute Value

- The stability function is blocked.

Possible Source

- Open-circuit in the circuit for internal power supply cable to the steering wheel angle sensor

- Open-circuit in the circuit for ground terminal to the steering wheel angle sensor.

Fault symptom[s]

- Anti-spin warning lamp lit.
- General warning lamp lit.

OPEN-CIRCUIT, PERMANENT FAULTS

Fig. 9: Checking For Open Circuit
Courtesy of VOLVO CARS CORPORATION

An open-circuit in a cable is indicated by a loss of one or more functions.

Chafed and broken cables or terminals that have come loose are common causes of faults in electrical systems.

Checks:

- Disconnect the connectors at both ends of the cable.

Connect an ohmmeter between the ends of the cable.

The ohmmeter should read approximately 0 ohms if there is no open-circuit in the cable.

Fig. 10: Identifying Control Module Installation
Courtesy of VOLVO CARS CORPORATION

Always check the control module and control module box connectors to ensure that their pins and sockets are not bent or damaged, as this can cause faults.

Check pins and terminals particularly for this fault. See **CHECK TERMINALS VISUALLY**.

CONTACT RESISTANCE AND OXIDATION

Fig. 11: Identifying Terminal Inspection
Courtesy of VOLVO CARS CORPORATION

In theory, the resistance across contacts, leads and terminals should be 0 ohms. However, there is always some resistance due to terminal oxidation.

If this resistance becomes too great the result will be a malfunction. The magnitude of the resistance before it causes a malfunction depends on the circuit load.

Checks:

- Check the cables visually according to. See **CHECK TERMINALS VISUALLY**

Cleaning female socket terminals and male pin terminals

Fig. 12: Apply Rust Solvent Spray Or Grease To Connectors
Courtesy of VOLVO CARS CORPORATION

NOTE: **Do not apply rust solvent spray or grease to the catalyst monitor sensor or instrument cluster connectors.**

- Ignition off
- Disconnect the battery negative terminal
- Use compressed air to clean the disconnected connector
- Apply rust solvent spray 1161422 to the disconnected connectors
- Blow clean using compressed air.

Greasing female terminals

Fig. 13: Identifying Grease Pressed Into Terminals
Courtesy of VOLVO CARS CORPORATION

NOTE: Note Do not fill the protective cover with grease.

- Press grease, P/N 1161417-9, into the female sockets directly from tube
- Check that all the terminal cavities are filled
- Use a loose male pin to ensure that the connection in the sockets is good. The pin should remain in position when pulled gently.

Fig. 14: Checking To Ensure Contact In Sockets Is Good
Courtesy of VOLVO CARS CORPORATION

CHECK TERMINALS VISUALLY

Fig. 15: Checking Contact Resistance & Oxidation
Courtesy of VOLVO CARS CORPORATION

NOTE: **When checking the engine control module (ECM), do not remove the control module from the car before the main relay has interrupted the power supply. This may take up to 4 minutes after the ignition has been switched off and the engine cooling fan (FC) has stopped running.**

Inspect the terminals visually when checking, or taking readings from, opened connectors.

Checks:

- Check for oxidation. This can cause poor connections in the terminals
- Check for damage to pins and terminals. Check that they are properly inserted into the connector. Check that the cable is properly connected to the pin or terminal. Check pins and terminals particularly carefully
- Use a separate male terminal to check the female terminal. Check that they are secure: Pull on the pin.

FAULT-TRACING INFORMATION

The fault should be diagnosed and remedied. Since this is not the case the fault-tracing process has failed.

Complete the fault-tracing for those fault or try again.

CHECKING THE POWER SUPPLY (2003-2004)

CHECKING THE POWER SUPPLY AND GROUND TERMINALS. INTERMITTENT FAULT

CHECKING THE POWER SUPPLY AND GROUND FOR THE CONTROL MODULE

Check steering wheel module (SWM) connector A. Check for contact resistance and oxidation.

Check fuse 22 in the passenger compartment fusebox for the steering wheel module (SWM).

Note- If the fuse was blown, check the circuit after the fuse. Check for contact resistance and oxidation.

Check the cable for power supply between fuse 22 in the passenger compartment fusebox and the control module terminals #A1 and #A6. Check for an open-circuit.

Check the ground lead between control module #A22 and ground terminal 31/84. Check for an open-circuit.

Check ground terminal 31/84. Check for contact resistance and oxidation.

Remedy as necessary.

Other information:

- To access the steering wheel module (SWM), see **STEERING WHEEL MODULE (SWM), REPLACING**
- For further information about the fuses and relays, see the appropriate service information.
- see **CHECKING WIRING AND TERMINALS** .

CHECKING THE POWER SUPPLY AND GROUND TERMINALS. PERMANENT FAULT

CHECKING POWER SUPPLY AND GROUND TERMINALS

Check steering wheel module (SWM) connector A. Check for contact resistance and oxidation.

Check fuse 22 in the passenger compartment fusebox for the steering wheel module (SWM).

Note- If the fuse is blown, check the circuit after the fuse. Check for a short-circuit to ground before replacing the fuse. Then replace the fuse. For further information about the circuit after the fuse, refer to the appropriate service information.

Check the cable for power supply between fuse 22 in the passenger compartment fusebox and the control module terminals #A1 and #A6. Check for an open-circuit.

Check the ground lead between control module #A22 and ground terminal 31/84. Check for an open-circuit. Check ground terminal 31/84. Check for contact resistance and oxidation.

Remedy as necessary.

Other information:

- To access or replace the steering wheel module (SWM), see **STEERING WHEEL MODULE (SWM), REPLACING**
- For further information about the fuses and relays, see the appropriate service information.

CONNECTING THE BREAKOUT BOX

Fig. 19: Identifying Ignition In Off Position

- Ignition off
- Expose the steering wheel module according to **STEERING WHEEL MODULE (SWM), REPLACING** .

Check that the male and female terminals on the unit connectors are undamaged and secure (cannot be pressed in). Check that the cables to the female terminals are secured to the terminal pins.

Connect adapter see **9511463** to the control module connector (wiring side). Connect the breakout box

see **9511428** to the adapter. Steering wheel module terminals #A1-#A22 correspond to #1-#22 on the breakout box. If the contact reel is to be checked, connect adapter see **9511508** to breakout box see **9511428** . Contact reel terminals #B1-#B5 correspond to #26-#30 on the breakout box. The breakout box is designed to facilitate reading off the control module input and output signals when the control module is connected; and the cable and component resistance when the control module is disconnected. The use of a breakout box reduces the risk of accidental short-circuited cables and damage to the connector pins.

For further information about signals and other values, see **SIGNAL SPECIFICATION** .

CHECKING THE VOLTAGE/GROUND, STEERING WHEEL ANGLE SENSOR MODULE (SAS) (2005-2012)

CHECKING THE VOLTAGE / GROUND TERMINAL

CHECKING THE POWER SUPPLY/GROUND TERMINAL

Steering wheel angle sensor module (SAS) is located inside, and is supplied with power by, the steering wheel module (SWM).

Power supply, steering wheel module (SWM)

The steering wheel module (SWM) is powered via a power input on the control module.

Power input terminal #A8 (#8) receives 15i-supply via fuse 11C/9:2 in the passenger compartment relay/fusebox, which is in turn supplied with power by fuse F34 in the cargo compartment relay/fusebox.

Checking the power supply

Check the power supply cable from the battery to steering wheel module (SWM) terminal #A8 (#8). Check for an open-circuit. Check for loose connections. Check for contact resistance. Check for oxidation. Check the fuse. The voltage must be approximately battery voltage.

Ground terminal, steering wheel module (SWM)

The steering wheel module (SWM) has a ground input. The ground input from the control module is a power ground and is connected to ground terminal 31/84 in the car body.

Checking the ground terminal

Check the ground lead between steering wheel module (SWM) terminal #2 (#2) and the ground terminal. Check for an open-circuit. Check for loose connections. Check for contact resistance. Check for oxidation. With the ignition on, the drop in voltage between the ground connection for the steering wheel module (SWM) and the ground terminal must not be greater than 0.5 V.

Remedy as necessary.

- Ignition off
- Expose the control module for the steering wheel angle sensor. For -2004, see **STEERING WHEEL ANGLE SENSOR MODULE (SAS), REPLACING** . For -2005, see **STEERING WHEEL MODULE (SWM), REPLACING** .
- Disconnect the control module for the steering wheel angle sensor by pressing in the lock catch and pull the connector straight outwards
- Check the control module and control module connectors to ensure that the male and female terminals are undamaged and secure (cannot be pressed in). Check that the cables to the female terminals are secured to the terminal pins
- In particular, check the terminal pins relevant to the diagnostic trouble code (DTC) / symptom. See **SIGNAL DESCRIPTION, CONTROL UNIT FOR THE STEERING WHEEL ANGLE SENSOR (SAS)**.
- Connect adapter see **9511463** to the control module connector (wiring side). Connect breakout box see **9511428** to the adapter. Terminals #1 - #16 on the control module for the steering wheel angle sensor correspond to terminals (#A25 - (#A40 on the breakout box
- The breakout box is designed to facilitate reading off the control module input and output signals when the control module is connected; and cable and component resistance when the control module is disconnected. The use of a breakout box reduces the risk of accidental short-circuits and damage to the connector pins.

SIGNAL DESCRIPTION, CONTROL UNIT FOR THE STEERING WHEEL ANGLE SENSOR (SAS)

Check that the male and female terminals on the unit connectors are undamaged and secure (cannot be pressed in). Check that the cables to the female terminals are secured to the terminal pins.

Connect adapter see **9511508** to the control module connector (wiring side). Connect the breakout box.

see **9511428** to the adapter. Steering wheel module (SWM) terminals #A1-#A10 correspond to terminals #1-#10 on the breakout box. The breakout box is designed to facilitate reading off the control module input and output signals when the steering wheel module (SWM) is connected, and the cable and component resistance when the control module is disconnected. The use of a breakout box reduces the risk of accidental short-circuited cables and damage to the connector pins.

Disconnect the breakout box in reverse order.

NOTE: Before the control module can be checked and readings taken, the removed fuses must first be installed.

For information about the signals and other values, see **SIGNAL SPECIFICATION** .

- Turn the ignition key to position 0. Remove the ignition key from the ignition switch.
- Disconnect the battery negative lead.

NOTE: **Wait at least three minutes before unplugging the connectors or removing other electrical equipment.**

REMOVING THE 3-SPOKE STEERING WHEEL

Fig. 2: Identifying Steering Wheel Turned To Access Holes On Back
Courtesy of VOLVO CARS CORPORATION

- Reinsert the ignition key and turn it to position "I" to prevent the steering lock from engaging.
- Turn the steering wheel a quarter turn so that the holes on the reverse of the steering wheel are accessible.

Fig. 3: Identifying Screwdriver Inserted In Back Of Steering Wheel & Locating End Of Locking Spring
Courtesy of VOLVO CARS CORPORATION

- Insert a screwdriver in the hole (2) on the reverse side of the steering wheel at right angles to the rear surface.

  Insert the screwdriver as far as possible to locate the end of the locking spring (1).

- Position the end of the screwdriver on the top of the spring clip as illustrated
- Pry the screwdriver upwards towards the upper edge of the hole (2) so that the end of the screwdriver presses the spring clip down (1) until one side of the steering wheel module springs out and releases from the mounting

- Turn the steering wheel a half turn in the opposite direction. Carry out the same operation on the other side
- Turn the steering wheel to a neutral position.

Fig. 4: Identifying Airbag Cable Connectors
Courtesy of VOLVO CARS CORPORATION

- Fold the steering wheel module out
- Remove the two connectors (1) for the ignition cables for the airbag. First press in the catches on the sides. Then pull the connectors straight out.

NOTE: The connectors are tightly secured. However, tools must not be used when removing.

- Place the steering wheel module to one side.

Fig. 5: Identifying Connector And Screw

REMOVING

Fig. 11: Detaching Spring-Loaded Screws & Steering Wheel Module
Courtesy of VOLVO CARS CORPORATION

- Reinsert the ignition key and turn it to position "I" to prevent the steering lock from engaging.
- Detach both spring-loaded screws (1) on the reverse side of the steering wheel with a Torx T30 screwdriver.
- Unscrew the screws until they release from the threads and spring back.
- Fold out the steering wheel module (2).

NOTE: Handle the cables with care.

Fig. 12: Identifying Vibration Damper, Bolt, & Connectors
Courtesy of VOLVO CARS CORPORATION

Remove:

- the connector (1) for the horn.
- the SRS connectors (2). Press in the catches on the sides and carefully pull the connectors straight back.

NOTE: Although the connectors are tightly secured, do not use any tools when removing.

- the steering wheel module. Place the steering wheel module safely with the front side facing upwards.
- the bolt (3), but leave the steering wheel in place.
- the vibration damper (4), if applicable.
- the connector for the RTI keypad, if applicable.

Fig. 13: Identifying Screws & Pulled Wiring
Courtesy of VOLVO CARS CORPORATION

Remove:

- the screw (1). Install the screw in the contact reel (2).
- the steering wheel. Pull the wiring out of the hole (3).

INSTALLING THE NEW STEERING WHEEL

- Install the new steering wheel.

Applies to cars with vibration damper

- Install the vibration damper in the new steering wheel and secure it with the screw, see step, see **REMOVING STEERING WHEEL ASSEMBLY W/ VIBRATION DAMPER**.

NOTE: Make sure the screw is properly tightened and that the vibration damper is

secure. The screw is self-tapping, which can make it difficult to tighten.

Applies to cars with RTI keypad mounted to the steering wheel when installing in a wooden steering wheel

Fig. 14: Cutting Hole For Keypad
Courtesy of VOLVO CARS CORPORATION

Illustration A

- Place the steering wheel in a suitable position and cut along the existing marks with a small knife.

NOTE: When cutting, make sure to hold the knife so that the cuts are perpendicular to the reverse side of the steering wheel. This will reduce the risk of cutting a hole that is too large since the edge around the keypad is only a few millimeters larger than the keypad itself.

Illustration B

Fig. 15: Finishing Keypad Hole

- Cut away some of the material on the reverse side of the steering wheel spoke.
- Test and cut until the keypad fits properly.

Fig. 16: Inserting Keypad Into Hole In Steering Wheel
Courtesy of VOLVO CARS CORPORATION

Applies to cars with RTI keypad mounted to the steering wheel when installing in a wooden steering wheel

- Install the keypad, two screws and clamp. Make sure the cable is positioned on the underside of the steering wheel spoke.
- Insert the keypad into the hole in the steering wheel with the text on the buttons facing out. Press until it connects securely against the steering column cover.

Fig. 17: Identifying Screws & Keypad Clamp

- Install the screws and attach the keypad with the clamp around the steering wheel spoke.

Fig. 18: Identifying Horn Ring Position
Courtesy of VOLVO CARS CORPORATION

Applies to cars with RTI keypad mounted to the steering wheel

- Position the horn ring as illustrated.
- Plug in the keypad connector to the terminal on the reverse side of the keypad located on the right-hand side of the horn ring. The wire from the installed keypad is very short and it can be difficult to install the connector.

- Reinstall the horn ring in the steering wheel, see steps, see **REMOVING HORN RING** - **REMOVING**

HORN RING. Make sure that the three springs on the underside are correctly positioned. Check that the ground lead is not trapped.

- Install the three screws in the horn ring and tighten crosswise them to **8 ± 2 Nm (6 ± 1.5 lbf. ft.)** .

NOTE: The screws are self-tapping.

- Reinstall the ground lead. Tighten.

NOTE: Make sure the screw is properly tightened and that the ground lead is secure. The screw is self-tapping, which can make it difficult to tighten.

- Check the function of the horn by pressing the horn around its entire circumference. A metallic noise should be heard when the three contact points come into contact

Fig. 19: Identifying Airbag Ignition Cables, Locating Pins, Screw & Connector
Courtesy of VOLVO CARS CORPORATION

- Insert the wiring through the hole in the new steering wheel. Insert the airbag ignition cables through the holder (1).
- Carefully install the new steering wheel by holding it straight and aligning the locating pins (2) on the contact reel.
- Remove the screw from the contact reel and reinstall the screw in the holder. See step, see **REMOVING STEERING WHEEL ASSEMBLY**.
- Install the new screw (3). Tighten to **40 Nm (30 lbf. ft.)** .
- Plug in the connector (4).

Fig. 20: Checking That Springs Are In Position
Courtesy of VOLVO CARS CORPORATION

- Check that the two springs (1) are in position
- Press the two connectors for the ignition cables for the airbag into the steering wheel module
- Insert the two pins on the reverse of the steering wheel module in the two springs. Ensure that the ignition cables are not trapped
- Press the steering wheel module firmly into its mountings. (Two clearly audible clicks should be heard)

SUPPLEMENTARY WORK

Install the solenoid with the new screws, 2 pcs., included in the kit and tighten alternately to contact.

Tighten in the following order:

Step 1. (1) 0.5 Nm

Step 2. (2) 1.5 Nm

Step 3. (1) 2.9 Nm

Step 4. (2) 2.9 Nm

Plug in the connector for the solenoid.

FINISHING

Install:

- any protective casings
- the wheel. See **INSTALLING WHEELS** .

Check the oil level in the power steering fluid reservoir, top up if necessary.

Bleed the power steering system.

NOTE: Only use Volvo power steering fluid, part number 30741424 (1 liter).

Start the engine and turn the steering wheel slowly back and forth to the end-positions.

Move the vehicle after a few turns of the steering wheel to prevent generating wear marks on the tires.

Check the oil level again.

Remove the bolts, x2, at the suspension turrets on both sides.

INSTALLING THE LIFTING TOOL

Fig. 8: Installing The Lifting Tool
Courtesy of VOLVO CARS CORPORATION

NOTE: **When raising the engine make sure that the lifting eye does not scratch the torque rod. Tape the torque rod at the lifting eye.**

Remove:

- the oil filler cap
- the upper front engine casing by pulling it straight up.

- Fit: the oil filler cap
- the lifting tool: see **9995716** converted with kit: see **9997070** and the lifting hooks: see **9995460** . Raise the engine slightly so that the engine pads are unloaded.

REMOVING THE WING LINER

Release the heated oxygen sensor (HO2S) connectors, x2, from the subframe. Fold aside the protective plate under the steering gear to gain access to the engine pad's lower bolt. Remove the engine pad's bolt.

REMOVING THE STEERING SHAFT JOINT, LOWER

Fig. 14: Removing Steering Shaft Joint
Courtesy of VOLVO CARS CORPORATION

NOTE: **Turn the steering wheel until optimum access to the bolt is achieved. Lock the steering wheel and take out the ignition key, so that the steering wheel lock is activated.**

Fig. 15: Identifying Length Of Track Rod In Relation To Steering Gear Housing
Courtesy of VOLVO CARS CORPORATION

NOTE: **On one side, measure the length of the track rod in relation to the steering gear housing. Make a note of the measurement.**

Remove:

- the bolt to the lower steering shaft joint
- the connector to the solenoid.

REMOVING THE TRACK ROD ENDS

Fig. 16: Removing Track Rod Ends
Courtesy of VOLVO CARS CORPORATION

NOTE: **Make sure that the wheels are in the straight forward position. Lock the steering wheel by removing the ignition key. Do not turn the front wheels so that the position of the steering gear is changed. This could damage the SRS system's contact reel.**

Remove the track rod ends. Counterhold with a wrench so that the gaiter is not damaged.

LOWERING THE SUBFRAME AT THE REAR EDGE

Fig. 17: Identifying Rear Sub-Frame Screws, Brackets & Washers
Courtesy of VOLVO CARS CORPORATION

NOTE: Press the lower steering shaft joint up from the steering gear.

Make sure that no pipes or lines are loaded or trapped when lowering.

Position a mobile jack at the rear end of the subframe.

Remove:

- the bolts to the subframe's brackets at the rear edge
- the bolts to the subframe in the rear edge
- the subframe's brackets.

Release the heated oxygen sensor (HO2S) lines from the anti-roll bar. Lower the subframe carefully.

REMOVING THE PRESSURE PIPE AND RETURN PIPE FROM THE STEERING GEAR

Fig. 18: Removing Steering Gear Pipes (1 of 2)

Remove:

- the nuts (1), x4
- the bolt (2), x1
- the steering gear through the left-hand side of the vehicle.

INSTALLATION

NOTE: For tightening torques, see: TIGHTENING TORQUE .

INSTALLING THE STEERING GEAR

Install:

- the steering gear
- the nuts (1), M10 x4
- the bolt (2), M10 x1.

INSTALLING THE METAL PROTECTIVE COVER

Install:

- the protective plate on the steering gear
- the bolt, M5, holding the protective plate on the steering gear, x1
- the bolt, M6, holding the protective plate to the subframe, x1.

INSTALLING THE OIL PIPES TO THE STEERING GEAR

Install:

- the pipes in the valve housing
- the pipes' bolts on the valve housing in accordance with: **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS**
- the bolt, M6, to the oil pipe bracket on the subframe
- the pipe in the clips.

INSTALLING THE SUBFRAME AT THE REAR EDGE

Raise the subframe's rear edge using a mobile jack.

Install the sub-frame's four screws together with the sub-frame's brackets and engine heater, if installed.

Use new screws. Lube the screws with oil.

Tighten acc. to:**SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS** . First tighten the screws on the sub-frame's left side, then on the right.

Tighten the screws for the brackets M10.

Install the heated oxygen sensor's cables on the anti-roll bar

FITTING THE LOWER BOLT TO THE REAR ENGINE PAD

HINT: Unscrew the upper nut in order to facilitate fitting the lower bolt.

Install:

- the lower bolt to the engine pad, M10, x1
- the heated oxygen sensor (HO2S) connectors on the subframe, x2.

Refit the protective plate under the steering gear.

INSTALLING THE STEERING ARMS TO THE WHEEL SPINDLES

Install the steering arms to the wheels spindles. Use new lock nuts.

Tighten, see: **TIGHTENING TORQUE** . Use see **9512050** .

INSTALLING THE STEERING SHAFT JOINT, LOWER

Fig. 22: Locating Steering Shaft Joint On Steering Gear
Courtesy of VOLVO CARS CORPORATION

NOTE: **Always check carefully that the join'ts screw hole is aligned with the slot in the steering gear's shaft.**

Install:

- the lower steering shaft joint
- the bolt, M8
- the connector to the solenoid.

INSTALLING THE EXHAUST PIPES BETWEEN FRONT AND REAR CATALYTIC CONVERTERS

NOTE: **To ensure that there is no exhaust leakage, see: FLANGED JOINT, ASSEMBLING .**

Install:

- both exhaust pipes
- both exhaust pipes' nuts, M8.

INSTALLING THE PROTECTIVE COVER UNDER THE ENGINE

Install:

- the protective cover under the engine
- the bolts, M8, x6.

FITTING THE BOLTS TO THE ENGINE PAD, RIGHT

Fit the bolts, x2. Tighten in accordance with: **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS** .

INSTALLING THE WING LINER

Install:

- the wing liner
- the plastic nuts, x2.

REMOVING THE LIFTING TOOL

Remove the lifting tool see **9995716** , kit see **9997070** and lifting hooks see **9995460** .

FITTING THE BOLTS TO THE TORQUE ROD

Fit the bolts, M10 x2, at the suspension turrets on both sides.

FILLING THE POWER STEERING FLUID RESERVOIR

Fit the battery cable.

WARNING: Avoid skin contact with the oil.

Install:

- the hose with the clamp to the oil reservoir
- the oil reservoir.

Fill the power steering fluid reservoir.

NOTE: For the correct oil grade use Volvo power steering fluid, part number: 116 1529-1.

Turn the steering wheel between both end positions several times.

Check and fill with oil as necessary. Apply the parking brake. Start the engine.

A: Turn the steering wheel slowly to the right, keep it at the end position for 2 seconds.

B: Turn the steering wheel slowly to the left, keep it at the end position for 2 seconds. Repeat steps A and B 10 times.

FINISHING

Remove the oil filler cap.

Install:

- the upper front engine casing
- the oil filler cap.

Fit the front wheels on both sides in accordance with: **INSTALLING WHEELS** .

Carry out wheel alignment in accordance with: **WHEEL ALIGNMENT, CHECKING / ADJUSTING** .

STEERING WHEEL, STEERING WHEEL LOCK, STEERING COLUMN, SHAFT (2005-2012)

LEVER STEERING WHEEL ADJUSTMENT, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATIONS

Remove:

- the battery lead, see **BATTERY, DISCONNECTING**
- the soundproofing panel. See **SOUNDPROOFING PANEL, REPLACING**
- the steering wheel covers. See **REPLACING THE STEERING COLUMN COVERS** .

REMOVING THE LEVER FOR STEERING WHEEL ADJUSTMENT

Fig. 23: Identifying Steering Column Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the four screws holding the steering column
- Pull the steering column backwards out from the three guides and press to the right.

Fig. 24: Identifying Lever Removal
Courtesy of VOLVO CARS CORPORATION

- Remove the lever by pulling it straight out.

INSTALLING THE LEVER FOR STEERING WHEEL ADJUSTMENT

- Install the lever (press to the bottom position)
- Hook the steering column into the three guides.

Remove:

- the screw from the steering column (x4). Tighten to **25 Nm**
- the steering column covers. See **REPLACING THE STEERING COLUMN COVERS**
- the soundproofing panel. See **SOUNDPROOFING PANEL, REPLACING** .

STEERING COLUMN, REPLACING

NOTE: **The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATORY WORK

REMOVING COMPONENTS

CAUTION: Vehicles equipped with the dynamic stability and traction control (DSTC) system: When working on the steering or wheel alignment, the adaptation of the steering wheel angle must be set to zero using the diagnostic tool. Test drive according to TEST DRIVE FORM (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL) /BRAKE CONTROL MODULE), DESCRIPTION .

Remove:

- the battery negative cable. See: **BATTERY, DISCONNECTING**
- the soundproofing panel. See: **SOUNDPROOFING PANEL, REPLACING** .

REMOVING THE STEERING WHEEL

Fig. 25: Identifying Locking Screw Removal
Courtesy of VOLVO CARS CORPORATION

Remove the drivers airbag (SRS). See **AIRBAG DRIVER'S SIDE (SRS), REPLACING** .

Remove the lock screw from its "parking hole" in the steering wheel and install it in the contact reel.

Fig. 26: Identifying Steering Wheel Screw
Courtesy of VOLVO CARS CORPORATION

Remove the steering wheel screw. Ensure that the front wheels and steering wheel are in the straight ahead position. Remove the steering wheel.

NOTE: Ensure that the connectors do not catch on the steering wheel during removal.

REMOVING STEERING COLUMN COVERS

Fig. 27: Identifying Steering Column Covers Removal
Courtesy of VOLVO CARS CORPORATION

Remove the 3 screws.

Pull the steering wheel as far out as possible.

Remove the clip mounting between the covers.

Remove the lower steering column cover.

Remove the seal for the clip mounting at the dashboard.

Remove the upper steering column cover.

REMOVING THE GEAR SELECTOR ASSEMBLY AND STEERING WHEEL MODULE

Remove the gear selector assembly. See:

REMOVING THE STEERING WHEEL LOCK MODULE

Fig. 28: Identifying Snap Fastener & Steering Wheel Lock Unit
Courtesy of VOLVO CARS CORPORATION

Disconnect the connectors.

Press in the snap fastener and remove the steering wheel lock unit.

REMOVING THE CABLE FOR IGNITION SWITCH INTERLOCK (AUTOMATIC TRANSMISSIONS ONLY)

Fig. 29: Identifying Ignition Switch Interlock Cable
Courtesy of VOLVO CARS CORPORATION

Remove the ignition switch interlock cable.

Move the ignition key to position I.

Press up the lock facing and pull out the cable.

REMOVING THE CABLE HARNESS

Fig. 30: Cable Sleeve From Steering Column
Courtesy of VOLVO CARS CORPORATION

Remove the cable bracket with the cable harness from the steering column. Route the cable harness and bracket through the hole in the dashboard. Place on the floor.

REMOVING THE LOWER STEERING SHAFT JOINT

Fig. 31: Identifying Lower Steering Shaft Joint
Courtesy of VOLVO CARS CORPORATION

Fold the floor carpet out of the way.

Bend up the outer section of the steering shaft boot.

Remove the retaining clip around the boot.

Pull the boot up.

Remove:

- the screw securing the mounting for the steering shaft in the joint
- the joint from the steering shaft.

REMOVING STEERING COLUMN

Fig. 32: Identifying Steering Column Screws
Courtesy of VOLVO CARS CORPORATION

Remove the 4 x screws holding the steering column in place.

Pull the steering column backwards from the three guides.

Remove the steering column.

TRANSFERRING COMPONENTS

Fig. 33: Drilling Out Security Screws Holding Steering Wheel Lock
Courtesy of VOLVO CARS CORPORATION

Drill out the security screws holding the steering wheel lock.

Transfer the steering wheel lock.

Install the ignition key in the steering wheel lock.

Check that the key is in position I and that the locking lug on the steering wheel lock is down.

Install the steering wheel lock against the cap on the steering column.

Install the new security screws.

Tighten the security screws until the screw heads break off.

INSTALLING

INSTALLING THE STEERING COLUMN

NOTE: Lubricate the steering shaft friction surfaces and the steering column bearing. Use low temperature grease, P/N 1161417-9 (30 grams).

Lubrication is important to avoid noise from the steering column.

NOTE: Check that the rear seat rails are undamaged.

Hook the steering column into the three guides.

Install the screws. Tighten to **25 Nm** . Tighten the rear screw first.

INSTALLING THE LOWER STEERING SHAFT JOINT

Install the steering shaft on the lower steering shaft joint.

Install:

- a new screw. Tighten to **25 Nm** .
- the steering shaft boot and snap ring.

Fold back the carpet.

INSTALLING THE CABLE HARNESS

Pull up the cable harness and bracket. Install on the steering column.

INSTALLING THE CABLE FOR IGNITION SWITCH INTERLOCK (VEHICLES WITH AUTOMATIC TRANSMISSIONS ONLY).

Set the gear selector lever to P position.

Move the ignition key to position I.

Press the cable into the ignition switch and feel to, see that it sits correctly.

Remove the ignition key and check that the gear selector lever is blocked in P position.

INSTALLING THE STEERING WHEEL LOCK MODULE

Remove the ignition key.

Install the steering wheel lock module.

Connect the connector.

INSTALLING THE GEAR SELECTOR ASSEMBLY AND STEERING WHEEL MODULE

Install the gear selector assembly.

INSTALLING STEERING COLUMN COVERS

Install:

- the lower cover for the steering column. Secure the seals for the switches
- the 3 screws.

Press the seal in towards the dashboard in the upper steering column cover.

Press the lower cover into place in the upper cover.

NOTE: Check that the seals for the switches are positioned correctly throughout the operation.

INSTALLING THE STEERING WHEEL

Route the connectors through the hole in the steering wheel one by one.

Install:

- the steering wheel
- the center screw. Tighten. See **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS** .

Remove the screw from the contact reel and place it in the "parking hole".

Install the drivers airbag (SRS). See **AIRBAG DRIVER'S SIDE (SRS), REPLACING** .

FINISHING

Ensure that the steering wheel turns easily and that the steering lock functions.

Install the battery lead.

Test drive the vehicle.

Check that the steering wheel is in the correct position.

Adjust the steering wheel position if necessary. See **STEERING WHEEL POSITION, ADJUSTING** .

STEERING SHAFT, LOWER, REPLACING

NOTE: As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

REMOVAL

REMOVING WHEELS

Remove the wheel on the driver's side.

REMOVING THE SCREW ON THE LOWER STEERING SHAFT

Fig. 34: Identifying Tool Assembly
Courtesy of VOLVO CARS CORPORATION

Remove the screw on the lower steering shaft on the driver's side wheel housing. Use the tool depicted in the illustration.

DISASSEMBLING THE LOWER STEERING SHAFT

Fig. 35: Identifying Lower Steering Shaft Upper Screw
Courtesy of VOLVO CARS CORPORATION

Set the wheels to straight ahead. Lock the steering wheel lock

Remove the upper screw on the lower steering shaft

Expose the lower steering shaft from the upper steering shaft

Press the upper steering shaft up slightly for better access.

REMOVING THE LOWER STEERING SHAFT

Fig. 36: Bending Up Outer Section Of Steering Shaft Boot
Courtesy of VOLVO CARS CORPORATION

Fold back the floor carpet

Bend up the outer section of the steering shaft boot

Remove:

- the lock ring around the boot
- the boot
- the lower steering shaft.

INSTALLATION

INSTALLING THE LOWER STEERING SHAFT

Fig. 37: Identifying Lower Steering Shaft Screw
Courtesy of VOLVO CARS CORPORATION

Clean the steering gear pinion from any rust and lubricate.

Install:

- the lower steering shaft
- the screw of the lower steering shaft from within the vehicle.

NOTE: Ensure that the screw is seated in its groove on the steering gear. Use a new screw. Finger tighten.

INSTALLING THE NEEDLE BEARING

Fig. 38: Identifying Needle Bearing In Boot
Courtesy of VOLVO CARS CORPORATION

Ensure that the needle bearing in the boot is in the groove. Lubricate the needle bearing in the boot with low temperature grease

NOTE: **If necessary, make sure that the plain bearing is properly seated. Lubricate the plain bearing in the boot with low temperature grease, part no. 1161427-8 (6 grams).**

Lubricate the edge on the inside of the inner part of the gaiter with soapy water.

INSTALLING THE SNAP RING

Fig. 39: Identifying Snap Ring On Boot
Courtesy of VOLVO CARS CORPORATION

Install the snap ring on the boot as illustrated.

INSTALLING THE BOOT

Fig. 40: Identifying Boot Threaded Over Lower Steering Shaft
Courtesy of VOLVO CARS CORPORATION

Thread the boot over the lower steering shaft. Press the boot over the flange of the panel

Start by pressing the boot from the bottom upwards

NOTE: Ensure that the boot seals round the panel flange.

INSTALLING THE SNAP RING

Fig. 41: Identifying Outer Section Of Boot Bent Back
Courtesy of VOLVO CARS CORPORATION

Install the snap ring around the boot. Bend back the outer section of the boot

Fold back the carpet.

ASSEMBLING THE UPPER AND LOWER STEERING SHAFT

Fig. 42: Identifying Upper & Lower Steering Shaft Assembled
Courtesy of VOLVO CARS CORPORATION

Pull the upper steering shaft down. Assemble the upper steering shaft with the lower steering shaft

Install the screw and nut. Tighten to 30 Nm

NOTE: Use a new screw and nut.

TIGHTENING THE LOWER SCREW ON THE LOWER STEERING SHAFT

Expose the steering wheel lock. Turn the steering wheel so that the screw on the lower steering shaft points straight forward

Tighten the lower screw on the lower steering shaft in the engine compartment. Tighten to 25 Nm.

FITTING THE WHEEL

Remount the wheel, see **INSTALLING WHEELS**

STEERING WHEEL LOCK, REPLACING

NOTE: The illustrations in this service information are used for different model years

and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

REPLACING

PREPARATION

Pull down the steering wheel adjustment lever and pull up the steering wheel to the uppermost position.

REMOVING THE STEERING COLUMN COVERS

Fig. 43: Steering Column Covers
Courtesy of VOLVO CARS CORPORATION

Remove the ignition key (1).

Remove the three screws (2).

Press in the snap fasteners and remove the lower steering column cover (3).

Pull up the upper steering column cover (4).

REMOVING THE STEERING WHEEL LOCK UNIT

Fig. 44: Identifying Snap Fastener & Steering Wheel Lock Unit
Courtesy of VOLVO CARS CORPORATION

Disconnect the connectors.

Press in the snap fastener and remove the steering wheel lock unit.

REMOVING THE MECHANICAL CABLE FOR THE IGNITION SWITCH INTERLOCK (ONLY APPLIES TO CARS WITH AUTOMATIC TRANSMISSIONS)

Fig. 45: Identifying Ignition Switch Interlock Cable
Courtesy of VOLVO CARS CORPORATION

Remove the ignition switch interlock cable.

Move the ignition key to position I.

Press up the lock facing and pull out the cable.

REMOVING THE CONNECTORS ON THE STEERING WHEEL MODULE (SWM)

Fig. 46: Identifying Connectors On Gear Selector Assembly
Courtesy of VOLVO CARS CORPORATION

Disconnect the connectors on the gear selector assembly.

REMOVING THE STEERING WHEEL LOCK

Fig. 47: Drilling Out Security Screws Holding Steering Wheel Lock
Courtesy of VOLVO CARS CORPORATION

Drill out the security screws holding the steering wheel lock.

HINT: Use an angle drill.

Remove the steering wheel lock.

INSTALLING

INSTALLING THE STEERING WHEEL LOCK

Fig. 48: Identifying Ignition Key Slot & New Steering Wheel Lock
Courtesy of VOLVO CARS CORPORATION

Insert the ignition key in the new steering wheel lock.

Check that the key is in position I and that the locking lug on the steering wheel lock is down.

Install the new steering wheel lock against the cap on the steering column.

Install the new security screws.

Tighten the security screws until the screw heads break off.

INSTALLING THE CONNECTORS ON THE STEERING WHEEL MODULE (SWM)

Fig. 49: Identifying Connectors On Gear Selector Assembly
Courtesy of VOLVO CARS CORPORATION

Install the connectors on the gear selector assembly.

INSTALLING THE MECHANICAL CABLE FOR THE IGNITION SWITCH INTERLOCK (ONLY APPLIES TO CARS WITH AUTOMATIC TRANSMISSIONS)

Fig. 50: Identifying Ignition Switch Interlock Cable
Courtesy of VOLVO CARS CORPORATION

Set the gear selector lever to P position.

Move the ignition key to position I.

Press the cable into the ignition switch and feel to, see that it sits correctly.

Remove the ignition key and check that the gear selector lever is blocked in P position.

INSTALLING THE STEERING WHEEL LOCK UNIT

Fig. 51: Identifying Steering Lock Module
Courtesy of VOLVO CARS CORPORATION

Remove the ignition key.

Install:

- the connectors
- the steering lock module.

INSTALLING THE STEERING COLUMN COVERS

Fig. 52: Identifying Steering Column Covers
Courtesy of VOLVO CARS CORPORATION

Install the lower steering column cover.

NOTE: Ensure that none of the wiring is trapped.

Install the screws for the lower steering column cover.

Fold down the upper steering column cover and press the snap fasteners into place in the lower steering column cover.

NOTE: Ensure that the gaiters around the control levers are correctly positioned against the column covers.

FINISHING

Adjust the steering wheel setting and lock the steering wheel adjustment lever.

Use VIDA vehicle communication to check that no diagnostic trouble codes have been stored during the work.

ORDERING SOFTWARE / KEYS

NOTE: **To install the key, the key and the software must be ordered. To erase the key, only the software needs to be ordered.**

Order a key and/or software. See 9438428 .

NOTE: **Keys can only be programmed or erased when the key and/or software have been delivered.**

The function must be checked if a new key has been added.

FUNCTION TEST

Test start the engine.

STEERING WHEEL MODULE (SWM), REPLACING

REMOVAL

STEERING WHEEL MODULE (SWM)

Remove the steering wheel. See **STEERING WHEEL, REPLACING**. Remove the steering column covers. See **REPLACING THE STEERING COLUMN COVERS**

Fig. 53: Gear Selector Assembly And Steering Wheel Module
Courtesy of VOLVO CARS CORPORATION

Remove:

- 2 screws
- the connectors
- the control module with stalks and the contact reel by releasing the catches on the underside
- windscreen wiper and direction indicator stalks. See **WASHER / WIPER SWITCH, REPLACING** and **TURN SIGNAL SWITCH, REPLACING**
- the contact reel. See **CONTACT REEL, REPLACEMENT**

The control module is now exposed.

INSTALLATION

- the contact reel and steering wheel angle sensor. See **CONTACT REEL, REPLACEMENT**
- windscreen wiper and direction indicator stalks. See **WASHER / WIPER SWITCH, REPLACING** and **TURN SIGNAL SWITCH, REPLACING**
- the control module with the levers and contact reel. Check that the hooks engage underneath
- the connectors
- 2 screws. Tighten
- the steering column covers. See **REPLACING THE STEERING COLUMN COVERS**
- the steering wheel. See **STEERING WHEEL, REPLACING**

PROGRAMMING THE CONTROL MODULE

Program the new control module. See the table below:

NOTE: **Software must be downloaded to the Steering wheel module (SWM) for vehicles up to and including model year 2004. Software must only be downloaded to the Steering Angle Sensor Module (SAS) for vehicles from and including model year 2005 if the vehicle is equipped with DSTC. For 2005- vehicles, without DSTC, software does not have to be downloaded.**

REMOVING

REMOVING THE STEERING WHEEL

Fig. 54: Bolt From Steering Wheel Column
Courtesy of VOLVO CARS CORPORATION

Remove the driver's airbag module. See **AIRBAG DRIVER'S SIDE (SRS), REPLACING** .

Lock the contact reel in position with the locking screw.

Remove the screw steering wheel - steering column.

Pull the steering wheel straight back.

Pull out the cable harness through the hole in the steering wheel. Remove the steering wheel.

INSTALLING

INSTALLING THE STEERING WHEEL

Pull the cable harness through the hole. Install the steering wheel.

Install the screw for the steering wheel - steering column. Use a new screw.

For tightening torques, see: **TIGHTENING TORQUE** .

Remove the screw for the locking the contact reel.

Install the driver's airbag module. See **AIRBAG DRIVER'S SIDE (SRS), REPLACING** .

Remove the control module by pressing the 2 catches using a finger and pulling the control module backwards (see the arrow).

Remove the connector and the cable.

INSTALLING

THE CONTROL MODULE

Fig. 56: Identifying Control Module Cable In Holder
Courtesy of VOLVO CARS CORPORATION

Install the cable in the holder for the control module. Press the connector into place.

Reinstall the control module. Press the module into place until there is an audible click.

To install, reverse the removal procedure.

Ignition off.

Remove the soundproofing panel on the driver's side. See **SOUNDPROOFING PANEL, REPLACING** .

HINT: The control module for the steering gear is on the pedal box bracket. See the illustration.

REMOVAL

Fig. 58: Steering Gear Control Module Location
Courtesy of VOLVO CARS CORPORATION

Remove the control module for the steering gear.

Disconnect the connector.

INSTALLATION

Connect the connector.

Install the control module for the steering gear.

FINISHING WORK

Install the soundproofing panel. See **SOUNDPROOFING PANEL, REPLACING** .

Test the function.

LIMITERS, REPLACING

see **LIMITERS, REPLACING**

REPLACING THE OUTER STEERING ARM

Remove:

- the wheel
- the steering arm from the spindle.

Remove the lock nut. Remove the steering arm.

INSTALLING THE STEERING ARM

Fig. 60: Identifying Lock Nut
Courtesy of VOLVO CARS CORPORATION

Install:

- the steering arm
- the steering arm on the wheel spindle. Use new lock nut. Use counterhold and tighten. See: **TIGHTENING TORQUE**

  Use: see **9512050**

- the wheel. See: **INSTALLING WHEELS**

SOLENOID, STEERING GEAR, REPLACEMENT

NOTE: The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATORY WORK

Ignition key in position 0.

NOTE: **Seal connections to inlet and outlet on the steering gear immediately after removing.**

REMOVING

Fig. 61: Identifying Steering Gear Solenoid
Courtesy of VOLVO CARS CORPORATION

Lift up the car and remove the front wheel on the left side.

Remove:

- protective cover under engine (applies to some versions)
- protection over the drive axle for better access (applies to some versions)

Fig. 62: Identifying Solenoid, Connector & Screws
Courtesy of VOLVO CARS CORPORATION

Place a container under the steering gear to collect the oil.

NOTE: Clean very carefully around the solenoid before removing is started.

Remove:

- the connector
- the screws, 2 pcs., for the solenoid
- the solenoid.

INSTALLING

Fig. 63: Identifying Steering Gear Filter
Courtesy of VOLVO CARS CORPORATION

NOTE: Check carefully that there are no impurities.

Change the filter in the steering gear to the new one included in the kit.

Fig. 64: Identifying Solenoid Seals
Courtesy of VOLVO CARS CORPORATION

Lube the solenoid's seals with some oil.

NOTE: Only use Volvo power steering fluid, part number 30741424 (1 liter).

Fig. 65: Identifying Solenoid & Screws
Courtesy of VOLVO CARS CORPORATION

Install the solenoid with the new screws, 2 pcs., included in the kit and tighten alternately to contact.

Tighten in the following order:

Step 1. (1) 0.5 Nm

Step 2. (2) 1.5 Nm

Step 3. (1) 2.9 Nm

Step 4. (2) 2.9 Nm

Plug in the connector for the solenoid.

FINISHING

Install:

- any protective casings
- the wheel. See **INSTALLING WHEELS** .

Check the oil level in the power steering fluid reservoir, top up if necessary.

Bleed the power steering system.

NOTE: Only use Volvo power steering fluid, part number 30741424 (1 liter).

Start the engine and turn the steering wheel slowly back and forth to the end-positions.

Move the vehicle after a few turns of the steering wheel to prevent generating wear marks on the tires.

Check the oil level again.

STEERING ARM INNER, REPLACING

Special tools:

see **9997020**

see **9997083**

NOTE: As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATORY WORK

Remove the wheel.

Clean the boot and the surrounding area thoroughly.

REMOVAL

REMOVING THE OUTER STEERING ARM AND BOOT

Fig. 66: Identifying Outer Steering Arm & Boot
Courtesy of VOLVO CARS CORPORATION

Remove the steering arm from the wheel spindle.

Slacken off the lock nut.

Remove:

- the steering arm and the lock nut
- the clamps (1) and (2).

Tape the threads on the inner steering arm to protect the boot when removing.

Remove the boot (3).

INSTALLING THE COUNTERHOLD

Fig. 67: Counter Hold
Courtesy of VOLVO CARS CORPORATION

NOTE: Cleanliness is very important as the seals in the steering gear are sensitive to scratches on the rack.

Clean the surfaces on the steering rack and the tool **thoroughly** .

Install counterhold 999 7020.

Tighten to **25 Nm** .

Position the counterhold as close to the limiter as possible.

REMOVING THE INNER STEERING ARM

Fig. 68: Identifying Steering Arm Tool (999 7083)
Courtesy of VOLVO CARS CORPORATION

Use tool see **9997083** to remove the steering arm.

Ensure that the connecting rods used are the same length.

Remove the steering arm from the steering gear.

INSTALLATION

INSTALLING THE INNER STEERING ARM

Fig. 69: Identifying Steering Arm Tool (999 7083)
Courtesy of VOLVO CARS CORPORATION

Install the inner tie rod.

Use thread sealant **1161053** .

For tightening torques, see **TIGHTENING TORQUE** .

Remove counterhold see **9997020** and socket see **9997083** .

Clean the steering rack after removing the tool. Check the steering rack for damage.

INSTALLING THE BOOT

Fig. 70: Ensuring That Tape Is In Place On Threads
Courtesy of VOLVO CARS CORPORATION

Check that the boot is undamaged.

Use a new boot if in any doubt.

Tape the threads on the inner steering arm to protect the boot when installing.

Install the boot using new clamps.

Remove the tape.

INSTALLING THE STEERING ARM

Install:

- the steering arm
- the steering arm on the wheel spindle. Use a counterhold. For tightening torques, see **TIGHTENING TORQUE**
- the wheel. See **INSTALLING WHEELS** .

Align the wheels. See **WHEEL ALIGNMENT, CHECKING / ADJUSTING** .

STEERING GEAR, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

REPLACING

Set the steering wheel to the "straight ahead" position. Remove the key so that the steering wheel lock engages.

Remove the battery lead. See **BATTERY, DISCONNECTING** .

Install the lock grip pliers on the feeder hose and the return hose for the power steering pump.

REMOVING THE SCREW ON THE LOWER STEERING SHAFT

Fig. 71: Identifying Tool Assembly
Courtesy of VOLVO CARS CORPORATION

HINT: If the access to the screw for the steering shaft joint mounting in the steering gear is very limited, set up the tool as illustrated.

Fig. 72: Steering Shaft Joint Mounting Screw
Courtesy of VOLVO CARS CORPORATION

Remove the screw on the steering shaft joint mounting in the steering gear from the engine compartment.

REMOVING THE SUB-FRAME

Remove the sub-frame. See: **SUB-FRAME FRONT, REPLACING** .

REMOVING THE TRACK ROD ENDS

Fig. 73: Removing Track Rod Ends
Courtesy of VOLVO CARS CORPORATION

NOTE: Ensure that the front wheels are pointing straight ahead.

Remove

- the front wheels
- the track rod ends from the steering arms.

Counterhold using a fixed spanner so that the boot is not damaged.

Fig. 74: Identifying Length Of Track Rod In Relation To Steering Gear Housing
Courtesy of VOLVO CARS CORPORATION

NOTE: **On one side, measure the length of the track rod in relation to the steering gear housing. Note the measurement.**

REMOVING THE RETURN LINES AND DELIVERY LINE

Fig. 75: Identifying Pressure Hose
Courtesy of VOLVO CARS CORPORATION

Place a container under the steering gear.

Remove:

- the return line from the steering gear and drain the fluid
- the delivery line from the steering gear and drain the fluid.

Fig. 76: Identifying Pipe Tie Straps Where Return Hose Meets Pressure Hose
Courtesy of VOLVO CARS CORPORATION

Remove the clips holding the same lines.

NOTE: Note the routing of the lines / hoses.

REMOVING STEERING GEAR

Remove the steering gear.

INSTALLING STEERING GEAR

Fig. 77: IDENTIFYING LENGTH OF TRACK ROD IN RELATION TO STEERING GEAR HOUSING

Courtesy of VOLVO CARS CORPORATION

Measure and adjust according to the measurements made earlier between the track rod end and the steering gear housing on the new steering gear.

Install the steering gear.

INSTALLING THE RETURN LINE AND DELIVERY LINE

Fig. 78: Identifying Pipe Tie Straps Where Return Hose Meets Pressure Hose
Courtesy of VOLVO CARS CORPORATION

Install the lines according to the noted routing.

Tighten the return line and the delivery line to the steering gear. Tighten to **TIGHTENING TORQUE** .

NOTE: Use a new O-ring on the tube at the steering gear.

Install the clips holding the same lines.

INSTALLING THE STEERING ARMS TO THE WHEEL SPINDLES

Fig. 79: Installing Steering Arm To Wheel Spindle
Courtesy of VOLVO CARS CORPORATION

Install the steering arms to the wheel spindles. Use new lock nuts.

Tighten, see: **TIGHTENING TORQUE** . Use see **9512050** .

INSTALLING THE SUB-FRAME

Install the sub-frame. See: **SUB-FRAME FRONT, REPLACING** .

INSTALLING THE SCREW ON THE LOWER STEERING SHAFT

NOTE: **Always check carefully that the ball joint's screw hole aligns with the cut-out in the steering gear shaft.**

Fig. 80: Installing Steering Shaft Joint Screw
Courtesy of VOLVO CARS CORPORATION

Expose the steering wheel lock. Turn the steering wheel so that the screw in the mounting for the steering shaft joint points straight ahead.

Tighten the lower screw on the steering shaft joint mounting in the steering gear from the engine compartment. Tighten to **TIGHTENING TORQUE** . Use a new screw.

FINISHING

Install:

- the fluid reservoir return hose
- the clips for the cable harness along the hose
- the delivery line on the power steering pump. Tighten. See:**TIGHTENING TORQUE** .

Use a new O-ring on the pipe at the power steering pump.

Install:

- the clamp on the stay between the power steering pump / engine
- the battery lead.

Fig. 81: Filling Servo Reservoir With Oil
Courtesy of VOLVO CARS CORPORATION

Fill the reservoir with oil.

NOTE: Use Volvo power steering fluid, P/N 1161529-1 to ensure the correct oil quality.

Repeatedly turn the steering wheel to full lock. Check and top up oil if required.

Lower the car.

Apply the handbrake. Start the engine.

A: Turn the steering wheel slowly to the right. Hold on full lock for 2 seconds.

B: Turn the steering wheel slowly to the left, hold on full lock for 2 seconds.

Repeat operations A and B approximately 10 times.

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

REPLACING

Set the steering wheel to the "straight ahead" position. Remove the key so that the steering wheel lock engages.

Remove the battery lead. See **BATTERY, DISCONNECTING** .

Install the lock grip pliers on the feeder hose and the return hose for the power steering pump.

REMOVING THE SCREW ON THE LOWER STEERING SHAFT

Fig. 82: Identifying Tool Assembly

Measure and adjust according to the measurements made earlier between the track rod end and the steering gear housing on the new steering gear.

Install the steering gear.

INSTALLING THE RETURN LINE AND DELIVERY LINE

Fig. 89: Identifying Pipe Tie Straps Where Return Hose Meets Pressure Hose
Courtesy of VOLVO CARS CORPORATION

Install the lines according to the noted routing.

Tighten the return line and the delivery line to the steering gear. Tighten to **TIGHTENING TORQUE** .

NOTE: Use a new O-ring on the tube at the steering gear.

Install the clips holding the same lines.

INSTALLING THE STEERING ARMS TO THE WHEEL SPINDLES

Fig. 90: Installing Steering Arms To Wheel Spindle

Expose the steering wheel lock. Turn the steering wheel so that the screw in the mounting for the steering shaft

joint points straight ahead.

Tighten the lower screw on the steering shaft joint mounting in the steering gear from the engine compartment. Tighten to **TIGHTENING TORQUE** . Use a new screw.

FINISHING

Install:

- the fluid reservoir return hose
- the clips for the cable harness along the hose
- the delivery line on the power steering pump. Tighten. See:**TIGHTENING TORQUE** .

Use a new O-ring on the pipe at the power steering pump.

Install:

- the clamp on the stay between the power steering pump / engine
- the battery lead.

Fig. 93: Filling Servo Reservoir With Oil

Fill the reservoir with oil.

NOTE: Use Volvo power steering fluid, P/N 1161529-1 to ensure the correct oil quality.

Repeatedly turn the steering wheel to full lock. Check and top up oil if required.

Lower the car.

Apply the handbrake. Start the engine.

A: Turn the steering wheel slowly to the right. Hold on full lock for 2 seconds.

B: Turn the steering wheel slowly to the left, hold on full lock for 2 seconds.

Repeat operations A and B approximately 10 times.

POWER STEERING EQUIPMENT (2003-2004)

FLUID RESERVOIR

REMOVING THE FLUID RESERVOIR

Fig. 94: Identifying Lock Grip Pliers & Feeder Hose
Courtesy of VOLVO CARS CORPORATION

- Install lock grip pliers on the return hose from the fluid reservoir as close to the power steering pump as possible.

WARNING: Avoid skin contact with the oil.

Fig. 95: Identifying Suction Unit
Courtesy of VOLVO CARS CORPORATION

- Extract the oil using the suction unit according to Volvo's Workshop Guide Bulletin 239
- Lift the fluid reservoir from its mounting
- Disconnect both the hoses from the reservoir
- Remove the reservoir.

INSTALLING FLUID RESERVOIR

Fig. 96: Filling Servo Reservoir With Oil
Courtesy of VOLVO CARS CORPORATION

- Install the reservoir in reverse order
- Top up with oil. Use Volvo power steering fluid, P/N 1161529-1 to ensure the correct oil quality.

HYDRAULIC PIPES/HOSES STEERING GEAR, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVAL

PREPARATORY WORK

Remove the battery lead. See **BATTERY, DISCONNECTING** .

Install lock grip pliers on the feeder hose for the power steering pump.

HINT: Place paper or a cloth under the delivery line to absorb any spillage.

Remove the pressure line from the power steering pump.

REMOVING THE SUB-FRAME

Remove the sub-frame. See **SUB-FRAME FRONT, REPLACING (2003-2006)** or **SUB-FRAME FRONT, REPLACING (2007)** and **SUB-FRAME FRONT, REPLACING** .

REMOVING THE RETURN HOSE

Fig. 97: Removing Return Hose
Courtesy of VOLVO CARS CORPORATION

Remove:

- the clamp for the oil cooler return hose
- the return hose.

REMOVING THE RETURN LINES AND DELIVERY LINE

Fig. 98: Identifying Pressure Hose
Courtesy of VOLVO CARS CORPORATION

Place a container under the steering gear.

Remove:

- the return lines from the steering gear and drain the fluid
- the delivery line from the steering gear and drain the fluid.

Fig. 99: Identifying Pipe Tie Straps Where Return Hose Meets Pressure Hose
Courtesy of VOLVO CARS CORPORATION

Remove:

- the clips holding the pipes together
- the return line by pressing the pipe to the left and pulling down the end of the hose from the engine compartment
- the delivery line by pulling the hose end down from the engine compartment.

NOTE: Note the routing of the lines / hoses.

INSTALLATION

NOTE: For tightening torques, see TIGHTENING TORQUE .

INSTALLING THE RETURN LINE AND DELIVERY LINE

Fig. 100: Identifying Pipe Tie Straps Where Return Hose Meets Pressure Hose
Courtesy of VOLVO CARS CORPORATION

Install the lines according to the noted routing.

Tighten the return line and the delivery line against the steering gear. See **TIGHTENING TORQUE** .

Remove the lock grip pliers from the feeder cable.

NOTE: Use a new O-ring on the pipe at the steering gear.

Install the clips holding the pipes together.

INSTALLING THE SUB-FRAME

Install the sub-frame. See **SUB-FRAME FRONT, REPLACING (2007)** or **SUB-FRAME FRONT, REPLACING (2003-2006)** and **SUB-FRAME FRONT, REPLACING** .

INSTALLING THE RETURN HOSE

Install the return hose on the oil cooler.

NOTE: Use a new clamp.

INSTALLING DELIVERY LINES

Fig. 101: Installing Delivery Lines
Courtesy of VOLVO CARS CORPORATION

Install:

- the delivery line on the power steering pump. Tighten. See **TIGHTENING TORQUE**
- lock facing, M6.

Remove the lock grip pliers from the feeder hose.

NOTE: Use a new O-ring on the pipe at the power steering pump.

FINISHING

Fig. 102: Filling Servo Reservoir With Oil
Courtesy of VOLVO CARS CORPORATION

Connect the battery lead.

Fill the reservoir with oil.

NOTE: Use Volvo power steering fluid, P/N 116 1529, to ensure the correct oil quality.

Repeatedly turn the steering wheel to full lock. Check and top up oil if required.

Lower the car.

Apply the parking brake. Start the engine.

A: Turn the steering wheel slowly to the right. Hold on full lock for 2 seconds.

B: Turn the steering wheel slowly to the left, hold on full lock for 2 seconds.

Repeat operations A and B approximately 10 times.

INTERNAL PIPE STEERING GEAR

REMOVAL

Remove the steering gear. See **REPLACING THE STEERING GEAR**

NOTE: Seal the servo pump's inlet and outlet connections with plastic plugs immediately after removal

Fig. 103: Identifying Oil Pipes
Courtesy of VOLVO CARS CORPORATION

Remove the protective plate above the pipes.

Clean around the oil pipe connections and blow dry.

Remove the pipes.

Fig. 104: Identifying Oil Pipe Connections
Courtesy of VOLVO CARS CORPORATION

NOTE: **Ensure that all remnants of the old sealing rings have been removed from the connections on the steering gear.**

INSTALLATION

Fig. 105: Identifying Sealing Rings On Oil Pipes
Courtesy of VOLVO CARS CORPORATION

Install the new sealing rings on the oil pipes. Lubricate the sealing rings. **Use:** Power steering fluid, 30741424

Fig. 106: Identifying Pipes With Sealing Rings
Courtesy of VOLVO CARS CORPORATION

Carefully install the new pipes with the sealing rings on the steering gear.

NOTE: **Use a new screw for the holders for the pipes.**

Tighten all pipe nuts to 7 Nm.

Tighten the screw to the holder. Tighten to 12 Nm.

Install the protective panel over the pipes.

Fig. 107: Identifying Support On Longer Of Oil Pipes

see **9995972**

see **9997018**

REMOVAL

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

INSTALLING LIFTING TOOLS

Fig. 108: Fixture 999 7018 Installed On Left Hand Side Of Engine At 2 Screws
Courtesy of VOLVO CARS CORPORATION

Ensure that the front wheels are pointing straight ahead

Lock the steering wheel by removing the ignition key

Do not turn the front wheels so that the position of the steering gear changes. This could damage the contact reel for the SRS-system.

Install lifting lug see **9997018** (applies only to 6 cylinder engines).

Fig. 109: 999 5716 And Lifting Hooks 999 5460 Installed
Courtesy of VOLVO CARS CORPORATION

Position the lifting device see **9995716** and lifting hooks see **9995460** .

Lift the engine to relieve the load on the engine pads.

DISCONNECTING THE CONNECTOR

Fig. 110: Connector At Brake Servo

Courtesy of VOLVO CARS CORPORATION

NOTE: Only applies to cars with speed related power steering.

Left-hand drive:

Disconnect the connector at the brake servo.

Right-hand drive:

Disconnect the connector at the right suspension turret.

Left and right-hand drive:

Disconnect the connector cable from the clips along the ABS cable.

Push down the connector and cable to the steering gear.

REMOVING TRACK ROD ENDS

Fig. 111: Identifying Steering Arm Track Rod End
Courtesy of VOLVO CARS CORPORATION

Raise the car.

NOTE: Ensure that the front wheels are pointing straight ahead.

Remove:

- the front wheels
- the track rod ends from the steering arms.

NOTE: If the car has steel wheel spindles, use puller see 9995259 .

MEASURING THE POSITION OF THE TRACK ROD IN THE STEERING GEAR

Fig. 112: Identifying Length Of Track Rod In Relation To Steering Gear Housing
Courtesy of VOLVO CARS CORPORATION

On one side, measure the length of the track rod in relation to the steering gear housing. Note the measurement.

REMOVING THE SPLASH GUARD

Fig. 113: Identifying Splash Guard Under Engine
Courtesy of VOLVO CARS CORPORATION

Remove the splash guard under the engine.

REMOVING THE BRACKET FOR THE EXHAUST PIPE

Fig. 114: Exhaust Pipe Bracket Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the mounting for the exhaust pipe on the bracket
- the screws holding the exhaust pipe bracket.

Disconnect the brake pipe from the snap fasteners on the bracket.

Remove the bracket.

REMOVING THE COLLISION PROTECTION SYSTEM OVER THE STEERING GEAR

Fig. 115: Collision Protection System Over Steering Gear
Courtesy of VOLVO CARS CORPORATION

Right-hand drive:

- Remove the collision protection system over the steering gear (2 screws)
- Position a container under the steering gear to collect the oil.
- Disconnect the oil pipes from the steering gear.

REMOVING THE NUTS AND SCREW FOR THE STEERING GEAR

Fig. 116: Identifying Bolt And Nut Holding Steering Gear To Sub-Frame
Courtesy of VOLVO CARS CORPORATION

Remove the four nuts and the screw holding the steering gear to the sub-frame.

Right-hand drive:

Remove the nut (A) holding the lower half of the collision protection.

LOWERING THE SUB-FRAME AT THE REAR EDGE

Fig. 117: Identifying Rear Sub-Frame Screws, Brackets & Washers
Courtesy of VOLVO CARS CORPORATION

Place a mobile jack with a universal fixture see **9995972** at the rear of the subframe.

Remove the screws holding the sub-frame brackets to the bodywork on both sides.

Remove the rear sub-frame screws together with the brackets and washers.

Unscrew the front screws in the sub-frame by 10-15 mm.

Fig. 118: Bracket For Heated Oxygen Sensor (HO2S) From Mounting
Courtesy of VOLVO CARS CORPORATION

Remove the bracket for the heated oxygen sensor (HO2S) from its mounting (6 cylinder engines only).

Lower the rear edge of the sub-frame approximately 90 mm. Ensure that the steering gear screws are released from the sub-frame.

Remove the mobile jack.

REMOVING STEERING GEAR

Fig. 119: Identifying Rear Engine Mounting Screw
Courtesy of VOLVO CARS CORPORATION

Remove the rear engine mounting screw.

Position a container under the steering gear to collect the oil.

Remove the oil pipes from the steering gear and holders along the steering gear.

Fig. 120: Identifying Screw For Joint Between Steering Gear And Steering Shaft
Courtesy of VOLVO CARS CORPORATION

Remove the screw for the joint between the steering gear and the steering shaft.

Press up the joint from the steering gear.

Lift the steering gear out to the left (left-hand drive cars only).

Lift the steering gear out to the right (right-hand drive cars only).

INSTALLATION

INSTALLING STEERING GEAR

Fig. 121: Heat Shield
Courtesy of VOLVO CARS CORPORATION

Transfer the heat shield.

When replacing steering gear:

Replace the oil pipe holder (only left-hand drive).

CHECKING THE POSITION OF THE TRACK ROD IN THE STEERING GEAR

Fig. 122: Identifying Length Of Track Rod In Relation To Steering Gear Housing
Courtesy of VOLVO CARS CORPORATION

Check that track rod is in the same position as when it was removed.

Fig. 123: Identifying Screw For Joint Between Steering Gear And Steering Shaft
Courtesy of VOLVO CARS CORPORATION

Lift in the steering gear in from the left (left-hand drive cars).

Lift in the steering gear in from the right (right-hand drive cars).

Allow the steering gear to rest on the sub-frame.

Install the oil pipes on the steering gear. Use new O-rings. Tighten to **25 Nm** .

Secure the oil pipes in the holders on the power steering (left-hand drive).

Applies to cars with speed related power steering:

Slide the connector to the terminal at the brake servo.

Install the cabling in the clip along the ABS cable.

Applies to all models:

Fig. 124: Locating Steering Shaft Joint On Steering Gear
Courtesy of VOLVO CARS CORPORATION

NOTE: Always check carefully that the ball joint's screw hole aligns with the cut-out in the steering gear shaft.

Align the steering shaft joint.

Lift up the rear edge of the sub-frame slightly using a mobile jack and universal fixture see **9995972** .

Locate the steering shaft joint on the steering gear.

Install a new steering shaft screw. Tighten to **20 Nm** .

Fig. 125: Identifying Rear Engine Mounting Screw
Courtesy of VOLVO CARS CORPORATION

Install the rear engine mounting screw.

Align the steering gear so that it is positioned straight relative to the sub-frame. Tighten the screw. Tighten to **50 Nm** .

INSTALLING THE SUB-FRAME AT THE REAR EDGE

Fig. 126: Identifying Bolts, Washers And Brackets In Sub-Frame
Courtesy of VOLVO CARS CORPORATION

- Lift the sub-frame. At the same time locate the steering gear mounting screws in the frame and, on right-hand drive cars, the collision protection system screw
- Loosely install the sub-frame brackets together with the washers
- Install the rear screws in the sub-frame. Use new screws. Do not tighten yet
- Transfer the mobile jack to the sub-frame front edge
- Replace the front sub-frame screws
- First tighten the screws on the left side of the sub-frame. Tighten to **105 Nm** . Angle tighten 120°.
- Then tighten the right-hand side to the same values as the left side
- Finally tighten the screws for the brackets on both sides. Tighten to **50 Nm** .

Fig. 127: Identifying Bolt And Nut Holding Steering Gear To Sub-Frame
Courtesy of VOLVO CARS CORPORATION

Install the four nuts and the screw holding the steering gear. Use new nuts and a new screw. Tighten to **50 Nm** .

Right-hand drive:

Install nut (A) holding the lower half of the collision protection system. Tighten to **50 Nm** .

Install the oil pipes. Use new O-rings.

Fig. 128: Collision Protection System Over Steering Gear
Courtesy of VOLVO CARS CORPORATION

Install the collision protection system over the steering gear (2 screws).

Tighten to **80 Nm** .

INSTALLING THE CABLE HARNESS FOR THE HEATED OXYGEN SENSORS (HO2S)

Fig. 129: Bracket For Heated Oxygen Sensor (H02S) In Mounting
Courtesy of VOLVO CARS CORPORATION

Applies only to 6 cylinder engines:

Install the bracket for the heated oxygen sensor (H02S) in its mounting. Connect the connectors.

Install the wiring on the sub-frame. Connect the connectors.

INSTALLING THE BRACKET FOR THE EXHAUST PIPE

Fig. 130: Exhaust Pipe Bracket Screws
Courtesy of VOLVO CARS CORPORATION

Install:

- the mounting for the exhaust pipe on the bracket. Tighten to **10 Nm**
- the brake pipe on the exhaust pipe bracket
- the exhaust pipe bracket. Tighten the bracket screws. Tighten to **25 Nm** .

INSTALLING THE TRACK ROD ENDS ON THE STEERING ARMS

Fig. 131: Identifying Steering Arm Track Rod End
Courtesy of VOLVO CARS CORPORATION

Install the track rod ends on the steering arms. Use new nuts.

Tighten the steering arm on the wheel spindle. See **TIGHTENING TORQUE**

Install:

- the splash guard under the engine
- the wheels. See **INSTALLING WHEELS** .

REMOVING THE LIFTING TOOLS

Fig. 132: Connector At Brake Servo
Courtesy of VOLVO CARS CORPORATION

Lower the car.

Remove the lifting tools.

Applies to cars with speed related power steering:

Connect the connector at the brake servo (left-hand drive cars).

Connect the connector at the right-hand suspension turret (right-hand drive cars).

Fig. 133: Identifying Oil Level Topped Up In Servo Reservoir
Courtesy of VOLVO CARS CORPORATION

Top up the oil level in the servo reservoir. Bleed the system.

WARNING: **Avoid skin contact with the oil.**

Repeatedly turn the steering wheel to full lock.

Top up the oil if necessary.

Lower the car.

Apply the handbrake.

Start the engine.

A: Turn the steering wheel slowly to the right. Hold on full lock for 2 seconds.

B: Turn the steering wheel slowly to the left. Hold on full lock for 2 seconds.

Repeat operations A and B approximately 10 times.

FINISHING

Check the toe-in. See **WHEEL ALIGNMENT, CHECKING / ADJUSTING** .

OIL COOLER STEERING GEAR, REPLACING

REMOVAL

REMOVING THE OIL COOLER

Fig. 134: Removing Oil Cooler
Courtesy of VOLVO CARS CORPORATION

Slacken off the screws for the oil cooler.

Fold the oil cooler down.

NOTE: Place a container under the steering gear.

Remove:

- the clamps
- the hoses
- the oil cooler.

INSTALLATION

NOTE: **For tightening torques, see TIGHTENING TORQUE .**

INSTALLING THE OIL COOLER

Fig. 135: Installing Oil Cooler
Courtesy of VOLVO CARS CORPORATION

Install:

- the hoses on the oil cooler
- the clamps for the power steering hose
- the screws for the oil cooler.

Tighten the clamps.

POWER STEERING PUMP, REPLACING

REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

PREPARATION

WARNING: Used fluid is considerably more dangerous than new fluid. Avoid skin contact with the oil.

Remove

- the oil hose from the mounting on top of the power steering pump
- the auxiliaries belt. See **REPLACING THE ACCESSORY DRIVE BELT / BELT TENSIONER** on 6-cylinder gasoline cars, or **AUXILIARIES BELT / BELT TENSIONER, REPLACING** on 5-cylinder gasoline cars.

NOTE: If there is dirt in the fluid, drain the system and remove the hoses from the steering gear.

REMOVING THE POWER STEERING PUMP

Fig. 136: Removing Power Steering Pump
Courtesy of VOLVO CARS CORPORATION

REMOVING THE FEEDER HOSE AND DELIVERY LINE

Fig. 137: Removing Feeder Hose And Delivery Line
Courtesy of VOLVO CARS CORPORATION

Install:

- the lock grip pliers on the feeder hose as close to the power steering pump as possible
- the lock grip pliers on the return hose at the fluid reservoir.

NOTE: Place paper over the generator (GEN) as protection against oil.

Remove:

- the screw nipple. Remove the delivery line from the pump
- the hose clamp. Remove the feeder hose from the power steering pump.

WARNING: Avoid skin contact with the oil.

REMOVING THE POWER STEERING PUMP

Fig. 138: Removing Power Steering Pump
Courtesy of VOLVO CARS CORPORATION

Remove:

- the 3 screws
- the servo pump.

INSTALLING

Install:

- the servo pump
- the three screws. Tighten to **25 Nm** .

INSTALLING THE POWER STEERING PUMP

- the feeder hose. Tighten the clamp
- the delivery line. Do not tighten yet.

FINISHING

Tighten the delivery line. Tighten to **25 Nm** .

Remove paper and lock grip pliers.

Install the auxiliaries belt. See **REPLACING THE ACCESSORY DRIVE BELT / BELT TENSIONER** on 6-cylinder gasoline cars, or **AUXILIARIES BELT / BELT TENSIONER, REPLACING** on 5-cylinder gasoline cars.

Fig. 139: Filling Servo Reservoir With Oil
Courtesy of VOLVO CARS CORPORATION

Fill the reservoir with oil.

NOTE: Use Volvo power steering fluid, P/N 1161529-1 to ensure the correct oil quality.

Repeatedly turn the steering wheel to full lock. Check and top up oil if required.

Lower the car.

Apply the parking brake. Start the engine.

A: Turn the steering wheel slowly to the right. Hold on full lock for 2 seconds.

B: Turn the steering wheel slowly to the left, hold on full lock for 2 seconds.

Repeat operations A and B approximately 10 times.

AUXILIARIES BELT / BELT TENSIONER, REPLACING

Special tools	
	T9997109 WRENCH **Tool number:** T9997109 **Tool description:** WRENCH **Tool boards:**

NOTE: **Since the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVING THE AUXILIARIES BELT

Remove the upper engine cover by pulling it straight up.

Fig. 140: Identifying Auxiliaries Belt Removal
Courtesy of VOLVO CARS CORPORATION

Remove the plastic cover on the belt tensioner. see **9997109** Turn clockwise as far as possible to relieve the load on the belt.

Remove the belt.

REPLACING THE BELT TENSIONER

Remove:

- the plastic cover on the idler wheel
- the idler wheel

- the two screws for the belt tensioner from the bracket for the auxiliaries equipment
- belt tensioner.

Install a new timing belt tensioner using two screws.

Tighten the screws.

Install the idler wheel and its plastic cover.

INSTALLING THE AUXILIARIES BELT

Fig. 141: Identifying Auxiliaries Belt Installation
Courtesy of VOLVO CARS CORPORATION

CAUTION: Ensure that the belt is correctly seated in all its grooves and on the pulley.

Use a spanner and turn the belt tensioner clockwise as far as possible.

Position the belt as illustrated.

Install the plastic cover on the tensioner

CHECKING WORK

Carry out a function test:

Start the engine.

Check the rotation of the belt and the function of the belt tensioner

PULLEY POWER STEERING PUMP, REPLACING

Special tools:

Courtesy of VOLVO CARS CORPORATION

- Remove the power steering pump. See **POWER STEERING PUMP, REPLACING**
- Secure the power steering pump in a vise
- Remove the pulley. Use puller see **9995737** .

INSTALLING PULLEY, ALTERNATIVE 1

Fig. 143: Installing Pulley
Courtesy of VOLVO CARS CORPORATION

Install the pulley. Lubricate the pump shaft with oil

Use press tool see **9995738** .

- Counterhold using B
- Tighten with A.

INSTALLING PULLEY, ALTERNATIVE 2

Fig. 144: Installing Pulley Using A Screw With Correct Thread
Courtesy of VOLVO CARS CORPORATION

- Install the screw on the pump shaft.

NOTE: Use a screw with the correct thread (M8x75mm).

- Install special tool see **9995628** on compression tool see **9995575**
- Lubricate the pump shaft and install the pulley
- Install tool 999 5628

  on the pulley

- Hook tool see **9995628** onto the screw for the pump shaft.

REMOVAL

PREPARATORY WORK

Fig. 152: Identifying Lock Grip / Hose Pliers On Power Steering Pump Feeder Hose
Courtesy of VOLVO CARS CORPORATION

Remove the battery lead. See **BATTERY, DISCONNECTING** .

HINT: Place paper or a rag under the supply pipe to absorb any oil spillage.

Install a hose clip on the feed hose for the power steering pump.

Remove the pressure line from the power steering pump.

REMOVING THE SUB-FRAME

Remove the sub-frame. See: **SUB-FRAME FRONT, REPLACING** .

REMOVING THE DELIVERY LINES

Fig. 153: Identifying Steering Gear Supply Pipe & Nut
Courtesy of VOLVO CARS CORPORATION

Position a container under the steering gear.

Remove:

- the supply pipe from the steering gear. Drain the oil
- release the supply pipe /hose from the clip
- the supply pipe.

NOTE: Note the routing of the supply pipe / hose.

INSTALLATION

NOTE: For tightening torques, see: TIGHTENING TORQUE .

INSTALLING THE SUPPLY PIPE / HOSE

Fig. 154: Identifying Steering Gear Supply Pipe & Nut

Position a container under the steering gear.

Remove:

- the return line from the valve housing, drain the fluid
- disconnect the line from the clips on the steering gear
- the pipe.

INSTALLATION

NOTE: For tightening torques, see: TIGHTENING TORQUE .

INSTALLING THE RETURN HOSE

Fig. 159: Identifying Oil Cooler Return Hose Clamp

REMOVAL

PREPARATIONS

Remove:

- the battery cable, see: **BATTERY, DISCONNECTING**
- the front wheels on both sides.

REMOVING THE RETURN PIPE

Fig. 206: Removing Return Pipe
Courtesy of VOLVO CARS CORPORATION

WARNING: Avoid skin contact with the oil.

Lift up the oil reservoir. Place paper under the oil reservoir for any oil spillage.

Position a container under the oil reservoir. Remove the hose with the clamp from the oil reservoir. Drain the oil.

NOTE: Make a note of the oil pipe's location

Release the oil hose from the tie strap and the clip on the engine cooling fan (FC).

REMOVING THE BOLTS TO THE TORQUE ROD

Fig. 207: Engine Stabilizer Brace
Courtesy of VOLVO CARS CORPORATION

Remove the bolts, x2, at the suspension turrets on both sides.

INSTALLING THE LIFTING TOOL

Fig. 208: Installing Lifting Tool
Courtesy of VOLVO CARS CORPORATION

NOTE: **When lifting the engine make sure that the lifting eye does not scratch the torque rod. Tape the torque rod and keep it away from the eye.**

Remove:

- the oil filler cap
- the upper front engine casing by pulling it straight up.

Install:

- the oil filler cap
- the lifting tool: see **9995716** converted with the kit: see **9997070** and lifting hooks: see **9995460** . Lift up the engine slightly so that the engine pads are unloaded.

REMOVING THE WING LINER

Remove the lower bolt to the engine pad.

REMOVING THE LOWER BOLT TO THE REAR ENGINE PAD

Fig. 217: Removing Engine Pad Bolt
Courtesy of VOLVO CARS CORPORATION

Release the heated oxygen sensor (HO2S) connectors, x2, from the subframe.

Fold aside the protective plate under the steering gear to gain access to the engine pad's lower bolt.

Remove the engine pad's bolt.

REMOVING THE LOWER STEERING SHAFT JOINT

Fig. 218: Steering Shaft Joint Mounting Bolt
Courtesy of VOLVO CARS CORPORATION

NOTE: **Turn the steering wheel until optimum access to the bolt is achieved. Lock the steering wheel and take out the ignition key, so that the steering wheel lock is activated.**

Fig. 219: Identifying Length Of Track Rod In Relation To Steering Gear Housing
Courtesy of VOLVO CARS CORPORATION

NOTE: **On one side, measure the length of the track rod in relation to the steering gear housing. Make a note of the measurement.**

Remove:

- the bolt to the lower steering shaft joint
- the connector to the solenoid.

LOWERING THE SUBFRAME

Fig. 220: Identifying Bolts, Washers And Brackets In Sub-Frame
Courtesy of VOLVO CARS CORPORATION

NOTE: Press the joint up from the steering gear. Make sure that no pipes or lines are loaded or trapped when lowering.

Position a lifting table under the subframe.

Remove on both sides:

- the bolts to the subframe's brackets at the rear edge
- the bolts to the subframe in the front and rear edge
- the subframe's brackets.

Release the heated oxygen sensor (HO2S) cables from the anti-roll bar.

Lower the subframe carefully.

REMOVING THE RETURN PIPE, CONTINUED

Fig. 221: Removing Return Pipe
Courtesy of VOLVO CARS CORPORATION

Release the pipe from the clips on the subframe.

Fig. 222: Removing Steering Gear Pipe
Courtesy of VOLVO CARS CORPORATION

Place a container under the steering gear.

Remove:

- the pipes' bolt on the valve housing
- the pipe.

INSTALLATION

NOTE: For tightening torques, see: TIGHTENING TORQUE .

INSTALLING THE RETURN PIPE

NOTE: Use a new O-ring.

Install:

- the hose with the clamp to the oil reservoir
- the oil reservoir

- the pipe in the clip and the clamp on the engine cooling fan (FC)
- the pipe in the clips on the subframe
- the pipe in the valve housing
- the pipes' bolt, M8, on the valve housing.

INSTALLING THE SUBFRAME

Install the sub-frame. See **INSTALLING THE SUBFRAME**.

FITTING THE LOWER BOLT TO THE REAR ENGINE PAD

HINT: Unscrew the upper nut in order to facilitate fitting the lower bolt.

Install:

- the lower bolt to the engine pad, M10, x1
- the 2 x heated oxygen sensor (HO2S) connectors on the subframe. Reinstall the protective plate under the steering gear.

FITTING THE LOWER BOLT TO THE FRONT ENGINE PAD

Fit the lower bolt to the engine pad, M10, x1.

INSTALLING THE GEARBOX BOLTS TO THE LOWER TORQUE ROD

Fit the bolts, x2, in accordance with: **TIGHTENING TORQUE** .

INSTALLING THE LOWER STEERING SHAFT JOINT

Install:

- the lower steering shaft joint
- the bolt, M8
- the connector to the solenoid.

INSTALLING THE EXHAUST PIPES BETWEEN FRONT AND REAR CATALYTIC CONVERTERS

NOTE: To ensure that there is no exhaust leakage, see: FLANGED JOINT, ASSEMBLING

Install:

- both exhaust pipes
- both exhaust pipes' nuts M8.

INSTALLING THE PROTECTIVE COVER UNDER THE ENGINE

Install:

- the protective cover under the engine
- the bolts, M8, x6.

INSTALLING THE PROTECTIVE PLATE

Move the protective plate up in the bumper cover. Press forward until the mounting brackets enter the subframe. Fit the bolts, M10.

FITTING THE BOLTS TO THE RIGHT-HAND ENGINE PAD

Fit the bolts, x2, in accordance with: **TIGHTENING TORQUE** .

INSTALLING THE WING LINER

Install:

- the wing liner
- the plastic nuts, x2.

REMOVING THE LIFTING TOOL

Remove the lifting tool: see **9995716** , the kit: see **9997070** and lifting hooks: see **9995460** .

FITTING THE BOLTS TO THE TORQUE ROD

Fit the bolts, M10 x2, at the suspension turrets on both sides.

FILLING THE POWER STEERING FLUID RESERVOIR

CAUTION: Avoid skin contact with the oil.

NOTE: For the correct oil grade use Volvo power steering fluid, part number: 116 1529-1.

Fit the battery cable. Fill the power steering fluid reservoir.

Turn the steering wheel between both end positions several times.

Check and fill with oil as necessary.

Apply the parking brake.

Start the engine.

A: Turn the steering wheel slowly to the right, keep it at the end position for 2 seconds.

B: Turn the steering wheel slowly to the left, keep it at the end position for 2 seconds. Repeat steps A and B 10 times.

FINISHING

Remove the oil filler cap.

Install:

- the upper front engine casing
- the oil filler cap
- the front wheels on both sides in accordance with: **INSTALLING WHEELS** .

ADDITIVE AIR SYSTEM

Fig. 223: Additive Air System Component Identification
Courtesy of VOLVO CARS CORPORATION

The purpose of the additive air system is to minimize hydrocarbon and carbon dioxide emissions at cold start by warming up the catalysator as rapidly as possible. By adding air to the exhaust ports during cold-starting, the additive air system initiates post-ignition of unburned hydrocarbons. This allows the injection period to be increased and the ignition to be retarded to give a higher exhaust temperature and, thus, more rapid activation of

the catalysator.

The system consists of:

- An air pump (1) activated by a relay and fitted with a filter. It has its intake directed towards the side in order to avoid ingress of dust or water.
- A shut-off valve (2) which regulates air supply to the exhaust ports.
- A magnetic valve (3) which controls the shut-off valve on the basis of intake manifold vacuum.
- A non-return valve (4) to prevent exhaust gas backflow.

The ECM controls the air-pump relay which, when the system is activated, starts the air pump and opens the magnetic valve. Air is led from the pump via the shut-off valve and non-return valve to the exhaust ports.

The air pump starts about 5-20 seconds after the engine, depending on engine type and temperature during starting. (Pre-B6254FS, it was also necessary for vehicle speed to exceed 3 km/h (2 mph)). The air pump then runs for between 45 and 120 seconds, depending on engine type and temperature during starting.

NOTE: The plate's upper mounting has a guide sleeve and therefore it must be lifted slightly so that it can be slid forward.

Raise and move the protective plate forward. Remove the protective plate.

REMOVING THE PROTECTIVE COVER UNDER THE ENGINE

Fig. 233: Removing Splash Guard
Courtesy of VOLVO CARS CORPORATION

Remove:

- the bolts, x6
- the protective cover under the engine.

REMOVING THE GEARBOX BOLTS TO THE LOWER TORQUE ROD

Remove:

- both exhaust pipes' nuts
- both exhaust pipes.

REMOVING THE LOWER BOLT TO THE FRONT ENGINE PAD

Fig. 236: Front Engine Pad Screw
Courtesy of VOLVO CARS CORPORATION

Remove the lower bolt to the engine pad.

REMOVING THE LOWER BOLT TO THE REAR ENGINE PAD

Fig. 237: Removing Engine Pad Bolt
Courtesy of VOLVO CARS CORPORATION

Release the heated oxygen sensor (HO2S) connectors, x2, from the subframe.

Fold aside the protective plate under the steering gear to gain access to the engine pad's lower bolt. Remove the engine pad's bolt.

REMOVING THE STEERING SHAFT JOINT, LOWER

Fig. 238: Removing Steering Wheel Shaft
Courtesy of VOLVO CARS CORPORATION

NOTE: **Turn the steering wheel until optimum access to the bolt is achieved. Lock the steering wheel and take out the ignition key, so that the steering wheel lock is activated.**

Fig. 239: Identifying Length Of Track Rod In Relation To Steering Gear Housing
Courtesy of VOLVO CARS CORPORATION

NOTE: **On one side, measure the length of the track rod in relation to the steering gear housing. Make a note of the measurement.**

Remove:

- the bolt to the lower steering shaft joint
- the connector to the solenoid.

LOWERING THE SUBFRAME

Fig. 240: Identifying Bolts, Washers And Brackets In Sub-Frame
Courtesy of VOLVO CARS CORPORATION

NOTE: Press the joint up from the steering gear.

Make sure that no pipes or lines are loaded or trapped when lowering.

Position a lifting table under the subframe.

Remove on both sides:

- the bolts to the subframe's brackets at the rear edge
- the bolts to the subframe in the front and rear edge
- the subframe's brackets.

Release the heated oxygen sensor (HO2S) lines from the anti-roll bar. Lower the subframe carefully.

REMOVING THE PRESSURE PIPE, CONTINUED

Fig. 241: Removing Pressure Pipe
Courtesy of VOLVO CARS CORPORATION

Position a container under the steering gear. Remove the bolt to the oil pipe bracket on the subframe.

Release the pipe from the clips.

Fig. 242: Removing Power Steering Pipe
Courtesy of VOLVO CARS CORPORATION

Remove:

- the pipes' bolt on the valve housing
- the pipe.

INSTALLATION

INSTALLING THE PRESSURE PIPE

CAUTION: Use new O-rings.

Install:

- the pipe in the power steering pump
- the bolt (1) in accordance with: **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS**
- the nut (2) M6
- the bolt (3) M6

- the bolt, M6, to the oil pipe bracket on the subframe
- the pipe in the clips
- the pipe in the valve housing
- the pipes' bolt on the steering gear/valve housing in accordance with: **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS** .

INSTALLING THE SUBFRAME

CAUTION: Make sure that no pipes or lines are loaded or trapped when raising the subframe.

Raise the subframe.

Install the sub-frame's four screws together with the sub-frame's brackets and engine heater, if installed.

Use new screws. Lube the screws with oil.

Tighten acc. to: **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS** . First tighten the screws on the sub-frame's left side, then on the right.

Tighten the screws for the brackets M10.

Install the heated oxygen sensor's cables on the anti-roll bar.

Remove the lifting table.

FITTING THE LOWER BOLT TO THE REAR ENGINE PAD

HINT: Unscrew the upper nut in order to facilitate fitting the lower bolt.

Install:

- the lower bolt to the engine pad, M10 x1.
- the heated oxygen sensor (HO2S) connectors on the subframe, x2. Refit the protective plate under the steering gear.

FITTING THE LOWER BOLT TO THE FRONT ENGINE PAD

Fit the lower bolt to the engine pad, M10 x1.

INSTALLING THE GEARBOX BOLTS TO THE LOWER TORQUE ROD

Fit the bolts, x2, in accordance with: **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS** .

INSTALLING THE STEERING SHAFT JOINT, LOWER

Install:

- the lower steering shaft joint
- the bolt, M8
- the connector to the solenoid.

INSTALLING THE EXHAUST PIPES BETWEEN FRONT AND REAR CATALYTIC CONVERTERS

NOTE: To ensure that there is no exhaust leakage, see: FLANGED JOINT, ASSEMBLING .

Install:

- both exhaust pipes
- both exhaust pipes' nuts, M8.

INSTALLING THE PROTECTIVE COVER UNDER THE ENGINE

Install:

- the protective cover under the engine
- the bolts, M8 x6.

INSTALLING THE PROTECTIVE PLATE

Move the protective plate up in the bumper cover. Press forward until the mounting brackets enter the subframe.

Fit the bolts, M10.

FITTING THE BOLTS TO THE RIGHT-HAND ENGINE PAD

Fit the bolts, x2, in accordance with: **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS** .

INSTALLING THE WING LINER

Install:

- the wing liner
- the plastic nuts, x2.

REMOVING THE LIFTING TOOL

Remove the lifting tool: see **9995716** , kit: see **9997070** and lifting hooks: see **9995460** .

FITTING THE BOLTS TO THE TORQUE ROD

Fit the bolts, M10 x2, at the suspension turrets on both sides.

FILLING THE POWER STEERING FLUID RESERVOIR

Fit the battery cable.

CAUTION: Avoid skin contact with the oil.

Install:

- the hose with the clamp to the oil reservoir
- the oil reservoir.

Fill the power steering fluid reservoir.

NOTE: For the correct oil grade use Volvo power steering fluid, part number: 116 1529-1.

Turn the steering wheel between both end positions several times.

Check and fill with oil as necessary.

Apply the parking brake. Start the engine.

A: Turn the steering wheel slowly to the right, keep it at the end position for 2 seconds.

B: Turn the steering wheel slowly to the left, keep it at the end position for 2 seconds.

Repeat steps A and B 10 times.

INSTALLING THE PROTECTIVE COVER OVER THE POWER STEERING PUMP

Install:

- the protective cover
- the plastic bolt
- the upper rear engine casing.

FINISHING

Remove the oil filler cap.

Install:

- the upper front engine casing

- the oil filler cap
- the front wheels on both sides in accordance with, see **INSTALLING WHEELS** .

POWER STEERING PUMP, REPLACING

WARNING: **Avoid skin contact with the oil.**

Lift up the oil reservoir. Place paper under the oil reservoir for any oil spillage.

Position a container under the oil reservoir. Remove the hose with the clamp from the oil reservoir.

Drain the oil.

REMOVING THE INTAKE MANIFOLD.

Remove the intake manifold in accordance with: **INTAKE MANIFOLD/GASKET, REPLACING** .

REMOVING THE AUXILIARIES BELT/BELT TENSIONER

Remove the auxiliaries belt in accordance with: **AUXILIARIES BELT/BELT TENSIONER, REPLACEMENT** .

REMOVING THE POWER STEERING PUMP

Fig. 244: Removing Power Steering Pump
Courtesy of VOLVO CARS CORPORATION

Remove:

- the bolt to the pressure pipe (1)
- the pressure pipe
- the delivery hose with the clamp (2).
- the 3 x screws for the power steering pump
- the power steering pump.

INSTALLATION

NOTE: For tightening torques, see: TIGHTENING TORQUE .

INSTALLING THE POWER STEERING PUMP

Fig. 245: Installing Power Steering Pump
Courtesy of VOLVO CARS CORPORATION

Install:

- the power steering pump
- the bolts, M8 x3
- the pressure pipe. Use a new O-ring
- the screw for the pressure pipe (1). Tighten. See **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS**
- the delivery hose with the clamp (2).

INSTALLING THE AUXILIARIES BELT/BELT TENSIONER

Install the auxiliaries belt in accordance with: **AUXILIARIES BELT/BELT TENSIONER, REPLACEMENT** .

INSTALLING THE INTAKE MANIFOLD

Install the intake manifold in accordance with: **INTAKE MANIFOLD/GASKET, REPLACING** .

FINISHING

WARNING: Avoid skin contact with the oil.

Install:

- the hose with the clamp to the oil reservoir
- the oil reservoir.

Fill the power steering fluid reservoir.

NOTE: Use Volvo power steering fluid, P/N 116 1529-1 to ensure the correct oil quality.

Hang the oil reservoir from the hood catch. Use welding wire or similar. Ensure that the hose is extended.

Turn the steering wheel between both end positions 10 times.

Check and fill with oil as necessary.

Apply the parking brake. Start the engine.

A: Turn the steering wheel slowly to the right, keep it at the end position for a maximum of 2 seconds.

B: Turn the steering wheel to the left, keep it at the end position for a maximum of 2 seconds.

Switch off the engine and wait 5 minutes. Repeat step A and B 10 times. Repeat the procedure. Switch off the engine and wait 5 minutes. Repeat step A and B 10 times.

Reinstall the oil reservoir. Check the oil level.

REMOVAL

PREPARATIONS

Remove:

- the battery cable, see: **BATTERY, DISCONNECTING**
- the front wheels on both sides.

REMOVING THE RETURN PIPE

Fig. 250: Removing Return Pipe
Courtesy of VOLVO CARS CORPORATION

WARNING: **Avoid skin contact with the oil.**

Lift up the oil reservoir. Place paper under the oil reservoir for any oil spillage.

Position a container under the oil reservoir. Remove the hose with the clamp from the oil reservoir. Drain the oil.

NOTE: Make a note of the oil pipe's location

Release the oil hose from the tie strap and the clip on the engine cooling fan (FC).

REMOVING THE BOLTS TO THE TORQUE ROD

Fig. 251: Engine Stabilizer Brace
Courtesy of VOLVO CARS CORPORATION

Remove the bolts, x2, at the suspension turrets on both sides.

INSTALLING THE LIFTING TOOL

Fig. 252: Installing Lifting Tool
Courtesy of VOLVO CARS CORPORATION

NOTE: **When lifting the engine make sure that the lifting eye does not scratch the torque rod. Tape the torque rod and keep it away from the eye.**

Remove:

- the oil filler cap
- the upper front engine casing by pulling it straight up.

Install:

- the oil filler cap
- the lifting tool: see **9995716** converted with the kit: see **9997070** and lifting hooks: see **9995460** . Lift up the engine slightly so that the engine pads are unloaded.

REMOVING THE WING LINER

Fig. 253: removing Wing Liner
Courtesy of VOLVO CARS CORPORATION

Remove:

- the plastic nuts, x2
- the wing liner.

REMOVING THE BOLTS TO THE RIGHT-HAND ENGINE PAD

Release the heated oxygen sensor (HO2S) connectors, x2, from the subframe.

Fold aside the protective plate under the steering gear to gain access to the engine pad's lower bolt.

Remove the engine pad's bolt.

REMOVING THE LOWER STEERING SHAFT JOINT

Fig. 262: Removing Steering Shaft Joint
Courtesy of VOLVO CARS CORPORATION

NOTE: **Turn the steering wheel until optimum access to the bolt is achieved. Lock the steering wheel and take out the ignition key, so that the steering wheel lock is activated.**

NOTE: **On one side, measure the length of the track rod in relation to the steering gear housing. Make a note of the measurement.**

Remove:

- the bolt to the lower steering shaft joint
- the connector to the solenoid.

LOWERING THE SUBFRAME

Fig. 264: Identifying Bolts, Washers And Brackets In Sub-Frame
Courtesy of VOLVO CARS CORPORATION

NOTE: Press the joint up from the steering gear. Make sure that no pipes or lines are loaded or trapped when lowering.

Position a lifting table under the subframe.

Remove on both sides:

- the bolts to the subframe's brackets at the rear edge
- the bolts to the subframe in the front and rear edge
- the subframe's brackets.

Release the heated oxygen sensor (HO2S) cables from the anti-roll bar.

Lower the subframe carefully.

REMOVING THE RETURN PIPE, CONTINUED

Fig. 265: Removing Return Pipe
Courtesy of VOLVO CARS CORPORATION

Release the pipe from the clips on the subframe.

Fig. 266: Removing Power Steering Pipe
Courtesy of VOLVO CARS CORPORATION

Place a container under the steering gear.

Remove:

- the pipes' bolt on the valve housing
- the pipe.

INSTALLATION

NOTE: For tightening torques, see: TIGHTENING TORQUE .

INSTALLING THE RETURN PIPE

NOTE: Use a new O-ring.

Install:

- the hose with the clamp to the oil reservoir
- the oil reservoir

- the pipe in the clip and the clamp on the engine cooling fan (FC)
- the pipe in the clips on the subframe
- the pipe in the valve housing
- the pipes' bolt, M8, on the valve housing.

INSTALLING THE SUBFRAME

Install the sub-frame. See: **SUB-FRAME FRONT, REPLACING (2007, 2008)** or **SUB-FRAME FRONT, REPLACING (2005, 2006)** .

FITTING THE LOWER BOLT TO THE REAR ENGINE PAD

HINT: Unscrew the upper nut in order to facilitate fitting the lower bolt.

Install:

- the lower bolt to the engine pad, M10, x1
- the 2 x heated oxygen sensor (HO2S) connectors on the subframe. Reinstall the protective plate under the steering gear.

FITTING THE LOWER BOLT TO THE FRONT ENGINE PAD

Fit the lower bolt to the engine pad, M10, x1.

INSTALLING THE GEARBOX BOLTS TO THE LOWER TORQUE ROD

Fit the bolts, x2, in accordance with: **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS** .

INSTALLING THE LOWER STEERING SHAFT JOINT

Install:

- the lower steering shaft joint
- the bolt, M8
- the connector to the solenoid.

INSTALLING THE EXHAUST PIPES BETWEEN FRONT AND REAR CATALYTIC CONVERTERS

NOTE: To ensure that there is no exhaust leakage, see: FLANGED JOINT, ASSEMBLING

Install:

- both exhaust pipes
- both exhaust pipes' nuts M8.

INSTALLING THE PROTECTIVE COVER UNDER THE ENGINE

Install:

- the protective cover under the engine
- the bolts, M8, x6.

INSTALLING THE PROTECTIVE PLATE

Move the protective plate up in the bumper cover. Press forward until the mounting brackets enter the subframe. Fit the bolts, M10.

FITTING THE BOLTS TO THE RIGHT-HAND ENGINE PAD

Fit the bolts, x2, in accordance with: **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS** .

INSTALLING THE WING LINER

Install:

- the wing liner
- the plastic nuts, x2.

REMOVING THE LIFTING TOOL

Remove the lifting tool: see **9995716** , the kit: see **9997070** and lifting hooks: see **9995460** .

FITTING THE BOLTS TO THE TORQUE ROD

Fit the bolts, M10 x2, at the suspension turrets on both sides.

FILLING THE POWER STEERING FLUID RESERVOIR

CAUTION: Avoid skin contact with the oil.

NOTE: For the correct oil grade use Volvo power steering fluid, part number: 116 1529-1.

Fit the battery cable. Fill the power steering fluid reservoir.

Turn the steering wheel between both end positions several times.

Check and fill with oil as necessary.

Apply the parking brake.

Start the engine.

A: Turn the steering wheel slowly to the right, keep it at the end position for 2 seconds.

B: Turn the steering wheel slowly to the left, keep it at the end position for 2 seconds. Repeat steps A and B 10 times.

FINISHING

Remove the oil filler cap.

Install:

- the upper front engine casing
- the oil filler cap
- the front wheels on both sides in accordance with: **INSTALLING WHEELS** .

VEHICLE COMMUNICATION, STEERING WHEEL ANGLE SENSOR MODULE (SAS) (B5254T2; 2005-2007)

DESCRIPTION OF PARAMETERS

INTRODUCTION / STATUS

STEERING WHEEL ANGLE SENSOR MODULE

The steering wheel angle sensor module (SAS) must be initiated before values can be read off. Initiation is carried out by turning the steering wheel more than 5° in either direction.

STEERING WHEEL ANGLE

The value displays the steering wheel angle in degrees.

0° = Steering wheel in the straight forward position

1° to 500° = Steering wheel angle

STEERING WHEEL MOVEMENT SPEED

The value displays the steering wheel turning speed in °/second.

Measurement range: 0 - 255°/second

STEERING DIRECTION

The value indicates in which direction the steering wheel is turned.

The values displayed are **right** or **left** .

POWER SUPPLY

The value indicates battery voltage at the steering wheel angle sensor module (SAS).

Measurement range: 5 - 15 V

DESCRIPTION OF FROZEN VALUES

READING CODES

Frozen values are parameter values that are stored when a diagnostic trouble code (DTC) is stored.

The steering wheel angle sensor module (SAS) must be initiated before values can be read off. Initiation is carried out by turning the steering wheel more than 5° in either direction.

STEERING WHEEL ANGLE

The value displays the steering wheel angle in degrees.

0° = Steering wheel in the straight forward position

1° - 720° = Angle of the steering wheel when turning to the left

-1° - -720° = Angle of the steering wheel when turning to the right

STEERING WHEEL ANGLE SPEED

The value displays the steering wheel turning speed in °/second.

Measurement range: 0-255°/secs.

STEERING DIRECTION

The value indicates in which direction the steering wheel is turned.

The values displayed are **right** and **left** .

POWER SUPPLY

The value indicates battery voltage at the steering wheel angle sensor module (SAS).

Measurement range: 5 - 15 V

ENGINE, RUNNING

The value indicates the status of the engine when the diagnostic trouble code (DTC) was stored.

OFF = Engine not running.

On = Engine running.

PASSENGER COMPARTMENT TEMPERATURE

The value indicates the passenger compartment temperature when the diagnostic trouble code (DTC) was stored. The transmission control module (TCM) obtains the value via the controller area network (CAN) from the central electronic module (CEM). The value is given in °C.

OUTSIDE TEMPERATURE

The value indicates the outside temperature when the diagnostic trouble code (DTC) was stored. The transmission control module (TCM) obtains the value via the controller area network (CAN) from the central electronic module (CEM). The value is given in °C.

BATTERY VOLTAGE

The value displays the voltage the first and last times the diagnostic trouble code (DTC) was stored. The transmission control module (TCM) obtains the value via the controller area network (CAN) from the central electronic module (CEM). The value is given in volts (V).

MILEAGE

The value indicates the total mileage of the car at the time the diagnostic trouble code (DTC) was stored. The transmission control module (TCM) obtains the value via the controller area network (CAN) from the central electronic module (CEM).

READING CODES

Frozen values are parameter values that are stored when a diagnostic trouble code (DTC) is stored.

The steering wheel angle sensor module (SAS) must be initiated before values can be read off. Initiation is carried out by turning the steering wheel more than 5° in either direction.

GLOBAL TIME

The value shows the actual time in seconds when the diagnostic trouble code was stored. The steering wheel angle sensor module (SAS) obtains the value from the central electronic module (CEM) via the controller area network (CAN).

TOTAL MILEAGE

The value shows the total mileage in kilometres when the diagnostic trouble code was stored. The steering wheel angle sensor module (SAS) obtains the value from the central electronic module (CEM) via the controller area network (CAN).

POWER SUPPLY, CENTRAL ELECTRONIC MODULE (CEM)

The value shows the battery voltage when the diagnostic trouble code was stored. The steering wheel angle sensor module (SAS) obtains the value from the central electronic module (CEM) via the controller area network (CAN).

ENGINE RUNNING

The status indicates whether or not the engine was running when the diagnostic trouble code was stored. The steering wheel angle sensor module (SAS) obtains the value from the central electronic module (CEM) via the controller area network (CAN).

The status displayed is **Yes** and **No** .

PASSENGER COMPARTMENT TEMPERATURE

The value shows the cabin temperature in degrees centigrade at the time the diagnostic trouble code was stored. The steering wheel angle sensor module (SAS) obtains the value from the central electronic module (CEM) via the controller area network (CAN).

OUTSIDE TEMPERATURE

The value shows the outside temperature in degrees centigrade at the time the diagnostic trouble code was stored. The steering wheel angle sensor module (SAS) obtains the value from the central electronic module (CEM) via the controller area network (CAN).

POWER SUPPLY, STEERING WHEEL ANGLE SENSOR MODULE (SAS)

The value shows the power supply in volts at the steering wheel angle sensor module (SAS) when the diagnostic trouble code was stored.

STEERING WHEEL ANGLE

The value displays the steering wheel angle in degrees.

0° = Steering wheel in the straight forward position

1° - 720° = Angle of the steering wheel when turning to the left

-1° - -720° = Angle of the steering wheel when turning to the right

STEERING WHEEL ANGLE SPEED

The value shows the speed (in degrees per second) at which the steering wheel is turned.

Measurement range: 0 - 255 degrees/sec.

STEERING WHEEL ANGLE, STEERING DIRECTION

The value indicates in which direction the steering wheel is turned.

CHECKING REAR WINDSHIELD WASHING (2003-2004)

CHECKING REAR WINDSHIELD WASHING

CHECKING COMPONENTS

Activate the tailgate washer with the wiper switch. Read off the status.

HINT: If the wiper switch status is OK the fault is not in the steering wheel module (SWM).

Was the wiper switch status OK?

- **YES**

  FAULT NOT FOUND: Troubleshooting has been completed.

- **NO**

  Refer to **REPLACING THE COMPONENT**

REPLACING THE COMPONENT

Replace the wiper switch.

Was a fault detected?

FAULT-TRACING INFORMATION

Condition

- No steering wheel module diagnostic trouble codes (DTCs) are stored in the central electronic module.
- No diagnostic trouble codes (DTCs) are stored in the steering wheel module.

Possible Source

- Defective tailgate washer.
- Defective control module.

Fault symptom[s]

- Rear windshield washing does not operate.

CHECKING THE AUDIO / CARPHONE SWITCH (2003-2004)

CHECKING THE AUDIO / CARPHONE SWITCH

CHECKING COMPONENTS

CHECKING THE STEERING WHEEL MODULE (SWM) (2003-2004)

CHECKING THE STEERING WHEEL MODULE (SWM)

FAULT-TRACING INFORMATION

Before continuing with fault-tracing, the following must be checked:

- All tests for the relevant symptom must have been carried out
- No component, connector or wiring faults etc. should have been detected.

Have all tests been carried out and no faults detected?

- **YES**

  Refer to **REPLACING THE COMPONENT**

- **NO**

  FAULT NOT FOUND: Troubleshooting has been completed.

REPLACING THE COMPONENT

Try replacing the steering wheel module (SWM).

CAUTION: A new control module is delivered without software. The control module must be programmed in order to function after replacement.

Remove the left side panel in the cargo compartment.

Release the integrated relay/fusebox. Lift the catch by the upper edge and angle out the integrated relay/fusebox.

Fig. 54: Cargo Compartment/Rear Relay/Fusebox Fuse Locations
Courtesy of VOLVO CARS CORPORATION

HINT: The rear panel in the side panel of the cargo compartment can be removed to change fuses.

RELAY AND FUSE LOCATION, 11D

For the location of the relays and fuses, see:

1. Appropriate service information for relevant model year
2. Decals at both the integrated relay box and fusebox in the car
3. Pocket data book
4. Owner's Manual.

INSTALLING THE INTEGRATED RELAY / FUSEBOX IN THE CARGO COMPARTMENT

Align the integrated relay/fusebox in the grooves in the bracket and press into place.

Install the left side panel in the cargo compartment.

REPLACING THE REAR ELECTRONIC MODULE (REM)

The rear electronic module (REM) is a separate unit in the relay box in the cargo compartment.

CAUTION: New software can only be ordered when the control module is installed in the car. VIDA (Volvo Scan Tool) reads off the new control module identity which is required to order the correct software.

Release the relay and fuse box. See **EXPOSING THE INTEGRATED RELAY/FUSEBOX IN THE CARGO COMPARTMENT**.

REMOVING THE CONTROL MODULE

Fig. 55: Disconnecting Control Module Connector
Courtesy of VOLVO CARS CORPORATION

Unscrew the screw holding the connector so that it is free of its threads. Check that the screw is free with your fingers.

Disconnect the connector. Use an open spanner and a support. See the illustration.

NOTE: Do not damage the terminal pins. Always check that the control module and control module box connectors do not have bent or damaged terminals or socket / sleeves. This may have been the cause of the fault.

Fig. 56: Identifying Relay Box In Passenger Compartment/Cargo Compartment
Courtesy of VOLVO CARS CORPORATION

Remove all relays and shunts bridged to the control module. Note the locations.

Fig. 57: Identifying Control Module Removal
Courtesy of VOLVO CARS CORPORATION

Release the catch on the rear. Use a screwdriver.

Lift and pull out the control module.

CHECK

Check that the control module connectors are intact.

INSTALLING THE CONTROL MODULE

- Press the control module into place so that the catch on the rear engages
- Position the connector. **Carefully** press the connector down.

NOTE: The pins are fragile. Check that the connector goes straight down into the control module.

- Tighten the screw for the connector
- Check that the connector cover is correctly positioned. Remedy if necessary
- Install the relays and shunts. Note their locations
- Install the integrated relay / fusebox. See **INSTALLING THE INTEGRATED RELAY / FUSEBOX**

IN THE CARGO COMPARTMENT.

ORDERING SOFTWARE

Order the software. See 9438285 .

FAULT-TRACING INFORMATION

Condition

- No steering wheel module diagnostic trouble codes (DTCs) are stored in the central electronic module.
- No diagnostic trouble codes (DTCs) are stored in the steering wheel module.

STEERING SHAFT BOOT

CHECKING THE BOOT FOR THE STEERING SHAFT/FIREWALL

Fig. 1: Identifying Bearing In Boot
Courtesy of VOLVO CARS CORPORATION

Check that the bearing in the boot is in position.

If it has become detached apply a little grease to the edge of the boot (around the hole). Press the bearing back down into the boot.

Check that the boot is correctly positioned against the firewall and that the snap ring is correctly positioned. Adjust if necessary.

NOTE: **It is essential that the above checks are carried out. Otherwise there may be noise from the transmission/engine and road noise in the passenger**

compartment.

- the ball joint nut (clean the exposed threads outside the nut before removing).

- the 2 x ball joint screws.

INSTALLING THE PRESS TOOL

Fig. 3: Press Tool 99907255
Courtesy of VOLVO CARS CORPORATION

When installing see **9997255** , install the tool's cap nut for the ball joint. Ensure that there is a clearance of 1-1.5 mm (A) between the nut and control arm.

NOTE: Thoroughly check that the correct nut is used as there are two different thread pitches.

Fig. 4: Press Tool 99907255

PREPARATORY WORK

REMOVING LINK ARM

Remove the link arm according to: **CONTROL ARM FRONT, REPLACING**.

NOTE: **The following method shows the position of the bushings in relation to the link arm.**

This method shows work done on left link arm. The placement on the right side is mirror-imaged.

NOTE: **It is very important for the bushings characteristics and service life that they are positioned correctly.**

REMOVAL

REMOVING THE FRONT BUSHING

Fig. 15: Pressing Out Front Bushing Using Special Service Tools

NOTE: Pay close attention to the bushing's position in the link arm.

The two slots in the bushing's inner sleeve shall be placed in 75 degrees direction in relation to the longitudinal line.

Mark up the bushing and link arm with a color marker.

INSTALLING THE REAR BUSHING, CONTINUED

Fig. 22: Installing Rear Bushing Using Special Service Tools
Courtesy of VOLVO CARS CORPORATION

Place the link arm in a workshop press. Use see **9997209** and see **9997051** , and a suitable sleeve.

Press in the bushing so that the distance on the plane between the bushing's inner sleeve and the machined surface on the link arm becomes 40 mm.

FINISHING

INSTALLING THE LINK ARM

Applies to all models:

Remove:

- the two screws
- the screw and nut
- the control arm.

INSTALLING

TIGHTENING TORQUE

For tightening torques, see **TIGHTENING TORQUE** .

INSTALLING THE CONTROL ARM

Install:

- the control arm
- the screw and nut

- the two screws.

NOTE: Use new screws.

For tightening torques, see **TIGHTENING TORQUE**

Only applies to cars with 4T65EV transmissions when removing the left-hand control arm:

Lower the engine. Install the screw for the front engine pad. M10.

Applies to the right-hand side only:

Install the hose for the EVAP canister and the fuel line for the engine block heater (if applicable) in their mountings.

INSTALLING THE DRIVE SHAFT

Fig. 28: Identifying Drive Shaft Screw Removal Using A Screwdriver As A Counter Hold On Brake Disc
Courtesy of VOLVO CARS CORPORATION

Install the drive shaft in the hub.

Install a new screw. Use a screwdriver as a counterhold.

For tightening torques, see **TIGHTENING TORQUE** .

INSTALLING THE NUT FOR THE BALL JOINT

Install the nut. M12.

INSTALLING THE SPLASH GUARD

Install the splashguard under the engine. M8.

Press out the stub axle. At the same time pull the drive shaft from the gearbox.

Hang the drive shaft from a hook see **9995045** .

NOTE: Be careful to not damage the drive shaft boot.

Loosen the ball joint from the control arm. See **BALL JOINT, REPLACING**

TIGHTENING TORQUE

For tightening torques, see **TIGHTENING TORQUE** .

INSTALLING THE STUB AXLE

Install:

- the stub axle on the trailing arm
- a new nut on the ball joint. Tighten. For tightening torques, see **TIGHTENING TORQUE** . Use a Torx spanner as counterhold.

NOTE: Make sure that the mating surfaces on the ball joint and control arm are clean.

Fig. 34: Identifying Drive Shaft Splines

Install:

- both screws retaining the spring strut in the stub axle. Use new screws and nuts.

Adjust the position of the stub axle and spring strut acc. to **WHEEL KNUCKLE / SPRING STRUT, CALIBRATING** . Tighten. For tightening torques, see **TIGHTENING TORQUE** . Use bevel protractor see **9512050** .

Install:

- the anti-roll bar link to the spring strut. Use a new nut. (M12) Counterhold using a Torx spanner so that the boot is not damaged
- the ABS sensor cable
- ABS sensor onto the stub axle. Tighten the ABS sensor. (M6).

NOTE: **Make sure that the sensor seat in the stub axle is absolutely clean. Clean the ABS sensor with a soft brush.**

Install:

- the track rod end onto the stub axle. Use a new nut. For tightening torques, see **TIGHTENING TORQUE** .

Fig. 36: Identifying Drive Shaft Screw Removal Using A Screwdriver As A Counter Hold On Brake Disc

Remove the steering arm from the wheel spindle

Slacken off the lock nut.

Remove:

- the steering arm and the lock nut
- the clamps (1) and (2).

Tape the threads on the inner steering arm to protect the boot when removing.

Remove the boot (3).

INSTALLING THE COUNTERHOLD

Fig. 41: Counter Hold
Courtesy of VOLVO CARS CORPORATION

Clean the surfaces on the steering rack and the tool **thoroughly** .

NOTE: **Cleanliness is very important as the seals in the steering gear are sensitive to scratches on the rack.**

Install counterhold see **9997020** .

Tighten to **25 Nm** .

Position the counterhold as close to the limiter as possible. When replacing with a longer limiter, measure the new limiter and position the counterhold so that there is enough space for the new limiter.

REMOVING LIMITER

Fig. 42: Identifying Steering Arm Tool (999 7083)

Secure the spring strut in a vise.

Remove:

- the nut for the shock absorber bearing. Use socket see **9995467** and a 3/8" Torx-wrench as a counterhold.
- the washer
- the support.

REMOVING THE SPRING

Fig. 52: Removing Spring

Take the load off the spring seat. Use hydraulic tool see **9512911** with see **9512914** .

Remove:

- the fixing nut on the shock absorber. Use socket see **9995469** and a 3/8" Torx-wrench as a counterhold.
- the spring seat
- the spring
- the rubber bump stop and gaiter.

Install:

- the bump stop with the boot
- the spring
- the spring seat.

Install the fixing nut. Tighten. See **TIGHTENING TORQUE** . Use socket see **9995469** and a 3/8" Torx-wrench as a counterhold.

Remove the spring clamps.

INSTALLING THE SHOCK ABSORBER BEARING

Tighten, see: **TIGHTENING TORQUE** . Use protractor see **9512050** .

Install:

- the anti-roll bar link to the spring strut. Use a new nut. Tighten. See: **TIGHTENING TORQUE** . Counterhold using a Torx wrench to prevent damage to the boot.
- The ABS sensor. Tighten to **10 Nm** .

NOTE: **Ensure that the ABS sensor seat in the stub axle is absolutely clean. Clean the ABS sensor with a soft brush.**

Install:

- the ABS sensor cable in the bracket.
- the wheel. See **INSTALLING WHEELS** .

General - Cleaning, Inspection And Adjustment

WHEEL ALIGNMENT

WHEEL ALIGNMENT, CHECKING / ADJUSTING

CHECKING/ADJUSTING

NOTE: **When working on the steering or wheel alignment on cars with DSTC, the adaptation of the steering wheel angle must be set to zero using VIDA (Volvo scan tool). Test drive. See TEST DRIVE FORM (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL) /BRAKE CONTROL MODULE), DESCRIPTION .**

NOTE: **For tightening torques, see: TIGHTENING TORQUE .**

NOTE: **When checking and adjusting front wheel alignment the following applies:**

- Any adjustment to the front camber angle must always be carried out before adjusting the toe angle.
- Since the car's rear wheels also have adjustable toe angles, the front toe angle must always be adjusted in relation to the car's geometric driving axis (the thrust line). This is to achieve maximum stability and minimum tyre wear.
- All measurements must be made using alignment equipment for four-wheel drive vehicles.
- All measurements must be made with the car empty
- All measurements must be made with a full fuel tank
- Check all the tire pressures before beginning measurement.

CHECK PLAY, FRONT

Fig. 1: Checking Front Play
Courtesy of VOLVO CARS CORPORATION

Raise the front end. Lift under the control arms as close to the ball joint as possible.

Check that there is no play in

- the tie rods
- the wheel bearings
- the upper spring strut mounting
- the ball joints or control arm bushings.

If there is play in any of the components above, this must be remedied before the wheel settings are checked/adjusted.

CHECKING PLAY, REAR

Lift up the rear suspension.

NOTE: Only the toe angle can be adjusted on the rear end but the camber angle must also be checked.

Check that there is no play in

- the wheel bearings. (If there is play the hub assembly must be replaced)
- the control arms, lateral link and track rod.

If there is play in any of the components above, this must be remedied before the wheel settings are checked/adjusted.

INSTALLING THE TEST EQUIPMENT

Fig. 2: Identifying Test Equipment Set Up On Front And Rear Wheels
Courtesy of VOLVO CARS CORPORATION

Set up the test equipment on the front and rear wheels. Set up the test equipment according to the instructions.

Position the turntables under the front wheels. Use turntables which take up lateral movement

NOTE: The car must stand level when the front wheels are on the turntables. This is to ensure that the correct values are obtained when checking the camber and caster.

Bounce the front and rear suspension heavily a few times when the car has sunk onto the turntables. This is so that the suspension resumes the normal setting.

HINT: The following order of work is recommended for best results

- Step 1 Camber angle front check/adjust.
- Step 2 Rear suspension angles check/adjust.
- Step 3 Check/adjust front toe angle.

CHECKING THE CAMBER ANGLE, FRONT

Check the camber angle on both sides.

ADJUSTING THE CAMBER ANGLE, FRONT

Fig. 3: Adjusting Camber Angle
Courtesy of VOLVO CARS CORPORATION

Conditions

The camber angle is adjusted by moving the stub axle at the upper hole in the spring strut outwards or inwards depending on the value measured.

If the stub axle is centered in the spring strut, the degree of adjustment is ± 0.5°.

Adjustment

Raise the front end.

Remove

- the instrument
- the wheel.

Replace the screws and nuts securing the spring strut to the stub axle. Tighten to light contact.

Press the stub axle in or out to the maximum, depending on the value measured in relation to the spring strut.

Tighten the screws according to **TIGHTENING TORQUE** .

Install

- the wheel. See **INSTALLING WHEELS** .
- the instrument and make a new adjustment according to the instructions.

Lower the car on the turn table. Rock the car a few times. Check the values.

CHECKING THE CAMBER ANGLE, REAR

Fig. 4: Adjusting Camber Angle
Courtesy of VOLVO CARS CORPORATION

Check the camber angle on both sides.

CHECKING REAR TOE ANGLE

Fig. 5: Checking That Instruments Are Adjusted In Relation To Each Other On Front And Rear Axles
Courtesy of VOLVO CARS CORPORATION

NOTE: Always check thrust angle when checking/adjusting rear toe angle.

Check that the instruments are adjusted in relation to each other on the front and rear axles. This is extremely important so that the rear wheel toe angle can be adjusted in relation to the car's thrust line (geometric driving axis). The thrust line is the line created when the toe angles for the rear wheels are equally divided. See the illustration.

The difference between the symmetry line of the wheels and the thrust line is called the thrust angle. The thrust angle must not deviate by more than a maximum of 0° ± 0.25° from the symmetry line of the wheels.

NOTE: The differences in the diagram are heavily exaggerated in order to illustrate the differences.

Fig. 6: Checking Symmetry Line Of Wheels, Thrust Line, And Thrust Angle
Courtesy of VOLVO CARS CORPORATION

Check

- the symmetry line of the wheels
- the thrust line
- the thrust angle
- Toe angle.

ADJUSTING REAR TOE ANGLE

Fig. 7: Identifying Screw For Drive Shaft Mounting
Courtesy of VOLVO CARS CORPORATION

- Slacken off the inner nut on the track rod
- Adjust the toe angle using the eccentric screw. Tighten the nuts slightly.
- Check the thrust angle. If it does not comply with the specified value, undo the nuts and readjust the toe angle.
- Tighten the nut. See: **TIGHTENING TORQUE** .

CHECKING THE CASTER ANGLE, FRONT

Fig. 8: Checking Caster Angle
Courtesy of VOLVO CARS CORPORATION

Check the caster angle on both sides.

The correct value is 4.0° ± 1.0°. The caster angle must not vary by more than 0.25° between the left and right-hand sides.

CHECKING FRONT TOE ANGLE

Fig. 9: Checking That Instruments Are Adjusted In Relation To Each Other On Front And Rear Axles
Courtesy of VOLVO CARS CORPORATION

Check that the instruments are calibrated to each other on the front and rear axles. This is very important so that the front toe angle can be adjusted in relation to the thrust line of the car (geometric driving axis). The thrust line is the line formed when the rear wheel toe angles are divided equally, see illustration.

The difference between the symmetry line of the wheels and the thrust line is called the thrust angle. The thrust angle must not deviate by more than a maximum of 0° ± 0.25° from the symmetry line of the wheels.

NOTE: The differences in the diagram are heavily exaggerated in order to illustrate the differences.

Check

- the symmetry line of the wheels
- the thrust line
- the thrust angle.

Fig. 10: Checking Symmetry Line Of Wheels, Thrust Line, And Thrust Angle
Courtesy of VOLVO CARS CORPORATION

ADJUSTING FRONT TOE ANGLE

Fig. 11: Identifying Lock Nut, Outer Steering Arm Inner To Steering Arm Inner
Courtesy of VOLVO CARS CORPORATION

Adjust with the tie rods after loosening the lock nuts. Adjusting towards a positive value will give toe-in and towards a negative value toe-out.

NOTE: The lengths of the tie rods must not vary between themselves by more than 2mm. Measure between the lock nut and the edge of thread.

Tighten the lock nut, outer steering arm inner to steering arm inner. See: **TIGHTENING TORQUE** .

Treat the strut threads using rustproofing agent after tightening.

ADJUSTING THE POSITION OF THE STEERING WHEEL

Fig. 12: Identifying Minor Misalignment Of Steering Wheel
Courtesy of VOLVO CARS CORPORATION

A minor misalignment of the steering wheel can be adjusted in conjunction with adjusting the toe angle above.

For larger deviations in the steering wheel, adjust the position of the steering wheel. See **ADJUSTING THE POSITION OF THE STEERING WHEEL**.

ADJUSTING THE POSITION OF THE STEERING WHEEL

Special tools:

see **9988695**

CAUTION: Cars with DSTC systems. When working on the steering or wheel alignment, the adaptation of the steering wheel angle must be set to zero using the diagnostic tool. Test drive. See TEST DRIVE FORM (DSTC (DYNAMIC STABILITY AND TRACTION CONTROL) /BRAKE CONTROL MODULE), DESCRIPTION .

CHECKING THE STEERING WHEEL POSITION

- Drive the car straight forward and check that the steering wheel is in the "straight ahead" position

- If the steering wheel position is incorrect adjust as follows.

ADJUSTING THE STEERING WHEEL POSITION

REMOVE THE STEERING WHEEL

- Remove the driver's airbag module. See **INTERIOR EQUIPMENT - REMOVAL, REPLACEMENT AND INSTALLATION** .

Fig. 13: Locking Screw From Parking Hole In Steering Wheel
Courtesy of VOLVO CARS CORPORATION

- Remove the locking screw from the ""parking hole"" in the steering wheel. Install the screw in the contact reel.

Fig. 14: Identifying Steering Wheel Screw
Courtesy of VOLVO CARS CORPORATION

- Remove the steering wheel screw
- Ensure that the front wheels and steering wheel are in the straight-ahead position
- Remove the steering wheel.

NOTE: **Take care to ensure that the connector does not catch on the steering wheel during removal.**

ZERO THE CONTACT REEL

Zero the contact reel. See **CONTACT REEL DRIVER AIRBAG MODULE, RESETTING** .

INSTALL THE STEERING WHEEL AND CHECK THE STEERING WHEEL POSITION

Fig. 15: Pulling Connectors From Contact Reel Through Steering Wheel
Courtesy of VOLVO CARS CORPORATION

NOTE: Ensure that front wheels are pointing straight ahead.

- Pull the connectors from the contact reel through the steering wheel
- Install the steering wheel carefully so that both catches on the contact reel are seated in the two recesses in the steering wheel hub
- Install the steering wheel screw. Use a **new screw** . Finger tighten.

CAUTION: Do not turn the steering wheel when it is on the steering shaft. Since the contact reel is locked, it will be damaged beyond repair if the wheel is turned in this situation.

- Remove the locking screw holding the contact reel. Install the contact reel in the parking hole in the steering wheel
- Connect tool see **9988695** to the contact reel cable
- Drive the car straight forward and check that the steering wheel is in the "straight ahead" position
- If the steering wheel position is incorrect repeat the adjustment.

TIGHTEN THE SCREW IN THE CENTER OF THE STEERING WHEEL

- Remove tool 998 8695
- Tighten the screw in the center of the steering wheel. Tighten to **35 Nm**
- Check that the SRS light is extinguished, i. e. that no DTCs are present.

INSTALL THE STEERING WHEEL MODULE

Fig. 16: Folding In Steering Wheel Module & Ensuring Wiring Lies Free And Is Not Trapped
Courtesy of VOLVO CARS CORPORATION

- Turn the ignition key to position I to unlock the steering wheel
- Position the lower section of the steering wheel module against the steering wheel
- Connect the connector
- Fold in the steering wheel module. Ensure that wiring lies free and is not trapped
- Secure the steering wheel module with the Torx screws from the side
- Tighten the steering wheel module screws. Tighten to **10 Nm** .

CHECK THE FUNCTION

Ensure that the steering wheel turns easily and that the steering lock functions.

Check that no diagnostic trouble codes (DTCs) have been stored while the repair was carried out.

Remove:

- the rear wheels
- the bracket between the filler pipe and the washer on the right-hand side
- the screws in the bracket under the exhaust pipe.

Position a lifting table under the sub-frame.

Apply the lifting table so that the load is taken off the sub-frame screws.

Remove the 2 x rear screws.

Carefully lower the sub-frame approximately 70 mm.

Slacken off the upper screw for the control arm

Remove:

- the screw in the sub-frame for the lower control arm
- the screw for the inner mounting for the lateral link. See **TIE ROD, REPLACING**.

REMOVING THE ANTI-ROLL BAR

Fig. 19: Removing Anti-Roll Bar
Courtesy of VOLVO CARS CORPORATION

Remove:

- the anti-roll bar from the outer mounting on the side bushing must be replaced. Use a Torx wrench as a counterhold so that the boot is not damaged
- the screws holding the anti-roll bar in the sub-frame.

Raise the outer end of the control arm slightly so that the inner section of the control arm tips down to release the inner bushing.

REMOVING THE BUSHING

Fig. 20: Removing Bushing Using Special Service Tool

NOTE: Install the bushing according to the previous markings.

Install the new bushing. Pull the bushing through the sub-frame as illustrated.

INSTALLING THE ANTI-ROLL BAR

Fig. 22: Installing Anti-Roll Bar
Courtesy of VOLVO CARS CORPORATION

Lower the outer ends of the control arm to the original position.

Tighten. See: **TIGHTENING TORQUE** .

Install:

- the 2 x M12 screws holding the anti-roll bar in the sub-frame
- the anti roll bar outer mountings.

Use a Torx wrench as a counterhold so that the boot is not damaged.

INSTALLING THE INNER MOUNTING FOR THE CONTROL ARM

Fig. 23: Installing Inner Mounting

Remove:

- the spring. See **SPRING REAR, REPLACING**
- the screw in the sub-frame for the lower control arm
- the control arm
- control arm rail (5740-1).

TIGHTENING TORQUE

For tightening torques, see **TIGHTENING TORQUE** .

NOTE: Tighten all joints and rubber bushings with the rear suspension in the normal position.

INSTALLING THE LOWER CONTROL ARM

Install:

- rail (5742-1) in the control arm

- the control arm in the sub-frame. Do not tighten yet
- the spring. See **SPRING REAR, REPLACING** .

Raise the control arms to their normal position using the tensioner. See **TENSIONER 999 5659, USER INSTRUCTIONS**.

Tighten the M12 screw for the inner mounting for the control arm.

NOTE: **If the car is equipped with Bi-Xenon lamps, the position sensor must be calibrated. Carry out calibration according to VIDA (Volvo scan tool).**

Remove:

- the screw for the inner rear control arm mounting
- the two screws for the inner front control arm mounting
- the control arm.

INSTALLING

TIGHTENING TORQUE

For tightening torques, see **TIGHTENING TORQUE** .

INSTALLING THE UPPER CONTROL ARM

Install:

- the screws for the inner rear control arm mounting

- the screws for the front inner control arm mounting
- the screws for the outer control arm mounting.

Install tensioner see **9995659** . See **TENSIONER 999 5659, USER INSTRUCTIONS**.

NOTE: The tensioner must be positioned as far out as possible on the tensioner plates to achieve the correct lifting force.

Tighten:

- the screws for the inner rear control arm mounting (M12)
- the screws for the front inner control arm mounting (M12)
- the screws for the outer control arm mounting (M12).

NOTE: Tighten the screws when the rear suspension is in the normal position.

FINISHING

Remove tensioner see **9995659** . See **TENSIONER 999 5659, USER INSTRUCTIONS**.

Install the wheel. See **INSTALLING WHEELS** .

NOTE: If the car is equipped with Bi-Xenon lamps, the position sensor must be calibrated. Carry out calibration according to VIDA (Volvo scan tool).

Start at the front when separating the three-way catalytic converter (TWC).

Hang up the three-way catalytic converter (TWC) on a hook.

Remove:

- the mountings in the sub-frame
- the rearmost exhaust mounting
- the screws for the bracket.

REMOVING THE SPRING

Install tensioner see **9995659** . See **TENSIONER 999 5659, USER INSTRUCTIONS**.

NOTE: The tensioner must be positioned as far out as possible on the tensioner plates to provide the correct lifting force.

Press the tensioner up approximately 25mm from the normal position.

Remove the screw from the lower mounting for the shock absorber.

Fig. 58: Tie Rod, Control Arm, Anti-Roll Bar Links
Courtesy of VOLVO CARS CORPORATION

Remove:

- the inner and outer screws for the tie rod
- the tie rod (1)
- the anti-roll bar link from the anti-roll bar (3). Use a Torx wrench as a counterhold so that the boot is not damaged
- the screws for the lateral link (4)
- the lateral link
- the screw for the control arm in the wheel spindle (2).

Lower the control arm with the tensioner. The spring is now unloaded.

Remove tensioner see **9995659** . See **TENSIONER 999 5659, USER INSTRUCTIONS**.

Press the control arm down by hand.

Remove:

- the spring

- the screw for the inner mounting for the control arm in the sub-frame
- the control arm.

REMOVING BRAKE COMPONENTS

Fig. 59: Brake Caliper And Brake Pads

Remove:

- the screws for the brake caliper holder (4)
- the brake caliper holder
- the screw for the brake disc (5)
- the brake disc.

Fig. 61: Identifying Return Spring And Expander
Courtesy of VOLVO CARS CORPORATION

Remove:

- the return spring at the expander
- the expander.

Lift the brake shoe slightly. Grip the expander and pull it outwards to access the cable.

Unhook or pry apart the expander (1) by the mechanical cable to remove it.

Fig. 62: Removing Guide Sleeve
Courtesy of VOLVO CARS CORPORATION

Remove the guide sleeve for the cable sleeve. Apply a screwdriver between the guide sleeve lug and wheel arch. Pry apart slightly to remove the sleeve.

LOWERING THE SUB-FRAME

Fig. 63: Lowering Sub-Frame
Courtesy of VOLVO CARS CORPORATION

Position a lifting table under the sub-frame.

Install the lifting table so that the load is taken off the sub-frame screws. Remove the bracket for the fuel pre-filter and brake pipes. Remove the sub-frame screws with the accompanying washers and brackets. Carefully lower the sub-frame approximately 100 mm.

Remove:

- the pressure pump
- the hose for the carbon filter container
- the plastic clips.

Lower the sub-frame.

REMOVING THE SHOCK ABSORBER

Remove the upper shock absorber nut. Use socket see **9995500** and a Torx wrench as a counterhold.

Fig. 64: Identifying Carbon Filter Container/Rear Axle Member Cover

Remove:

- the screw for the carbon filter container
- the carbon filter container
- the screws for the cover on the rear axle member
- the rear axle member cover.

Fig. 65: Screw And Wheel Spindle From Upper Control Arm
Courtesy of VOLVO CARS CORPORATION

Slacken off the screw for the outer control arm mounting three turns.

Use tool: hydraulic hole cylinder see **9512923** , locating pin see **9997031** and mounting bracket see **9997030** together with threaded rod see **9997039** .

Press off the wheel spindle.

Remove:

- the screw
- wheel spindle.

NOTE: Only press until the bushing releases from the splined area.

Fig. 66: Removing Inner Rear Control Arm Mounting
Courtesy of VOLVO CARS CORPORATION

Remove the 2 screws for the inner front control arm mounting.

Slacken off the screw three turns for the inner rear control arm mounting. Use puller see **9985434** with counterhold see **9997074** .

NOTE: Only press until the bushing releases from the splined area.

Remove the screw.

Remove:

- the upper control arm
- the 4 screws for the anti-roll bar
- the anti-roll bar.

INSTALLATION

TIGHTENING TORQUE

For tightening torques, see **TIGHTENING TORQUE** .

INSTALLING THE SUB-FRAME

Install:

- the anti-roll bar
- the 4 M10 screws for the anti-roll bar in the sub-frame.

INSTALLING THE SHOCK ABSORBER

Raise the new shock absorber to the upper mounting.

Install the new nut. Tighten. See **TIGHTENING TORQUE** .

NOTE: Ensure that the bushing seats correctly in the opening in the rear suspension.

Install:

- the sub-frame
- the M12 screws for the sub-frame cover
- the carbon filter container
- the M6 screws for the carbon filter container.

INSTALLING THE UPPER CONTROL ARM

Install:

- the screws for the rear control arm mounting. Only tighten a few turns
- the front upper control arm mounting using an M12 screw.

INSTALLING THE WHEEL SPINDLE

Install the screw on the outer control arm mounting in the wheel spindle. Only tighten a few turns.

LIFTING THE SUB-FRAME

Lift up the sub-frame approximately 100 mm from the upper position.

Install:

- the clamp for the pressure pump hose
- the pressure pump on the bracket
- the plastic clips.

Raise the sub-frame to the upper position.

Install:

- the bracket for the fuel filter using an M6 screw
- the bracket for the brake pipes using an M6 screw
- the M6 screws for the bracket for the sub-frame front mounting
- the 4 M12 screws for the sub-frame.

For tightening torques, see **TIGHTENING TORQUE** .

INSTALLING THE SPRING

Fig. 67: Lower Control Arm
Courtesy of VOLVO CARS CORPORATION

Install:

- the lower control arm
- the screw for the lower control arm on the sub-frame. Finger tighten
- the spring.

Press up the control arm by hand.

Install the screw on the control arm in the wheel spindle. Finger tighten.

NOTE: Check that the spring is correctly installed in the lower spring seat.

Install:

- the parking brake cable
- the expander
- the spring for the parking brake shoes
- the brake disc
- the 1 M6 screw for the brake disc
- the ABS sensor using an M6 screw
- the ABS line on the wheel spindle and the lateral link.

INSTALLING THE BRAKE CALIPER

Install:

- the brake caliper holder
- the sliding pin for the brake caliper. Tighten. See **TIGHTENING TORQUE**
- the brake pads.

Install tensioner see **9995659** . See **TENSIONER 999 5659, USER INSTRUCTIONS**.

Press the tensioner up approximately 25mm from the normal position.

NOTE: The tensioner must be positioned as far out as possible on the tensioner plates to provide the correct lifting force.

Install the screw for the lower mounting for the shock absorber. Finger tighten.

Press the control arms up into the normal position.

Tighten (lower control arm):

- the lower control arm in the wheel spindle using an M12 screw
- the lower inner control arm mounting in the sub-frame using an M12 screw
- the lower mounting for the shock absorber using an M12 screw.

Tighten:

- the M12 screws for the lateral link
- the M12 screws for the tie rod
- the anti-roll bar link for the anti-roll bar using an M12 screw.

Use a Torx wrench as a counterhold so that the boot is not damaged.

Tighten (upper control arm):

- the rear upper control arm mounting using an M12 screw
- the upper control arm mounting in the wheel spindle using an M12 screw.

INSTALLING THE EXHAUST SYSTEM

Install the exhaust system. See **EXHAUST SYSTEM, REPLACING** .

FINISHING

Remove tensioner see **9995659** . See **TENSIONER 999 5659, USER INSTRUCTIONS**.

Install the wheel. See **INSTALLING WHEELS** .

Activate the self adjuster for the parking brake. See **PARKING BRAKE SELF-ADJUSTMENT, RESETTING** .

Align the wheels. See **WHEEL ALIGNMENT, CHECKING / ADJUSTING** .

PREPARATORY WORK

REMOVING WHEELS

Raise the vehicle.

Remove the wheels.

REMOVAL

REMOVING THE EXHAUST SYSTEM

Fig. 68: Exhaust System, Brackets And Fasteners
Courtesy of VOLVO CARS CORPORATION

Start at the front when separating the three-way catalytic converter (TWC).

Hang up the three-way catalytic converter (TWC) on a hook.

Remove:

- the mountings in the sub-frame

- the rearmost exhaust mounting
- the screws in the bracket.

REMOVING THE POSITION SENSOR

NOTE: Only applies to cars with Bi-Xenon lights.

Remove the position sensor for Bi-Xenon lamps. See **POSITION SENSOR BI-XENON LAMPS, REPLACING** .

REMOVING THE SPRING

Install tensioner see **9995659** . See **TENSIONER 999 5659, USER INSTRUCTIONS**.

NOTE: The tensioner must be positioned as far out as possible on the tensioner plates to provide the correct lifting force.

Press the tensioner up approximately 25 mm from the normal position.

Remove the screw from the lower mounting for the shock absorber.

Fig. 69: Tie Rod, Control Arm, Anti-Roll Bar Links
Courtesy of VOLVO CARS CORPORATION

Remove:

- the inner and outer screws for the tie rod
- the tie rod (1)
- the link from the anti-roll bar (3). Use a Torx wrench as a counterhold so that the boot is not damaged
- the screws for the lateral link (4)
- the lateral link
- the screw for the control arm in the wheel spindle (2).

Lower the control arm with the tensioner. The spring is now unloaded.

Remove tensioner see **9995659** see: **TENSIONER 999 5659, USER INSTRUCTIONS**.

Press the control arm down by hand.

Remove:

- the spring
- the screw in the inner mounting on the control arm in the sub-frame
- the control arm.

REMOVING THE BRAKE CALIPER

Fig. 70: Brake Caliper And Brake Pads
Courtesy of VOLVO CARS CORPORATION

Remove:

- the sliding pin for the brake caliper
- the brake pads
- the brake caliper. Hang the brake caliper on a hook in the sub-frame
- the screw for the ABS sensor
- the ABS sensor
- the ABS line on the wheel spindle.

Fig. 71: Brake Caliper And Brake Disc Screws

Remove:

- the screws for the holder on the brake caliper (4)
- the holder for the brake caliper
- the screw for the brake disc (5)
- the brake disc.

Fig. 72: Identifying Return Spring And Expander
Courtesy of VOLVO CARS CORPORATION

Remove:

- the return spring at the expander
- the expander.

Lift the brake shoe slightly. Grip the expander and pull it outwards to access the cable.

Unhook or pry apart the expander (1) by the mechanical cable to remove it.

Fig. 73: Removing Guide Sleeve
Courtesy of VOLVO CARS CORPORATION

Remove the guide sleeve for the cable sleeve. Apply a screwdriver between the guide sleeve lug and wheel arch. Pry apart slightly to remove the sleeve.

Fig. 74: Identifying Propeller Shaft Bolts
Courtesy of VOLVO CARS CORPORATION

NOTE: Only applies to vehicles with 6-cylinder engines.

Pay attention to the following when removing propeller shaft

Follow instructions. See **PROPELLER SHAFT, SPECIAL INFORMATION**

NOTE: Only applies to cars with AWD.

Remove:

- the 4 screws for the propeller shaft
- the propeller shaft
- the power supply cable and the clamps for the Active on Demand coupling (AOC).

LOWERING THE SUB-FRAME

Fig. 75: Lowering Sub-Frame
Courtesy of VOLVO CARS CORPORATION

Position a lifting table under the sub-frame.

Apply the lifting table so that the load is taken off the sub-frame screws. Remove the bracket for the fuel pre-filter and brake pipe. Remove the sub-frame screws with accompanying washers and brackets. Carefully lower the sub-frame approximately 100 mm.

Remove:

- the pressure pump
- the hose for the carbon filter container
- the plastic clips.

Lower the sub-frame.

REMOVING THE SHOCK ABSORBER

Remove the upper shock absorber nut. Use socket see **9995500** and a Torx wrench as a counterhold.

Fig. 76: Identifying Carbon Filter Container/Sub-Frame Cover

Remove:

- the screw for the carbon filter container
- the carbon filter container
- the screws for the sub-frame cover
- the cover on the sub-frame.

Fig. 77: Screw And Wheel Spindle From Upper Control Arm
Courtesy of VOLVO CARS CORPORATION

Slacken off the screw for the outer control arm mounting. Slacken off 3 turns.

Use: see **9512923** , see **9997031** and see **9997030** together with threaded rod see **9997039** .

Press off the wheel spindle.

NOTE: Only applies to cars with AWD.

Remove:

- the screw
- the screw for the drive shaft.

Press in the drive shaft and remove the spindle.

Fig. 78: Removing Inner Rear Control Arm Mounting
Courtesy of VOLVO CARS CORPORATION

Remove the 2 screws for the inner front control arm mounting.

Slacken off the screw for the inner rear control arm mounting. Slacken off 3 turns. Use puller see **9985434** with counterhold see **9997074** .

NOTE: Only press until the bushing releases from its splined area.

Remove the screw.

Remove:

- the upper control arm
- the 4 x screws for the anti-roll bar
- the anti-roll bar.

REMOVING THE DRIVE SHAFT FROM THE FINAL DRIVE

NOTE: Only applies to cars with AWD.

Remove the drive shafts.

Use a larger screwdriver. Position the tip of the screwdriver between the constant velocity joint and the final drive.

Tap firmly so that the snap ring for the drive shaft releases. Pull out the drive shaft. Do not damage the drive shaft seal.

Install sealing plug see **9997060** .

REMOVING THE FINAL DRIVE

NOTE: Only applies to cars with AWD.

Remove:

- the 3 screws for the final drive
- the final drive.

INSTALLATION

NOTE: For tightening torques, see: TIGHTENING TORQUE .

NOTE: To ensure that there is no exhaust leakage, see: FLANGED JOINT, ASSEMBLING .

INSTALLING THE SUB-FRAME

NOTE: Only applies to cars with AWD.

Install:

- the final drive
- the 3 M12 screws for the final drive
- the drive shafts
- the anti-roll bar
- the 4 x M10 screws for the anti-roll bar in the sub-frame
- the anti-roll bar
- the 4 x M10 screws for the anti-roll bar in the sub-frame.

INSTALLING THE SHOCK ABSORBER

Raise the new shock absorber to the upper mounting.

Install the new nut.

For tightening torques, see: **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC**

COMPONENTS .

NOTE: Make sure that the bushing seats correctly in the opening in the rear end.

Install:

- the sub-frame
- the M12 screws for the sub-frame cover
- the carbon filter container
- the M6 screws for the carbon filter container.

INSTALLING THE UPPER CONTROL ARM

Install:

- the screws for the rear control arm mounting. Only tighten a few turns
- the front upper control arm mounting, M12.

INSTALLING THE WHEEL SPINDLE

Install the screw on the outer control arm mounting in the wheel spindle. Only tighten a few turns.

NOTE: Only applies to cars with AWD.

Install the drive shaft in the wheel spindle, M10.

LIFTING SUB-FRAME

Lift up the sub-frame approximately 100 mm from the upper position.

Install:

- the clamp for the hose on the pressure pump
- the pressure pump on the bracket
- the plastic clips.

Raise the sub-frame to the upper position.

Install:

- the bracket for the fuel pre-filter, M6
- the bracket for the brake pipe, M6
- the M6 screws for the front mounting for the bracket on the sub-frame
- the 4 x M12 screws for the sub-frame. For model year 2005- see **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS** .

INSTALLING THE PROPELLER SHAFT

NOTE: Only applies to cars with AWD.

Install:

- the propeller shaft
- the 4 x screws for the propeller shaft. Tighten. See **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS** .
- the power supply cable and the clamps for the Active on Demand coupling (AOC).

INSTALLING THE SPRING

Fig. 79: Lower Control Arm
Courtesy of VOLVO CARS CORPORATION

Install:

- the lower control arm
- the screw holding the lower control arm to the sub-frame. Finger tighten
- the spring

Press up the control arm by hand.

Install the screw for the control arm in the wheel spindle. Finger tighten.

NOTE: Check that the spring ends up correctly installed in the lower spring seat.

Install:

- the parking brake cable
- the expander
- the spring for the parking brake shoes
- the brake disc
- the M6 screw for the brake disc
- the ABS sensor, M6
- the ABS line on the wheel spindle and the lateral link.

INSTALLING THE BRAKE CALIPER

Install:

- the holder for the brake caliper
- the sliding pin for the brake caliper. Tighten. See **SUMMARY OF SPECIFIC COMPONENTS AND TIGHTENING TORQUES** .
- the brake pads
- the tensioner see **9995659** . See **TENSIONER 999 5659, USER INSTRUCTIONS**.

Press the tensioner up approximately 25 mm from the normal position.

NOTE: The tensioner must be positioned as far out as possible on the tensioner plates to provide the correct lifting force.

Install the screw for the lower mounting for the shock absorber. Finger tighten.

Move the control arms to the normal position. See **NORMAL POSITION** .

Tighten:

- the M12 screws for the tie rod
- the M12 screws for the lateral link
- the anti-roll bar link, M12, to the anti-roll bar. Use a Torx wrench as a counterhold on the ball joint so that the rubber boot is not damaged

Tighten (lower control arm):

- the lower control arm, M12, in the wheel spindle
- the lower inner control arm mounting, M12, in the sub-frame

- the lower mounting, M12, in the shock absorber.

Tighten (upper control arm):

- the rear upper control arm mounting, M12
- the upper control arm mounting in the wheel spindle, M12.

REMOVING THE TENSIONER

Remove tensioner. see **9995659** See: **TENSIONER 999 5659, USER INSTRUCTIONS**.

INSTALLING THE POSITION SENSOR

NOTE: Only applies to cars with Bi-Xenon lights.

Install the position sensor for Bi-Xenon lamps. See **POSITION SENSOR BI-XENON LAMPS, REPLACING** .

INSTALLING THE EXHAUST SYSTEM

Install the exhaust system. See **EXHAUST SYSTEM, REPLACING** .

INSTALLING WHEELS

Install the wheels. See: **INSTALLING WHEELS** .

Carry out wheel alignment in accordance with: **WHEEL ALIGNMENT, CHECKING / ADJUSTING** .

NOTE: If the vehicle is equipped with Bi-Xenon lamps, the position sensor must be calibrated. Calibrate according to Vehicle communication, Function group 3, Electrical system, Rear electronic module (REM).

USER INSTRUCTIONS

Special tools:

see **9995659**

see **9997061**

see **9989761**

NOTE: The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

PREPARATION

Raise the vehicle.

Remove the handbrake cable mountings from the sub-frame.

Install the tensioner.

NOTE: The tensioner must be positioned as far out as possible on the tensioner plates

to provide the correct lifting force.

USE THE TENSIONER

Fig. 81: Identifying Mounting 9997061
Courtesy of VOLVO CARS CORPORATION

Tensioner see **9995659** is used when working on the suspension. It is vital that the screwed joints for the rubber bushings are tightened in the normal position (in the same position as when the car is on the ground and has three people in the car and a full fuel tank).

The tensioner relieves the pressure on the components in the suspension when removing and installing.

The tool is secured to the sub-frame with mounting see **9997061** . This means that the lift stability is not affected during work.

NOTE: Thoroughly check that the power cable to the AOC connection does not get trapped between tool 9997061 and the sub frame.

Fig. 82: Identifying Tensioner Caliper 9995659
Courtesy of VOLVO CARS CORPORATION

Install the threaded bar on the tensioner caliper see **9995659** .

Fig. 83: Identifying Threaded Bar 9995659 And Mounting 9997061
Courtesy of VOLVO CARS CORPORATION

Lift up the tensioner caliper with the threaded bar see **9995659** .

Insert the threaded bar in the mounting see **9997061** from underneath.

Insert the locking washer with the handle in from the side in mounting see **9997061** under the threaded screw.

Lock the screw in the locking washer. Align the locking washer in the mounting.

NOTE: The locking washer has a locating pin which must be aligned with the screw.

Fig. 84: Identifying Screws From Kit 9989761
Courtesy of VOLVO CARS CORPORATION

Install the 2 screws (5740-3c) from kit see **9989761** in the control arm holes.

Fig. 85: Identifying Rails 5740-1
Courtesy of VOLVO CARS CORPORATION

Install the rails 5740-1 modified according to (VM-277) on the control arms.

Make sure that the outer support lugs of the rail come in contact with the edge of the cast holes in the control arms and that the inner of the two center holes is used for the screw.

Make sure that the rollers on the tensioner comes in contact with the rails on both sides.

NOTE: The tensioner must be positioned as far out as possible on the rails with the lifting arms extended equally on both sides to provide the correct lifting force.

Fig. 86: Identifying Control Arms At Normal Position
Courtesy of VOLVO CARS CORPORATION

Raise the control arms to their normal position using the tensioner.

NORMAL POSITION

Fig. 87: Checking Distance From Fender Edge To Center Of Wheel
Courtesy of VOLVO CARS CORPORATION

The normal position of the rear suspension is 453 mm from the wing edge to the center of the wheel.

REMOVING THE TENSIONER

Detach the tensioner, pull out the fork and lower the tensioner using the threaded bar.

Remove:

- mounting see **9995659** from the sub frame.
- the rails 5740-1 from the control arms.

Install the handbrake cable mountings in the sub-frame.

LEVEL CONTROL

LEVEL CONTROL

Fig. 1: Folding Front Backrest
Courtesy of VOLVO CARS CORPORATION

- Fold the front backrest forward in the second row of seats.

Fig. 2: Removing Two Center Floor Hatches
Courtesy of VOLVO CARS CORPORATION

- Remove the two floor hatches by first lifting up a little and then pulling them out of their mountings at the front edge.

If the rear floor hatch has bag holders underneath, the floor hatch is secured by a strap with knob on each short side of the storage box.

- Turn the knob 90° and remove the straps.

Fig. 3: Identifying Storage Boxes

REMOVING LOAD FLOOR SUPPORT

Fig. 6: Load Floor Support Screws
Courtesy of VOLVO CARS CORPORATION

- Remove the four screws holding the load floor support at the rear edge.

Fig. 7: Removing Jack Strap
Courtesy of VOLVO CARS CORPORATION

- Remove the screw at the front edge of the load floor support.

Fig. 8: Removing Load Floor Support
Courtesy of VOLVO CARS CORPORATION

- Carefully pull off the load floor support at the front edge by lifting it up slightly so that it releases from the insulation. Then pull it slightly in towards the center of the car. Pull carefully as the load floor support is fragile.

Fig. 9: Removing Load Floor Support
Courtesy of VOLVO CARS CORPORATION

- Carefully pull off the load floor support at the rear edge by first pressing in the side panel slightly at the rear edge, opposite the two stud screws on the load floor support so that it goes free and then lift it out.

NOTE: Do not damage the load floor support as it is fragile.

Fig. 10: Folding Insulation
Courtesy of VOLVO CARS CORPORATION

- Fold the insulation from the shock absorber mounting in the cargo compartment to one side.

Fig. 11: Removing Shock Absorber Mounting Cover
Courtesy of VOLVO CARS CORPORATION

- Carefully fold the foam rubber seal from the upper shock absorber mounting to one side.
- Remove the cover from above the shock absorber mounting.

REMOVING SHOCK ABSORBER

Fig. 12: Removing Shock Absorber Upper Bearing Nut Using 999 5500
Courtesy of VOLVO CARS CORPORATION

- Remove the nut for the shock absorber's upper bearing. Use sleeve part no. 9995500 and Torx socket 40 as counterhold.
- Place the nut to one side, a new panel is in the kit.
- Repeat steps, see **REMOVING LOAD FLOOR SUPPORT** and **REMOVING SHOCK ABSORBER** for the other side.

REMOVING/INSTALLING SHOCK ABSORBER

Fig. 13: Shock Absorber/Lower Control Arm Mounting Screw
Courtesy of VOLVO CARS CORPORATION

- Raise the car.
- Remove the wheels.
- Remove the lower screw in the shock absorber's mounting at the lower control arm. Place the screw to one side, a new one is in the kit.
- Remove the shock absorber.

Fig. 14: Relieving Load On Lateral Links Front Mounting Screw
Courtesy of VOLVO CARS CORPORATION

- Secure a strap between the jack mounting and outer hole in the underneath of the lower control arm to relieve the load from the screw for the lateral link's front mounting.

Fig. 15: Removing Lateral Link Screw
Courtesy of VOLVO CARS CORPORATION

- Take the workshop lift and position it under the lateral link's rear mounting in the wheel spindle to relieve the load from the screw for the lateral link's front mounting.
- Remove the screw in the lateral link's front mounting and relieve the load at the same time using the strap and workshop lift.
- Put away the screw, new is included in the kit.

Fig. 16: Removing Screw And Nut From Track Rods
Courtesy of VOLVO CARS CORPORATION

- Remove the screw and nut for the track rod's mounting in the wheel spindle and place the end above the mounting.
- Discard the screw and nut. There are new ones in the kit.

Fig. 17: Positioning Lift Under Rear Mounting Eye
Courtesy of VOLVO CARS CORPORATION

- Position the workshop lift under the rear mounting eye for the shock absorber's lower mounting, to relieve the load from the screw for the lower control arm's mounting in the wheel spindle.
- Relieve the load, remove the screw and lower the workshop lift carefully.
- Put away the screw, new is included in the kit.

Fig. 18: Lowering Control Arm's Outer End
Courtesy of VOLVO CARS CORPORATION

- Lower the lower control arm's outer end as far as possible so that the old spring can be removed upwards.

Fig. 19: Installing Spring
Courtesy of VOLVO CARS CORPORATION

- Take the new spring from the kit, insert it from above with the wider part of the spring facing down. The control arm may need pushing down slightly to get the spring in place.
- Position the spring's ends against the relevant stop in the upper mounting and control arm.
- Take the workshop lift and position it under the rear eyelet for the shock absorber's mounting in the control arm.
- Carefully push the control arm up into position. Take a new M12x100 screw from the kit and tighten the control arm to the wheel spindle. Do not tighten fully yet.

Fig. 20: Installing Track Rod
Courtesy of VOLVO CARS CORPORATION

- Take a new M12x60 screw and nut from the kit for the track rod.
- Place the track rod's loose end into position.
- Place the workshop lift under the lateral link's rear mounting in the wheel spindle.

- Press the wheel spindle up and align the screw in the track rod and wheel spindle. Install the nut, but do not tighten fully yet,

Fig. 21: Installing Lateral Link's Front End
Courtesy of VOLVO CARS CORPORATION

- Take a new M12x100 screw from the kit for the lateral link's front mounting.
- Insert the lateral link's front end into position by pushing the wheel spindle up using the workshop lift. Use the lateral link's mounting in the wheel spindle as a lifting point. Adjust to the correct position using the strap and install the new screw. Do not tighten fully yet.

Fig. 22: Lubricating Shock Absorber's Upper Bearing
Courtesy of VOLVO CARS CORPORATION

- Take the shock absorber's upper bearing and lubricate it using soapy water or similar to that it slides into the upper mounting more easily.

Fig. 23: Positioning Bearing On Shock Absorber
Courtesy of VOLVO CARS CORPORATION

- Take the new shock absorber from the kit and install the bearing. Ensure that the bearing is positioned on the shock absorber with the bearing slightly turned in relation to the length of the car, to fit in the corresponding hole in the upper mounting in the body.

INSTALLING SHOCK ABSORBER

- Move up the new shock absorber through the lower control arm, spring and up into the mounting in the body. Ensure that the loose bearing does not rotate on the shock absorber and ends up in the wrong position.
- Take a new M12x110 screw from the kit and tighten the shock absorber. Torque tighten to **80 Nm (59 lbf. ft.)** .
- Remove the strap and workshop lift.
- Repeat steps, see **REMOVING/INSTALLING SHOCK ABSORBER** and **INSTALLING SHOCK ABSORBER** for the other side.

INSTALLING SHOCK ABSORBER, CONTINUED

Fig. 24: Positioning Upper Shock Absorber Bearing
Courtesy of VOLVO CARS CORPORATION

- Lower the car to almost ground level.
- Take a jack and position it under the shock absorber's lower mounting and raise slightly.
- Check that the upper shock absorber bearing is correctly positioned in its upper mounting in the body by moving the loose washer (1) for the bearing that is located there. The bearing must be positioned in the upper mounting as illustrated.

INSTALLING SHOCK ABSORBER, CONTINUED

Fig. 25: Installing Shock Absorber Assembly
Courtesy of VOLVO CARS CORPORATION

- When the bearing is correctly positioned, raise further using the jack until the bearing is fully up in the mounting.
- Pull out the washer and install it on the shock absorber
- Take a new nut from the kit, install it on the shock absorber and tighten. Torque tighten to **80 Nm (59 lbf.**

ft.) . Use sleeve part no. 999 5500 and Torx socket 40 as counterhold.

- Remove the jack.
- Repeat steps, see **INSTALLING SHOCK ABSORBER, CONTINUED** and **INSTALLING SHOCK ABSORBER, CONTINUED** for the other side.

Fig. 26: Releasing Parking Brake Cables
Courtesy of VOLVO CARS CORPORATION

- Raise the car.
- Release the parking brake cables' mountings from the sub frame.

RELIEVING THE LOAD FROM THE REAR SUSPENSION USING TENSIONER 999 5659

Illustration A

Fig. 27: Special Service Tool -Tensioner 999 5659
Courtesy of VOLVO CARS CORPORATION

Tensioner, part no. 999 5659, is used when working with suspension because it is extremely important that the screwed joint to the rubber bushings is tightened in the normal position, i. e. same position as when the car is on the ground with three people in the car and a full tank of fuel. Use the tensioner to relieve the load from the component parts in the suspension when at removal/installation.

Illustration B

Fig. 28: Special Service Tool - Mounting 999 7061
Courtesy of VOLVO CARS CORPORATION

The tool is attached in the subframe itself with mounting part no. 999 7061. This means that the stability of the lift is not affected during work.

Illustration C

Fig. 29: Installing Tensioner To Mounting
Courtesy of VOLVO CARS CORPORATION

- Install the threaded bar on the tensioner (part no. 999 5659).

- Lift up the tensioner with the threaded bar (part no. 999 5659).
- Insert the threaded bar into the mounting (part no. 999 7061) from underneath.
- Take the locking washer with handle and insert it from the side into the mounting (part no. 999 7061) under the threaded screw.
- Lock the screw in the locking washer and align the locking washer into the mounting.

NOTE: The locking washer has a guide pin that must fit the screw.

Fig. 30: Installing Screws Into Control Arm's Hole

- Install the two screws, part no. 5470-36, from kit, part no. 998 9761, into the control arms' holes.

Fig. 31: Installing Rails Onto Control Arm
Courtesy of VOLVO CARS CORPORATION

- Install the rails, part no. 5740-1, modified according to VM-276, on the control arms. Ensure that the rollers are against the rails on both sides of the control arms.

NOTE: **The tensioner must be applied as far out as possible on the tensioner plates in order to provide the correct lifting force.**

Fig. 32: Adjusting Control Arms Using Tensioner
Courtesy of VOLVO CARS CORPORATION

- Move the control arms up to the normal position using the tensioner.

Fig. 33: Setting Control Arms
Courtesy of VOLVO CARS CORPORATION

- Move the control arms up so far that the dimension between the wheel center and the wing edge is 453 mm (17 13/16").

  The track rod's mountings in the wheel spindles **80 Nm (59 lbf. ft.)**

  The control arms' lower mountings in the wheel spindles **80 Nm (59 lbf. ft.)**

  The lateral link's front mountings in the body **80 Nm (59 lbf. ft.)**
- Torque tighten the screws in the slackened joint as follows:

The track rod's mountings in the wheel spindles **80 Nm (59 lbf. ft.)**
The control arms' lower mountings in the wheel spindles **80 Nm (59 lbf. ft.)**
The lateral link's front mountings in the body **80 Nm (59 lbf. ft.)**

- Remove the tensioner with component parts.
- Reinstall the mountings for the parking brake cables in the subframe.

Fig. 34: Installing Wheels
Courtesy of VOLVO CARS CORPORATION

- Lower the car.
- Reinstall the wheels. Tighten the wheel bolts alternately and torque tighten to **140 Nm (103 lbf. ft.)**
- Reinstall the covers and the foam rubber seals over the upper shock absorber mountings.
- Fold the insulation panels and floor mats back.
- Reset the seats.

Reinstall:

- load floor support
- the jack
- the side floor hatches
- the storage boxes
- the floor hatches.

Remove the heated oxygen sensor's wiring from the right side of the **sub-frame.** .

LOWERING THE SUB-FRAME

Fig. 13: Identifying Rear Sub-Frame Screws, Brackets & Washers
Courtesy of VOLVO CARS CORPORATION

Position a mobile jack with universal plate see **9995972** at the rear of the sub-frame.

Remove the following on both sides:

- the two screws holding the sub-frame bracket in the body
- the rear screw for the sub-frame with the bracket and washer.

Fig. 14: Lowering Sub-Frame

Remove:

- the screws for the anti-roll bar
- the anti-roll bar.

INSTALLATION

NOTE: **To ensure that there is no exhaust leakage, see: FLANGED JOINT, ASSEMBLING .**

NOTE: **For tightening torques, see TIGHTENING TORQUE .**

INSTALLING THE ANTI-ROLL BAR

Remove:

- the anti-roll bar
- the screws for the anti-roll bar. (M10)
- the nut for the anti-roll bar link on both sides. (M12).

Use a Torx wrench as a counterhold so that the gaiter is not damaged.

INSTALLING THE SUB-FRAME

Fig. 17: Identifying Rear Sub-Frame Screws, Brackets & Washers
Courtesy of VOLVO CARS CORPORATION

Raise the subframe.

Install the sub-frame's four screws together with the sub-frame's brackets and engine heater, if installed.

Use new screws. Lube the screws with oil.

Tighten acc. to: **TIGHTENING TORQUE** . First tighten the screws on the sub-frame's left side, then on the right.

Tighten the screws for the brackets M10 with 50 Nm.

Remove the lifting table.

INSTALLING THE NUTS AND SCREW FOR THE STEERING GEAR

Install the four nuts and the screw holding the steering gear. Use new nuts and a new screw. (M10)

INSTALLING THE EXHAUST MOUNTING

Install the rubber mountings for the exhaust pipe.

HINT: Use soap solution to facilitate installing the rubber mountings.

INSTALLING THE SIPS MEMBER

Install:

- the brake pipe in the snap fastener on the member
- The SIPS member.
- the four screws for the SIPS (side impact protection system) member mounting. (M8).

INSTALLING THE SKID PLATE

Move the skid plate up into the bumper wraparound.

Press forwards until the mounting brackets engage in the sub frame.

Install:

- the six screws. (M10)
- the splash guard under the engine. (M8).

INSTALLING THE RIGHT-HAND ENGINE MOUNTING

Install the two screws for the right-hand engine mounting. Use new screws.

Fold the fender liner back into position.

Install:

- the skid plate
- the plastic nuts
- the front wheel. See **INSTALLING WHEELS** .

Applies only to the T6:

Install the four screws for the vibration damper. Use new screws.

For tightening torques, see **TIGHTENING TORQUE** .

REMOVING LIFTING TOOLS

Remove:

- lifting tools see **9995716** and lifting hooks see **9995460** .
- lifting eye see **9997018** .

Courtesy of VOLVO CARS CORPORATION

Remove:

- the wheel
- the anti-roll bar link from the mountings. Use socket see **9995500** and a Torx wrench as a counterhold so that the boot is not damaged.

INSTALLING THE ANTI-ROLL BAR LINK

Install:

- the anti-roll bar link in the spring strut. See: **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS**
- the anti-roll bar link in the anti-roll bar. See: **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS** .

NOTE: Use socket see 9995500 and a Torx wrench as a counterhold so that the boot is not damaged.

- the wheel. See **INSTALLING WHEELS** .

Remove:

- the wheel
- the anti-roll bar link from the mountings. Use a Torx wrench as a counterhold so that the boot is not damaged.

INSTALLING THE ANTI-ROLL BAR LINK

Install the anti-roll bar link.

Use new nuts. Tighten the nuts. Tighten to **80 Nm** .

Use a Torx wrench as a counterhold so that the boot is not damaged.

Install the wheel. See **INSTALLING WHEELS** .

ANTI-ROLL BAR REAR, REPLACING

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.**

REMOVING

REMOVING THE EXHAUST SYSTEM

Fig. 20: Exhaust System, Brackets And Fasteners
Courtesy of VOLVO CARS CORPORATION

Raise the car.

Remove the exhaust system. Start from the front by separating the system after the three-way catalytic converter (TWC).

Hang up the three-way catalytic converter (TWC) on a hook.

Remove:

- the mountings in the sub-frame
- the exhaust mounting at the back
- the screws for the cross member.

REMOVING THE SPRING

Remove the spring on the left-hand side. See: **SPRING REAR, REPLACING** .

REMOVING THE ANTI-ROLL BAR

Fig. 21: Removing Anti-Roll Bar Link

Courtesy of VOLVO CARS CORPORATION

Remove:

- the anti-roll bar from the outer mountings. Use a Torx wrench as a counterhold so that the boot is not damaged
- the screws holding the anti-roll bar in the sub-frame.

INSTALLATION

NOTE: To ensure that there is no exhaust leakage, see: FLANGED JOINT, ASSEMBLING .

NOTE: For tightening torques, see: TIGHTENING TORQUE .

INSTALLING THE ANTI-ROLL BAR

Fig. 22: Installing Anti-Roll Bar
Courtesy of VOLVO CARS CORPORATION

NOTE: The parking brake cable must be under the anti-roll bar.

Insert the anti-roll bar past the removed shock absorber.

Install:

- the 2 M12 screws holding the anti-roll bar in the sub-frame
- the anti roll bar outer mountings. Use a Torx wrench as a counterhold so that the boot is not damaged.

INSTALLING THE SPRING

Install the spring. See: **SPRING REAR, REPLACING** .

INSTALLING THE EXHAUST SYSTEM

Fig. 23: Exhaust System, Brackets And Fasteners

Install:

- the mountings in the sub-frame
- the 2 M8 nuts in the flange to the three-way catalytic converter (TWC)
- the exhaust mounting at the back
- the cross member
- the 2 M8 screws for the cross member.

NOTE: Install a new flange gasket.

Lower the car.

Tighten to **105 Nm** and angle-tighten to 90°. Use protractor see **9512050** .

Install:

- the anti-roll bar link to the spring strut. Use a new nut. Tighten to **50 Nm** . Counterhold using a Torx spanner to prevent damage to the boot.
- The ABS sensor. Tighten to **10 Nm** .

NOTE: **Ensure that the ABS sensor seat in the stub axle is absolutely clean. Clean the ABS sensor with a soft brush.**

Install:

- the ABS sensor cable in the bracket.
- the wheel. See **INSTALLING WHEELS** .

Remove:

- the four screws
- the hub.

INSTALLATION

TIGHTENING TORQUE

For tightening torques, see **TIGHTENING TORQUE** .

INSTALLING THE HUB

Install:

- the hub
- the four screws.

For tightening torques, see **TIGHTENING TORQUE** .

INSTALLING THE CONTROL ARM ON THE BALL JOINT

Install the drive shaft in the hub. Align the ball joint against the control arm.

Release the tensioning strap between the control arms.

Install a nut on the ball joint. (M10)

NOTE: Counterhold using the Torx wrench so as not to damage the boot.

Remove the tensioner strap.

INSTALLING THE CABLE HARNESS FOR THE ABS SENSOR

Install the cable harness in the brackets.

INSTALLING THE ANTI-ROLL BAR LINK

Install:

- the anti-roll bar link
- the nut (M12).

NOTE: Counterhold using a Torx wrench so that the boot for the link is not damaged.

INSTALLING THE STEERING ARM

Install:

- the steering arm
- the nut.

For tightening torques, see **TIGHTENING TORQUE** .

NOTE: Counterhold using the wrench grip so that the screw does not rotates and damage the rubber boot.

INSTALLING THE BRAKE DISC

Install:

- the brake disc
- the screw.

INSTALLING THE DRIVE SHAFT SCREW

Install a new screw. Use a screwdriver as a counterhold.

For tightening torques, see **TIGHTENING TORQUE** .

INSTALLING BRAKE CALIPERS

Install:

- the brake caliper
- the two screws.

For tightening torques, see **TIGHTENING TORQUE** .

FINISHING

Install the wheel. See **INSTALLING WHEELS**.

Remove:

- the wheel sensor cable from the retainer on the brake hose
- the brake caliper mounting screws.

  Suspend the caliper in a steel wire.

- the brake disc locating pin/screw
- the brake disc.

REMOVING THE WHEEL SENSOR

Fig. 11: Identifying Sensor From Wheel Spindle Removal
Courtesy of VOLVO CARS CORPORATION

Clean the area around the wheel sensor and remove the screw.

Carefully remove the sensor from the wheel spindle.

Bind the sensor so it is well protected.

INSTALLING THE TENSIONER

Install see **9995659** . See **TENSIONER 999 5659, USER INSTRUCTIONS** .

Support the rear suspension 500 mm up between the fender edge and the center of the wheel.

REMOVING THE HUB

Fig. 12: Hub Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the 4 screws
- the hub.

CLEANING

CHECKING AND CLEANING

Clean:

- the mating faces of the wheel hub in the wheel spindle
- the wheel sensor
- the sensor seat in the wheel spindle so it is absolutely clean
- the wheel sensor. Use a soft brush.

INSTALLATION

NOTE: For tightening torque, see TIGHTENING TORQUE or TIGHTENING TORQUE .

INSTALLING THE HUB

Install:

- the hub to the wheel spindle

  Use new screws. Tighten. See **TIGHTENING TORQUE** .

- The wheel sensor (M6). Tighten. See **TIGHTENING TORQUE** .

REMOVING THE TENSIONER

Remove the tensioner. See see **TENSIONER 999 5659, USER INSTRUCTIONS** .

INSTALLING THE BRAKE DISC AND BRAKE CALIPER

Install:

- the brake disc
- the brake disc locating pin/screw (M6). Tighten. See **TIGHTENING TORQUE** .
- the brake caliper
- the brake caliper mounting screws.

  Use new screws. Tighten. See **TIGHTENING TORQUE** .

- the wheel sensor cable to the retainer on the brake hose.

INSTALLING THE REAR WHEEL

Install the rear wheel. See **INSTALLING WHEELS**.

Remove:

- the wheel sensor lead from the holder on the brake hose
- the brake caliper mounting screws.

Suspend the caliper with a steel wire.

- the brake disc locating pin/screw
- the brake disc.

REMOVING THE WHEEL SENSOR

Fig. 16: Identifying Sensor From Wheel Spindle Removal
Courtesy of VOLVO CARS CORPORATION

Clean around the wheel sensor and remove the screw.

Carefully remove the sensor from the stub axle.

Tie up the sensor well protected.

INSTALLING THE TENSIONER

Fit see **9995659** as described in: **TENSIONER 999 5659, USER INSTRUCTIONS** .

Support the rear suspension 500 mm up between the wing edge and the center of the wheel.

REMOVING THE HUB

Fig. 17: Hub Screws
Courtesy of VOLVO CARS CORPORATION

Remove:

- the 4 screws
- the hub.

NOTE: **Make sure the drive shaft comes free from the rear wheel hub. There must not be any axial forces acting on the drive shaft joints.**

CLEANING

CHECKING AND CLEANING

Fig. 18: Cleaning Drive Shaft End
Courtesy of VOLVO CARS CORPORATION

Clean:

- drive shaft end, especially rust on the edges, see illustration.

  (Outer wheel hub sealing ring will rest against this surface).

- the mating surfaces for wheel hub in stub axle
- the wheel sensor
- the seat for the sensor in the stub axle to ensure it is absolutely clean
- the wheel sensor. Use a soft brush.

GREASING THE SEAL

Fig. 19: Identifying Lubrication Point On Wheel Bearing Sealing Lip
Courtesy of VOLVO CARS CORPORATION

Lubricate the wheel bearing sealing lip abutting the drive shaft with a little wheel bearing grease. P/N 1161689.

Brush high pressure grease, P/N 1161246 onto the drive shaft so that the splines on the rear half of the drive shaft pin are filled.

INSTALLATION

NOTE: For tightening torque, see TIGHTENING TORQUE and TIGHTENING TORQUE .

INSTALLATION OF HUB AND DRIVE SHAFT

Install:

- the hub on the stub axle and drive shaft.

  Use new screws. Tighten. See: **SUMMARY OF TIGHTENING TORQUES FOR SPECIFIC COMPONENTS**

- a new screw loosely on the drive shaft. The screw will be tightened later
- the wheel sensor M6, tighten according to: **TIGHTENING TORQUE** .

REMOVING THE TENSIONER

Remove tensioner according to: **TENSIONER 999 5659, USER INSTRUCTIONS** .

INSTALLING THE BRAKE DISC AND BRAKE CALIPER

Install:

- the brake disc
- brake disc guide pin/screw M6, tighten according to: **TIGHTENING TORQUE**
- the brake caliper
- the brake caliper mounting screws.

  Use new screws. Tighten. See: **SUMMARY OF SPECIFIC COMPONENTS AND TIGHTENING TORQUES**

- the wheel sensor lead to the holder on the brake hose.

FITTING THE REAR WHEEL

Install the screw, M10 to the drive shaft. Use a new screw. Tighten.

Fit the rear wheel according to: **INSTALLING WHEELS**

FINISHING

ADJUSTING THE PARKING BRAKE

Adjust the hand brake according to: **PARKING BRAKE SELF-ADJUSTMENT, RESETTING** or **PARKING BRAKE, ADJUSTING** .

INSTALLING

Fig. 20: Identifying Wheel Studs Tightening Sequence
Courtesy of VOLVO CARS CORPORATION

Ensure that the brake disc and wheel rim mating surfaces are clean. Grease the hub center location dowel for the rim. Use installation paste **1161397-3** .

Install the wheel studs lightly. Then tighten crosswise. Tighten to **140 Nm** . Use torque socket see **9512835** if an impact wrench is being used.

Crosswise tightening and torque tightening is important to prevent stresses in the brake disc.

NOTE: **The torque socket is designed for use with a standard, pneumatic impact nut runner providing a torque of 250-350 Nm .**

Take out measurement tool set see **9995418** .

Remove:

- the wheel
- the mounting screws for the brake caliper holder.

Hang the brake caliper from the spring using a wire.

Remove:

- 1 screw
- the brake disc.

INSTALLING THE DIAL GAUGE

Fig. 2: Brake Caliper Bracket
Courtesy of VOLVO CARS CORPORATION

Install the bracket, included in the test equipment, in the upper mounting hole for the brake caliper first.

Press the bracket against the constant velocity joint housing.

Then install the lower mounting screw in the hole. At the same time, secure the bracket using the lower screw. Tighten the nuts.

Use the M12 screws and nuts included in kit see **9995507** .

CHECKING INTERNAL COMPONENTS OF THE TRANSMISSION (B8444S, TF-80SC AWD)

CHECKING SOLENOIDS AND TEMPERATURE SENSOR

CHECKING SHIFT SOLENOIDS

Fig. 1: Identifying Ohms Resistance Temperature Graph
Courtesy of VOLVO CARS CORPORATION

Fig. 2: Identifying Check For Ohms Resistance
Courtesy of VOLVO CARS CORPORATION

Fig. 3: Identifying Gear Shift Solenoid Check
Courtesy of VOLVO CARS CORPORATION

NOTE: **Do not damage components and terminals when test measuring. Handle components and terminals carefully.**

Check 1

Connect an ohmmeter between terminal #1 and the outer casing of the gear shift solenoid. For resistance values, see the table below.

When measuring at temperatures other than +20 °C a test measurement must be taken at +20 °C. This is to establish if the resistance is correct or not.

Component	Note	Resistance (ohms)

Gear shift solenoid S1, S2	Resistance between the solenoid pins and the solenoid casing/transmission housing	+20 °C= 11-16 ohms

Check 2

Connect a temporary voltage supply (+) to gear shift solenoid terminal # 1 and a temporary ground terminal (-) to the gearshift solenoid outer casing. Check the function of the solenoid.

Check 3

Connect a temporary voltage supply (+) to gear shift solenoid terminal # 1 and a temporary ground terminal (-) to the gearshift solenoid outer casing. Blow using compressed air according as shown in the illustration. Check the function of the solenoid.

CHECKING THE LINE PRESSURE SOLENOID SLT, SLC1, SLC2, SLC3, SLB1 AND LOCK-UP SOLENOID SLU

Fig. 4: Identifying Connector B Terminals
Courtesy of VOLVO CARS CORPORATION

Connect the breakout box. See:**CONNECTING THE BREAKOUT BOX**

NOTE: **Do not damage components and terminals when test measuring. Handle components and terminals carefully.**

Check 1

Connect an ohmmeter to the breakout box between the terminals for the selected solenoid. For resistance values, see the table below.

for line pressure solenoid SLT:

- terminals #B3 (#3) and #B1 (#1)

for lock-up solenoid SLU:

- terminals #B9 (#9) and #B4 (#4)

for line pressure solenoid SLB1:

- terminals #B21 (#21) and #B16 (#16)

for line pressure solenoid SLC1:

- terminals #B11 (#11) and #B10 (#10)

for line pressure solenoid SLC2:

- terminals #B17 (#17) and #B18 (#18)

for line pressure solenoid SLC3:

- terminals #B14 (#14) and #B22 (#22)

When measuring at temperatures other than +20 °C a test measurement must be taken at +20 °C. This is to establish if the resistance is correct or not.

Component	Note	Resistance (ohms)
Lock-up solenoid (SLU) Line pressure solenoids (SLT), (SLC1),(SLC2),(SLC3),(SLB1)	Resistance between solenoid pins	+20 °C= 5.0-5.6 ohms

CHECKING THE OIL TEMPERATURE SENSOR

Fig. 5: Identifying Connector B Terminals
Courtesy of VOLVO CARS CORPORATION

Connect the breakout box. See:**CONNECTING THE BREAKOUT BOX**

NOTE: **Do not damage components and terminals when test measuring. Handle components and terminals carefully.**

Check 1

Connect an ohmmeter between # A7 and #A8 on the breakout box.

Start the engine and run it at idle speed to raise the temperature of the transmission.

For resistance values, see the table below.

A test measurement must be taken at all three temperatures. This is to establish if the resistance is correct or not.

Component	Note	Resistance (ohms)
Oil temperature sensor	Resistance between the temperature sensor terminals	+10 °C= 5620-7310 ohms
		+25 °C= 3500 ohms
		+110 °C= 220-270 ohms

CHECKING INPUT AND OUTPUT SPEED SENSORS FOR TRANSMISSION

CHECKING THE INPUT AND OUTPUT SPEED SENSORS FOR THE TRANSMISSION

Fig. 6: Identifying Connector B Terminals
Courtesy of VOLVO CARS CORPORATION

NOTE: The transmission control module (TCM) must not be connected.

Connect the breakout box. See:**CONNECTING THE BREAKOUT BOX**

NOTE: Do not damage components and terminals when test measuring. Handle components and terminals carefully.

Check 1

Connect an ohmmeter between the sensor terminals on the breakout box. Check the resistance. The resistance must be more than 1 Mohms but not infinite.

For transmission input speed sensor:

- terminal #12 and #13 on the breakout box

For transmission output speed sensor:

- terminal #19 and #20 on the breakout box

NOTE: Check the resistance using an ohmmeter which can measure resistances above 10 Mohms.

If the resistance is 0 ohms it means that the cables are short-circuited to each other or that the sensor is faulty.

If resistance is infinite it means that there is an open circuit in the circuit.

Check the wiring. Measure the resistance between a terminal and a ground point.

If the resistance is 0 ohms it means that the cable has a short-circuit to ground.

If resistance is infinite it means that there is an open circuit in the circuit.

Check 2

Connect a temporary voltage supply to:

transmission input speed sensor:

- terminal #A12 on the breakout box

transmission output speed sensor:

- terminal #A19 on the breakout box

Connect a temporary ground terminal via a 100 ohms resistor and an ammeter/voltmeter to:

transmission input speed sensor:

- terminal #A13 on the breakout box

transmission output speed sensor:

- terminal #A20 on the breakout box

Move the gear selector lever to gear position **N** . Raise the vehicle so that the drive wheels hang freely. Measure the current/voltage while spinning the wheels in the same direction. For values, see the table below.

Component	Note	Current (mA)
Transmission input speed sensor Transmission output speed sensor	Current between the sensor terminals	High = 12-16 mA Low= 4-8 mA

Component	Note	Voltage (V)
Transmission input speed sensor Transmission output speed sensor	Voltage between the sensor terminals	Highapprox. 1.4 V below Ubat Lowapprox. 0.8 V below U_{bat}

NOTE: Do not damage components and terminals when test measuring. Handle

components and terminals carefully.

Check 1

Connect an ohmmeter between terminal #1 and the outer casing of the gear shift solenoid. For resistance values, see the table below.

When measuring at temperatures other than +20 °C a test measurement must be taken at +20 °C. This is to establish if the resistance is correct or not.

Component	Note	Resistance (ohms)
Gear shift solenoid S1, S2	Resistance between the solenoid pins and the solenoid casing/transmission housing	+20 °C= 11-16 ohms

Check 2

Connect a temporary voltage supply (+) to gear shift solenoid terminal # 1 and a temporary ground terminal (-) to the gearshift solenoid outer casing. Check the function of the solenoid.

Check 3

Connect a temporary voltage supply (+) to gear shift solenoid terminal # 1 and a temporary ground terminal (-) to the gearshift solenoid outer casing. Blow using compressed air according as shown in the illustration. Check the function of the solenoid.

CHECKING THE LINE PRESSURE SOLENOID SLT, SLC1, SLC2, SLC3, SLB1 AND LOCK-UP SOLENOID SLU

Fig. 10: Identifying 22--Pin Connector

Connect the breakout box. See: **CONNECTING THE BREAKOUT BOX**

NOTE: Do not damage components and terminals when test measuring. Handle components and terminals carefully.

Check 1

Connect an ohmmeter to the breakout box between the terminals for the selected solenoid. For resistance values, see the table below.

for line pressure solenoid SLT:

- terminals #B3 (#3) and #B1 (#1)

for lock-up solenoid SLU:

- terminals #B9 (#9) and #B4 (#4)

for line pressure solenoid SLB1:

- terminals #B21 (#21) and #B16 (#16)

for line pressure solenoid SLC1:

- terminals #B11 (#11) and #B10 (#10)

for line pressure solenoid SLC2:

- terminals #B17 (#17) and #B18 (#18)

for line pressure solenoid SLC3:

- terminals #B14 (#14) and #B22 (#22)

When measuring at temperatures other than +20 °C a test measurement must be taken at +20 °C. This is to establish if the resistance is correct or not.

Component	Note	Resistance (ohms)
Lock-up solenoid (SLU) Line pressure solenoids (SLT), (SLC1),(SLC2),(SLC3),(SLB1)	Resistance between solenoid pins	+20 °C= 5.0-5.6 ohms

CHECKING THE OIL TEMPERATURE SENSOR

Fig. 11: Identifying 22--Pin Connector
Courtesy of VOLVO CARS CORPORATION

Connect the breakout box. See: **CONNECTING THE BREAKOUT BOX**

NOTE: **Do not damage components and terminals when test measuring. Handle components and terminals carefully.**

Check 1

Connect an ohmmeter between # A7 and #A8 on the breakout box.

Start the engine and run it at idle speed to raise the temperature of the transmission.

For resistance values, see the table below.

A test measurement must be taken at all three temperatures. This is to establish if the resistance is correct or not.

Component	Note	Resistance (ohms)
Oil temperature sensor	Resistance between the temperature sensor terminals	+10 °C= 5620-7310 ohms
		+25 °C= 3500ohms
		+110 °C= 220-270 ohms

CHECKING INPUT AND OUTPUT SPEED SENSORS FOR TRANSMISSION

CHECKING THE INPUT AND OUTPUT SPEED SENSORS FOR THE TRANSMISSION

Fig. 12: Identifying 22--Pin Connector
Courtesy of VOLVO CARS CORPORATION

NOTE: The transmission control module (TCM) must not be connected.

Connect the breakout box. See: **CONNECTING THE BREAKOUT BOX**

NOTE: Do not damage components and terminals when test measuring. Handle components and terminals carefully.

Check 1

Connect an ohmmeter between the sensor terminals on the breakout box. Check the resistance. The resistance must be more than 1 Mohms but not infinite.

For transmission input speed sensor:

- terminal #12 and #13 on the breakout box

For transmission output speed sensor:

- terminal #19 and #20 on the breakout box

NOTE: Check the resistance using an ohmmeter which can measure resistances above 10 Mohms.

If the resistance is 0 ohms it means that the cables are short-circuited to each other or that the sensor is faulty.

If resistance is infinite it means that there is an open circuit in the circuit.

Check the wiring. Measure the resistance between a terminal and a ground point.

If the resistance is 0 ohms it means that the cable has a short-circuit to ground.

If resistance is infinite it means that there is an open circuit in the circuit.

Check 2

Connect a temporary voltage supply to:

transmission input speed sensor:

- terminal #A12 on the breakout box

transmission output speed sensor:

- terminal #A19 on the breakout box

Connect a temporary ground terminal via a 100 ohms resistor and an ammeter/voltmeter to:

transmission input speed sensor:

- terminal #A13 on the breakout box

transmission output speed sensor:

- terminal #A20 on the breakout box

Move the gear selector lever to gear position **N** . Raise the vehicle so that the drive wheels hang freely. Measure the current/voltage while spinning the wheels in the same direction. For values, see the table below.

Component	Note	Current (mA)
Transmission input speed sensor Transmission output speed sensor	Current between the sensor terminals	High = 12-16 mA Low= 4-8 mA

Component	Note	Voltage (V)

- Ignition off.
- Disconnect the automatic transmission control module (TCM)) according to. See **TRANSMISSION CONTROL MODULE (TCM), REPLACING** .
- Check that the male and female terminals in the control module and control module connector are intact and secure and that the wiring to the female terminals is properly secured to the pins.
- Pay particular attention to the terminals related to the diagnostic trouble code (DTC)/symptom. See **SIGNAL DESCRIPTION. TRANSMISSION CONTROL MODULE (TCM)** .
- Connect adapter see **9511504** to the control module connector (wiring side) and connect breakout box see **9511428** to the adapter.
- The breakout box is designed to facilitate reading off the control module input and output signals when the control module is connected; and the cable and component resistance when the control module is disconnected. Using a breakout box reduces the risk of accidental short-circuits and damaged connector pins.

RESETTING TRANSMISSION FLUID CHANGE COUNTER

RESETTING TRANSMISSION FLUID CHANGE COUNTER

HINT: The transmission control module (TCM) has a counter for the oil quality. The counter counts up if the transmission is exposed to too high a load or an ambient temperature that is too high. If the counter

is not reset when the oil is drained or changed, there is a risk that a diagnostic trouble code (DTC) will be stored in faulty circumstances. Therefore it is important that the "Transmission oil change" counter is reset.

NOTE: **This applies only when the transmission fluid is changed and when the fluid is changed when repairs are carried out to the transmission temperature sensor.**

EMERGENCY MODE IN CASE OF MALFUNCTION

EXPLANATION

The Transmission Control Module (TCM) activates the Emergency mode function in the event of certain malfunctions so that any damage is not made worse, resulting in complete transmission breakdown. The Transmission Control Module (TCM) can activate the function in 2 different stages, depending on the severity of the malfunction.

Function	Description
Emergency mode 1	-Adaptation function is blocked. -The lock-up function is blocked. -Slip lock-up function is blocked. -Neutral check function is blocked. -The transmission only shifts to 3rd gear and reverse gear. All other shifts are blocked.
Emergency mode 2	-The transmission only shifts to 5th gear and reverse gear. All other shifts are blocked.

FROZEN VALUES FOR THE TRANSMISSION CONTROL MODULE (TCM), DESCRIPTION

GENERAL INFORMATION

Frozen values are parameter values that are stored when a diagnostic trouble code (DTC) is stored.

Not all the parameters described need to be implemented in the control module. This varies from system to system. Parameters can also vary depending on which type of transmission the car has.

Certain parameters can be displayed without a value or with implausible values. This can occur if the control module has not stored a value, when a base value has been stored instead or if the parameter is received via the CAN network when there is an error on the CAN network. For example, the transmission speed value may be excessive if the fault occurs for the transmission speed sensor.

Definition of an operating cycle

The definition of an operating cycle varies depending on the software version.

Alternative definitions

- The ignition has been switched off, then switched on and finally switched off again
- The ignition has been switched off, the engine started and finally the ignition switched off again
- The ignition has been off, the engine started, the car driven at a speed above 30 km/h for more than 3 minutes and finally the ignition switched off again.

DIAGNOSTIC TROUBLE CODE (DTC)

The diagnostic trouble code (DTC) the frozen values are stored for.

COUNTER 2

Counts the number of operating cycles in which the tests have been completed without the fault being detected again. If the value is zero there is a fault or the control module test for the fault has not been carried out.

ENGINE, STATUS

The value indicates the status of the engine when the diagnostic trouble code (DTC) was stored.

OFF = Engine not running.

On = Engine running.

OUTSIDE TEMPERATURE

The value indicates the outside temperature when the diagnostic trouble code (DTC) was stored. The transmission control module (TCM) obtains the value via the Control Area Network (CAN) from the central electronic module.

COUNTS - THE OPERATING CYCLES SINCE THE DIAGNOSTIC TROUBLE CODE (DTC) WAS FIRST/LAST STORED

The value indicates the number of operating cycles since the diagnostic trouble code (DTC) was **first** or **last** stored.

TIME SINCE THE DIAGNOSTIC TROUBLE CODE (DTC) WAS FIRST/LAST STORED

The time in hours since the diagnostic trouble code (DTC) was **first** or **last** stored. The transmission control module (TCM) obtains the value via the Control Area Network (CAN) from the central electronic module. The time is the total time that the central electronic module has been running.

The difference between the "last" time and the "first" time is the time from the when the diagnostic trouble code (DTC) was first stored to when it was last stored. If the same amount of hours are displayed, the fault has only been detected once.

THE VOLTAGE IN THE CENTRAL ELECTRONIC MODULE WHEN THE DIAGNOSTIC TROUBLE CODE (DTC) WAS FIRST/LAST STORED

The value indicates the voltage in volts the **first** or **last** time the diagnostic trouble code (DTC) was stored. The transmission control module (TCM) obtains the value via the Control Area Network (CAN) from the central electronic module.

TOTAL MILEAGE SINCE THE DIAGNOSTIC TROUBLE CODE (DTC) WAS FIRST / LAST STORED

The value indicates the mileage in kilometers and miles the **first** and **last** time the diagnostic trouble code (DTC) was stored. The transmission control module (TCM) obtains the value via the Control Area Network (CAN) from the central electronic module.

PASSENGER COMPARTMENT TEMPERATURE

The value indicates the passenger compartment temperature when the diagnostic trouble code (DTC) was stored. The transmission control module (TCM) obtains the value via the Control Area Network (CAN) from the central electronic module.

OIL TEMPERATURE

The value indicates the temperature of the transmission fluid. The value is calculated based on the oil temperature sensor signal.

GEAR RATIOS

The value indicates the transmission gear ratio.

EXPECTED GEAR RATIO

The value indicates the gear ratio anticipated by the transmission control module (TCM).

CALCULATED SPEED OF THE SIGNAL FROM THE TRANSMISSION SPEED SENSOR (OUTPUT SPEED)

The value indicates the calculated speed based on the signal from the transmission speed sensor (output speed).

SPEED SIGNAL, CALCULATED FROM THE ENGINE SPEED (RPM)

The value indicates the speed, calculated using the engine speed.

GEAR ACCORDING TO THE SHIFT SOLENOIDS

The value indicates the selected gear (according to the gear solenoids). The value indicated depends on the transmission type.

The following values can be displayed: Back-up (reverse) gear, Gear 1, Gear 2, Gear 3, Gear 4, Gear 5.

GEAR-SHIFT POSITION SENSOR

The value indicates the gear-shift position sensor gear-shift position sensor based on the signal from the gear selector assembly. The following values can be displayed: P, R, N, D, 4/Tip, 3/Tip, 2, L.

ACCELERATOR PEDAL (AP) POSITION

The value indicates the position of the accelerator pedal (AP). The transmission control module (TCM) obtains the value via the Control Area Network (CAN) from the central electronic module.

TRANSMISSION SPEED SENSOR, OUTPUT SPEED

The value indicates the output speed from the transmission speed sensor.

TRANSMISSION SPEED SENSOR, INPUT SPEED

The value indicates the input speed from the transmission speed sensor. The speed can be generated with the engine idling and the gear selector in P/N position. If the gear selector is in any other position, a gear is engaged and the transmission input shaft is connected to the output shaft and an RPM will not be indicated until the car is driven. Depending on slippage in the torque converter the transmission speed and the engine speed will differ when the lock-up function is not engaged. With lock-up engaged the transmission speed should be the same as engine speed (RPM).

GEAR-SHIFT POSITION SENSOR, POSITION

The value indicates the calculated position of the gear-shift position sensor. The following values can be displayed: P, R, N, D, 4/Tip, 3/Tip, 2, L.

ENGINE SPEED (RPM)

The engine control module (ECM) transmits the engine speed (RPM) on the Control area network (CAN) from which the transmission control module (TCM) retrieves the signal which it then compares with its own speed sensor signal.

The value indicates the engine speed (RPM).

POSITION OF THE GEAR-SHIFT POSITION SENSOR ABCPA

The value indicates the position of the gear-shift position sensor. See the table below.

SYSTEM VOLTAGE

The value indicates the system voltage. The value is given in volts (V).

ENGINE TORQUE

The value indicates the engine torque. The value is given in Nm.

ENGINE COOLANT TEMPERATURE (ECT)

The engine control module (ECM) transmits a signal indicating the engine coolant temperature (ECT) on the Control area network (CAN). The value indicates the temperature. The value is given in °C.

KICKDOWN, STATUS

The engine control module (ECM) transmits a signal indicating the accelerator pedal (AP) position. During rapid acceleration, with the accelerator pedal (AP) almost fully depressed, the transmission control module (TCM) receives a signal about kickdown.

Off = Kickdown is not activated.

On = Kickdown is activated.

GEAR ACCORDING TO SOLENOIDS

The value indicates the calculated gear position according to the control module. The value indicated depends on the transmission type.

The following values can be displayed: Back-up (reverse) gear, Gear 1, Gear 2, Gear 3, Gear 4, Gear 5.

Fig. 2: TCM, Solenoid, Seal Rings, And Friction Pad
Courtesy of VOLVO CARS CORPORATION

1. **Tapered bearings** - To reduce the inner friction losses, some of the tapered bearings now have bigger diameter and shorter length of bearing rollers. This change gives fewer rollers and thus less friction.
2. **Torque converter** - To reduce noise/sound when locking at lower engine rpms, the LTD (Long Travel Damper) has been provided with an inner circle of damping springs
3. **TCM** (**T** ransmission **C** ontrol **M** odule) - TCM has the same hardware as before but the software has been changed.
4. **Solenoids** - Faster shifting has been achieved by making all linear solenoids that control the clutch systems more effective. This change has been achieved by removing the hydraulic part of the solenoids. Further, the magnetic flow in the solenoid has been increased and gap between thrust piston and magnetic coil has been reduced to increase power.
5. **Seal rings** - New seal rings with smaller sealing surface contributes to reducing the inner friction. By tapering the seal, the sealing surface is reduced as is the pressure on the sealing surface.
6. **Friction pads** - The new friction pads on the discs reduce the impact of drag losses between the friction pads. This has been achieved by optimizing the oil flow channels between the friction surfaces.

TORQUE CONVERTER WITH LOCK-UP

Number	Designation	Number	Designation
1	Lock-up-clutch	5	Stator
2	Casing	6	Oil pump
3	Turbine rotor	7	Input shaft
4	Pump rotor		

The torque converter is between the engine and the automatic transmission. It consists of a round metal casing

which contains three impellers. The torque converter is filled with oil. The first impeller, pump rotor, is secured in the torque converter casing, which is connected to the engine's crankshaft via a carrier plate. The pump rotor rotates with the crankshaft.

The second impeller, the turbine rotor, is connected to the transmission's input shaft and is driven by the oil that is circulated by the pump rotor.

The third impeller, the stator, is located between the pump rotor and the turbine rotor.

There is a hydraulically controlled lock-up clutch with a friction plate in the torque converter. The turbine rotor can connect with the torque converter housing via the lock-up clutch. This reduces fuel consumption.

The torque converter functions like a hydraulic automatic clutch. At idle, the pump action is too weak to drive the turbine rotor and thus the vehicle is stationary. When the engine speed is increased the turbine rotor starts to drive in a smooth way. Thanks to the stator rotor, the torque converter can also reinforce the engine's torque when starting and low driving speed.

The rotating impellers and the oil in the torque converter "slip" slightly. This gives a certain power loss, which slightly increases fuel consumption.

When the vehicle is moving the torque converter's reinforcement of the engine's torque is not needed. In this situation the lock-up function is activated and, at a certain speed, mechanically connects the transmission's input shaft with the engine. This is automatic and cannot be affected by the driver. The engine speed drops and, since the torque converter's slipping disappears, fuel consumption is also reduced.

PLANETARY TRAIN

Fig. 5: Identifying Planetary Train

X = locked

Number	Designation	Number	Designation
1	Rear planetary train, (Ravigneaux)	6	Input shaft
2	Front planetary train	7	Driven gear
3	Planetary gear	8	Oil pump
4	Sun gear	9	Differential
5	Ring gear	10	Driven counter rotating gear

Unique to the TF-80SC is a Ravigneaux planetary gear connected in series to a conventional planetary gear. The conventional planetary gear creates a reduction in RPM in the Ravigneaux planetary gear for 1st gear up to 5th gear and reverse.

The planetary gear's ratios are controlled by 3 clutches (C1, C2, C3) and 2 brakes (B1, B2).

The number of planetary gears depends on the engine's cylinder displacement and can therefore differ from what is shown here.

Planetary train, Ravigneaux

Fig. 6: Identifying Ravigneaux Planetary Train
Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Large sun gear	4	Inner planetary gear
2	Small sun gear	5	Ring gear
3	Outer planetary gear	6	Planetary wheel carrier

The characteristic of a Ravigneaux planetary train is that several gears can be used in comparison to a conventional planetary train. It is compact (takes up little room) in relation to the number of possible ratios. The Ravigneaux planetary train has two sun gears of different diameters and sets of two planetary gears, an inner and outer set. The inner planetary gears are constantly connected to the outer planetary gears and the small sun gear. The outer planetary gears are constantly connected to the ring gear and large sun gear.

The planetary train has a common planetary gear carrier for both sets of planetary gears.

Principles of function

Courtesy of VOLVO CARS CORPORATION

Number	Designation	Number	Designation
1	Small sun gear	4	Outer planetary gear
2	Large sun gear	5	Ring gear
3	Inner planetary gear	6	Planetary wheel carrier

The ratios are obtained through different combinations of locked and/or connected components. The table displays the principle for how the ratios are obtained from large ratio, 1, to small ratio, 6, and counter rotation (i. e. reverse with large ratio).

Combination	Power in	Locked	Power out
1	Small sun gear	Planetary gear carrier	Ring gear
2	Small sun gear	Large sun gear	Ring gear
3	Small sun gear and large sun gear	No component	Ring gear
4	Small sun gear and planetary gear carrier	No component	Ring gear

OIL PUMP

Fig. 8: Identifying Oil Pump
Courtesy of VOLVO CARS CORPORATION

The oil pump is of "non-crescent" type and is located after the torque converter. It is driven by the engine's crankshaft via the torque converter housing.

The oil pump supplies the hydraulics with oil and supplies the other components of the transmission with oil for lubrication and cooling. Excess oil is routed back to the oil sump.

OIL COOLER

The oil is routed in/out in separate lines to the external oil cooler.

THE HYDRAULIC SYSTEM

Fig. 9: Identifying Hydraulic System

Number	Designation	Number	Designation
1	Transmission control module (TCM)	5	Oil cooler
2	Torque converter	6	Oil pump
3	Valves and solenoids	7	Planetary train
4	Clutches and brakes	8	Oil sump

The transmission's hydraulic system consists of oil pump, torque converter, hydraulic control system and oil cooler.

The solenoids, which control the hydraulic valves, are located in the transmission's control system, which are mounted on the front edge of the transmission. The solenoids are activated by the Transmission control module (TCM).

The oil pump supplies the hydraulics with oil and supplies the other components of the transmission with oil for lubrication and cooling. Excess oil is routed back to the oil sump.

CAUTION: The transmission oil differs from conventional ATF oil properties. Always use transmission oil that is specified for this transmission. Otherwise the

function of the transmission will be damaged.

The oil level is checked though a level pipe (transmission does not have conventional oil dipstick).

SLT = Line pressure solenoid, SLT	LU = Lock-up

Shifting occurs by the oil pump building up hydraulic pressure. The hydraulic valves, which are controlled by their respective solenoids, send the hydraulic pressure to the relevant clutch, brake or lock-up depending on which signals come from the Transmission control module (TCM).

Hydraulic pressure chamber

Fig. 11: Identifying Hydraulic Pressure Chambers
Courtesy of VOLVO CARS CORPORATION

A = Piston's hydraulic pressure chamber

B = Counter acting hydraulic pressure chamber

When the rotation of the clutch increases, the centrifugal force affects the oil inside the clutch. The hydraulic pressure increases and the clutch engages. The centrifugal force means that a difference occurs in the rotation between the input and output shafts, which can mean a shift judder. To solve this, there is an extra pressure chamber opposite the piston's hydraulic pressure chamber. This extra pressure chamber means that the centrifugal force also works in the opposite direction and therefore affects the pressure from the piston's hydraulic pressure chamber. In addition, the clutch does not engage too soon.

GEAR SELECTOR ASSEMBLY

Fig. 12: Identifying Gear Selector Assembly
Courtesy of VOLVO CARS CORPORATION

The gear selector assembly is in the tunnel console. It is mechanically connected to the transmission by a cable which moves the gear valve. The gear valve is integrated in the Transmission control module (TCM). The gear selected is indicated by a row of LEDs in the top panel on the gear selector assembly.

Gear selector assemblies with Geartronic, in addition to P/R/N/D modes, have a manual (M) shifting mode. The manual gear positions can be selected at any point while driving. The engaged gear is locked until the driver selects another gear. The automatic transmission only down shifts if the vehicle slows down to very low speed. To downshift the gear selector must be moved to minus (-). To upshift the gear selector must be moved to plus (+). At start, 3rd is the highest possible gear.

The engine can only be started in position P or N.

THE DIFFERENT GEAR SELECTOR POSITIONS:

Position	Meaning	Function
P	Park	The transmission's output shaft is locked, so that the vehicle does not roll. This position should be selected when the engine is started or the vehicle is parked.
R	Reverse	Reverse gear. This mode may only be engaged when the vehicle is completely

		stationary.
N	Neutral	Neutral means that no gear is engaged. The engine can start and run freely.
D	Drive	When D is engaged, the engine drives the vehicle forward except when idling. The D position is used for all forward motion. Up and down shifting occurs automatically depending on acceleration and speed.
M	Manual	This position allows the driver to change gears manually.

The rear planetary train's inner planetary gear rotates counter-clockwise on its shaft. The rear planetary gear carrier attempts to rotate counter-clockwise but is prevented by freewheel F1.

The rear planetary train's outer planetary gear rotates clockwise on its shafts. The rear planetary train's small sun gear rotates counter-clockwise, at idle.

The rear planetary train's ring gear rotates clockwise using the rear planetary train's outer planetary gear. Because the rear planetary train's ring gear has inner teeth, the direction of rotation does not change.

The front planetary train's planetary gear rotates clockwise on its shafts. Because the front planetary train's sun gear is locked by the oil pump, the planetary train's planetary gear presses against the front planetary train's ring

Clutch C1 rotates clockwise and connects the front planetary gear carrier with the rear planetary train's small sun gear.

Clutch C3 rotates clockwise and connects the front planetary gear carrier with the rear planetary train's large sun gear.

The rear planetary train rotates clockwise. Because the rear planetary train's inner and outer planetary gears are in constant engagement with each other, they are kinetically locked in relation to each other. The kinetic energy from both the rear planetary train's sun gears is therefore transferred to the rear planetary train's ring gear.

The rear planetary train's ring gear rotates clockwise.

The driven gear rotates clockwise. Because the rear planetary train's ring gear is on the driven gear, the driven gear rotates in the same direction as the rear planetary train's ring gear.

The rear planetary train's outer planetary gear rotates counter-clockwise on its shafts.

The rear planetary train's ring gear rotates clockwise. Because the rear planetary train's outer planetary gear rotation pulls away from the rear planetary gear carrier's rotation, the ring gear's speed is lower than the speed at the planetary carrier.

The front planetary gear carrier rotates clockwise.

Clutch C3 rotates clockwise and connects the front planetary gear carrier with the rear planetary train's large sun gear.

The rear planetary train's large sun gear rotated clockwise. Its speed is reduced by the front planetary train so that the speed becomes lower than the speed of the input shaft.

The intermediate shaft rotates clockwise, the same direction as the input shaft.

Clutch C2 rotates clockwise.

The rear planetary gear carrier rotates clockwise.

The rear planetary train's outer planetary gear rotates clockwise. Because the rear planetary gear carrier rotates faster than the rear planetary train's large sun gear, the inner planetary gears are pressed outwards by the speed difference and rotate clockwise on their shafts.

The rear planetary train's ring gear rotates clockwise. Because the rear planetary train's outer planetary gear rotation is added to the rear planetary gear carrier's rotation, the ring gear's speed is greater than the speed at the planetary carrier.

DIFFERENTIAL

Fig. 21: Identifying Differential
Courtesy of VOLVO CARS CORPORATION

The differential consists of the differential housing, large and small differential gears, shaft journals and thrust washers. The differential housing is completely sealed so that if a drive shaft is removed no dirt can penetrate and no oil can run out.

The differential distributes power equally between the drive wheels, even if they are rotating at different speeds. When driving straight ahead, the ring gear and differential housing rotate at the same speed as the drive shafts and the driving wheels. When cornering, the differential gears rotate to compensate for the different speeds of the wheels. Because the small differential gears are rotating on the shaft journal, the drive shafts can rotate at different speeds. Power is transferred from the differential housing to the drive shafts via the small differential gears in the same way as when driving straight ahead. Both drive wheels still have the same driven power.

AWD

Cars with four wheel drive have a splined pin on the differential housing. The sleeve on the pin connects the differential housing with the bevel gear. This transfers the power to the rear wheels.

OVERVIEW

AUTOMATIC TRANSMISSION TF80SC GENERATION 2

Fig. 24: Transmission Unit
Courtesy of VOLVO CARS CORPORATION

HINT: The shape of the transmission casing differs depending on which engine is included in the driveline.

This transmission has been updated on several points to meet high demands for fuel economy and comfort. TF80SC Gen 2 replaces earlier versions of TF80SC.

Changes compared to earlier version:

- Solenoids
- tapered bearings
- friction pads
- Seals
- oil with lower viscosity

- "lock-up" at lower engine rpm
- software in **TCM** (**T** ransmission **C** ontrol **M** odule)
- fastening AC bracket (6-cyl. engines)

These changes contribute to lower internal losses and, together with upshifting at lower engine rpms, faster downshifts, the result is lower fuel consumption, better shifting quality, and higher efficiency.

TF-80SL (TF-80SL AWD) is an electronically controlled 6-speed automatic transmission with Geartronic.

The Geartronic function combines two transmissions in one. One adaptive 6-gear automatic transmission which enables relaxed driving, and a "manually" shifted transmission which enables more active driving with manual shifting. In case of manual shifting, the gear selector is pushed forward to upshift to a higher gear and it's pulled back to downshift to a lower gear. However, in certain situations the Transmission control module (TCM) assumes the gearshifting decisions

TF-80SL has a lock-up-function on all forward gears except 1st gear. The torque converter has a locked and slipping lock-up-function.

Gearshifts are controlled by an hydraulic operating system. Gearshifts take place without freewheeling and completely automatically in terms of load and speed.

TF-80SL has two planetary gear units, a front and a rear, whose shifts are controlled by a number of clutches and brakes. The rear planetary gear is of the Ravigneaux type.

The oil level is checked by level pipe (the transmission does not have a conventional dipstick).

The transmission has a total of 8 solenoids that control the hydraulic flow. 6 of these solenoids control the shift process, 1 solenoid controls the torque converter's lock-up function and 1 solenoid controls the system pressure.

The gear selector sensor is integrated in the Transmission control module (TCM). The Transmission control module (TCM) is integrated in the transmission.

CHECKING THE ENGINE IDLING SPEED

Start the engine. Allow it to idle in neutral.

Check the idling speed. See: **SYSTEM PRESSURE/STALL SPEED**

CHECKING THE LINE PRESSURE

Depress the brake pedal.

Move the gear selector to position D and read off the line pressure. See: **SYSTEM PRESSURE/STALL SPEED**

CHECKING THE STALL SPEED

Check the stall speed when checking the line pressure.

The stall speed test gives an indication of the condition of the torque converter, the transmission clutches and the engine.

For the test to be accurate the following conditions must be met:

- the engine must be properly tuned
- the line pressure must be correct
- the oil level in the transmission must be correct and the transmission must be at operating temperature.

NOTE: Never conduct a stall speed check when the line pressure is too low.

CHECK

Air conditioning (AC) must be off.

Chock all four wheels.

Start the engine.

CAUTION: Apply the parking brake. Press down hard on the brake pedal using your left foot during the test.

NOTE: Do not test the stall speed for longer than 5 seconds.

If the speed exceeds the table values, see **High stall speed** if speed is below the table values, see **Low stall speed** .

HIGH STALLING SPEED

The test conditions described in, see **CHECK** above, have been met. Is the acceleration time from 0-100 km/h normal?

If the stalling speed recorded exceeds the normal value by more than 300 RPM:

Check if the oil is discolored or smells burnt. See **OIL GRADE, CHECKING (AW50/51 AWD; AW55-50/51SN)**

If the oil is OK, replace the torque converter.

see **TRANSMISSION - REMOVAL, REPLACEMENT AND INSTALLATION**

Dirty oil indicates worn or burnt clutch plates. Replace the transmission.

see **TRANSMISSION - REMOVAL, REPLACEMENT AND INSTALLATION**

Check the stall speed again after replacing the transmission.

LOW STALLING SPEED

The test conditions described in, see **CHECK** above have been met.

Try a new torque converter if the stall speed recorded is below the normal value by more than 300 RPM.

see **TRANSMISSION - REMOVAL, REPLACEMENT AND INSTALLATION**

Check the stalling speed again after replacing the torque converter

If the fault remains, replace the transmission. See **TRANSMISSION - REMOVAL, REPLACEMENT AND INSTALLATION**

After the check is completed:

OIL COOLER, FLUSH CLEANING

NOTE: **When replacing the transmission, the oil cooler must always be flushed clean because there may be particles in the oil cooler.**

PREPARATIONS

A vacuum oil extractor is used to suck the oil through the oil cooler when flushing the oil cooler.

The following material is required to flush the oil cooler:

Fig. 1: Identifying Vacuum Extractor

5 l. Plastic container.

Plastic hose

Inner diameter: O 10 mm.

Length: 900 mm.

Assemble as shown in the illustration.

Fig. 3: Cutting Pipe

Upper oil hose and pipe. This oil hose must be on the upper section of the oil cooler.

Cut the pipe as shown in the illustration. Smooth of the edge of the pipe.

NOTE: Blow the pipe clean.

Fig. 4: Locating Lower Oil Hose And Pipe

Filling with oil

Fill the plastic container with 2 liters of oil.

NOTE: Only approved automatic transmission fluid may be used.

Fig. 9: Plastic Container Hanging Under Hood

Connect the hose from the plastic container to the cut oil pipe. Hang the plastic container under the hood.

Raise the car.

FLUSHING

Charge the vacuum extractor.

Fig. 10: Connecting Vacuum Extractor
Courtesy of VOLVO CARS CORPORATION

Connecting the vacuum extractor

Connect an oil pipe with an external diameter of O 10 mm from the vacuum extractor. Connect the oil pipe to the short hose.

Flushing

Open the cock and suck the oil out of the oil cooler. Check that the filler container is not completely drained. (There should be a little oil left in the hose.) Flow: 2 liters take approximately 40 seconds.

If the level sinks slowly the flushing must be repeated. If the level still sinks slowly replace the oil cooler.

REMOVING AND INSTALLING THE EXISTING OIL HOSES

Fig. 11: Hose Installed On The Oil Pipe

Remove the plastic container and the oil pipe from the oil cooler.

Reinstall the existing oil hose on the oil cooler.

Checking the transmission fluid level

Check the level. See **OIL LEVEL, CHECKING** .

OIL GRADE, CHECKING (AW50/51 AWD; AW55-50/51SN)

CHECK THE OIL

NOTE: **Oil grade: Only ATF-oil, Volvo part number 1161540-8 (1-liter container) may be used.**

WARNING: **Avoid skin contact with the oil.**

Check the oil. Take a sample with the dipstick.

Is the oil discolored or does it smell burnt?

- Check if diagnostic trouble code TCM-0042, TCM-0046 is stored.
- Also troubleshoot the transmission according to code TCM-0046.
- When changing the oil. See **TRANSMISSION FLUID, REPLACING** .

Is there coolant in the oil (oil grey-colored)?

- Check the oil for coolant, see **CHECKING FOR COOLANT IN THE OIL**
- Determine the cause why there is coolant in the oil.
- Replace the gearbox. See **TRANSMISSION - REMOVAL, REPLACEMENT AND INSTALLATION** .

NOTE: **Always replace the cooler and the additional oil cooler (where applicable) if there are signs of water in the transmission oil.**

Flush the oil cooler, pipes and oil hoses

Use only ATF-oil, Volvo part no. 1161540-8 (1-liter container).

WARNING: **Avoid skin contact with the oil.**

OIL GRADE, CHECKING (TF-80SC; TF-80SC AWD)

NOTE: **As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information is always correct.**

WARNING: **Avoid skin contact with the transmission fluid.**

CHECK

CHECKING OIL

NOTE: **Oil grade: Only automatic transmission fluid, Volvo P/N 116 1540-8 (1 liter container) may be used.**

Check the oil. Take a sample with the dipstick.

Is the oil discolored or does it smell burnt?

- Check whether diagnostic trouble codes (DTC) TCM 0042 or TCM 0046 are stored

- Also fault-trace the transmission for diagnostic trouble code (DTC) TCM-0046
- When replacing oil, see: **TRANSAXLE OIL** .

Is there water in the oil (gray discoloration)?

- Determine the cause of the water in the oil
- Replace the transmission. See: **TRANSMISSION - REMOVAL, REPLACEMENT AND INSTALLATION** .

NOTE: Always replace the radiator and the additional oil cooler (where applicable) if there are signs of water in the transmission fluid.

Flush out the oil lines

Only automatic transmission fluid, Volvo P/N 116 1540-8 (1 liter containers) may be used.

WARNING: Avoid skin contact with the transmission fluid.

OIL LEVEL, CHECKING

WARNING: Oil grade: Only automatic transmission fluid (ATF). Dexron III (the fluid must have a G license). This is usually given as "Dexron III (G-xxxxx)" where xxxxx is a 5 digit serial number. "Dexron III-G" (without a number) may also occur. The Volvo P/N for this oil is 1161521-8 (1 liter container).

WARNING: Avoid skin contact with the transmission fluid.

CONDITIONS

Fig. 13: Identifying Oil Level Graph
Courtesy of VOLVO CARS CORPORATION

The difference between the MAX and MIN volumes is 0.5 liters. Check the oil temperature in the transmission.

At room temperature (+20 °C) the oil level is close to the MIN mark on the "cold area".

At room temperature (+20 °C) and **low oil level** the oil barely reaches the dipstick.

The "cold range" (+40 °C) is reached after approximately 15 minutes idling in the workshop, while the "hot range" (+80 °C) is reached after approximately 30 minutes highway driving at an air temperature above +15 °C.

NOTE: **Carry out the check at an oil temperature of +80 °C. Go to car communication function group 4. Select the digital display parameter. Select the parameter for the transmission oil temperature.**

PREPARING TO CHECK THE OIL LEVEL

Park the car on a level surface.

Apply the parking brake.

Apply the foot brake.

Let the engine idle.

Move the gear selector lever to position P.

MOVE THE GEAR SELECTOR THROUGH ALL POSITIONS. WAIT IN EACH POSITION FOR APPROXIMATELY 3 SECONDS

Move gear selector to position P and wait approximately 2 minutes before checking the oil level.

The dipstick must be pushed down **as far as possible** into the dipstick tube.

CAUTION: Wipe the dipstick with a nylon cloth or similar. Do not use a cloth which may leave fluff or threads.

LOW LEVEL (TOPPING UP)

TOP UP WITH OIL THROUGH THE DIPSTICK PIPE

Take account of the temperature when topping up with oil. See **PREPARING TO CHECK THE OIL LEVEL**.

HIGH LEVEL (OVERFILLING)

WARNING: The oil may be very hot if the car has just been driven. Avoid skin contact with the transmission fluid.

WARNING: The transmission must not be operated if the oil level is too high. This can cause increased operating temperatures and oil leakage.

DRAIN OFF OIL

Fig. 14: Draining Off Oil
Courtesy of VOLVO CARS CORPORATION

Undo the drain plug.

Allow some of the oil to drain out and reinstall the plug. Tighten to **40 Nm** .

Check the level taking account of the temperature. See **CONDITIONS**, **PREPARING TO CHECK THE OIL LEVEL** and **MOVE THE GEAR SELECTOR THROUGH ALL POSITIONS. WAIT IN EACH POSITION FOR APPROXIMATELY 3 SECONDS**.

The oil can also be sucked out through the dipstick pipe using an oil suction syringe with a narrow gauge hose.

NOTE: Strict cleanliness is important.

OUTPUT SPEED SENSOR TRANSMISSION, REPLACING

NOTE: As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

CAUTION: Avoid skin contact with the transmission fluid.

GREASING THE SPLINES

Fig. 1: Identifying Splines

NOTE: Use all the grease in the package.

Always grease the splines joint between the transmission and the bevel gear. Greasing is carried out to avoid corrosion between the terminal sleeve and the bevel gear tubular shaft.

Check that the terminal sleeve on the transmission is free of damage and corrosion. Otherwise the sleeve must be replaced with a new one.

Use grease, P/N 1161748. Thoroughly lubricate the splines in the terminal sleeve.

TEST DRIVING ACTIVE ON DEMAND COUPLING, MANUAL TRANSMISSION

TEST DRIVING

Fig. 4: Identifying Test Drive
Courtesy of VOLVO CARS CORPORATION

WARNING: **Observe all traffic regulations during the test drive.**

HINT: The test drive consists of two tests. The first test is at low engine speeds (RPM). The second is at higher engine speeds (RPM).

HINT: At low engine speeds (RPM), four wheel drive is normally disengaged. At high engine speeds, four wheel drive will be engaged. This will have a braking effect when the clutch is depressed and the accelerator pedal (AP) is released.

HINT: The stopping distance with four wheel drive engaged must be approximately half the distance of that when four wheel drive is disengaged.

The test drive

Drive the car in a circle at full lock (the smallest turning circle) at a speed of approximately 10 km/h. Press the clutch and release the accelerator pedal (AP). Let the car come to a standstill.

Note how long it took for the car to stop.

Repeat the test. Increase the engine speed to 3000-4000 RPM. Let the car come to a standstill.

The car will stop in half the distance it took to stop in the first test if the function is correct.

Drive the car while looking out for any faults in functions or noise from the rear suspension.

If there is a fault or noise, stop the test drive. Return to the workshops. Fault trace the symptoms.

TEST-DRIVE SCHEDULE, AW55-50/51SN WITH TCM-002E

Perform the following test-drive:

NOTE: Read through the whole document before starting to test-drive.

1. Check the oil temperature in the transmission via read-out. Suitable temperature range is 40-65 °C.

   Vehicles with GearTronic lever carrier:

   1. Perform the same step as above once more with the gear lever in GearTronic-position with 4th gear selected. Try also to keep the engine in the same engine speed range as during the previous check. In this position, slipping lock-up will not be possible, only locked lock-up. Then the indicator light will be on with a steady glow.
2. Start Activation of gear indication using VIDA (Volvo scan tool)

   NOTE: The activation only applies during one driving cycle.

   Vehicles with GearTronic lever carrier:

   1. Perform the same step as above once more with the gear lever in GearTronic-position with 4th gear selected. Try also to keep the engine in the same engine speed range as during the previous check. In this position, slipping lock-up will not be possible, only locked lock-up. Then the indicator light will be on with a steady glow.
3. Drive the vehicle with light load, approx. 60 km/h (37 mph) in 4th gear (engine speed approx. 1600 RPM). Check status of lock-up via control light IND.

   HINT: The problems occur at slipping lock-up (IND-light flashes).

   Vehicles with GearTronic lever carrier:

   1. Perform the same step as above once more with the gear lever in GearTronic-position with 4th gear selected. Try also to keep the engine in the same engine speed range as during the previous check. In this position, slipping lock-up will not be possible, only locked lock-up. Then the indicator light will be on with a steady glow.
4. When the IND-light flashes, throttle up slightly on a slight uphill grade. Pay attention to if a brief vibration occurs, and that slipping lock-up is turned off. The engine speed should increase by approx. 500 RPM.

Vehicles with GearTronic lever carrier:

1. Perform the same step as above once more with the gear lever in GearTronic-position with 4th gear selected. Try also to keep the engine in the same engine speed range as during the previous check. In this position, slipping lock-up will not be possible, only locked lock-up. Then the indicator light will be on with a steady glow.

5. Check if the vibrations follow the speed or if they are brief vibrations.

NOTE: It is likely that no new diagnostic trouble code will be stored as the diagnosis requires that the malfunction occurs during a number of driving cycles to enable storing of the diagnostic trouble.

Perform one of the alternatives below:

1. Vibrations occur both at slipping and locked lock-up: replace transmission.

   see **TRANSMISSION - REMOVAL, REPLACEMENT AND INSTALLATION**

2. Vibrations only occur at slipping lock-up: replace torque converter.
3. Vibrations only occur at locked lock-up: replace transmission.

   see **TRANSMISSION - REMOVAL, REPLACEMENT AND INSTALLATION**

4. Vibrations follow the speed:

   Investigate other components, such as tire imbalance and similar.

5. No vibrations can be detected:

   No further troubleshooting is required.

Transmission - Design and Function

EMERGENCY PROGRAMS IN THE EVENT OF A FAULT (4T65 AWD; 2003-2006)

EMERGENCY PROGRAMS IN THE EVENT OF A FAULT

An emergency program is activated to deal with the fault when the transmission control module (TCM) detects a transmission fault (permanent fault). The control system then implements corrective action to protect the transmission, while leaving the car in the best possible driveable condition. Minor malfunctions do not activate an emergency program.

There are different programs depending on the type of fault:

Emergency mode I
Emergency mode II
Emergency mode III
Limp-home mode

Emergency mode I is activated in the event of minor faults and the Limp-home mode is activated for the most serious faults. If the malfunction is intermittent, the transmission control module (TCM) returns to normal operation the next time the ignition is switched on.

Emergency mode I

- The warning lamp in the combined instrument panel lights (S80), flashes (S/V/C70) for certain diagnostic trouble codes (DTCs).
- The transmission shifts in all gears but transmits no signal to the lock-up solenoid. This means that lock-up is not available.

Emergency mode II

- Remedy as for Emergency mode I.
- No reduction of line pressure when moving the gear selector between positions P-R, N-R and N-D. This results in harsh shifting.
- No torque limiting request from the engine control module (ECM) during gear shifting.
- The warning lamp in the combined instrument panel lights / flashes.

Emergency mode III

- Remedy as for Emergency modes I and II.
- No control of line pressure solenoid SLT. Constant maximum system pressure. This results in harsh shifting and harsher gear engagement in positions P-R, N-R and N-D.

Limp-home mode

- The transmission control module (TCM) interrupts the activation of all solenoids. This results in the transmission not shifting at all. The transmission operates only in 3rd gear in positions 3 and L, 4th gear in position D and reverse in position R. Shifting can only be carried out manually between 3rd and 4th gear and reverse gear.
- No control of line pressure solenoid STH. Constant maximum system pressure. This results in harsh shifting and harsher gear engagement in positions P-R, N-R and N-D.
- The warning lamp in the combined instrument panel flashes.

NOTE: When starting and driving, the gear selector should first be moved to position L to minimize stress on the transmission.

TCM-0001: SHIFT SOLENOID S1. SIGNAL TOO HIGH (4T65 AWD; 2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 1: Identifying Shift Solenoid S1 And S2
Courtesy of VOLVO CARS CORPORATION

Shift solenoids S2 and S1 operate in tandem to control gear-shifting. The solenoids are controlled by power stages in the transmission control module (TCM). The transmission control module (TCM) opens the power stages to activate the solenoids and sends a voltage through the circuit. Solenoid S1 is activated in 1st and 4th gears. Diagnostic trouble code (DTC) TCM-0001 is stored if the control module registers that the signal in the solenoid S1 circuit is too high when the solenoid should not be activated.

Substitute Value

- The control module "Limp Home" program has been initiated.

Possible Source

- Short-circuit to supply voltage in the signal cable.

Fault symptom[s]

- General orange warning lamp lit.
- Malfunction indicator lamp (MIL) lit.
- Harsh gear shifting.
- No shifting.
- No lock-up function.

HINT: Harsh shifting - due to disabled line pressure solenoid STH control. This results in constant maximum line pressure and leads to harsher shifting and gear engagement.

HINT: No shifting -because the transmission control module (TCM) prevents activation of the solenoids. This stops gear-shifting.

SIGNAL TOO HIGH

CHECKS

CHECKING THE TEMPERATURE SENSOR

HINT: In some cases, the diagnostic trouble code (DTC) may be caused by a defective oil temperature sensor. Check the function of the oil temperature sensor first.

- Ignition off
- Read off the oil temperature.

  Check that the function of the temperature sensor is OK. Test drive the car to increase the temperature of the transmission fluid. Read off the temperature again. Check that the temperature has increased.

  HINT: If the temperature is outside its permitted range, fault-trace the temperature sensor.

- Transmission connector disconnected
- Ignition on
- Gear selector in position P
- Activate and read off the status of solenoid S1.

  Connect a voltmeter between terminals #50 (#A50) and #53 (#A53) while activating solenoid S1. The voltage must be approximately 0 V when the solenoid is not activated (OFF) and above 9 V when the solenoid is activated (ON).

The control module is OK if the voltage changes as above when the solenoid is activated/not activated. The control module is defective if the voltage does not change.

NOTE: **If the system voltage is too low, this may result in a low voltage value when solenoid S1 is activated. Check the system voltage and remedy as necessary.**

NOTE: **When removing the transmission connector, the control module may store diagnostic trouble codes (DTCs) for the gear-shift position sensor, the shift solenoids and the temperature sensor etc.**

RESETTING THE ADAPTATION

RESETTING ADAPTATION AND THE COUNTER FOR "TRANSMISSION OIL CHANGE"

HINT: The transmission has torque controlled adaptive pressure control. Pressure control means that the transmission regulates the pressure itself during each gear shift. This avoids harsh gear shifting. Each gear shift is evaluated by the control module and stored in the memory. This allows for compensation for wear and tear in the transmission and clutch. It is important that the adaptation in the memory is reset after the transmission has been repaired. This is to ensure normal operation. The oil is replaced during

repair; the "Transmission oil change" counter must be reset. If the counter is not reset when the fluid is drained and replaced, there is a risk that a diagnostic trouble code (DTC) will be stored in incorrect circumstances.

NOTE: **This applies only if the transmission or one of the components in the transmission have been replaced.**

RESETTING TRANSMISSION FLUID CHANGE COUNTER

RESETTING TRANSMISSION FLUID CHANGE COUNTER

HINT: The transmission control module (TCM) has a counter for the oil quality. The counter counts up if the transmission is exposed to too high a load or an ambient temperature that is too high. If the counter is not reset when the oil is drained or changed, there is a risk that a diagnostic trouble code (DTC) will be stored in faulty circumstances. Therefore it is important that the "Transmission oil change" counter is reset.

TCM-0001: SHIFT SOLENOID S1. SIGNAL TOO HIGH (AW50/51 AWD; AW55-50/51SN; 2003-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 44: Identifying Transmission Control Module (TCM)
Courtesy of VOLVO CARS CORPORATION

Shift solenoids S1, S2, S3, S4 and S5 operate in tandem to control gear-shifting. The solenoids are controlled by power stages in the transmission control module (TCM). The transmission control module (TCM) opens the power stages to activate the solenoids and sends a voltage through the circuit. Diagnostic trouble codes (DTCs) TCM-0001, TCM-0007, TCM-0101 TCM-0107 or TCM-010A are stored (depending on the solenoid) if the transmission control module (TCM) registers that the signal in circuits S1, S2, S3, S4 or S5 is too high when the solenoid should not be activated.

Substitute Value

- The transmission control module (TCM) "Emergency mode I" program has been initiated.

Possible Source

- Short-circuit to supply voltage in the signal cable.
- Internal fault in the control module.

Fault symptom[s]

- General orange warning lamp lit.
- Malfunction indicator lamp (MIL) lit.

- Harsh gear shifting.
- No shifting.
- No lock-up function.

RESETTING THE ADAPTATION

RESETTING ADAPTATION AND THE COUNTER FOR "TRANSMISSION OIL CHANGE"

HINT: The transmission has torque controlled adaptive pressure control. Pressure control means that the transmission regulates the pressure itself during each gear shift. This avoids harsh gear shifting. Each gear shift is evaluated by the control module and stored in the memory. This allows for compensation for wear and tear in the transmission and clutch. It is important that the adaptation in the memory is reset after the transmission has been repaired. This is to ensure normal operation. The oil is replaced during

repair; the "Transmission oil change" counter must be reset. If the counter is not reset when the fluid is drained and replaced, there is a risk that a diagnostic trouble code (DTC) will be stored in incorrect circumstances.

TCM-0002: SHIFT SOLENOID S1. SIGNAL MISSING (4T65 AWD; 2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 82: Identifying Shift Solenoid S1 And S2
Courtesy of VOLVO CARS CORPORATION

Shift solenoids S2 and S1 operate in tandem to control gear-shifting. The solenoids are controlled by power stages in the transmission control module (TCM). The transmission control module (TCM) opens the power stages to activate the solenoids and sends a voltage through the circuit. Solenoid S1 is activated in 1st and 4th gears. Diagnostic trouble code (DTC) TCM-0002 is stored if the control module registers that the signal in the solenoid S1 circuit is missing when the solenoid is activated.

Substitute Value

- The control module "Limp Home" program has been initiated.

Possible Source

- Contact resistance in the terminals.
- Open-circuit in the signal cable.
- Defective solenoid.

Fault symptom[s]

- General orange warning lamp lit.
- Malfunction indicator lamp (MIL) lit.

- Harsh gear shifting.
- No shifting.
- No lock-up function.

HINT: Harsh shifting - due to disabled line pressure solenoid STH control. This results in constant maximum line pressure and leads to harsher shifting and gear engagement.

HINT: No shifting -because the transmission control module (TCM) prevents activation of the solenoids. This stops gear-shifting.

RESETTING TRANSMISSION FLUID CHANGE COUNTER

RESETTING TRANSMISSION FLUID CHANGE COUNTER

HINT: The transmission control module (TCM) has a counter for the oil quality. The counter counts up if the transmission is exposed to too high a load or an ambient temperature that is too high. If the counter is not reset when the oil is drained or changed, there is a risk that a diagnostic trouble code (DTC) will be stored in faulty circumstances. Therefore it is important that the "Transmission oil change" counter is reset.

NOTE: **This applies only when the transmission fluid is changed and when the fluid is changed when repairs are carried out to the transmission temperature sensor.**

TCM-0002: SHIFT SOLENOID S1. SIGNAL MISSING (AW50/51 AWD; AW55-50/51SN; 2003-2007)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 128: Identifying Transmission Control Module (TCM)
Courtesy of VOLVO CARS CORPORATION

Shift solenoids S1, S2, S3, S4 and S5 operate in tandem to control gear-shifting. The solenoids are controlled by power stages in the transmission control module (TCM). The transmission control module (TCM) opens the power stages to activate the solenoids and sends a voltage through the circuit. Diagnostic trouble codes (DTCs) TCM-0002, TCM-0008, TCM-0102, TCM-0108 or TCM-010B are stored (depending on the solenoid) if the transmission control module (TCM) registers that the signal in circuits S1, S2, S3, S4 or S5 is missing when the solenoid is activated.

Substitute Value

- The transmission control module (TCM) "Emergency mode I" program has been initiated.

Possible Source

- Contact resistance in terminals.
- Open-circuit in the signal cable.
- Defective solenoid.
- Internal fault in the control module.

Fault symptom[s]

- General orange warning lamp lit.
- Malfunction indicator lamp (MIL) lit.
- Harsh gear shifting.
- No shifting.
- No lock-up function.

RESETTING THE ADAPTATION

RESETTING ADAPTATION AND THE COUNTER FOR "TRANSMISSION OIL CHANGE"

HINT: The transmission has torque controlled adaptive pressure control. Pressure control means that the transmission regulates the pressure itself during each gear shift. This avoids harsh gear shifting. Each gear shift is evaluated by the control module and stored in the memory. This allows for compensation for wear and tear in the transmission and clutch. It is important that the adaptation in the memory is reset after the transmission has been repaired. This is to ensure normal operation. The oil is replaced during

repair; the "Transmission oil change" counter must be reset. If the counter is not reset when the fluid is drained and replaced, there is a risk that a diagnostic trouble code (DTC) will be stored in incorrect circumstances.

NOTE: **This applies only if the transmission or one of the components in the transmission have been replaced.**

TCM-0003: SHIFT SOLENOID S1. SIGNAL TOO LOW (4T65 AWD; 2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 172: Identifying Shift Solenoid S1 And S2
Courtesy of VOLVO CARS CORPORATION

Shift solenoids S2 and S1 operate in tandem to control gear-shifting. Solenoid S1 is activated in 1st and 4th gears. Diagnostic trouble code (DTC) TCM-0003 is stored if the control module registers that the signal in the solenoid S1 circuit is too low when the solenoid should be activated. Solenoid S1 cannot then be activated.

Substitute Value

- The control module "Limp Home" program has been initiated.

Possible Source

- Short-circuit to ground in the signal cable.
- Defective solenoid.

Fault symptom[s]

- The automatic transmission warning lamp flashes.
- No lock-up function.
- Harsh gear shifting.
- No shifting.

HINT: Harsh shifting because there is no line pressure solenoid STH control. This results in constant maximum line pressure.

HINT: No shifting -because the transmission control module (TCM) prevents activation of the solenoids. This stops gear-shifting.

RESETTING THE ADAPTATION

RESETTING ADAPTATION AND THE COUNTER FOR "TRANSMISSION OIL CHANGE"

HINT: The transmission has torque controlled adaptive pressure control. Pressure control means that the transmission regulates the pressure itself during each gear shift. This avoids harsh gear shifting. Each gear shift is evaluated by the control module and stored in the memory. This allows for compensation for wear and tear in the transmission and clutch. It is important that the adaptation in the memory is reset after the transmission has been repaired. This is to ensure normal operation. The oil is replaced during

repair; the "Transmission oil change" counter must be reset. If the counter is not reset when the fluid is drained and replaced, there is a risk that a diagnostic trouble code (DTC) will be stored in incorrect circumstances.

NOTE: This applies only if the transmission or one of the components in the transmission have been replaced.

TCM-0007: SHIFT SOLENOID S2. SIGNAL TOO HIGH (4T65 AWD; 2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 264: Identifying Shift Solenoid S1 And S2
Courtesy of VOLVO CARS CORPORATION

Shift solenoids S2 and S1 operate in tandem to control gear-shifting. The solenoids are controlled by power stages in the transmission control module (TCM). The transmission control module (TCM) opens the power stages to activate the solenoids and sends a voltage through the circuit. Solenoid S2 is activated in 1st and 2nd gears. Diagnostic trouble code (DTC) TCM-0007 is stored if the control module registers that the signal in the circuit is too high when the solenoid should not be activated.

Substitute Value

- The control module "Limp Home" program has been initiated.

Possible Source

- Short-circuit to supply voltage in the signal cable.

Fault symptom[s]

- General orange warning lamp lit.
- Malfunction indicator lamp (MIL) lit.
- No lock-up function.
- Harsh gear shifting.

- No shifting.

HINT: Harsh shifting - due to disabled line pressure solenoid STH control. This results in constant maximum line pressure and leads to harsher shifting and gear engagement.

HINT: No shifting -because the transmission control module (TCM) prevents activation of the solenoids. This stops gear-shifting.

  Connect a voltmeter between terminals #B8 (#A68) and #A53 (#A53) while activating solenoid S2. The voltage must be approximately 0 V when the solenoid is not activated (OFF) and above 9 V when the solenoid is activated (ON).

The control module is OK if the voltage changes as above when the solenoid is activated/not activated. The control module is defective if the voltage does not change.

NOTE: **If the system voltage is too low this may result in a low voltage value when solenoid S2 is activated. Check the system voltage and remedy as necessary.**

NOTE: **When removing the transmission connector, the control module may store diagnostic trouble codes (DTCs) for the gear-shift position sensor, the shift solenoids and the temperature sensor etc.**

RESETTING THE ADAPTATION

RESETTING ADAPTATION AND THE COUNTER FOR "TRANSMISSION OIL CHANGE"

HINT: The transmission has torque controlled adaptive pressure control. Pressure control means that the transmission regulates the pressure itself during each gear shift. This avoids harsh gear shifting. Each gear shift is evaluated by the control module and stored in the memory. This allows for compensation for wear and tear in the transmission and clutch. It is important that the adaptation in the memory is reset after the transmission has been repaired. This is to ensure normal operation. The oil is replaced during

repair; the "Transmission oil change" counter must be reset. If the counter is not reset when the fluid is drained and replaced, there is a risk that a diagnostic trouble code (DTC) will be stored in incorrect circumstances.

NOTE: **This applies only if the transmission or one of the components in the transmission have been replaced.**

TCM-0008: SHIFT SOLENOID S2. SIGNAL MISSING (4T65 AWD; 2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 342: Identifying Shift Solenoid S1 And S2
Courtesy of VOLVO CARS CORPORATION

Shift solenoids S2 and S1 operate in tandem to control gear-shifting. The solenoids are controlled by power stages in the transmission control module (TCM). The transmission control module (TCM) opens the power stages to activate the solenoids and sends a voltage through the circuit. Solenoid S2 is activated in 1st and 2nd gears. Diagnostic trouble code (DTC) TCM-0008 is stored if the control module registers an open-circuit in the solenoid S2 circuit when the solenoid is activated.

Substitute Value

- The control module "Limp Home" program has been initiated.

Possible Source

- Contact resistance in the terminals.
- Open-circuit in the signal cable.

- Defective solenoid.

Fault symptom[s]

- General orange warning lamp lit.
- Malfunction indicator lamp (MIL) lit.
- No lock-up function.
- No shifting.
- Harsh gear shifting.

HINT: Harsh shifting - due to disabled line pressure solenoid STH control. This results in constant maximum line pressure and leads to harsher shifting and gear engagement.

HINT: No shifting -because the transmission control module (TCM) prevents activation of the solenoids. This stops gear-shifting.

RESETTING THE ADAPTATION

RESETTING ADAPTATION AND THE COUNTER FOR "TRANSMISSION OIL CHANGE"

HINT: The transmission has torque controlled adaptive pressure control. Pressure control means that the transmission regulates the pressure itself during each gear shift. This avoids harsh gear shifting. Each gear shift is evaluated by the control module and stored in the memory. This allows for compensation for wear and tear in the transmission and clutch. It is important that the adaptation in the memory is reset after the transmission has been repaired. This is to ensure normal operation. The oil is replaced during

repair; the "Transmission oil change" counter must be reset. If the counter is not reset when the fluid is drained and replaced, there is a risk that a diagnostic trouble code (DTC) will be stored in incorrect circumstances.

NOTE: This applies only if the transmission or one of the components in the transmission have been replaced.

If the counter is not reset when the oil is drained or changed, there is a risk that a diagnostic trouble code (DTC) will be stored in faulty circumstances. Therefore it is important that the "Transmission oil change" counter is reset.

NOTE: **This applies only when the transmission fluid is changed and when the fluid is changed when repairs are carried out to the transmission temperature sensor.**

TCM-0009: SHIFT SOLENOID S2. SIGNAL TOO LOW (4T65 AWD; 2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 433: Identifying Shift Solenoid S1 And S2
Courtesy of VOLVO CARS CORPORATION

Shift solenoids S2 and S1 operate in tandem to control gear-shifting. The solenoids are controlled by power stages in the transmission control module (TCM). The transmission control module (TCM) opens the power stages to activate the solenoids and sends a voltage through the circuit. Solenoid S2 is activated in 1st and 2nd gears. Diagnostic trouble code (DTC) TCM-0009 is stored if the control module registers that the signal in the solenoid S2 circuit is too low when the solenoid should be activated. Solenoid S2 cannot then be activated.

Substitute Value

- The control module "Limp Home" program has been initiated.

Possible Source

- Contact resistance in the terminals.
- Short-circuit to ground in the signal cable.
- Defective solenoid.

Fault symptom[s]

- General orange warning lamp lit.
- Malfunction indicator lamp (MIL) lit.

- Harsh gear shifting.
- No shifting.
- No lock-up function.

HINT: Harsh shifting - due to disabled line pressure solenoid STH control. This results in constant maximum line pressure and leads to harsher shifting and gear engagement.

HINT: No shifting -because the transmission control module (TCM) prevents activation of the solenoids. This stops gear-shifting.

CHECKS

CHECKING THE TEMPERATURE SENSOR

HINT: In some cases, the diagnostic trouble code (DTC) may be caused by a defective oil temperature sensor. Check the function of the oil temperature sensor first.

RESETTING TRANSMISSION FLUID CHANGE COUNTER

RESETTING TRANSMISSION FLUID CHANGE COUNTER

HINT: The transmission control module (TCM) has a counter for the oil quality. The counter counts up if the transmission is exposed to too high a load or an ambient temperature that is too high. If the counter is not reset when the oil is drained or changed, there is a risk that a diagnostic trouble code (DTC) will be stored in faulty circumstances. Therefore it is important that the "Transmission oil change" counter is reset.

NOTE: **This applies only when the transmission fluid is changed and when the fluid is changed when repairs are carried out to the transmission temperature sensor.**

TCM-000B: SHIFT SOLENOID S1. HYDRAULIC FAULT (4T65 AWD; 2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 527: Identifying Shift Solenoid S1 And S2
Courtesy of VOLVO CARS CORPORATION

The transmission control module (TCM) compares the speed signal from the brake control module (BCM) with the speed signal from the transmission. The control module also checks which gear is selected and compares it with the calculated gear. The speed signal from the brake control module (BCM) and the transmission speed signals should be almost identical, the transmission speed signal should be greater or lower than the brake control module (BCM) speed signal (vehicle speed must be above 30 km/h, engine speed (RPM) above 1400 rpm and transmission oil temperature over 20 °C).

Diagnostic trouble code (DTC) TCM-000B is stored if the control module detects that the vehicle speed and engine speed (RPM) signals do not correspond with the programmed values and that an "incorrect" gear is being used in relation to the calculated gear. This is because a solenoid fault has occurred in the hydraulic circuit for gears 1-2 or 3-4.

Substitute Value

- The control module "Limp-home" mode is engaged and only gear positions 3 and R are available. When the ignition is switched off, the control module switches to normal function and all four forward shift positions can be used.

Possible Source

- Glycol in the transmission fluid.

- The hydraulic valve for solenoid S1 has stuck in the open or closed position
- Defective control system (the solenoid binds or is stuck)
- Internal leakage in the transmission
- Warn or damaged clutch driven plates in the transmission.

Fault symptom[s]

- General orange warning lamp lit
- Malfunction indicator lamp (MIL) lit
- No shifting (may be intermittent)
- No lock-up function.

HINT: When the transmission control module (TCM) detects disrupted function, "Limp-home" mode is activated and only shift positions 3 and R are available. Lock-up function is also unavailable.

CHECKING ENGINE BRAKING

HINT: Test drive the car to determine whether the fault is in the transmission or in the transmission control system. Test drive as follows:

- Start the engine and move the gear selector to position 1 (Geartronic 1)
- Accelerate up to 4500-6000 rpm and release the accelerator pedal (AP).

  If there is **no** engine breaking, there is an internal fault in the transmission. Replace the transmission.

  If there is engine breaking, there is an internal fault in the transmission control system. Replace the control system

RESETTING THE ADAPTATION

RESETTING ADAPTATION AND THE COUNTER FOR "TRANSMISSION OIL CHANGE"

HINT: The transmission has torque controlled adaptive pressure control. Pressure control means that the transmission regulates the pressure itself during each gear shift. This avoids harsh gear shifting. Each gear shift is evaluated by the control module and stored in the memory. This allows for compensation for wear and tear in the transmission and clutch. It is important that the adaptation in the memory is reset after the transmission has been repaired. This is to ensure normal operation. The oil is replaced during repair; the "Transmission oil change" counter must be reset. If the counter is not reset when the fluid is drained and replaced, there is a risk that a diagnostic trouble code (DTC) will be stored in incorrect

circumstances.

NOTE: This applies only if the transmission or one of the components in the transmission have been replaced.

CHECKING THE OIL LEVEL IN THE TRANSMISSION

CHECK THE TRANSMISSION OIL LEVEL

NOTE: The transmission fluid level is extremely important for transmission function. Therefore it is imperative that it is correct. In addition the oil level is dependent on oil temperature.

- Read off the oil temperature.

When checking the gearbox oil level the oil temperature **must** be **80 °C - 90 °C** .

At the correct temperature, the oil level should be between "Min hot" and "Max hot".

Too high: Drain the transmission fluid to the correct level
Too low: Check the transmission for leakage.

TCM-000C: SHIFT SOLENOID S2. HYDRAULIC FAULT (4T65 AWD; 2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 1: Identifying Shift Solenoid S1 And S2
Courtesy of VOLVO CARS CORPORATION

The transmission control module (TCM) compares the speed signal from the brake control module (BCM) with the speed signal from the transmission. The control module also checks which gear is selected and compares it with the calculated gear. The speed signal from the brake control module (BCM) and the transmission speed signals should be almost identical, the transmission speed signal should be greater or lower than the brake control module (BCM) speed signal (vehicle speed must be above 30 km/h, engine speed (RPM) above 1400 RPM and transmission oil temperature over 20 °C).

Diagnostic trouble code (DTC) TCM-000C is stored if the control module detects that the vehicle speed and engine speed (RPM) signals do not correspond with the programmed values and that an "incorrect" gear has been selected. This is because a solenoid fault has occurred in the hydraulic circuit for gears 1-2 or 3-4.

Substitute Value

- The control module "Limp-home" mode is engaged and only gear positions 3 and R are available. When the ignition is switched off the control module switches to normal function and all four forward shift positions can be used.

Possible Source

- Glycol in the transmission fluid.
- The hydraulic valve for solenoid S2 has stuck in the open or closed position
- Defective control system (the solenoid binds or is stuck)
- Internal leakage in the transmission
- Warn or damaged clutch driven plates in the transmission.

Fault symptom[s]

- General orange warning lamp lit
- Malfunction indicator lamp (MIL) lit
- No shifting
- Harsh gear shifting
- No lock-up function.

HINT: When the transmission control module (TCM) detects disrupted function, "Limp-home" mode is activated and only shift positions 3 and R are available. Lock-up function is also unavailable.

HINT: Harsh shifting - due to disabled line pressure solenoid STH control. This results in constant maximum line pressure and leads to harsher shifting and gear engagement.

TCM-000D: LINE PRESSURE SOLENOID STH. SIGNAL TOO HIGH. INTERMITTENT FAULT (4T65 AWD; 2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 2: Identifying Line Pressure Solenoid, STH
Courtesy of VOLVO CARS CORPORATION

Line pressure solenoid STH regulates line pressure in the transmission. The solenoid is controlled by an amplifier in the transmission control module (TCM) output. The transmission control module (TCM) uses the amplifier to control the current to the solenoid. A low amperage gives a high line pressure. A high amperage (approximately 1 A) gives a low line pressure. Amperage is primarily affected by throttle position. Diagnostic trouble code (DTC) TCM-000D is stored if the control module registers that the current is too high through the circuit. Solenoid STH is unable to control the system pressure.

Substitute Value

- The control module "Limp Home" program initiated.

Possible Source

- Short-circuit to supply voltage in the control signal wiring or signal wiring.
- Short-circuit between control signal cable and signal cable.
- Defective solenoid STH.

Fault symptom[s]

- General orange warning lamp lit.

- Malfunction indicator lamp (MIL) lit.
- No shifting.
- No lock-up function.

HINT: No shifting - because the transmission control module (TCM) prevents activation of the solenoids. This stops gear-shifting.

CAUTION: There is a danger that this fault will cause line pressure in the transmission to be too low, which will result in wear.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 10: Identifying Line Pressure Solenoid, STH
Courtesy of VOLVO CARS CORPORATION

Line pressure solenoid STH regulates the line pressure in the transmission. The solenoid is controlled by a power stage in the control module output. The transmission control module (TCM) uses the power stage to control the current to the solenoid. A low amperage results in a high line pressure. A high amperage (approximately 1 A) gives a low line pressure. The amperage is primarily affected by the throttle position. Diagnostic trouble code (DTC) TCM-000F is stored if the control module registers that there is no current in the circuit for solenoid STH. Solenoid STH cannot then control the line pressure.

Substitute Value

- The control module "Limp Home" program has been initiated.

Possible Source

- Contact resistance in the terminals.
- Open-circuit in the control signal cable or the signal cable.
- Defective solenoid STH.

Fault symptom[s]

- General orange warning lamp lit.
- Malfunction indicator lamp (MIL) lit.
- No lock-up function.
- Harsh gear shifting.

HINT: Harsh gear shifting can be caused by:

- No torque limiting request to engine control module (ECM) when shifting.
- No line pressure solenoid STH control. This results in constant maximum line pressure.

RESETTING THE ADAPTATION

RESETTING ADAPTATION AND THE COUNTER FOR "TRANSMISSION OIL CHANGE"

HINT: The transmission has torque controlled adaptive pressure control. Pressure control means that the transmission regulates the pressure itself during each gear shift. This avoids harsh gear shifting. Each gear shift is evaluated by the control module and stored in the memory. This allows for compensation for wear and tear in the transmission and clutch. It is important that the adaptation in the memory is reset after the transmission has been repaired. This is to ensure normal operation. The oil is replaced during

repair; the "Transmission oil change" counter must be reset. If the counter is not reset when the fluid is drained and replaced, there is a risk that a diagnostic trouble code (DTC) will be stored in incorrect circumstances.

NOTE: **This applies only if the transmission or one of the components in the transmission have been replaced.**

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

TCM-0010: LINE PRESSURE SOLENOID STH. SIGNAL TOO LOW. INTERMITTENT FAULT (4T65 AWD; 2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 34: Identifying Line Pressure Solenoid, STH
Courtesy of VOLVO CARS CORPORATION

Line pressure solenoid STH regulates line pressure in the transmission. The solenoid is controlled by an amplifier in the transmission control module (TCM) output. The transmission control module (TCM) uses the amplifier to control the current to the solenoid. A low amperage gives a high line pressure. A high amperage (approximately 1 A) gives a low line pressure. Amperage is primarily affected by throttle position. Diagnostic trouble code (DTC) TCM-0010 is stored if the control module registers that there is no current in the solenoid STH circuit. Solenoid STH cannot then control line pressure.

Substitute Value

- The control module "Limp Home" program initiated.

Possible Source

- Short-circuit to ground in the control signal cable or signal cable.
- Defective solenoid STH.

Fault symptom[s]

- General orange warning lamp lit.
- Malfunction indicator lamp (MIL) lit.
- No lock-up function.
- Harsh gear shifting.

HINT: Harsh gear shifting can be caused by:

- No adaptation of the gear slippage times at high altitude (High Altitude Compensation).
- No torque limiting request to engine control module (ECM) when shifting.
- No line pressure solenoid STH control. Results in constant maximum line pressure.

CHECK THE QUALITY OF THE TRANSMISSION OIL

NOTE: **The transmission fluid quality is extremely important for transmission function. Therefore it is imperative that this is correct.**

Fig. 58: Identifying Ignition OFF

- Ignition off.

  Check the transmission oil quality. Take a sample using the dip stick.

  - Replace the transmission fluid if it smells burnt
  - Replace the fluid and filter if the transmission fluid contains particles
  - Check if there is oil or an oil film in the expansion tank. Oil in the expansion tank indicates leakage from the transmission oil cooler which is positioned in the cooler unit.

NOTE: **The transmission oil is red and must not be confused with black engine oil.**

- If the transmission fluid is cloudy or pink, it is contaminated with coolant. In such cases the transmission must be replaced. For checking coolant in transmission oil, see **CHECKING FOR COOLANT IN THE OIL**

  When replacing the transmission, the cooler unit, including the additional cooler must be replaced if installed. Replace the hoses between the cooler and the transmission.

Other information:

- To replace the transmission fluid and filter, see **TRANSMISSION OIL / OIL FILTER, REPLACING** .

TCM-0012: LOCK-UP SOLENOID SL. SIGNAL TOO HIGH. INTERMITTENT FAULT (4T65 AWD; 2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 69: Identifying Lock-Up Solenoid, SL
Courtesy of VOLVO CARS CORPORATION

Lock-up solenoid SL controls the transmission lock-up function. Solenoid SL operates when it receives voltage from the transmission control module (TCM) and is activated under different driving conditions depending on road speed, throttle position and the driving mode selected. Diagnostic trouble code (DTC) TCM-0012 is stored if the control module registers that the signal is too high in the circuit for solenoid SL when the solenoid should not be activated. Solenoid SL is then probably permanently activated.

Substitute Value

- The control module does not activate the lock-up solenoid.

Possible Source

- Short-circuit to supply voltage in the signal cable.

Fault symptom[s]

- General orange warning lamp lit.

- Malfunction indicator lamp (MIL) lit.
- Harsh gear shifting.
- No shifting.
- Irregular shifting.

HINT: Harsh shifting - because the solenoid is permanently activated, the lock-up function is permanently engaged in 2nd, 3rd and 4th gears. Harsh shifting and engine braking function in 2nd, 3rd and 4th gears.

TCM-0013: LOCK-UP SOLENOID SL. SIGNAL MISSING. INTERMITTENT FAULT (4T65 AWD; 2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 94: Identifying Lock-Up Solenoid, SL
Courtesy of VOLVO CARS CORPORATION

The lock-up solenoid SL controls the transmission lock-up function. Solenoid SL operates when it receives voltage from the control module and is activated under different driving conditions depending on road speed, throttle position and the driving mode selected. Diagnostic trouble code (DTC) TCM-0013 is stored if the control module registers that the signal in the solenoid SL circuit is missing when the solenoid should be activated. Solenoid SL cannot then be activated.

Substitute Value

- The control module does not activate the lock-up solenoid.

Possible Source

- Contact resistance in the terminals.
- Open-circuit in the signal cable.
- Defective solenoid.

Fault symptom[s]

- General orange warning lamp lit.
- Malfunction indicator lamp (MIL) lit.
- No lock-up function.
- Harsh gear shifting.

RESETTING THE ADAPTATION

RESETTING ADAPTATION AND THE COUNTER FOR "TRANSMISSION OIL CHANGE"

HINT: The transmission has torque controlled adaptive pressure control. Pressure control means that the transmission regulates the pressure itself during each gear shift. This avoids harsh gear shifting. Each gear shift is evaluated by the control module and stored in the memory. This allows for compensation for wear and tear in the transmission and clutch. It is important that the adaptation in the memory is reset after the transmission has been repaired. This is to ensure normal operation. The oil is replaced during repair; the "Transmission oil change" counter must be reset. If the counter is not reset when the fluid is drained and replaced, there is a risk that a diagnostic trouble code (DTC) will be stored in incorrect circumstances.

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 148: Identifying Lock-Up Pressure Switch
Courtesy of VOLVO CARS CORPORATION

Lock-up solenoid SL controls the transmission lock-up function. Solenoid SL operates when it receives voltage from the transmission control module (TCM) and is activated under different driving conditions depending on road speed, throttle position and the driving mode selected. The control module checks if lock-up solenoid SL is stuck in open or closed position by comparing the signals from solenoid SL and lock-up pressure sensor PS4. Pressure sensor PS4 detects whether solenoid SL is activated or not. Diagnostic trouble code (DTC) TCM-0015 is stored if the signals do not correspond with each other for 10 seconds.

Substitute Value

- The control module does not activate the lock-up solenoid.

Possible Source

- Lock-up solenoid SL has stuck in open or shut position.

TCM-0016: CONTROL MODULE. INTERNAL FAULT. INTERMITTENT FAULT (4T65 AWD; 2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 161: Identifying Transmission Control Module (TCM)
Courtesy of VOLVO CARS CORPORATION

The solenoids are controlled by amplifiers in the transmission control module (TCM). The transmission control module (TCM) opens the amplifiers to activate the solenoids and sends a voltage through the circuit. Diagnostic trouble code (DTC) TCM-0016 is stored if the control module registers an internal fault in one of the amplifier circuits.

Substitute Value

- The control module "Limp Home" program initiated.

Possible Source

- Defective control module.

Fault symptom[s]

- General orange warning lamp lit.

- Malfunction indicator lamp (MIL) lit.
- No lock-up function.
- Harsh gear shifting.
- No shifting.

HINT: Harsh gear shifting can be caused by:

- No adaptation of the gear slippage times at high altitude (High Altitude Compensation).
- No reduction of line pressure when shifting.
- No torque limiting request to engine control module (ECM) when shifting.

HINT: No shifting - because the transmission control module (TCM) prevents activation of the solenoids. This stops gear-shifting.

CAUTION: There is a danger that this fault will cause line pressure in the transmission to be too low, which will result in wear.

Diagnostic trouble code (DTC) TCM-001F is stored if the control module registers that the signal from the speed sensor is missing.

Substitute Value

- None.

Possible Source

- Contact resistance in the terminals.
- Open-circuit in the power supply.
- Open-circuit in the signal cable.
- Defective speed sensor.

Fault symptom[s]

- General orange warning lamp lit.
- Malfunction indicator lamp (MIL) lit.
- No lock-up function.

- Harsh gear shifting.

HINT: Harsh gear shifting can be caused by:

- No reduction of the line pressure when shifting.
- No reduction of the line pressure when moving the gear selector between positions P-R, N-R and N-D.
- No request for torque limiting to the engine control module (ECM) when shifting.

- Check the transmission control module (TCM) and speed sensor connectors. Check for contact resistance and oxidation according to **CONTACT RESISTANCE AND OXIDATION** . Remedy if necessary
- Raise the car so that the drive wheels are clear of the ground
- Start the engine. Allow the engine to idle
- Move the gear selector to position D so that the drive wheels begin to rotate
- Read off the transmission speed.

Depress the accelerator pedal (AP) and check that the speed is updated.

NOTE: Ensure that the wheels are not rotating when the gear selector is moved.

NOTE: Diagnostic trouble codes (DTCs) may be stored in the ABS system when the rear wheels are stationary and the front wheels rotate. Erase any diagnostic trouble codes (DTCs) stored in the ABS system after fault-tracing.

If the speed is updated, the cause of the fault was probably contact resistance or oxidation in the control module or vehicle speed sensor (VSS) connectors.

TCM-0023: INPUT SPEED SENSOR. SIGNAL MISSING. INTERMITTENT FAULT (4T65 AWD; 2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 216: Identifying Transmission Speed Sensor
Courtesy of VOLVO CARS CORPORATION

The transmission speed signal is transmitted by a sensor on the transmission. The transmission control module (TCM) uses the signal to determine the input shaft speed after the torque converter. This signal is used to compare the transmission speed and vehicle speed. The transmission control module (TCM) uses this comparison to calculate gear-shift timing. Engine speed (RPM) and vehicle speed data affects the adjustment of system pressure, lock-up function control and engine torque reduction. The result is smooth gear-shifting. The control module calculates and compares the transmission speed, engine speed (RPM) and speed at the transmission. Diagnostic trouble code (DTC) TCM-0023 is stored if the control module registers that the engine speed (RPM) signal is missing.

Substitute Value

- No torque reduction
- No lock-up

Possible Source

- Contact resistance in the terminals.
- Open-circuit on power supply.
- Open-circuit in the signal cable.
- Defective input speed sensor.

Fault symptom[s]

- General orange warning lamp lit.
- Malfunction indicator lamp (MIL) lit.
- No lock-up function.
- Harsh gear shifting.

HINT: Harsh gear shifting can be caused by:

- No reduction of line pressure when shifting.
- No reduction of line pressure when moving the gear selector between positions P-R, N-R and N-D.
- No torque limiting request to engine control module (ECM) when shifting.

RESETTING THE ADAPTATION

RESETTING ADAPTATION AND THE COUNTER FOR "TRANSMISSION OIL CHANGE"

HINT: The transmission has torque controlled adaptive pressure control. Pressure control means that the transmission regulates the pressure itself during each gear shift. This avoids harsh gear shifting. Each gear shift is evaluated by the control module and stored in the memory. This allows for compensation for wear and tear in the transmission and clutch. It is important that the adaptation in the memory is reset after the transmission has been repaired. This is to ensure normal operation. The oil is replaced during

repair; the "Transmission oil change" counter must be reset. If the counter is not reset when the fluid is drained and replaced, there is a risk that a diagnostic trouble code (DTC) will be stored in incorrect circumstances.

NOTE: This applies only if the transmission or one of the components in the transmission have been replaced.

- Start the engine. Allow the engine to idle
- Read off the transmission input speed.

  Check that the transmission input speed is updated.

  Compare with the engine speed (RPM).

If the transmission speed increases, the cause of the fault was loose connections in the control module or transmission speed sensor connectors.

FAULT-TRACING INFORMATION

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.

Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

TCM-0027: BACK-UP (REVERSE) GEAR. INCORRECT GEAR RATIO (4T65 AWD; 2003-2006)

DIAGNOSTIC TROUBLE CODE (DTC) INFORMATION

Condition

Fig. 279: Identifying Transmission
Courtesy of VOLVO CARS CORPORATION

The transmission control module (TCM) calculates the ratio between the transmission input speed and the vehicle speed. There is a specific ratio for each gear. Diagnostic trouble code (DTC) TCM-0027 is stored if the control module registers that the ratio deviates by more than 10% when oil temperature is above +20°C and throttle opening exceeds 3%.

Substitute Value

- The control module "Limp Home" program initiated.

Possible Source

- Contact resistance in the Solenoid S1 and S2 circuits.
- Interference with or faulty transmission speed sensor signal.
- Interference with or faulty speed signal from transmission speed sensor.
- Gear-shift position sensor incorrectly adjusted.

- Transmission oil level too low.
- Mechanical fault in the transmission. Worn components in the transmission causing slippage or too low line pressure.
- Defective power ground.
- Short-circuited to ground in transmission speed sensor signal cable.

Fault symptom[s]

- General orange warning lamp lit.
- Malfunction indicator lamp (MIL) lit.
- No lock-up function.
- No shifting.
- Harsh gear shifting.

HINT: Harsh shifting - due to disabled line pressure solenoid STH control. This results in constant maximum line pressure.

HINT: No shifting - because the transmission control module (TCM) prevents activation of the solenoids. This stops gear-shifting.

INCORRECT GEAR RATIO

CHECKS

CHECKING SOFTWARE

HINT: This may be due to old software in Engine control module (ECM). The fault can be rectified by updating the software in the Transmission Control Module (TCM).

FAULT-TRACING INFORMATION

The fault must now be detected and remedied. As this is not the case, the fault-tracing has failed.

This fault can also be caused by an internal fault in the Transmission Control Module (TCM) or its component parts. Fault trace the Transmission Control Module (TCM) and rectify as necessary.

CHECKING THE OIL LEVEL IN THE TRANSMISSION

Too high: Drain the transmission fluid to the correct level
Too low: Check the transmission for leakage.

Remedy as necessary.

RESETTING THE ADAPTATION

RESETTING ADAPTATION AND THE COUNTER FOR "TRANSMISSION OIL CHANGE"

HINT: The transmission has torque controlled adaptive pressure control. Pressure control means that the transmission regulates the pressure itself during each gear shift. This avoids harsh gear shifting. Each gear shift is evaluated by the control module and stored in the memory. This allows for compensation for wear and tear in the transmission and clutch. It is important that the adaptation in the memory is reset after the transmission has been repaired. This is to ensure normal operation. The oil is replaced during repair; the "Transmission oil change" counter must be reset. If the counter is not reset when the fluid is drained and replaced, there is a risk that a diagnostic trouble code (DTC) will be stored in incorrect

circumstances.

NOTE: This applies only if the transmission or one of the components in the transmission have been replaced.
